Agenda

- Intel on HTML5
- Optimize Web App
 - Methodology
 - Case Study
 - WAPA

Intel on HTML5

A CROSS PLATFORM
LANGUAGE

FLEXIBLE
CLOUD

ROBUST
SECURITY

THREE KEY ELEMENTS OF
**TRANSPARENT
COMPUTING**

HTML5 becomes a key element of the next era of computing

Intel Commit to Provide Best HTML5 Experience

Collaborate with leading Web browser vendors

- **750+** patches to Webkit in the last 2 months
 - the **2nd largest contributor** to Chromium behind Google*
-
- HTML5 and EcmaScript implementations – WebRTC, RiverTrail etc.
 - Open source tools on **01.org** – Web Simulator, RIB etc.

Web Simulator

RIB (Rapid Interface Builder)

Intel HTML5 Toolkit Introduction

The Intel XDK interface is shown on a laptop screen. It features a central smartphone emulator displaying the XDK logo, a left sidebar with project management tools, and a right sidebar with various settings and a map view.

intel XDK

- 1 Write**
 - HTML/HTML5
 - CSS
 - JavaScript
- 2 Emulate**
 - Smartphones
 - Tablets
 - Webapps
- 3 Build App**
 - iOS
 - Android
 - Facebook
 - Kindle
 - Nook
 - Desktop Browser

Intel App Framework

jqMobi

A fast query
selector library

jqUI

Cross platform UI
library

jqPlugin

Plugins to augment
applications

Optimize Web App - Methodology

General Optimization Methodology

Optimize Web App

Application Level

- Loading efficiency
- Slow APIs
- Cache
- Language characteristics

Library Level

- Query selector
- DOM manipulation
- Event binding

Web Runtime Level

- Rendering engine
- JS engine

Optimize Web App

- Case Study

Case Study 1 – jQuery Selector

Pattern 1 `$ ( 'ul#list li' )` **1.0x**

Pattern 2 `$ ( 'li' , '#list' )` **1.6x**

Pattern 3 `$ ( '#list' ) .find ( 'li' )` **1.9x**

Pattern 4 `$ ( 'ul#list' ) .find ( 'li' )` **1.2x**

Case Study 1 – Root Cause

Case Study 1 – Best Practice

```
$ ( 'ul#list li' )
```

Divide into shortcut selectors

```
$ ( 'ul#list' ) .find ( 'li' )
```

Reduce redundant selectors around #id selector

```
$ ( '#list' ) .find ( 'li' )
```

Case Study 2 – Static Style

Pattern 1 `foo.style.backgroundColor = 'red'`
`foo.style.width = '200px'` **1.0x**

Pattern 2 `foo.style.cssText = 'background-`
`color: red; width: 200px; '` **0.2x**

Pattern 3 `foo.classList.add('my-style')` **2.2x**

Pattern 4 `foo.className = 'my-style'` **2.4x**

Case Study 2 – Root Cause

JS Code

Under the Hood

```
1 foo.style.cssText = 'background-color: red; width: 200px; '
```

```
1 load(style)
  create-css-parser
  parse-css
  set-styles
```

New CSS parser should be created each time

```
1 foo.style.backgroundColor = 'red'
2 foo.style.width = '200px'
```

```
1 load(style)
  set-style
2 load(style)
  set-style
```

No CSS parsing

```
1 foo.className = 'my-style'
```

```
1 set-attr (class,
  my-style)
```

No property loading

Case Study 2 – Best Practice

```
foo.style.backgroundColor = 'red'  
foo.style.width = '200px'
```

Use className property

```
foo.className = 'my-style'
```

Case Study 3 – Global Variable

Pattern 1 `self.v += 1` 1x

Pattern 2 `obj.v += 1` 21x

Pattern 3 `v += 1` 23x

Case Study 3 – Root Cause

JS Code

```
1 self.v += 1;
```

Under the Hood

```
1 load-named-generic_runtime (v)  
  Add (v, 1)
```

JIT call runtime to load global property variable

```
1 obj.v += 1;
```

```
1 cmp [ecx+0xff], obj_hidden_class  
  jnz Bailout  
  mov edi, [ecx+property_offset]  
  Add (v, 1)
```

Hidden class speeds up property access

```
1 v += 1;
```

```
1 load-global-cell(v)  
  Add (v, 1)  
  store-global-cell(v)
```

Even faster access through closure variable

Case Study 3 – Best Practice

```
self.v += 1
```

Store values in normal object

```
obj.v += 1
```

Store values in closure variable

```
v += 1
```

Case Study 4 – Cache Closure Variable

Pattern 1

```
var v;  
function NoCache() {  
    for (var i = 0; i < 10000; i++)  
        v += i;  
}
```

1.0x

Pattern 2

```
var v;  
function Cache() {  
    var local = v;  
    for (var i = 0; i < 10000; i++)  
        local += i;  
    v = local;  
}
```

5.7x

Case Study 4 – Root Cause

JS Code

```
1 var v;  
2 function NoCache() {  
3   for (var i = 0; i < 10000; i++)  
4     v += i;  
  
5 }
```

Under the Hood

```
1  
2  
3 for loop  
4   load-global-cell(v)  
   Add(v, i)  
   store-global-cell(v)  
5
```

Load/Store global cell for each loop

```
1 var v;  
2 function Cache() {  
3   var local = v;  
4   for (var i = 0; i < 10000; i++)  
5     local += i;  
6   v = local;  
7 }
```

```
1  
2  
3 load-global-cell(v)  
4 for loop  
5   Add(local, i)  
6 store-global-cell(v)  
7
```

Load/Store global cell only once

Case Study 4 – Best Practice

```
var v;  
function Cache() {  
    var local = v;  
    for (var i = 0; i < 10000; i++)  
        local += i;  
    v = local;  
}
```

Cache closure variables into local & batch operations

Case Study 5 – With Statement

Pattern 1	<pre>with (obj) { v += 1; }</pre>	1.0x
-----------	---	------

Pattern 2	<pre>obj.v += 1;</pre>	42x
-----------	------------------------	-----

Case Study 5 – Root Cause

JS Code

```
1 with (obj) {  
2   v += 1;  
  
3 }
```

Under the Hood

```
1  
2 if (obj.v === undefined) {  
    v = v + 1;  
  } else {  
    obj.v = obj.v + 1;  
  }  
3
```

JS engine cannot optimize so many possibilities for each variable access

Case Study 5 – Best Practice

```
with (obj) {  
    v += 1;  
}
```

Use object property instead of
with statement

```
obj.v += 1;
```

Optimize Web App - WAPA

Make it
HTML5
Without Boundaries

WAPA

- Web Application Performance Aalyzer
- Statically analyze web applications
- Based on micro-benchmarks and best practices

Q & A

Software

software.intel.com/html5

Backup

Case Study – Negative

Pattern 1

```
function abs(x) {  
    return x > 0 ? x : -x;  
}
```

1.0x

Pattern 2

```
function abs(x) {  
    return x >= 0 ? x : -x;  
}
```

1.1x

Case Study – Children Nodes

Pattern 1

```
var children = parentNode.childNodes;  
for (var i = 0, len = children.length;  
     i < len; i++) {  
    handleNode(children[i]);  
}
```

1.0x

Pattern 2

```
var child = parentNode.firstChild;  
while (child) {  
    handleNode(child);  
    child = child.nextSibling;  
}
```

1.4x

Case Study – String Join

Pattern 1 `var str = sArr.join("");`

1.0x

Pattern 2

```
var str = "";
for (var i = 0, length = sArr.length;
    i < length; i++) {
    str += sArr[i];
}
```

4.1x

Case Study - Reflow

Pattern 1

```
target.style.width =  
    source.clientWidth + 'px';  
target.style.height =  
    source.clientHeight + 'px';
```

1.0x

Pattern 2

```
var clientWidth = source.clientWidth;  
var clientHeight = source.clientHeight;  
target.style.width = clientWidth + 'px';  
target.style.height = clientHeight + 'px';
```

1.8x
