Apache CloudStack is an effort undergoing incubation at The Apache Software Foundation (ASF).

Incubation is required of all newly accepted projects until a further review indicates that the infrastructure, communications, and decision making process have stabilized in a manner consistent with other successful ASF projects. While incubation status is not necessarily a reflection of the completeness or stability of the code, it does indicate that the project has yet to be fully endorsed by the ASF.

Release notes for the Apache CloudStack 4.1.0 release.

Preface	v
1. Document Conventions	v
2. Submitting Feedback and Getting Help	vii
1. Welcome to CloudStack 4.1	1
2. Compatibility Matrix for 4.1.0	3
2.1. Supported Operating Systems	3
2.2. Supported Hypervisors	3

2.4. External Devices	4
3. Version 4.1.0	5
3.1. What's New in 4.1	5
3.2. Issues Fixed in 4.1.0	11
3.3. Known Issues in 4.1.0	29
4. Upgrade Instructions	37
4.1. Upgrade from 4.0.x to 4.1.0	37
4.2. Upgrade from 3.0.2 to 4.1.0	41
4.3. Upgrade from 2.2.14 to 4.1.0	51
5. API Changes in 4.1.0	65
5.1. New API commands in 4.1	65
5.2. Changed API commands in 4.1	66

Preface

1. Document Conventions

This manual uses several conventions to highlight certain words and phrases and draw attention to specific pieces of information.

In PDF and paper editions, this manual uses typefaces drawn from the [Liberation Fonts](https://fedorahosted.org/liberation-fonts/)¹ set. The Liberation Fonts set is also used in HTML editions if the set is installed on your system. If not, alternative but equivalent typefaces are displayed. Note: Red Hat Enterprise Linux 5 and later includes the Liberation Fonts set by default.

1.1. Typographic Conventions

Four typographic conventions are used to call attention to specific words and phrases. These conventions, and the circumstances they apply to, are as follows.

Mono-spaced Bold

Used to highlight system input, including shell commands, file names and paths. Also used to highlight keycaps and key combinations. For example:

To see the contents of the file **my_next_bestselling_novel** in your current working directory, enter the **cat my_next_bestselling_novel** command at the shell prompt and press **Enter** to execute the command.

The above includes a file name, a shell command and a keycap, all presented in mono-spaced bold and all distinguishable thanks to context.

Key combinations can be distinguished from keycaps by the hyphen connecting each part of a key combination. For example:

Press **Enter** to execute the command.

Press **Ctrl+Alt+F2** to switch to the first virtual terminal. Press **Ctrl+Alt+F1** to return to your X-Windows session.

The first paragraph highlights the particular keycap to press. The second highlights two key combinations (each a set of three keycaps with each set pressed simultaneously).

If source code is discussed, class names, methods, functions, variable names and returned values mentioned within a paragraph will be presented as above, in **mono-spaced bold**. For example:

File-related classes include **filesystem** for file systems, **file** for files, and **dir** for directories. Each class has its own associated set of permissions.

Proportional Bold

This denotes words or phrases encountered on a system, including application names; dialog box text; labeled buttons; check-box and radio button labels; menu titles and sub-menu titles. For example:

Choose **System** → **Preferences** → **Mouse** from the main menu bar to launch **Mouse Preferences**. In the **Buttons** tab, click the **Left-handed mouse** check box and click

¹ <https://fedorahosted.org/liberation-fonts/>

Close to switch the primary mouse button from the left to the right (making the mouse suitable for use in the left hand).

To insert a special character into a **gedit** file, choose **Applications** → **Accessories** → **Character Map** from the main menu bar. Next, choose **Search** → **Find...** from the **Character Map** menu bar, type the name of the character in the **Search** field and click **Next**. The character you sought will be highlighted in the **Character Table**. Double-click this highlighted character to place it in the **Text to copy** field and then click the **Copy** button. Now switch back to your document and choose **Edit** → **Paste** from the **gedit** menu bar.

The above text includes application names; system-wide menu names and items; application-specific menu names; and buttons and text found within a GUI interface, all presented in proportional bold and all distinguishable by context.

Mono-spaced Bold Italic or ***Proportional Bold Italic***

Whether mono-spaced bold or proportional bold, the addition of italics indicates replaceable or variable text. Italics denotes text you do not input literally or displayed text that changes depending on circumstance. For example:

To connect to a remote machine using ssh, type **ssh *username@domain.name*** at a shell prompt. If the remote machine is **example.com** and your username on that machine is john, type **ssh *john@example.com***.

The **mount -o remount *file-system*** command remounts the named file system. For example, to remount the **/home** file system, the command is **mount -o remount */home***.

To see the version of a currently installed package, use the **rpm -q *package*** command. It will return a result as follows: ***package-version-release***.

Note the words in bold italics above — *username*, *domain.name*, *file-system*, *package*, *version* and *release*. Each word is a placeholder, either for text you enter when issuing a command or for text displayed by the system.

Aside from standard usage for presenting the title of a work, italics denotes the first use of a new and important term. For example:

Publican is a *DocBook* publishing system.

1.2. Pull-quote Conventions

Terminal output and source code listings are set off visually from the surrounding text.

Output sent to a terminal is set in **mono-spaced roman** and presented thus:

```
books      Desktop  documentation  drafts  mss    photos  stuff  svn
books_tests Desktop1  downloads      images  notes  scripts svgs
```

Source-code listings are also set in **mono-spaced roman** but add syntax highlighting as follows:

```
package org.jboss.book.jca.ex1;
import javax.naming.InitialContext;
public class ExClient
{
```

```
public static void main(String args[])
    throws Exception
{
    InitialContext iniCtx = new InitialContext();
    Object         ref     = iniCtx.lookup("EchoBean");
    EchoHome       home    = (EchoHome) ref;
    Echo           echo    = home.create();

    System.out.println("Created Echo");

    System.out.println("Echo.echo('Hello') = " + echo.echo("Hello"));
}
}
```

1.3. Notes and Warnings

Finally, we use three visual styles to draw attention to information that might otherwise be overlooked.

Note

Notes are tips, shortcuts or alternative approaches to the task at hand. Ignoring a note should have no negative consequences, but you might miss out on a trick that makes your life easier.

Important

Important boxes detail things that are easily missed: configuration changes that only apply to the current session, or services that need restarting before an update will apply. Ignoring a box labeled 'Important' will not cause data loss but may cause irritation and frustration.

Warning

Warnings should not be ignored. Ignoring warnings will most likely cause data loss.

2. Submitting Feedback and Getting Help

If you find a typographical error in this manual, or if you have thought of a way to make this manual better, we would love to hear from you! Please submit a bug: <https://issues.apache.org/jira/browse/CLOUDSTACK> against the component **Doc**.

If you have a suggestion for improving the documentation, try to be as specific as possible when describing it. If you have found an error, please include the section number and some of the surrounding text so we can find it easily.

Better yet, feel free to submit a patch if you would like to enhance the documentation. Our documentation is, along with the rest of the CloudStack source code, kept in the project's git repository.

The most efficient way to get help with CloudStack is to ask on the mailing lists.

The Apache CloudStack project has mailing lists for users and developers. These are the official channels of communication for the project and are the best way to get answers about using and contributing to CloudStack. It's a good idea to subscribe to the `users@cloudstack.apache.org` mailing list if you've deployed or are deploying CloudStack into production, and even for test deployments.

The CloudStack developer's mailing list (`dev@cloudstack.apache.org`) is for discussions about CloudStack development, and is the best list for discussing possible bugs in CloudStack. Anyone contributing to CloudStack should be on this mailing list.

To posts to the lists, you'll need to be subscribed. See the [CloudStack Web site](http://cloudstack.apache.org/mailling-lists.html)² for instructions.

² <http://cloudstack.apache.org/mailling-lists.html>

Welcome to CloudStack 4.1

Welcome to the 4.1.0 release of CloudStack, the first major release from the Apache CloudStack project since its graduation from the Apache Incubator.

This document contains information specific to this release of CloudStack, including upgrade instructions from prior releases, new features added to CloudStack, API changes, and issues fixed in the release. For installation instructions, please see the [Installation Guide](#)¹. For usage and administration instructions, please see the [CloudStack Administrator's Guide](#)². Developers and users who wish to work with the API will find instruction in the [CloudStack API Developer's Guide](#)³

If you find any errors or problems in this guide, please see [Section 2, "Submitting Feedback and Getting Help"](#). We hope you enjoy working with CloudStack!

¹ http://cloudstack.apache.org/docs/en-US/Apache_CloudStack/4.1.0/html/Installation_Guide/index.html

² http://cloudstack.apache.org/docs/en-US/Apache_CloudStack/4.1.0/html/Admin_Guide/index.html

³ http://cloudstack.apache.org/docs/en-US/Apache_CloudStack/4.0.1-incubating/html/API_Developers_Guide/index.html

Compatibility Matrix for 4.1.0

CloudStack is tested against certain operating systems, hypervisors, and other components to ensure that it works on specific platforms. It may work well on other platforms, but the platforms listed below are the ones we specifically test against and are more likely to be able to help troubleshoot if you run into any issues.

2.1. Supported Operating Systems

This section lists the operating systems that are supported for running CloudStack's Management Server.

Note that we test against specific versions of the OSES, so compatibility with CentOS 6.3 may not indicate compatibility with CentOS 6.2, etc.

- CentOS 6.3
- Red Hat Enterprise Linux 6.3
- Ubuntu 12.04 LTS

2.2. Supported Hypervisors

CloudStack supports three hypervisor families, Xen with XAPI, KVM, and VMware with vSphere.

- CentOS 6.2 with KVM
- Red Hat Enterprise Linux 6.2 with KVM
- XenServer 6.0.2 (with Hotfix)
- XenServer 6.1
- VMware vSphere/Vcenter 5.1

Bare Metal Support

Bare metal support is not present in this release.

2.3. Supported Browsers

The CloudStack Web-based UI should be compatible with any modern browser, but it's possible that some browsers will not render portions of the UI reliably, depending on their support of Web standards. For best results, we recommend one of the following browsers.

- Internet Explorer 8
- Firefox 10+
- Chrome
- Safari

Note that it's difficult to confirm specific browser versions for Firefox and Google Chrome, given the speed of their update cycle.

2.4. External Devices

The following external devices are supported in CloudStack 4.1.0.

- F5: 10.1.10 (Build 3341.1084)
- SRX model srx100b: Must be 10.3 or higher -10.4R7.5
- Netscaler VPX 9.3, 10.0(Build 54.7.nc and 54.161)
- Netscaler MPX 10
- Netscaler SDX 10

Version 4.1.0

3.1. What's New in 4.1

Apache CloudStack 4.1.0 includes many new features. This section covers the most prominent new features and changes.

3.1.1. Localization

The 4.1.0 release adds partial User Interface (UI) support for Catalan, Chinese, French, German, Italian, Japanese, Korean, Norwegian, Portuguese, Russian, and Spanish. Not all languages are complete.

The 4.1.0 release also adds documentation translations for Chinese, Chinese (Taiwan), Italian, Japanese, Korean, and Portuguese.

3.1.2. Added Region Support

*CLLOUDSTACK-241*¹: This feature adds a "region" construct that spans several management servers. The objective of this feature is to add AWS EC2 like Regions implementation into CloudStack. Regions are dispersed and located in separate geographic areas. Availability Zones (or Zones in CloudStack) are distinct locations within a Region that are engineered to be isolated from failures in other Zones and provide inexpensive, low latency network connectivity to other Zones in the same Region.

Regions are expected to add the following benefits

- Higher availability of the services: users can deploy services across AZs and even if one of the AZ goes down the services are still available to the end-user through VMs deployed in other zones.
- Higher availability of the Management Server (MS): Since each MS Cluster only manages a single Region, if that MS Cluster goes down, only that particular Region is impacted. Admin should be able to access all the other Regions.
- Scalability: The scalability limit of CloudStack dramatically improves, as the scalability limit of MS Cluster is limited to a single Region.
- Object Store: With Regions construct, CloudStack would also allow users to define Object Store (Secondary Storage) across AZs. This helps users easily deploy VMs in different AZs using the same template, offerings.
- Geographical Grouping: Regions allow admins to group AZs (that have low latency and are geographically located nearby) into a broader region construct.

Currently the Region feature is exposed in the API, but does not have a UI component.

3.1.3. Support for EC2 Query API

*CLLOUDSTACK-197*²: This introduces a query API for the AWS APIs that are currently only supported by SOAP. The AWS Java SDK and AWS PHP SDK should now be supported by the AWSAPI in CloudStack.

¹ <https://issues.apache.org/jira/browse/CLLOUDSTACK-241>

² <https://issues.apache.org/jira/browse/CLLOUDSTACK-197>

Supported Query APIs in 4.1.0:

- **AllocateAddress**
- **AssociateAddress**
- **AttachVolume**
- **AuthorizeSecurityGroupIngress**
- **CreateImage**
- **CreateKeyPair**
- **CreateSecurityGroup**
- **CreateSnapshot**
- **CreateTags**
- **CreateVolume**
- **DeleteKeyPair**
- **DeleteSecurityGroup**
- **DeleteSnapshot**
- **DeleteTags**
- **DeleteVolume**
- **DeregisterImage**
- **DescribeAddresses**
- **DescribeAvailabilityZones**
- **DescribeImageAttribute**
- **DescribeImages**
- **DescribeInstanceAttribute**
- **DescribeInstances**
- **DescribeKeyPairs**
- **DescribeSecurityGroups**
- **DescribeSnapshots**
- **DescribeTags**
- **DescribeVolumes**
- **DetachVolume**
- **DisassociateAddress**
- **GetPasswordData**

- **ImportkeyPair**
- **ModifyImageAttribute**
- **RebootInstances**
- **RegisterImage**
- **ReleaseAddress**
- **ResetImageAttribute**
- **RevokeSecurityGroupIngress**
- **RunInstances**
- **StartInstances**
- **StopInstances**
- **TerminateInstances**

See the [Feature Specification](#)³ for more information on the Query API support.

3.1.4. Auto-Completing Shell for CloudStack (CloudMonkey)

[CLOUDSTACK-132](#)⁴: Adds a auto-completing shell and command-line tool for CloudStack written in Python, called **CloudMonkey**.

CloudMonkey includes the following features:

- Usable as a command line tool and interactive shell.
- All commands are lowercase unlike API.
- Api Discovery using sync feature, with build time api precaching for failsafe sync.
- Raw api execution support.
- Auto-completion via double **tab**.
- Reverse search using **Ctrl+R**
- Emacs compatible key bindings.
- Output that's "pipeable" to other *nix programs.
- Unix shell execution.
- Support to handle asynchronous jobs using user defined blocking or non-blocking way.
- Tabular or JSON output with filtering of table columns.
- Colored output.
- API parameter value completion (based on predication, fuzzy results may fail sometimes).

³ <https://cwiki.apache.org/CLOUDSTACK/ec2-functional-spec-for-query-api-support.html>

⁴ <https://issues.apache.org/jira/browse/CLOUDSTACK-132>

CloudMonkey has a few requirements above and beyond CloudStack, and does not need to be run on the same machine as a management server. If you wish to run **CloudMonkey** you'll need Python 2.5 or later, **readline**, **Pygments**, and **prettytable**. CloudMonkey can be installed with **pip**:

```
$ pip install cloudmonkey
```

See the Developer's Guide and [the CloudStack wiki](#)⁵ for the latest information on **CloudMonkey** installation and use.

3.1.5. API Discovery Service

[CLOUDSTACK-926](#)⁶: CloudStack has more than 300 APIs and more are added in each major release. CloudStack admins can enable or disable APIs, or add plugins which provide more APIs. The API Discovery Service is a plugin which will help users discover the APIs available to them on a CloudStack Management Server.

The discovery service implements a method called **listApis** which will return information about APIs for a user. It currently accepts an `apiName` to list api information of that particular API. The method ensures that user can only list APIs they are entitled to.

All CloudStack APIs are implemented by annotated command class and `PluggableService` is a contract implemented by all the components such as the Management Server and all the plugins which provide an API. During load time, API discovery service asks all the pluggable services to return list of API cmd classes from whose fields and annotations it gathers information about each API, the information consists of name, description, parameter name, parameter description, etc.

For more information on the implementation of the API Discovery Service for 4.1.0, see the [CloudStack wiki](#)⁷.

3.1.6. Events Framework

[CLOUDSTACK-820](#)⁸: The event notification framework provides a means for the Management Server components to publish and subscribe to CloudStack events. Event notification is achieved by implementing the concept of event bus abstraction in the Management Server. An event bus is introduced in the Management Server that allows the CloudStack components and extension plugins to subscribe to the events by using the Advanced Message Queuing Protocol (AMQP) client. In CloudStack, a default implementation of event bus is provided as a plug-in that uses the RabbitMQ AMQP client. The AMQP client pushes the published events to a compatible AMQP server. Therefore all the CloudStack events are published to an exchange in the AMQP server.

A new event for state change, resource state change, is introduced as part of Event notification framework. Every resource, such as user VM, volume, NIC, network, public IP, snapshot, and template, is associated with a state machine and generates events as part of the state change. That implies that a change in the state of a resource results in a state change event, and the event is published in the corresponding state machine on the event bus. All the CloudStack events (alerts, action events, usage events) and the additional category of resource state change events, are published on to the events bus.

See the Events Framework section of the Admin Guide for more information on using the events framework.

⁵ <https://cwiki.apache.org/CLOUDSTACK/cloudstack-cloudmonkey-cli.html>

⁶ <https://issues.apache.org/jira/browse/CLOUDSTACK-926>

⁷ <https://cwiki.apache.org/CLOUDSTACK/api-discovery-service.html>

⁸ <https://issues.apache.org/jira/browse/CLOUDSTACK-820>

3.1.7. L3 Router Functionality in Nicira NVP Plugin

[CLOUDSTACK-726](#)⁹: Adds on work done in CloudStack 4.0.x series to add support for the Nicira Network Virtualization Platform (NVP). The 4.0.x releases added L2 (data link layer) support for NVP, but L3 (network layer) support was missing.

With 4.1.0, CloudStack adds support for the following features:

- L3 Routing (Gateway)
- Source NAT
- Static NAT
- Port Forwarding

3.1.8. Persistent Networks without Running VM

[CLOUDSTACK-706](#)¹⁰: Prior to CloudStack 4.1.0, a network had to have at least one instance (VM) running to actually deploy a network. In 4.1.0, we add the ability to deploy physical network devices without having a instance (VM) running on that network.

One use case for this is creating a Virtual Private Cloud (VPC) with a tier consisting only of physical devices. For example, you might create a VPC for a three-tier application, deploy VMs for Web and Application tier, and use physical machines for the Database tier. Another use case is that if you are providing services by using physical hardware, you can define the network as persistent and therefore even if all its VMs are destroyed the services will not be discontinued.

See the *Persistent Networks* section in the Admin Guide for more on this feature.

3.1.9. Add/Remove Network on VM

[CLOUDSTACK-645](#)¹¹: provides the ability to move VMs between networks and reconfigure a VM's network. You can remove a VM from a physical network and add to a new physical network. You can also change the default physical network of a virtual machine. With this functionality, hybrid or traditional server loads can be accommodated with ease.

This feature is supported on XenServer and KVM hypervisors.

The following APIs have been added to support this feature. These API calls can function only while the VM is in running or stopped state:

- **addNicToVirtualMachine**
- **removeNicFromVirtualMachine**
- **updateDefaultNicForVirtualMachine**

See the Developer's Guide for more on using the new APIs.

⁹ <https://issues.apache.org/jira/browse/CLOUDSTACK-726>

¹⁰ <https://issues.apache.org/jira/browse/CLOUDSTACK-706>

¹¹ <https://issues.apache.org/jira/browse/CLOUDSTACK-645>

3.1.10. Resize Volumes Feature

[CLOUDSTACK-644](#)¹²: With 4.1.0 CloudStack now provides the ability to resize data disks. Volumes within the disk offerings with the same storage tag can be resized. For example, if you only want to offer 10GB, 50GB, and 100GB offerings, the allowed resize should stay within those limits. That implies if you define a 10GB, a 50GB and a 100GB disk offerings, a user can upgrade from 10GB to 50GB, or 50GB to 100GB. If you create a custom-sized disk offering, then you have the option to resize the volume by specifying a new, larger size.

This feature is supported on KVM, XenServer, and VMware hosts. However, shrinking volumes is *not* supported on VMware hosts.

Using the **resizeVolume** API, a data volume can be moved from a static disk offering to a custom disk offering with the size specified. This functionality allows those who might be billing by certain volume sizes or disk offerings to stick to that model, while providing the flexibility to migrate to whatever custom size necessary.

3.1.11. Autoscale

[CLOUDSTACK-637](#)¹³: AutoScaling allows you to scale your back-end services or application instances up or down automatically according to the conditions you define. With AutoScaling enabled, you can ensure that the number of instances you are using seamlessly scale up when demand increases, and automatically decreases when demand subsides.

Conditions for triggering a scaleup or scaledown action can vary from a simple use case like monitoring the CPU usage of a server to a complex use case of monitoring a combination of server's responsiveness and its CPU usage. For example, you can configure AutoScaling to launch an additional instance whenever CPU usage exceeds 80 percent for 15 minutes, or to remove a VM whenever CPU usage is less than 20 percent for 30 minutes.

AutoScale is supported on NetScaler Release 10 Build 73.e and beyond.

3.1.12. API Request Throttling

[CLOUDSTACK-618](#)¹⁴: Limits the number of API requests per second that can be placed against a management server to avoid DoS attacks via API requests.

The throttling is controlled by the **api.throttling.enabled**, **api.throttling.interval**, and **api.throttling.max** configuration settings. Note that **api.throttling.enabled** is set to *false* by default.

3.1.13. S3 Backed Secondary Storage

[CLOUDSTACK-509](#)¹⁵: This enhancement backs NFS secondary storage with an S3-compatible object store. Periodically, a reaper thread synchronizes the templates, ISOs, and snapshots stored on a NFS secondary storage mount with a configured S3 object store. In addition to permitting the use of commodity or IaaS storage solutions for static assets, it provides a means of automatically synchronizing template and ISO assets across multiple zones.

¹² <https://issues.apache.org/jira/browse/CLOUDSTACK-644>

¹³ <https://issues.apache.org/jira/browse/CLOUDSTACK-637>

¹⁴ <https://issues.apache.org/jira/browse/CLOUDSTACK-618>

¹⁵ <https://issues.apache.org/jira/browse/CLOUDSTACK-509>

See the [CloudStack wiki](#)¹⁶ for more information on this feature, currently the [documentation is incomplete](#)¹⁷.

3.1.14. User and Domain Admin Can Create API Key and Secret

[CLOUDSTACK-437](#)¹⁸: This feature adds the ability for domain admins and users to create their own API Key and Secret. Domain admins can create keys for themselves, subdomain admins, and for regular users, but not for other domain admins.

3.1.15. Support Inline Mode for F5 and SRX

[CLOUDSTACK-306](#)¹⁹: For CloudStack deployments using the Juniper SRX (firewall) and F5 Big IP (load balancer), CloudStack 4.1.0 supports putting the firewall in front of the load balancer, making the firewall device the gateway and putting the load balancer behind the public network.

3.1.16. Egress Firewall Rules for Guest Networks

[CLOUDSTACK-299](#)²⁰: This feature allows users to create egress (exit) traffic rules from private networks to public networks (e.g. from your internal network to the public Internet). By default all traffic is blocked from internal networks to the public networks, this allows you to open ports as necessary.

Egress traffic rules are supported only on virtual routers at this time, physical devices are not supported.

3.1.17. Reset SSH Key to Access VM

[CLOUDSTACK-297](#)²¹: CloudStack 4.1.0 introduces a new API `resetSSHKeyForVirtualMachine`, that can allow them to set or reset the SSH keypair assigned to a virtual machine.

3.2. Issues Fixed in 4.1.0

Apache CloudStack uses [Jira](#)²² to track its issues. All new features and bugs for 4.1.0 have been tracked in Jira, and have a standard naming convention of "CLOUDSTACK-NNNN" where "NNNN" is the issue number.

This section includes a summary of known issues against 4.0.0 that were fixed in 4.1.0. Approximately 470 bugs were resolved or closed in the 4.1.0 cycle.

Defect	Description
CLOUDSTACK-46	Remnants of mycloud remain.
CLOUDSTACK-70	Improve Network Restart Behaviour for Basic Zone: Restarting Network Fail
CLOUDSTACK-94	"API command, listIsos documentation clarity
CLOUDSTACK-95	IP address allocation not working when a user tries to allocate IP addresses in a Project

¹⁶ <https://cwiki.apache.org/CLOUDSTACK/s3-backed-secondary-storage.html>

¹⁷ <https://issues.apache.org/jira/browse/CLOUDSTACK-878>

¹⁸ <https://issues.apache.org/jira/browse/CLOUDSTACK-437>

¹⁹ <https://issues.apache.org/jira/browse/CLOUDSTACK-306>

²⁰ <https://issues.apache.org/jira/browse/CLOUDSTACK-299>

²¹ <https://issues.apache.org/jira/browse/CLOUDSTACK-297>

²² <https://issues.apache.org/jira/browse/CLOUDSTACK>

Defect	Description
CLOUDSTACK-97	Vmware network labels are ignored when creating a Zone using basic networking
CLOUDSTACK-108	VM should not be allowed to be deployed on two Isolated Networks of an Account that were created from DefaultNetworkOfferingwithSourceNATService
CLOUDSTACK-118	Status of host resource stuck in "ErrorInMaintenance"
CLOUDSTACK-119	Move Agent-Simulator in to the hypervisor plugin model
CLOUDSTACK-130	Clarify docs on tags parameter in API reference
CLOUDSTACK-152	Routes on the User VM are programmed incorrectly on a VM present on both Isolated and Shared Guest Network
CLOUDSTACK-178	Expose name parameter of VM in list Vm view.
CLOUDSTACK-198	vpn:failto add VPN Users deletes all the existing Vpn user
CLOUDSTACK-222	Admin UI prompts to restart Management server with cancel edit operation
CLOUDSTACK-225	API Docs: Request params repeated with different description
CLOUDSTACK-226	UpdatePhysicalNetworkcommand failed due to java.sql.BatchUpdateException ; Tried to extend the existing Guest VLAN Range of one physical network into the Guest VLAN range of the other physical network
CLOUDSTACK-227	ReconnectHostCmd: NullPointerException: Unable to get host Information for XenServer 6.0.2 host - on intentionally changing the traffic labels on the physical network
CLOUDSTACK-228	UI provides an option to reconnect a disconnected host - ServerApiException is thrown on an attempt
CLOUDSTACK-232	Zone infrastructure chart -- disable resource total display
CLOUDSTACK-235	Network rate can be set in 2 places. Clarify docs on how this works
CLOUDSTACK-249	Add host id to failed VM deploy alerts
CLOUDSTACK-250	Incorrect description of maintenance mode in admin guide
CLOUDSTACK-256	"vpn:As an admin user, not able to delete VPN user which is present in a regular user's network.
CLOUDSTACK-271	updatePhysicalNetwork dies with an NPE when the vlan range is empty
CLOUDSTACK-274	Two error codes mapped to same value in API
CLOUDSTACK-275	hostid not always a UUID
CLOUDSTACK-277	Message during CloudStack management server Installation: cannot access /usr/share/cloud/bridge/lib: No such file or directory
CLOUDSTACK-279	deleteProject fails when executed by the regular user (works fine for root/domain admin)
CLOUDSTACK-284	listVirtualMachines does not return deleted machines when zone is specified
CLOUDSTACK-290	3.0.0 template also needed for 2.2.14 to 3.0.5 direct upgrade.
CLOUDSTACK-293	"We do awful, hacky things in our spec file for client"

Defect	Description
CLOUDSTACK-304	Add synchronization for createSnapshot command per host basis
CLOUDSTACK-309	iptables rules being deleted from wrong VM after a migration
CLOUDSTACK-318	Adding XenServer Host Fails - 6.0.2 fails with 4.0.0
CLOUDSTACK-320	"sessionKey query parameter should be case-insensitive, now only sessionkey is accepted"
CLOUDSTACK-322	During upgrade displays error - a foreign key constraint fails (<code>cloud/#sql-f34_6e`..</code>
CLOUDSTACK-332	"count" property in list* API response should be equal to how many entries in database, not how many objects in API response
CLOUDSTACK-333	When Datacenter name in VCenter has spaces Primary Storage (VMFS) discovery will fail
CLOUDSTACK-335	KVM VPC load balancer not working
CLOUDSTACK-336	listZones doesn't honour paging
CLOUDSTACK-343	"Document what tools and packages are required to build, package and install CloudStack 4.0
CLOUDSTACK-346	Cannot add Vmware cluster with class loader conflict exception
CLOUDSTACK-347	listNetworks API: return vlan information only when the caller is ROOT admin
CLOUDSTACK-348	deleteNetwork does not clean up network resource count correctly
CLOUDSTACK-354	Display of storage statistics is wrong
CLOUDSTACK-355	"Fix ""count"" in a bunch of API commands
CLOUDSTACK-357	"ISOs can be deleted while still attached to a running VM, and they subsequently cannot be detached from a running VM
CLOUDSTACK-359	PropagateResourceEventCommand fails in cluster configuration
CLOUDSTACK-361	Wrong creation of guest networks on a KVM host in Multiple Physical Networks with guest traffic
CLOUDSTACK-364	Docs point to download.cloud.com for AWS API script
CLOUDSTACK-368	OVM - cannot create guest VM
CLOUDSTACK-369	ASF 4.0 - unable to support XenServer 6.1 host
CLOUDSTACK-373	"static NAT and Firewall is not working on external firewall device SRX, it needs to be implemented
CLOUDSTACK-377	provide deployment config access to marvin's testcase
CLOUDSTACK-378	mavenize marvin on master
CLOUDSTACK-390	Install Guide: Section 4.5.7 (Prepare the System VM Template): Links go to cloud.com
CLOUDSTACK-397	Install Guide: Section 11.1 (Guest Traffic): Diagram is the wrong diagram
CLOUDSTACK-398	Install Guide: Section 11.17.3 (Using VPN with Mac OSX): Not complete
CLOUDSTACK-404	Update docs on the usage of cloud-setup-database
CLOUDSTACK-412	Data truncation: Out of range value for column 'ram' at row

Defect	Description
CLOUDSTACK-415	restartNetwork call causes VM to be unreachable when Nicira based SDN is used
CLOUDSTACK-416	XCP 1.6beta2 (61002c) - can't add a host
CLOUDSTACK-417	Handle password server securely to run on port 8080 on VR
CLOUDSTACK-424	Updated userdata not propagating to the VR
CLOUDSTACK-427	Change hardcoded step number references to dynamic link
CLOUDSTACK-428	Storage capacity shown in UI is incorrect
CLOUDSTACK-435	Vmware network labels are ignored when creating a Zone using basic networking
CLOUDSTACK-441	Running mgmt server using jetty fails to start api server
CLOUDSTACK-446	"Host going to alert state, if you are adding already added host

CLOUDSTACK-1987	Deleted service offerings owned by a domain show up to domain user.
CLOUDSTACK-1988	AWS API using SOAP client - User Registration fails
CLOUDSTACK-1989	"Query service offering by ID returns no result, but querying all returns service offering
CLOUDSTACK-2003	Deleting domain while deleted account is cleaning up leaves VMs expunging forever due to 'Failed to update resource count
CLOUDSTACK-2007	Release Notes failing to build on jenkins.cs.

3.3. Known Issues in 4.1.0

Issue ID	Description
CLOUDSTACK-2492 ²³	<p>System VM Clock Drift</p> <p>Testing of the new S3-backed secondary storage feature identified that the system VM templates offered as part of the 3.x releases (which are still the official templates for 4.1.0) did not contain the necessary configuration to enable time synchronization within the system VM guest operating systems. With 4.1.0, this issue has been corrected for both the VMware vSphere and KVM system VM flavors via post boot configurations. The XenServer system VM template does not have an official fix for this problem. If you choose to take advantage of the new S3-backed secondary storage feature while running your system VMs on XenServer, you may be impacted by time synchronization issues.</p>

²³ <https://issues.apache.org/jira/browse/CLOUDSTACK-2492>

Issue ID	Description
CLOUDSTACK-1747 ²⁴	mvn deploydb only creates 4.0 DB, not 4.1 Due to tooling changes between 4.1 and 4.2, CloudStack's database is created using the 4.0 schema and updated to the 4.1 schema when the management server starts for the first time. It's OK to see the same schema if the management server has not started yet.
CLOUDSTACK-1824 ²⁵	Service CloudStack-Management is being displayed as cloud-management service Many scripts and text entries have references to cloud-management rather than cloudstack-management due to the changeover between 4.0 and 4.1 to rename services. This is a minor issue and should be corrected by 4.2.
CLOUDSTACK-1824 ²⁶	Service CloudStack-Management is being displayed as cloud-management service
CLOUDSTACK-1510 ²⁷	NPE when primary storage is added with wrong path
CLOUDSTACK-1428 ²⁸	[UI] Instance which are created without display name are not visible when added to LB
CLOUDSTACK-1306 ²⁹	Better Error message when trying to deploy Vm by passing static Ipv4 addresses that are assigned to another VM/IP4 address is outside the iprange.
CLOUDSTACK-1236 ³⁰	Warning while adding Xen 6.1 host [Unable to create local link network]
CLOUDSTACK-969 ³¹	api: zone response lists vlan in it as "vlan range of zone" but the vlan belongs to physical network
CLOUDSTACK-963 ³²	[cloud.utils.AnnotationHelper] class java.lang.String does not have a Table annotation
CLOUDSTACK-458 ³³	xen:snapshots:Storage gc fail to clean the failed snapshot images from secondarystorage
CLOUDSTACK-315 ³⁴	Infrastructure view does not show capacity values
CLOUDSTACK-300 ³⁵	Creation of compute offering allow combination of local storage + HA
CLOUDSTACK-282 ³⁶	Virtual Routers do not properly resolve DNS SRV Records

Issue ID	Description
CLOUDSTACK-2053 ¹⁰⁴	[BUG] userdata.sh on router VM fixes for if else logic and missing meta-data

¹⁰⁴ <https://issues.apache.org/jira/browse/CLOUDSTACK-2053>

Upgrade Instructions

This section contains upgrade instructions from prior versions of CloudStack to Apache CloudStack 4.1.0. We include instructions on upgrading to Apache CloudStack from pre-Apache versions of Citrix CloudStack (last version prior to Apache is 3.0.2) and from the releases made while CloudStack was in the Apache Incubator.

If you run into any issues during upgrades, please feel free to ask questions on users@cloudstack.apache.org or dev@cloudstack.apache.org.

4.1. Upgrade from 4.0.x to 4.1.0

This section will guide you from CloudStack 4.0.x versions to CloudStack 4.1.0.

Any steps that are hypervisor-specific will be called out with a note.

Package Structure Changes

The package structure for CloudStack has changed significantly since the 4.0.x releases. If you've compiled your own packages, you'll notice that the package names and the number of packages has changed. This is *not* a bug.

However, this *does* mean that the procedure is not as simple as an **apt-get upgrade** or **yum update**, so please follow this section carefully.

We recommend reading through this section once or twice before beginning your upgrade procedure, and working through it on a test system before working on a production system.

1. Most users of CloudStack manage the installation and upgrades of CloudStack with one of Linux's predominant package systems, RPM or APT. This guide assumes you'll be using RPM and Yum (for Red Hat Enterprise Linux or CentOS), or APT and Debian packages (for Ubuntu).

Create RPM or Debian packages (as appropriate) and a repository from the 4.1.0 source, or check the Apache CloudStack downloads page at <http://cloudstack.apache.org/downloads.html> for package repositories supplied by community members. You will need them for step 8 or step 9.

Instructions for creating packages from the CloudStack source are in the [Installation Guide](#)¹.

2. Stop your management server or servers. Run this on all management server hosts:

```
# service cloud-management stop
```

3. If you are running a usage server or usage servers, stop those as well:

```
# service cloud-usage stop
```

¹ <http://cloudstack.apache.org/docs/en-US/index.html>

4. Make a backup of your MySQL database. If you run into any issues or need to roll back the upgrade, this will assist in debugging or restoring your existing environment. You'll be prompted for your password.

```
# mysqldump -u root -p cloud > cloudstack-backup.sql
```

5. Whether you're upgrading a Red Hat/CentOS based system or Ubuntu based system, you're going to need to stop the CloudStack management server before proceeding.

```
# service cloud-management stop
```

6. If you have made changes to `/etc/cloud/management/components.xml`, you'll need to carry these over manually to the new file, `/etc/cloudstack/management/componentContext.xml`. This is not done automatically. (If you're unsure, we recommend making a backup of the original `components.xml` to be on the safe side.)
7. After upgrading to 4.1, API clients are expected to send plain text passwords for login and user creation, instead of MD5 hash. In case, api client changes are not acceptable, following changes are to be made for backward compatibility:

Modify `componentsContext.xml`, and make `PlainTextUserAuthenticator` as the default authenticator (1st entry in the `userAuthenticators` adapter list is default)

```
<!-- Security adapters -->
<bean id="userAuthenticators" class="com.cloud.utils.component.AdapterList">
  <property name="Adapters">
    <list>
      <ref bean="PlainTextUserAuthenticator"/>
      <ref bean="MD5UserAuthenticator"/>
      <ref bean="LDAPUserAuthenticator"/>
    </list>
  </property>
</bean>
```

`PlainTextUserAuthenticator` works the same way `MD5UserAuthenticator` worked prior to 4.1.

8. If you are using Ubuntu, follow this procedure to upgrade your packages. If not, skip to step 9.

Community Packages

This section assumes you're using the community supplied packages for CloudStack. If you've created your own packages and APT repository, substitute your own URL for the ones used in these examples.

- a. The first order of business will be to change the sources list for each system with CloudStack packages. This means all management servers, and any hosts that have the KVM agent. (No changes should be necessary for hosts that are running VMware or Xen.)

Start by opening `/etc/apt/sources.list.d/cloudstack.list` on any systems that have CloudStack packages installed.

This file should have one line, which contains:

```
deb http://cloudstack.apt-get.eu/ubuntu precise 4.0
```

We'll change it to point to the new package repository:

```
deb http://cloudstack.apt-get.eu/ubuntu precise 4.1
```

If you're using your own package repository, change this line to read as appropriate for your 4.1.0 repository.

- b. Now update your apt package list:

```
$ sudo apt-get update
```

- c. Now that you have the repository configured, it's time to install the **cloudstack-management** package. This will pull in any other dependencies you need.

```
$ sudo apt-get install cloudstack-management
```

- d. You will need to manually install the **cloudstack-agent** package:

```
$ sudo apt-get install cloudstack-agent
```

During the installation of **cloudstack-agent**, APT will copy your **agent.properties**, **log4j-cloud.xml**, and **environment.properties** from **/etc/cloud/agent** to **/etc/cloudstack/agent**.

When prompted whether you wish to keep your configuration, say Yes.

- e. Verify that the file **/etc/cloudstack/agent/environment.properties** has a line that reads:

```
paths.script=/usr/share/cloudstack-common
```

If not, add the line.

- f. Restart the agent:

```
service cloud-agent stop
killall jsvc
service cloudstack-agent start
```

- g. During the upgrade, **log4j-cloud.xml** was simply copied over, so the logs will continue to be added to **/var/log/cloud/agent/agent.log**. There's nothing *wrong* with this, but if you prefer to be consistent, you can change this by copying over the sample configuration file:

```
cd /etc/cloudstack/agent
mv log4j-cloud.xml.dpkg-dist log4j-cloud.xml
service cloudstack-agent restart
```

- h. Once the agent is running, you can uninstall the old cloud-* packages from your system:

```
sudo dpkg --purge cloud-agent
```

9. If you are using CentOS or RHEL, follow this procedure to upgrade your packages. If not, skip to step 10.

Community Packages

This section assumes you're using the community supplied packages for CloudStack. If you've created your own packages and yum repository, substitute your own URL for the ones used in these examples.

- a. The first order of business will be to change the yum repository for each system with CloudStack packages. This means all management servers, and any hosts that have the KVM agent. (No changes should be necessary for hosts that are running VMware or Xen.)

Start by opening `/etc/yum.repos.d/cloudstack.repo` on any systems that have CloudStack packages installed.

This file should have content similar to the following:

```
[apache-cloudstack]
name=Apache CloudStack
baseurl=http://cloudstack.ap-get.eu/rhel/4.0/
enabled=1
gpgcheck=0
```

If you are using the community provided package repository, change the baseurl to `http://cloudstack.ap-get.eu/rhel/4.1/`

If you're using your own package repository, change this line to read as appropriate for your 4.1.0 repository.

- b. Now that you have the repository configured, it's time to install the **cloudstack-management** package by upgrading the older **cloud-client** package.

```
$ sudo yum upgrade cloud-client
```

- c. For KVM hosts, you will need to upgrade the **cloud-agent** package, similarly installing the new version as **cloudstack-agent**.

```
$ sudo yum upgrade cloud-agent
```

During the installation of **cloudstack-agent**, the RPM will copy your **agent.properties**, **log4j-cloud.xml**, and **environment.properties** from `/etc/cloud/agent` to `/etc/cloudstack/agent`.

- d. Verify that the file `/etc/cloudstack/agent/environment.properties` has a line that reads:

```
paths.script=/usr/share/cloudstack-common
```

If not, add the line.

- e. Restart the agent:

```
service cloud-agent stop
killall jsvc
service cloudstack-agent start
```

10. Once you've upgraded the packages on your management servers, you'll need to restart the system VMs. Make sure port 8096 is open in your local host firewall to do this.

There is a script that will do this for you, all you need to do is run the script and supply the IP address for your MySQL instance and your MySQL credentials:

```
# nohup cloudstack-sysvmadm -d IP address -u cloud -p -a > sysvm.log 2>&1 &
```

You can monitor the log for progress. The process of restarting the system VMs can take an hour or more.

```
# tail -f sysvm.log
```

The output to `sysvm.log` will look something like this:

```
Stopping and starting 1 secondary storage vm(s)...
Done stopping and starting secondary storage vm(s)
Stopping and starting 1 console proxy vm(s)...
Done stopping and starting console proxy vm(s).
Stopping and starting 4 running routing vm(s)...
Done restarting router(s).
```

11.  **For Xen Hosts: Copy vhd-utils**

This step is only for CloudStack installs that are using Xen hosts.

Copy the file `vhd-utils` to `/usr/share/cloudstack-common/scripts/vm/hypervisor/xenserver`.

4.2. Upgrade from 3.0.2 to 4.1.0

This section will guide you from Citrix CloudStack 3.0.2 to Apache CloudStack 4.1.0. Sections that are hypervisor-specific will be called out with a note.

1.

Note

The following upgrade instructions apply only if you're using VMware hosts. If you're not using VMware hosts, skip this step and move on to [2](#).

In each zone that includes VMware hosts, you need to add a new system VM template.

- a. While running the existing 3.0.2 system, log in to the UI as root administrator.
- b. In the left navigation bar, click Templates.
- c. In Select view, click Templates.
- d. Click Register template.

The Register template dialog box is displayed.

- e. In the Register template dialog box, specify the following values (do not change these):

Field	Value
Name	systemvm-vmware-4.0
Description	systemvm-vmware-4.0
URL	http://download.cloud.com/templates/burbank/burbank-systemvm-08012012.ova
Zone	Choose the zone where this hypervisor is used
Hypervisor	VMware
Format	OVA
OS Type	Debian GNU/Linux 5.0 (32-bit)
Extractable	no
Password Enabled	no
Public	no
Featured	no

- f. Watch the screen to be sure that the template downloads successfully and enters the READY state. Do not proceed until this is successful.

2. Stop all Usage Servers if running. Run this on all Usage Server hosts.

```
# service cloud-usage stop
```

3. Stop the Management Servers. Run this on all Management Server hosts.

```
# service cloud-management stop
```

4. On the MySQL master, take a backup of the MySQL databases. We recommend performing this step even in test upgrades. If there is an issue, this will assist with debugging.

In the following commands, it is assumed that you have set the root password on the database, which is a CloudStack recommended best practice. Substitute your own MySQL root password.

```
# mysqldump -u root -pmysql_password cloud > ccloud-backup.dmp
# mysqldump -u root -pmysql_password cloud_usage > ccloud-usage-backup.dmp
```

5. Either build RPM/DEB packages as detailed in the Installation Guide, or use one of the community provided yum/apt repositories to gain access to the CloudStack binaries.
6. If you are using Ubuntu, follow this procedure to upgrade your packages. If not, skip to step 7.

Community Packages

This section assumes you're using the community supplied packages for CloudStack. If you've created your own packages and APT repository, substitute your own URL for the ones used in these examples.

- a. The first order of business will be to change the sources list for each system with CloudStack packages. This means all management servers, and any hosts that have the KVM agent. (No changes should be necessary for hosts that are running VMware or Xen.)

Start by opening `/etc/apt/sources.list.d/cloudstack.list` on any systems that have CloudStack packages installed.

This file should have one line, which contains:

```
deb http://cloudstack.apt-get.eu/ubuntu precise 4.0
```

We'll change it to point to the new package repository:

```
deb http://cloudstack.apt-get.eu/ubuntu precise 4.1
```

If you're using your own package repository, change this line to read as appropriate for your 4.1.0 repository.

- b. Now update your apt package list:

```
$ sudo apt-get update
```

- c. Now that you have the repository configured, it's time to install the **cloudstack-management** package. This will pull in any other dependencies you need.

```
$ sudo apt-get install cloudstack-management
```

- d. You will need to manually install the **cloudstack-agent** package:

```
$ sudo apt-get install cloudstack-agent
```

During the installation of **cloudstack-agent**, APT will copy your **agent.properties**, **log4j-cloud.xml**, and **environment.properties** from **/etc/cloud/agent** to **/etc/cloudstack/agent**.

When prompted whether you wish to keep your configuration, say Yes.

- e. Verify that the file **/etc/cloudstack/agent/environment.properties** has a line that reads:

```
paths.script=/usr/share/cloudstack-common
```

If not, add the line.

- f. Restart the agent:

```
service cloud-agent stop
killall jsvc
service cloudstack-agent start
```

- g. During the upgrade, **log4j-cloud.xml** was simply copied over, so the logs will continue to be added to **/var/log/cloud/agent/agent.log**. There's nothing *wrong* with this, but if you prefer to be consistent, you can change this by copying over the sample configuration file:

```
cd /etc/cloudstack/agent
mv log4j-cloud.xml.dpkg-dist log4j-cloud.xml
service cloudstack-agent restart
```

- h. Once the agent is running, you can uninstall the old **cloud-*** packages from your system:

```
sudo dpkg --purge cloud-agent
```

7. If you are using CentOS or RHEL, follow this procedure to upgrade your packages. If not, skip to [step 8](#).

Community Packages

This section assumes you're using the community supplied packages for CloudStack. If you've created your own packages and yum repository, substitute your own URL for the ones used in these examples.

- a. The first order of business will be to change the yum repository for each system with CloudStack packages. This means all management servers, and any hosts that have the KVM agent. (No changes should be necessary for hosts that are running VMware or Xen.)

Start by opening **/etc/yum.repos.d/cloudstack.repo** on any systems that have CloudStack packages installed.

This file should have content similar to the following:

```
[apache-cloudstack]
name=Apache CloudStack
baseurl=http://cloudstack.appt-get.eu/rhel/4.0/
enabled=1
gpgcheck=0
```

If you are using the community provided package repository, change the baseurl to `http://cloudstack.appt-get.eu/rhel/4.1/`

If you're using your own package repository, change this line to read as appropriate for your 4.1.0 repository.

- b. Now that you have the repository configured, it's time to install the **cloudstack-management** package by upgrading the older **cloud-client** package.

```
$ sudo yum upgrade cloud-client
```

- c. For KVM hosts, you will need to upgrade the **cloud-agent** package, similarly installing the new version as **cloudstack-agent**.

```
$ sudo yum upgrade cloud-agent
```

During the installation of **cloudstack-agent**, the RPM will copy your **agent.properties**, **log4j-cloud.xml**, and **environment.properties** from `/etc/cloud/agent` to `/etc/cloudstack/agent`.

- d. Verify that the file `/etc/cloudstack/agent/environment.properties` has a line that reads:

```
paths.script=/usr/share/cloudstack-common
```

If not, add the line.

- e. Restart the agent:

```
service cloud-agent stop
killall jsvc
service cloudstack-agent start
```

8. If you have made changes to your copy of `/etc/cloud/management/components.xml` the changes will be preserved in the upgrade. However, you need to do the following steps to place these changes in a new version of the file which is compatible with version 4.1.0.

- a. Make a backup copy of `/etc/cloud/management/components.xml`. For example:

```
# mv /etc/cloud/management/components.xml /etc/cloud/management/components.xml-backup
```

- b. Copy `/etc/cloud/management/components.xml.rpmnew` to create a new `/etc/cloud/management/components.xml`:

```
# cp -ap /etc/cloud/management/components.xml.rpmnew /etc/cloud/management/
components.xml
```

- c. Merge your changes from the backup file into the new **components.xml**.

```
# vi /etc/cloud/management/components.xml
```

Note

If you have more than one management server node, repeat the upgrade steps on each node.

9. After upgrading to 4.1, API clients are expected to send plain text passwords for login and user creation, instead of MD5 hash. In case, api client changes are not acceptable, following changes are to be made for backward compatibility:

Modify `componentsContext.xml`, and make `PlainTextUserAuthenticator` as the default authenticator (1st entry in the `userAuthenticators` adapter list is default)

```
<!-- Security adapters -->
<bean id="userAuthenticators" class="com.cloud.utils.component.AdapterList">
  <property name="Adapters">
    <list>
      <ref bean="PlainTextUserAuthenticator"/>
      <ref bean="MD5UserAuthenticator"/>
      <ref bean="LDAPUserAuthenticator"/>
    </list>
  </property>
</bean>
```

`PlainTextUserAuthenticator` works the same way `MD5UserAuthenticator` worked prior to 4.1.

10. Start the first Management Server. Do not start any other Management Server nodes yet.

```
# service cloudstack-management start
```

Wait until the databases are upgraded. Ensure that the database upgrade is complete. After confirmation, start the other Management Servers one at a time by running the same command on each node.

**Note**

Failing to restart the Management Server indicates a problem in the upgrade. Having the Management Server restarted without any issues indicates that the upgrade is successfully completed.

11. Start all Usage Servers (if they were running on your previous version). Perform this on each Usage Server host.

```
# service cloudstack-usage start
```

- 12.

**Note**

Additional steps are required for each KVM host. These steps will not affect running guests in the cloud. These steps are required only for clouds using KVM as hosts and only on the KVM hosts.

- a. Configure a yum or apt repository containing the CloudStack packages as outlined in the Installation Guide.

- b. Stop the running agent.

```
# service cloud-agent stop
```

- c. Update the agent software with one of the following command sets as appropriate for your environment.

```
# yum update cloud-*
```

```
# apt-get update
```

```
# apt-get upgrade cloud-*
```

- d. Start the agent.

```
# service cloudstack-agent start
```

- e. Edit `/etc/cloud/agent/agent.properties` to change the resource parameter from `"com.cloud.agent.resource.computing.LibvirtComputingResource"` to `"com.cloud.hypervisor.kvm.resource.LibvirtComputingResource"`.

- f. Start the cloud agent and cloud management services.

- g. When the Management Server is up and running, log in to the CloudStack UI and restart the virtual router for proper functioning of all the features.

13. Log in to the CloudStack UI as administrator, and check the status of the hosts. All hosts should come to Up state (except those that you know to be offline). You may need to wait 20 or 30 minutes, depending on the number of hosts.

Note

Troubleshooting: If login fails, clear your browser cache and reload the page.

Do not proceed to the next step until the hosts show in Up state.

14. If you are upgrading from 3.0.2, perform the following:
 - a. Ensure that the admin port is set to 8096 by using the "integration.api.port" global parameter.

This port is used by the cloud-sysvmadm script at the end of the upgrade procedure. For information about how to set this parameter, see "Setting Global Configuration Parameters" in the Installation Guide.
 - b. Restart the Management Server.

Note

If you don't want the admin port to remain open, you can set it to null after the upgrade is done and restart the management server.

15. Run the **cloud-sysvmadm** script to stop, then start, all Secondary Storage VMs, Console Proxy VMs, and virtual routers. Run the script once on each management server. Substitute your own IP address of the MySQL instance, the MySQL user to connect as, and the password to use for that user. In addition to those parameters, provide the **-c** and **-r** arguments. For example:

```
# nohup cloud-sysvmadm -d 192.168.1.5 -u cloud -p password -c -r >
sysvm.log 2>&1 &
```

```
# tail -f sysvm.log
```

This might take up to an hour or more to run, depending on the number of accounts in the system.

16. If needed, upgrade all Citrix XenServer hypervisor hosts in your cloud to a version supported by CloudStack 4.1.0. The supported versions are XenServer 5.6 SP2 and 6.0.2. Instructions for upgrade can be found in the CloudStack 4.1.0 Installation Guide under "Upgrading XenServer Versions."
17. Now apply the XenServer hotfix XS602E003 (and any other needed hotfixes) to XenServer v6.0.2 hypervisor hosts.
 - a. Disconnect the XenServer cluster from CloudStack.

In the left navigation bar of the CloudStack UI, select Infrastructure. Under Clusters, click View All. Select the XenServer cluster and click Actions - Unmanage.

This may fail if there are hosts not in one of the states Up, Down, Disconnected, or Alert. You may need to fix that before unmanaging this cluster.

Wait until the status of the cluster has reached Unmanaged. Use the CloudStack UI to check on the status. When the cluster is in the unmanaged state, there is no connection to the hosts in the cluster.

- b. To clean up the VLAN, log in to one XenServer host and run:

```
/opt/xensource/bin/cloud-clean-vlan.sh
```

- c. Now prepare the upgrade by running the following on one XenServer host:

```
/opt/xensource/bin/cloud-prepare-upgrade.sh
```

If you see a message like "can't eject CD", log in to the VM and unmount the CD, then run this script again.

- d. Upload the hotfix to the XenServer hosts. Always start with the Xen pool master, then the slaves. Using your favorite file copy utility (e.g. WinSCP), copy the hotfixes to the host. Place them in a temporary folder such as /tmp.

On the Xen pool master, upload the hotfix with this command:

```
xe patch-upload file-name=XS602E003.xsupdate
```

Make a note of the output from this command, which is a UUID for the hotfix file. You'll need it in another step later.

Note

(Optional) If you are applying other hotfixes as well, you can repeat the commands in this section with the appropriate hotfix number. For example, XS602E004.xsupdate.

- e. Manually live migrate all VMs on this host to another host. First, get a list of the VMs on this host:

```
# xe vm-list
```

Then use this command to migrate each VM. Replace the example host name and VM name with your own:

```
# xe vm-migrate live=true host=host-name vm=VM-name
```

Troubleshooting

If you see a message like "You attempted an operation on a VM which requires PV drivers to be installed but the drivers were not detected," run:

```
/opt/xenource/bin/make_migratable.sh  
b6cf79c8-02ee-050b-922f-49583d9f1a14.
```

- f. Apply the hotfix. First, get the UUID of this host:

```
# xe host-list
```

Then use the following command to apply the hotfix. Replace the example host UUID with the current host ID, and replace the hotfix UUID with the output from the patch-upload command you ran on this machine earlier. You can also get the hotfix UUID by running `xe patch-list`.

```
xe patch-apply host-uuid=host-uuid uuid=hotfix-uuid
```

- g. Copy the following files from the CloudStack Management Server to the host.

Copy from here...	...to here
/usr/lib64/cloud/common/scripts/vm/hypervisor/xenserver/xenserver60/NFSSR.py	/opt/xenource/sm/NFSSR.py
/usr/lib64/cloud/common/scripts/vm/hypervisor/xenserver/setupxenserver.sh	/opt/xenource/bin/setupxenserver.sh
/usr/lib64/cloud/common/scripts/vm/hypervisor/xenserver/make_migratable.sh	/opt/xenource/bin/make_migratable.sh

- h. (Only for hotfixes XS602E005 and XS602E007) You need to apply a new Cloud Support Pack.

- Download the CSP software onto the XenServer host from one of the following links:

For hotfix XS602E005: <http://coltrane.eng.hq.xenource.com/release/XenServer-6.x/XS-6.0.2/hotfixes/XS602E005/56710/xe-phase-2/xenserver-cloud-supply.tgz>

For hotfix XS602E007: <http://coltrane.eng.hq.xenource.com/release/XenServer-6.x/XS-6.0.2/hotfixes/XS602E007/57824/xe-phase-2/xenserver-cloud-supply.tgz>

- Extract the file:

```
# tar xf xenserver-cloud-supply.tgz
```

- Run the following script:

```
# xe-install-supplemental-pack xenserver-cloud-supp.iso
```

- If the XenServer host is part of a zone that uses basic networking, disable Open vSwitch (OVS):

```
# xe-switch-network-backend bridge
```

- Reboot this XenServer host.
- Run the following:

```
/opt/xensource/bin/setupxenserver .sh
```

Note

If the message "mv: cannot stat `/etc/cron.daily/logrotate': No such file or directory" appears, you can safely ignore it.

- Run the following:

```
for pbd in `xe pbd-list currently-attached=false| grep ^uuid | awk '{print $NF}'`; do
  xe pbd-plug uuid=$pbd ;
```

- On each slave host in the Xen pool, repeat these steps, starting from "manually live migrate VMs."

Troubleshooting Tip

If passwords which you know to be valid appear not to work after upgrade, or other UI issues are seen, try clearing your browser cache and reloading the UI page.

4.3. Upgrade from 2.2.14 to 4.1.0

1. Ensure that you query your IPaddress usage records and process them; for example, issue invoices for any usage that you have not yet billed users for.

Starting in 3.0.2, the usage record format for IP addresses is the same as the rest of the usage types. Instead of a single record with the assignment and release dates, separate records are generated per aggregation period with start and end dates. After upgrading to 4.1.0, any existing IP address usage records in the old format will no longer be available.

2. If you are using version 2.2.0 - 2.2.13, first upgrade to 2.2.14 by using the instructions in the [2.2.14 Release Notes](#)².

KVM Hosts

If KVM hypervisor is used in your cloud, be sure you completed the step to insert a valid username and password into the host_details table on each KVM node as described in the 2.2.14 Release Notes. This step is critical, as the database will be encrypted after the upgrade to 4.1.0.

3. While running the 2.2.14 system, log in to the UI as root administrator.
4. Using the UI, add a new System VM template for each hypervisor type that is used in your cloud. In each zone, add a system VM template for each hypervisor used in that zone
 - a. In the left navigation bar, click Templates.
 - b. In Select view, click Templates.
 - c. Click Register template.

The Register template dialog box is displayed.

- d. In the Register template dialog box, specify the following values depending on the hypervisor type (do not change these):

Hypervisor	Description
XenServer	Name: systemvm-xenserver-3.0.0 Description: systemvm-xenserver-3.0.0 URL: http://download.cloud.com/templates/acton/acton-systemvm-02062012.vhd.bz2 Zone: Choose the zone where this hypervisor is used Hypervisor: XenServer Format: VHD OS Type: Debian GNU/Linux 5.0 (32-bit) Extractable: no Password Enabled: no Public: no Featured: no

² <http://download.cloud.com/releases/2.2.0/CloudStack2.2.14ReleaseNotes.pdf>

Hypervisor	Description
KVM	<p>Name: systemvm-kvm-3.0.0</p> <p>Description: systemvm-kvm-3.0.0</p> <p>URL: http://download.cloud.com/templates/acton/acton-systemvm-02062012.qcow2.bz2</p> <p>Zone: Choose the zone where this hypervisor is used</p> <p>Hypervisor: KVM</p> <p>Format: QCOW2</p> <p>OS Type: Debian GNU/Linux 5.0 (32-bit)</p> <p>Extractable: no</p> <p>Password Enabled: no</p> <p>Public: no</p> <p>Featured: no</p>
VMware	<p>Name: systemvm-vmware-4.0</p> <p>Description: systemvm-vmware-4.0</p> <p>URL: http://download.cloud.com/templates/burbank/burbank-systemvm-08012012.ova</p> <p>Zone: Choose the zone where this hypervisor is used</p> <p>Hypervisor: VMware</p> <p>Format: OVA</p> <p>OS Type: Debian GNU/Linux 5.0 (32-bit)</p> <p>Extractable: no</p> <p>Password Enabled: no</p> <p>Public: no</p> <p>Featured: no</p>

5. Watch the screen to be sure that the template downloads successfully and enters the READY state. Do not proceed until this is successful
6. **WARNING:** If you use more than one type of hypervisor in your cloud, be sure you have repeated these steps to download the system VM template for each hypervisor type. Otherwise, the upgrade will fail.
7. Stop all Usage Servers if running. Run this on all Usage Server hosts.

```
# service cloud-usage stop
```

8. Stop the Management Servers. Run this on all Management Server hosts.

```
# service cloud-management stop
```

9. On the MySQL master, take a backup of the MySQL databases. We recommend performing this step even in test upgrades. If there is an issue, this will assist with debugging.

In the following commands, it is assumed that you have set the root password on the database, which is a CloudStack recommended best practice. Substitute your own MySQL root password.

```
# mysqldump -u root -pmysql_password cloud > ccloud-backup.dmp
# mysqldump -u root -pmysql_password cloud_usage > ccloud-usage-
backup.dmp
```

10. Either build RPM/DEB packages as detailed in the Installation Guide, or use one of the community provided yum/apt repositories to gain access to the CloudStack binaries.
11. If you are using Ubuntu, follow this procedure to upgrade your packages. If not, skip to step [12](#).

Community Packages

This section assumes you're using the community supplied packages for CloudStack. If you've created your own packages and APT repository, substitute your own URL for the ones used in these examples.

- a. The first order of business will be to change the sources list for each system with CloudStack packages. This means all management servers, and any hosts that have the KVM agent. (No changes should be necessary for hosts that are running VMware or Xen.)

Start by opening `/etc/apt/sources.list.d/cloudstack.list` on any systems that have CloudStack packages installed.

This file should have one line, which contains:

```
deb http://cloudstack.apt-get.eu/ubuntu precise 4.0
```

We'll change it to point to the new package repository:

```
deb http://cloudstack.apt-get.eu/ubuntu precise 4.1
```

If you're using your own package repository, change this line to read as appropriate for your 4.1.0 repository.

- b. Now update your apt package list:

```
$ sudo apt-get update
```

- c. Now that you have the repository configured, it's time to install the **cloudstack-management** package. This will pull in any other dependencies you need.

```
$ sudo apt-get install cloudstack-management
```

- d. You will need to manually install the **cloudstack-agent** package:

```
$ sudo apt-get install cloudstack-agent
```

During the installation of **cloudstack-agent**, APT will copy your **agent.properties**, **log4j-cloud.xml**, and **environment.properties** from **/etc/cloud/agent** to **/etc/cloudstack/agent**.

When prompted whether you wish to keep your configuration, say Yes.

- e. Verify that the file **/etc/cloudstack/agent/environment.properties** has a line that reads:

```
paths.script=/usr/share/cloudstack-common
```

If not, add the line.

- f. Restart the agent:

```
service cloud-agent stop
killall jsvc
service cloudstack-agent start
```

- g. During the upgrade, **log4j-cloud.xml** was simply copied over, so the logs will continue to be added to **/var/log/cloud/agent/agent.log**. There's nothing *wrong* with this, but if you prefer to be consistent, you can change this by copying over the sample configuration file:

```
cd /etc/cloudstack/agent
mv log4j-cloud.xml.dpkg-dist log4j-cloud.xml
service cloudstack-agent restart
```

- h. Once the agent is running, you can uninstall the old cloud-* packages from your system:

```
sudo dpkg --purge cloud-agent
```

12. If you are using CentOS or RHEL, follow this procedure to upgrade your packages. If not, skip to step [13](#).

Community Packages

This section assumes you're using the community supplied packages for CloudStack. If you've created your own packages and yum repository, substitute your own URL for the ones used in these examples.

- a. The first order of business will be to change the yum repository for each system with CloudStack packages. This means all management servers, and any hosts that have the KVM agent. (No changes should be necessary for hosts that are running VMware or Xen.)

Start by opening `/etc/yum.repos.d/cloudstack.repo` on any systems that have CloudStack packages installed.

This file should have content similar to the following:

```
[apache-cloudstack]
name=Apache CloudStack
baseurl=http://cloudstack.appt-get.eu/rhel/4.0/
enabled=1
gpgcheck=0
```

If you are using the community provided package repository, change the baseurl to `http://cloudstack.appt-get.eu/rhel/4.1/`

If you're using your own package repository, change this line to read as appropriate for your 4.1.0 repository.

- b. Now that you have the repository configured, it's time to install the **cloudstack-management** package by upgrading the older **cloud-client** package.

```
$ sudo yum upgrade cloud-client
```

- c. For KVM hosts, you will need to upgrade the **cloud-agent** package, similarly installing the new version as **cloudstack-agent**.

```
$ sudo yum upgrade cloud-agent
```

During the installation of **cloudstack-agent**, the RPM will copy your **agent.properties**, **log4j-cloud.xml**, and **environment.properties** from `/etc/cloud/agent` to `/etc/cloudstack/agent`.

- d. Verify that the file `/etc/cloudstack/agent/environment.properties` has a line that reads:

```
paths.script=/usr/share/cloudstack-common
```

If not, add the line.

- e. Restart the agent:

```
service cloud-agent stop
killall jsvc
service cloudstack-agent start
```

13. If you have made changes to your existing copy of the file `components.xml` in your previous-version CloudStack installation, the changes will be preserved in the upgrade. However, you need to do the following steps to place these changes in a new version of the file which is compatible with version 4.0.0-incubating.

**Note**

How will you know whether you need to do this? If the upgrade output in the previous step included a message like the following, then some custom content was found in your old `components.xml`, and you need to merge the two files:

```
warning: /etc/cloud/management/components.xml created as /etc/cloud/management/
components.xml.rpmnew
```

- a. Make a backup copy of your `/etc/cloud/management/components.xml` file. For example:

```
# mv /etc/cloud/management/components.xml /etc/cloud/management/components.xml-backup
```

- b. Copy `/etc/cloud/management/components.xml.rpmnew` to create a new `/etc/cloud/management/components.xml`:

```
# cp -ap /etc/cloud/management/components.xml.rpmnew /etc/cloud/management/
components.xml
```

- c. Merge your changes from the backup file into the new `components.xml` file.

```
# vi /etc/cloud/management/components.xml
```

14. After upgrading to 4.1, API clients are expected to send plain text passwords for login and user creation, instead of MD5 hash. In case, api client changes are not acceptable, following changes are to be made for backward compatibility:

Modify `componentsContext.xml`, and make `PlainTextUserAuthenticator` as the default authenticator (1st entry in the `userAuthenticators` adapter list is default)

```
<!-- Security adapters -->
<bean id="userAuthenticators" class="com.cloud.utils.component.AdapterList">
  <property name="Adapters">
    <list>
      <ref bean="PlainTextUserAuthenticator"/>
      <ref bean="MD5UserAuthenticator"/>
      <ref bean="LDAPUserAuthenticator"/>
    </list>
  </property>
</bean>
```

`PlainTextUserAuthenticator` works the same way `MD5UserAuthenticator` worked prior to 4.1.

15. If you have made changes to your existing copy of the `/etc/cloud/management/db.properties` file in your previous-version CloudStack installation, the changes will be preserved in the upgrade. However, you need to do the following steps to place these changes in a new version of the file which is compatible with version 4.0.0-incubating.

- a. Make a backup copy of your file `/etc/cloud/management/db.properties`. For example:

```
# mv /etc/cloud/management/db.properties /etc/cloud/management/db.properties-backup
```

- b. Copy `/etc/cloud/management/db.properties.rpmnew` to create a new `/etc/cloud/management/db.properties`:

```
# cp -ap /etc/cloud/management/db.properties.rpmnew etc/cloud/management/db.properties
```

- c. Merge your changes from the backup file into the new `db.properties` file.

```
# vi /etc/cloud/management/db.properties
```

16. On the management server node, run the following command. It is recommended that you use the command-line flags to provide your own encryption keys. See Password and Key Encryption in the Installation Guide.

```
# cloud-setup-encryption -e encryption_type -m management_server_key -k database_key
```

When used without arguments, as in the following example, the default encryption type and keys will be used:

- (Optional) For `encryption_type`, use `file` or `web` to indicate the technique used to pass in the database encryption password. Default: `file`.
- (Optional) For `management_server_key`, substitute the default key that is used to encrypt confidential parameters in the properties file. Default: `password`. It is highly recommended that you replace this with a more secure value
- (Optional) For `database_key`, substitute the default key that is used to encrypt confidential parameters in the CloudStack database. Default: `password`. It is highly recommended that you replace this with a more secure value.

17. Repeat steps 10 - 14 on every management server node. If you provided your own encryption key in step 14, use the same key on all other management servers.

18. Start the first Management Server. Do not start any other Management Server nodes yet.

```
# service cloudstack-management start
```

Wait until the databases are upgraded. Ensure that the database upgrade is complete. You should see a message like "Complete! Done." After confirmation, start the other Management Servers one at a time by running the same command on each node.

19. Start all Usage Servers (if they were running on your previous version). Perform this on each Usage Server host.

```
# service cloudstack-usage start
```

20. (KVM only) Additional steps are required for each KVM host. These steps will not affect running guests in the cloud. These steps are required only for clouds using KVM as hosts and only on the KVM hosts.

- a. Configure your CloudStack package repositories as outlined in the Installation Guide
- b. Stop the running agent.

```
# service cloud-agent stop
```

- c. Update the agent software with one of the following command sets as appropriate.

```
# yum update cloud-*
```

```
# apt-get update
# apt-get upgrade cloud-*
```

- d. Start the agent.

```
# service cloudstack-agent start
```

- e. Copy the contents of the **agent.properties** file to the new **agent.properties** file by using the following command

```
sed -i 's/com.cloud.agent.resource.computing.LibvirtComputingResource/
com.cloud.hypervisor.kvm.resource.LibvirtComputingResource/g' /etc/cloud/agent/
agent.properties
```

- f. Start the cloud agent and cloud management services.
- g. When the Management Server is up and running, log in to the CloudStack UI and restart the virtual router for proper functioning of all the features.

21. Log in to the CloudStack UI as admin, and check the status of the hosts. All hosts should come to Up state (except those that you know to be offline). You may need to wait 20 or 30 minutes, depending on the number of hosts.

Do not proceed to the next step until the hosts show in the Up state. If the hosts do not come to the Up state, contact support.

22. Run the following script to stop, then start, all Secondary Storage VMs, Console Proxy VMs, and virtual routers.

- a. Run the command once on one management server. Substitute your own IP address of the MySQL instance, the MySQL user to connect as, and the password to use for that user. In addition to those parameters, provide the "-c" and "-r" arguments. For example:

```
# nohup ccloud-sysvmadm -d 192.168.1.5 -u cloud -p password -c -r > sysvm.log 2>&1 &
# tail -f sysvm.log
```

This might take up to an hour or more to run, depending on the number of accounts in the system.

- b. After the script terminates, check the log to verify correct execution:

```
# tail -f sysvm.log
```

The content should be like the following:

```
Stopping and starting 1 secondary storage vm(s)...  
Done stopping and starting secondary storage vm(s)  
Stopping and starting 1 console proxy vm(s)...  
Done stopping and starting console proxy vm(s).  
Stopping and starting 4 running routing vm(s)...  
Done restarting router(s).
```

23. If you would like additional confirmation that the new system VM templates were correctly applied when these system VMs were rebooted, SSH into the System VM and check the version.

Use one of the following techniques, depending on the hypervisor.

XenServer or KVM:

SSH in by using the link local IP address of the system VM. For example, in the command below, substitute your own path to the private key used to log in to the system VM and your own link local IP.

Run the following commands on the XenServer or KVM host on which the system VM is present:

```
# ssh -i private-key-path link-local-ip -p 3922  
# cat /etc/cloudstack-release
```

The output should be like the following:

```
Cloudstack Release 4.0.0-incubating Mon Oct 9 15:10:04 PST 2012
```

ESXi

SSH in using the private IP address of the system VM. For example, in the command below, substitute your own path to the private key used to log in to the system VM and your own private IP.

Run the following commands on the Management Server:

```
# ssh -i private-key-path private-ip -p 3922  
# cat /etc/cloudstack-release
```

The output should be like the following:

```
Cloudstack Release 4.0.0-incubating Mon Oct 9 15:10:04 PST 2012
```

24. If needed, upgrade all Citrix XenServer hypervisor hosts in your cloud to a version supported by CloudStack 4.0.0-incubating. The supported versions are XenServer 5.6 SP2 and 6.0.2. Instructions for upgrade can be found in the CloudStack 4.0.0-incubating Installation Guide.

25. Apply the XenServer hotfix XS602E003 (and any other needed hotfixes) to XenServer v6.0.2 hypervisor hosts.

- a. Disconnect the XenServer cluster from CloudStack.

In the left navigation bar of the CloudStack UI, select Infrastructure. Under Clusters, click View All. Select the XenServer cluster and click Actions - Unmanage.

This may fail if there are hosts not in one of the states Up, Down, Disconnected, or Alert. You may need to fix that before unmanaging this cluster.

Wait until the status of the cluster has reached Unmanaged. Use the CloudStack UI to check on the status. When the cluster is in the unmanaged state, there is no connection to the hosts in the cluster.

- b. To clean up the VLAN, log in to one XenServer host and run:

```
/opt/xensource/bin/cloud-clean-vlan.sh
```

- c. Prepare the upgrade by running the following on one XenServer host:

```
/opt/xensource/bin/cloud-prepare-upgrade.sh
```

If you see a message like "can't eject CD", log in to the VM and umount the CD, then run this script again.

- d. Upload the hotfix to the XenServer hosts. Always start with the Xen pool master, then the slaves. Using your favorite file copy utility (e.g. WinSCP), copy the hotfixes to the host. Place them in a temporary folder such as /root or /tmp.

On the Xen pool master, upload the hotfix with this command:

```
xe patch-upload file-name=XS602E003.xsupdate
```

Make a note of the output from this command, which is a UUID for the hotfix file. You'll need it in another step later.

Note

(Optional) If you are applying other hotfixes as well, you can repeat the commands in this section with the appropriate hotfix number. For example, XS602E004.xsupdate.

- e. Manually live migrate all VMs on this host to another host. First, get a list of the VMs on this host:

```
# xe vm-list
```

Then use this command to migrate each VM. Replace the example host name and VM name with your own:

```
# xe vm-migrate live=true host=host-name vm=VM-name
```

Troubleshooting

If you see a message like "You attempted an operation on a VM which requires PV drivers to be installed but the drivers were not detected," run:

```
/opt/xen-source/bin/make_migratable.sh  
b6cf79c8-02ee-050b-922f-49583d9f1a14.
```

- f. Apply the hotfix. First, get the UUID of this host:

```
# xe host-list
```

Then use the following command to apply the hotfix. Replace the example host UUID with the current host ID, and replace the hotfix UUID with the output from the patch-upload command you ran on this machine earlier. You can also get the hotfix UUID by running `xe patch-list`.

```
xe patch-apply host-uuid=host-uuid uuid=hotfix-uuid
```

- g. Copy the following files from the CloudStack Management Server to the host.

Copy from here...	...to here
<code>/usr/lib64/cloud/common/scripts/vm/hypervisor/xenserver/xenserver60/NFSSR.py</code>	<code>/opt/xen-source/sm/NFSSR.py</code>
<code>/usr/lib64/cloud/common/scripts/vm/hypervisor/xenserver/setupxenserver.sh</code>	<code>/opt/xen-source/bin/setupxenserver.sh</code>
<code>/usr/lib64/cloud/common/scripts/vm/hypervisor/xenserver/make_migratable.sh</code>	<code>/opt/xen-source/bin/make_migratable.sh</code>

- h. (Only for hotfixes XS602E005 and XS602E007) You need to apply a new Cloud Support Pack.

- Download the CSP software onto the XenServer host from one of the following links:

For hotfix XS602E005: <http://coltrane.eng.hq.xen-source.com/release/XenServer-6.x/XS-6.0.2/hotfixes/XS602E005/56710/xe-phase-2/xenserver-cloud-supp.tgz>

For hotfix XS602E007: <http://coltrane.eng.hq.xen-source.com/release/XenServer-6.x/XS-6.0.2/hotfixes/XS602E007/57824/xe-phase-2/xenserver-cloud-supp.tgz>

- Extract the file:

```
# tar xf xenserver-cloud-supply.tgz
```

- Run the following script:

```
# xe-install-supplemental-pack xenserver-cloud-supply.iso
```

- If the XenServer host is part of a zone that uses basic networking, disable Open vSwitch (OVS):

```
# xe-switch-network-backend bridge
```

- Reboot this XenServer host.
- Run the following:

```
/opt/xensource/bin/setupxenserver.sh
```

Note

If the message "mv: cannot stat `/etc/cron.daily/logrotate': No such file or directory" appears, you can safely ignore it.

- Run the following:

```
for pbd in `xe pbd-list currently-attached=false | grep ^uuid | awk '{print $NF}'`; do xe pbd-plug uuid=$pbd ;
```

- On each slave host in the Xen pool, repeat these steps, starting from "manually live migrate VMs."

API Changes in 4.1.0

5.1. New API commands in 4.1

- lockAccount (Locks an account)
- lockUser (Locks a user account)
- resetSSHKeyForVirtualMachine (Resets the SSH Key for virtual machine. The virtual machine must be in a "Stopped" state. [async])
- updatePortForwardingRule (Updates a port forwarding rule. Only the private port and the virtual machine can be updated.)
- createCounter (Adds metric counter)
- createCondition (Creates a condition)
- createAutoScalePolicy

(Creates an autoscale policy for a provision or deprovision action, the action is taken when the all the conditions evaluates to true for the specified duration. The policy is in effect once it is attached to a autscale vm group.)
- createAutoScaleVmProfile

(Creates a profile that contains information about the virtual machine which will be provisioned automatically by autoscale feature.)
- createAutoScaleVmGroup (Creates and automatically starts a virtual machine based on a service offering, disk offering, and template.)
- deleteCounter (Deletes a counter)
- deleteCondition (Removes a condition)
- deleteAutoScalePolicy (Deletes a autoscale policy.)
- deleteAutoScaleVmProfile (Deletes a autoscale vm profile.)
- deleteAutoScaleVmGroup (Deletes a autoscale vm group.)
- listCounters (List the counters)
- listConditions (List Conditions for the specific user)
- listAutoScalePolicies (Lists autoscale policies.)
- listAutoScaleVmProfiles (Lists autoscale vm profiles.)
- listAutoScaleVmGroups (Lists autoscale vm groups.)
- enableAutoScaleVmGroup (Enables an AutoScale Vm Group)
- disableAutoScaleVmGroup (Disables an AutoScale Vm Group)
- updateAutoScalePolicy (Updates an existing autoscale policy.)

- `updateAutoScaleVmProfile` (Updates an existing autoscale vm profile.)
- `updateAutoScaleVmGroup` (Updates an existing autoscale vm group.)
- `addS3` (Adds S3)
- `listS3s` (Lists S3s)
- `resizeVolume` (Resizes a volume)
- `addNicToVirtualMachine` (Adds VM to specified network by creating a NIC)
- `removeNicFromVirtualMachine` (Removes VM from specified network by deleting a NIC)
- `updateDefaultNicForVirtualMachine` (Changes the default NIC on a VM)
- `createEgressFirewallRule` (Creates a egress firewall rule for a given network)
- `deleteEgressFirewallRule` (Deletes an ggress firewall rule)
- `listEgressFirewallRules` (Lists all egress firewall rules for network id.)
- `addBigSwitchVnsDevice` (Adds a BigSwitch VNS device)
- `deleteBigSwitchVnsDevice` (delete a bigswitch vns device)
- `listBigSwitchVnsDevices` (Lists BigSwitch Vns devices)
- `listApis` (lists all available apis on the server, provided by the Api Discovery plugin)
- `getApiLimit` (Get API limit count for the caller)
- `resetApiLimit` (Reset api count)
- `addRegion` (Adds a Region)
- `updateRegion` (Updates a region)
- `removeRegion` (Removes specified region)
- `listRegions` (Lists Regions)

5.2. Changed API commands in 4.1

5.2.1. Changes in command type (sync versus async)

- `deleteNiciraNvpDevice` became Async
- `addNiciraNvpDevice` became Async

5.2.2. Changes in command arguments

API Commands	Change Description
<code>copyTemplate</code>	New response parameters: sshkeyenabled
<code>listRouters</code>	New response parameters: ip6dns1, ip6dns2

API Commands	Change Description
listNiciraNvpDeviceNetworks	New response parameters: ip6cidr , ip6gateway , ispersistent
createVlanIpRange	New request parameters: endipv6 (optional), ip6cidr (optional), ip6gateway (optional), startipv6 (optional) Changed parameters: startip (old version - required, new version - optional) New response parameters: endipv6 , ip6cidr , ip6gateway , startipv6
listNetworkOfferings	New response parameters: ispersistent
registerTemplate	New response parameters: sshkeyenabled
addTrafficMonitor	New request parameters: excludezones (optional), includezones (optional)
createAccount	New request parameters: accountid (optional), userid (optional) New response parameters: iscallerchilddomain
listTrafficMonitors	
registerSSHKeyPair	New response parameters: privatekey
createNetwork	New request parameters: endipv6 (optional), ip6cidr (optional), ip6gateway (optional), startipv6 (optional) New response parameters: ip6cidr , ip6gateway , ispersistent
getUser	New response parameters: iscallerchilddomain
stopRouter	New response parameters: ip6dns1 , ip6dns2
listTemplates	New response parameters: sshkeyenabled
listNetworks	New response parameters: ip6cidr , ip6gateway , ispersistent
prepareTemplate	New response parameters: sshkeyenabled
changeServiceForRouter	New response parameters: ip6dns1 , ip6dns2
updateZone	New request parameters: ip6dns1 (optional), ip6dns2 (optional) New response parameters: ip6dns1 , ip6dns2
createSSHKeyPair	New response parameters: privatekey
listFirewallRules	New response parameters: networkid
updateUser	New response parameters: iscallerchilddomain

API Commands	Change Description
createZone	New request parameters: ip6dns1 (optional), ip6dns2 (optional) New response parameters: ip6dns1 , ip6dns2
createStoragePool	Changed request parameters: podid (old version - optional, new version - required), clusterid (old version - optional, new version - required)
updateTemplate	New response parameters: sshkeyenabled
disableUser	New response parameters: iscallerchilddomain
listSSHKeyPairs	New response parameters: privatekey
listNiciraNvpDevices	New response parameters: hostname , l3gatewayserviceuuid , transportzoneuuid
registerIso	New response parameters: sshkeyenabled
listZones	New request parameters: name (optional) New response parameters: ip6dns1 , ip6dns2
startRouter	New response parameters: ip6dns1 , ip6dns2
listCapabilities	New response parameters: apilimitinterval , apilimitmax
deployVirtualMachine	New request parameters: ip6address (optional)
addVpnUser	New response parameters: state
destroyRouter	New response parameters: ip6dns1 , ip6dns2
enableUser	New response parameters: iscallerchilddomain
addNiciraNvpDevice	New request parameters: l3gatewayserviceuuid (optional) New response parameters: hostname , l3gatewayserviceuuid , transportzoneuuid
createNetworkOffering	New request parameters: ispersistent (optional) New response parameters: ispersistent
copyIso	New response parameters: sshkeyenabled
createDomain	New request parameters: domainid (optional)
updateIso	New response parameters: sshkeyenabled
updateNetwork	New response parameters: ip6cidr , ip6gateway , ispersistent
rebootRouter	New response parameters: ip6dns1 , ip6dns2
createFirewallRule	New response parameters: networkid

API Commands	Change Description
createUser	New request parameters: userid (optional) New response parameters: iscallerchilddomain
deleteUser	New response parameters: displaytext , success
listVlanIpRanges	New response parameters: endipv6 , ip6cidr , ip6gateway , startipv6
updateNetworkOffering	New response parameters: ispersistent
listVpnUsers	New response parameters: state
listUsers	New response parameters: iscallerchilddomain
listIsos	New response parameters: sshkeyenabled
