# Adopting Handoff on iOS and OS X

Session 219
Michael Jurewitz
Engineering

Vince Spader Cocoa Frameworks Engineer Keith Stattenfield CoreFrameworks Engineer

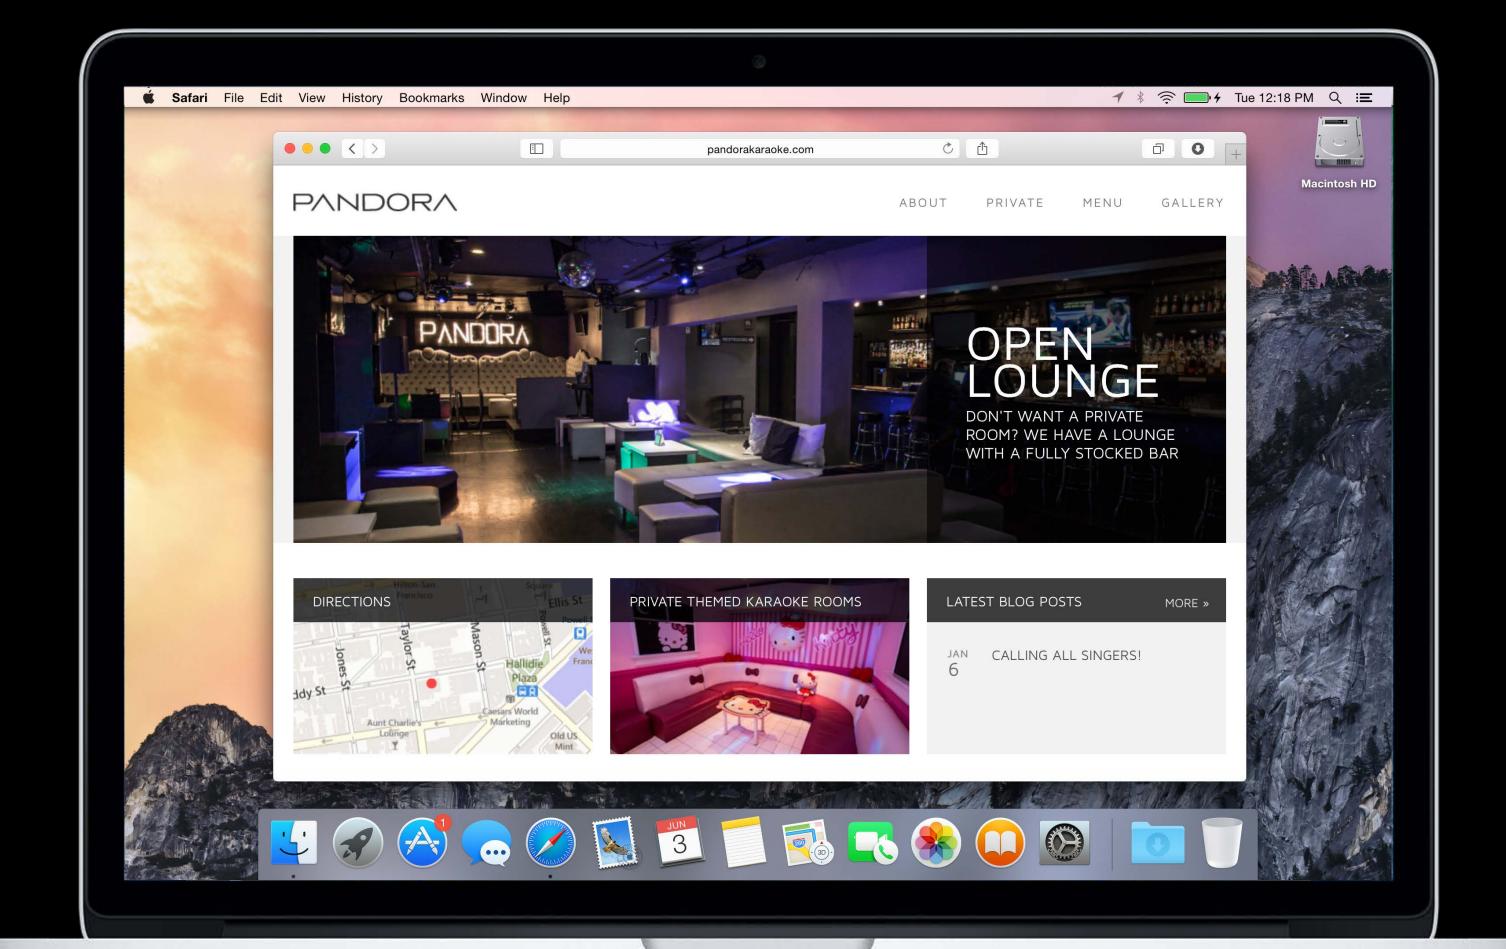

#### What You Will Learn

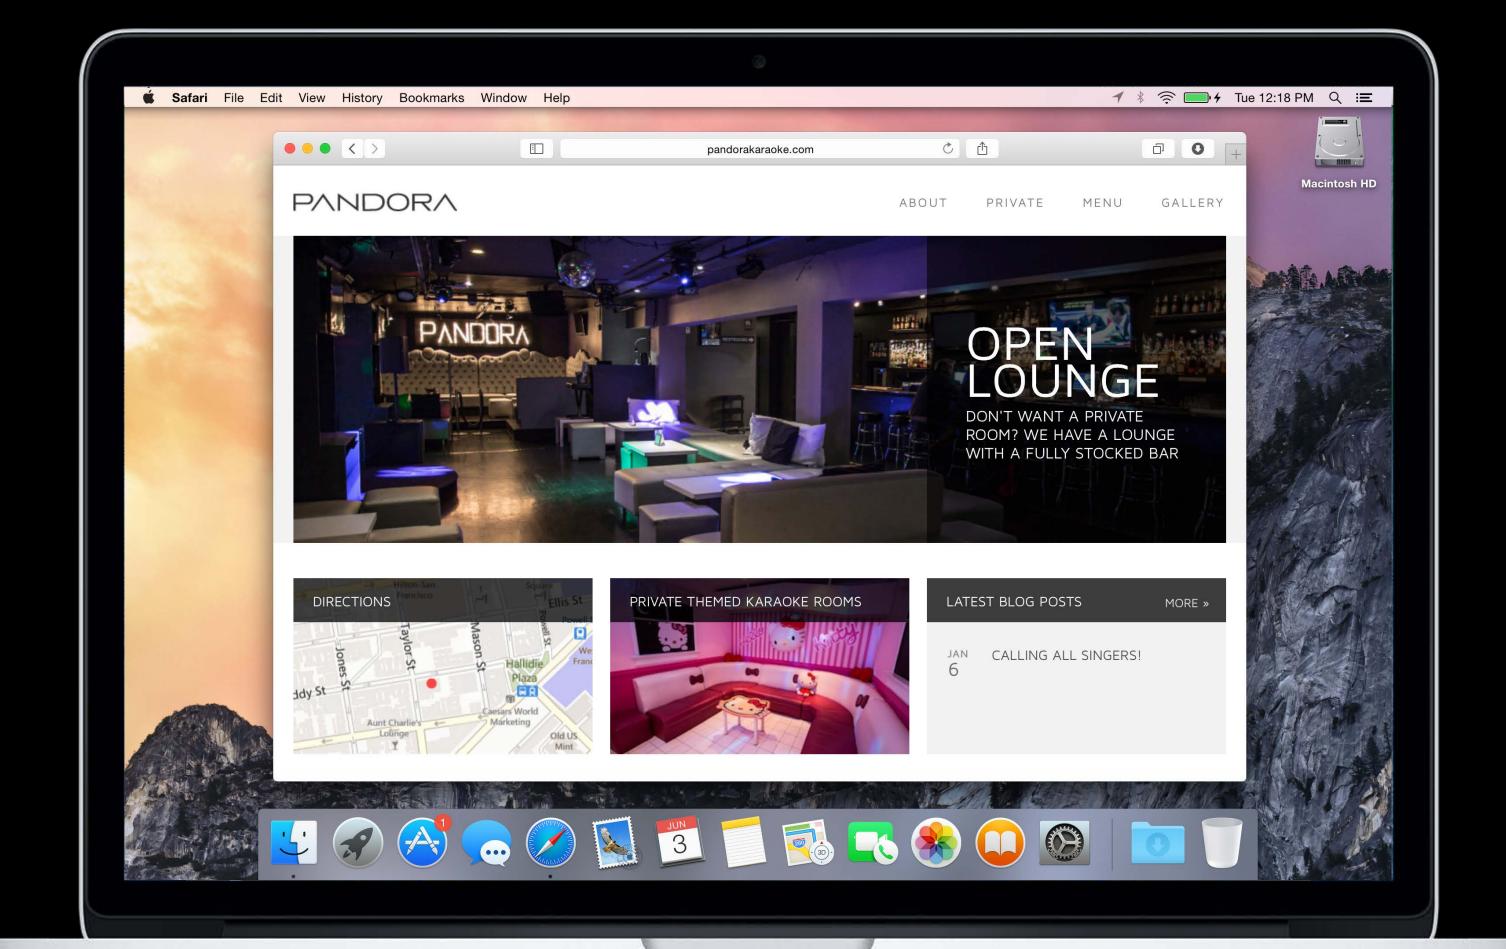

What is Handoff

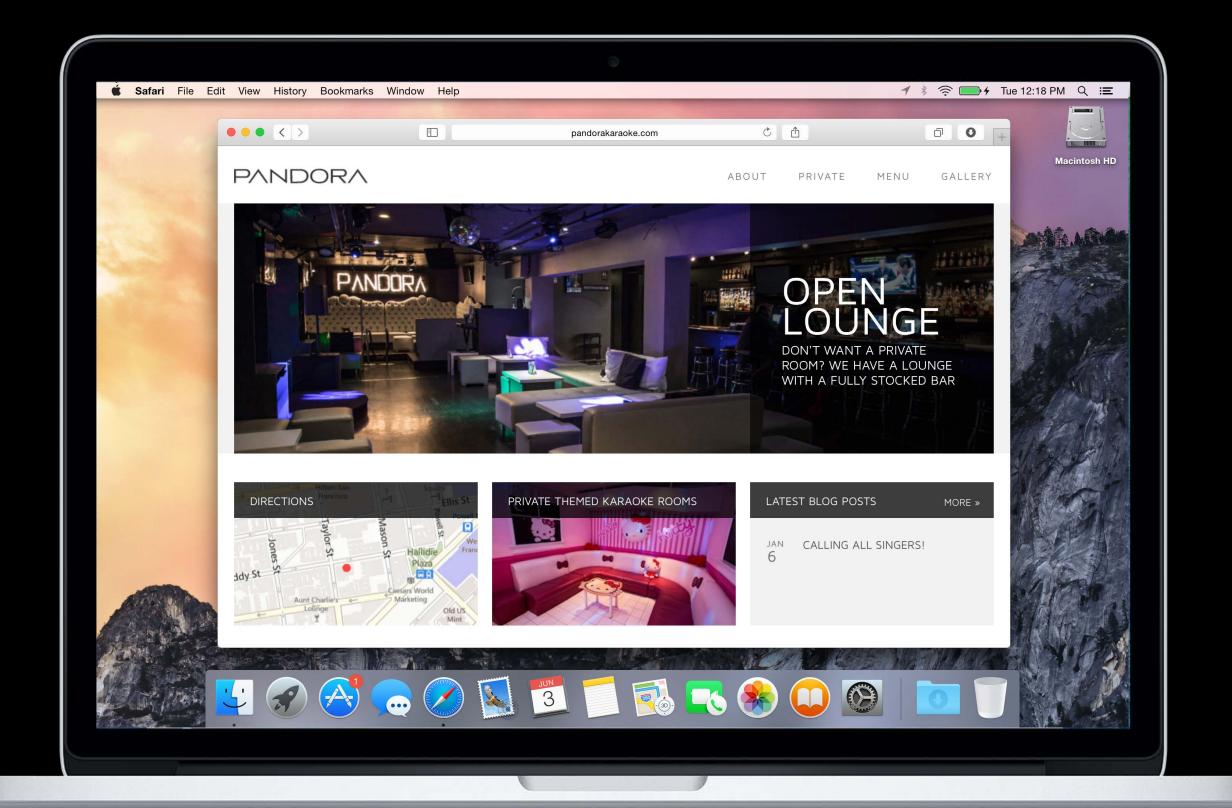

Adopting Handoff in your app

In-depth Handoff adoption

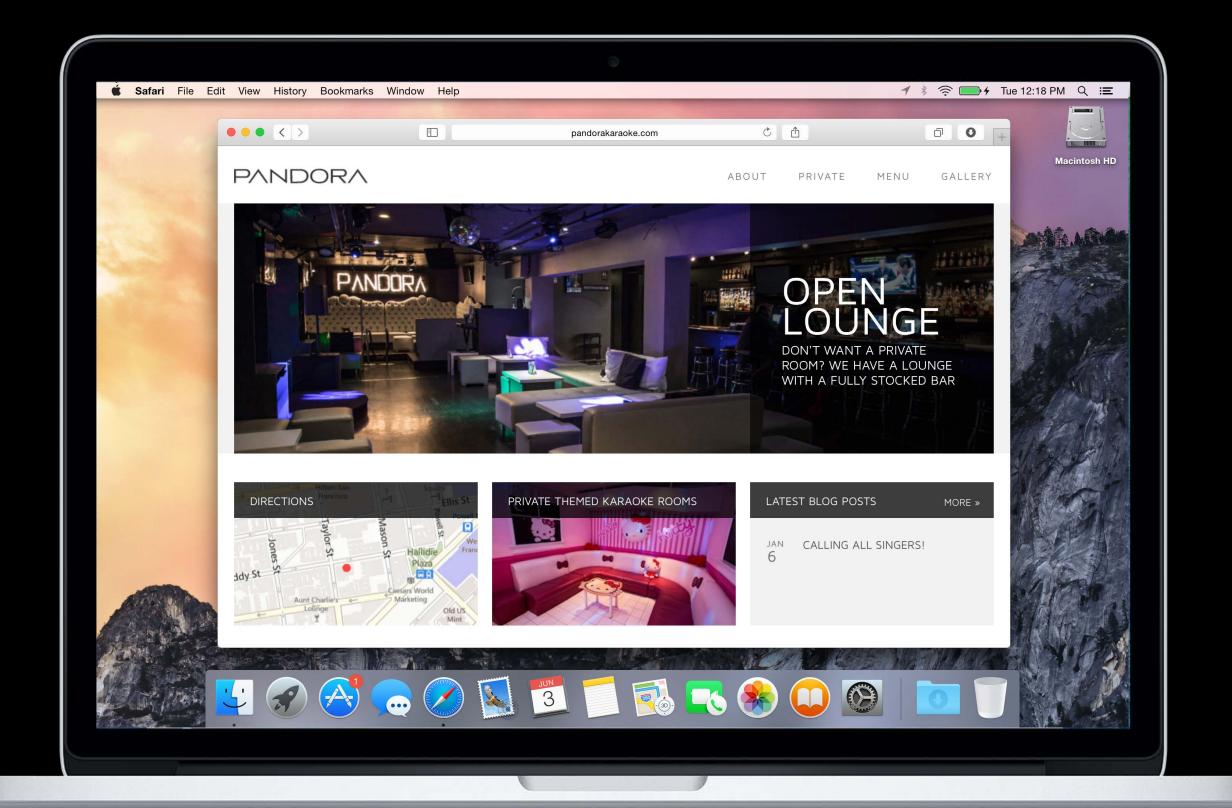

# What is Handoff?

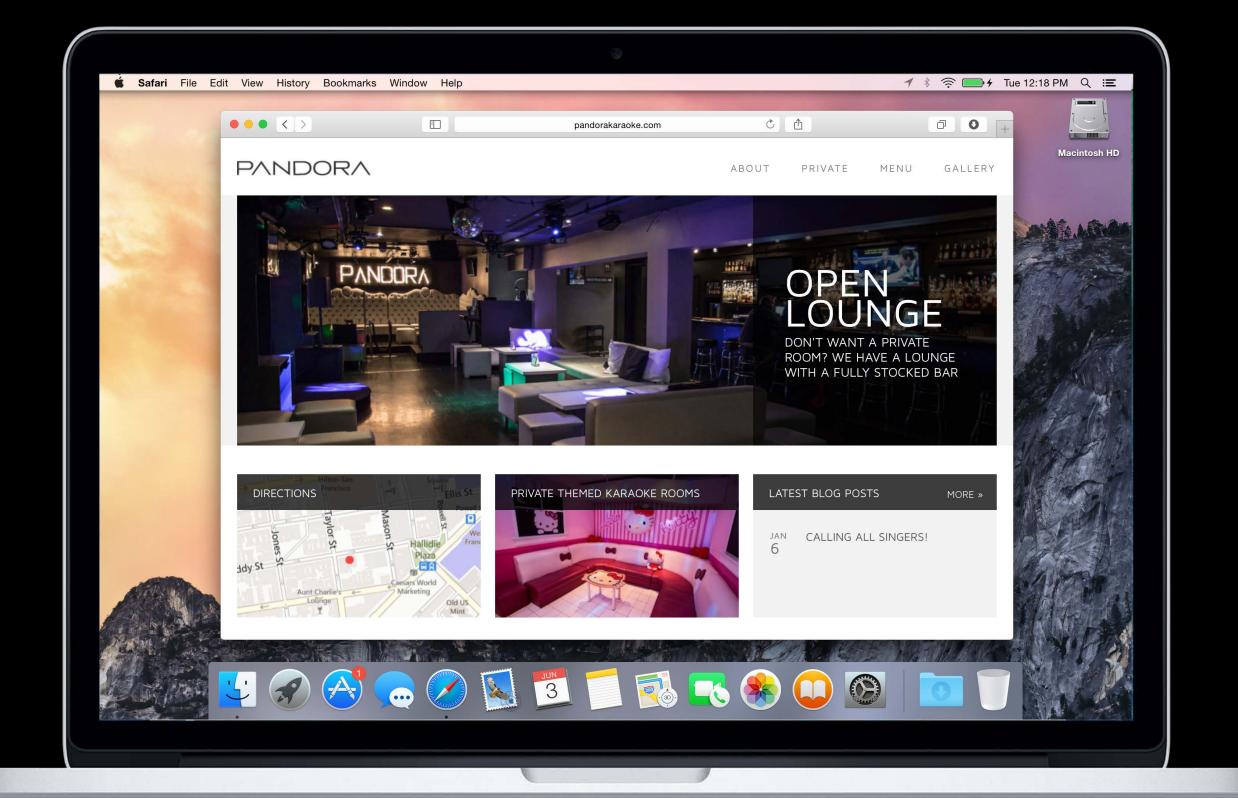

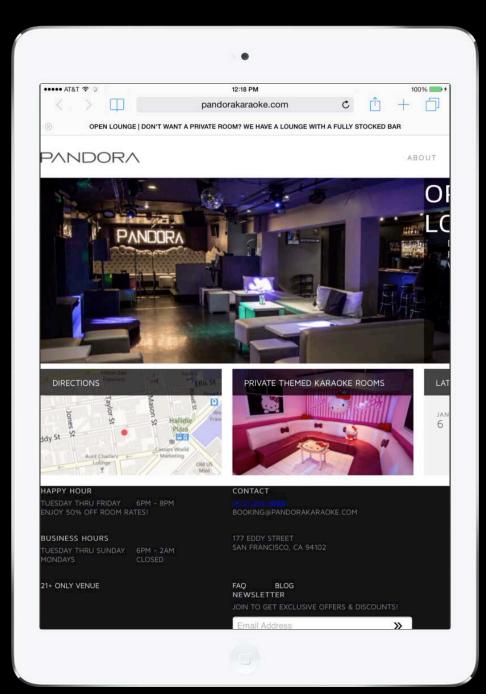

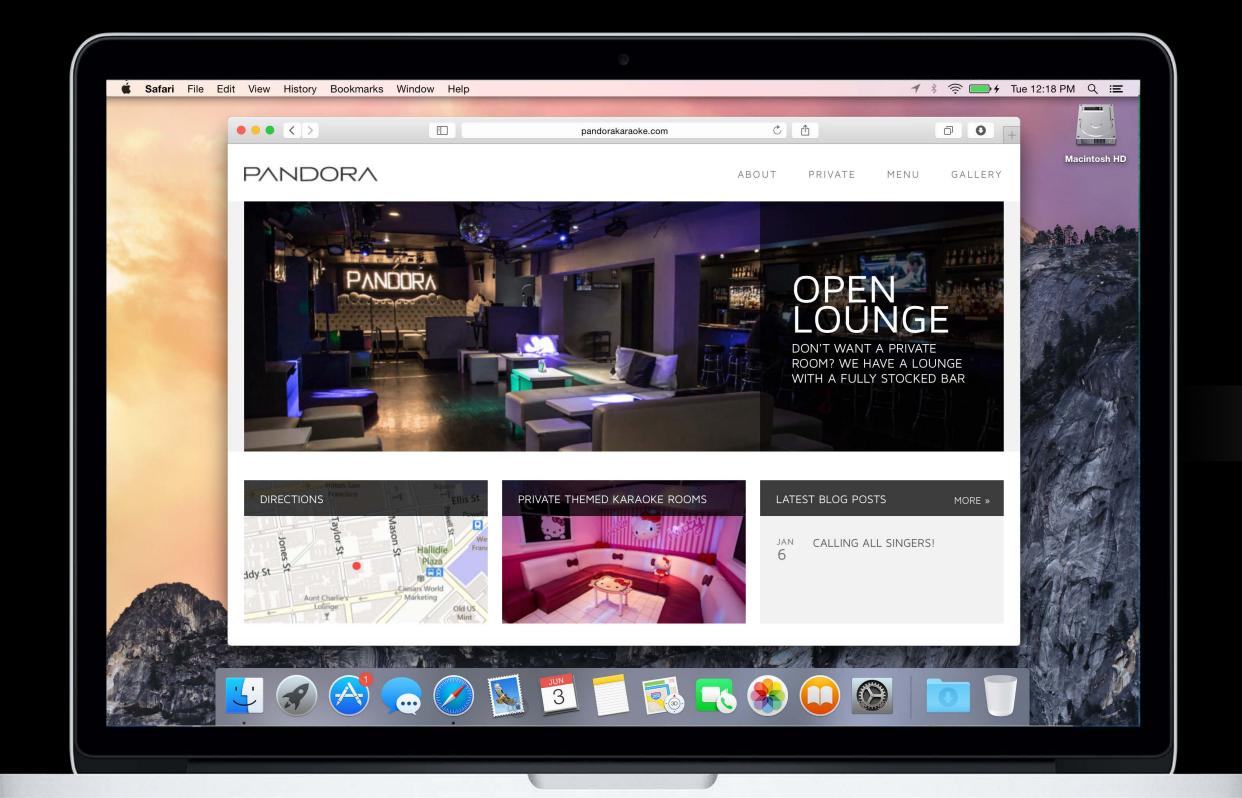

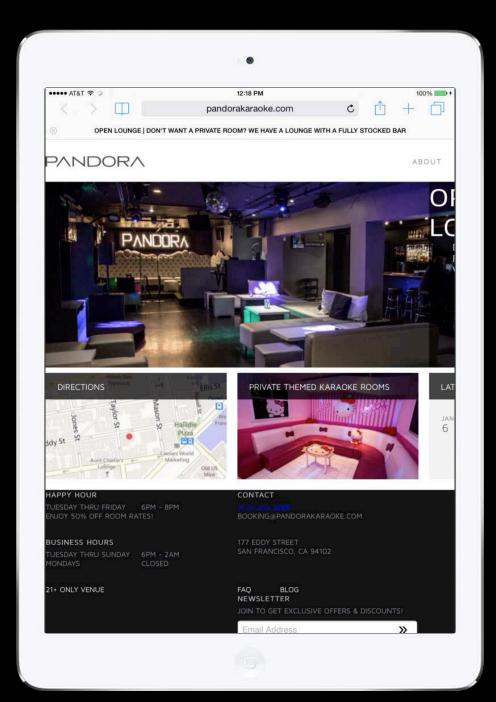

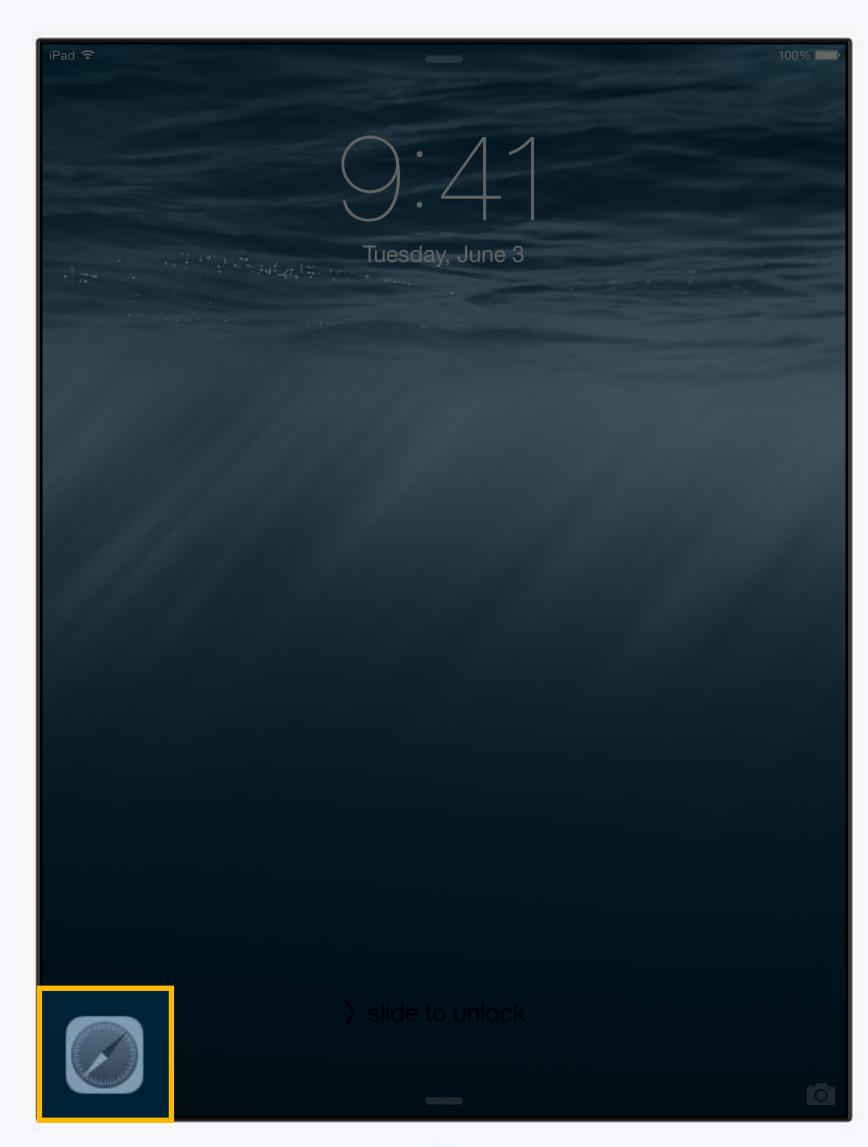

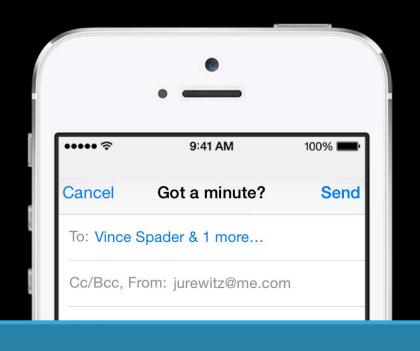

## Adopting Handoff

Decide which activities to support in your app
Create activities in specific parts of your app
Handle continuing incoming activities in your app

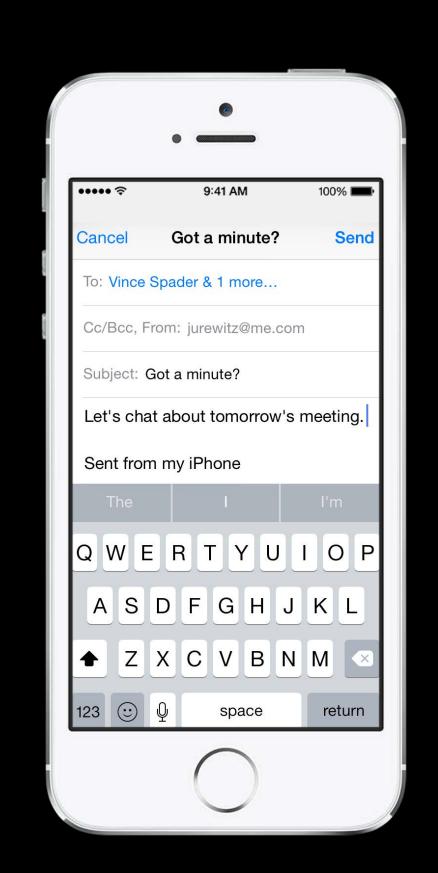

Activity

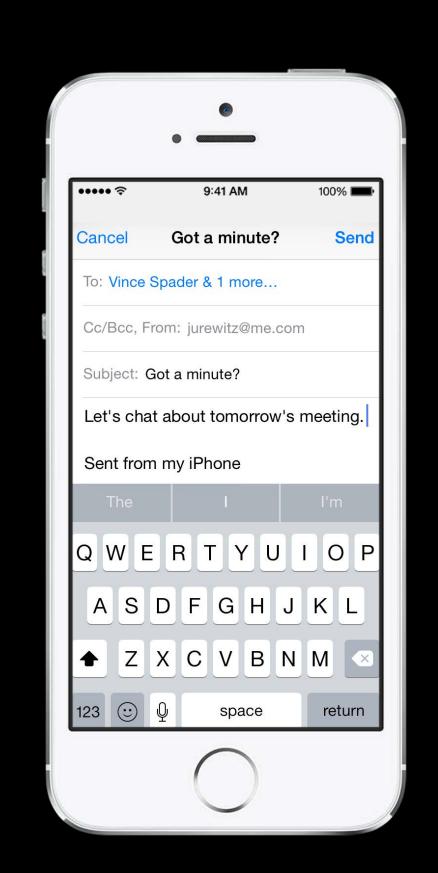

NSUserActivity

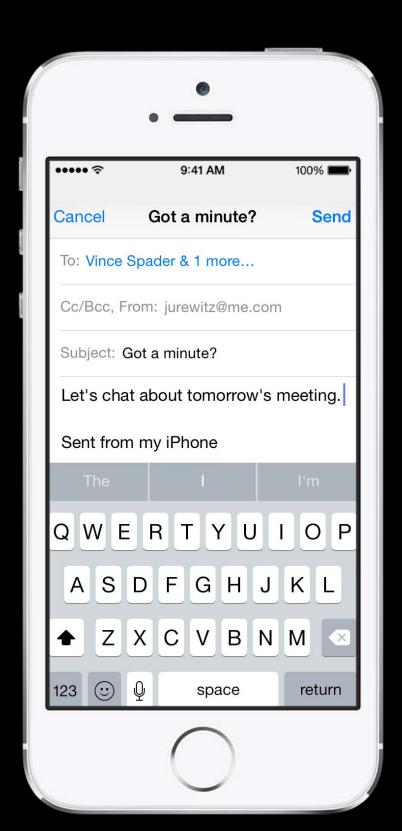

#### NSUserActivity

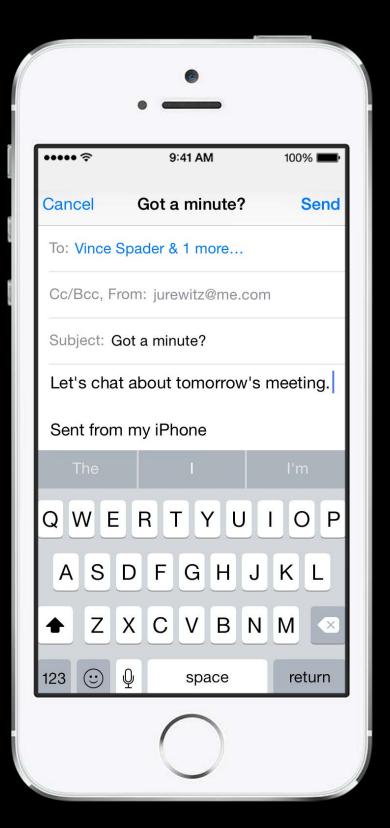

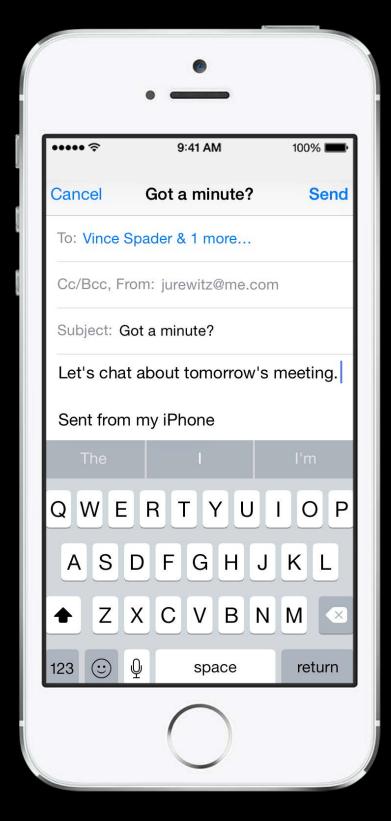

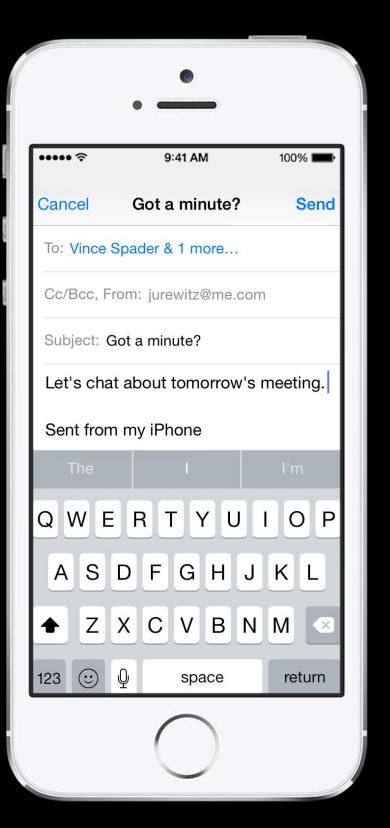

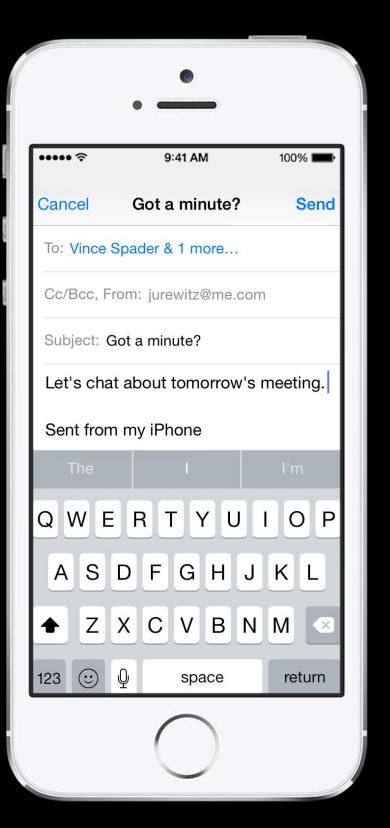

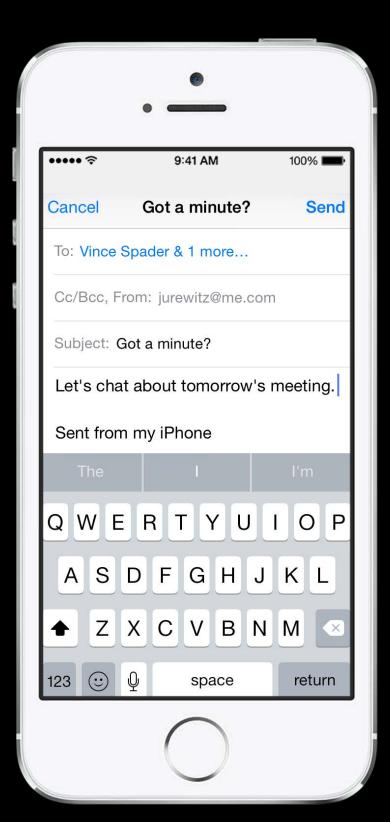

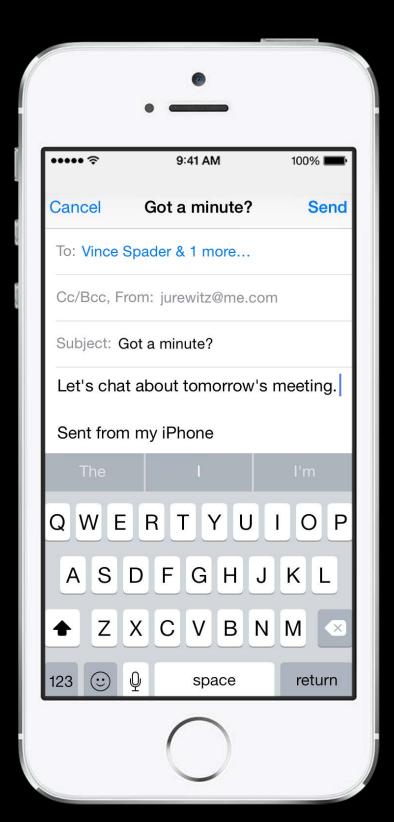

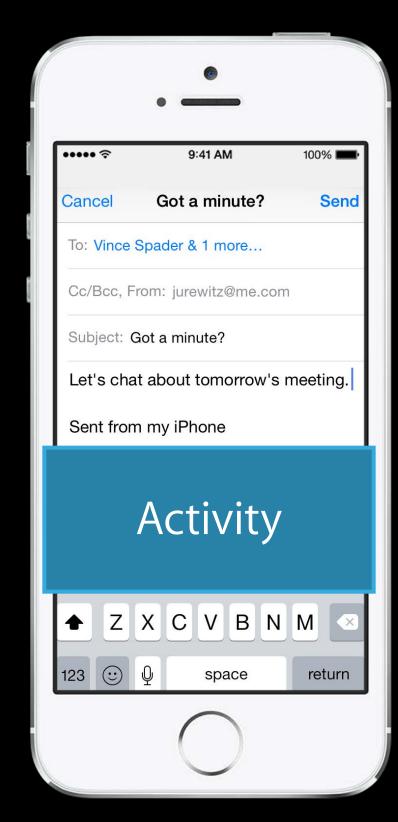

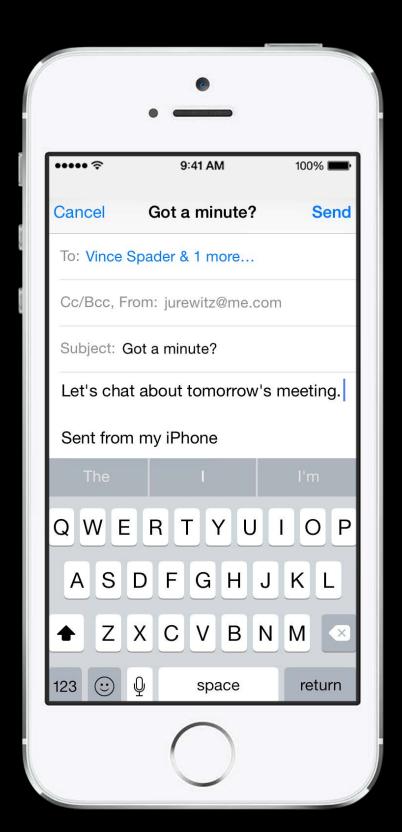

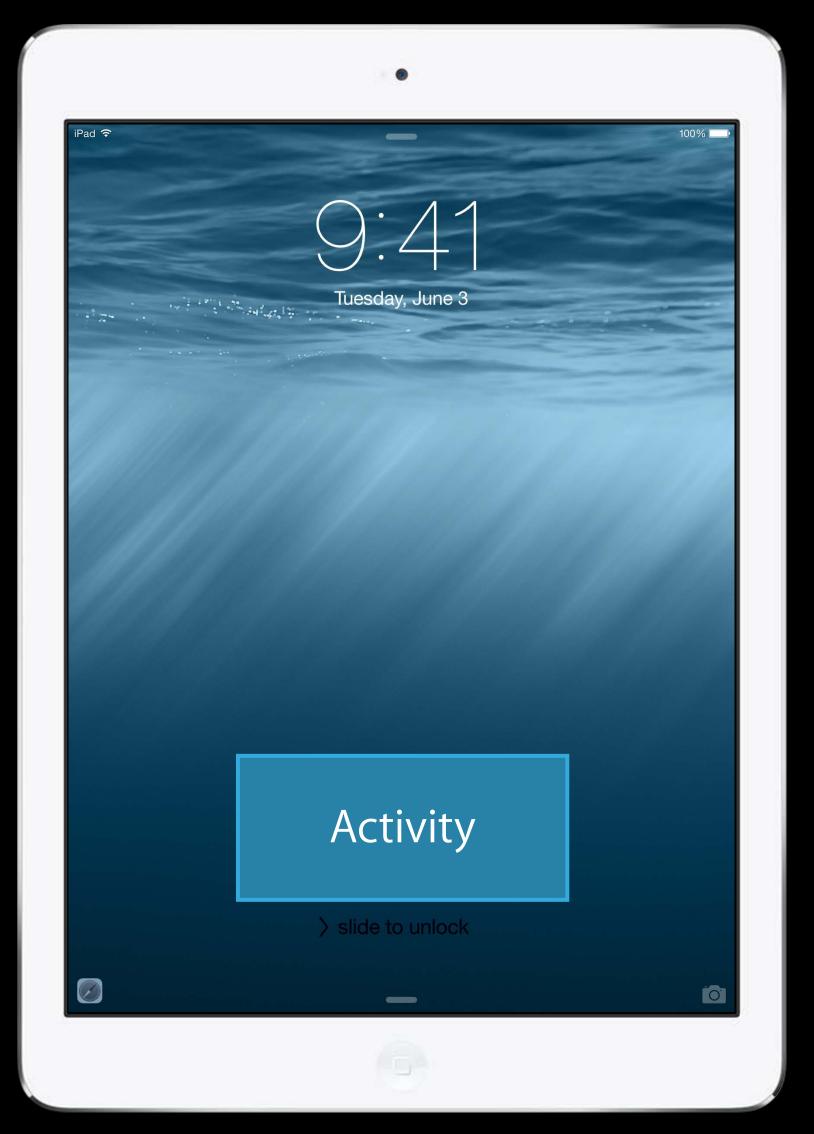

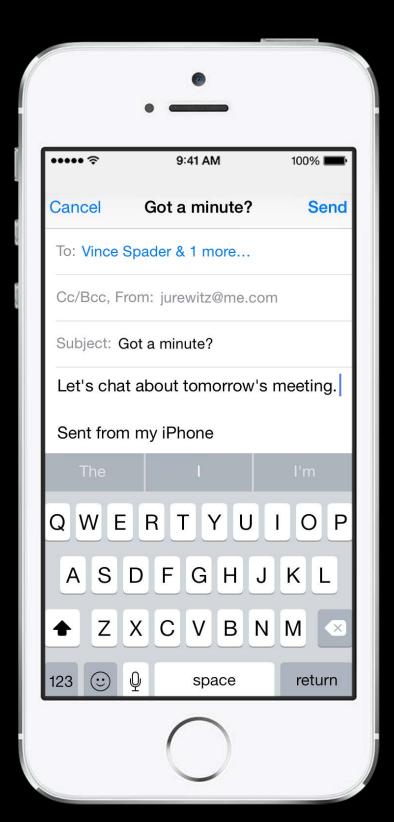

### Additional Handoff Support

Streams between applications in two devices

Handoff between native app and website you own

## Agenda

AppKit and UlKit support for adopting Handoff
Working with NSUserActivity directly
Native app to website Handoff
Using continuation streams between apps

# Adopting Handoff in Your App

Vince Spader Cocoa Frameworks Engineer

# Adopting Handoff in Your App

AppKit/UlKit support for Handoff

Creating

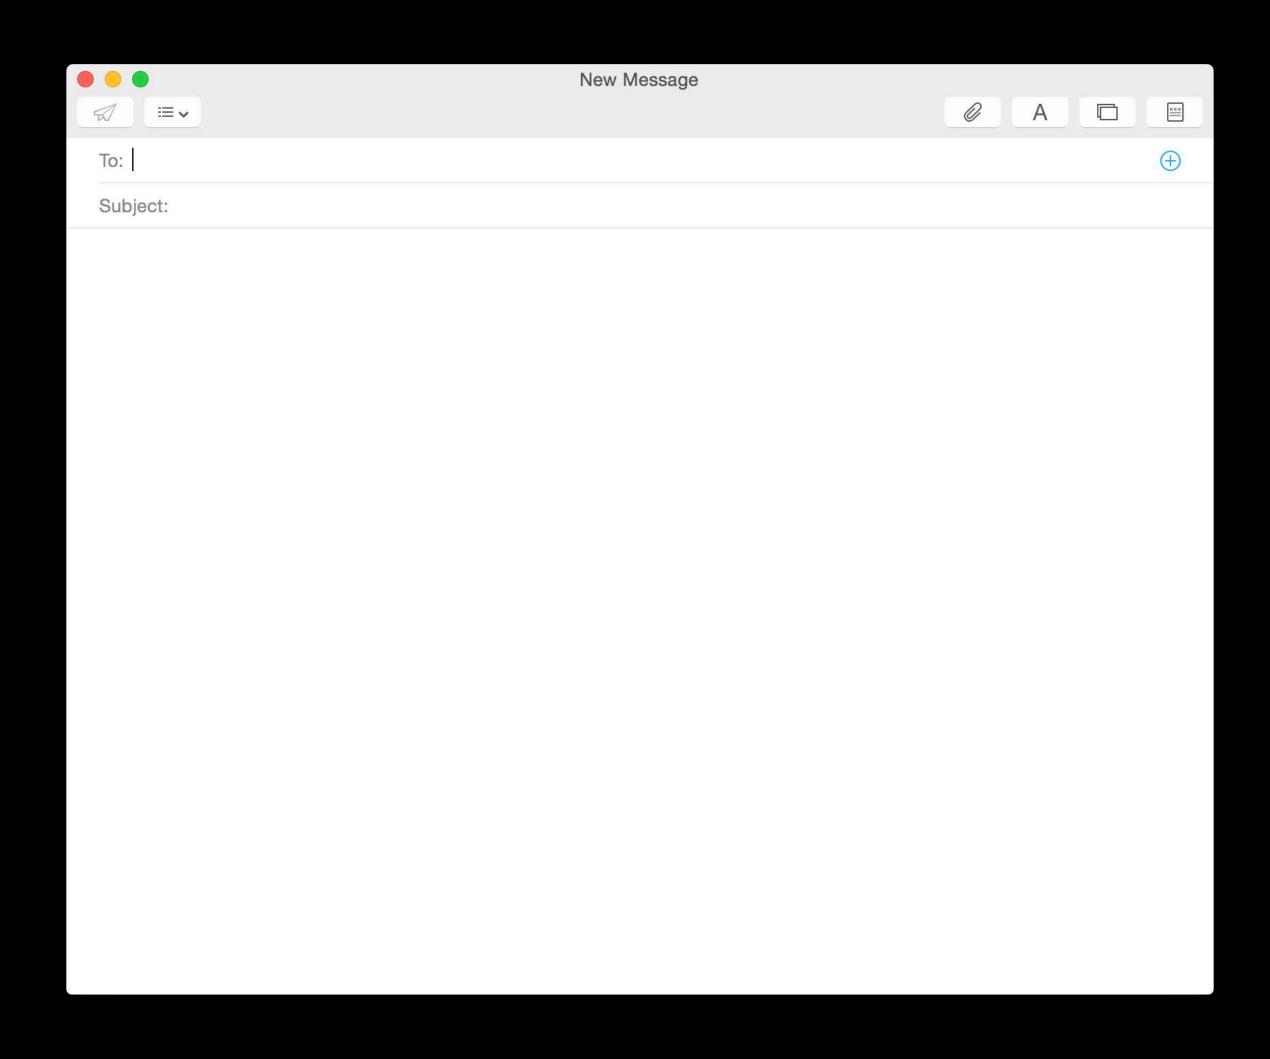

Updating

Continuing

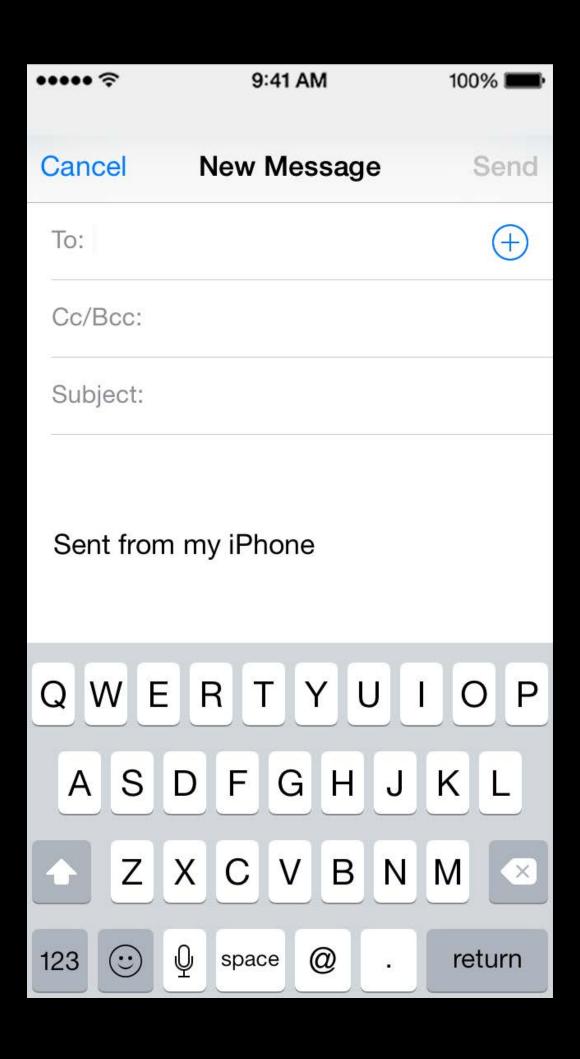

# Creating User Activities

What do users do in your app?

What do users do in your app?

# Creating User Activities What do users do in your app?

# Creating User Activities What do users do in your app?

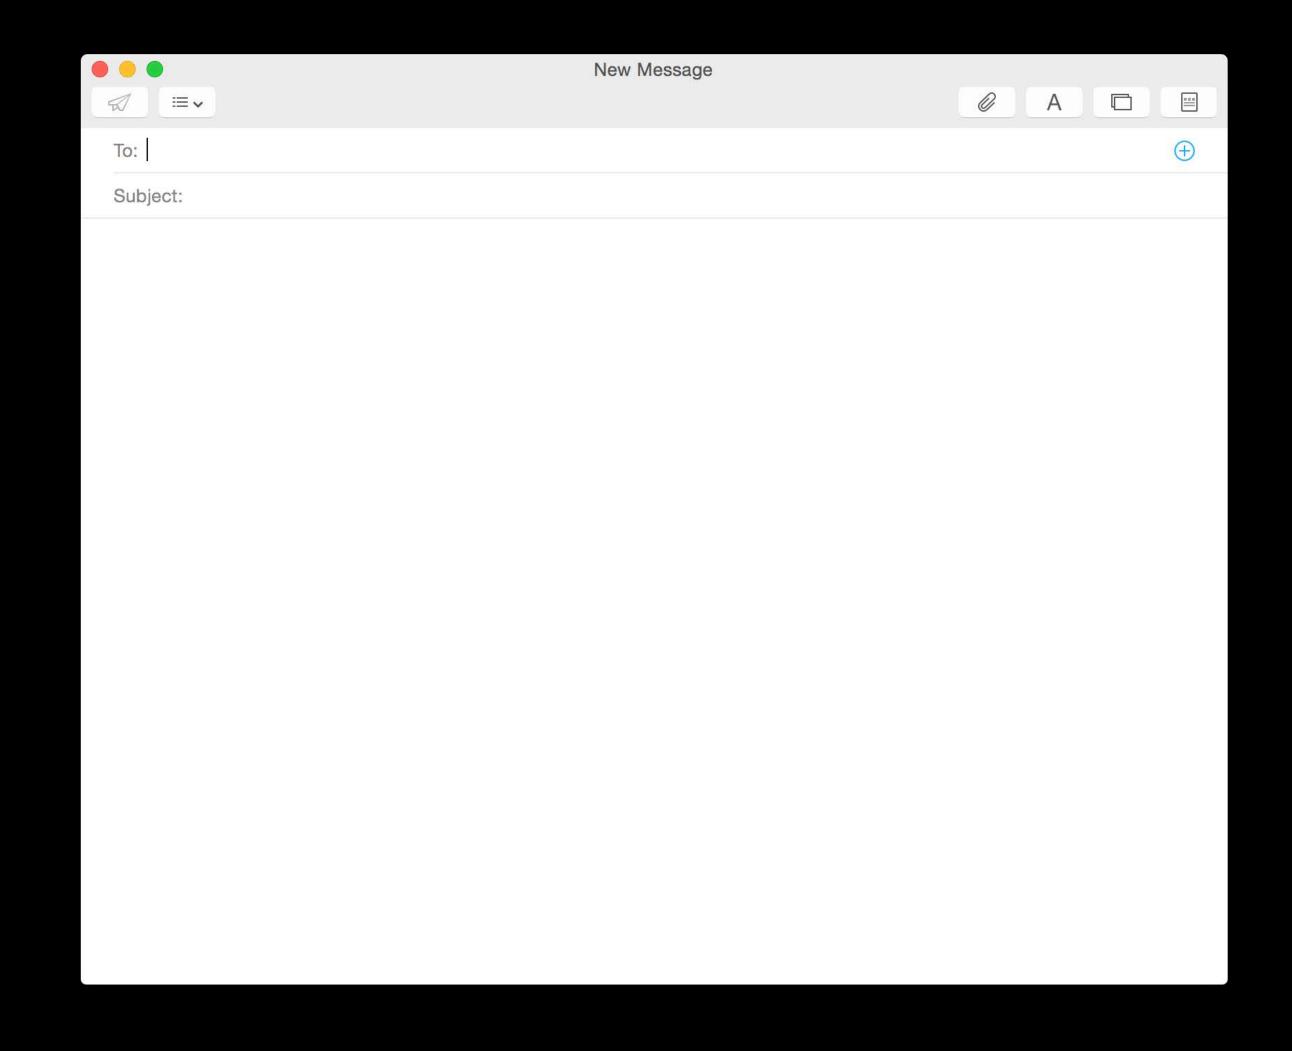

Reading messages

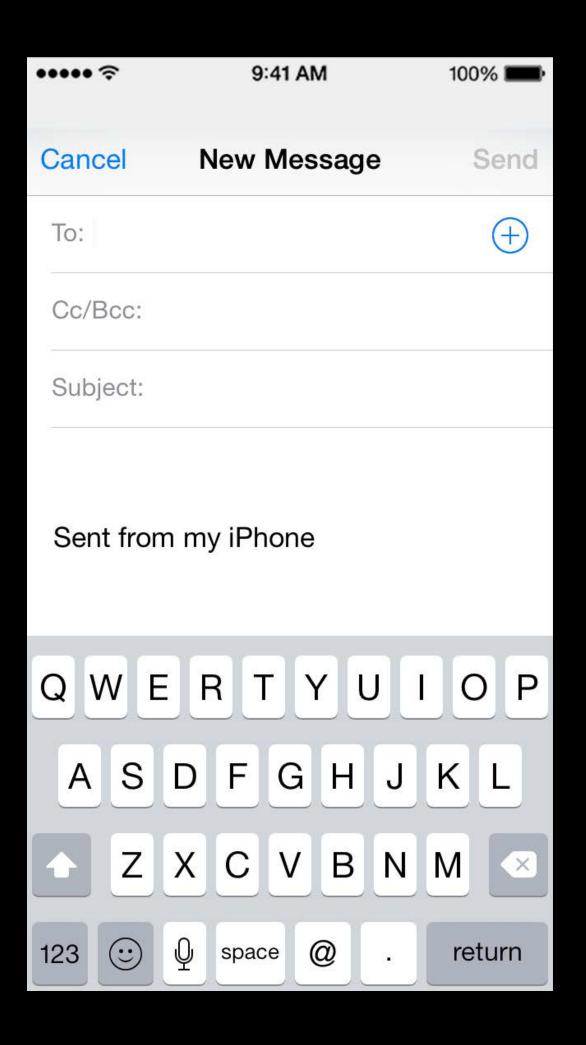

Picking an item from a list

Editing a document

What do users do in your app?

# Creating User Activities What do users do in your app?

Documents and Responders

## Creating User Activities Documents and Responders

```
NSDocument, UIDocument, NSResponder and UIResponder now have: @property (strong) NSUserActivity *userActivity;
```

Documents and Responders

```
NSDocument, UIDocument, NSResponder and UIResponder now have: @property (strong) NSUserActivity *userActivity;
```

You can set it like this:

```
NSUserActivity *userActivity = [[NSUserActivity alloc]
    initWithActivityType:@"com.company.viewing-message"];
userActivity.title = @"Viewing Message";
document.userActivity = userActivity;
```

Document-based apps

# Creating User Activities Document-based apps

Add NSUbiquitousDocumentUserActivityType to each CFBundleDocumentTypes entry

Documents and Responders

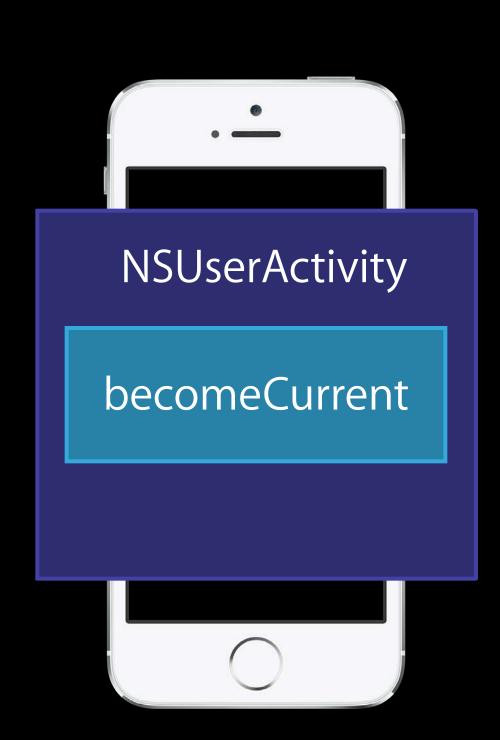

# Creating User Activities Documents and Responders

We manage it for you

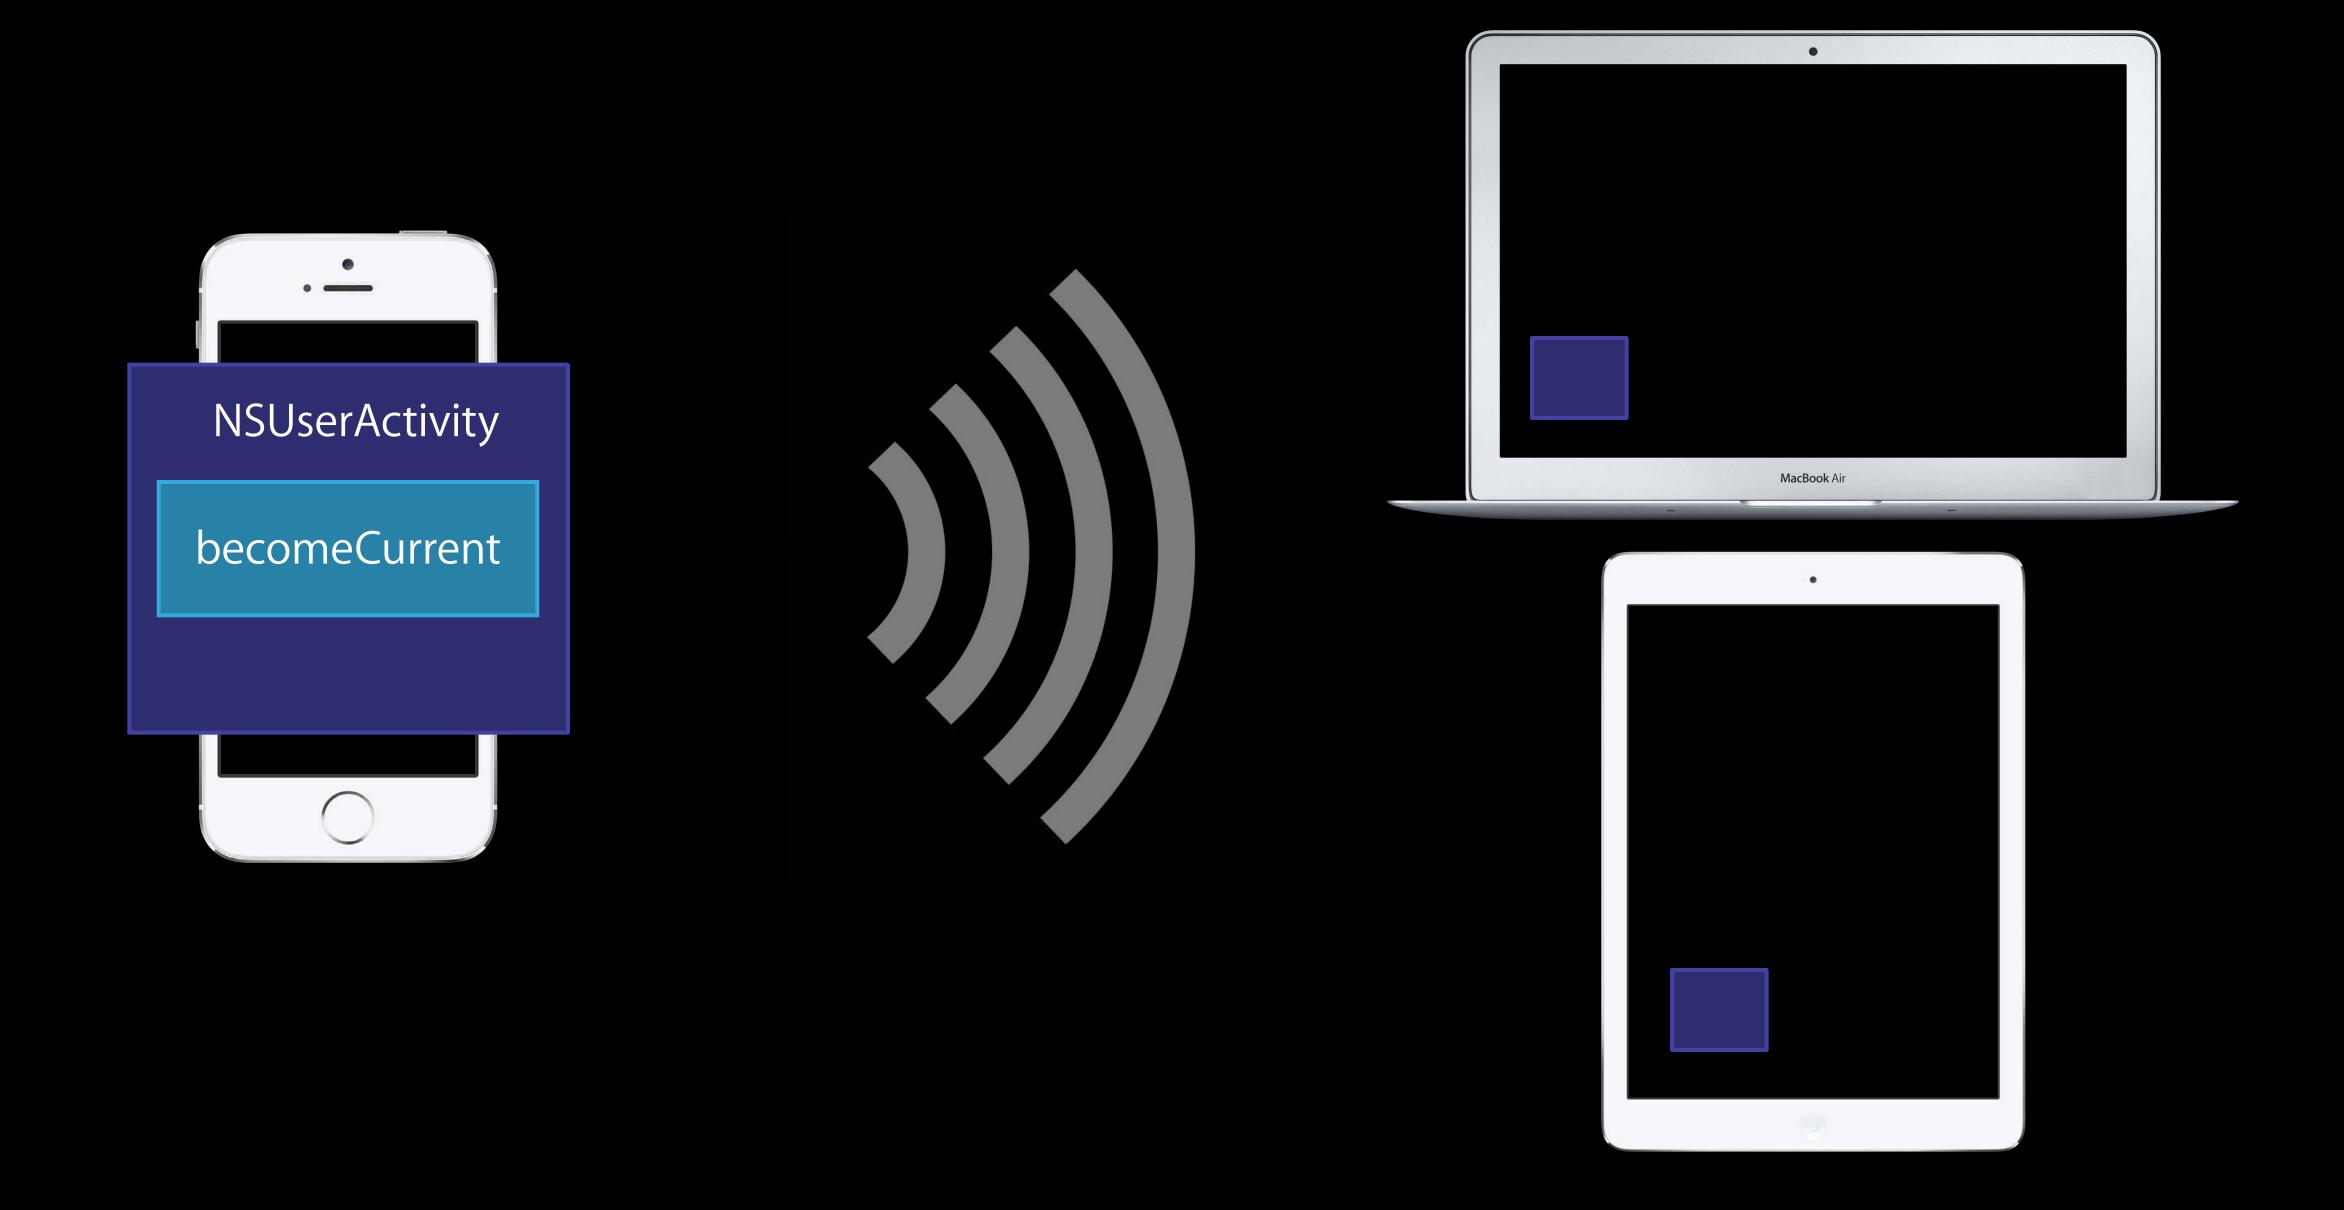

# Creating User Activities Documents and Responders

We manage it for you

We call becomeCurrent

becomeCurrent on iOS

When the app is launched, comes into the foreground, or tabs are switched:

When the app is launched, comes into the foreground, or tabs are switched:

UlKit walks the view controller hierarchy

When the app is launched, comes into the foreground, or tabs are switched:

- UlKit walks the view controller hierarchy
  - Including presented view controllers

When the app is launched, comes into the foreground, or tabs are switched:

- UlKit walks the view controller hierarchy
  - Including presented view controllers
  - The view controller's view must be in the view hierarchy

When the app is launched, comes into the foreground, or tabs are switched:

- UlKit walks the view controller hierarchy
  - Including presented view controllers
  - The view controller's view must be in the view hierarchy

When userActivity is set:

When the app is launched, comes into the foreground, or tabs are switched:

- UlKit walks the view controller hierarchy
  - Including presented view controllers
  - The view controller's view must be in the view hierarchy

#### When userActivity is set:

• If the view controller is in a transition, we wait until after it's done

When the app is launched, comes into the foreground, or tabs are switched:

- UlKit walks the view controller hierarchy
  - Including presented view controllers
  - The view controller's view must be in the view hierarchy

#### When userActivity is set:

- If the view controller is in a transition, we wait until after it's done
- If the view controller's view is in the window hierarchy

becomeCurrent on iOS

UIDocument will not becomeCurrent automatically.

becomeCurrent on iOS

UIDocument will not become Current automatically.

```
Share the userActivity:
[document openWithCompletionHandler:^(B00L success) {
    viewController.userActivity = document.userActivity;
...
}];
```

becomeCurrent on OS X

AppKit looks for a userActivity:

AppKit looks for a userActivity:

Main window's responder chain

#### AppKit looks for a userActivity:

- Main window's responder chain
- Main window controller's document

# Creating User Activities become Current on OS X

AppKit looks for a userActivity:

- Main window's responder chain
- Main window controller's document

We'll reevaluate when appropriate

# Creating User Activities

Documents and Responders

# Creating User Activities Documents and Responders

We manage it for you

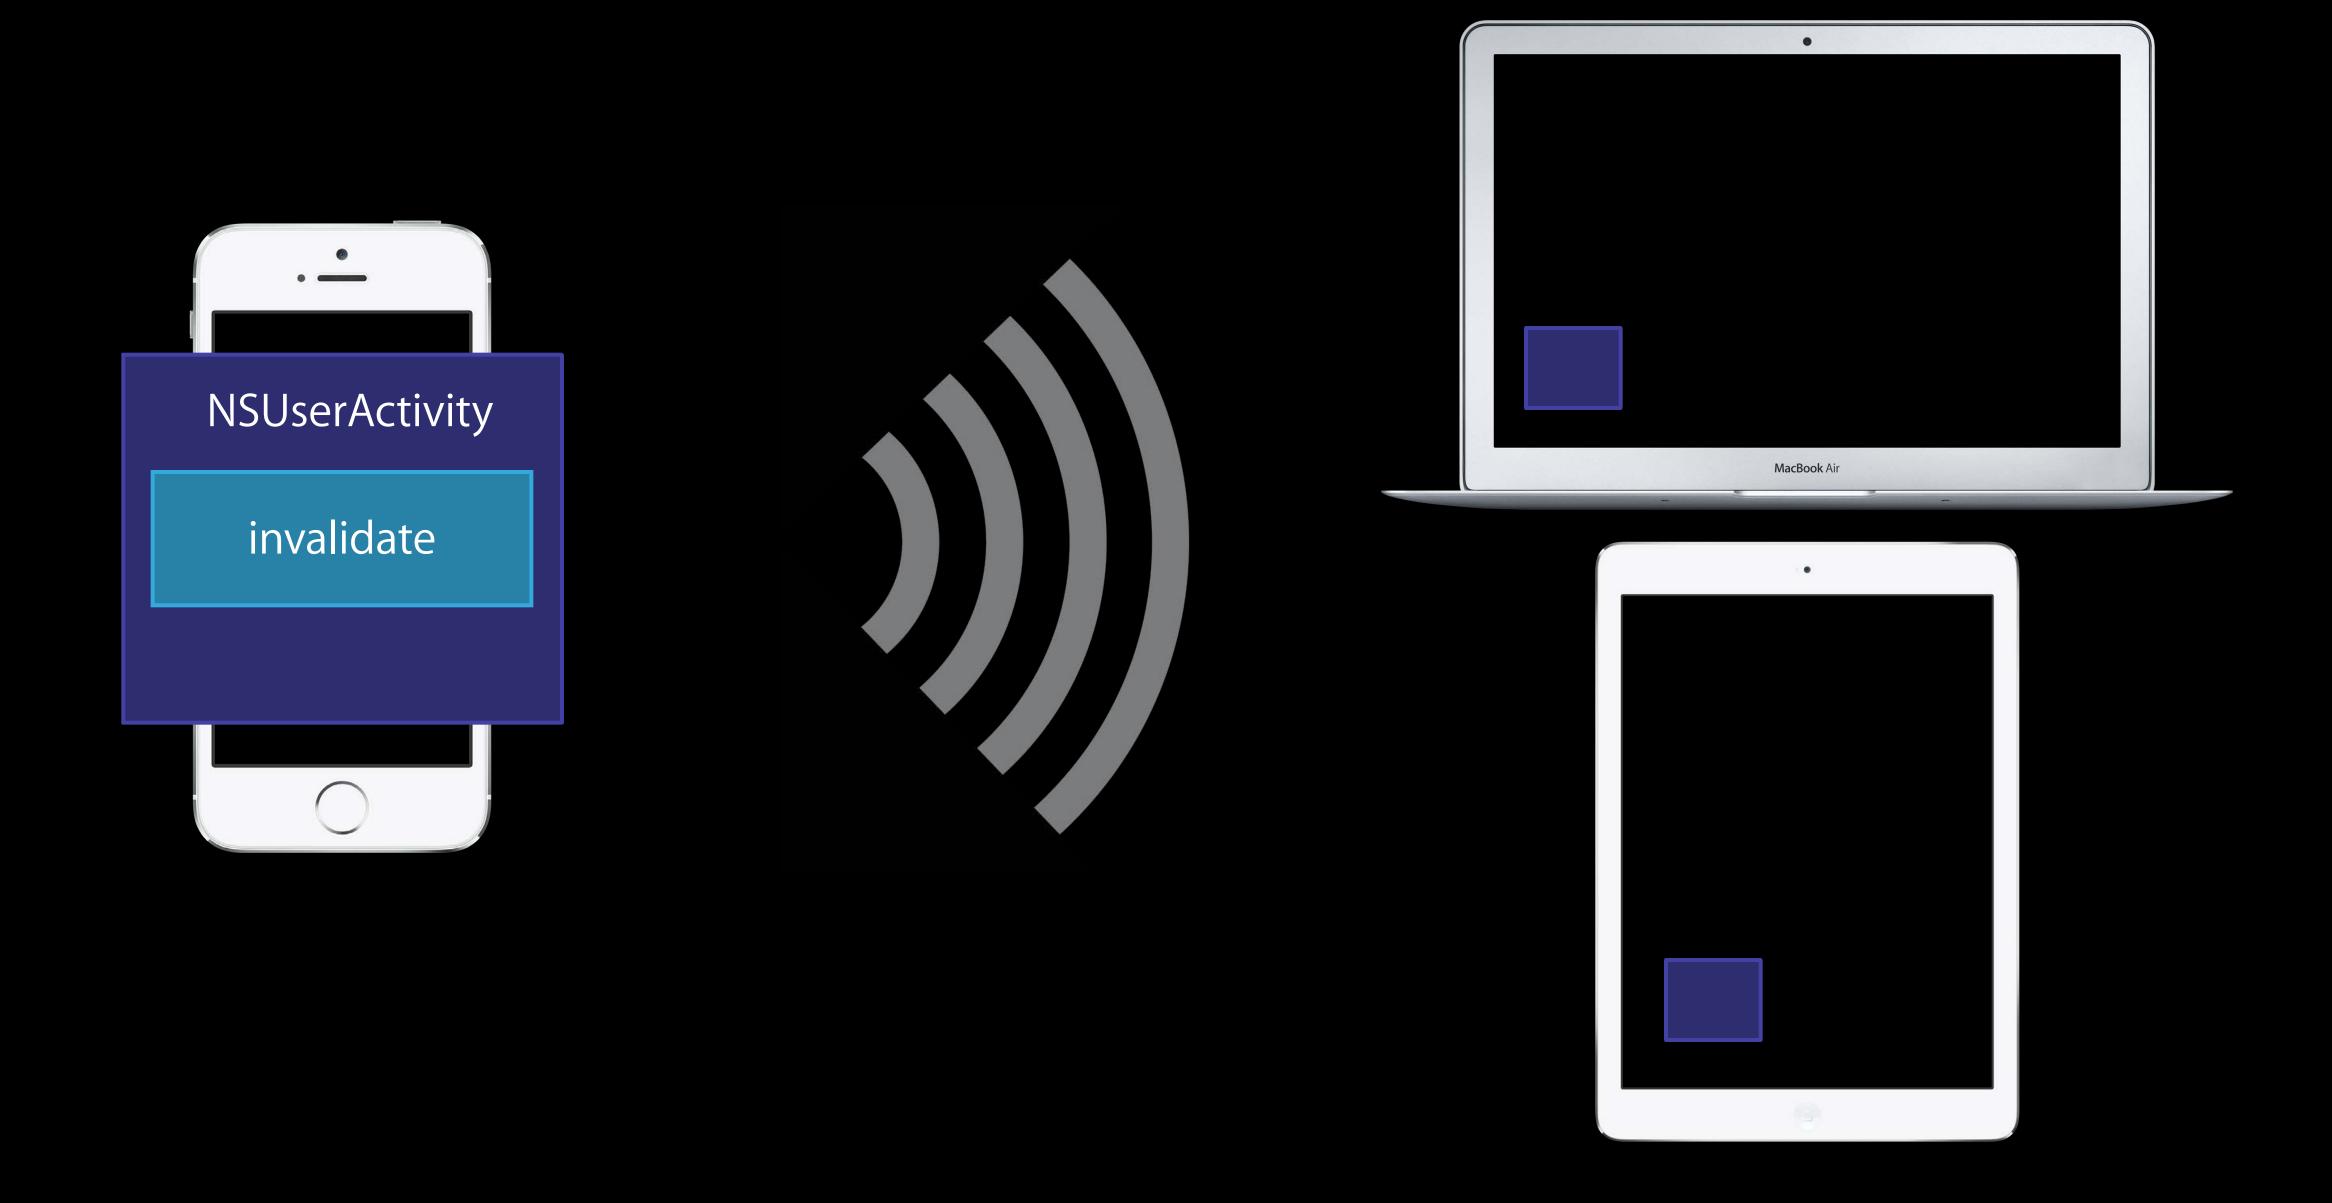

We call becomeCurrent

# Creating User Activities Documents and Responders

We manage it for you

- We call becomeCurrent
- We call invalidate

# Creating User Activities

# Creating User Activities

Documents and Responders

# Updating User Activities Documents and Responders

NSUserActivity has a userInfo dictionary

Documents and Responders

NSUserActivity has a userInfo dictionary

#### Override:

- (void)updateUserActivityState:(NSUserActivity \*)userActivity

Documents and Responders

NSUserActivity has a userInfo dictionary

#### Override:

- (void)updateUserActivityState:(NSUserActivity \*)userActivity

The userInfo is emptied each time

Documents and Responders

### Documents and Responders

### Something like this:

```
- (void)updateUserActivityState:(NSUserActivity *)userActivity {
    [super updateUserActivityState:userActivity];

    [userActivity addUserInfoEntriesFromDictionary:@{
        @"messageID": self.messageID,
    }];
}
```

### Documents and Responders

### Something like this:

```
- (void)updateUserActivityState:(NSUserActivity *)userActivity {
    [super updateUserActivityState:userActivity];

    [userActivity addUserInfoEntriesFromDictionary:@{
        @"messageID": self.messageID,
     }];
}
```

When your info is stale: userActivity.needsSave = YES;

What to include

What to include

Can store NSArray, NSData, NSDate, NSDictionary, NSNull, NSNumber, NSSet, NSString, NSUUID, or NSURL

What to include

Can store NSArray, NSData, NSDate, NSDictionary, NSNull, NSNumber, NSSet, NSString, NSUUID, or NSURL

File URLs in iCloud or from a document provider are OK

What to include

What to include

Keep the minimal amount of information in the userInfo

What to include

Keep the minimal amount of information in the userInfo

Just the state

What to include

Keep the minimal amount of information in the userInfo

- Just the state
- Avoid platform specifics

### What to include

Keep the minimal amount of information in the userInfo

- Just the state
- Avoid platform specifics
- NS/UIDocument will add its fileURL with NSUserActivityDocumentURLKey

What to include

What to include

Think about versioning

What to include

Think about versioning

```
Maybe something like:
```

```
We start fetching it from the other device:
```

```
- (BOOL)application:(NS/UIApplication *)application
willContinueUserActivityWithType:(NSString *)activityType;
```

### App Delegate

We start fetching it from the other device:

```
- (BOOL)application: (NS/UIApplication *)application
willContinueUserActivityWithType: (NSString *)activityType;
```

Use this to show the user what's being continued

```
- (BOOL)application: (NS/UIApplication *)application
       willContinueUserActivityWithType:(NSString *)activityType {
   if ([activityType isEqual:@"com.company.viewing-message"]) {
      id vc = [[MessageViewController alloc] init];
     vc.showLoadingIndicator = YES;
      [self showMessageViewController:vc];
      return YES;
   return NO;
```

```
We got the activity:
```

```
- (B00L)application:(NS/UIApplication *)application
continueUserActivity:(NSUserActivity *)userActivity
restorationHandler:
   (void(^)(NSArray *restorableObjects))restorationHandler;
```

### App Delegate

```
We got the activity:
```

```
- (BOOL)application:(NS/UIApplication *)application
continueUserActivity:(NSUserActivity *)userActivity
restorationHandler:
  (void(^)(NSArray *restorableObjects))restorationHandler;
```

Reconstruct the user's activity

### App Delegate

### We got the activity:

```
- (B00L)application:(NS/UIApplication *)application
continueUserActivity:(NSUserActivity *)userActivity
restorationHandler:
  (void(^)(NSArray *restorableObjects))restorationHandler;
```

Reconstruct the user's activity

Call the restorationHandler, passing it an array of documents or responders that present the user activity

```
Here's an example:
- (BOOL)application:continueUserActivity:restorationHandler: {
  NSString *activityType = activity activityType;
   if ([activityType isEqual:@"com.company.viewing-message"]) {
      id vc = [[MessageViewController alloc] init];
      restorationHandler(@[vc]);
      return YES;
   return NO;
```

```
Here's an example:
- (BOOL)application:continueUserActivity:restorationHandler: {
  NSString *activityType = activity activityType;
   if ([activityType isEqual:@"com.company.viewing-message"]) {
      id vc = [[MessageViewController alloc] init];
      restorationHandler(@[vc]);
      return YES;
   return NO;
```

```
@implementation MessageViewController
 (void)restoreUserActivityState:(NSUserActivity *)activity {
   [super restoreUserActivityState:activity];
   [self setMessageID:activity.userInfo[@"messageID"]];
  id cvc = [[ConversationViewController alloc] init];
   [cvc restoreUserActivityState:activity];
@end
```

```
@implementation ConversationViewController
- (void)restoreUserActivityState:(NSUserActivity *)activity {
   [super restoreUserActivityState:activity];
  NSString *version = activity.userInfo[@"handoffVersion"]
   BOOL isOldVersion = [self isOldVersion:version];
  NSString *recipientKey = isOldVersion ? @"to" : @"rcptID";
   self.recipient = activity.userInfo[recipientKey];
   [self updateRecipientImage];
```

```
If there was an error:
```

```
- (void)application:(NS/UIApplication *)application
    didFailToContinueUserActivityWithType:(NSString *)activityType
    error:(NSError *)error;
```

#### App Delegate

If there was an error:

```
- (void)application:(NS/UIApplication *)application
    didFailToContinueUserActivityWithType:(NSString *)activityType
    error:(NSError *)error;
```

Can be NSUserCancelledError!

Document-based app

Document-based app

Document-based app

# Continuing User Activity Document-based app

On OS X, AppKit can use NSDocumentController restoreUserActivityState:

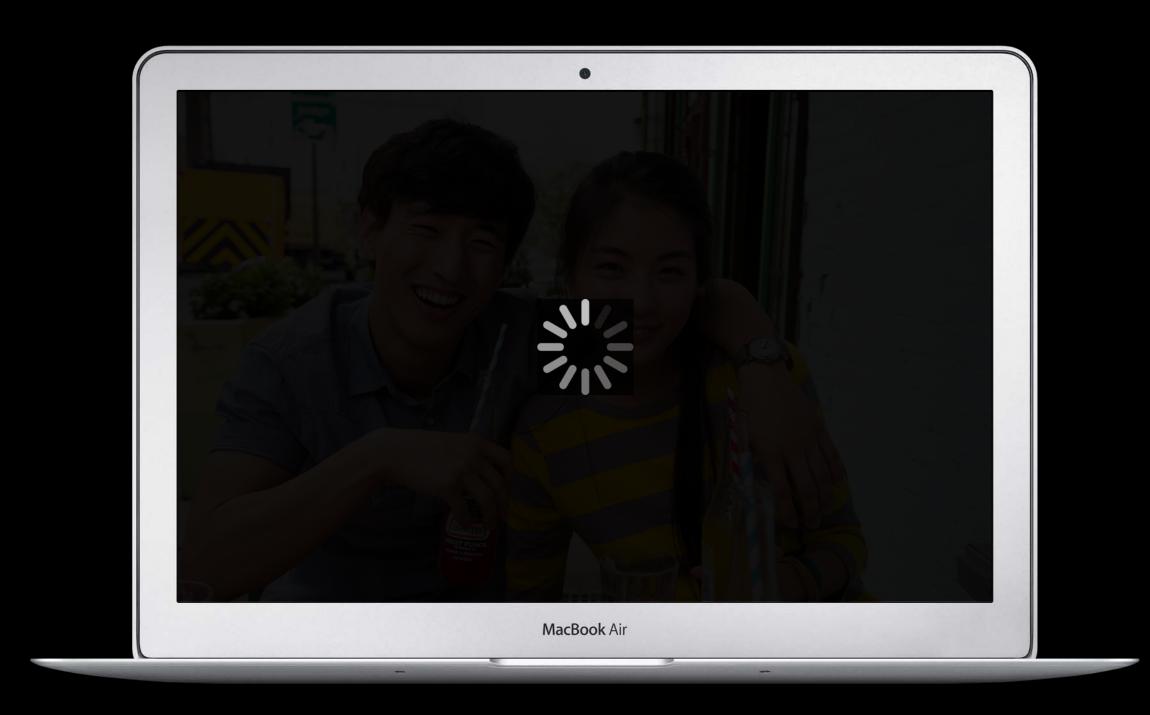

application:willContinueUserActivityWithType:

application:willContinueUserActivityWithType:

application:willContinueUserActivityWithType:

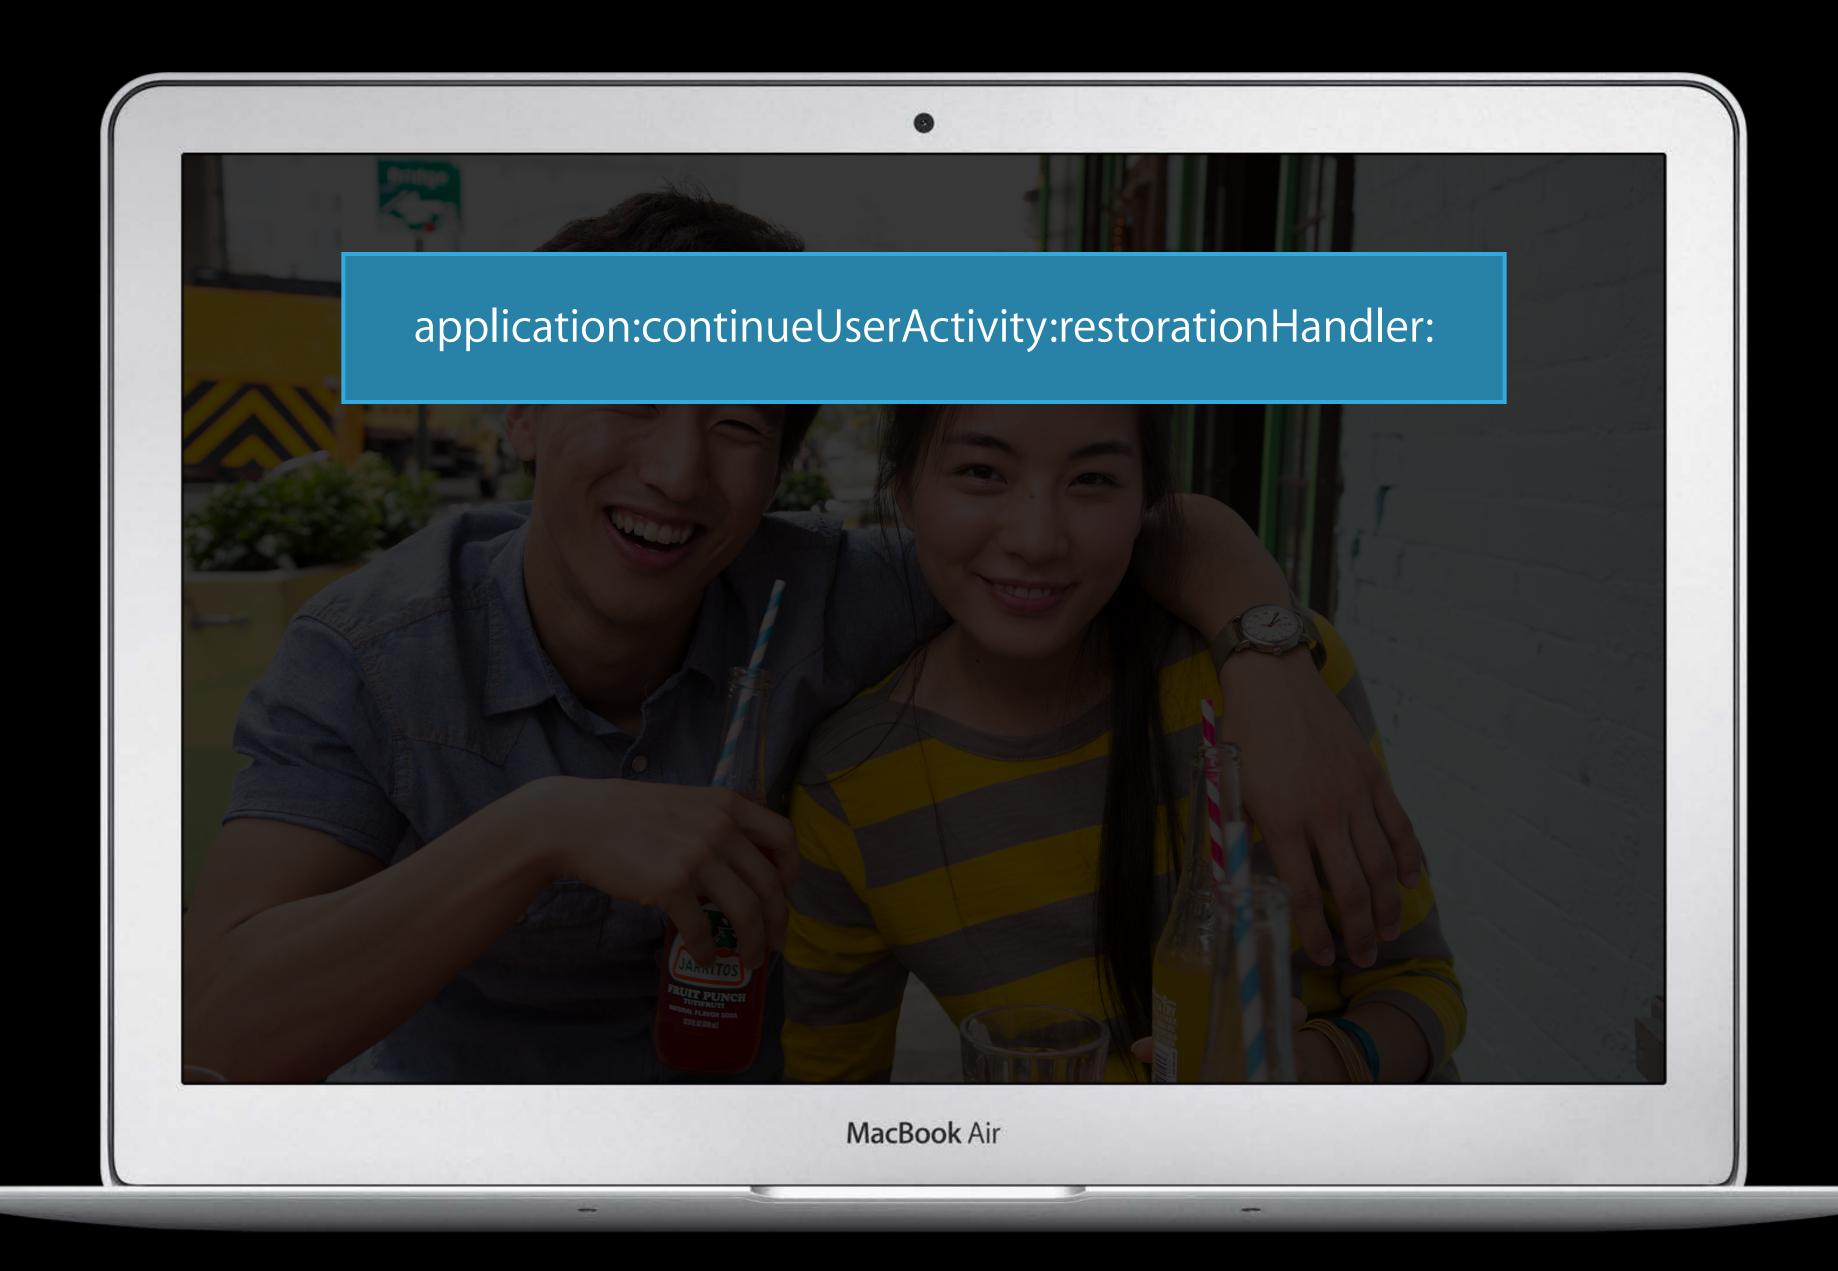

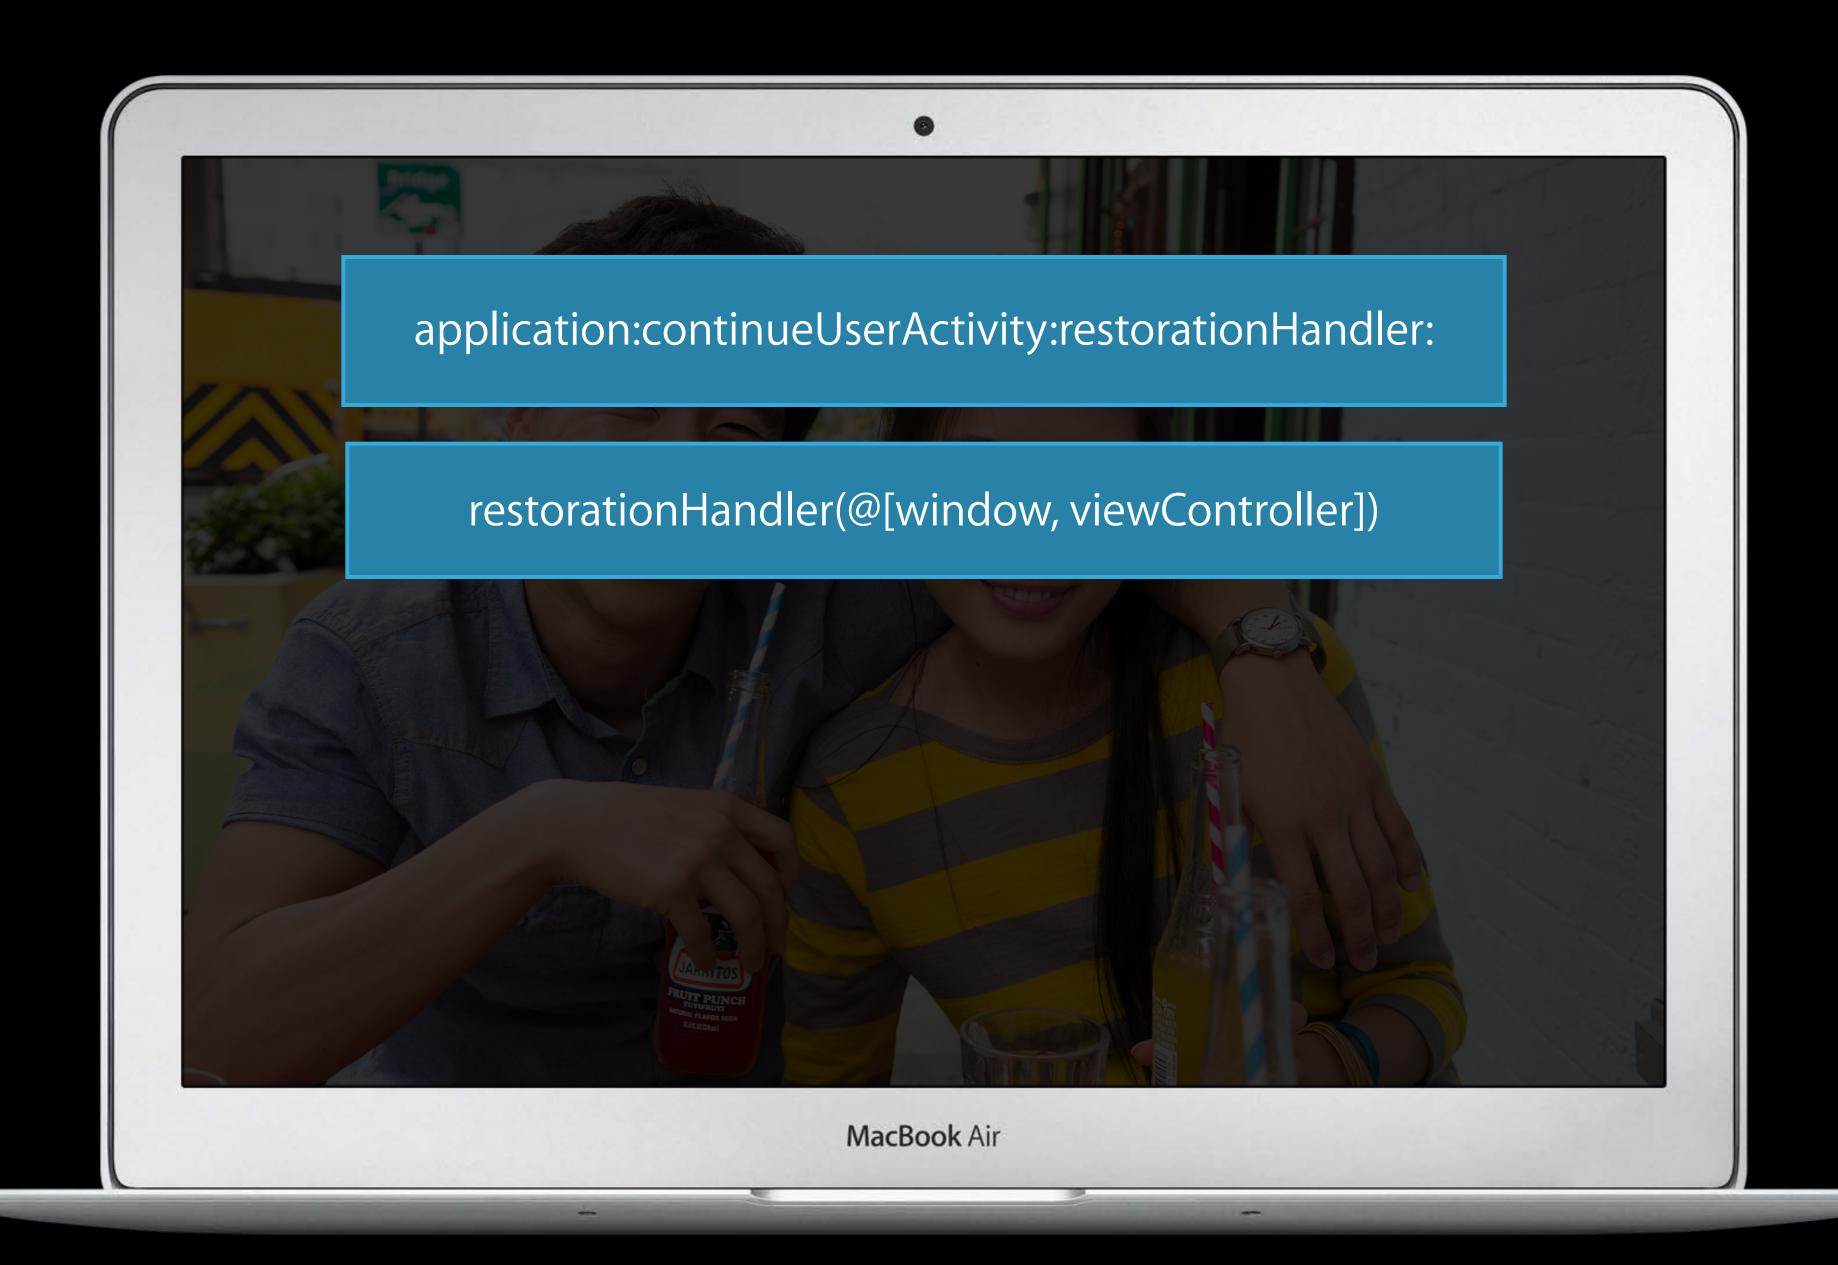

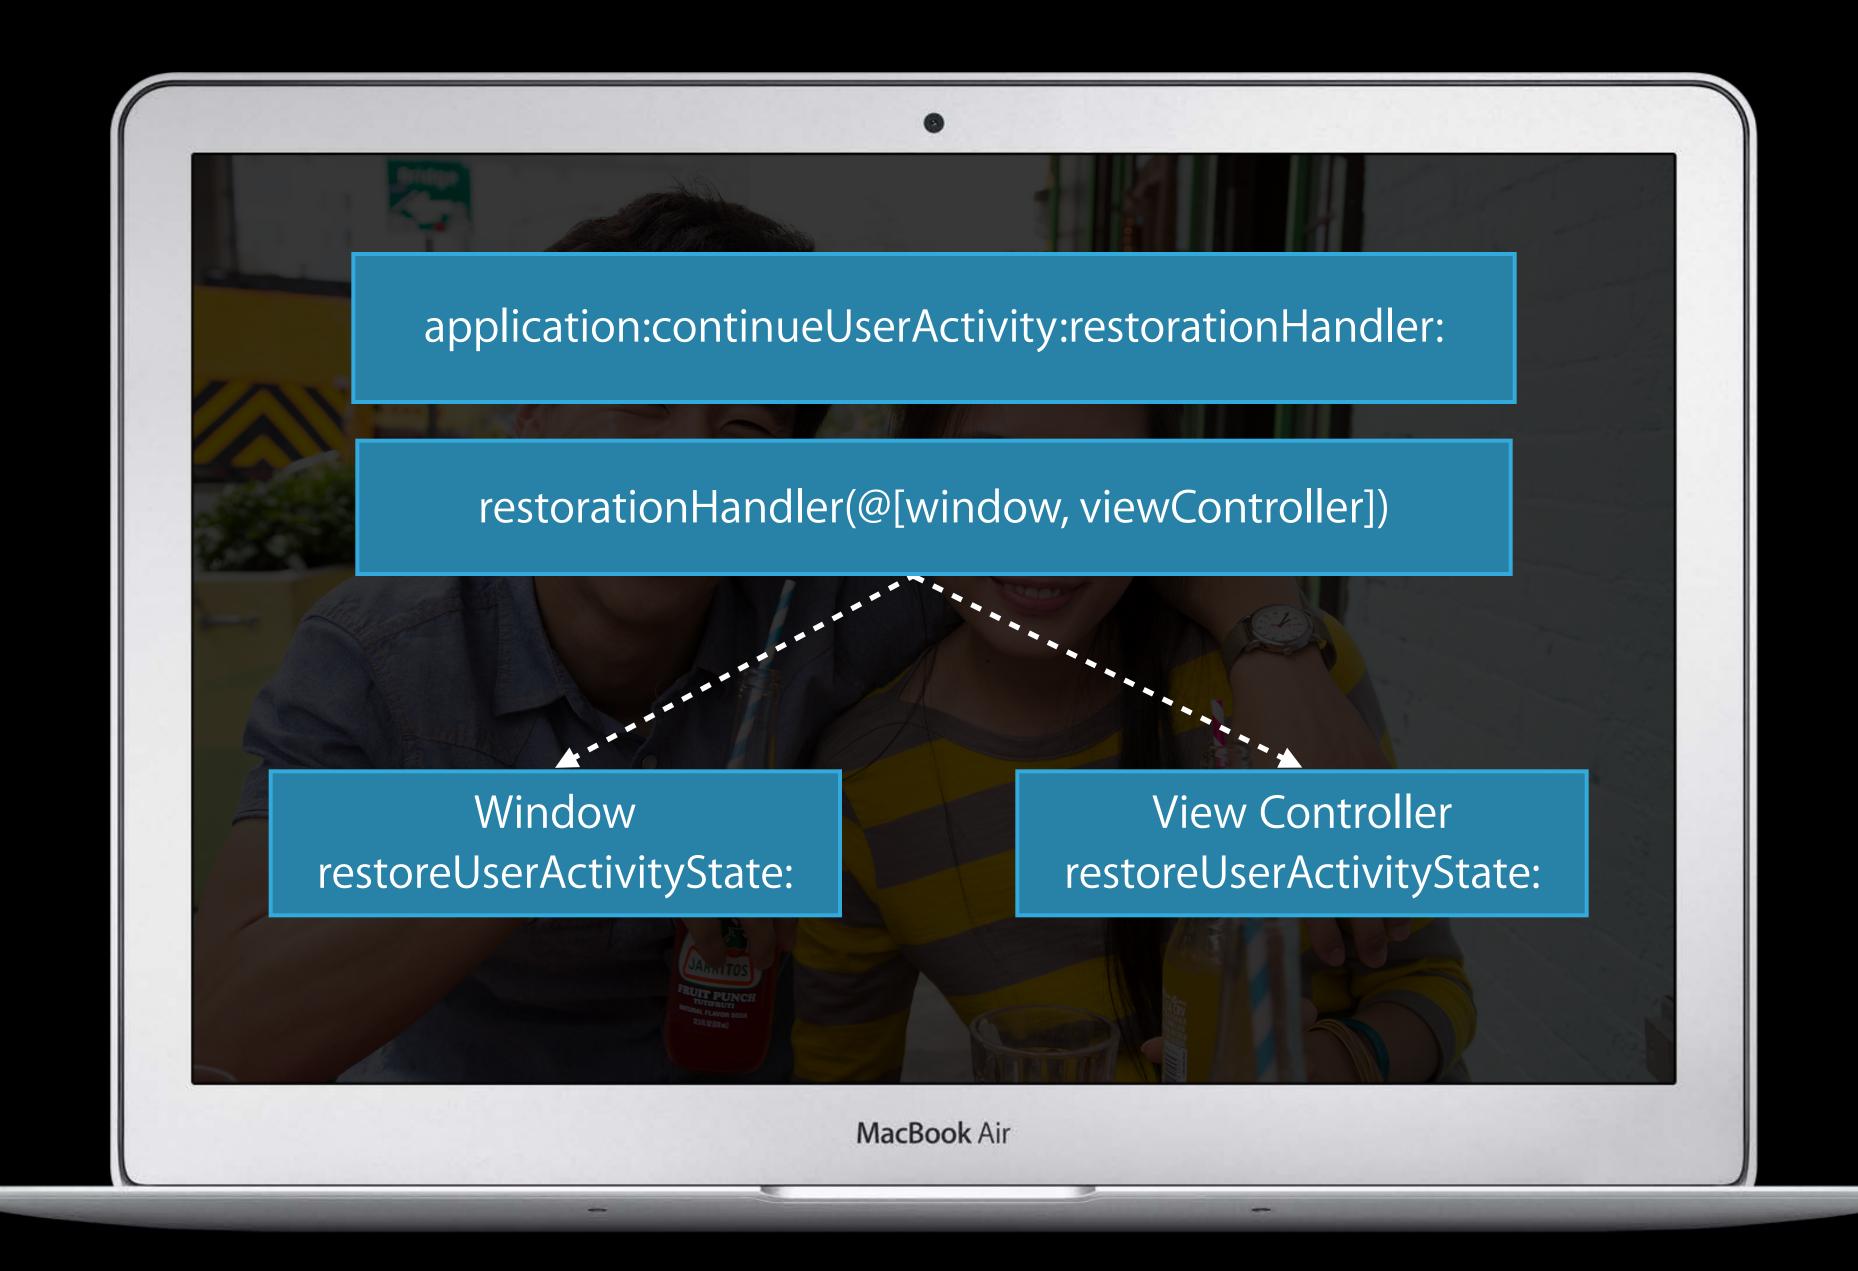

application:continueUserActivity:restorationHandler:

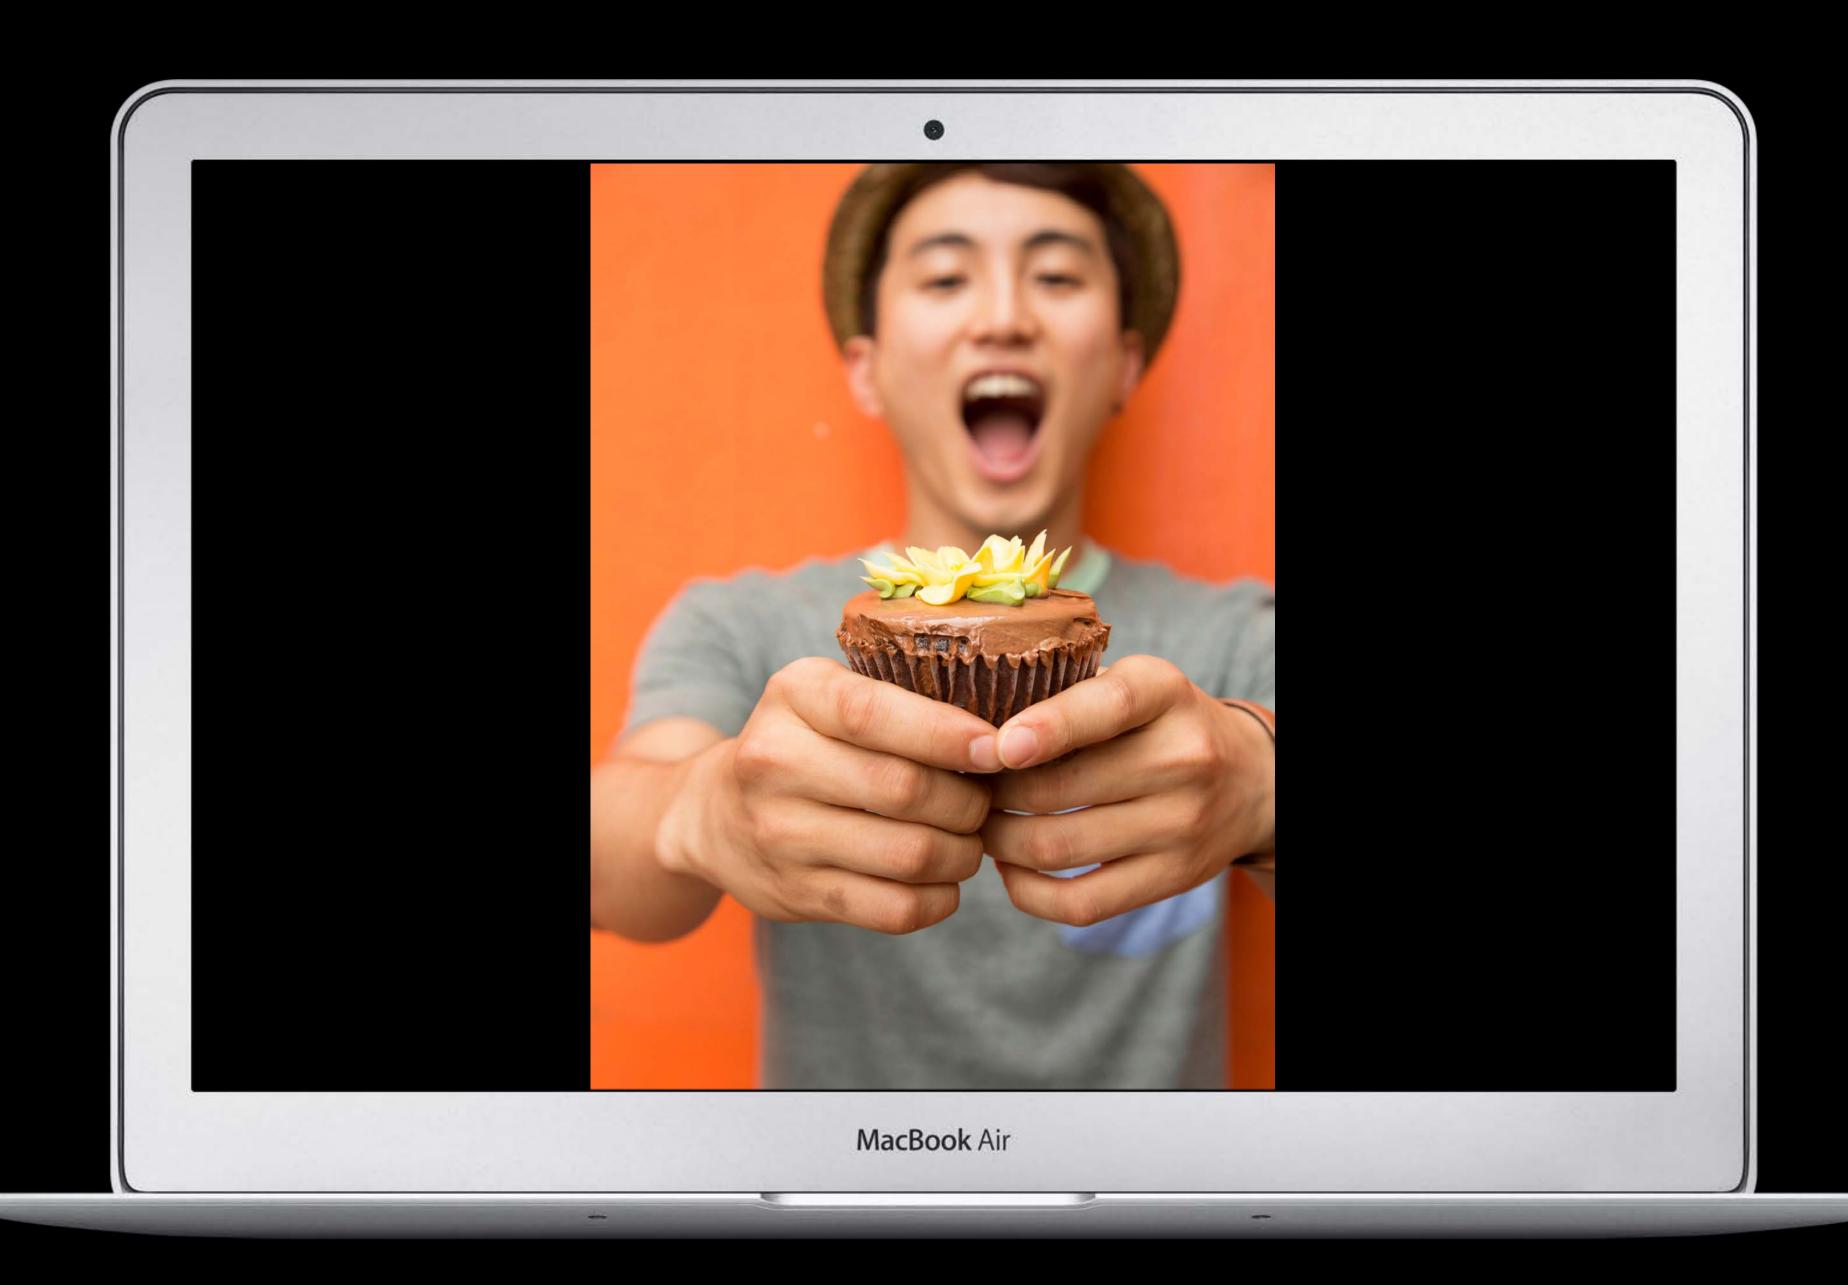

# NSUserActivity In-depth

Keith Stattenfield CoreFrameworks Engineer

# Non AppKit/UlKit uses

NSUserActivity

# Non AppKit/UlKit uses

NSUserActivity

Your application creates an activity with an activity type string [[NSUserActivity alloc] initWithActivityType:@"com.company.edit.foo"];

# Activity Type Strings

NSUserActivity

Applications which want to receive activities claim them in their Info.plist Either in NSUserActivityTypes or in CFBundleDocumentTypes

Bundle version	<b>‡00</b>	Stri	ng	1		
▼ NSUserActivityTypes	<b>\$</b>	Arra	ay	(3	items)	
Item 0		Stri	ng	C	om.company.edit.foo	
Item 1		Stri	ng	C	om.company.viewing.foo	
Item 2		String		C	om.company.viewing.bar	
Application requires iPhone envi	ir 🔺	Boo	olean	Y	ES	
▼ Document types		\$	Array		(13 items)	
▼ Item 0 (NSRTFPboardType)			Dictionary		(8 items)	
Icon File Name		<b>‡</b>	String		rtf.icns

▶ Document Content Type UTIs		<b>‡</b>	Array		(1 item)	

# Activity Type Strings

NSUserActivity

All applications from the same developer can exchange activities

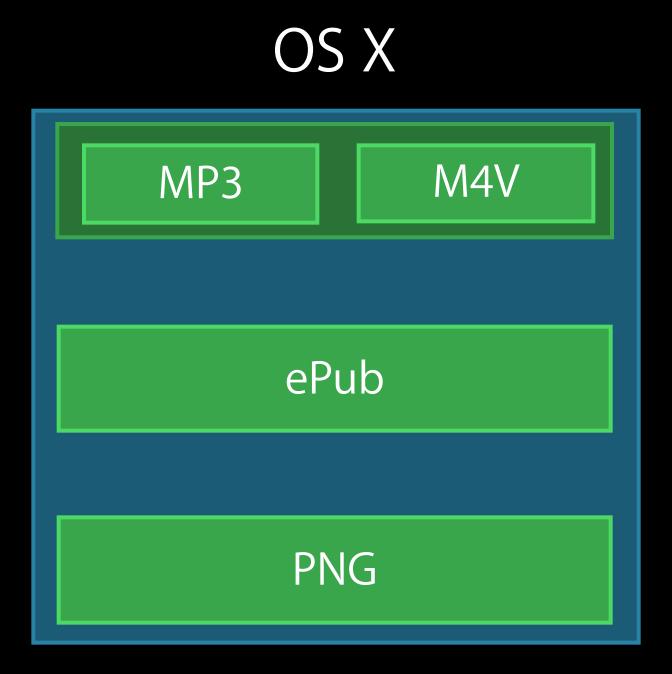

All applications from the same developer can exchange activities

Applications don't have to claim the same activity types they create

Applications don't have to claim any activity types, but can still create them

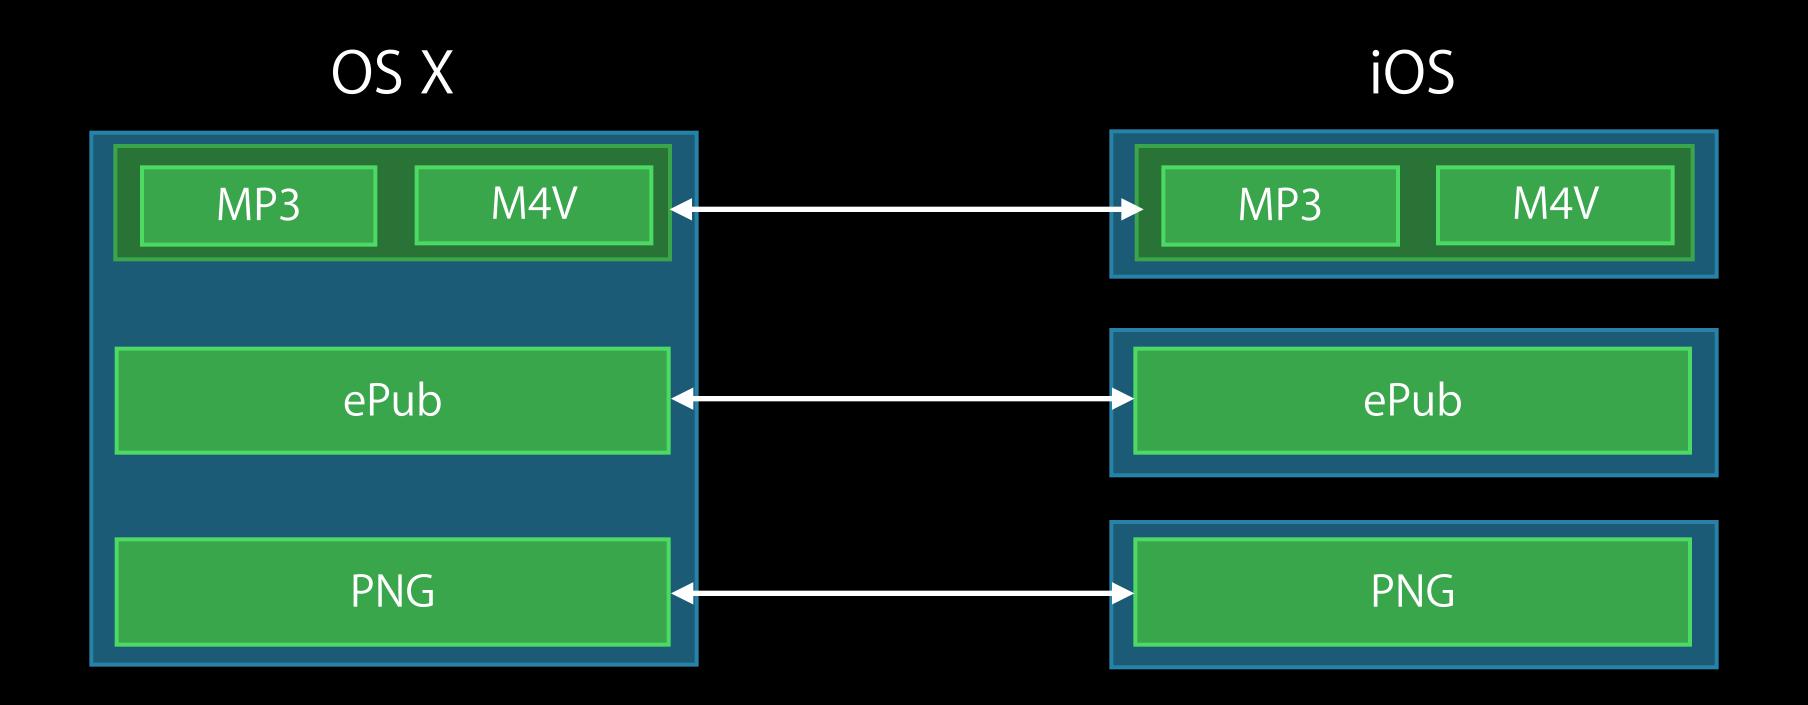

All applications from the same developer can exchange activities

Applications don't have to claim the same activity types they create Applications don't have to claim any activity types, but can still create them

All applications from the same developer can exchange activities

Applications don't have to claim the same activity types they create Applications don't have to claim any activity types, but can still create them

Setting the activity information

Setting the activity information

```
activity.title = @" ... "
activity.userInfo = @{ ... }
    [activity addUserInfoEntriesFromDictionary: @{ ... }]
[activity becomeCurrent]
[activity invalidate]
```

NSUserActivityDelegate

NSUserActivityDelegate

```
activity.delegate = self;
...
activity.needsSave = YES;
Then, when the system needs information from your activity
```

- (void)userActivityWillSave:(NSUserActivity \*)userActivity

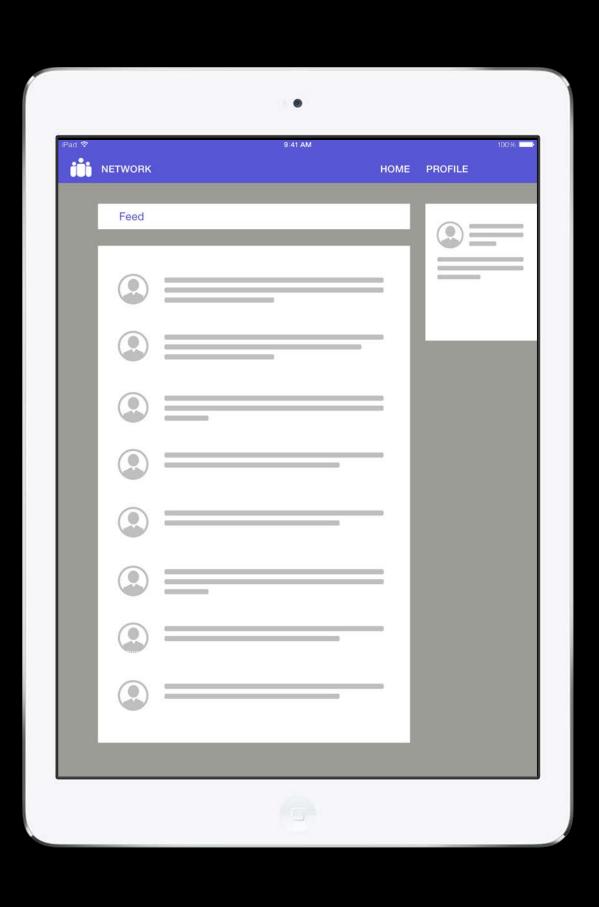

NSUserActivityDelegate

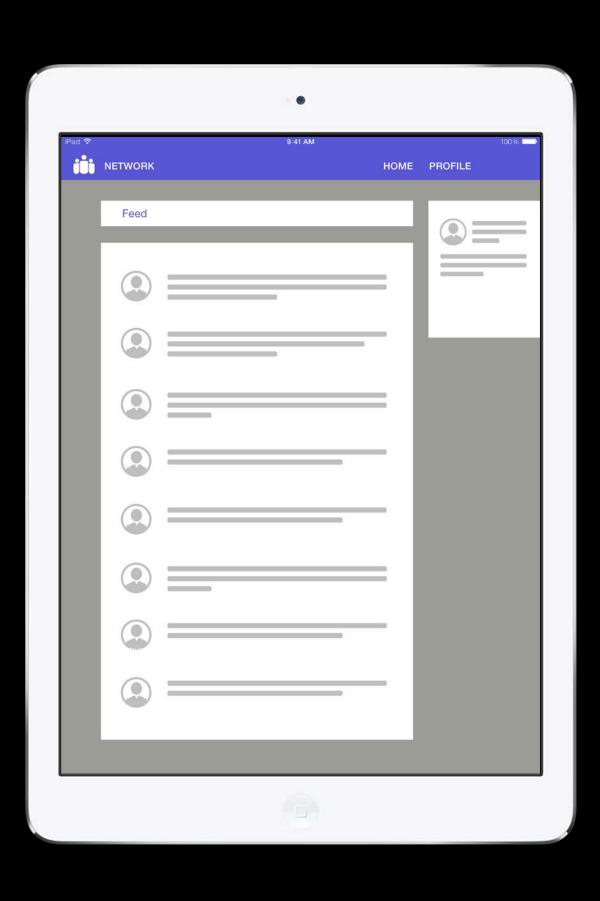

NSUserActivityDelegate

When continued from another device:

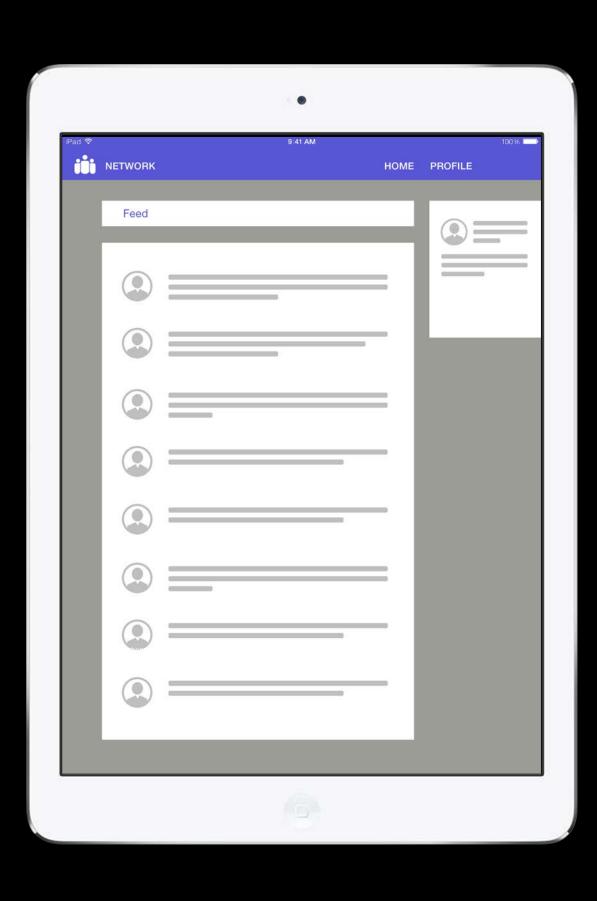

- (void)userActivityWasContinued:(NSUserActivity \*)userActivity

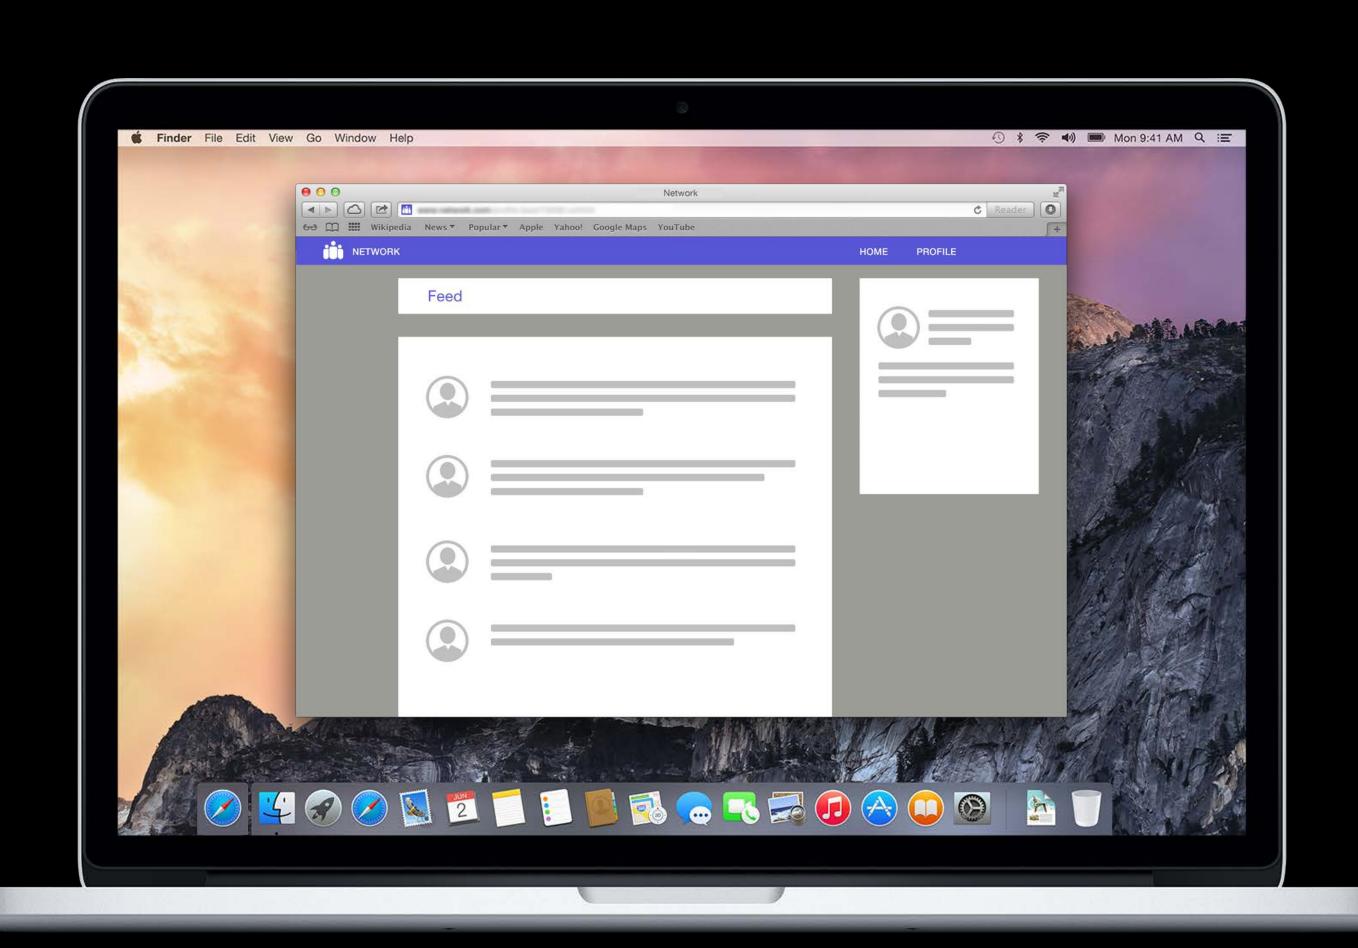

Called when this activity was successfully continued on another device Most applications won't need this at all

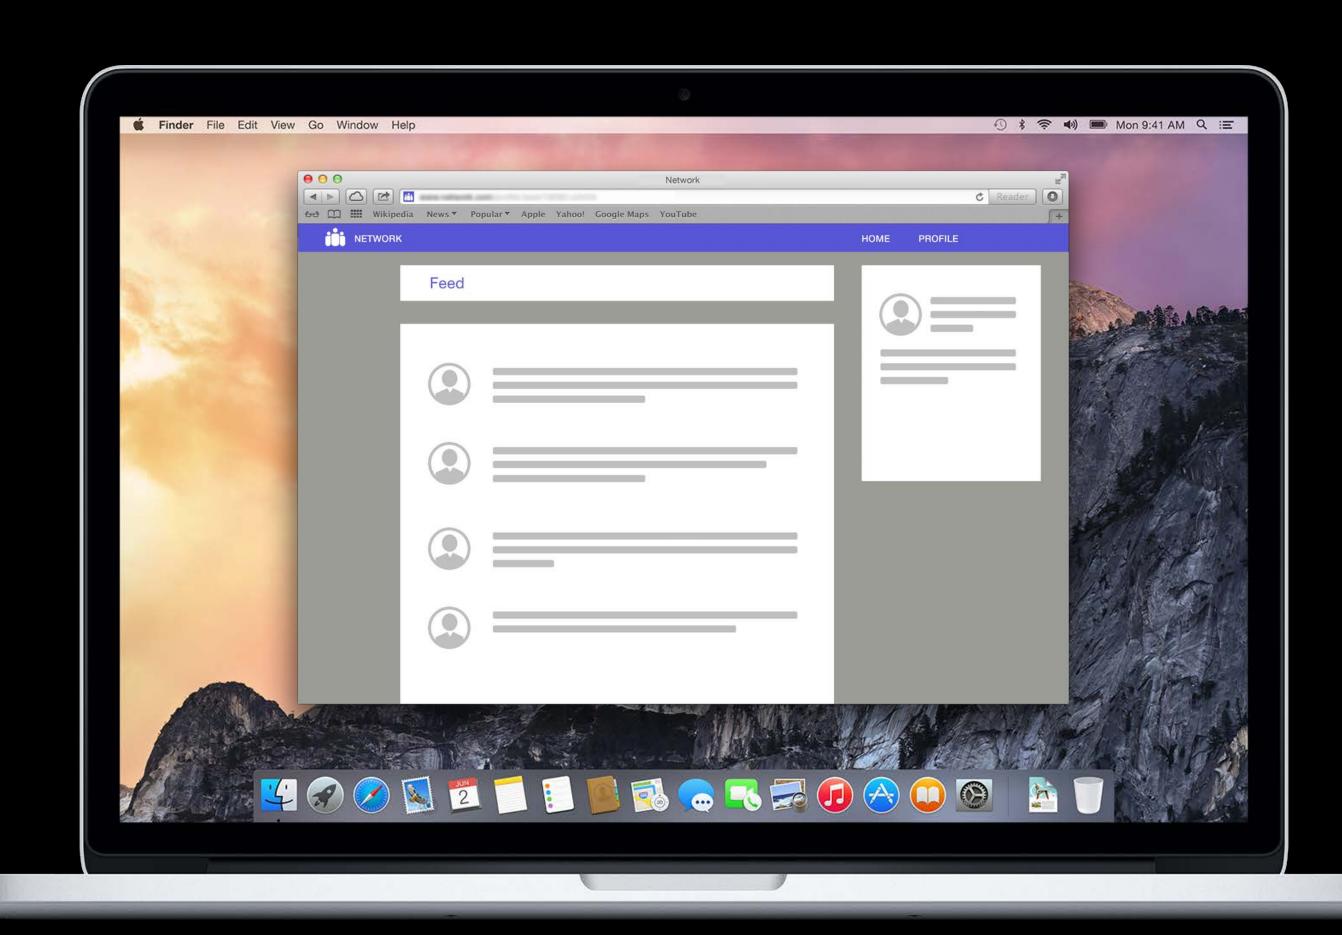

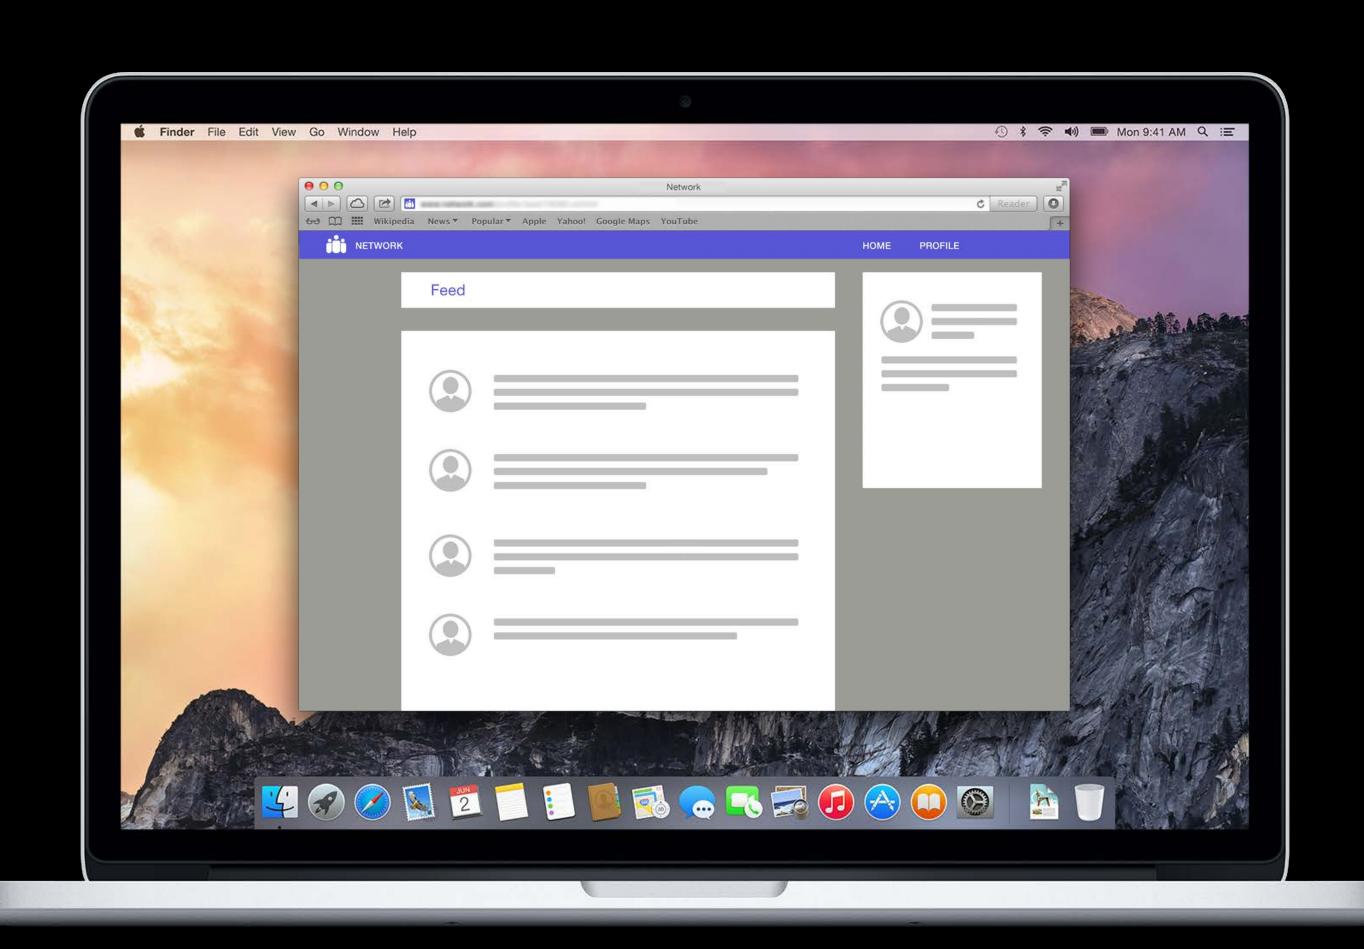

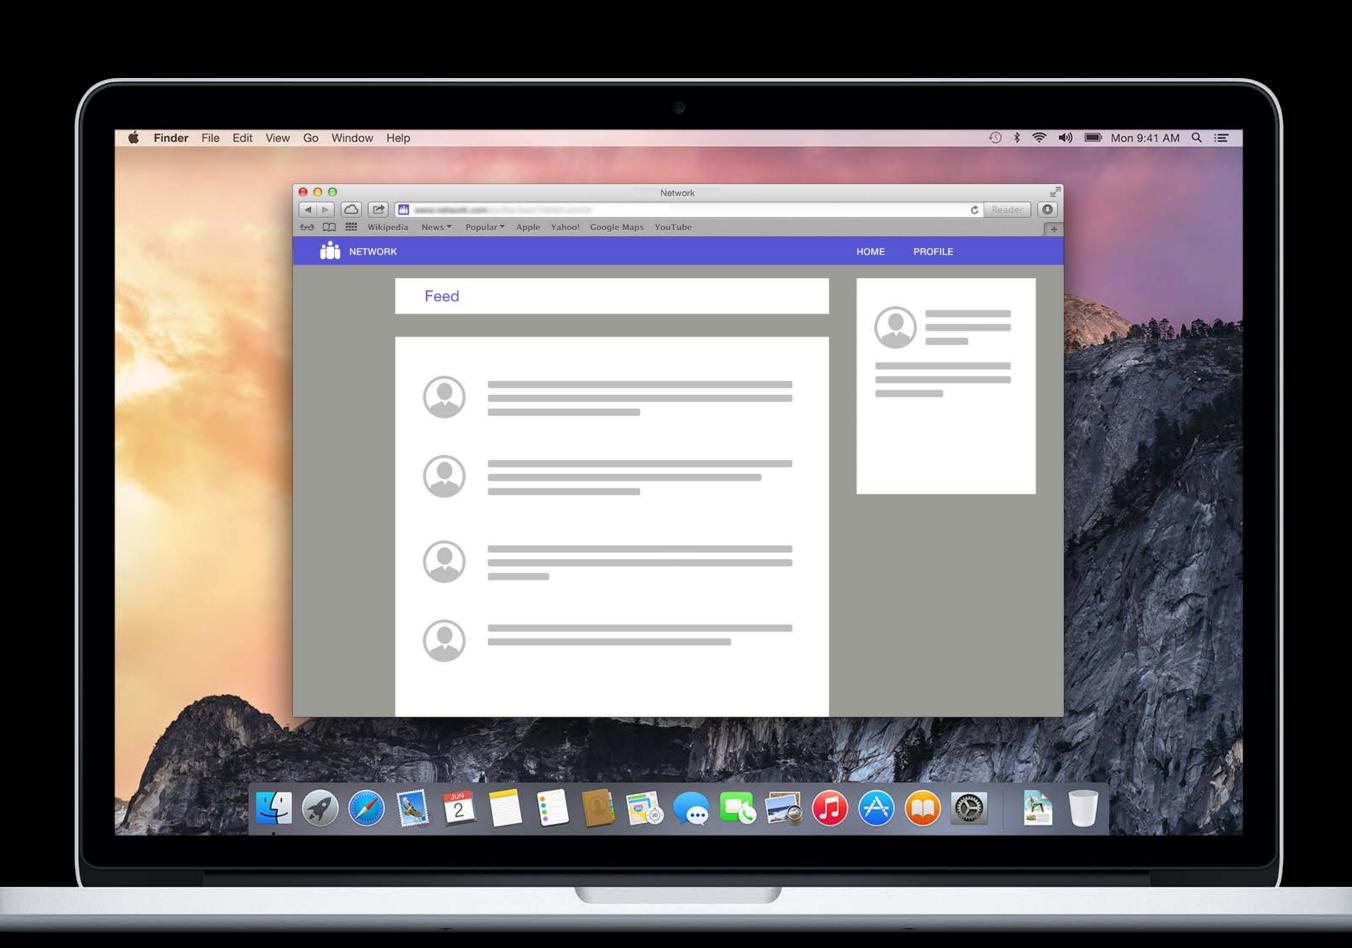

```
NSUserActivity* activity = [[NSUserActivity alloc]
initWithActivityType:...];
activity.userInfo = @{ ... }
activity.webpageURL = [NSURL URLWithString: ...];
```

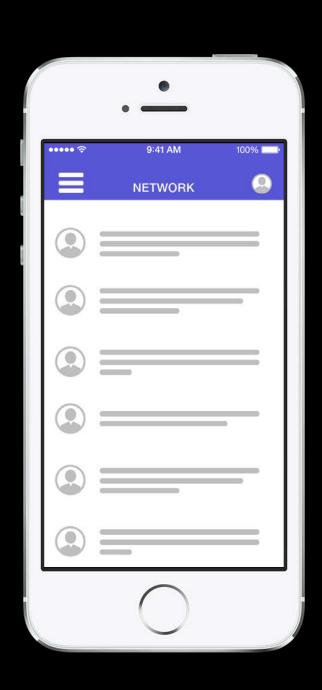

▼ Root	Dictionary	(1 item)
▼ com.apple.developer.associated-domains	Array	(2 items)
Item 0	String	AVeryLongSampleDomainName.com
Item 1	String	AVeryLongSampleDomainName.co.uk

```
application:continueUserActivity:(NSUserActivity*)userActivity
restorationHandler:(void(^)(NSArray
*restorableObjects))restorationHandler {
  if ([userActivity.activityType
        isEqual:NSUserActivityTypeContinuingFromWebBrowser]) {
     /* resume an activity based on the webpageURL */
   } else if ([userActivity isEqual:@"com.company.type12"]) {
```

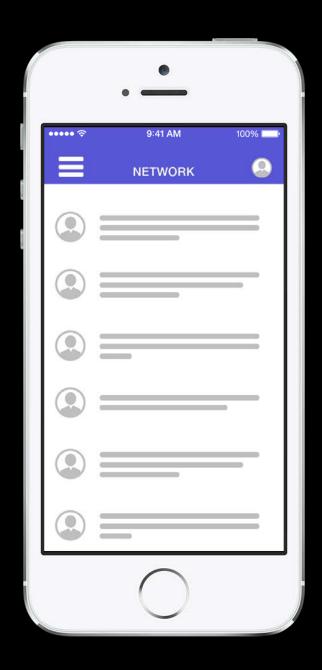

Need more than a one-way, one time exchange of data from creator to receiver

Establishes a bidirectional stream for some kind of interactive purposes

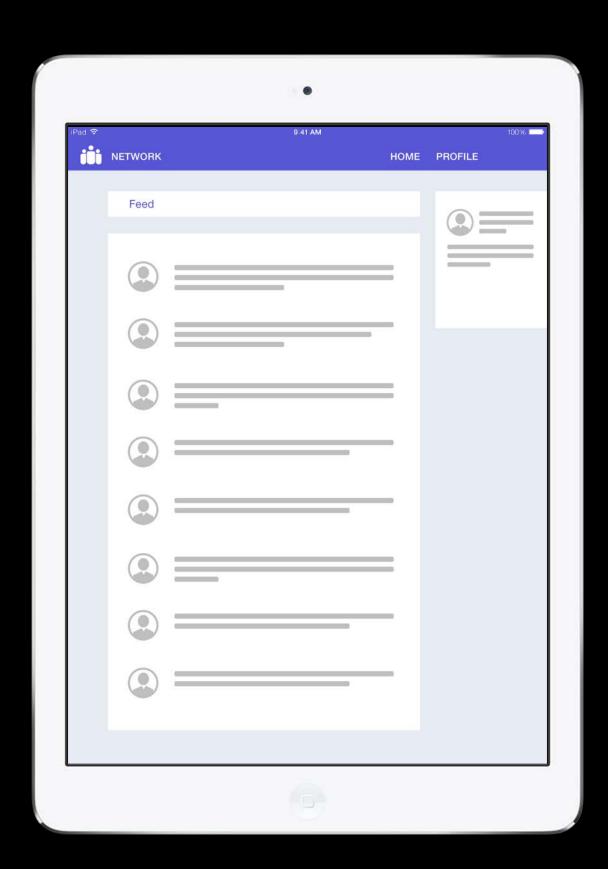

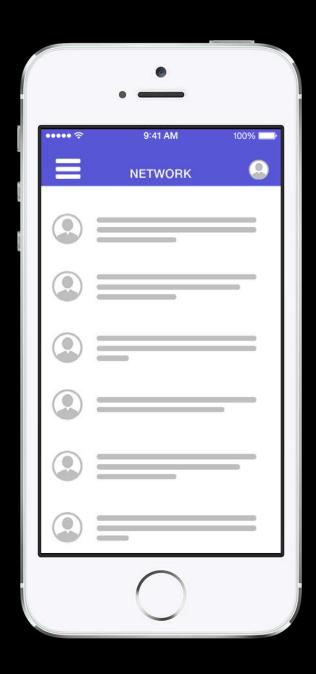

Need more than a one-way, one time exchange of data from creator to receiver Establishes a bidirectional stream for some kind of interactive purposes

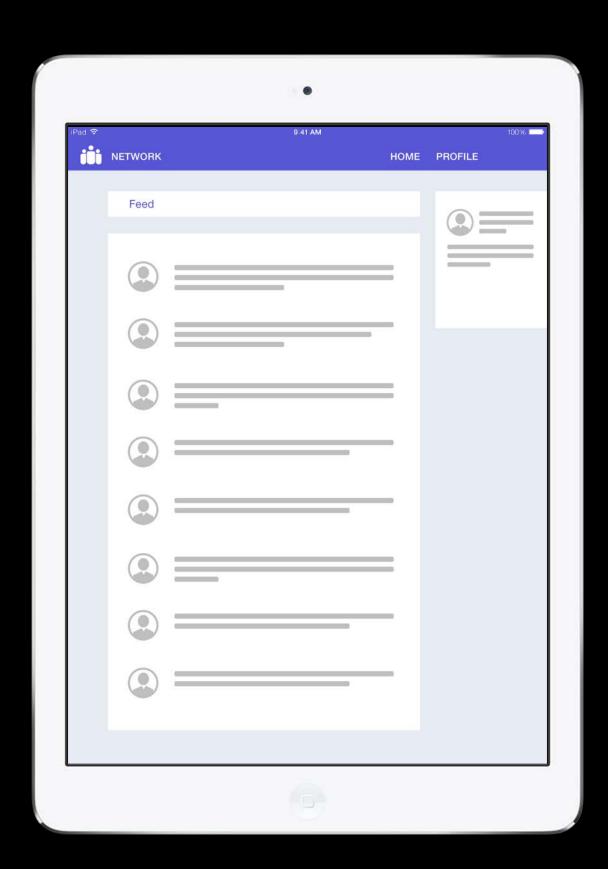

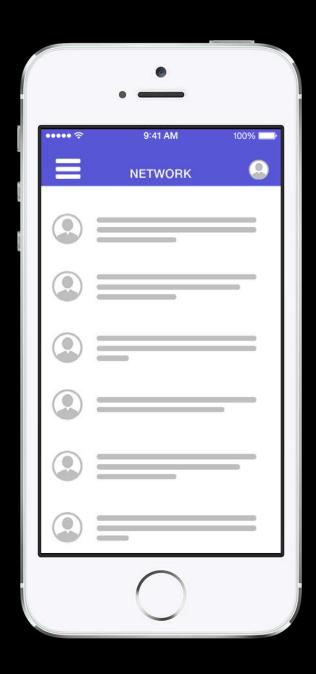

Need more than a one-way, one time exchange of data from creator to receiver Establishes a bidirectional stream for some kind of interactive purposes

Need more than a one-way, one time exchange of data from creator to receiver Establishes a bidirectional stream for some kind of interactive purposes

### NSUserActivity

```
NSUserActivity* activity = [[NSUserActivity alloc] initWithActivityType: @"com.company.interact"];
activity.userInfo = @{ ... }
activity.delegate = self;
activity.supportsContinuationStreams = YES;
[activity becomeCurrent];
```

NSUserActivity, on the receiving device

```
- application: (NS/UIApplication*) continueUserActivity:
(NSUserActivity*)activity restorationHandler:...
   if (activity supportsContinuationStreams ) {
      [activity getContinuationStreamsWithCompletionHandler:
        ^(NSInputStream* inputstream, NSOutputStream*
           outputstream, NSError* error) {
           if (!error) {
              /* You can send and receive over these streams! */
```

### ConnectBack

NSUserActivity, back on the initiating device

```
Lastly, this delegate method is called with the streams
```

```
-(void) userActivity:(NSUserActivity *)userActivity
didReceiveInputStream:(NSInputStream *)inputStream outputStream:
(NSOutputStream *)outputStream {
    ...
}
```

# So, you've learned

AppKit/UlKit support
NS/UlDocument support
Continuation streams
Website interoperability
