

A decorative background featuring a stylized, overlapping pattern of yellow leaves or petals. The pattern is composed of several large, irregular yellow shapes that resemble leaves or petals, arranged in a way that creates a sense of depth and movement. The leaves are set against a white background, and the overall composition is clean and modern.

# AMF Testing Made Easy!

# About me

# Agenda

- ⌘ Context
- ⌘ AMF specification, BlazeDS
- ⌘ Current techniques and tools
- ⌘ Drawbacks and limitations
- ⌘ Blazer
  - architecture, core techniques, heuristics
- ⌘ Testing with Blazer
  - Objects generation and fuzzing DEMO
- ⌘ Finding vulnerabilities with Blazer
  - Unauthenticated operations DEMO
  - SQL Injection DEMO
- ⌘ Introducing a gray-box testing methodology
- ⌘ Conclusion

# Introduction and context

## ⌘ Adobe Flex

- Framework for building **Rich-Internet-Applications** based on Adobe Flash

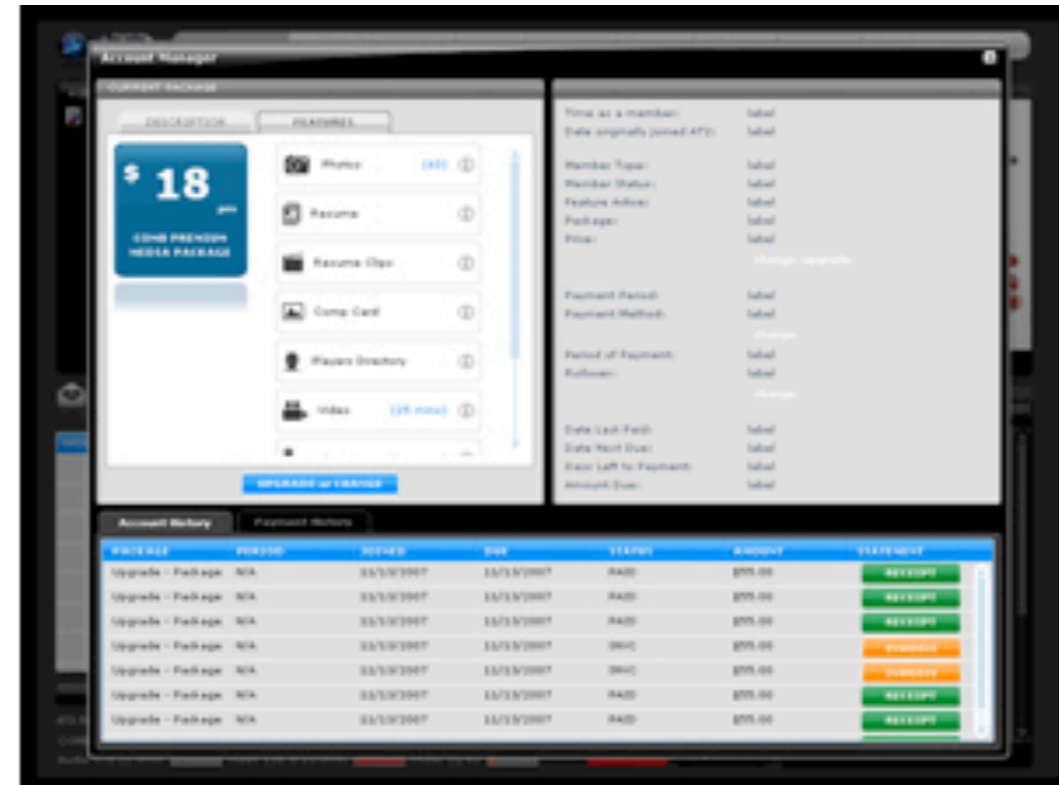

## ⌘ ActionScript

- ActionScript is an object-oriented programming language commonly used within Adobe Flash applications

## ⌘ Action Message Format (AMF)

- Introduced with Flash Player 6
- Compact binary format to serialize ActionScript objects
- Fast data transfer, comparing to text-based protocols
- An efficient mechanism to:
  - **Save and retrieve application resources**
  - **Exchange strongly typed data between client-server**

# AMF for end-users

# AMF for old-school hackers

16	http://127.0.0.1:8400	POST	/ds-console/messagebroker/amf			200	470	AMF	
18	http://127.0.0.1:8400	GET	/ds-console/			304	123		

Below the list, there are tabs for Request and Response. Under the Request tab, there are sub-tabs for Raw, Params, Headers, Hex, and AMF. The AMF tab is selected, showing the following structure:

Property	Type	Value
body		
target	string	null
response	string	/2
response method	string	null
data	array	
[0]	RemotingMessage	
Source	null	
Body	array	
Operation	string	getFlexMBeanObjectNames
RemoteUsername	null	
RemotePassword	null	
Timestamp	number	0
Headers	map	
DSId	string	C48FF0DF-3F18-CF9B-C992-1EDES935823F
DSEndpoint	string	amf
TimeToLive	number	0
Destination	string	RuntimeManagement
ClientId	null	
MessageId	string	23A4CAC9-A1A5-A30E-A612-6E147317E42D

# AMFv0 versus AMFv3

- ⌘ Flash Player 6
- ⌘ Object instances can be sent by reference
- ⌘ Support for ActionScript 1.0
- ⌘ Flash Player 9
- ⌘ Object instances, traits and strings can be sent by reference
- ⌘ Support for new ActionScript 3.0 data types
- ⌘ Support for `flash.utils.IExternalizable`
- ⌘ Variable length encoding scheme for integers

# Adobe BlazeDS

- ⌘ Server-side Java Remoting/Messaging technology
- ⌘ Using Flex Remoting, any Flex client or AIR application can communicate with remote services and inter-exchange data
- ⌘ In practice, clients invoke Java methods from classes deployed within a traditional J2EE application server (e.g. Apache Tomcat)
- ⌘ A widely deployed implementation
- ⌘ Multiple alternatives exist:
  - Java: Adobe LiveCycle Data Service, Granite, ...
  - Others: RubyAMF, FluorineFX, amfPHP, ...

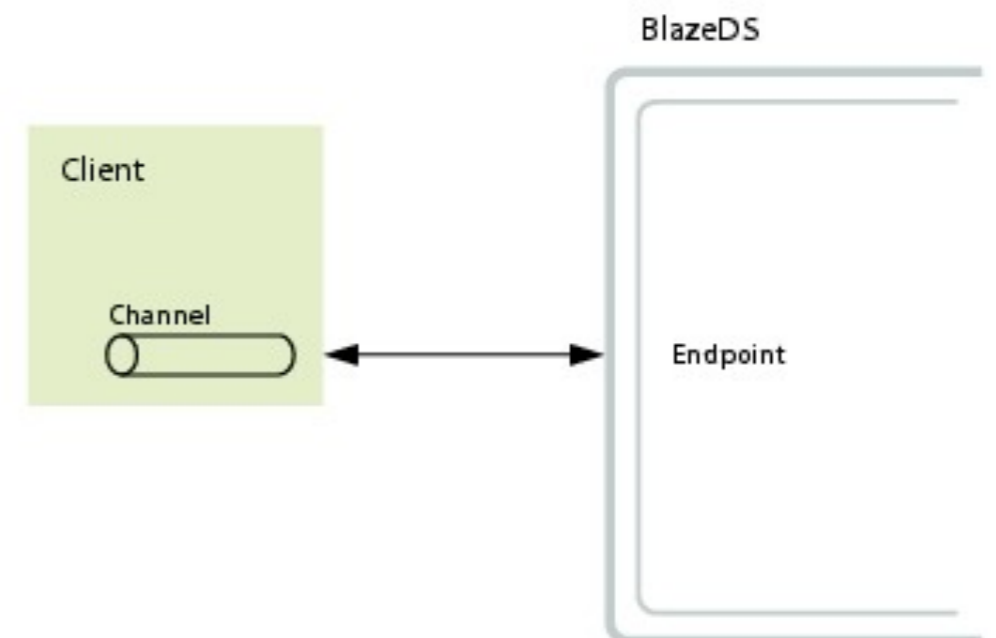

# Action Message Format (AMF)

## ⌘ AMF request/response types:

- CommandMessage
- **RemotingMessage**
- AcknowledgeMessage
- ErrorMessage
- HTTPMessage / SOAPMessage

## ⌘ Client-Server communication through channels:

- Endpoint
  - e.g. `http://<>/messagebroker/amf`
- Destination Service
  - e.g. `echoService`
- Operation
  - e.g. `String echo(String input)`

# State of art (research, tools)

- ⌘ **Testing Flash Applications, OWASP AppSec 2007**
  - Stefano di Paola
- ⌘ **Flex, AMF3 And Blazeds - An Assessment, Blackhat USA 2008**
  - Jacob Karlson and Kevin Stadmeyer
- ⌘ **Deblaze, Defcon 17**
  - Jon Rose
  - Deblaze: remote method enumeration tool for Flex servers
- ⌘ **Pentesting Adobe Flex Applications, OWASP NY 2010**
  - Marcin Wielgoszewski
  - Blazentoo: a tool to exploit proxy services
- ⌘ **Starting from Burp Suite 1.2.124**
  - Allows to visualize and tamper AMF requests and responses
- ⌘ **Other debugging tools**
  - Charles Proxy, WebScarab, Pinta AIR app, ...

# Testing remote methods, today

## ⌘ Traffic inspection and tampering

- Using network packet analyzers
- Using HTTP proxies

## ⌘ Enumeration (black-box testing)

- Retrieving endpoints, destinations and operations from the traffic
- Decompiling the Flex application
- Brute-forcing endpoint, destination and operation names

**Life is pain, highness.  
Anyone who tells you  
differently is selling  
something**

W. Goldman

# Is this the best we can do?

## PRO

- ⌘ Ideal for black-box testing, limited knowledge required

## CONS

- ⌘ Time consuming
- ⌘ Requires to invoke all application functionalities
- ⌘ What about custom objects?
- ⌘ What about "hidden" services?
- ⌘ How to ensure coverage?

# Enterprise-grade applications

- ⌘ Large attack surface
- ⌘ Custom externalizable classes
- ⌘ We have seen applications with more than 500 remote invokable methods and more than 600 custom Java objects

# Security Testing Areas

## ⌘ Authentication

- Missing authentication
- Authentication bypass flaws
- ...

## ⌘ Authorization and Access Control

- Direct object reference bugs
- Horizontal and vertical escalation bugs
- ...

## ⌘ Error Handling

- Information disclosure via stack traces
- ....

## ⌘ Input Validation

- SQL Injection vulnerabilities
- ...

## ⌘ Output Encoding

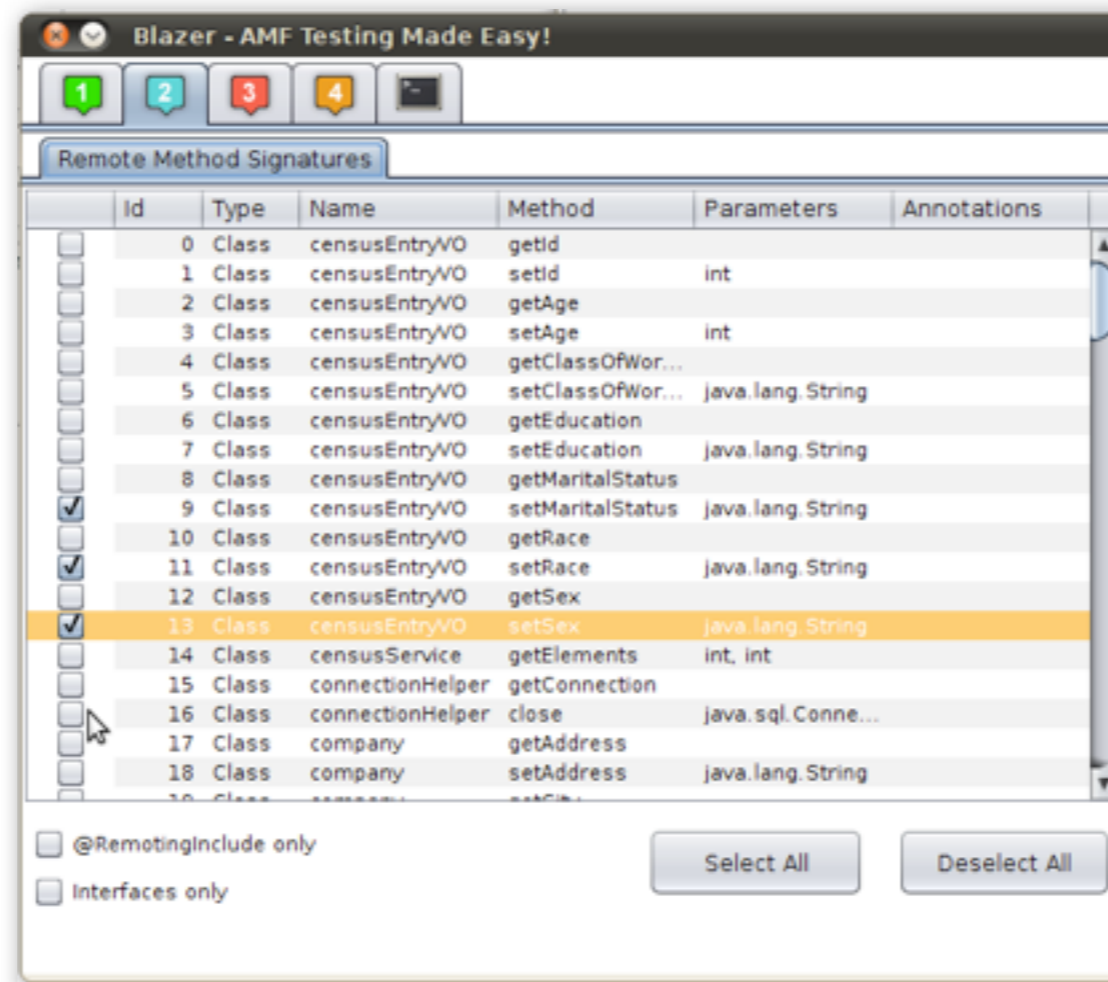

**Life is not  
and**

**#ffffff**

**#000000**

# Say hello to Blazer

- Custom AMF message generator with fuzzing capabilities
- Method signatures and Java reflection are used to generate dynamically valid objects

# Blazer v0.2

## ⌘ GUI-based Burp Suite plugin

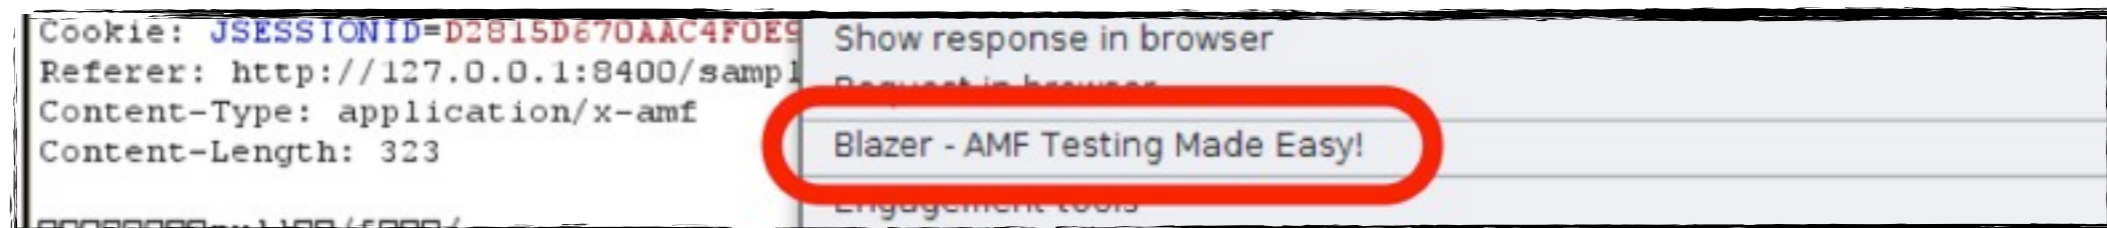

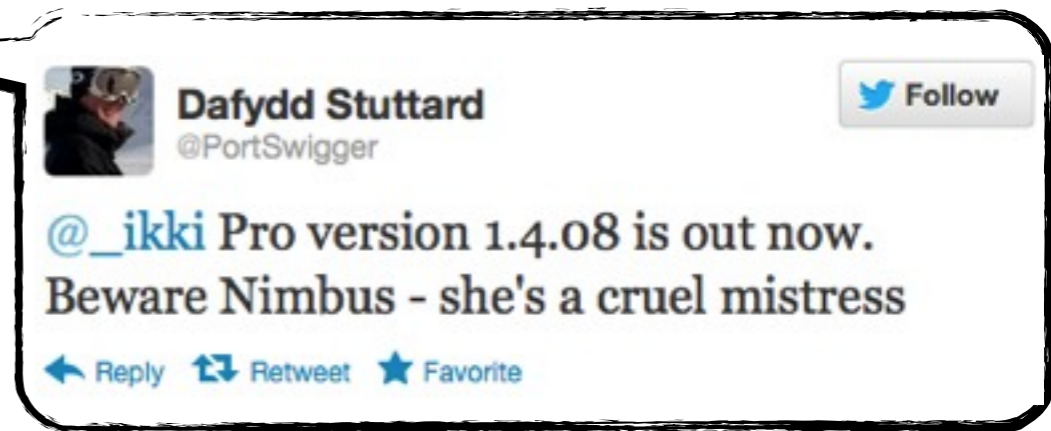

- Well-integrated so you won't need to leave your favorite tool
- Burp Free and Pro
- With Nimbus look'n'feel too

## ⌘ GNU GPL software

## ⌘ Start Burp with

- `java -classpath burp.jar:Blazer_v0.2.jar burp.StartBurp`

**and launch Blazer from the context menu**

# Blazer - Architecture 1/2

## ⌘ A packet generator

- based on Adobe AMF OpenSource libraries

## ⌘ An object generator

- to build valid application objects using “best-fit” heuristics

## ⌘ A lightweight fuzzing infrastructure

- to generate attack vectors, insert payloads within objects, manage multiple threads and monitor the progress

## ⌘ Blazer's core classes are:

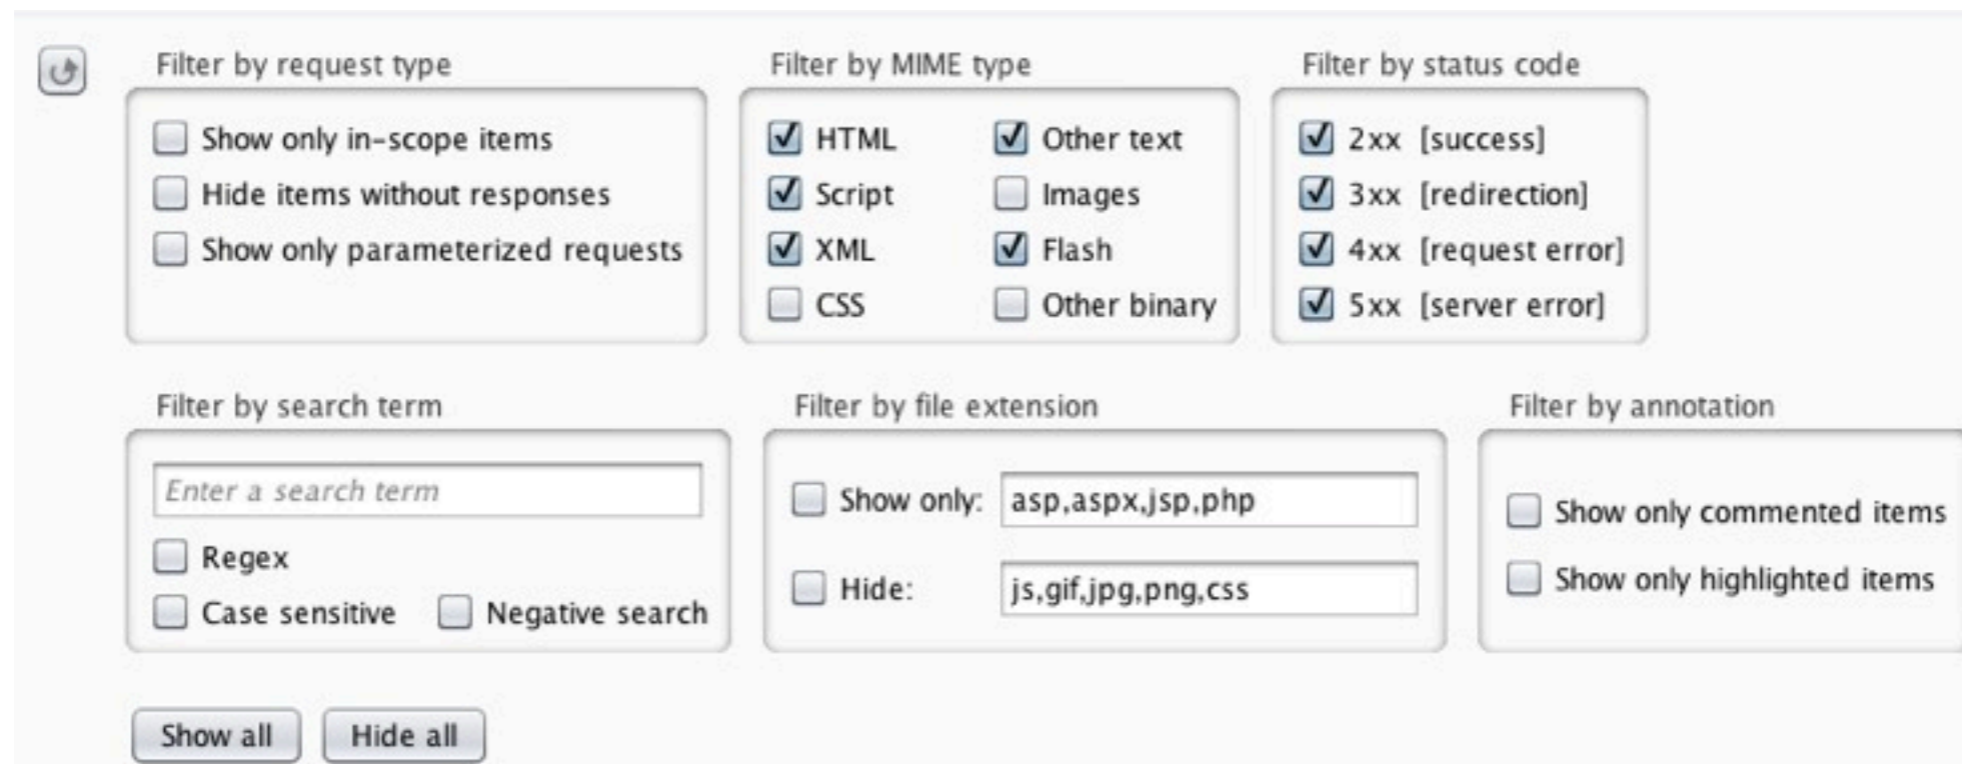

- `com.mtso.blazer.ObjectGenerator`
- `com.mtso.blazer.MessageGenerator`
- `com.mtso.blazer.TaskManager`
- `com.mtso.blazer.MessageTask`

# Blazer - Architecture 2/2

## ⌘ By default, Blazer uses Burp Proxy to record requests and responses

- so that you can benefit from all Burp's built-in tools available

## ⌘ Users can configure their custom proxy:

- Another instance of Burp to avoid a "collapse" during fuzzing
- A better tool for displaying AMF messages

# DEMO 1

## ⌘ General usage

1. Application Libraries
2. Remote Method Signatures
3. General Options and Data Pools
4. Status
5. (Optional) BeanShell

## ⌘ Objects generation

## ⌘ Manual testing using BeanShell

```
$ MessageGenerator myGen = new  
MessageGenerator("127.0.0.1", "8080", ENDPOINT, "");  
$ MessageSkeleton message = new MessageSkeleton(SERVICE, OPERATION);  
$ message.addPar("BH");  
$ myGen.send(message);
```

# DEMO 2

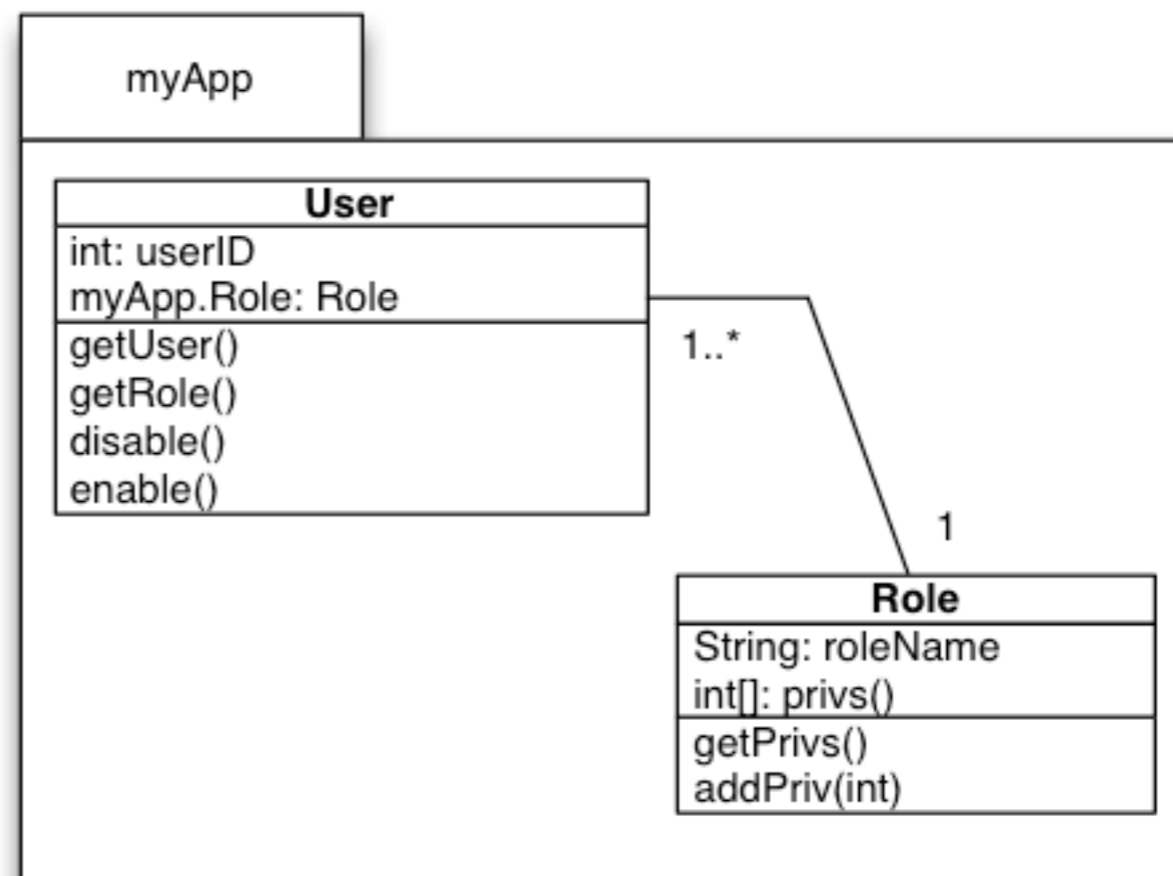

## ⌘ Finding vulnerabilities with Blazer

- Test case: Discover unauthenticated and exposed operations

# Blazer - Core techniques 1/3

## ⌘ Objects generation

- Java reflection
- "Best-fit" heuristics
- Randomness and permutations

# Blazer - Core techniques 2/3

## ⌘ Data Pools

- Containers for “good” user-supplied input
- Allow to instantiate objects and invoke methods with semantically valid data
- Available for all primitive types and String
- Require to be customized for the target

## ⌘ Attack vectors

- Relevant for String objects only
- Attack vector’s probability allows to unbalance the String data pool with attack vectors

# Blazer - Core techniques 3/3

## ∇ Attack vector

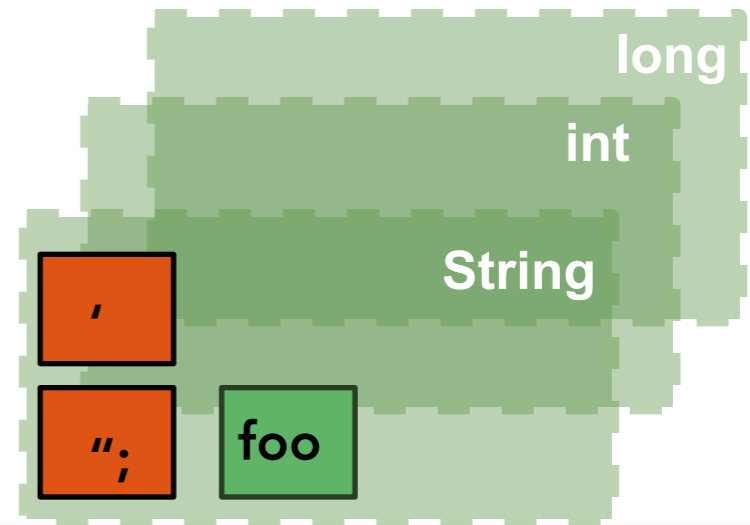

### ∇ Destination (classes)

### ∇ Operation (methods)

```
while (numPerm < maxPerm){  
    generateObject(signature);  
    sendObject();  
}
```

Thread

Data Pools

```
Object generate(String signature){  
    if ( int ){  
        getIntFromPool();  
    } else if ( java.lang.String ){  
        getStringFromPool();  
    }  
    ... else {  
        //Build the obj  
        obj = fc.newInstance();  
        //Populate obj using internal methods  
        //Call recursively generate(newSign)  
    }  
}
```

# Test case: SQL injection

```
public List getProductsByHash(HashMap paramHashMap)
    throws DAOException
{
    String str = (String)paramHashMap.get("key");

    ArrayList localArrayList = new ArrayList();
    Connection localConnection = null;
    try
    {
        localConnection = ConnectionHelper.getConnection();
        PreparedStatement localPreparedStatement =
localConnection.prepareStatement("SELECT * FROM product WHERE UPPER("+str+"")");
        ...
    }
}
```

# Blazer - "Best-fit" heuristics 1/2

## ⌘ For example, let's build a HashMap

```
//Generation only
```

```
ObjectGenerator tCObj = new ObjectGenerator(task, null);  
tCObj.generate("java.util.HashMap");
```

### Constructor Summary

[HashMap\(\)](#)

Constructs an empty `HashMap` with the default initial capacity (16) and the default load factor (0.75).

[HashMap\(int initialCapacity\)](#)

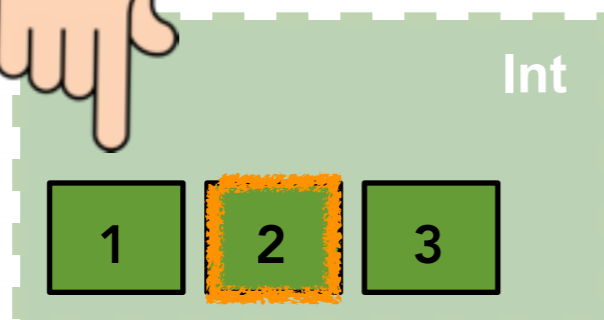

Constructs an empty `HashMap` with the specified initial capacity and the default load factor (0.75).

[HashMap\(int initialCapacity, float loadFactor\)](#)

Constructs an empty `HashMap` with the specified initial capacity and load factor.

[HashMap\(Map m\)](#)

Constructs a new `HashMap` with the same mappings as the specified `Map`.

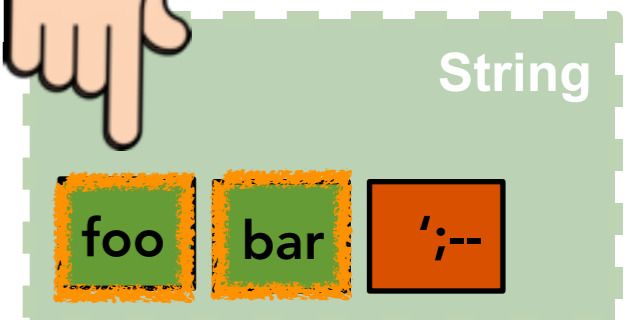

# Blazer - "Best-fit" heuristics 2/2

```
{foo=bar, null}
```

## Method Summary

void	<a href="#">clear()</a> Removes all mappings from this map.
Object	<a href="#">clone()</a> Returns a shallow copy of this <code>HashMap</code> instance: the keys and values themselves are not cloned.
boolean	<a href="#">containsKey(Object key)</a> Returns <code>true</code> if this map contains a mapping for the specified key.
boolean	<a href="#">containsValue(Object value)</a> Returns <code>true</code> if this map maps one or more keys to the specified value.
Set	<a href="#">entrySet()</a> Returns a collection view of the mappings contained in this map.
Object	<a href="#">get(Object key)</a> Returns the value to which the specified key is mapped in this identity hash map, or <code>null</code> if the map contains no mapping for this key.
boolean	<a href="#">isEmpty()</a> Returns <code>true</code> if this map contains no key-value mappings.
Set	<a href="#">keySet()</a> Returns a set view of the keys contained in this map.
Object	<a href="#">put(Object key, Object value)</a> Associates the specified value with the specified key in this map.

# DEMO 3

## ⌘ Finding vulnerabilities with Blazer

- Test case: SQL injection

# Coverage and Scalability

- ⌘ **With unlimited time, you could get theoretically close to 99.9% coverage**
- ⌘ **In practice, Blazer and target setup are crucial**
  - Optimize the number of permutations, depending on method's arguments complexity
  - Balance "good" and "bad" attack vectors
- ⌘ **During big assessments, time matters!**
- ⌘ **Let's do some math:**
  - Application with **~500** exposed operations
  - **45** attack vectors (Burp's default fuzzing list in Intruder)
  - **35** permutations (average for big apps, experimentally determined)
  - $\sim 500 \times 45 \times 35 = \sim \mathbf{787500}$  reqs
  - Let's assume a conservative **~80 reqs/sec**
  - It's **~2.7** hours for a full run with a relatively small wordlist

# AMF Security Testing with Blazer

## ⌘ Authentication

- Generate valid messages and verify that all operations require a valid session token
- ...

## ⌘ Authorization and Access Control

- Generate valid messages with different session tokens
- Customize the data pools, generate objects with multiple permutations and look for DOR bugs
- ....

## ⌘ Error Handling, Input Validation

- Perform fuzzing with your favorite wordlists and manually validate the results:
  - **Sorting by response size**
  - **Filtering by search term with regex**
  - **Exporting responses and using your custom "grep" tool**
  - ...

# Conclusions

- ⌘ During real-life assessment, the approach has been proven to increase **coverage** and **effectiveness**
- ⌘ Blazer was designed to make **AMF testing easy**, and yet allows researchers to control fully the entire security testing process
- ⌘ From 0 to message generation and fuzzing in just few clicks
- ⌘ Using Blazer's internal classes, it is possible to build and send AMF messages from your favorite scripting language

# Future improvements

## ⌘ Upcoming:

- Allow import of source code and classes from entire directories
- Sandbox `com.mtso.blazer.ObjectGenerator` to avoid dangerous methods execution while generating custom objects

## ⌘ Wish-list:

- Embed an utility for displaying complex AMF messages
- Auto-selection of remote method signatures for requests already present in Burp History
- Auto-save of recent Blazer's configurations

# That's all folks!
