# Signature Gateway Profile of the OASIS Digital Signature Service

3

4

## Committee Draft, 13 June 2005

5

(editorial revision for public review 11 September 2006)

6

### Document identifier:

7

oasis-dss-1.0-profiles-SignatureGateway-spec-cd-r1

8

### Location:

9

<http://docs.oasis-open.org/dss/v1.0/>

10

### Editor:

11

Glenn Benson, JPMorgan

12

### Contributors:

13

Burt Kaliski, RSA Security

14

John Linn, RSA Security

15

Trevor Perrin, Individual

16

### Abstract:

17

This draft profiles the OASIS DSS core protocol for signature gateway transformation processing. This profile is intended to be generic, so it may be combined with other profiles freely.

18

19

20

### Status:

21

This is a **Public review Draft** produced by the OASIS Digital Signature Service Technical Committee. Comments may be submitted to the TC by any person by clicking on "Send A Comment" on the TC home page at:

22

23

[http://www.oasis-open.org/committees/tc\\_home.php?wg\\_abbrev=dss](http://www.oasis-open.org/committees/tc_home.php?wg_abbrev=dss)

24

25

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Digital Signature Service TC web page at <http://www.oasis-open.org/committees/dss/ipr.php>.

# 1 Introduction

66

## 1.1 Profile Type

67

An OASIS DSS profile has exactly one class: *concrete* or *abstract*. The most significant difference between the two classes is that one may directly implement a concrete protocol; however, one may not claim conformance of a specific realization to an abstract protocol. A concrete profile sufficiently constrains the flexibility of the DSS core protocol **[DSSCore]** so that a profile-compliant client and server should be interoperable at the levels of the protocol as defined in the profile. An abstract profile requires further definition of a subordinate concrete profile before an implementer may create a conformant realization.

74

This document identifies one abstract profile and two concrete profiles. The abstract profile defines all definitions required for DSS interoperability with one exception: transmission binding.

76

The concrete profiles fill the gap by permitting an implementer to build a realization and claim Signature Gateway Profile realization by both conforming to the abstract profile, and conforming to a permissible transmission binding as defined in one of the concrete profiles.

79

The two concrete profiles identified in this document each a specific transmission binding:

80

- HTTP POST Transport Binding, or

81

- SOAP 1.2 Transport Binding.

82

The addition of security to these bindings is optional.

83

Subsequent revisions may either add new concrete profiles in separate documents, or as modifications to this document.

85

The following sections describe how to understand the rest of this document.

86

## 1.2 Overview (Non-Normative)

87

This document standardizes a Signature Gateway by profiling the DSS signing and verifying protocols **[DSSCore]**. This Signature Gateway transforms both *signing technology* and *credential logistics*. The signing technology specifies the mechanisms through which one creates and verifies a signature. Example technologies include, but are not limited to photocopied signatures, Public Key Infrastructure signatures, and signatures defined using symmetric keying material (see **[XMLDSIG]** for some symmetric specifications). Credential logistics, describes the means to distribute credentials to remote parties; and the associated vehicle for distributing trust. Although electronic means allows communication at a distance, geographic separation increases the difficulty of trusting one's peers. Credentials overcome many of the geographic impediments to trust; and the associated logistics securely define the means of managing the credential lifecycle, e.g., distribution, revocation, renewal, and retirement.

98

Each kind of technology and logistics has its own distinct advantages and disadvantages. As a result, no universal best-of-breed solution exists for all deployment scenarios. Some scenarios require different solutions for distinct spaces; and a gateway serves as an intermediary connector. The DSS Signature Gateway operates in the following use case. A signer applies its signing credential to create a signature. The signer does not transmit the signature directly to a recipient, because the recipient might not understand the signer's signature technology; and the recipient may not trust the signer's credential. Instead, the signer sends the signature to a mutually trusted Signature Gateway which transforms the signature into a format that the

100

101

102

103

104

105

106 recipient validates. The Gateway's transformation operation first validates the original signature,  
107 and then creates a new signature. Consider the following example. An organization may allow  
108 its employees and machines to trust communication that originates from within the security  
109 perimeter, while requiring extra security for externally-originated messages. Rather than  
110 distribute the means for secure interoperability throughout the enterprise and extranet, the  
111 organization may establish a trusted Signature Gateway. The Gateway validates its incoming  
112 messages from the external parties; and then marks the Gateway's stamp of approval which  
113 downstream servers consume.

114 The signature gateway profile may operate in multiple different deployment models. Two  
115 example models are described below.

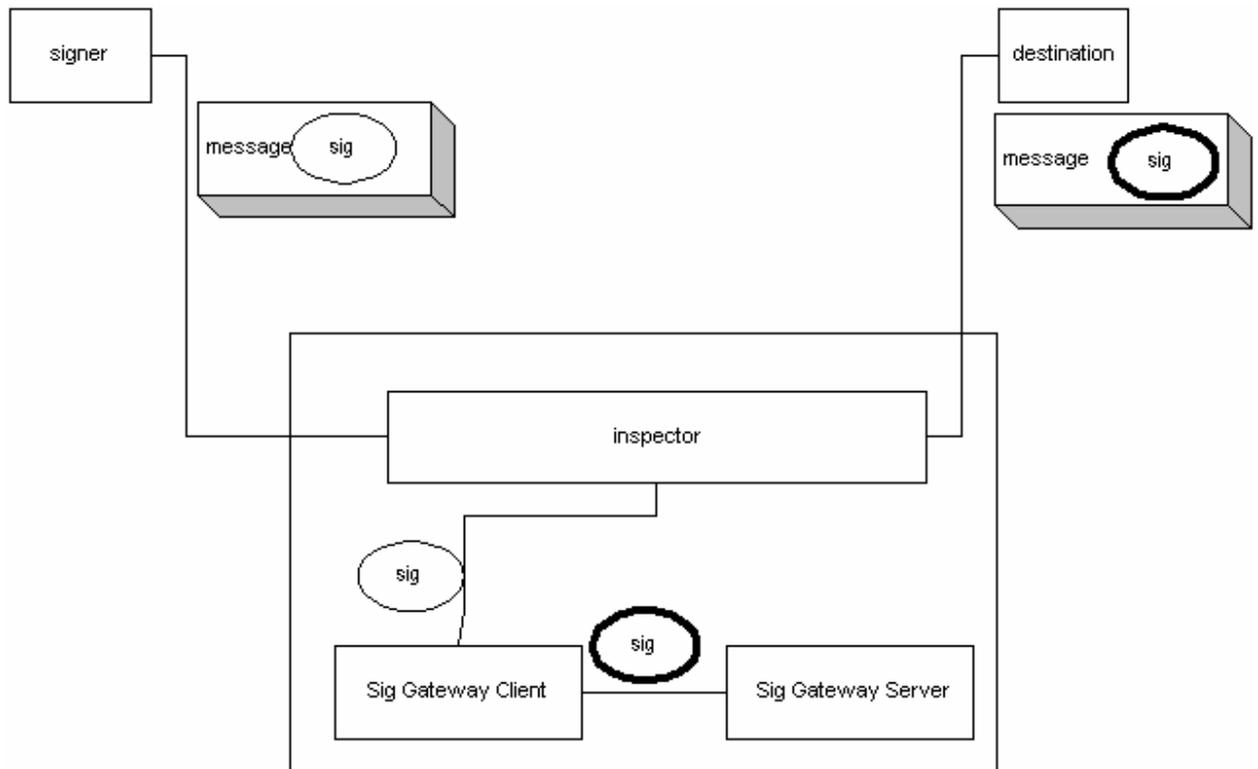

### 116 **1.3 Request-Response Deployment Model**

117 The request-response deployment model has three actors: signature client, DSS client, and DSS  
118 Signature Gateway Server.

- 119 1. The signature client signs a document or transaction, and sends the signed data to the  
120 DSS client.
- 121 2. The DSS client wraps the signed data in the context of DSS Signature Gateway Profile  
122 VerifyRequest, and sends the request to the DSS Signature Gateway Server.
- 123 3. The DSS Signature Gateway server performs the necessary validation services, and  
124 returns a DSS Signature Gateway VerifyResponse to the DSS client.

### 125 **1.4 In-Line Deployment Model**

126 Devices located at the security perimeter may combine Signature Gateway with other security  
127 services. Consider for example, deep packet inspection firewalls, content-inspecting load  
128 balancers, intelligent reverse proxies, or XML firewalls. These devices contain the technology to  
129 inspect incoming communication while searching for signatures. When the device identifies a  
130 signature within the context of a message, the device applies the Signature Gateway  
131 transformation, and then forwards the modified communication to the destination. The Figure  
132 below illustrates the constituent components:

133  
134

135 The request-response deployment model has three actors: signer, inline proxy, and destination.  
136 The inline proxy has three constituent components: inspector, Signature Gateway Client, and  
137 Signature Gateway Server.

- 138 1. The signer sends a message that contains a signature to the in-line proxy.
- 139 2. The inspector component of the in-line proxy captures the message and searches for  
140 signed data. If the inspector identifies signed data, then the inspector passes the signed  
141 data to the DSS Signature Gateway Client.
- 142 3. The DSS Signature Gateway Client creates DSS Signature Gateway VerifyRequest using  
143 the signed data. The DSS client sends this VerifyRequest to the DSS Signature Gateway  
144 Server component.
- 145 4. The DSS Signature Gateway Server responds issuing a VerifyResponse.
- 146 5. The DSS client passes the response to the inspector component.
- 147 6. The inspector modifies the message per the response returned from the DSS Signature  
148 Gateway Server and sends the modified message to a downstream, destination  
149 application.

## 150 1.5 Notation

151 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD",  
152 "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be  
153 interpreted as described in IETF RFC 2119 [RFC 2119]. These keywords are capitalized when  
154 used to unambiguously specify requirements over protocol features and behavior that affect the

155 interoperability and security of implementations. When these words are not capitalized, they are  
156 meant in their natural-language sense.

157 This specification uses the following typographical conventions in text: `<ns:Element>`,  
158 `Attribute`, **Datatype**, `OtherCode`.

## 159 1.6 Namespaces

160 Conventional XML namespace prefixes are used in this document:

161 - The prefix `dss:` (or no prefix) stands for the DSS core namespace [**Core-XSD**].

162 - The prefix `ds:` stands for the W3C XML Signature namespace [**XMLDSIG**].

163 Applications MAY use different namespace prefixes, and MAY use whatever namespace  
164 defaulting/scoping conventions they desire, as long as they are compliant with the Namespaces  
165 in XML specification [**XML-ns**].

---

## 166 2 Profile Features

### 167 2.1 Identifier

168 urn:oasis:names:tc:dss:1.0:profiles:siggty

169 This identifier names an abstract profile. An <AdditionalProfile> identifier is mandatory in order to  
170 name a subordinate concrete profile.

#### 171 2.1.1 Core HTTP Transport Binding

172 The following <AdditionalProfile> specifies a concrete profile:

173 urn:oasis:names:tc:dss:1.0:HTTP-POST-Transport-binding

174

175 This concrete profile requires:

- 176 - ingress: HTTP POST Transport binding as specified in the 1.0 core
- 177 - egress: unspecified

178

#### 179 2.1.2 Core SOAP 1.2 Transport Binding

180 The following <AdditionalProfile> specifies a concrete profile:

181

182 urn:oasis:names:tc:dss:1.0:SOAP-Transport-binding

183

184 This concrete profile requires:

- 185 - ingress: SOAP 1.2 Transport binding as specified in the 1.0 core
- 186 - egress: unspecified

#### 187 2.1.3 Other Transport Bindings Defined as Concrete Sub-Profiles

188 If the transport binding is defined as in a subordinate profile, then add the requisite identifier as an  
189 <AdditionalProfile>.

190

## 191 2.2 Scope

192 This document profiles the DSS signing and verifying protocols defined in **[DSSCore]** and profiles  
193 XML signature format for a signature gateway. This document permits other signature formats  
194 such as CMS **[RFC3369]**.

## 195 2.3 Relationship To Other Profiles

196 This profile is based directly on the **[DSSCore]**.

197

198 This document contains an abstract profile and two concrete protocols.

## 199 **2.4 Signature Object**

200 This profile supports the verification of incoming signatures and the production of a resultant  
201 signature by the gateway. The profile MUST support XMLDSIG **[XMLDSIG]** for both incoming  
202 and produced signatures. Other formats are optional. This means that a Signature Gateway  
203 MAY accept incoming signatures in a non-XMLDSIG compliant format, e.g., CMS **[RFC3369]**.

## 204 **2.5 Transport Binding**

205 The combination of this abstract profile and a permissible transport binding provides sufficient  
206 specification for interoperability. For the transport bindings see the concrete protocols:  
207 **[DSSCore]** HTTP POST Transport binding as named by urn:oasis:names:tc:dss:1.0:HTTP-  
208 POST-Transport-binding, and **[DSSCore]** SOAP Transport Binding as named by  
209 urn:oasis:names:tc:dss:1.0:SOAP-Transport-binding.

210 Other permissible transport bindings may be defined in subordinate concrete profiles.

## 211 **2.6 Security Binding**

212 A security binding is permissible but not required. If used, this profile does not specify or  
213 constrain the security binding.

---

214 **3 Profile of Signing Protocol**

215 **3.1 Element <SignRequest>**

216 The <dss:SignRequest> is not supported in the Signature Gateway Profile.

217 **3.2 Element <SignResponse>**

218 The <dss:SignResponse> is not supported in the Signature Gateway Profile.

---

## 219 4 Profile of Verifying Protocol

### 220 4.1 Element VerifyRequest

### 221 4.2 Element OptionalInputs

222 The Signature Gateway Profile MAY support any client or server optional input defined in  
223 **[DSSCore]**. However, some optional inputs are mandatory, or further clarified as described  
224 below.

#### 225 4.2.1.1 Optional input < ServicePolicy >

226 The Signature Gateway MUST support the optional input defined in **[DSSCore]**  
227 `<dss:ServicePolicy>`. The `<dss:ServicePolicy>` MUST include a description of the  
228 signature that the Signature Gateway accepts (ingress). In addition `<dss:ServicePolicy>`  
229 MUST either include a description of the signature that the Signature Gateway produces (egress),  
230 or explicitly note the policy for the egress signature using the term “unspecified”.

231

232 The `<dss:ServicePolicy>` specification for the ingress signature MUST include the following  
233 items:

- 234 • The type of employed signature: **[XMLDSIG]** or **[RFC3369]**.
- 235 • Signature algorithm

236 The `<dss:ServicePolicy>` specification MAY include additional items such as signature  
237 attributes, properties, or policies. Topics include, but are not limited to the items on the following  
238 list:

- 239 • *Signed References and Properties*: Policy that determines if all the Signature Gateway  
240 validates some, or all of the signed references and properties such as the manifest, and  
241 timestamp.
- 242 • *Revocation*: Policy that specifies the rules by which the Signature Gateway checks  
243 revocation on the input signature
- 244 • *Signature Coverage*: Policy that determines if the Gateway’s signature covers the  
245 original document, the signature, the manifest, the signature properties, or some  
246 combination of the above.
- 247 • *Timestamp*: Policy that specifies any requirement for a timestamp, including the format.
- 248 • *Revocation*: Policy that specifies the format, and server that provides revocation  
249 information.

250

251 A Signature Gateway server MUST support at least one Service Policy. In the Signature  
252 Gateway Profile, the `<dss:ServicePolicy>` is NOT optional, i.e., the client must provide it in  
253 each request. A Signature Gateway MAY publish its service policy, where the means for  
254 publication is outside the scope of DSS.

#### 255 **4.2.1.2 OptionalInput < ReturnUpdatedSignature >**

256 Each <dss:VerifyRequest> MUST contain the optional input defined in[DSSCore]  
257 <dss:ReturnUpdatedSignature>. The DSS Server MUST NOT sign the input document  
258 unless it first validates the input <dss:SignatureObject> successfully.

### 259 **4.3 Element <VerifyResponse>**

#### 260 **4.3.1 Element <ResultMajor>**

261 If the <dss:VerifyRequest> misses any of the required <dss:OptionalInputs>, then the  
262 DSS server MUST return the following response in <dss:ResultMajor>.

263 urn:oasis:names:tc:dss:1.0:resultmajor:RequesterError

#### 264 **4.3.2 Element <ResultMinor>**

265

266 If the <dss:VerifyRequest> misses any of the required <dss:OptionalInputs>, then the  
267 DSS server MUST return the following response in <dss:ResultMinor>:

268 urn:oasis:names:tc:dss:1.0:resultminor:siggty:NotSupported

269

270 The <dss:ResultMessage> SHOULD contain the identity of the missing  
271 required <dss:OptionalInputs>.

#### 272 **4.3.2.1 Signature type mismatch with requested key**

273 If the <dss:VerifyRequest> explicitly specifies a <dss:KeySelector>, where the Signature  
274 Gateway's key is not valid, then the Signature Gateway MUST return an error with the following  
275 code in <dss:ResultMinor>:

276

277 urn:oasis:names:tc:dss:1.0:resultminor:siggty:KeyNotSupported

#### 278 **4.3.2.2 Signature policy not supported**

279 If the <dss:VerifyRequest> explicitly specifies an unsupported <dss:ServicePolicy>,  
280 then the Signature Gateway MUST return an error with the following code in  
281 <dss:ResultMinor>.

282

283 urn:oasis:names:tc:dss:1.0:resultminor:siggty:ServicePolicyNotSupported

284

### 285 **4.3.3 Element <OptionalOutputs>**

#### 286 **4.3.3.1 OptionalOutput < UpdatedSignature >**

287 If the Signature Gateway Server fails to validate the signature in the VerifyRequest, then the  
288 Signature Gateway Server MUST NOT include the <dss:UpdatedSignature>. If the Signature

289 Gateway Server successfully validates the signature in the VerifyRequest, then the Signature  
290 Gateway Server SHOULD include the <dss:UpdatedSignature>

---

291 **5 Profile of Signatures**

292 The profile MAY support the XML Signature as defined in **[XMLDSIG]** or **[XAdES]**. within the  
293 `<ds:object>` element of the XML signature.

294

295 The profile MAY support the CMS signature as defined in **[RFC3369]** specified as a  
296 `<Base64Signature>` as defined in **[DSSCore]**.

297

---

298 **6 Server Processing Rules**

299 **6.1 VerifyRequest**

300 In addition to the processing specified in **[DSSCore]**, the DSS server additionally validates the  
301 existence of all required optional inputs. The DSS server **MUST NOT** produce a signature unless  
302 it first successfully validates the client's signature in accordance with the Service Policy.
