App Nap for Safari Tabs New in Safari 7

App Nap for Safari Tabs New in Safari 7

• Each tab has its own Safari Web Content process

- Each tab has its own Safari Web Content process
- App Nap is applied to the Safari Web Content process for that tab

Content process Neb Content process for that tab

- Each tab has its own Safari Web Content process • App Nap is applied to the Safari Web Content process for that tab Saves power by napping background tabs

When Are Tabs Napped?

When Are Tabs Napped?

• Tab is not visible

- Background tab
- Minimized window
- In another space
- Screen saver is on
- Occluded window

When Are Tabs Napped?

• Tab is not visible

- Background tab
- Minimized window
- In another space
- Screen saver is on
- Occluded window
- Idle windows

JavaScript timers are rate-limited

 JavaScript timers are rate-limited setTimeout(), setInterval()

- JavaScript timers are rate-limited
 - setTimeout(), setInterval()
 - requestAnimationFrame()

JavaScript timers are rate-limited

setTimeout(), setInterval()

requestAnimationFrame()

Napping prevented when

JavaScript timers are rate-limited

- setTimeout(), setInterval()
- requestAnimationFrame()
- Napping prevented when Playing audio

- JavaScript timers are rate-limited
 - setTimeout(), setInterval()
 - requestAnimationFrame()
- Napping prevented when
 - Playing audio
 - Loading

What You Should Do

What You Should Do

Often nothing

What You Should Do

- Often nothing
- But be prepared for timer rate-limiting

App Nap for Safari Tabs New in Safari 7

Safari Power Saver New in Safari 7

Reduction In CPU Power Usage

Testing conducted by Apple in June 2013 using production 1.8GHz Intel Core i5-based 13-inch MacBook Air systems with 4GB of RAM and prerelease OS X v10.9. Tested with prerelease Safari 7.0 with Power Saver on (default) vs. off. Systems tested with WPA2 Wi-Fi network connection while running on battery power. Performance will vary based on system configuration, application workload, and other factors.

Problems using JavaScript timers for animation

 Problems using JavaScript timers for animation How often to run?

Problems using JavaScript timers for animation

How often to run?

Browser can't know that you're just animating

• Web API for animation:

window.requestAnimationFrame(callback);

• Web API for animation:

• Web API for animation:

window.requestAnimationFrame(callback);
window.cancelAnimationFrame(id);

Advantages

• Web API for animation:

- Advantages
 - Display-refresh friendly

• Web API for animation:

- Advantages
 - Display-refresh friendly
 - Pausable

• Web API for animation:

- Advantages
 - Display-refresh friendly
 - Pausable

Before requestAnimationFrame()

function doAnimation() {
 // Compute offset into animation
 // using new Date().
 ...
 // Update visuals.
 ...
 // Update visuals.
 ...
 // Use setTimeout() to get called in about 16ms.
 setTimeout(doAnimation, 16);
}

function doAnimation(currentTime) {
 // Compute offset into animation using currentTime.
 // currentTime is milliseconds since the document started to load.
 ...
 // Update visuals.
 ...
 // Update visuals.
 ...
 // Optionally, queue up another callback.
 requestAnimationFrame(doAnimation);
}

function doAnimation(currentTime) {
 // Compute offset into animation using currentTime.
 // currentTime is milliseconds since the document started to load.
 ...
 // Update visuals.
 ...
 // Update visuals.
 ...
 // Optionally, queue up another callback.
 requestAnimationFrame(doAnimation);
}

What You Should Do

What You Should Do

Use Page Visibility to stop doing work in hidden pages

What You Should Do

• Use Page Visibility to stop doing work in hidden pages

If you have to do JavaScript animation, use requestAnimationFrame()

What You Should Do

- Use Page Visibility to stop doing work in hidden pages
- Separate business logic from visual updates

If you have to do JavaScript animation, use requestAnimationFrame()

What You Should Do

- Use Page Visibility to stop doing work in hidden pages
- If you have to do JavaScript animation, use requestAnimationFrame()
- Separate business logic from visual updates
 - Remember that transitions and animations are affected by visibility

Posts Last Day Food Shopping At the Market Biking

Last Day

We managed to get down to the beach on the last day, for a final photo!

One last beach trip!

Food Shopping

Some table salad to go with our lunch. Yum!

At the Market

We had a fun afternoon going through the market.

14.2 ITTE DACKGround

Authors may specify the background of an element (i.e., its rendering surface) as either a color or an image. In terms of the box model, "background" refers to the background of the <u>content</u>, <u>padding</u> and <u>border</u> areas. Border colors and styles are set with the border properties. Margins are always transparent.

Background properties are not inherited, but the parent box's background will shine through by default because of the initial 'transparent' value on 'background-color'.

The background of the root element becomes the background of the canvas and covers the entire <u>canvas</u>, anchored (for <u>background-position</u>) at the same point as it would be if it was painted only for the root element itself. The root element does not paint this background again.

For HTML documents, however, we recommend that authors specify the background for the BODY element rather than the HTML element. For documents whose root element is an HTML "HTML" element or an XHTML "html" element that has computed values of 'transparent' for 'background-color' and 'none' for 'background-image', user agents must instead use the computed value of the background properties from that element's first HTML "BODY" element or XHTML "body" element child when painting backgrounds for the canvas, and must not paint a background for that child element. Such backgrounds must also be anchored at the same point as they would be if they were painted only for the root element.
