What Safari Extensions Can Do

Demo

Application Layer

window.safari

.application

safari\$._afden\$ion

safari.self

Windows and Tabs

- Access to all browser windows and tabs
- Can be created, closed and reordered
- Serve as access points to other objects
- Members of the event dispatch hierarchy

```
safari.application.browserWindows
```

```
safari.application.openBrowserWindow()
```

Bars

- Loaded once per browser window
- Displays above Safari's Tab bar
- Fixed height of 30px
- Access to the Global Page

```
safari.extension.bars
```

```
safari.self
```

Toolbar Items

- Created once per browser window
- Inserted in the toolbar by default
- Image styled to achieve a standard look
- Supports numerical badges
- Sends “validate” and “command” events per item

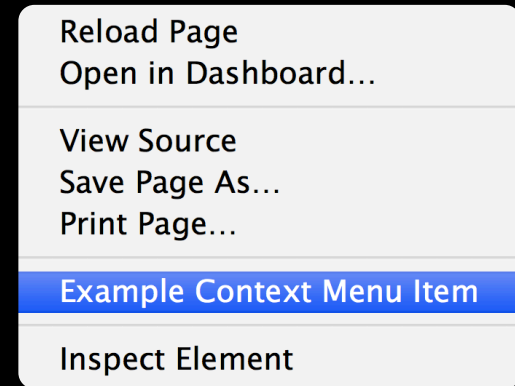

```
safari.extension.toolbarItems
```

```
event.target.badge = 42
```

Context Menu Items

- Appended to the web content's context menu
- Content scripts can provide context
- Sends "contextmenu" event each time
- Sends "validate" and "command" events per item

```
event.contextMenu.appendContextMenuItem(...)
```

Validate and Command Events

- Validate events are sent for “interesting” user actions
- Validate event listeners should disable or update the item
- Command events are sent when the user clicks the item
- Events are sent to the event target and bubble up

```
safari.application.addEventListener("validate", ...)
```

```
event.target.disabled = true
```

Global Page

- Loaded once
- Not visible
- Main extension logic
- Store large objects to share
- Access to Bars

```
safari.extension.globalPage.getWindow
```

Settings and Secure Settings

- Exposed in Safari's preferences
- Key/value storage
- Anything that is JSON serializable
- Secure storage available for sensitive data
- Default value when key is not set yet

```
safari.extension.settings.foo = {bar: 42, baz: false}
```

```
delete safari.extension.secureSettings.bar
```

Web Content Layer

.extension
safari
safari.self

Content Scripts

- Evaluated with each page load
- Only for pages that match a whitelist and blacklist
- Can load before or during the load event
- Isolated in a separate world — no global variable conflicts
- Scripting permissions are the same as the page
- Use message passing to talk to the Application Layer

```
safari.self.tab.dispatchMessage("foo", {bar: 42})
```

```
safari.self.addEventListener("message", ...)
```

Content Styles

- Applied to each page load
- Only for pages that match a whitelist and blacklist
- Treated as a user stylesheet — use !important to override the page
- Relative URLs load images from your extension bundle

Full Page Content

- Lets you provide an experience like Top Sites
- No URL is shown in the location field
- Load an extension HTML file in a browser window
- Access to extension content APIs in the normal world

```
safari.application.activeBrowserWindow.activeTab.url =  
    safari.extension.baseURI + "foo.html"
```

- What Safari Extensions can do
- How to build a Safari Extension

How to Build a Safari Extension

Demo

Extension Builder

- One-stop shop to define and build your extension
- Requires a free Safari Developer certificate to build
- Manage all your under development extensions

<http://developer.apple.com/safari>

Working with the Global Page

```
function showCurrentTweet() {  
  const globalWindow = safari.extension.globalPage.contentWindow;  
  const tweets = globalWindow.tweets;  
  
  if (tweets && tweets.length)  
    showTweet(tweets[globalWindow.currentTweetIndex || 0], true);  
}
```

Working Inside the Global Page

```
function showTweet(tweet) {  
  const bars = safari.extension.bars;  
  
  for (var i = 0; i < bars.length; ++i) {  
    if (bars[i].contentWindow.showTweet)  
      bars[i].contentWindow.showTweet(tweet);  
  }  
  
  for (var i = 0; i < tweetFlowTabs.length; ++i) {  
    if (tweetFlowTabs[i].page)  
      tweetFlowTabs[i].page.dispatchMessage("show-tweet", tweet);  
  }  
}
```

Responding to Commands

```
safari.application.addEventListener("command", performCommand, false);
```

```
function performCommand(event) {
```

```
  switch (event.command) {
```

```
    case "show-twitter-flow":
```

```
      const browserWindow = safari.application.activeBrowserWindow ||  
        safari.application.openBrowserWindow();
```

```
      browserWindow.activeTab.url = safari.extension.baseURI + "tweet-flow.html";
```

```
      break;
```

```
    }
```

```
  }
```

What You'll Learn

- When to make a Safari Extension
- What Safari Extensions can do
- How to build a Safari Extension

Summary

- Sign up for the free Safari Developer program
- Turn on the Develop menu and Extensions
- Get started with the Extension Builder
