Calculating Payments

```
// M = P [ i(1 + i)^n ] / [ (1 + i)^n - 1 ]  
function calcMonthlyPayment(principal, rate, term) {  
  
    var n = term * 12;  
    var i = (rate/100) / 12;  
    var numerator = i * Math.pow((1+i), n);  
    var denominator = Math.pow((1+i), n) - 1;  
  
    return principal * numerator / denominator;  
}  
  
function test() {  
    calcMonthlyPayment(100000, 4.0, 30);  
}
```

Tool Tip

Tag

What can the GUI Builder do for you?

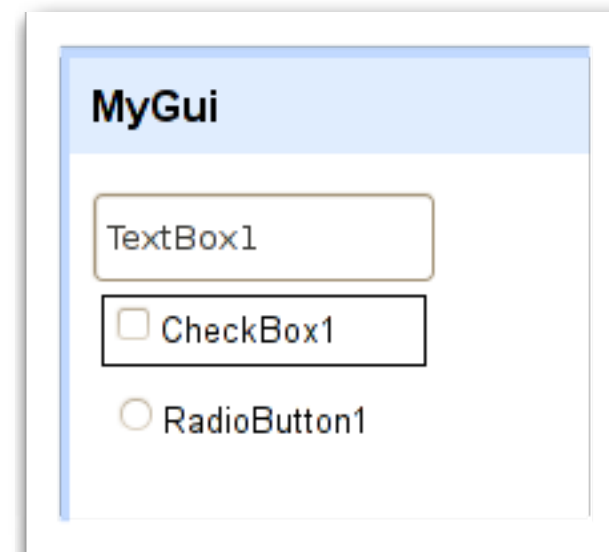

- Build a user interface easily
- Decorate it later
- Script it as usual
- Deploy it fast

What can the GUI Builder do for you?

- Reduce development time
 - Iterate on the UI quickly as you write the script
- Reduce code size
 - Separate UI and styling from business logic
- Avoid common UiApp pitfalls
 - The Builder prevents common UiApp errors
 - If it works in the Builder, it will work in UiApp

Building a GUI

- Building a UI is fast and intuitive
- *Application* design, not *website* design
- Real WYSIWYG, including browser quirks

Building a GUI - widgets and panels

- Draw or drag to create widgets
 - Use the same widgets as UiApp
 - And expect more widgets to be added
- Layout or group widgets with panels
 - Nested panels can create complex layout effects
 - Use flowing panels and % sizes for resolution independence
 - Try different resolutions without resizing your browser

Building a GUI - editing properties

- Each widget exposes only the properties it supports
 - Focus on exactly what you need
- Everything is checked as you type
 - If it works in the builder, it will work in your app
- Add event handlers directly from the Builder

Scripting GUI's - loading them in

- Load a Builder component with **loadComponent()**
 - 100% compatibility with UiApp
 - Components act as if you had typed in the code
- Show the app with this simple code

```
function doGet() {  
    var app = UiApp.createApplication();  
    app.add(app.loadComponent("MyGui"));  
    return app;  
}
```

Scripting GUI's - interaction with code

- Builder components can be edited in code

```
app.loadComponent( "MyGui" );  
var widgetFromBuilder = app.getElementById( "Button1" );  
widgetFromBuilder.setText( "new text" );
```

Scripting GUI's - interaction with code

- UiApp widgets can be added to Builder components

```
app.loadComponent("MyGui");  
var panelFromBuilder = app.getElementById("Panel1");  
panel.add(app.createButton("a new button"));
```

Scripting GUI's - interaction with code

- You can even pull out parts of a component

```
app.loadComponent( "MyGui" );  
var innerPanel = app.getElementById( "Panel1" );  
  
// Only adding part of the component to the app  
app.add( innerPanel );
```

Scripting GUI's - interaction with code

- Or add the same component to the app twice

```
// The prefix is applied to all ids  
app.add(app.loadComponent("MyGui"), {prefix: 1});  
app.add(app.loadComponent("MyGui"), {prefix: 2});
```

Agenda

- *Bob's Mortgage Calculator*
 - Debugging
 - WYSIWYG GUIs
 - **Deploying Apps and Add-Ins**
 - Reading Gmail
 - Writing Documents
 - Blobs and Conversions
- Making Apps More Interactive

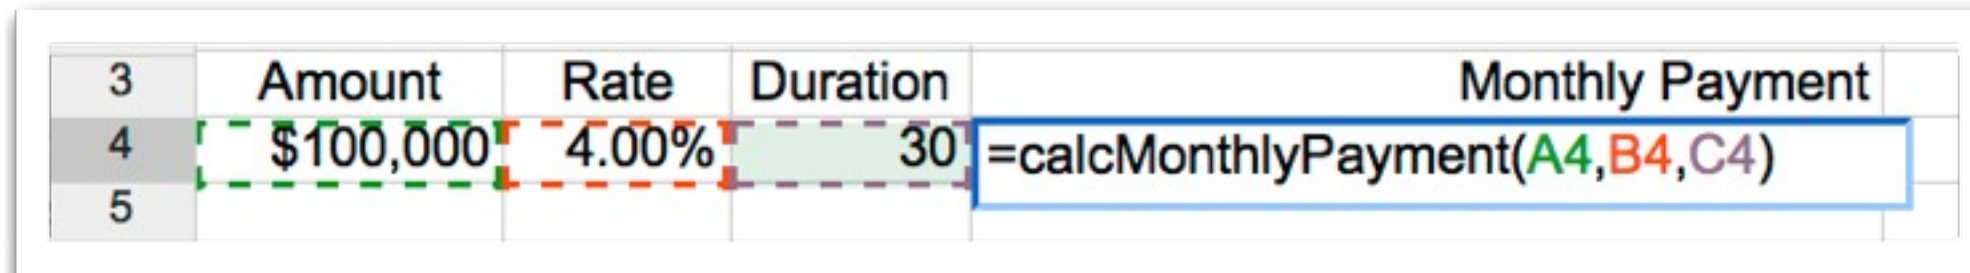

Deployment

- Spreadsheet Add-In
 - Custom function
 - Dialog with customized user interface
 - Integrated user menu
 - Executes as the user at the keyboard
- Published App
 - Fully capable web app
 - Executes as the publisher

Spreadsheet Add-In

- Custom Function

- Every *visible* function is available as a Spreadsheet function

A screenshot of a spreadsheet with the following data:

	Amount	Rate	Duration	Monthly Payment
3				
4	\$100,000	4.00%	30	=calcMonthlyPayment(A4,B4,C4)
5				

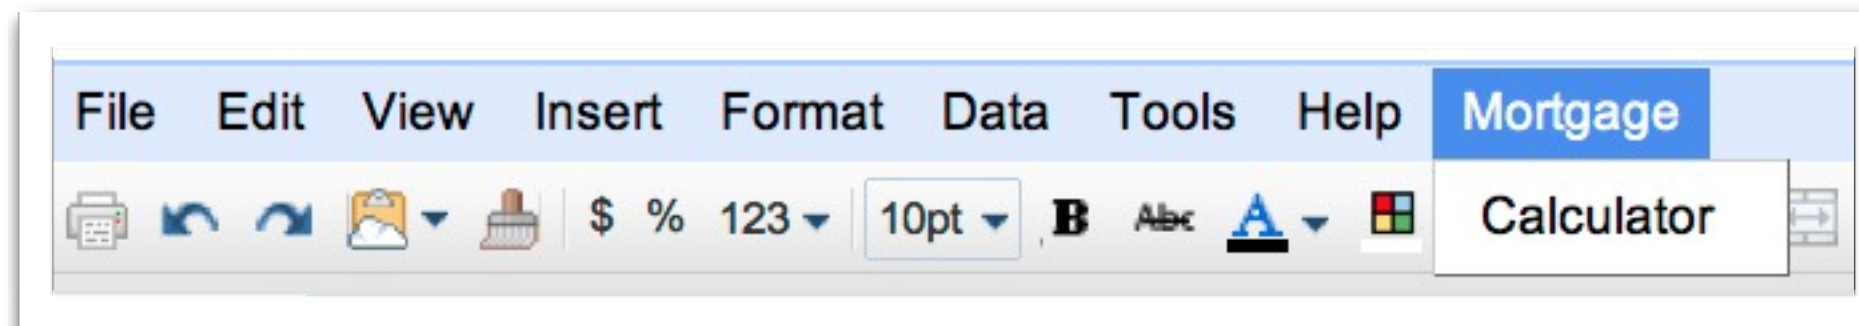

- Hide functions by appending ‘_’ to the end of the function name:

```
function calcMonthlyPayment_(principal, rate, term)
```

- Simply return the value to show in the cell
- *Tip:* returning arrays and double arrays is useful

Spreadsheet Add-In

- Custom Dialog
 - Usually raised from a menu, for example:

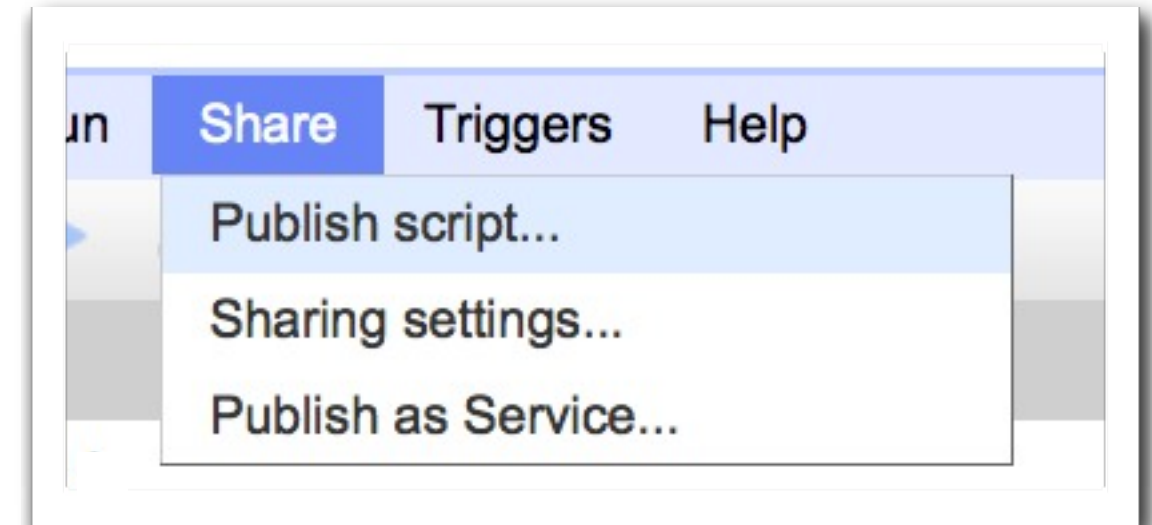

- Special function causes the menu to load along with the spreadsheet

```
function onOpen() {  
  var subMenus = [{name: "Calculator", functionName: "showCalc"}];  
  SpreadsheetApp.getActiveSpreadsheet()  
    .addMenu("Mortgage", subMenus);  
}
```

Distributing Add-Ins

- Publish to the Public Script Gallery
 - Public gallery, accessible from any Spreadsheet
 - Scripts can only be published from non-domain account
- Publish Spreadsheet to the Template Gallery
 - Domain specific gallery saves enterprise assets becoming public
 - Add-In Scripts very likely to rely on specific spreadsheet layout, etc

Publish your script

Script name	<input type="text" value="Mortgage Calculator"/>
Description	<input type="text" value="A beautiful mortgage calculator, and a custom function to too..."/>
Category	<input type="text" value="Personal Finance"/>
Help page	<input type="text"/>

About publishing scripts

When you publish a script to the public gallery, anyone will be able to use it by creating a copy of their own. By publishing a script, you agree to let anyone use the code that you created. Please make sure that you own the rights to distribute the code in your script. After a script is published, changes you make to it will not show up in the script gallery until the next time you publish the script.

Note: Your email address will be published in the gallery along with the script.

Please be sure to read the [Google Docs Additional Terms](#) before submitting your script.

NEW!

Gmail Service

If you use Gmail, you already know the API

- Compose
- Inbox
- Starred
- Sent Mail
- Labels
- Search

GmailApp

- There are just 3 objects:
 - GmailThread
 - GmailMessage
 - GmailLabel
- Threads are composed of messages
- Each thread can have multiple labels

GmailApp

- Labels are simple:
 - GmailApp.createLabel (*labelName*)
 - GmailApp.deleteLabel (*label*)
 - GmailApp.getUserLabelByName (*labelName*)
 - GmailApp.getUserLabels ()

GmailApp

- Threads are grouped by:
 - Inbox
 - PriorityInbox
 - Starred (contains a starred message)
 - Spam
 - Chat*
 - Trash*

*Chat and Trash don't have 'getUnreadCounts'

GmailApp

- Threads are can be marked as:
 - Important or Unimportant
 - Read or Unread
- Threads are can be 'moved' to:
 - Inbox
 - Archive
 - Spam
 - Trash

GmailApp

```
function getEmails() {  
  
    var threads = GmailApp.search('in:inbox is:unread');  
    var messages = [];  
  
    for (var t in threads) {  
        ...  
    }  
  
    return messages;  
}
```

Agenda

 - WYSIWYG GUIs
 - Deploying Apps and Add-Ins
 - Reading Gmail
 - **Writing Documents**
 - Blobs and Conversions
- Making Apps More Interactive

Document Service

The screenshot shows a Google Docs document titled "Alice in Wonderland" in a browser window. The address bar shows the URL: <https://docs.google.com/a/breakapps.com/document/d/1HUdSZssb4b52fVwn3ATkw9q2OhNcwW31GPRAc9d8Vuc/edit?hl=e...>. The document content includes:

Alice finding tiny door behind curtain

Alice opened the door and found that it led into a small passage, not much larger than a rat-hole: she knelt down and looked along the passage into the loveliest garden you ever saw. How she longed to get out of that dark hall, and wander about among those beds of bright flowers and those cool fountains, but she could not even get her head through the doorway; 'and even if my head would go through,'

thought poor Alice, 'it would be of very little use without my shoulders. Oh, how I wish I could shut up like a telescope! I think I could, if I only know how to begin.' For, you see, so many out-of-the-way things had happened lately, that Alice had begun to think that very few things indeed were really impossible.

There seemed to be no use in waiting by the little door, so she went back to the table, half hoping she might find another key on it, or at any rate a book of rules for shutting people up like telescopes: this time she found a little bottle on it, ('which certainly was not here before,' said Alice,) and round the neck of the bottle was a paper label, with the words 'DRINK ME' beautifully printed on it in large letters.

DocumentApp

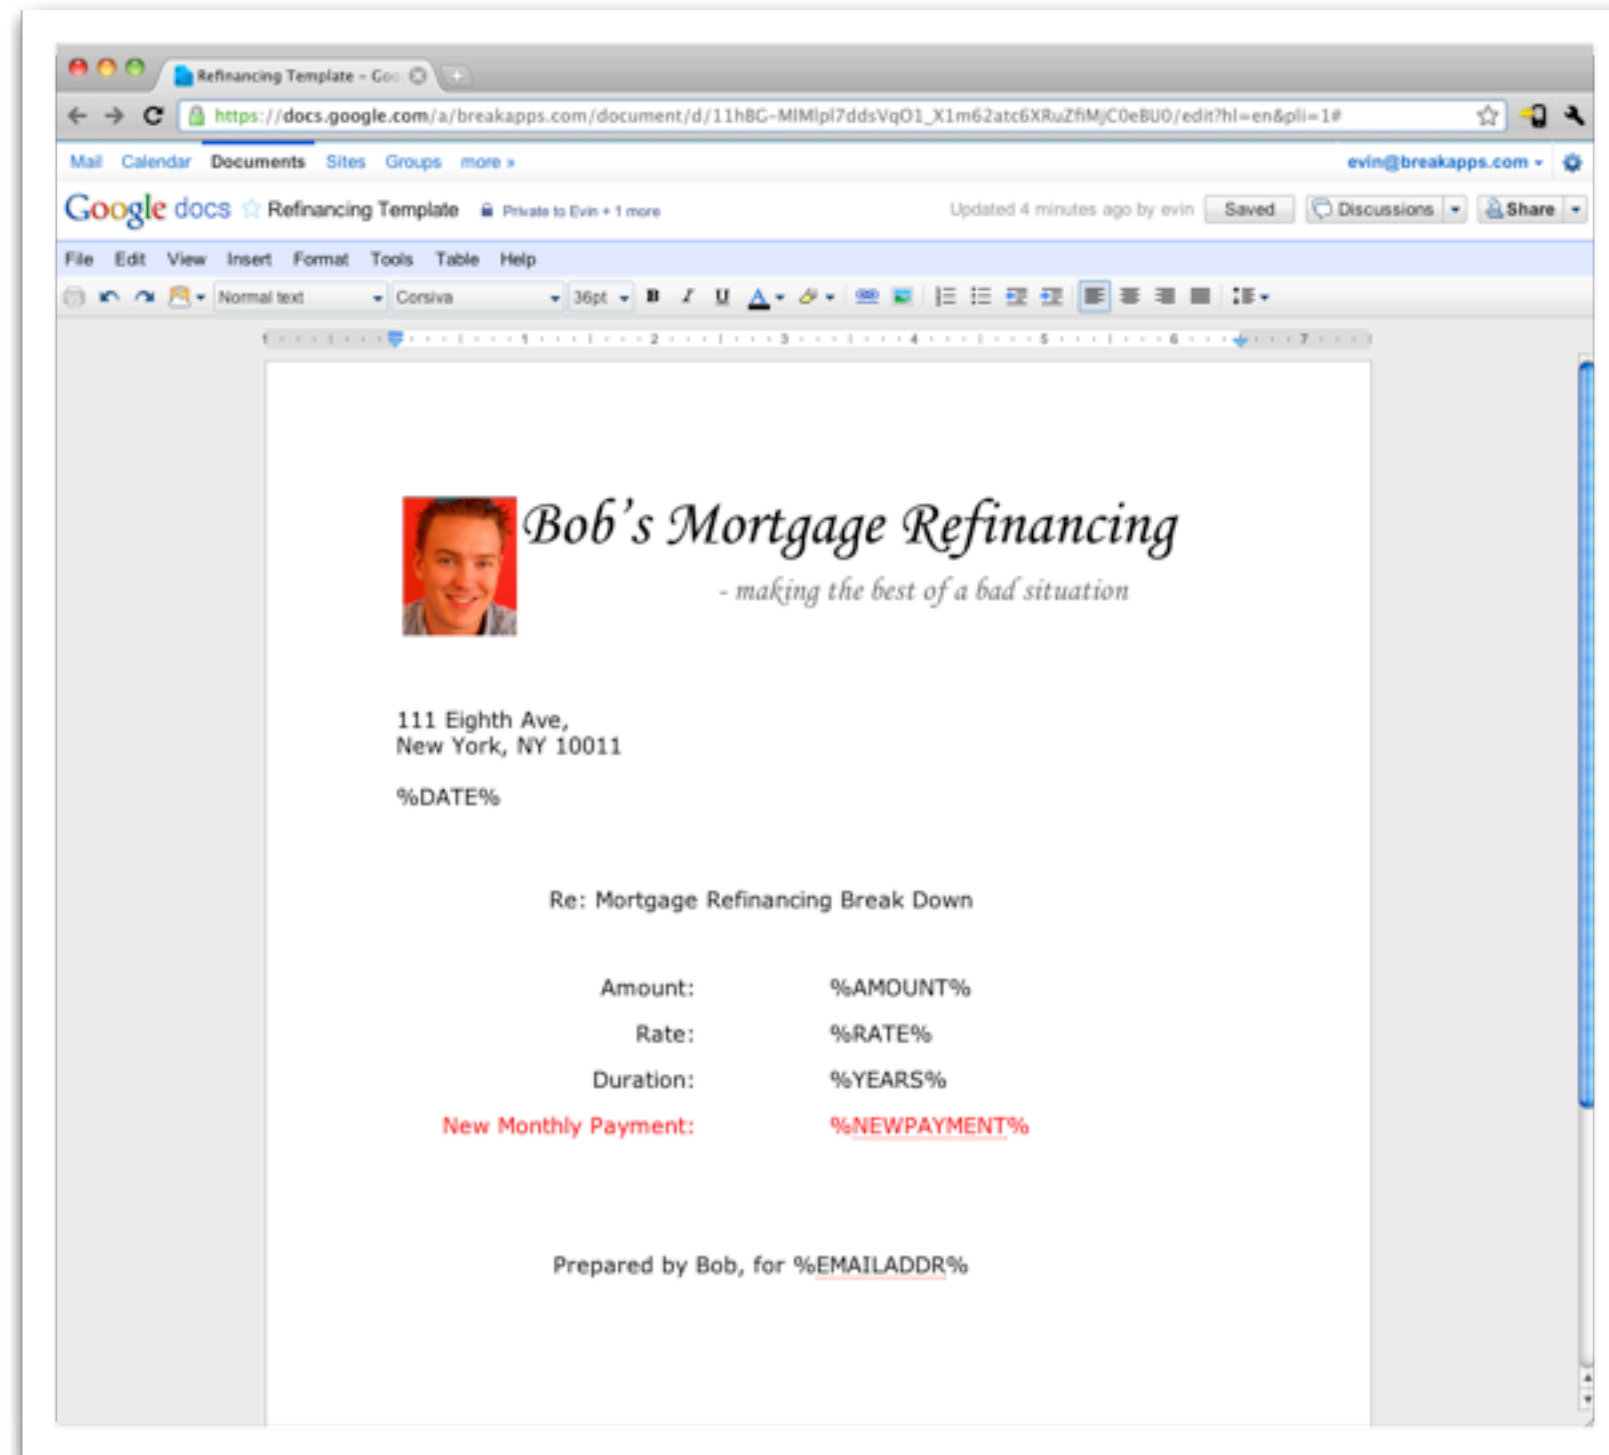

- Create a new document:
 - DocumentApp.create (*name*)
- Open an existing document:
 - DocumentApp.openById (*id*)

DocumentApp

Documents are composed of elements:

- DocumentBody
- Paragraphs
- Headers
- Footers
- ListItems
- Tables

Document Template

Document Template

```
function createDocument(emailAddr, date, rate, amount, years, payment) {
  var docId = DocsList
    .getFileById("1VP4ZW3zypaqmfbRkzZvez0fLqXJUGHbkOBYRrhcRBwM")
    .makeCopy().getId();

  var doc = DocumentApp.openById(docId);

  var body = doc.getActiveSection();
  body.replaceText("%DATE%", date);
  body.replaceText("%RATE%", "" + rate);
  body.replaceText("%AMOUNT%", "" + amount);
  body.replaceText("%YEARS%", "" + years);
  body.replaceText("%NEWPAYMENT%", "" + payment);
  body.replaceText("%EMAILADDR%", "" + emailAddr);
  return doc;
}
```

Agenda

- *Bob's Mortgage Calculator*

- Making Apps More Interactive

Gobs and Gobs of Blobs

What is a Blob?

- \ 'bläb\ - *noun*
- Something ill-defined or amorphous
- **B**inary **l**arge **o**bject

Blobs

Sources

- Unzip •
- JDBC •
- File Upload •
- Email Attachment •
- UrlFetch GET •
- DocsList read •
- Sites Attachment •
- Spreadsheet •
- Document •

Sinks

- Zip
- JDBC
- Email Attachment
- UrlFetch POST
- DocsList write
- Sites Attachment

Blobs

Sources

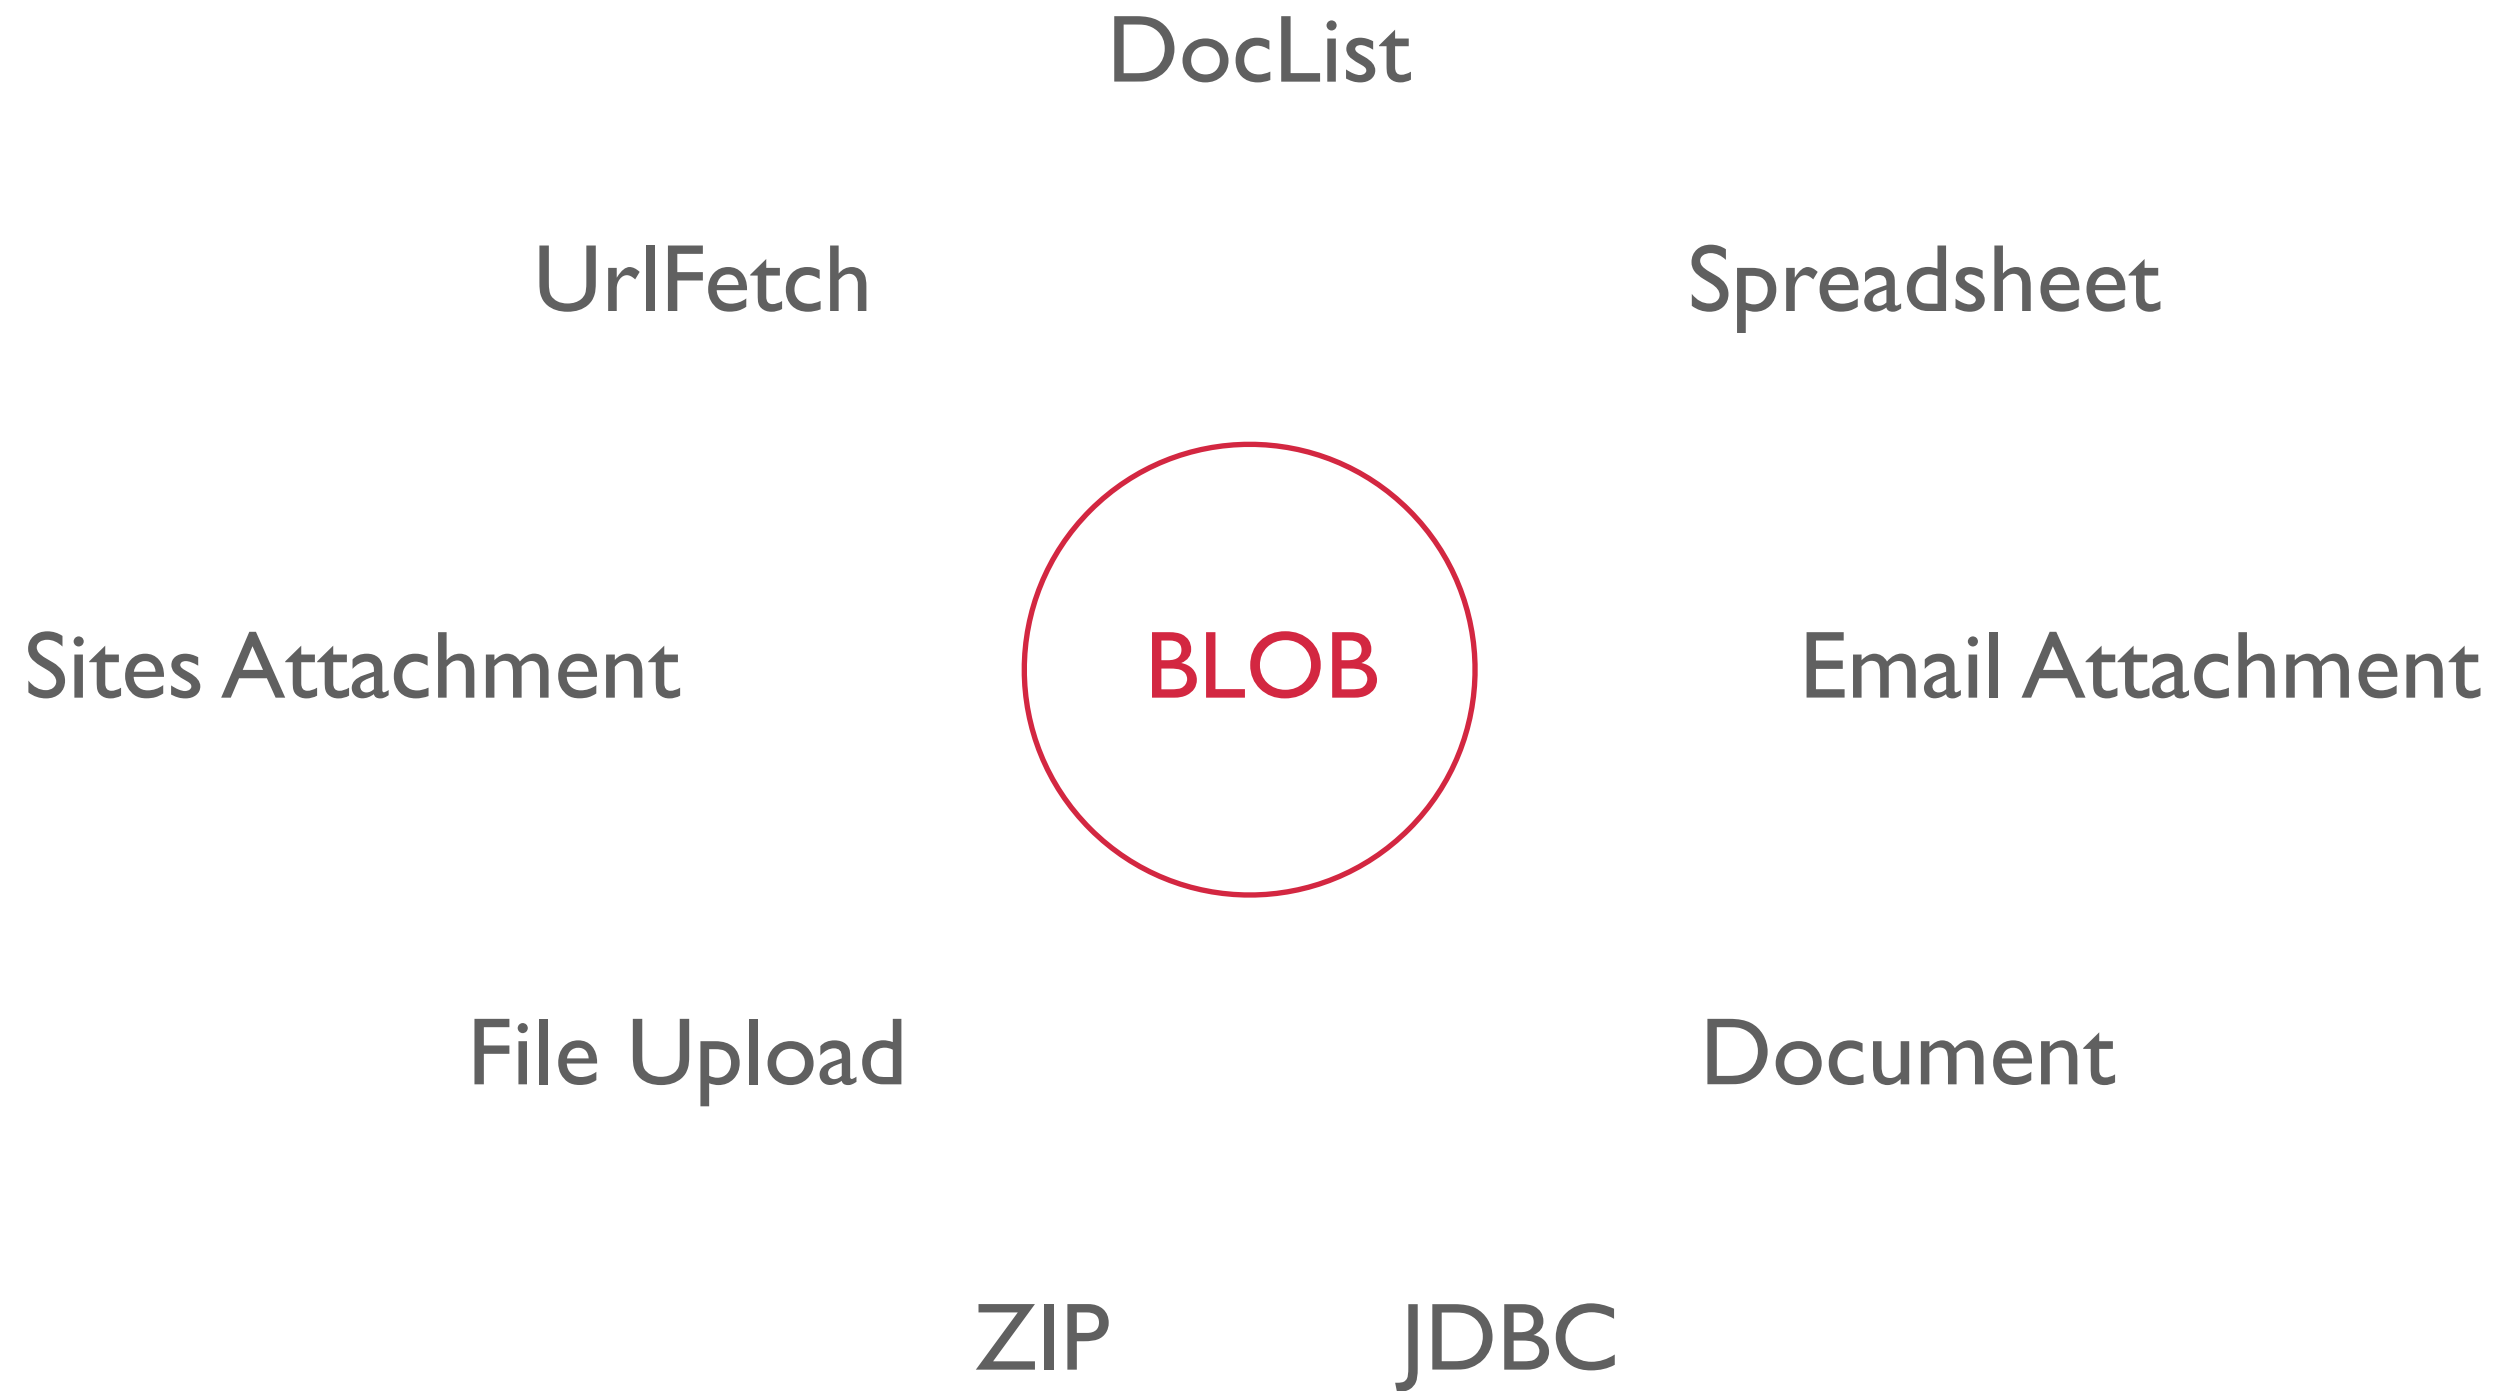

- Unzip
- JDBC
- File Upload
- Email Attachment
- UrlFetch GET
- DocsList read
- Sites Attachment
- Spreadsheet
- Document

Sinks

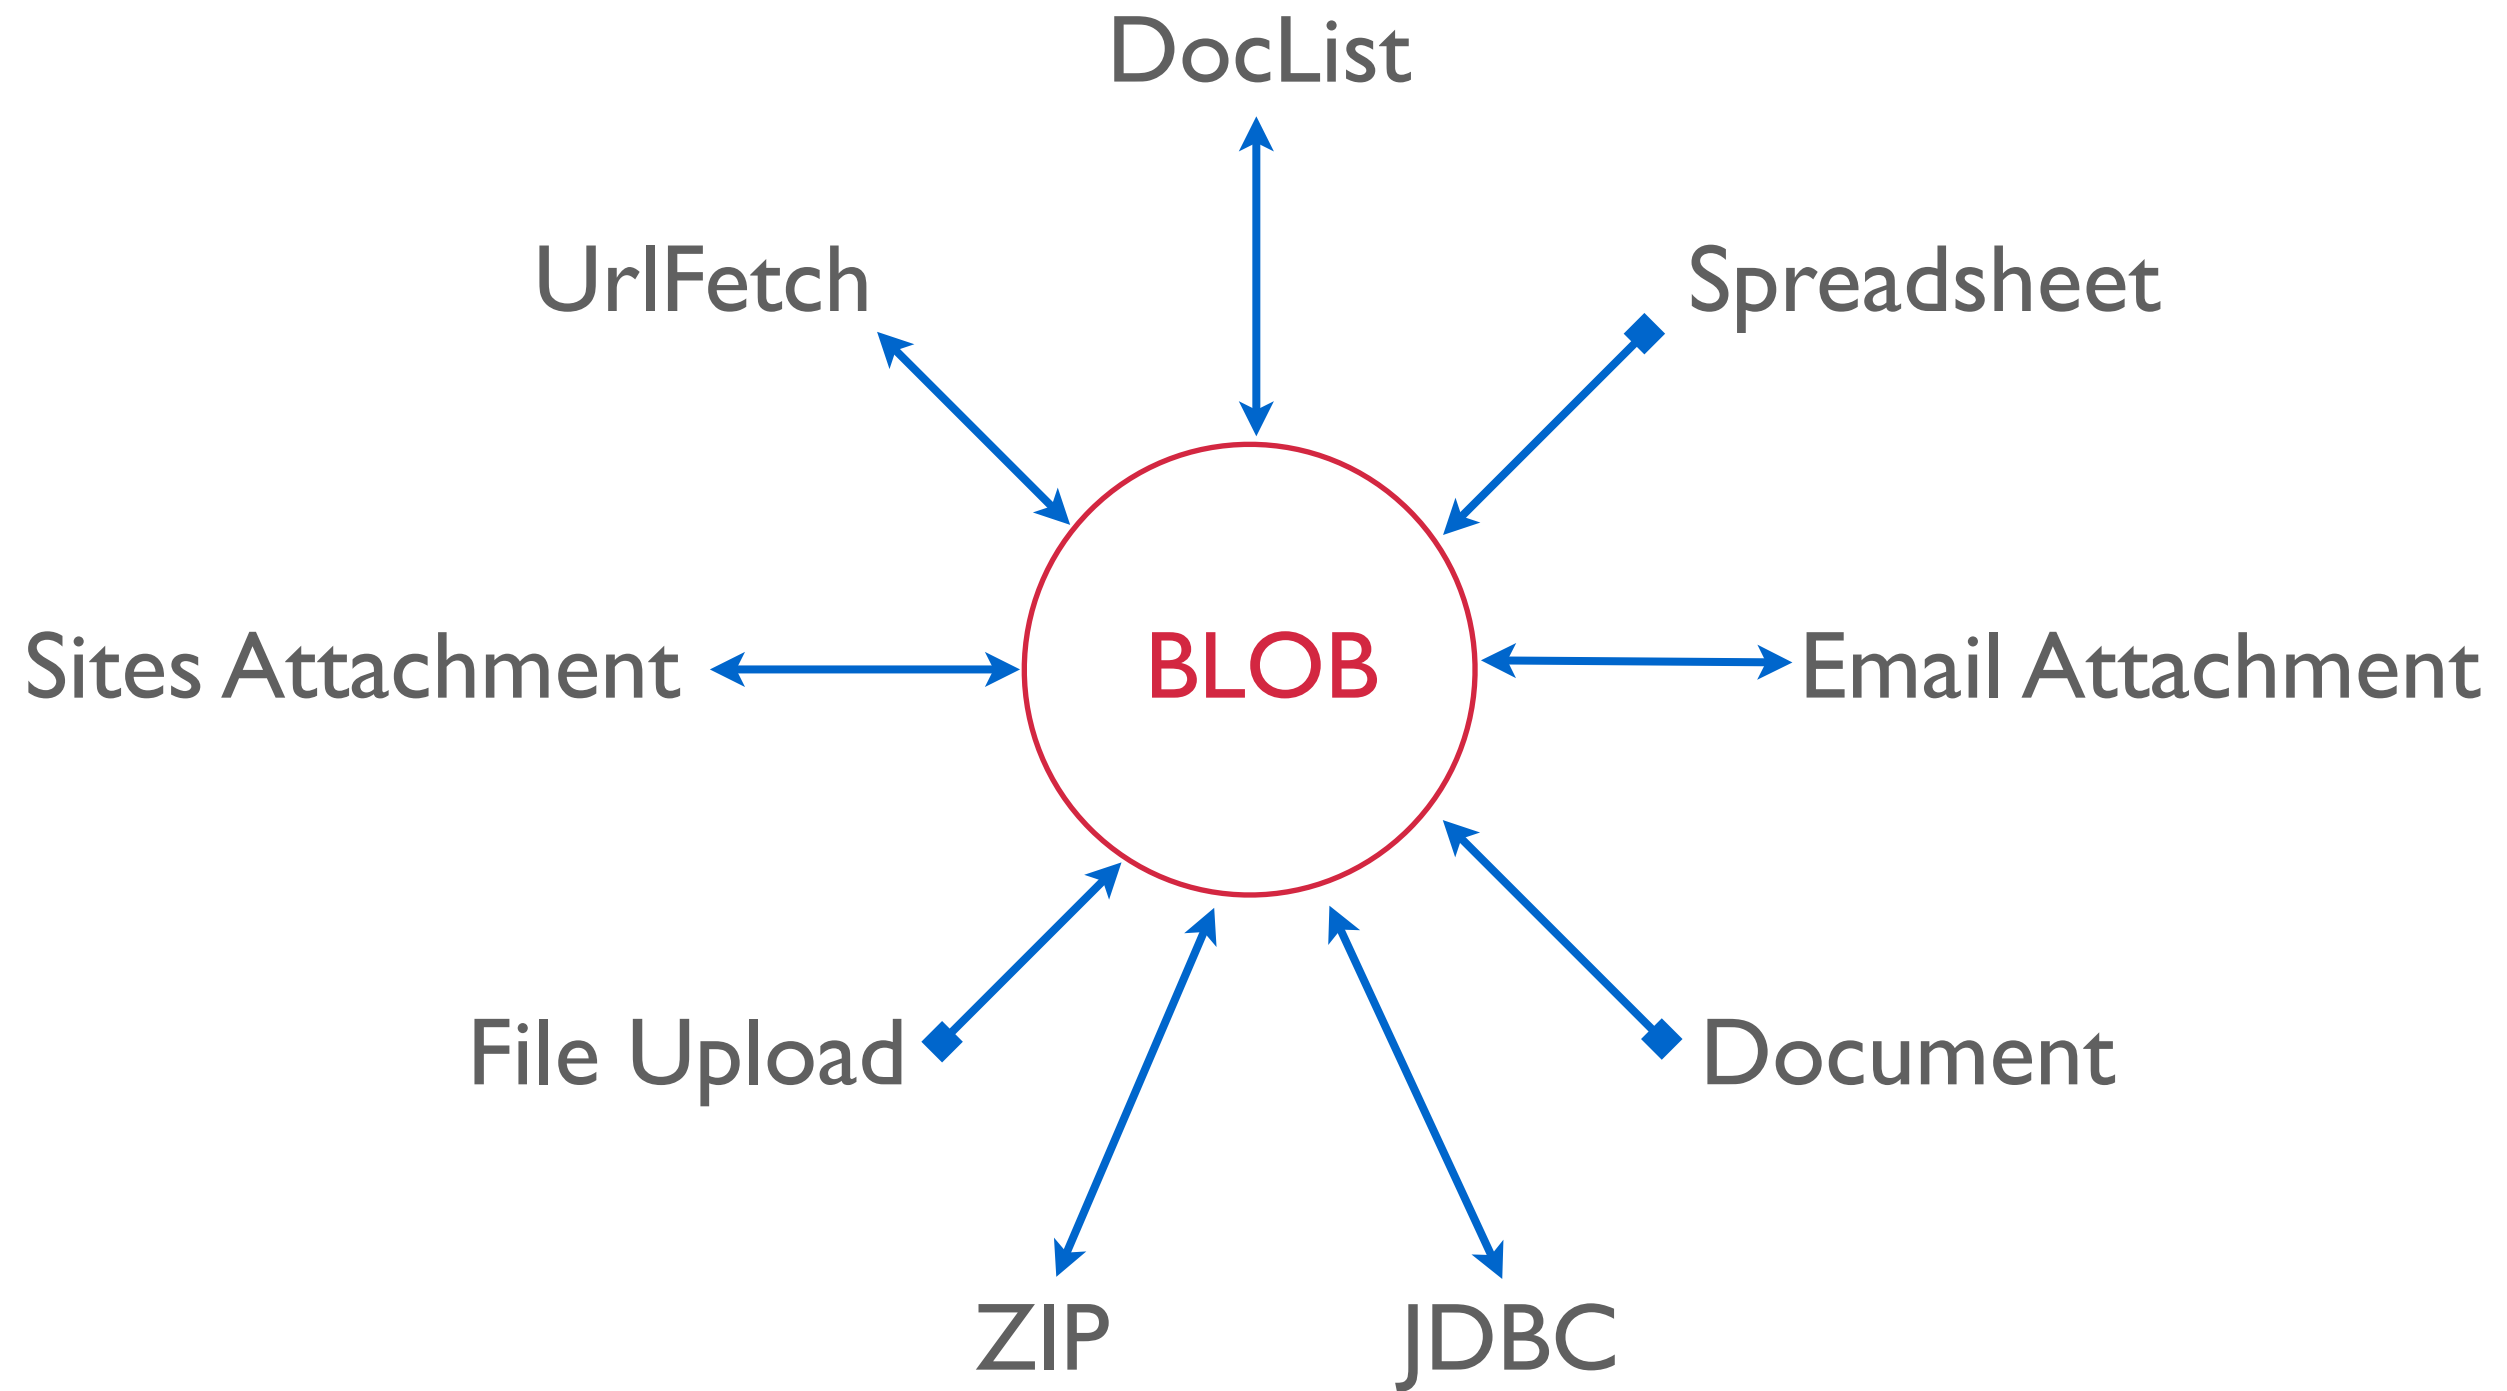

- Zip
- JDBC
- Email Attachment
- UrlFetch POST
- DocsList write
- Sites Attachment

Blobs

Blobs

Blobs

- Blobs are simple:
 - getName/setName
 - getContentType/setContentType
 - getBytes/getBytes
 - getDataAsString/setDataAsString
- Create a Blob:
 - Utilities.createBlob

Using Blobs

```
SitesApp.getPageByUrl(path).getAttachments()
```

Using Blobs

```
SitesApp.getPageByUrl(path).getAttachments().concat(  
    [UrlFetchApp.fetch(url)]  
);
```

Using Blobs

```
SitesApp.getPageByUrl(path).getAttachments().concat(  
    [UrlFetchApp.fetch(url)],  
    DocsList.find("image.png")  
);
```

Using Blobs

```
Utilities.zip(  
SitesApp.getPageByUrl(path).getAttachments().concat(  
  [UrlFetchApp.fetch(url)],  
  DocsList.find("image.png")  
), "files.zip")
```

Using Blobs

```
MailApp.sendEmail("bob@example.com",  
                  "my email with attachment",  
                  "here are the files",  
                  {attachments: Utilities.zip(  
SitesApp.getPageByUrl(path).getAttachments().concat(  
    [UrlFetchApp.fetch(url)],  
    DocsList.find("image.png")  
]), "files.zip"}));
```

NEW!

Conversions

- Why am I talking about Blobs?
- Spreadsheets and Documents are Blobs
 - Google Docs convert automatically to PDF
 - Many other types got to PDF also
 - Image to Image for PNG, JPEG, BMP and GIF
 - With a lot more to come...

Conversions

- Blobs are simple:
 - getName/setName
 - getContentType/setContentType
 - getBytes/getBytes
 - getDataAsString/setDataAsString
 - **getAs (contentType)**

Conversions

```
var pngBlob = DocsList.find("photo.jpg")[0].getAs("image/png");
```

Conversions

```
var pdfs = SitesApp.getPageByUrl(url).getAttachments()  
    .map(function(i) { return i.getAs("application/pdf") });
```

Conversions

```
var blobs = SitesApp.getPageByUrl(path).getAttachments();  
var pdfs = [];  
for (var i in blobs)  
    pdfs.push(blobs[i].getAs("application/pdf"));
```

Conversions

```
var docBlob = createDocument(emailAddr, rate, amount, years);  
  
message.reply("Here's the quote you requested",  
             {attachments: docBlob.getAs("application/pdf")});  
  
message.markRead();
```

Browser tabs: <https://docs-qa.corp.google>

help with refinancing...

Form fields:
Amount:
Rate:
Years:
\$
Calculate

Dear Bob,

I have heard from a few friends that you're a genius when it comes to refinancing, and I'm hoping that you can help me.

I'm looking to refinance \$240,000 over 25 years - what kind of rate do you think I could get?

thanks for your help,

James

Building a Canvas

- UiApp is the container

```
var app = UiApp.createApplication();
```

- We add widgets to the app

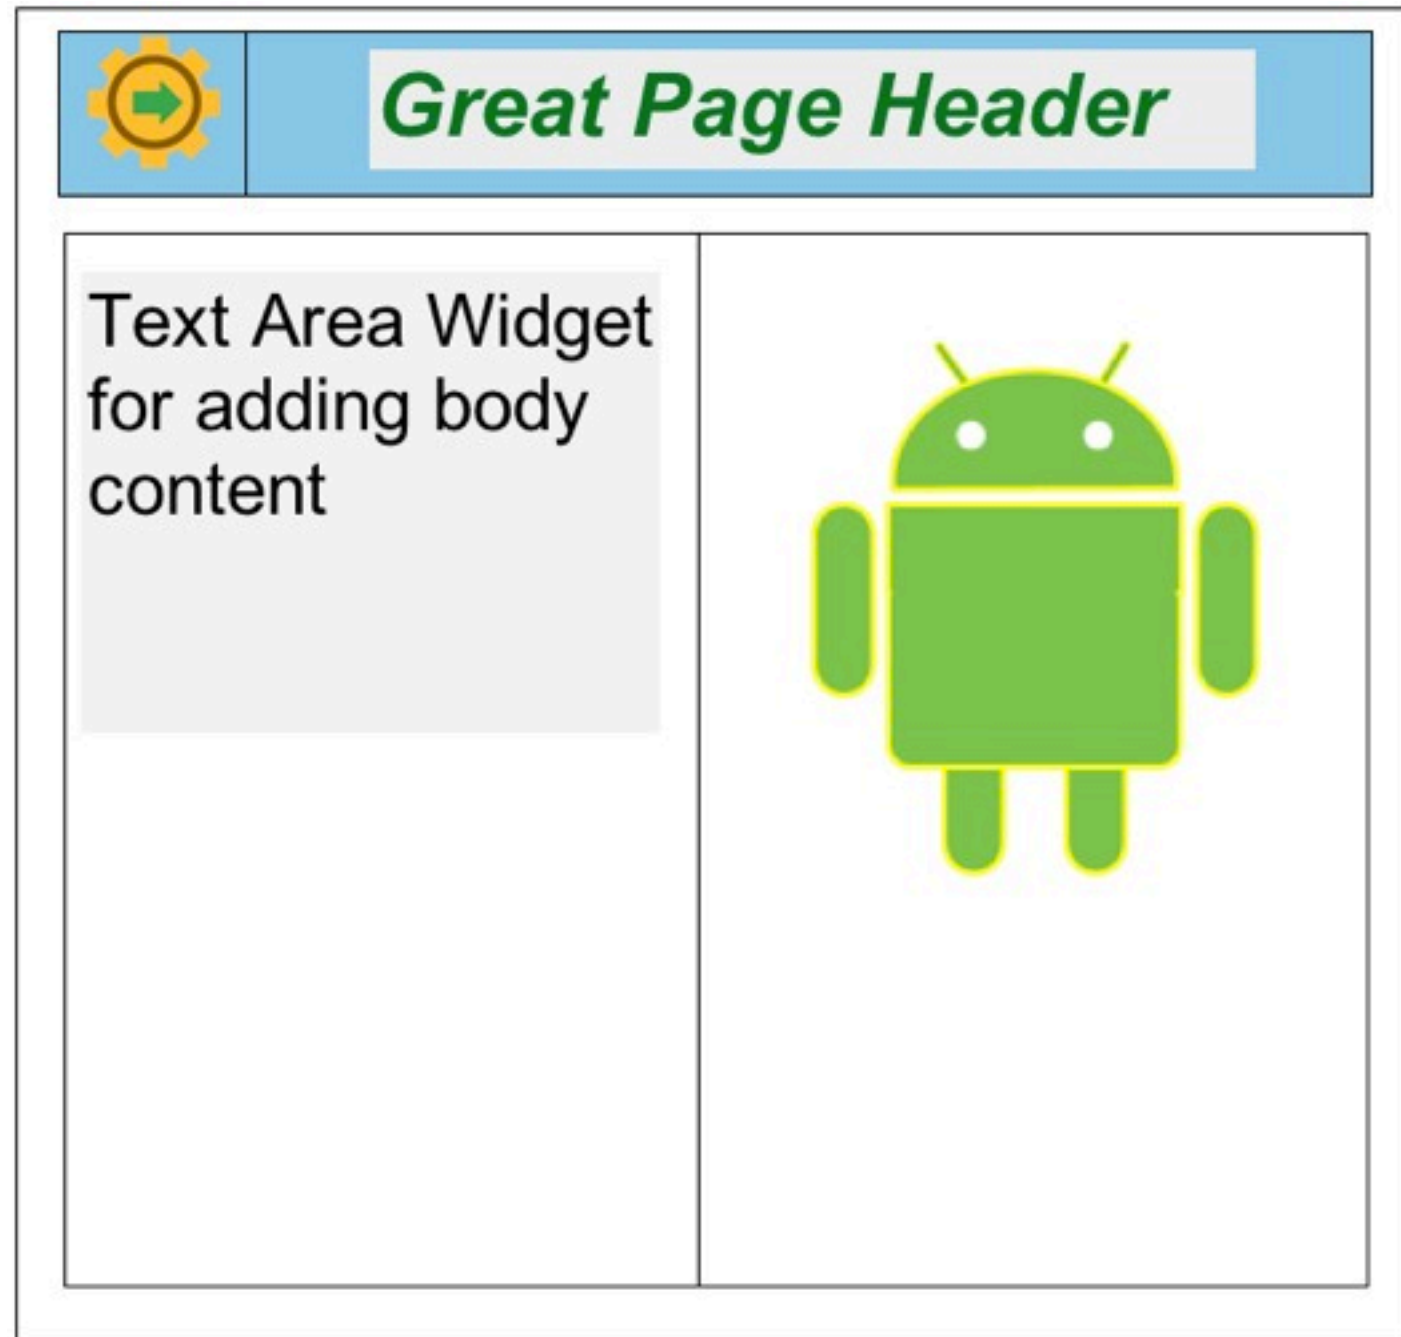

```
app.add(app.createImage(url));
```

```
app.add(app.createGrid(2,2));
```

```
app.add(app.createImage(url));
```

```
etc...
```

Widgets within Widgets

- Endless possible effects just by putting widgets in widgets
- E.g. widgets in a Grid:

```
app.add(grid1);  
app.add(grid2);
```

```
grid1.setWidget(0,0,gearImage);  
grid2.setWidget(0,0,textArea);  
grid1.setWidget(0,1,textBox);  
grid2.setWidget(0,1,AndyImage);
```

Placing Widgets with CSS

- Avoid lots of:

```
gearImg.  
  setStyleAttribute  
  ("position", "fixed");
```

```
gearImg.  
  setStyleAttribute  
  ("top", "550");
```

```
gearImg.  
  setStyleAttribute  
  ("left", "750");
```

- Instead try:

```
function applyCSS_(element, style){  
  for (var key in style){  
    element.  
      setStyleAttribute  
      (key, style[key]);  
  }  
}
```

```
var _gearAt = {  
  "position": "fixed",  
  "top": "550px",  
  "left": "750px"};
```

```
applyCSS_(gearImg, _gearAt);
```

Making Andy Move

```
// Initial position
ScriptProperties.setProperty( 'x' , 50 );
ScriptProperties.setProperty( 'y' , 450 );

var _andyAt = {
  "position": "fixed",
  "top": ScriptProperties.getProperty( 'y' )+"px",
  "left": ScriptProperties.getProperty( 'x' )+"px" };

var andy = app.createImage( 'https://Andy.png' ).setId( 'andy' );
app.add( andy );
applyCSS_( andy, _andyAt );
```

Making Andy Move

```
var up = app.createImage( 'https://Up.png' )  
    .setSize( '40px', '40px' ).setId( 'up' )  
    .addClickHandler( app.createServerClickHandler( 'move' ) );  
  
var dn = app.createImage( 'https://Down.png' )  
    .setSize( '40px', '40px' ).setId( 'dn' )  
    .addClickHandler( app.createServerClickHandler( 'move' ) );
```

Making Andy Move

```
function move(e){
  var app = UiApp.getActiveApplication();
  var x = parseInt(ScriptProperties.getProperty('x'));
  var y = parseInt(ScriptProperties.getProperty('y'));

  if (e.parameter.source == 'up'){
    if (y == 0){return app;} //stop andy side
    y = y-50;
    ScriptProperties.setProperty('y', y);
  }
  else if (e.parameter.source == 'dn'){
    if (y == 500){return app;} //stop andy side
    y = y+50;
    ScriptProperties.setProperty('y', y);
  } // [...] left, right

  var _andyAt = {
    "top":ScriptProperties.getProperty('y')+"px",
    "left":ScriptProperties.getProperty('x')+"px" };

  applyCSS_(app.getElementById('andy'), _andyAt);

  return app;
}
```

Recap

Recap

- GUI Builder
 - Mortgage App, and Mortgage Calculator Add-In
 - Deploying as a Service, and to the Gallery
- Gmail Service
 - Just as simple as using Gmail itself!
- Document Service
 - Finally an API for scripting Google Documents

Recap

- Blobs
 - Don't over think it, *it'll just work!*
- Conversions
 - Some simple cases covered today, stay tuned for more
- Andy App
 - There's more to Script than boring data entry!
