Alpha.h
vImageAlphaBlend_Planar8( const vImage_Buffer *srcTop, const vImage_Buffer *srcTopAlpha, const vImage_Buffer *srcBottom, const vImage_Buffer *srcBottomAlpha, const vImage_Buffer *alpha, const vImage_Buffer *dest, vImage_Flags flags )
*/
*
*   For planar data, you need to calculate alpha yourself ahead of time and provide that
*   as an argument to this function.
*   This can be done using:
*
*       vImagePremultipliedAlphaBlend_Planar(8/F)( srcTopAlpha, srcTopAlpha,
*       srcBottomAlpha, alpha, kvImageNoFlags );
*
*   For ARGB interleaved data, this is done for you while the other calculations are
*   taking place. Somewhat better alpha precision
*   is available for ARGB8888 data compared to Planar_8 data, because the result alpha
*   channel can be represented with fractional precision.
*
*   For calculations involving 8-bit integer data, the calculation is done in a fixed
*   point representation using signed 0.15 fixed point
*   internal representation with saturated clipping, to prevent results > 1.0 and results
*   < 0. The calculation is actually done with negative
*   numbers internally to make sure that -1.0 is representable where needed. Values are
*   rounded up by 1/2 ulp before truncation.
*
*   This function will work in place.
*/
vImage_Error vImageAlphaBlend_Planar8( const vImage_Buffer *srcTop, const vImage_Buffer *
srcTopAlpha, const vImage_Buffer *srcBottom, const vImage_Buffer *srcBottomAlpha, const
vImage_Buffer *alpha, const vImage_Buffer *dest, vImage_Flags flags )

Electronics

The performance-ready Expression System faithfully reproduces your Taylor's natural voice

Our commitment to great acoustic tone doesn't end with the guitar. It includes the realm of amplified sound for players who want to plug in and convey all the great acoustic nuances they love about their Taylors. A guitar's shape, its wood pairings, and the technique of the player together create a unique tonal character, and we think that voice deserves to be heard when the guitar is plugged-in. After all, many gigging acoustic players stake their livelihood on their live sound, and they want a pickup that sounds natural, is reliable, and is easy to use.

We decided to develop our own acoustic pickup, the Expression System™ (ES), because other aftermarket pickups like a traditional piezo transducer had never managed to produce a true acoustic sound. We started by studying how a guitar responds. We worked closely with

with all the richness, articulation and dynamic range you could ask for. It's also highly feedback resistant.

Another goal of the ES design was to offer easy-to-use tone controls without intruding on the beautiful aesthetic of a Taylor. With three soft-touch roller knobs elegantly embedded in the upper bout of the guitar, you can adjust your volume, bass, midrange and treble frequencies, allowing you to dial in your sound to suit the performance space.

The latest version of the ES (updated in 2007) allows players to turn off one or both body sensors with a switch on the preamp board inside the soundhole, features a battery indicator LED, and includes a fused string ground to protect players who play at venues that may not have proper electrical ground.

Although the ES was originally designed with performance in mind

for each string. The EST has an onboard preamp and the same active controls found on the full ES. Featuring a custom-voiced EQ and dynamic response, the system is powered by a 9-volt battery, with a battery life LED power indicator (which is lit when the battery is being used). The pickup also has a Phase switch for feedback control, which is located on the preamp board inside the soundhole.

ES-N / Nylon Series

New for 2010, the ES-N applies our ES pickup technology to our Nylon Series. It's similar to the ES-T, but the preamp design and tone controls were customized to complement the nylon-string voice. Our standard ES control knobs replace the Fishman EQ control unit formerly installed in the guitar's upper bout, adding more tonal-balance control

other electronics inside the body of the guitar and won't present an obstruction to the installation process. NT neck design only. (\$500)

- The **ES retrofit** is used on a Taylor that has the Fishman Onboard Blender, Fishman Prefix or the L.R. Baggs pickup used on the Doyle Dykes Signature Model. Side-mounted controls fit the existing preamp hole in the guitar. (\$500)
- The **ES upgrade** will modify your ES-equipped Taylor guitar from the former AA battery power source to the 9v system currently used. The latest version of the ES also includes a fused string ground, battery indicator LED, and switches that allow you to turn off the body sensors.

The K4
Another Taylor tone-shaping product that we feel deserves a place in any serious musician's toolbox is the K4 Preamp and Equalizer. Like the ES, it incorporates the ultra-musical analog circuitry of Mr. Rupert Neve and expands the degree of tone control of the ES, allowing you to precisely shape your guitar's tone by toting in on the holes or frequencies of your choice and then cutting or boosting them to taste. It's perfect for studio or home recording and live performance. Among the K4's features are a tuner output, phase reverse switch, headphone jack, and an effects

MacBook Air

Acoustic Electronics

The performance-ready Expression System faithfully reproduces your Taylor's natural voice

Our commitment to great acoustics runs deep with the guitar. It includes the maker of amplified sound for players who want to plug in and convey all the great acoustic nuances they love about their Taylor. At the guitar's shape, its wood grain, and the resonance of the plate together create a unique tone character and we find that unique character to be heard where the player is plugged in. And at every playing occasion, players share that feedback on their live sound, and they want a pickup that sounds natural, is reliable, and is easy to use.

We decided to create our own acoustic pickup, the Expression System™. Because our player market package like a traditional piezo transducer had never managed to produce a true acoustic sound. We started by studying how a guitar resonates. We worked closely with legendary luthier designer Ed Reuter Nason. Ultimately, our product development group designed a highly sensitive pickup and preamp that we felt integrated the best.

To the end, the ES will satisfy the most demanding pro player, yet makes a simple enough for anyone to plug in and get a great live tone. Even if you're not sure how to plug in our ES, you'll be ready to go when you get it.

The ES comes standard on acoustic models made from the ES™ 100 and 200 Series, the ES™ 300 Series up and is optional on models in our acoustic line.

ES™ Under-Saddle Transducer / 100 & 200 Series

Inspired by our Expression System technology and tailored to our 100 and 200 Series, the ES™ 100 is a single magnetic under-saddle transducer with individual elements

with all the richness, articulation and dynamic range you need and for its also highly feedback resistant.

Another goal of the ES design was to offer easy-to-use tone controls without adding to the beautiful aesthetics of a Taylor. With three without volume knobs elegantly introduced in the upper bout of the guitar, you can adjust your volume, bass, midrange and treble frequencies, allowing you to dial in your sound to suit the performance space.

The latest version of the ES (updated in 2007) allows players to turn off one or two pickup elements, which, in the primary sound mode, the soundhole, because a battery indicator LED, you'll receive a solid being ground to protect players who plug in units that may not have proper electrical ground.

Although the ES was originally designed with performance in mind, the sound quality is great enough that many players and recording engineers also use the ES signal for recording.

In the end, the ES will satisfy the most demanding pro player, yet makes a simple enough for anyone to plug in and get a great live tone. Even if you're not sure how to plug in our ES, you'll be ready to go when you get it.

ES-N / Nylon Series

Since 2012, the ES-N applies our ES pickup technology to our nylon guitars. It's similar to the ES-E, but the preamp design and tone controls work with nylon strings. Nylon strings have a different harmonic structure than steel strings. Our updated ES control mode replaces the Factory EQ control unit formerly installed in the guitar's upper bout, adding more tone-shaping control and preserving the natural design aesthetic.

ES Installation and Benefits

Whichever model of acoustic guitar you own, whether an older Taylor with pre-ES electronics, a modern acoustic, or even another brand of acoustic, our Factory Service Center can install or retrofit the Expression System. A retrofit for "older" Taylor models featuring a one-piece, piezo™ was designed to replicate the same type of a... (text is partially obscured)

The ES™ 100 and 200 Series are standard on acoustic models made from the ES™ 100 and 200 Series, the ES™ 300 Series up and is optional on models in our acoustic line.

ES™ Installation and Benefits

Whichever model of acoustic guitar you own, whether an older Taylor with pre-ES electronics, a modern acoustic, or even another brand of acoustic, our Factory Service Center can install or retrofit the Expression System. The ES™ 100 and 200 Series are standard on acoustic models made from the ES™ 100 and 200 Series, the ES™ 300 Series up and is optional on models in our acoustic line.

The KA Acoustic Taylor tone pickup product line that delivers a place in any acoustic guitarist's toolbox. The KA Pickup and Equalizer. Like the ES, it incorporates the ultra-modern wiring quality of...

The ES setup is used on a Taylor that has the Factory Original Blended, Flavored Pick or the L.R. Baggs pickup used on the Diego Davis Signature Model. Solo-mounted controls fit the existing preamp hole in the guitar.

tone, which allows you to use multiple, a stereo line, a volume pedal or other effects and maintain a balanced signal chain. Multiple, transformer-coupled balanced outputs give you mixing flexibility, enabling you to drive an amp, PA or board. The KA is also handy for enhancing the amplified sound of other piezo transducers, such as a monitor piece of gear.

The features of the pickup, including EQ section, the KA can come in handy in a playing session. By using the KA on a channel splitter on your mixing console the real time you do a mix.
