Google™ 

Agenda

- What is NFC
- Why use NFC
- How to NFC 101
- How to NFC 201

What is NFC

What is NFC

- **Near Field Communications**
- Short range wireless (1-4cm typical, 10cm theoretical)
- Low speed (106 to 424 kbps)
- Low friction setup (no discovery, no pairing)
- Passive targets (look ma', no batteries)

Why use NFC

Bridging the Physical and the Virtual Worlds

Demo – Basic tag read

- Tag's can be embedded in stickers
- Touch to read
- No need to launch an application
- Like QR Codes....but faster

Demo – Tag Content

- Tag's can contain:
 - URL
 - Text
 - Contacts
 - ...any MIME type

NFC – Low Friction

Google Inc

9606 N Mopac Expy #700
Austin, TX 78759

Reviews by Google users

SS - Apr 13, 2011

★★★★★ **Best company to work for!!!**

Alex - Mar 30, 2011

★★★★★ **Best place to work**

Kyle W. - Feb 18, 2011

★★★★★ **shuffleboard, ping pong, scooters...**
what's not to love?

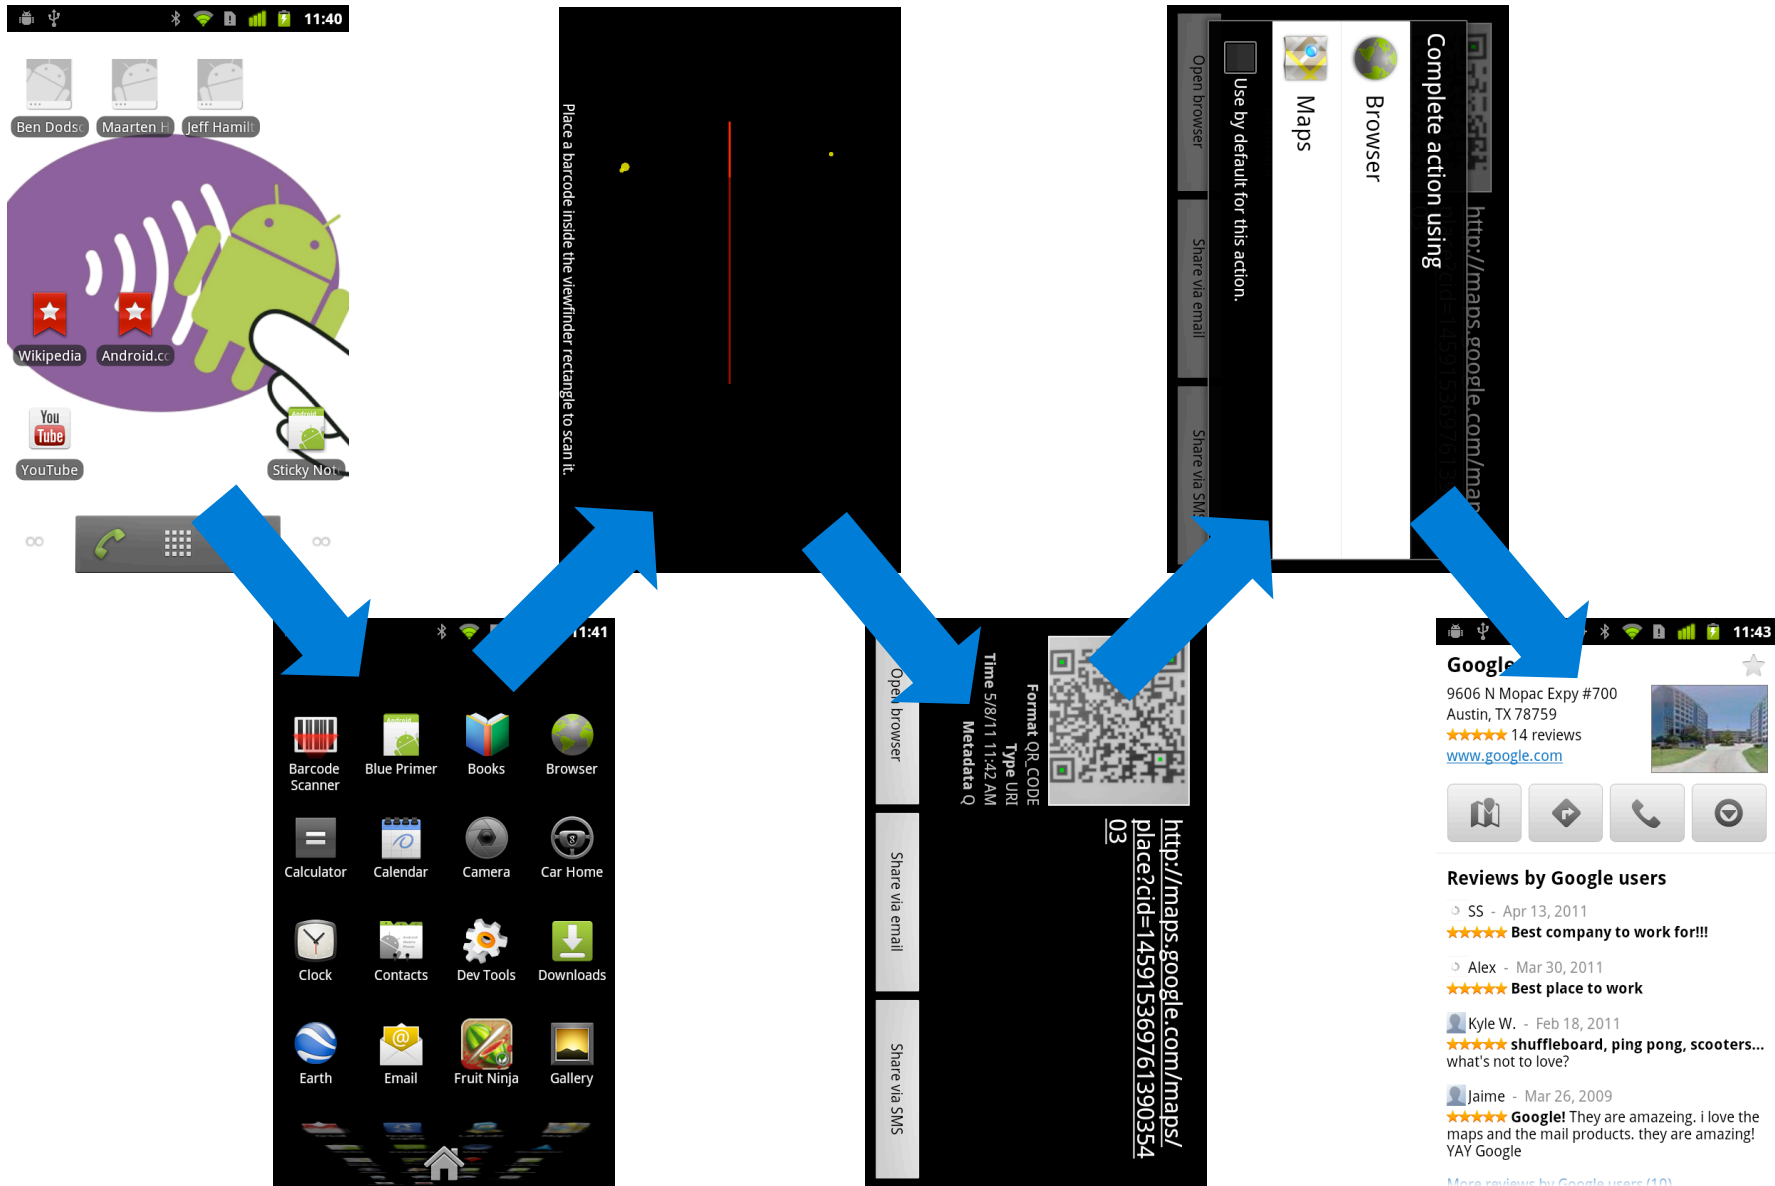

Jaime - Mar 26, 2009

★★★★★ **Google!** They are amazing. i love the maps and the mail products. they are amazing!
YAY Google

[More reviews by Google users \(10\)](#)

Demo – NFC vs QR-Code

Demo – Sticky Notes

- Gingerbread has developer API's for:
 - Tag Read
 - Tag Write (Yes, Tags can be writable!)
 - Peer-to-peer
 - (and a lot more)

Demo – Google Talk Portal

- Tag Read to initiate a connection through the cloud

Demo – Fruit Ninja

- NFC peer-to-peer to initiate connection
- Connection handover to Bluetooth

Ice Cream Sandwich Preview

How to NFC, 101

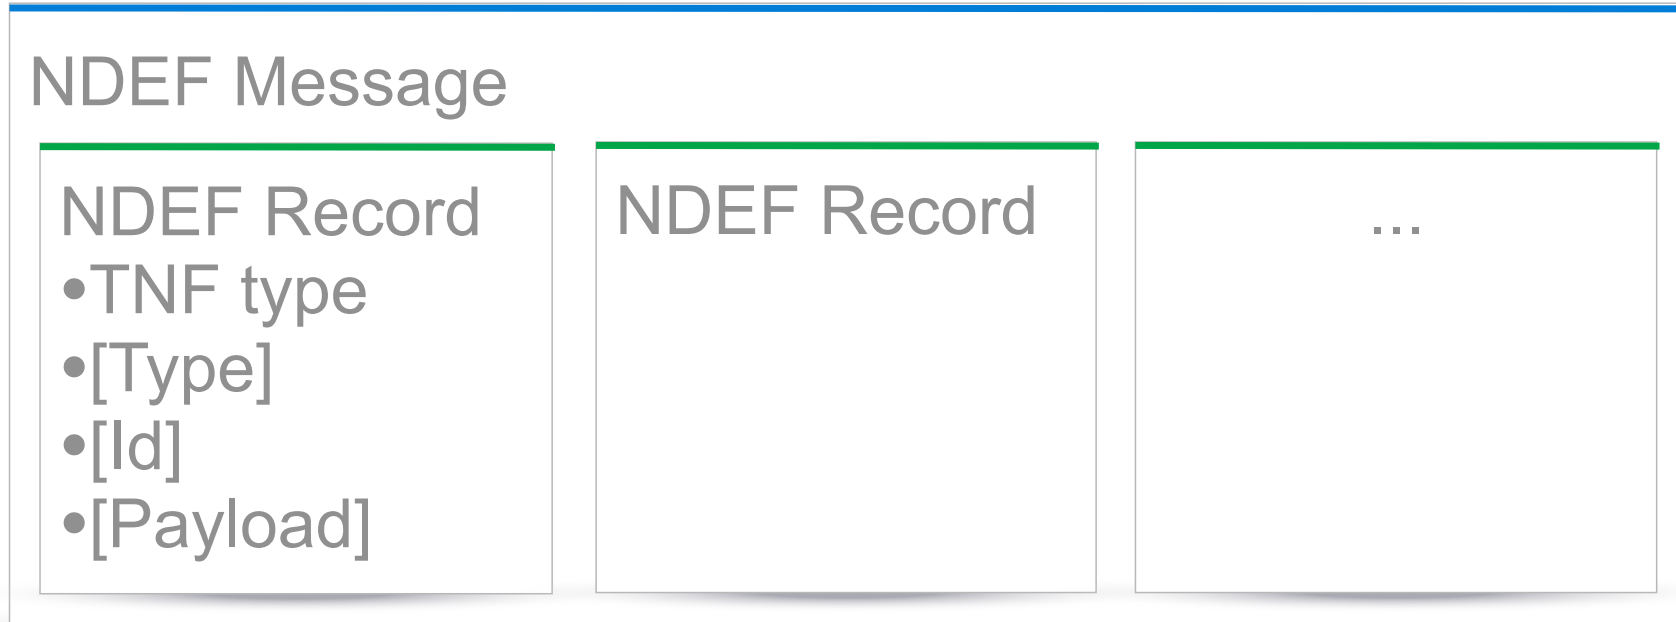

How to NFC

- Reading
 - NDEF
 - Dispatching
- Writing
 - NDEF to a tag
 - NDEF to P2P
- Advanced
 - Beyond NDEF: Tag technologies
 - Advanced Dispatching
 - NFC and Bluetooth
 - Security & Privacy

Standards – NDEF

Nfc Data Exchange Format

- *The data container format for NFC*

See NdefMessage and NdefRecord classes

Reading NDEF

Part 1 – Dispatch

- By design, NDEF data is dispatched to only **one** activity
- The type of the first NDEF record is used for dispatch

NDEF Message

NDEF Record

- **TNF type**
- **[Type]**
- [Id]
- [Payload]

NDEF Record

...

Reading NDEF

Part 2 – Different Dispatch Types

TNF_WELL_KNOWN
RTD_TEXT
“The lazy dog jumped...”

TNF_MIME_MEDIA
text/plain
“The lazy dog jumped...”

TNF_MIME_MEDIA
application/vnd.example
01001001101011100

TNF_WELL_KNOWN
RTD_URI
<http://example.com/foo>

→ `<data android:mimeType="text/plain" />`

→ `<data android:mimeType="application/vnd.example" />`

→ `<data android:scheme="http"
android:host="example.com"
android:path="/foo" />`

Reading NDEF

Part 3 – Receiving

AndroidManifest.xml:

```
<intent-filter>
    <action android:name="android.nfc.action.NDEF_DISCOVERED" />
    <data android:mimeType="text/plain" />
</intent-filter>
```

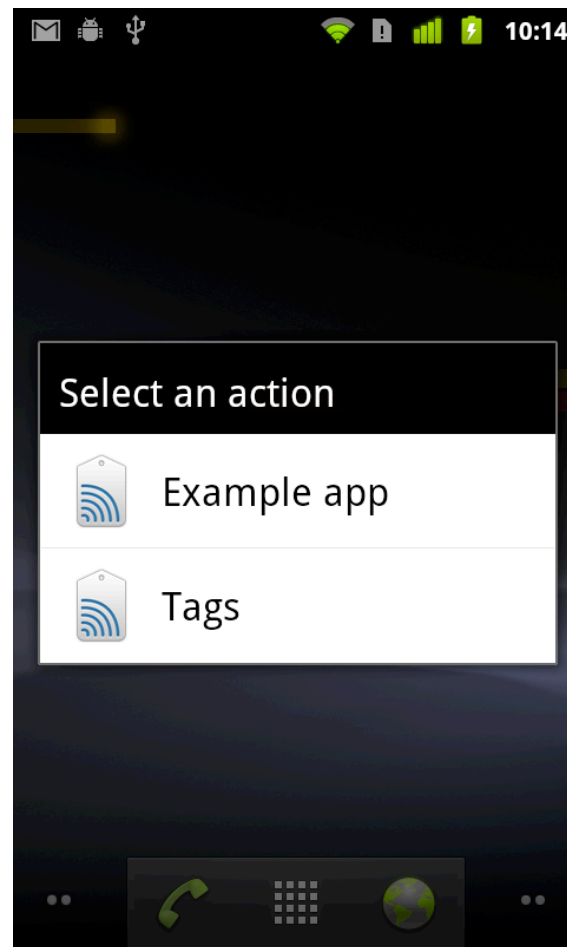

MyActivity.java:

```
protected void onResume() {
    ...
    NdefMessage msg =
        getIntent().getParcelableArrayExtra(NfcAdapter.EXTRA_NDEF_MESSAGES)[0];
    Byte[] payload = msg.getRecords()[0].getPayload()
    ...
}
```

Reading NDEF

Part 4 – Best Practices

- Always use precise intent filters

What can I read NDEF from?

- Passive NFC Forum Tags
 - Tag Type 1: Topaz™
 - Tag Type 2: MIFARE Ultralight™
 - Tag Type 3: Felica™
 - Tag Type 4: MIFARE Desfire™
- Proprietary NFC Tags
 - MIFARE Classic™ (supported by Nexus S)
- Peer to Peer Devices
 - Android to Android

NFC Stickers

Type 4 Tag, 2KB

Writing – Passive tags

- NDEF Tags can be writeable

Write the payload while the tag is in the field

```
String text;  
NdefRecord textRecord = new NdefRecord(NdefRecord.TNF_MIME_MEDIA,  
    "text/plain".getBytes(), text.getBytes());  
NdefMessage textMessage = new NdefMessage(new NdefRecord[]{textRecord});  
Tag tag = getIntent().getExtra(NfcAdapter.EXTRA_TAG);  
Ndef ndef = Ndef.get(tag);  
ndef.writeNdefMessage(textMessage);
```

Writing – Peer to Peer

- **Foreground** Activities can register an NDEF payload for P2P push

Register the payload in advance

```
adapter.enableForegroundNdefPush(this, ndefMessage);
```

- **Ice Cream Sandwich preview**

Register interest in P2P in advance, push the payload live

```
public interface NdefPushCallback {  
    public NdefMessage createMessage();  
}  
adapter.registerForegroundNdefPush(this, callback);
```

How to NFC, 201

We've talked about

- NDEF Tag Read
- NDEF Tag Write
- NDEF peer-to-peer

...

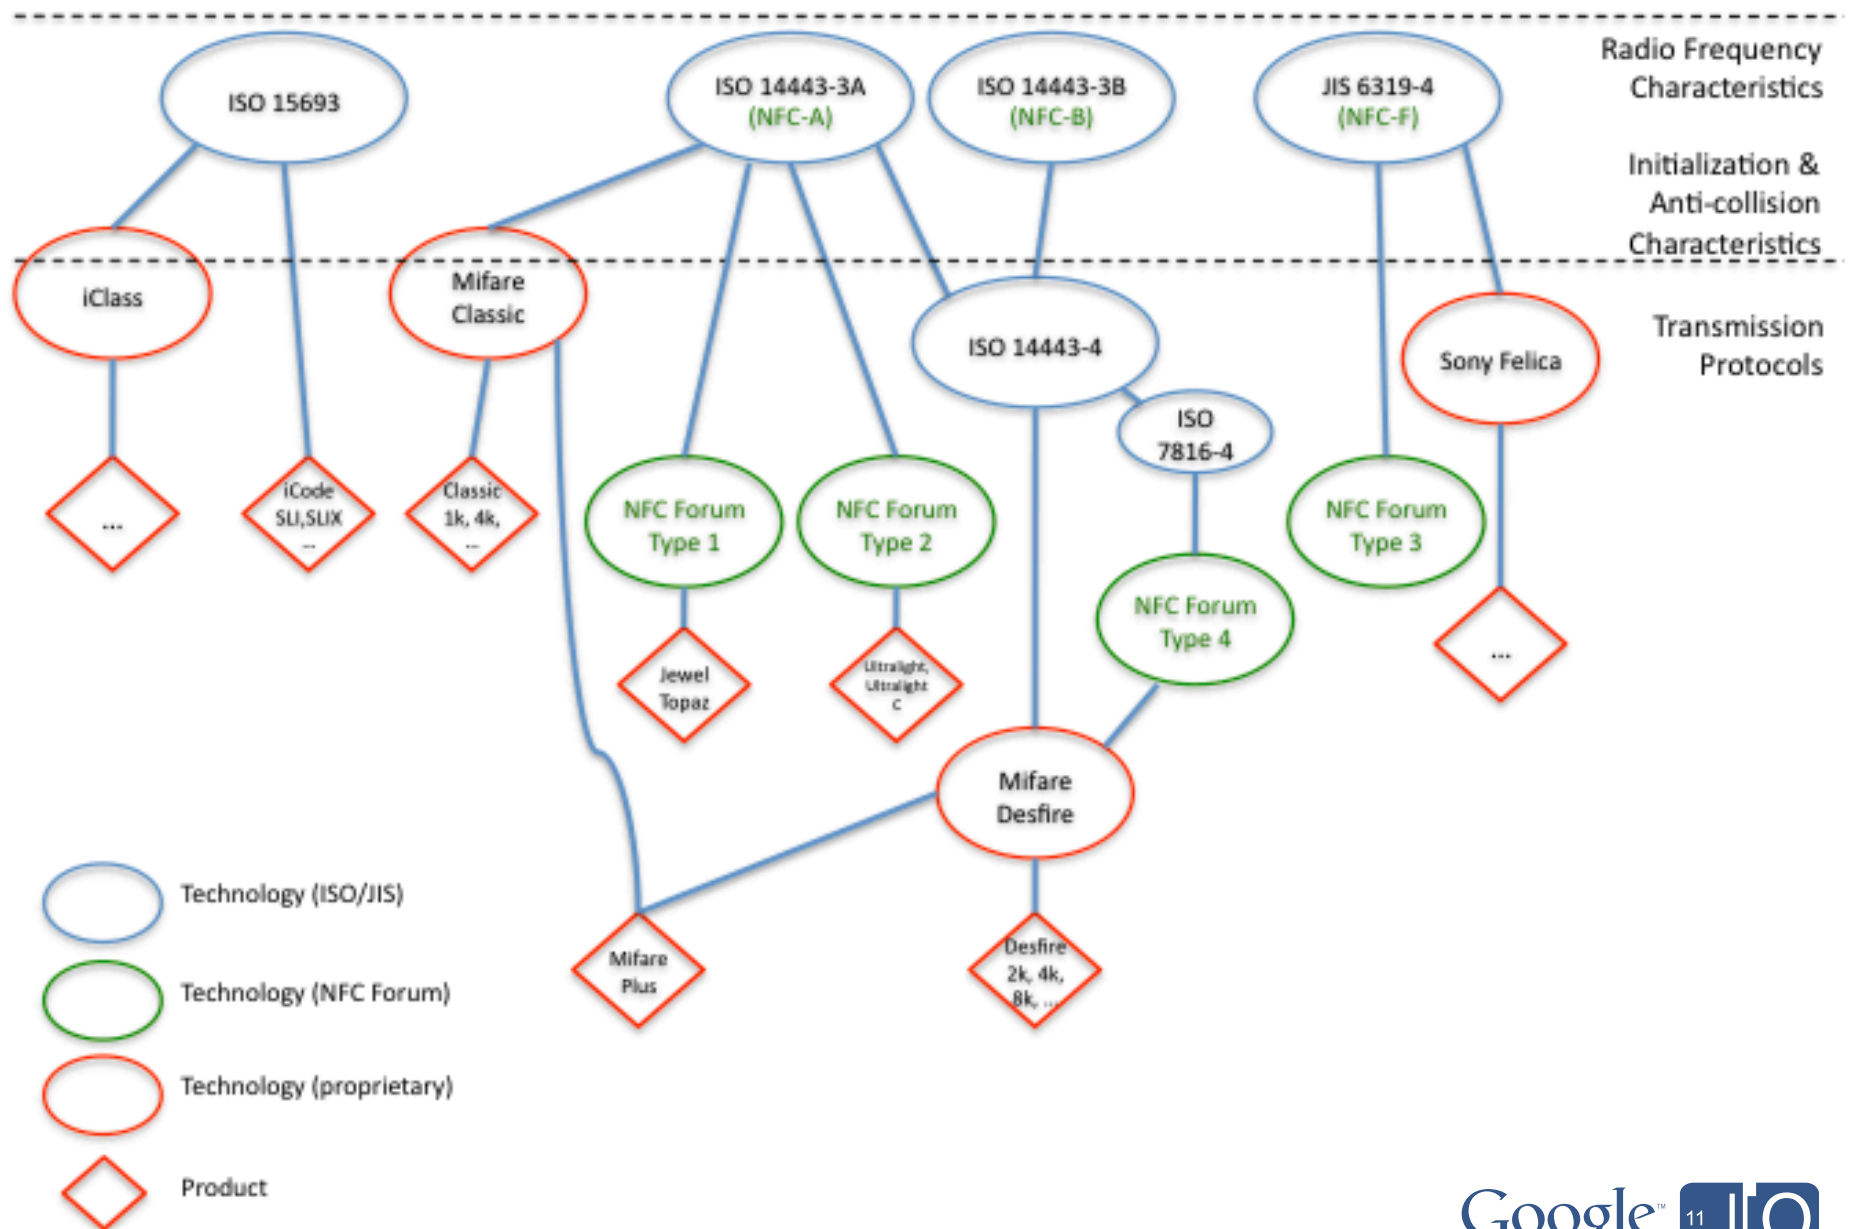

...are all NFC Tags NDEF?

Beyond NDEF...

There are over 5 billion NFC tags already deployed, that you might want to read or write, but most of them do not contain NDEF

- Transit
- Credit Cards
- Passports
- Physical Access Cards

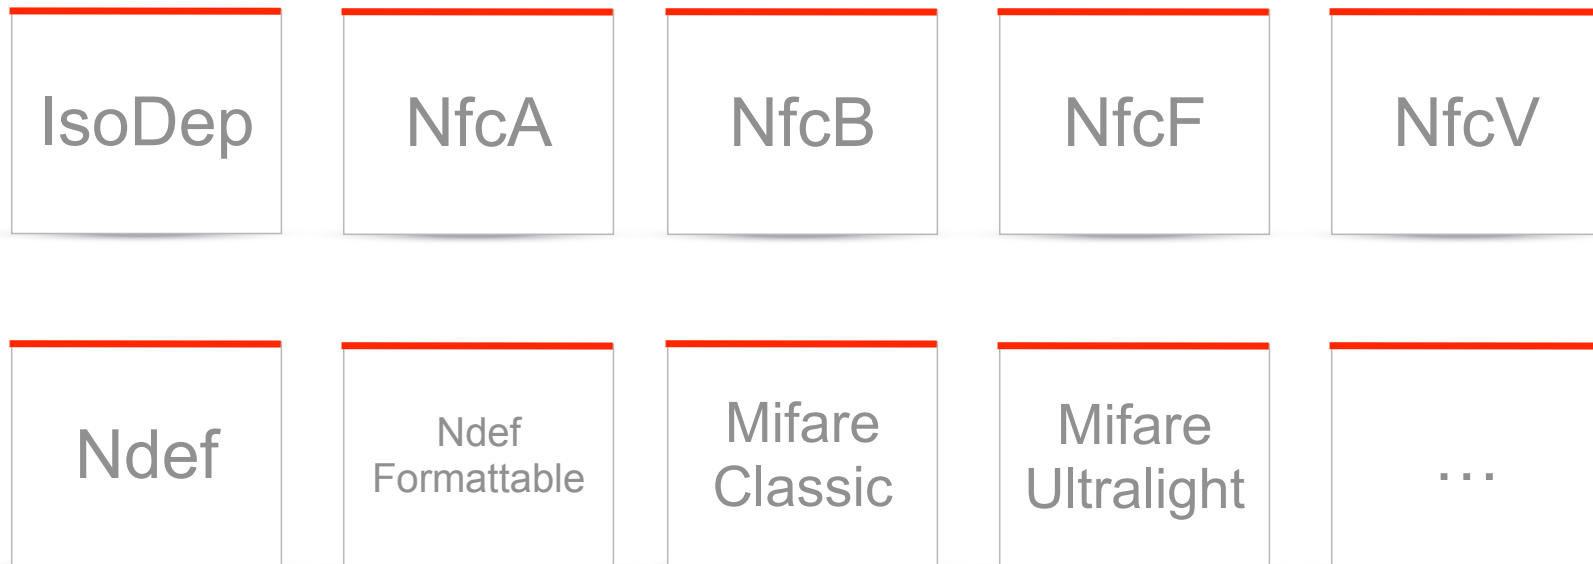

Beyond NDEF...

Beyond NDEF...

`android.nfc.technology`

- Classes to expose *technology specific* functionality
- A tag may have **zero or more** technologies present

Advanced Tag Dispatch

Introducing ACTION_TECH_DISCOVERED

Filter on the technologies you want to use (instead of NDEF contents)

For example

- I want all tags with NfcA **AND** IsoDep
- I want all tags with NfcA **OR** NfcB

Advanced Tag Dispatch

Introducing `enableForegroundDispatch()`

Peer-to-peer revisited

NFC

- Low Friction (no discovery or pairing)
- Low Range (1-4cm)
- Low Data Rate (106-414 kbps)

Bluetooth

- High Friction (12 second discovery, UI for pairing)
- High Range (10's of meters)
- High Data Rate (3Mbps, higher for 3.0)

Bluetooth + NFC == Wireless Nirvana

Recap

- Quick connection setup
- Passive devices
- NDEF dispatch – precise intent filters!
- Foreground interaction
- Bluetooth + NFC == Wireless Nirvana

Question 1 – Privacy

- Proximity – NFC is not RFID
- On Android NFC is off when the screen is off (no butt sniffing)
- 3rd party applications must be in the foreground to use NFC

Question 2 – Security

- NFC is by design extremely low power, attacker needs to be less than a meter away
- That said, there is no link level encryption built into NFC
- Applications should implement their own cryptographic solutions on the data being transferred over NFC if security is extremely important (access control, financial instruments)

Question 3 – Card Emulation

- We've talked a lot about Peer-Peer and Reader/Writer
- Gingerbread has no API support for Card Emulation
- Most popular topic on android-developers@googlegroups.com
- This is a useful use-case for deployments with legacy reader terminals

Why?

1. A single phone can read and write many different tag technologies, but can typically only emulate **one** technology
2. Limited resource, which application gets the right to manage card emulation?
