2 Processing Rules

2.1 Overview

- The View Cart Light Box functionality is required to provide a customer with a fast way to see the product details in the Cart without having to click on the View Cart link
- Upon hover-over a "light box" of all products currently in the cart will be displayed
- The imagery/text needs to be flexible for each implementation
- The View Cart Light Box dialog will effectively display similar details from the View Cart page without the customer having to leave the existing page
- Customers should be able to "Remove" items from the Light Box
- Customers should be able to "Go to Checkout" easily from the Light Box
- Examples:
 - www.jimmyjazz.com
 - www.schuh.co.uk

2.2 Implementation Notes

- For the most part, the implementation is a UI / styling exercise
- The back-end simply needs to provide the cart details to all pages for the Light Box to operate correctly
- The View Cart Light Box can be 'activated' by adding a class name of 'showLightboxCart' to the Anchor tag component in which the light box cart will be displayed whilst hovering.
 - Note: The Anchor Tag must defined in the SI_SHOPPING_CART context.
- For Example:

```
<a href="<@ofbizUrl>eCommerceShowcart</@ofbizUrl>" class="price showLightBoxCart">
</a>
```
- Parameter:
 - LIGHTBOX_DELAY_MS
 - The number of milli-seconds the light-box should remain open after mouse leaves the area
