Description: Computes the value FALSE. (A call to function FALSE is equivalent to using the *logical-constant* FALSE.)

Arguments: None.

Return Type and Value: logical – The value FALSE.

[Example:

FALSE() results in FALSE

end example]

18.17.7.118 FDIST

Syntax:

FDIST (x , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the F probability distribution.

Mathematical Formula:

$$FDIST = P(F > x)$$

where:

- F is a random variable that has an F distribution with degrees of freedom *degrees-freedom-1* and *degrees-freedom-2*
- x is argument x

Arguments:

Name	Type	Description
x	number	The value at which the function is to be evaluated.
<i>degrees-freedom-1</i>	number	The number of degrees of freedom for the numerator, truncated to an integer.
<i>degrees-freedom-2</i>	number	The number of degrees of freedom for the denominator, truncated to an integer.

Return Type and Value: number – The F probability distribution.

However, if

- x is negative, #NUM! is returned.
- $\text{degrees-freedom-1} < 1$ or $\text{degrees-freedom-1} \geq 10^{10}$, #NUM! is returned.
- $\text{degrees-freedom-2} < 1$ or $\text{degrees-freedom-2} \geq 10^{10}$, #NUM! is returned.

[Example:

FDIST(12.345,3,4) results in 0.017226183

end example]

18.17.7.119 FIND

Syntax:

FIND (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-sensitive search using a lexical comparison for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (FIND is intended for use with languages that

use the single-byte character set (SBCS), whereas FINDB (§18.17.7.120) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> .
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example:

FIND("de", "abcdef") results in 4

FIND(A10, B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

18.17.7.120 FINDB

Syntax:

FINDB (*string-1* , *string-2* , [*start-pos*])

Description: Performs a case-sensitive search using a lexical comparison for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (FINDB is intended for use with languages that use the double-byte character set (DBCS), whereas FIND (§18.17.7.119) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string

Name	Type	Description
<i>string-2</i>	text	designated by <i>string-2</i> .
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example: Assuming 1-byte characters

FINDB("de", "abcdef") results in 4

FINDB(A10, B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

18.17.7.121 FINV

Syntax:

FINV (*probability* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the inverse of the F probability distribution. Given a value for *probability*, FINV seeks that value *x* such that $\text{FDIST}(x, \text{degrees-freedom-1}, \text{degrees-freedom-2}) = \text{probability}$. Thus, precision of FINV depends on precision of FDIST.

Arguments:

Name	Type	Description
<i>probability</i>	number	A probability associated with the F cumulative distribution.
<i>degrees-freedom-1</i>	number	The number of degrees of freedom for the numerator, truncated to an integer.
<i>degrees-freedom-2</i>	number	The number of degrees of freedom for the denominator, truncated to an integer.

Return Type and Value: number – The inverse of the F probability distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10¹⁰, #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10¹⁰, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned

[Example:

FINV(0.5,3,4) results in 0.940534076

end example]

18.17.7.122 FISHER

Syntax:

FISHER (*x*)

Description: Computes the Fisher transformation at *x*.

Mathematical Formula:

$$z' = \frac{1}{2} \ln \left(\frac{1+x}{1-x} \right)$$

where:

- *x* = argument *x*

Arguments:

Name	Type	Description
<i>x</i>	number	The number for which the transformation is wanted.

Return Type and Value: number – The Fisher transformation at *x*.

However, if

- $x \leq -1$, #NUM! is returned.
- $x \geq 1$, #NUM! is returned.

[Example:

FISHER(-0.43) results in -0.459896681

FISHER(0.578) results in 0.659454094

end example]

18.17.7.123 FISHERINV

Syntax:

FISHERINV (*y*)

Description: Computes the inverse of the Fisher transformation.

Mathematical Formula:

$$x = \frac{e^{2y} - 1}{e^{2y} + 1}$$

where:

- *y* = argument *y*

Arguments:

Name	Type	Description
<i>y</i>	number	The number for which the inverse of the transformation is wanted.

Return Type and Value: number – The inverse of the Fisher transformation.

[*Example:*

FISHERINV(-0.43) results in 0.405321309

FISHERINV(0.578) results in 0.521210269

end example]

18.17.7.124 FIXED

Syntax:

FIXED (*number* [, [*num-decimal*] [, *suppress-commas-flag*]])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places, using the same rounding algorithm as ROUND (§18.17.7.278). Thousands separator commas are included as determined by *suppress-commas-flag*.

Arguments:

Name	Type	Description
<i>number</i>	number	Designate the number that is to be formatted, truncated to integer.
<i>num-decimal</i>	number	Designate the number of decimal places to be used in the resulting string. If negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.
<i>suppress-commas-flag</i>	logical	If TRUE, commas are not included; if FALSE or omitted, commas are included.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places.

[Example:

FIXED(1234567) results in 1,234,567.00

FIXED(1234567.555555,4,TRUE) results in 1234567.5556

FIXED(.555555,10) results in 0.5555550000

FIXED(1234567, -3) results in 1,235,000

end example]

18.17.7.125 FLOOR

Syntax:

FLOOR (*x* , *significance*)

Description: Computes *x* rounded down, toward zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded down when adjusted away from zero.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded,
<i>significance</i>	number	The multiple to which <i>x</i> is to be rounded.

Return Type and Value: number – The rounded-down value of *x*.

However, if *x* and *significance* have different signs, #NUM! is returned.

[Example:

FLOOR(2.5,1) rounds 2.5 down to nearest multiple of 1; that is, to 2

FLOOR(-2.5, -2) rounds -2.5 down to nearest multiple of -2; that is, to -2

FLOOR(1.5,0.1) rounds 1.5 down to the nearest multiple of 0.1; that is, to 1.5

FLOOR(0.234,0.01) rounds 0.234 down to the nearest multiple of 0.01; that is, to 0.23

end example]

18.17.7.126 FORECAST

Syntax:

FORECAST (*x* , *known-ys* , *known-xs*)

Description: Calculates, or predicts, a future value by using existing values. The predicted value is a y-value for a given x-value. The known values are existing x-values and y-values, and the new value is predicted by using linear regression.

Mathematical Formula:

FORECAST=a+bx, where:

$$a = \bar{y} - b\bar{x}$$

and:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- *x* = a sample value
- \bar{x} is the sample mean AVERAGE (known - xs)
- *y* = a sample value
- \bar{y} is the sample mean AVERAGE (known - ys)

Arguments:

Name	Type	Description
<i>x</i>	number	The data point for which a value is to be predicted.
<i>known-xs</i>	array, reference	The independent data.
<i>known-ys</i>	array, reference	The dependent data.

Return Type and Value: number – The future value.

However, if

- *known-xs* and *known-ys* are empty or contain a different number of data points, the return value is unspecified.

- The variance of *known-xs* equals zero, the return value is unspecified.

[Example:

FORECAST(30,{6,7,9,15,21},{20,28,31,38,40}) results in 10.60725309

end example]

18.17.7.127 FREQUENCY

Syntax:

FREQUENCY (*data-array* , *bins-array*)

Description: Calculates how often values occur within a range of values. A call to FREQUENCY shall be an array formula.

Arguments:

Name	Type	Description
<i>data-array</i>	array, reference to number	Set of values for which frequencies are to be computed. If <i>data-array</i> contains no values, FREQUENCY returns an array of zeros. Cells containing text or that are empty are ignored.
<i>bins-array</i>	array, reference	Set of intervals into which the values in <i>data-array</i> are to be grouped. If <i>bins-array</i> contains no values, FREQUENCY returns the number of elements in <i>data-array</i> .

Return Type and Value: vertical array of numbers – The frequency at which values occur within a range of values. The number of elements in the returned array is one more than the number of elements in *bins-array*. The extra element contains the count of any values above the highest interval.

[Example:

If the cells A2:A10 contain 79, 85, 78, 85, 50, 81, 95, 88, and 97, and the cells B2:B4 contain 70, 79, and 89, FREQUENCY(A2:A10,B2:B4) results in a vertical array containing 1 (50), 2 (79, 78), 4 (85, 85, 81, 88), and 2 (95, 97).

end example]

18.17.7.128 FTEST

Syntax:

FTEST (*array-1* , *array-2*)

Description: Computes the result of an F-test.

Arguments:

Name	Type	Description
<i>array-1</i>	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>		

Return Type and Value: number – The two-tailed probability that the variances in *array-1* and *array-2* are not significantly different.

However, if

- The number of data points in *array-1* or *array-2* is less than 2, the return value is unspecified.
- The variance of *array-1* or *array-2* is zero, the return value is unspecified.

[Example:

If the cells D6:D10 contain 6, 7, 9, 15, and 21, and the cells E6:E10 contain 20, 28, 31, 38, and 40, FTEST(D6:D10, E6:E10) results in 0.648317847

end example]

18.17.7.129 FV

Syntax:

FV (*rate* , *nper* , *pmt* [, [*pv*] [, [*type*]]])

Description: Computes the future value of an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
<i>rate</i>	number	The interest rate.
<i>nper</i>	number	The total number of payment periods, truncated to integer.
<i>pmt</i>	number	The payment made each period; it cannot change over the life of the annuity. [Note: Typically, <i>pmt</i> contains principal and interest, but no other fees or taxes. end note] If omitted, <i>pv</i> shall be provided.
<i>pv</i>	number	The the present value, or the lump-sum amount that a series of future payments is worth right now. If omitted, it is assumed to be 0, and <i>pmt</i> shall be provided.
<i>type</i>	number	The timing of the payment, truncated to integer, as

Name	Type	Description						
		follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The future value of an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

$FV(0.06/12, 10, -200, -500, 1)$ 2,581.40

$FV(0.12/12, 12, -1000)$ results in 12,682.50

$FV(0.11/12, 35, -2000, , 1)$ results in 82,846.25

$FV(0.06/12, 12, -100, -1000, 1)$ results in 2,301.40

end example]

18.17.7.130 FVSCHEDULE

Syntax:

FVSCHEDULE (*principal* , *schedule*)

Description: Computes the future value of an initial principal after applying a series of compound interest rates.

[Note: This function can be used to calculate the future value of an investment with a variable or adjustable rate.

end note]

Arguments:

Name	Type	Description
<i>principal</i>	number	The present value.
<i>schedule</i>	array	Set of interest rates to apply. The values in this array can be numbers or blank cells. Blank cells are taken as zeros (i.e., no interest).

Return Type and Value: number – The future value of an initial principal after applying a series of compound interest rates.

However, if any element of the array *schedule* is not a number and not blank, #VALUE! is returned.

[Example:

FVSCHEDULE(1,{0.09,0.11,0.1}) results in 1.33089

end example]

18.17.7.131 GAMMADIST

Syntax:

GAMMADIST (*x* , *alpha* , *beta* , *cumulative-flag*)

Description: Computes the gamma distribution.

Mathematical Formula:

The equation for the gamma probability density function is:

$$f(x, \alpha, \beta) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

$$f(x, \alpha, \beta) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

The standard gamma probability density function is:

$$f(x, \alpha) = \frac{x^{\alpha-1} e^{-x}}{\Gamma(\alpha)}$$

When *alpha* = 1, GAMMADIST returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

where:

- α = argument *alpha*
- β = argument *beta*
- x = argument *x*

For a positive integer *n*, when *alpha* = *n*/2, *beta* = 2, and *cumulative* = TRUE, GAMMADIST returns (1-CHIDIST(*x*)) with *n* degrees of freedom.

When *alpha* is a positive integer, GAMMADIST is also known as the Erlang distribution.

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
α	number	A parameter of the distribution.
β	number	A parameter of the distribution. If $\beta = 1$, GAMMADIST returns the standard gamma distribution.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function.

Return Type and Value: number – The gamma distribution.

However, if

- $x < 0$, #NUM! is returned.
- $\alpha \leq 0$ or $\beta \leq 0$, #NUM! is returned.

[Example:

GAMMADIST(10,9,2,FALSE) results in 0.03263902

GAMMADIST(10,9,2,TRUE) results in 0.068093631

end example]

18.17.7.132 GAMMAINV

Syntax:

GAMMAINV (*probability* , α , β)

Description: Computes the inverse of the gamma distribution. Given a value for *probability*, GAMMAINV seeks that value x such that $\text{GAMMADIST}(x, \alpha, \beta, \text{TRUE}) = \text{probability}$. Thus, the precision of GAMMAINV depends on the precision of GAMMADIST.

Arguments:

Name	Type	Description
<i>probability</i>	number	The probability associated with the gamma distribution.
α	number	A parameter of the distribution.
β	number	A parameter of the distribution. If $\beta = 1$, GAMMAINV returns the standard gamma distribution.

Return Type and Value: number – The inverse of the gamma distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *alpha* ≤ 0 or *beta* ≤ 0, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned.

[Example:

GAMMAINV(0.068,9,2) results in 9.997130086

end example]

18.17.7.133 GAMMALN

Syntax:

GAMMALN (*x*)

Description: Computes the natural logarithm of the gamma function.

Mathematical Formula:

$$GAMMALN = LN(\Gamma(x))$$

where:

$$\Gamma(x) = \int_0^{\infty} e^{-u} u^{x-1} du$$

where:

- *x* = argument *x*

Arguments:

Name	Type	Description
<i>x</i>	number	The value for which the gamma function is to be calculated.

Return Type and Value: number – The natural logarithm of the gamma function.

However, if *x* ≤ 0, #NUM! is returned.

[Example:

GAMMALN(4.5) results in 2.453736571

end example]

18.17.7.134 GCD

Syntax:

GCD (*argument-list*)

Description: Computes the greatest common divisor of the one or more numbers, designated by *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	numbers	The <i>arguments</i> in <i>argument-list</i> designate the values. Each argument is truncated to an integer.

Return Type and Value: number – The greatest common divisor of one or more numbers.

However, if any *argument* is negative, #NUM! is returned.

[Example:

GCD(5) results in 5

GCD(5,2) results in 1

GCD(100,50,28) results in 2

GCD(24.5,36.3) results in 12

GCD(7,1) results in 1

GCD(5,0) results in 5

end example]

18.17.7.135 GEOMEAN

Syntax:

GEOMEAN (*argument-list*)

Description: Computes the geometric mean of an array or range of positive data.

Mathematical Formula:

$$GM_{\bar{y}} = \sqrt[n]{y_1 y_2 y_3 \dots y_n}$$

where:

- n is the number of elements in *argument-list*.
- $y_1, y_2, y_3, \dots, y_n$ are the values of the n -th element in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, array, or reference to number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. Logical values and text representations of numbers that entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The geometric mean of an array or range of positive data.

However, if the value of any data point ≤ 0 , #NUM! is returned.

[Example:

GEOMEAN(10.5,5.3,2.9) results in 5.444454702

GEOMEAN(10.5,{5.3,2.9},"12") results in 6.633780588

end example]

18.17.7.136 GESTEP

Syntax:

GESTEP (*number* [, *step*])

Description: Tests if the value of *number* is greater than or equal to that of *step*.

Arguments:

Name	Type	Description
<i>number</i>	number	<i>number</i> is the value to test against <i>step</i> . If <i>step</i> is omitted, zero is used.
<i>step</i>	number	

Return Type and Value: number – 1 if *number* \geq *step*; otherwise, 0.

[Example:

GESTEP(5.6, -4.3) results in 1

GESTEP(5.6, 5.6) results in 1

GESTEP(-5.6) results in 0

end example]

18.17.7.137 GETPIVOTDATA

Syntax:

```
GETPIVOTDATA ( data-field , pivot-table , field-1 , item-1
[ , field-2 , item-2 [ , ... ] ] )
```

Description: Retrieves data stored in a PivotTable report. Calculated fields or items and custom calculations are included in GETPIVOTDATA calculations.

Arguments:

Name	Type	Description
<i>data-field</i>	text	The name of the data field that contains the data to be retrieved.
<i>pivot-table</i>	reference to any cell, range of cells, or named range of cells in a PivotTable report	This information is used to determine which PivotTable report contains the data to be retrieved. If <i>pivot-table</i> is a range that includes two or more PivotTable reports, data shall be retrieved from whichever report was created most recently in the range.
<i>field-1</i> through <i>field-n</i>	text	Argument pairs <i>field-1</i> and <i>item-1</i> , <i>field-2</i> and <i>item-2</i> through <i>field-n</i> and <i>item-n</i> are field names and item names that describe the data to be retrieved. The pairs can be in any order. Field names and names for items other than dates/times (which shall be expressed as numbers) and numbers shall be enclosed in quotation marks. For OLAP PivotTable reports, items can contain the source name of the dimension as well as the source name of the item. [Example: A field and item pair for an OLAP PivotTable might look like this: "[Product]", "[Product].[All Products].[Foods].[Baked Goods]" end example] If the field and item arguments describe a single cell, the value of that cell is returned regardless of its value.
<i>item-1</i> through <i>item-n</i>	text	

Return Type and Value: any – The data stored in a PivotTable report.

However, if

- *pivot-table* is not a range in which a PivotTable report is found, the return value is unspecified.
- The arguments do not describe a visible field, the return value is unspecified.
- The arguments include a page field that is not displayed, the return value is unspecified.

[Example: Given the following data:

	A	B	C	D	E
2	Region	North			
3					
4	Sum of Sales		Product		
5	Month	Salesperson	Beverages	Produce	Grand Total
6	March	Buchanan	\$ 3,522	\$ 10,201	\$ 13,723
7		Davolio	\$ 8,725	\$ 7,889	\$ 16,614
8	March Total		\$ 12,247	\$ 18,090	\$ 30,337
9	April	Buchanan	\$ 5,594	\$ 7,265	\$ 12,859
10		Davolio	\$ 5,461	\$ 668	\$ 6,129
11	April Total		\$ 11,055	\$ 7,933	\$ 18,988
12	Grand Total		\$ 23,302	\$ 26,023	\$ 49,325

GETPIVOTDATA("Sales", \$A\$4) returns the grand total of the Sales field, \$49,325.

GETPIVOTDATA("Sum of Sales", \$A\$4) also returns the grand total of the Sales field, \$49,325; the field name can be entered exactly as it looks on the sheet, or as its root (without "Sum of," "Count of," and so forth).

GETPIVOTDATA("Sales", \$A\$4, "Month", "March") returns the grand total for March, \$30,337.

GETPIVOTDATA("Sales", \$A\$4, "Month", "March", "Product", "Produce", "Salesperson", "Buchanan") returns \$10,201.

GETPIVOTDATA("Sales", \$A\$4, "Region", "South") is unspecified because the South region data is not visible.

GETPIVOTDATA("Sales", \$A\$4, "Product", "Beverages", "Salesperson", "Davolio") is unspecified because there is no total value of beverage sales for Davolio.

end example]

18.17.7.138 GROWTH

Syntax:

GROWTH (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes predicted exponential growth by using existing data. GROWTH can also fit an exponential curve to existing x-values and y-values.

Arguments:

Name	Type	Description
<i>known-ys</i>	array	Set of y-values already known in the relationship $y=b*m^x$. If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	Set of x-values that might already be know in the relationship $y=b*m^x$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a <i>known-ys</i> with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>new-xs</i>	array	A set of new x-values for which GROWTH is to return corresponding y-values. <i>new-xs</i> shall include a column (or row) for each independent variable, just as <i>known-xs</i> does. So, if <i>known-ys</i> is in a single column, <i>known-xs</i> and <i>new-xs</i> shall have the same number of columns. If <i>known-ys</i> is in a single row, <i>known-xs</i> and <i>new-xs</i> shall have the same number of rows. If <i>new-xs</i> are omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant b to equal 1. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set equal to 1 and the m-values are adjusted so that $y=m^x$.

Return Type and Value: array – The y-values for a series of new x-values.

However, if any of the numbers in *known-ys* are zero or negative, #NUM! is returned.

[Example: Given the following data:

	A	B	C
1	Month	Units	Formula (corresponding units)
2	11	33,100	32618.20377
3	12	47,300	47729.42261
4	13	69,000	69841.30086
5	14	102,000	102197.0734
6	15	150,000	149542.4867

	A	B	C
7	16	220,000	218821.8762
8	Month	Formula (Predicted Units)	
9	17	320,196.72	
10	18	468,536.05	

When GROWTH(A2:B4,A6:B8) is an array formula spanning cells C2:C7, those cells take on the results shown. When GROWTH(A2:B4,A6:B8,A9:A10) is an array formula spanning cells B9:B10, those cells take on the results shown.

end example]

18.17.7.139 HARMEAN

Syntax:

HARMEAN (*argument-list*)

Description: Computes the harmonic mean of a data set.

Mathematical Formula:

$$\frac{1}{H} = \frac{1}{n} \sum \frac{1}{Y_i}$$

where:

- n = number of elements in *argument-list*
- Y_i = each element in *argument-list*

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, text, number, name, array, or reference to number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. Argument values can be numbers, or names, arrays, or references that contain numbers. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The harmonic mean of a data set.

However, if the value of any data point ≤ 0 , #NUM! is returned.

[Example:

HARMEAN(4.6,5.8,8.3,7) results in 6.124222

HARMMEAN(10.5,{5.3,2.9},"12") results in 5.617360

end example]

18.17.7.140 HEX2BIN

Syntax:

HEX2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	text	A 10-digit hexadecimal number in a string that is to be converted to a binary string. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
<i>num-bin-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If <i>num-bin-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range "FFFFFFE00" (11111111111111111111111111111000000000 binary, - 512 decimal) to "1FF" (0000000000000000000000000000000011111111 binary, 511 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* is negative or > 10, #NUM! is returned.

[Example:

HEX2BIN("fE") results in 11111110
 HEX2BIN("FFFFFFFFFE") results in 1111111110
 HEX2BIN("2") results in 10
 HEX2BIN("F",6) results in 001111

end example]

18.17.7.141 HEX2DEC

Syntax:

HEX2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
<i>number</i>	string	A 10-digit hexadecimal number in a string that is to be converted to a decimal number. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- number* contains one or more non-hexadecimal digits, #NUM! is returned.
- number* contains more than 10 hexadecimal digits; that is, *number* is outside the range "8000000000" (-548,755,813,888 decimal) to "7FFFFFFFFF" (548,755,813,887 decimal), inclusive, #NUM! is returned.

[Example:

HEX2DEC("fE") results in 254
 HEX2DEC("FFFFFFFFFE") results in -2
 HEX2DEC("F000000000") results in -68719476736

end example]

18.17.7.142 HEX2OCT

Syntax:

HEX2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	text	A 10-digit hexadecimal number in a string that is to be converted to an octal string. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
<i>num-oct-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* is outside the range "FFE0000000" (17774000000000 octal, -536,870,912 decimal) to "1FFFFFFF" (00003777777777 octal, 536,870,911 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* is negative or > 10, #NUM! is returned.

[Example:

HEX2OCT("fE") results in 376

HEX2OCT("FFFFFFFFFE") results in 7777777776

HEX2OCT("2") results in 2

HEX2OCT("F",6) results in 000017

end example]

18.17.7.143 HLOOKUP

Syntax:

HLOOKUP (*lookup-value* , *table-array* , *row-index-num* [, [*range-lookup-flag*]])

Description: Performs a horizontal search for a value in the top row of a table or an array, noting the column in which the matching value is found. From that column, the value from a given row is returned.

Arguments:

Name	Type	Description
<i>lookup-value</i>	value or reference.	The value to be located in the first row of the table. If <i>range-lookup</i> is FALSE and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, use a tilde (~) before the character.
<i>table-array</i>	array, reference, name	Designates the table of information to be searched. The values in the first row of <i>table-array</i> can be text, numbers, or logical values. If <i>range-lookup-flag</i> is TRUE, the values in the first row of <i>table-array</i> shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. If <i>range-lookup-flag</i> is FALSE, <i>table-array</i> 's values need not be sorted. Uppercase and lowercase text is treated as equivalent.
<i>row-index-num</i>	number	The row number in <i>table-array</i> from which the matching value is to be returned. (A <i>row-index-num</i> of 1 returns the first row value in <i>table-array</i> , a <i>row-index-num</i> of 2 returns the second row value in <i>table-array</i> , and so on.)
<i>range-lookup-flag</i>	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than <i>lookup-value</i> is returned. If FALSE, an exact match is performed.

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *row-index-num* is less than 1, #VALUE! is returned.
- *row-index-num* is greater than the number of rows in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the first row of *table-array*, #N/A is returned.

[Example: Given the following data:

	A	B	C
1	Axles	Bearings	Bolts
2	4	6	9
3	5	7	10
4	6	8	11

HLOOKUP("Axles",A1:C4,2,TRUE) results in 4
HLOOKUP("Bearings",A1:C4,3,FALSE) results in 7
HLOOKUP("B",A1:C4,3,TRUE) results in 5
HLOOKUP("Bolts",A1:C4,4) results in 11
HLOOKUP(3,{1,2,3;"a","b","c";"d","e","f"},2,TRUE) results in c

end example]

18.17.7.144 HOUR

Syntax:

HOUR (*time-value*)

Description: Computes the hour for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
<i>time-value</i>	number	The date and/or time whose hour is to be computed. That date and/or time shall be expressed either as a serial date-time, in which case, its integer part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The hour for the date and/or time having the given *time-value*. The returned value shall be in the range 0–23.

However, if *time-value* is out of range for the current date system, #NUM! is returned.

[Example:

HOUR(DATE(2006,2,26)+TIME(2,10,20)) results in 2
HOUR(TIME(22,56,34)) results in 22
HOUR(0) results in 0, since serial date-time 0 represents 00:00:00
HOUR(10.5) results in 12, since serial date-time .5 represents 12:00:00

HOUR("22-Oct-2001 10:53:12") results in 10

HOUR("10:53:12 pm") results in 22

HOUR("22:53:12") results in 22

end example]

18.17.7.145 HYPERLINK

Syntax:

HYPERLINK (*link-location* [, [*friendly-name*]])

Description: Creates a shortcut that opens a document stored on a network server, an intranet, or the Internet. When the cell that contains the HYPERLINK function call is clicked, the file stored at *link-location* is opened.

Arguments:

Name	Type	Description
<i>link-location</i>	text	The location to be opened as text. <i>link-location</i> can refer to a place in a document—such as a specific cell or named range in a SpreadsheetML worksheet or workbook, or to a bookmark in a WordprocessingML document. The <i>link-location</i> can be to a location on a local hard disk drive, the path to a location on a server or a Uniform Resource Locator (URL) to a location on the Internet or an intranet. [Note: Using a URL is the preferred way of specifying <i>link-location</i> . end note] If the location specified in <i>link-location</i> does not exist or cannot be navigated, an unspecified error is produced when the cell is clicked. <i>link-location</i> can be a string or a reference to a cell containing a string.
<i>friendly-name</i>	text, number, name	The value that is displayed in the cell. If omitted, the cell displays <i>link-location</i> . <i>friendly-name</i> can be a value, a text string, a name, or a cell that contains the jump text or value. If the evaluation of <i>friendly-name</i> results in an error value, the cell displays that error value rather than the jump text.

Return Type and Value: text – The value of *friendly-name*, if it is specified; otherwise, the value of *link-location*.

[Example:

HYPERLINK("http://example.openxmlformats.org/report/budget report.xls", "Click for report"), which opens a worksheet named "budget report.xls" that is stored on the Internet at the location example.openxmlformats.org/report, and displays the text "Click for report".

HYPERLINK("D:\FINANCE\1stqtr.xls",H10), which opens the file 1stqtr.xls that is stored in a directory named Finance on drive D, and displays the numeric value stored in cell H10.

end example]

18.17.7.146 HYPGEOMDIST

Syntax:

HYPGEOMDIST (*sample-successes* , *number-sample* , *population-successes* , *number-population*)

Description: Computes the hypergeometric distribution; that is, the probability of a given number of sample successes, given the sample size, population successes, and population size.

Mathematical Formula:

$$P(X = x) = h(x, n, M, N) = \frac{\binom{M}{x} \binom{N - M}{n - x}}{\binom{N}{n}}$$

where:

- *M* = *population-successes* argument
- *N* = *number-population* argument
- *x* = *sample-successes* argument
- *n* = *number-sample* argument

Arguments:

Name	Type	Description
<i>sample-successes</i>	number	The number of successes in the sample, truncated to integer.
<i>number-sample</i>	number	The size of the sample, truncated to integer.
<i>population-successes</i>	number	The number of successes in the population, truncated to integer.
<i>number-population</i>	number	The population size, truncated to integer.

Return Type and Value: number – The hypergeometric distribution.

However, if

- *sample-successes* < 0 or *sample-successes* is greater than the lesser of *number-sample* and *population-successes*, #NUM! is returned.

- *sample-successes* is less than the larger of 0 or (*number-sample* - *number-population* + *population-successes*), #NUM! is returned.
- *number-sample* ≤ 0 or *number-sample* > *number-population*, #NUM! is returned.
- *population-successes* ≤ 0 or *population-successes* > *number-population*, #NUM! is returned.
- *number-population* ≤ 0, #NUM! is returned.

[Example:

HYPGEOMDIST(1,4,8,20) results in 0.363261

end example]

18.17.7.147 IF

Syntax:

IF (*logical-value* , [*value-if-true*] [, [*value-if-false*]])

Description: Tests *logical-value*, and if it is TRUE, *value-if-true* is evaluated and returned; otherwise, *value-if-false* is evaluated and returned.

Arguments:

Name	Type	Description
<i>logical-value</i>	logical	The value to be tested.
<i>value-if-true</i>	any	The value returned if <i>logical-value</i> is TRUE. If <i>logical-value</i> is TRUE and <i>value-if-true</i> is omitted, this argument evaluates to 0. <i>value-if-true</i> can contain up to seven levels of nested IF function calls. [Note: <i>value-if-true</i> and <i>value-if-false</i> need not evaluate to results of the same type. end note]
<i>value-if-false</i>	any	The value returned if <i>logical-value</i> is FALSE. If <i>logical-value</i> is FALSE and <i>value-if-false</i> and its preceding comma is omitted, this argument evaluates to FALSE. If <i>logical-value</i> is FALSE and <i>value-if-false</i> is omitted, but its preceding comma is present, this argument evaluates to 0. <i>value-if-false</i> can contain at least seven levels of nested IF function calls. [Note: <i>value-if-true</i> and <i>value-if-false</i> need not evaluate to results of the same type. end note]

If any argument is an array, every element of that array shall be evaluated when that argument is evaluated.

Return Type and Value: any – *value-if-true*, if *logical-value* is TRUE; otherwise, *value-if-false*.

[Example:

IF(10>5, "Yes", "No") results in Yes
IF(10>5, "Yes") results in Yes
IF(10>5, "Yes",) results in Yes
IF(10<5, "Yes") results in FALSE
IF(10<5, "Yes",) results in 0

IF(10>5, , "No") results in 0
IF(10>5, ,) results in 0
IF(10>5, "Yes", 20) results in Yes
IF(10<5, "Yes", 20) results in 20

end example]

18.17.7.148 IFERROR

Syntax:

IFERROR (*value* , *value-if-error*)

Description: Provides a simpler and more efficient way of trapping and handling errors. It allows the generation of user-defined error text for a function call that can result in an error.

Arguments:

Name	Type	Description
<i>value</i>	any	The value that is checked for an error (i.e., any of the following: #N/A, #VALUE!, #REF!, #DIV/0!, #NUM!, #NAME?, or #NULL!). If <i>value</i> is an empty cell, it is treated as an empty string.
<i>value-if-error</i>	any	The value to return if <i>value</i> evaluates to an error. If <i>value-if-error</i> is an empty cell, it is treated as an empty string.

Return Type and Value: any – *value*, if *value* is not an error; otherwise, *value-if-error*. If *value* is an array formula, an array of results for each cell in the range specified in *value*, is returned.

[Example: Consider the case in which A3 contains 55, and B3 contains 0:

A3/B3 results in #DIV/0

IFERROR(A3/B3, "Error in calculation") results in Error in calculation

end example]

18.17.7.149 IMABS

Syntax:

IMABS (*complex-number*)

Description: Computes the absolute value of *complex-number*.

Mathematical Formula:

$$IMABS(z) = |z| = \sqrt{x^2 + y^2}$$

where:

- z = argument *complex-number*, expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the absolute value is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: number – The absolute value of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMABS("3+4i") results in 5

IMABS("-2.5-34.6j") results in 34.69020035

end example]

18.17.7.150 IMAGINARY

Syntax:

IMAGINARY (*complex-number*)

Description: Computes the imaginary coefficient of *complex-number*.

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the imaginary coefficient is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: number – The imaginary coefficient of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMAGINARY("3+4i") results in 4

IMAGINARY("-2.5-34.6j") results in 34.6

end example]

18.17.7.151 IMARGUMENT

Syntax:

IMARGUMENT (*complex-number*)

Description: Computes the argument θ , an angle expressed in radians, such that for a complex number *complex-number* having the form $x+yi$:

$$x + yi = |x + yi| \times e^{i\theta} = |x + yi| (\cos \theta + i \sin \theta)$$

Mathematical Formula:

$$\text{IMARGUMENT}(z) = \tan^{-1} \left(\frac{y}{x} \right) = \theta$$

where:

- $\theta \in (-\pi; \pi]$
- z = argument *complex-number*, expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number in $x + yi$ or $x + yj$ text format.

Return Type and Value: number – The angle θ , expressed in radians.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMARGUMENT("13+4i") results in 0.298498932

IMARGUMENT("-2.5-5j") results in -2.034443936

end example]

18.17.7.152 IMCONJUGATE

Syntax:

IMCONJUGATE (*complex-number*)

Description: Computes the complex conjugate of the complex number *complex-number*.

Mathematical Formula:

$$IMCONJUGATE(x + yi) = \bar{z} = (x - yi)$$

where:

- \bar{z} = conjugate of the argument *complex-number*, expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the complex conjugate is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – A string containing the complex conjugate of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMCONJUGATE("2.3+4.5i") results in 2.3-4.5i

IMCONJUGATE("-1-4j") results in -1+4j

end example]

18.17.7.153 IMCOS

Syntax:

IMCOS (*complex-number*)

Description: Computes the cosine of the complex number *complex-number*.

Mathematical Formula:

$$\cos(x + yi) = \cos(x) \cosh(y) - \sin(x) \sinh(y)i$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the cosine is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – A string containing the cosine of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMCOS("2.3+4.5i") results in -29.9918288739746-33.5589799796873i

IMCOS("-1-4j") results in 14.7547011704838-22.963673499193j

end example]

18.17.7.154 IMDIV

Syntax:

IMDIV (*complex-number-1* , *complex-number-2*)

Description: Computes the quotient from dividing two complex numbers.

Mathematical Formula:

$$IMDIV(z_1, z_2) = \frac{(a + bi)}{(c + di)} = \frac{(ac + bd) + (bc - ad)i}{c^2 + d^2}$$

where:

- z_1 = argument *complex-number-1* expressed in the form of $a + bi$
- z_2 = argument *complex-number-2* expressed in the form of $c + di$

Arguments:

Name	Type	Description
<i>complex-number-1</i>	text	Complex numbers in $x + yi$ or $x + yj$ text format; they designate the dividend and divisor, respectively.
<i>complex-number-2</i>	text	

Return Type and Value: text – A string containing the quotient from *number-1* / *number-2*, in *x+yi* or *x+yj* text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, #NUM! is returned.

[Example:

IMDIV("13+4i", "5+3i") results in 2.26470588235294-0.558823529411765i

IMDIV("-3-3.5i", "5+3i") results in -0.75-0.25i

end example]

18.17.7.155 IMEXP

Syntax:

IMEXP (*complex-number*)

Description: Computes the exponential of the complex number *complex-number*.

Mathematical Formula:

$$\text{IMEXP}(z) = e^{(x+yi)} = e^x e^{yi} = e^x (\cos y + i \sin y)$$

where:

- *z* = the argument *complex-number*, expressed in the form *x + yi*

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the exponential is being computed. <i>complex-number</i> shall be in <i>x + yi</i> or <i>x + yj</i> text format.

Return Type and Value: text – A string containing the exponential of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMEXP("2.3+4.5i") results in -2.10251576423113-9.75006374866818i

IMEXP("-1-4j") results in -0.240462049968584+0.278412079051034j

end example]

18.17.7.156 IMLN

Syntax:

IMLN (*complex-number*)

Description: Computes the natural logarithm of *complex-number*.

Mathematical Formula:

$$\ln(x + yi) = \ln \sqrt{x^2 + y^2} + i \tan^{-1} \left(\frac{y}{x} \right)$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the natural logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – The natural logarithm of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLN("3+4i") results in 1.6094379124341+0.927295218001612i

IMLN("-2.5-34.6j") results in 3.54645723627033-1.64292531532225j

end example]

18.17.7.157 IMLOG10

Syntax:

IMLOG10 (*complex-number*)

Description: Computes the base-10 logarithm of *complex-number*.

Mathematical Formula:

The common logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_{10}(x + yi) = (\log_{10} e) \ln(x + yi)$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the base-10 logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – The base-10 logarithm of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLOG10("3+4i") results in 10.698970004336019+0.402719196273373i

IMLOG10("-2.5-34.6j") results in 11.54020680801806-0.713513398623614j

end example]

18.17.7.158 IMLOG2

Syntax:

IMLOG2 (*complex-number*)

Description: Computes the base-2 logarithm of *complex-number*.

Mathematical Formula:

The base-2 logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_2(x + yi) = (\log_2 e) \ln(x + yi)$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the base-2 logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Name	Type	Description
		$x + yj$ text format.

Return Type and Value: text – The base-2 logarithm of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLOG2("3+4i") results in 2.32192809506607+1.33780421255394i

IMLOG2("-2.5-34.6j") results in 5.11645626788577-2.37024020514877j

end example]

18.17.7.159 IMPOWER

Syntax:

IMPOWER (*complex-number* , y)

Description: Computes the complex number *complex-number* raised to the power y .

Mathematical Formula:

$$(x + yi)^n = r^n e^{in\theta} = r^n \cos \theta + ir^n \sin \theta$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1} \left(\frac{y}{x} \right)$$

and:

$$\theta \in (-\pi; \pi]$$

where:

- argument *complex-number* is expressed in the form $x + yi$
- n = argument y

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number in $x + yi$ or $x + yj$ text format.
<i>y</i>	number	The exponent to which <i>complex-number</i> is to be raised.

Return Type and Value: text – A string containing *complex-number*^y, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMPOWER("2.3+4.5i",2.5) results in -52.9752689709953+22.138528463954i

IMPOWER("-1-4j",-3.56) results in 6.34818926783845E-003+1.16156377299512E-003j

end example]

18.17.7.160 IMPRODUCT

Syntax:

IMPRODUCT (*argument-list*)

Description: Multiplies the values of its complex number arguments.

Mathematical Formula:

$$(a + bi)(c + di) = (ac - bd) + (ad + bc)i$$

where:

- Each element of *argument-list* is a complex number expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> is a complex number string in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – A string containing the product of the values of its arguments, in $x+yi$ or $x+yj$ text format.

However, if any *argument* in *argument-list* is ill-formed, #NUM! is returned.

[Example:

IMPRODUCT("13+4i") results in 13+4i

IMPRODUCT("-3-3.5i","5+3i") results in -4.5-26.5i

IMPRODUCT("1.3-2j","-3.4+3j","2.3-6j") results in 67.834+15.13j

end example]

18.17.7.161 IMREAL

Syntax:

IMREAL (*complex-number*)

Description: Computes the real coefficient of *complex-number*.

where:

- argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the real coefficient is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: number – The real coefficient of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMREAL("3+4i") results in 3

IMREAL("-2.5-34.6j") results in -2.5

end example]

18.17.7.162 IMSIN

Syntax:

IMSIN (*complex-number*)

Description: Computes the sine of the complex number *complex-number*.

Mathematical Formula:

$$\sin(x + yi) = \sin(x) \cosh(y) - \cos(x) \sinh(y)i$$

where:

- argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the sine is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – A string containing the sine of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMSIN("2.3+4.5i") results in 33.567264016308-29.9844272159606i

IMSIN("-1-4j") results in -22.9790855778861-14.7448051885587j

end example]

18.17.7.163 IMSQRT

Syntax:

IMSQRT (*complex-number*)

Description: Computes the square root of the complex number *complex-number*.

Mathematical Formula:

$$\sqrt{x + yi} = \sqrt{r} \cos\left(\frac{\theta}{2}\right) + i\sqrt{r} \sin\left(\frac{\theta}{2}\right)$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi; \pi]$$

where:

- argument *complex-number* is expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the square root is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – A string containing the square root of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMSQR("2.3+4.5i") results in 1.91751290835255+1.17339496918073i

IMSQR("-1-4j") results in 1.24962106768765-1.60048518044024j

end example]

18.17.7.164 IMSUB

Syntax:

IMSUB (*complex-number-1* , *complex-number-2*)

Description: Computes the difference of two complex numbers.

Mathematical Formula:

$$(a + bi) - (c + di) = (a - c) + (b - d)i$$

$$(a + bi) - (c + di) = (a - c) + (b - d)i$$

where:

- argument *complex-number-1* is expressed in the form $a + bi$
- argument *complex-number-2* is expressed in the form $c + di$

Arguments:

Name	Type	Description
<i>complex-number-1</i>	text	Complex numbers in $x + yi$ or $x + yj$ text format; they designate the minuend and subtrahend, respectively.
<i>complex-</i>	text	

Name	Type	Description
<i>number-2</i>		

Return Type and Value: text – A string containing *number-1* - *number-2*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, #NUM! is returned.

[Example:

IMSUB("13+4i", "5+3i") results in 8+i

IMSUB("-3-3.5i", "5+3i") results in -8-6.5i

end example]

18.17.7.165 IMSUM

Syntax:

IMSUM (*argument-list*)

Description: Adds the values of its arguments.

Mathematical Formula:

$$(a + bi) + (c + di) = (a + c) + (b + d)i$$

where:

- Each element of *argument-list* is a complex number expressed in the form $x + yi$

Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> is a complex number string in $x + yi$ or $x + yj$ text format.

Return Type and Value: text – The sum of the values of its arguments, in $x+yi$ or $x+yj$ text format.

However, if any *argument* in *argument-list* is ill-formed, #NUM! is returned.

[Example:

IMSUM("3+4i") results in 3+4i

IMSUM("3+4i", "5-3i") results in 8+i

end example]

18.17.7.166 INDEX

Syntax:

array form: INDEX (*array* , [*row-number*][, [*column-number*]])

reference form: INDEX (*reference* [, [*row-number*][, [*column-number*]
[, [*area-number*]]])

Description: Locates a value or the reference to a value from within a table or range. There are two forms of the INDEX function: the array form and the reference form.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	Table or range to be searched. If <i>array</i> contains only one row, the corresponding <i>row-number</i> argument is optional. If <i>array</i> contains only one column, the corresponding <i>column-number</i> argument is optional.
<i>reference</i>	reference	A reference to one or more cell ranges. If each area (§18.17.2.3) in <i>reference</i> contains only one row, <i>row-number</i> is optional. If each area contains only one column, <i>column-number</i> is optional.
<i>row-number</i>	number	<i>row-number</i> indicates the row in <i>array</i> (or <i>reference</i>) from which to return a value (or reference). If <i>row-number</i> is omitted, <i>column-number</i> shall be present. <i>column-number</i> indicates the column in <i>array</i> (or <i>reference</i>) from which to return a value (or reference). If <i>column-number</i> is omitted, <i>row-number</i> shall be present. If both the <i>row-number</i> and <i>column-number</i> arguments are used, INDEX returns the value (or reference) in the cell at the intersection of <i>row-number</i> and <i>column-number</i> . If <i>array</i> has more than one row and more than one column, and only <i>row-number</i> or <i>column-number</i> is used, INDEX returns an array of the entire row or column in array. If <i>row-number</i> or <i>column-number</i> , but not both, is 0, INDEX returns the array of values for the entire column or row, respectively. In the reference form, if <i>row-number</i> and <i>column-number</i> are both omitted, INDEX returns the area in reference specified by <i>area-number</i> .
<i>column-number</i>	number	
<i>area-number</i>	number	Indicates a range in <i>reference</i> from which to return the intersection of <i>row-number</i> and <i>column-number</i> . The first area selected or entered is numbered 1, the second 2, and so on. If <i>area-number</i> is omitted, 1 is assumed.

Name	Type	Description
		[<i>Example: If reference describes the cells (A1:B4, D1:E4, G1:H4), then area-number 1 is the range A1:B4, area-number 2 is the range D1:E4, and area-number 3 is the range G1:H4. end example</i>]

Return Type and Value: various – For the array form, returns a single value, a whole row, or a whole column from a table or an array, depending on the presence and values of the row and column number indexes.

For the reference form, returns a single reference, a whole row, or a whole column from a reference, depending on the presence and values of the row and column number indexes, and the area number.

However, for the array form

- *row-number* is outside the bounds of *array*, #REF! is returned.
- *column-number* is outside the bounds of *array*, #REF! is returned.

For the reference form

- *row-number* is outside the bounds of *reference*, #REF! is returned.
- *column-number* is outside the bounds of *reference*, #REF! is returned.
- *area-number* is outside the bounds of *reference*, #REF! is returned.

[*Example:*

INDEX({"Apples", "Lemons"; "Bananas", "Pears"}, 2, 2) results in Pears

INDEX({"Apples", "Lemons"; "Bananas", "Pears"}, 2, 1) results in Bananas

INDEX({"Apples", "Lemons"}, , 2) results in Lemons

INDEX({"Apples"; "Bananas"}, 1) results in Apples

Given the following data:

	A	B	C
1	Fruit	Price	Count
2	Apples	0.69	40
3	Bananas	0.34	38
4	Lemons	0.55	15
5	Oranges	0.25	25
6	Pears	0.59	40
7	Almonds	2.8	10

INDEX(A2:C7,2,3) results in 38
INDEX((A2:C4,A6:C7),2,2,2) results in 2.8
INDEX((A2:C4,A6:C7),2,2,1) results in 0.34

end example]

18.17.7.167 INDIRECT

Syntax:

INDIRECT (*ref-text* [, [*A1-ref-style-flag*]])

Description: Locates the reference specified by *ref-text* and evaluates that reference to get to its underlying value. [Note: This function should be used when the reference to a cell within a formula is to be changed without changing the formula itself. *end note*]

Arguments:

Name	Type	Description
<i>ref-text</i>	An A1-style reference, an R1C1-style reference, a name defined as a reference, or a reference to a cell as a string.	If <i>ref-text</i> refers to another workbook (i.e., it's an external reference), that other workbook shall be open.
<i>A1-ref-style-flag</i>	logical	Specifies the kind of reference that is contained in the cell <i>ref-text</i> . If TRUE or omitted, <i>ref-text</i> is interpreted as an A1-style reference (§18.17.2.3.1); otherwise, <i>ref-text</i> is interpreted as an R1C1-style reference (§18.17.2.3.2).

Return Type and Value: any – The underlying value of the location referred to by *ref-text*.

However, if

- *ref-text* is not a cell reference, #REF! is returned.
- *ref-text* refers to another workbook yet that other workbook is not currently open, the return value is unspecified.
- *ref-text* is a name, then the content of the named expression can have implementation-defined constraints.

[Example:

Given the following data:

	A	B
1	Data	Data
2	B2	1.333
3	B3	45
4	George	10
5	5	62

where A2 contains a reference to B2, A3 contains a reference to B3, A4 contains the defined name George that refers to B4, and A5 contains the row number of B5:

INDIRECT(\$A\$2) results in 1.333

INDIRECT(\$A\$3) results in 45

INDIRECT(\$A\$4) results in 10

INDIRECT("B"&\$A\$5) results in 62

INDIRECT("R[-1]C", FALSE) uses the cell in the previous row and current column.
end example]

18.17.7.168 INFO

Syntax:

INFO (*category*)

Description: Retrieves the operating environment value that corresponds to *category*.

Arguments:

Name	Type	Description
<i>category</i>	text	The string designated by <i>category</i> is not case-sensitive. The permitted strings are shown in the table below.

<i>category</i>	Meaning	Result Type
"directory"	Path of the current directory or folder.	text
"memavail"	Amount of memory available, in bytes.	number
"memused"	Amount of memory being used for data.	number
"numfile"	Number of active worksheets in the open workbooks.	number
"origin"	The absolute cell reference of the top and leftmost cell visible in the window, based on the current scrolling position, prefixed with "\$A:". [Example: Using cell D9 as an example, the return value would be \$A:\$D\$9. <i>end example]</i>	text

<i>category</i>	Meaning	Result Type
"osversion"	Current operating system version.	text
"recalc"	Current recalculation mode: "Automatic" or "Manual"	text
"release"	Version of the implementation.	text
"system"	Name of the operating environment.	text
"totmem"	Total memory available, including memory already in use, in bytes.	number

Return Type and Value: text – The operating environment value that corresponds to *category*.

However, if *category* is not one of the values defined above, #VALUE! is returned.

[Example:

INFO("directory") might result in e:\My Documents\

INFO(A10) might result in e:\My Documents\, where A10 contains directory

INFO("memavail") might result in 1048576

INFO("memused") might result in 1474464

INFO("numfile") might result in 5

INFO("origin") might result in \$A:\$C\$536

INFO("osversion") might result in Windows (32-bit) NT 5.01

INFO("recalc") might result in Automatic

INFO("release") might result in 11.0

INFO("system") might result in pcdos

INFO("totmem") might result in 2523040

end example]

18.17.7.169 INT

Syntax:

INT (*x*)

Description: Computes *x* rounded down to an integer.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded down.

Return Type and Value: number – The rounded-down value of x .

[Example:

INT(8.9) results in 8

INT(-8.9) results in -9

end example]

18.17.7.170 INTERCEPT

Syntax:

INTERCEPT (*known-ys* , *known-xs*)

Description: Computes the point at which a line intersects the y-axis by using existing x-values and y-values. The intercept point is based on a best-fit regression line plotted through the known x-values and known y-values.

Mathematical Formula:

The equation for the intercept of the regression line, a , is:

$$a = \bar{y} - b\bar{x}$$

where the slope, b , is calculated as:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- \bar{x} = the sample mean AVERAGE(*known-xs*)
- y = a sample value
- \bar{y} = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
<i>known-ys</i>	number, name, array, reference to number	The dependent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-xs</i>	number, name, array, reference to number	The independent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The point at which a line intersects the y-axis by using existing x-values and y-values.

However, if

- *known-ys* and *known-xs* contain a different number of data points, the return value is unspecified.
- *known-ys* or *known-xs* contain no data points, the return value is unspecified.

[Example:

INTERCEPT({2,3,9,1,8},{6,5,11,7,5}) results in 0.048387097

end example]

18.17.7.171 INTRATE

Syntax:

INTRATE (*settlement* , *maturity* , *investment* , *redemption* [, [*basis*]])

Description: Computes the interest rate for a fully invested security.

Mathematical Formula:

$$INTRATE = \frac{redemption - nvestment}{investment} \times \frac{B}{DIM}$$

where:

- *B* = number of days in a year, depending on the year basis
- *DIM* = number of days from settlement to maturity.
- *investment* = argument *investment*
- *redemption* = argument *redemption*

Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>investment</i>	number	The amount invested in the security.
<i>redemption</i>	number	The amount to be received at maturity.he security's annual yield.
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <div> <div>Value</div> <div>Day Count Basis</div> </div>

Name	Type	Description	
		Ø or omitted	<p>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.

Name	Type	Description	
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The interest rate for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *investment* or *redemption* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

INTRATE(DATE(2008,2,15),DATE(2008,5,15),1000000,1014420,2) results in 5.7680%

end example]

18.17.7.172 IPMT

Syntax:

IPMT (*rate* , *per* , *nper* , *pv* , [*fv*] [, [*type*]])

Description: Computes the interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>per</i>	number	The period for which the interest is to be found, and shall be in the range 1– <i>nper</i> .						
<i>nper</i>	number	The total number of payment periods in an annuity.						
<i>pv</i>	number	The present value, or the lump-sum amount that a series of future payments is worth right now.						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

IPMT(0.1/12,1*3,3,8000) results in -22.41

IPMT(0.1,3,3,8000) results in -292.45

end example]

18.17.7.173 IRR

IRR (*values* [, [*guess*]])

Description: Computes the internal rate of return for a series of cash flows represented by the numbers in *values*. (These cash flows do not have to be even, as they would be for an annuity. However, the cash flows shall occur at regular intervals, such as monthly or annually. The internal rate of return is the interest rate received for an investment consisting of payments (negative values) and income (positive values) that occur at regular periods.)

Arguments:

Name	Type	Description
<i>values</i>	array, reference, text, logical	The set of numbers for which the internal rate of return is to be calculated. <i>values</i> shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in <i>values</i> is significant, so be sure payment and income numbers are in the desired sequence. If <i>values</i> contains elements that are text, logical values, or empty cells, those elements are ignored.
<i>guess</i>	number	An estimate of the result of IRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

Return Type and Value: number – The internal rate of return for a series of cash flows.

However, if the implementation determines that a return value cannot be computed, #NUM! is returned.

[Example:

IRR({-70000,12000,15000,18000,21000}) results in -2.1245%

IRR({-70000,12000,15000,18000,21000,26000}) results in 8.6631%

IRR({-70000,12000,15000},-0.1) results in -44.3507%

end example]

18.17.7.174 ISBLANK

Syntax:

ISBLANK (*value*)

Description: Determines if *value* refers to an empty cell.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* refers to an empty cell; otherwise, FALSE.

[Example:

ISBLANK(A10) results in TRUE, when A10 is empty

ISBLANK(A10) results in FALSE, when A10 contains 123

end example]

18.17.7.175 ISERR

Syntax:

ISERR (*value*)

Description: Determines if *value* is any of the error values other than #N/A.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is one of the error values, excluding #N/A; otherwise, FALSE.

[Example:

ISERR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example

ISERR(B1) results in FALSE if B1 evaluates to #N/A

end example]

18.17.7.176 ISERROR

Syntax:

ISERROR (*value*)

Description: Determines if *value* is any of the error values.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is one of the error values; otherwise, FALSE.

[Example:

ISERROR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example

end example]

18.17.7.177 ISEVEN

Syntax:

ISEVEN (*value*)

Description: Determines if *value* is an even number or refers to a cell containing an even number.

Arguments:

Name	Type	Description
<i>value</i>	number	The value to be tested. It is truncated to an integer.

Return Type and Value: logical – TRUE if *value* is an even number or refers to a cell containing an even number; otherwise, FALSE.

[Example:

ISEVEN(12.456) results in TRUE

ISEVEN(A10) results in FALSE, when A10 contains -15

end example]

18.17.7.178 ISLOGICAL

Syntax:

ISLOGICAL (*value*)

Description: Determines if *value* contains a logical value or refers to a cell containing a logical value.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains a logical value or refers to a cell containing a logical value; otherwise, FALSE.

[Example:

ISLOGICAL(TRUE) results in TRUE

ISLOGICAL(A10) results in FALSE, when A10 contains 123

ISLOGICAL({TRUE, 2}) results in TRUE

ISLOGICAL({2, TRUE}) results in FALSE

end example]

18.17.7.179 ISNA

Syntax:

ISNA (*value*)

Description: Determines if *value* is the error value #N/A.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is #N/A; otherwise, FALSE.

[Example:

ISERR(A1) results in TRUE if A1 evaluates to #N/A

ISERR(B1) results in TRUE if B1 evaluates to #DIV/0!, for example

end example]

18.17.7.180 ISNONTEXT

Syntax:

ISNONTEXT (*value*)

Description: Determines if *value* does not contain text or does not refer to a cell containing text. An empty cell is not text.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* does not contain text or does not refer to a cell containing text; otherwise, FALSE.

[Example:

ISNONTEXT("ABC") results in FALSE

ISNONTEXT(A10) results in TRUE, when A10 contains 123

ISNONTEXT({1, "ABC"}) results in TRUE

ISNONTEXT({"ABC", 1}) results in FALSE

end example]

18.17.7.181 ISNUMBER

Syntax:

ISNUMBER (*value*)

Description: Determines if *value* contains a number or refers to a cell that contains a number.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains a number or refers to a cell that contains a number; otherwise, FALSE.

[Example:

ISNUMBER(10.56) results in TRUE

ISNUMBER(A10) results in FALSE, when A10 contains ABC

ISNUMBER({1, "ABC"}) results in TRUE

ISNUMBER({"ABC",1}) results in FALSE

end example]

18.17.7.182 ISO.CEILING

Syntax:

ISO.CEILING (*x* , [*significance*])

Description: Computes a value that is *x* rounded-up, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded
<i>significance</i>	number	<p>The optional multiple to which <i>x</i> is to be rounded.</p> <p>If <i>significance</i> is omitted, its default value is 1.</p> <p>[Note: The absolute value of the multiple is used, so the CEILING function will return the mathematical ceiling irrespective of the signs of <i>x</i> and <i>significance</i>. <i>end note</i>]</p>

Return Type and Value: number – The rounded-up value of *x*.

However, if *x* and/or *significance* is zero, zero is returned.

[Example:

ISO.CEILING(4.3) rounds 4.3 up to nearest multiple of 1; that is, to 5

ISO.CEILING(-4.3) rounds -4.3 up to nearest multiple of 1; that is, to -4

ISO.CEILING(4.3, 2) rounds 4.3 up to the nearest multiple of 2; that is, to 6

ISO.CEILING(4.3, -2) rounds 4.3 up to the nearest multiple of -2; that is, to 6

ISO.CEILING(-4.3, 2) rounds -4.3 up to the nearest multiple of 2; that is, to -4

ISO.CEILING(-4.3, -2) rounds -4.3 up to the nearest multiple of -2; that is, to -4

end example]

18.17.7.183 ISODD

Syntax:

ISODD (*value*)

Description: Determines if *value* is an odd number or refers to a cell containing an odd number.

Arguments:

Name	Type	Description
<i>value</i>	number	The value to be tested. It is truncated to an integer.

Return Type and Value: logical – TRUE if *value* is an odd number or refers to a cell containing an odd number; otherwise, FALSE.

[Example:

ISODD(12.456) results in FALSE

ISODD(A10) results in TRUE, when A10 contains -15

end example]

18.17.7.184 ISPMT

Syntax:

ISPMT (*rate* , *per* , *nper* , *pv*)

Description: Computes the interest paid during a specific period of an investment.

Arguments:

Name	Type	Description
<i>rate</i>	number	The interest rate for the investment.
<i>per</i>	number	The period for which the interest is to be found, and shall be in the range 1– <i>nper</i> .
<i>nper</i>	number	The total number of payment periods for the investment.
<i>pv</i>	number	The present value the investment.

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest paid during a specific period of an investment.

[Example:

ISPMT(0.1/12,1,3*12,8000000) results in -64814.81

ISPMT(0.1,1,3,8000000) results in -533333.33

end example]

18.17.7.185 ISREF

Syntax:ISREF (*value*)**Description:** Determines if *value* is a cell reference.**Arguments:**

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is a cell reference; otherwise, FALSE.*[Example:*

ISREF("ABC") results in FALSE

ISREF(A10) results in TRUE

end example]

18.17.7.186 ISTEXT

Syntax:ISTEXT (*value*)**Description:** Determines if *value* contains text or refers to a cell containing text.**Arguments:**

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains text or refers to a cell containing text; otherwise, FALSE.*[Example:*

ISTEXT("ABC") results in TRUE

ISTEXT(A10) results in FALSE, when A10 contains 123

ISTEXT({1, "ABC"}) results in FALSE

ISTEXT({"ABC", 1}) results in TRUE

end example]

18.17.7.187 JIS

Syntax:

JIS (*string*)

Description: Creates a string that is the conversion of half-width (single-byte) letters within *string* to full-width (double-byte) characters.

Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string to be converted. If <i>string</i> does not contain any half-width English letters or katakana, nothing in <i>string</i> is converted.

Return Type and Value: text – The string resulting from the conversion.

[*Example:*

JIS("ABC") results in ABC

JIS("エクセル") results in エクセル

end example]

18.17.7.188 KURT

Syntax:

KURT (*argument-list*)

Description: Computes the kurtosis of a data set. Kurtosis characterizes the relative peakedness or flatness of a distribution compared with the normal distribution. Positive kurtosis indicates a relatively peaked distribution. Negative kurtosis indicates a relatively flat distribution.

Mathematical Formula:

Kurtosis is defined as:

$$\left\{ \frac{n(n+1)}{(n-1)(n-2)(n-3)} \sum \left(\frac{x_i - \bar{x}}{s} \right)^4 \right\} - \frac{3(n-1)^2}{(n-2)(n-3)}$$

where:

n is the number of elements in *argument-list*.

x_j is the value of the j -th element in *argument-list*.

\bar{x} is the mean of the values in *argument-list*.

s is the standard deviation of the values in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	array reference to an array, number, name, or reference to number.	The <i>arguments</i> in <i>argument-list</i> are the values for which kurtosis is to be calculated. Any <i>argument</i> in <i>argument-list</i> can be an array or a reference to an array. Logical values and text representations of numbers that are directly entered into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The kurtosis of a data set.

However, if

- There are fewer than four data points, the return value is unspecified.
- The standard deviation of the sample equals zero, the return value is unspecified.

[Example:

KURT(10.5,12.4,19.4,23.2) results in -3.644621343

KURT(10.5,{12.4,19.4},23.2) results in -3.644621343

end example]

18.17.7.189 LARGE

Syntax:

LARGE (*array* , k)

Description: Computes the k^{th} largest value in a data set.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	The set of numbers from which the k^{th} -largest value is to be determined.
k	number	The position (from the largest) in the array or cell range of data to return.

Return Type and Value: number – The k^{th} largest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$, #NUM! is returned.
- k is greater than the number of data points, #NUM! is returned.

[Example:

LARGE({3,5,3,5,4;4,2,4,6,7},3) results in 5

LARGE({3,5,3,5,4;4,2,4,6,7},7) results in 4

end example]

18.17.7.190 LCM

Syntax:

LCM (*argument-list*)

Description: Computes the least common multiple of the one or more *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	number	<i>argument-list</i> specifies the <i>arguments</i> . Each argument is truncated to an integer.

Return Type and Value: number – The least common multiple of one or more numbers.

However, if any *argument* is negative, #NUM! is returned.

[Example:

LCM(5) results in 5

LCM(5,2) results in 10

LCM(24.99,36.45) results in 72

LCM(24,36,15) results in 360

end example]

18.17.7.191 LEFT

Syntax:

LEFT (*string* [, *number-chars*])

Description: Extracts the left-most *number-chars* characters from *string*. (LEFT is intended for use with languages that use the single-byte character set (SBCS), whereas LEFTB (§18.17.7.192) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-chars</i>	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. <i>number-chars</i> shall be at least 0. If <i>number-chars</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

Return Type and Value: text – A string containing the left-most *number-chars* characters from *string*.

However, if *number-chars* is negative, #VALUE! is returned.

[Example:

LEFT("abcdef",2) results in ab

LEFT(A10,4) results in xyz1, when A10 contains xyz123

end example]

18.17.7.192 LEFTB

Syntax:

LEFTB (*string* [, *number-bytes*])

Description: Extracts the left-most *number-bytes*-worth of characters from *string*. (LEFTB is intended for use with languages that use the double-byte character set (DBCS), whereas LEFT (§18.17.7.192) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-bytes</i>	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. <i>number-bytes</i> shall be at least 0. If <i>number-bytes</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

Return Type and Value: text – A string containing the left-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* is negative, #VALUE! is returned.

[*Example:* Assuming 1-byte characters:

LEFTB("abcdef",2) results in ab

LEFTB(A10,4) results in xyz1, when A10 contains xyz123

end example]

18.17.7.193 LEN

Syntax:

LEN (*string*)

Description: Determines the number of characters in *string*. (LEN is intended for use with languages that use the single-byte character set (SBCS), whereas LENB (§18.17.7.194) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string whose length is to be found.

Return Type and Value: number – The number of characters in *string*.

[*Example:*

LEN("abc") results in 3

LEN(A10) results in 3, when A1 contains abc

end example]

18.17.7.194 LENB

Syntax:

LENB (*string*)

Description: Determines the number of bytes in *string*. (LENB is intended for use with languages that use the double-byte character set (DBCS), whereas LEN (§18.17.7.193) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string whose length is to be found.

Return Type and Value: number – The number of bytes in *string*.

[Example: Assuming 1-byte characters:

LENB("abc") results in 3

LENB(A10) results in 3, when A1 contains abc

end example]

18.17.7.195 LINEST

Syntax:

LINEST (*known-ys* [, [*known-xs*] [, [*const-flag*] [, *stats-flag*]])

Description: Calculates the statistics for a line by using the "least squares" method to calculate a straight line that best fits the data, and returns an array that describes the line.

Mathematical Formula:

The equation for the line is:

$$y = mx + b$$

or

...

$$y = m_1x_1 + m_2x_2 + \dots + b \text{ (if there are multiple ranges of x-values)}$$

where the dependent y-value is a function of the independent x-values. The m-values are coefficients corresponding to each x-value, and b is a constant value. y, x, and m can be vectors.

When there is only one independent x-variable, the slope and y-intercept values can be obtained directly by using the following formulas:

Slope: INDEX(LINEST(*known-ys*,*known-xs*),1)

Y-intercept: INDEX(LINEST(*known-ys*,*known-xs*),2)

The accuracy of the line calculated by LINEST depends on the degree of scatter in the data. The more linear the data, the more accurate the LINEST model. LINEST uses the method of least squares for determining the best

fit for the data. When there is only one independent x-variable, the calculations for m and b are based on the following formulas:

$$m = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

$$b = \bar{y} - m\bar{x}$$

where:

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(known-xs)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(known-ys)`

Arguments:

Name	Type	Description
<i>known-ys</i>	array	The set of y-values already known in the relationship $y=mx+b$. If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	An optional set of x-values that might already be known in the relationship $y=mx+b$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a range with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant b to be zero. If TRUE or omitted, b is calculated normally. If FALSE, b is set to zero, and the m-values are adjusted to fit $y=mx$.
<i>stats-flag</i>	logical	Specifies whether to return additional regression statistics. If TRUE, LINEST returns the additional regression statistics (see table below), so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LINEST returns only the m-coefficients and the constant b.

The additional regression statistics are as follows:

Statistic	Description
se1, se2, ..., sen	The standard error values for the coefficients m1, m2, ..., mn.
seb	The standard error value for the constant b.
r2	The coefficient of determination.
sey	The standard error for the y estimate.
F	The F statistic, or the F-observed value.
df	The degrees of freedom.
ssreg	The regression sum of squares.
ssresid	The residual sum of squares.

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The following illustration shows the order in which the additional regression statistics are returned.

[Example:

LINEST({1,9,5,7},{0,4,2,3},,FALSE) results in a slope of 2 and a y-intercept of 1

end example]

18.17.7.196 LN

Syntax:

LN (x)

Description: Computes the natural logarithm of x .

Arguments:

Name	Type	Description
x	number	The positive real number for which the natural logarithm is being computed.

Return Type and Value: number – The natural logarithm of x .

However, if x is zero or negative, #NUM! is returned.

[Example:

LN(86) results in 4.454347296

LN(2.7182818) results in 0.99999999

LN(EXP(3)) results in 3

end example]

18.17.7.197 LOG

Syntax:

LOG (x [, $base$])

Description: Computes the logarithm of x to the base $base$.

Arguments:

Name	Type	Description
x	number	The positive real number for which the logarithm is being computed.
$base$	number	The base of the logarithm. If omitted, base 10 is assumed.

Return Type and Value: number – The logarithm of x .

However, if

- x is zero or negative, #NUM! is returned.
- $base$ is zero or negative, #NUM! is returned.

[Example:

LOG(10) results in 1

LOG(8,2) results in 3

LOG(86,2.7182818) results in 4.454347343

end example]

18.17.7.198 LOG10

Syntax:

LOG10 (x)

Description: Computes the base-10 logarithm of x .

Arguments:

Name	Type	Description
x	number	The positive real number for which the logarithm is being computed.

Return Type and Value: number – The base-10 logarithm of x .

However, if x is zero or negative, #NUM! is returned.

[Example:

LOG10(86) results in 1.934498451

LOG10(10) results in 1

LOG10(1E5) results in 5

LOG10(10^5) results in 5

end example]

18.17.7.199 LOGEST

Syntax:

LOGEST (*known-ys* [, [*known-xs*] [, [*const-flag*] [, *stats-flag*]])

Description: Calculates an exponential curve that fits the data, and returns an array of values that describes the curve.

Mathematical Formula:

The equation for the curve is:

$$y = b \times m^x$$

or

$$y = b \times m_1^{x_1} \times m_2^{x_2} \dots \text{(if there are multiple x-values)}$$

where the dependent y-value is a function of the independent x-values. The m-values are bases corresponding to each exponent x-value, and b is a constant value. [Note: y, x, and m can be vectors. end note]

When there is only one independent x-variable, the y-intercept (b) values can be obtained directly by using the following formula:

Y-intercept (b): INDEX(LOGEST(*known-ys*,*known-xs*) , 2)

Arguments:

Name	Type	Description
<i>known-ys</i>	array	The set of y-values already known in the relationship

Name	Type	Description
		$y=b*m^x$. If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	An optional set of x-values that might already be known in the relationship $y=b*m^x$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a range with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant <i>b</i> to be 1. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set to 1, and the m-values are adjusted to fit $y=m^x$.
<i>stats-flag</i>	logical	Specifies whether to return additional regression statistics. If TRUE, LOGEST returns the additional regression statistics, so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LOGEST returns only the m-coefficients and the constant b.

The additional regression statistics are described in §18.17.7.195.

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The order in which the additional regression statistics are returned is described in §18.17.7.195.

[Example: Given the following data:

	A	B
1	Month	Units
2	11	33,100
3	12	47,300
4	13	69,000
5	14	102,000
6	15	150,000
7	16	220,000
8	Formula	
9	1.463275628	495.3047702

When LOGEST(B2:B7,A2:A7,TRUE,FALSE) is an array formula spanning cells A9:B9, those cells take on the results shown.

end example]

18.17.7.200 LOGINV

Syntax:

LOGINV (*probability* , *mean* , *standard-dev*)

Description: Calculates the inverse of the lognormal cumulative distribution function of x, where ln(x) is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$\text{LOGINV}(p, \mu, \sigma) = e^{\left[\mu + \sigma \times (\text{NORMSINV}(p))\right]}$$

where:

- p = argument *probability*
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

Name	Type	Description
<i>probability</i>	number	A probability associated with the lognormal distribution.
<i>mean</i>	number	The mean of ln(x).
<i>standard-dev</i>	number	The standard deviation of ln(x).

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *standard-dev* ≤ 0, #NUM! is returned.

[Example:

LOGINV(0.039084,3.5,1.2) results in 4.000025219

end example]

18.17.7.201 LOGNORMDIST

Syntax:

LOGNORMDIST (*x* , *mean* , *standard-dev*)

Description: Calculates the cumulative lognormal distribution of *x*, where $\ln(x)$ is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$\text{LOGNORMDIST}(x, \mu, \sigma) = \text{NORMSDIST}\left(\frac{\ln(x) - \mu}{\sigma}\right)$$

where:

- *x* = argument *x*
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

Name	Type	Description
<i>x</i>	number	The value at which to evaluate the function.
<i>mean</i>	number	The mean of $\ln(x)$.
<i>standard-dev</i>	number	The standard deviation of $\ln(x)$.

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of *x*.

However, if

- $x \leq 0$, #NUM! is returned.
- $\text{standard-dev} \leq 0$, #NUM! is returned.

[Example:

LOGNORMDIST(4, 3.5, 1.2) results in 0.039083556

end example]

18.17.7.202 LOOKUP

Syntax:

vector form: LOOKUP (*lookup-value* , *lookup-vector* , *result-vector*)

array form: LOOKUP (*lookup-value* , *array*)

Description: The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

Arguments:

Name	Type	Description
<i>lookup-value</i>	number, string, logical, name, reference	The value to search for in <i>lookup-vector</i> (or <i>array</i>).
<i>lookup-vector</i>	reference	A range that contains only one row or one column. The values in <i>lookup-vector</i> can be strings, numbers, or logical values. These values shall be placed in "ascending" order, as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE . Upper- and lowercase strings are equivalent. If LOOKUP can't find the <i>lookup-value</i> , it matches the largest value in <i>lookup-vector</i> (or <i>array</i>) that is less than or equal to <i>lookup-value</i> .
<i>result-vector</i>	reference	A range that contains only one row or column. It shall be the same size as <i>lookup-vector</i> .
<i>array</i>	text, number, logical	A range of cells whose values are to be compared with <i>lookup-value</i> . These values shall be placed in "ascending" order, as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE . Upper- and lowercase strings are equivalent. If <i>array</i> covers an area that has more columns than rows, <i>lookup-value</i> is searched for in the first row. If <i>array</i> is square or has more rows than columns, <i>lookup-value</i> is searched for in the first column.

Return Type and Value: any – The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

However, if

- *lookup-value* is smaller than the smallest value in *lookup-vector* (or the first row or column of *array*), the return value is unspecified.
- The size of the range specified by *result-vector* is not the same as that specified by *lookup-vector*, the return value is unspecified.
- The values in *lookup-vector* (or *array*) are not in "ascending" order, the return value is unspecified.

[Example: Given the following data:

	A	B
1	Frequency	Color
2	4.14	red
3	4.19	orange
4	5.17	yellow
5	5.77	green
6	6.39	blue

LOOKUP(4.19,A2:A6,B2:B6) results in orange

LOOKUP(5,A2:A6,B2:B6) results in orange

LOOKUP(7.66,A2:A6,B2:B6) results in blue

LOOKUP("C",{ "a", "b", "c", "d";1,2,3,4}) results in 3

LOOKUP("bump",{ "a",1;"b",2;"c",3}) results in 2

end example]

18.17.7.203 LOWER

Syntax:

LOWER (*string*)

Description: Makes a lowercase version of *string* by doing a character-by-character conversion of *string* to lowercase, except as noted below. [*Note:* The conversion of characters in *string* is not dependent on position/context of the character within the string, except as noted below. *end note*]

Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string to be converted.

Return Type and Value: text – The lowercase version of *string* after doing a character-by-character conversion to lowercase. However, there is one exception; when Σ (U+03A3) is found in a word-final position, it is converted to ς (U+03C2) instead of σ (U+03C3).

[*Example:*

LOWER("AbCd123#\$\$%^") results in abcd123#\$\$%^

LOWER(A10) results in 234frtqwc\$##, when A10 contains 234FRTqwc\$##

end example]

18.17.7.204 MATCH

Syntax:

MATCH (*lookup-value* , *lookup-array* [, [*match-type*]])

Description: Locates the relative position of an array item that matches a specified value in a specified order. MATCH shall not distinguish between uppercase and lowercase letters when matching strings.

Arguments:

Name	Type	Description								
<i>lookup-value</i>	number, string, logical, name, reference	The value to search for in <i>lookup-array</i> . If <i>match-type</i> is 0 and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be used in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To locate a question mark or asterisk, precede that character with a tilde (~).								
<i>lookup-array</i>	array, reference	A contiguous range of cells containing possible lookup values.								
<i>match-type</i>	number	Specifies how <i>lookup-value</i> is matched with values in <i>lookup-array</i> , as follows: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>-1</td><td>Finds the smallest value that is greater than or equal to <i>lookup-value</i>. The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ...</td></tr><tr><td>0</td><td>Finds the first value that is exactly equal to <i>lookup-value</i>. The values in <i>lookup-array</i> can be in any order.</td></tr><tr><td>1 or omitted</td><td>Finds the largest value that is less than or equal to <i>lookup-value</i>. The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE.</td></tr></table>	Value	Meaning	-1	Finds the smallest value that is greater than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ...	0	Finds the first value that is exactly equal to <i>lookup-value</i> . The values in <i>lookup-array</i> can be in any order.	1 or omitted	Finds the largest value that is less than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE.
Value	Meaning									
-1	Finds the smallest value that is greater than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ...									
0	Finds the first value that is exactly equal to <i>lookup-value</i> . The values in <i>lookup-array</i> can be in any order.									
1 or omitted	Finds the largest value that is less than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE.									

Return Type and Value: number – The relative position of an array item that matches a specified value in a specified order.

However, if

- No match is found, #N/A is returned.
- *match-type*'s value is out-of-bounds, #NUM! is returned.

[Example:

MATCH(39,{25,38,40,41},1) results in 2

MATCH(41,{25,38,40,41},0) results in 4

end example]

18.17.7.205 MAX

Syntax:

MAX (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [Note: To include these, use MAXA (§18.17.7.206). end note] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[Example:

MAX(10.4,-3.5,12.6) results in 12.6

MAX(10.4,{-3.5,12.6}) results in 12.6

MAX({"ABC",TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MAX(-10, -12, -15, B3) results in -10

MAXA(-10, -12, -15, B3) results in 0

end example]

18.17.7.206 MAXA

Syntax:

MAXA (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. <i>[Note: To ignore these, use MAX (§18.17.7.205). end note]</i> If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[Example:

MAXA(10.4, -3.5, 12.6) results in 12.6

MAXA(10.4, {-3.5, 12.6}) results in 12.6

MAXA({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MAX(-10, -12, -15, B3) results in -10

MAXA(-10, -12, -15, B3) results in 0

end example]

18.17.7.207 MDETERM

Syntax:

MDETERM (*array*)

Description: Computes the determinant of the square matrix of numbers designated by *array*. The determinant is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the calculation is not complete. [*Example:* The determinant of a singular matrix can differ from zero by 1E-16. *end example*]

Arguments:

Name	Type	Description
<i>array</i>	array, reference	Designate a square matrix of numbers.

Return Type and Value: number – The determinant of *array*. Some square matrices cannot be inverted. The determinant of a non-invertible matrix is 0.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.

[*Example:*

MDETERM(A2:D5) results in the determinant of the 4x4 array designated by the cell range

MDETERM({3,6,1;1,1,0;3,10,2}) results in 1

MDETERM({3,6;1,1}) results in -3

end example]

18.17.7.208 MDURATION

Syntax:

MDURATION (*settlement* , *maturity* , *coupon* , *yld* , *frequency* [, [*basis*]])

Description: Computes the modified Macaulay duration for a security with an assumed par value of 100.

Mathematical Formula:

$$MDURATION = \frac{DURATION}{1 + \left(\frac{Market\ yield}{Coupon\ payments\ per\ yea} \right)}$$

where:

- *Coupon payments per year* = argument *frequency*
- *DURATION* = DURATION(*settlement*, *maturity*, *coupon*, *yld*, *frequency*, [*basis*])
- *Market yield* = argument *yld*

Arguments:

Name	Type	Description						
<i>settlement</i>	number	The security's settlement date.						
<i>maturity</i>	number	The security's maturity date.						
<i>coupon</i>	number	The security's annual coupon rate.						
<i>yld</i>	number	The security's annual yield.						
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer.						
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.	1	Actual/actual. The actual number of days
Value	Day Count Basis							
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.							
1	Actual/actual. The actual number of days							

Name	Type	Description	
			between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The modified Macaulay duration for a security with an assumed par value of 100.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *coupon* or *yld* < 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

MDURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1) results in 5.7357

end example]

18.17.7.209 MEDIAN

Syntax:

MEDIAN (*argument-list*)

Description: Computes the median of the numeric values of its arguments. The median of a set of values is the value for which half the numbers in the set are greater, and half the values are less. For sets with an odd number of values, the median is calculated by finding the value whose rank in the ordered set of all values is equal to half the number of items (n) in the set plus one half (i.e., $n/2 + 1/2$). If the number of values in the set is even, then the median is defined to be the average of the values of rank $n/2$ and $n/2 + 1$.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number.	The <i>arguments</i> in <i>argument-list</i> designate the values whose median is to be computed. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The median of the values of its arguments.

[Example:

MEDIAN(10,20) results in 15

MEDIAN(-3.5,1.4,6.9,-4.5) results in -1.05

MEDIAN({-3.5,1.4,6.9},-4.5) results in -1.05

end example]

18.17.7.210 MID

Syntax:

MID (*string* , *start-pos* , *number-chars*)

Description: Extracts *number-chars* characters from *string*, starting at character position *start-pos*. (MID is intended for use with languages that use the single-byte character set (SBCS), whereas MIDB (§18.17.7.211) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-chars</i>	number	The number of characters to be extracted. <i>number-chars</i> shall be at least 0.
<i>start-pos</i>	number	The starting position within <i>string</i> , where the first character is position 1. If <i>start-pos</i> is greater than the length of <i>string</i> , or if <i>start-pos</i> and <i>number-chars</i> combined exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

Return Type and Value: text – A string containing *number-chars* characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[Example:

MID("abcdef",3,2) results in cd

MID(A10,4,1) results in 1, when A10 contains xyz123

MID("abcdef",4,5) results in def

end example]

18.17.7.211 MIDB

Syntax:

MIDB (*string* , *start-pos* , *number-bytes*)

Description: Extracts *number-bytes*-worth of characters from *string*, starting at character position *start-pos*. (MIDB is intended for use with languages that use the double-byte character set (DBCS), whereas MID (§18.17.7.210) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-bytes</i>	number	The number of characters to be extracted. <i>number-bytes</i> shall be at least 0.
<i>start-pos</i>	number	The starting position within <i>string</i> , where the first byte is position 1. If <i>start-pos</i> is greater than the length of <i>string</i> , or if <i>start-pos</i> and <i>number-bytes</i> combined exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

Return Type and Value: text – A string containing *number-bytes*-worth of characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

MIDB("abcdef",3,2) results in cd

MIDB(A10,4,1) results in 1, when A10 contains xyz123

MIDB("abcdef",4,5) results in def

end example]

18.17.7.212 MIN

Syntax:

MIN (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [Note: To include these, use MINA (§18.17.7.213). <i>end note</i>] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The smallest of a set of numbers; however, if the *arguments* contain no numbers, zero is returned.

[Example:

MIN(10.4, -3.5, 12.6) results in -3.5

MIN(10.4, {-3.5, 12.6}) results in -3.5

MIN({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MIN(10, 12, 15, B3) results in 10

MINA(10, 12, 15, B3) results in 0

end example]

18.17.7.213 MINA

Syntax:

MINA (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [Note: To ignore these, use MIN (§18.17.7.212). <i>end note</i>] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however,

Name	Type	Description
		cells with the value 0 are included.

Any *argument* in *argument-list* can be an array or a reference to an array.

Return Type and Value: number – The smallest of a set of numbers; however, if the *arguments* contain no numbers, zero is returned.

[Example:

MINA(10.4, -3.5, 12.6) results in -3.5

MINA(10.4, {-3.5, 12.6}) results in -3.5

MINA({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MIN(10, 12, 15, B3) results in 10

MINA(10, 12, 15, B3) results in 0

end example]

18.17.7.214 MINUTE

Syntax:

MINUTE (*time-value*)

Description: Computes the minute for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
<i>time-value</i>	number	The date and/or time whose minute is to be computed. That date and/or time shall be expressed either as a serial date-time, in which case, its integer part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The minute for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date system, #NUM! is returned.

[Example:

MINUTE (DATE (2006, 2, 26) + TIME (2, 10, 20)) results in 10
MINUTE (TIME (22, 56, 34)) results in 56
MINUTE (0) results in 0, since serial date-time 0 represents 00:00:00
MINUTE (10.5) results in 0, since serial date-time .5 represents 12:00:00
MINUTE ("22-Oct-2001 10:53:12") results in 53
MINUTE ("10:53:12 pm") results in 53
MINUTE ("22:53:12") results in 53

end example]

18.17.7.215 MINVERSE

Syntax:

MINVERSE (*array*)

Description: Computes the inverse of the square matrix of numbers designated by *array*. The inverse matrix is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the cancellation is not complete.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	Designate a square matrix of numbers.

Return Type and Value: number – The inverse of the square matrix designated by *array*.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.
- The matrix cannot be inverted, the return value is unspecified.

[*Example:*

MINVERSE ({3,6,1;1,1,0;3,10,2}) results in 2
MINVERSE ({3,6;1,1}) results in -0.333333333

end example]

18.17.7.216 MIRR

MIRR (*values* , *finance-rate* , *reinvest-rate*)

Description: Computes the modified internal rate of return for a series of periodic cash flows. (Both the cost of the investment and the interest received on reinvestment of cash are considered.)

Mathematical Formula:

The formula for MIRR is:

$$\left(\frac{-NPV(rrate, values[positive]) * (1 + rrate)^n}{NPV(frate, values[negative]) * (1 + frate)} \right)^{\frac{1}{n-1}} - 1$$

where:

- *frate* = argument *finance-rate*
- *n* = number of cash flows in argument *values*
- *rrate* = argument *reinvest-rate*
- *values* = argument *values*

Arguments:

Name	Type	Description
<i>values</i>	array, reference	Designates a set of numbers for which the rate of return is to be calculated. <i>values</i> shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in <i>values</i> is significant, so be sure payment and income numbers are in the desired sequence. If <i>values</i> contains elements that are text, logical values, or empty cells, those elements are ignored.
<i>finance-rate</i>	number	The interest rate paid pay on the money used in the cash flows.
<i>reinvest-rate</i>	number	The interest rate received on the cash flows as they are reinvested.

Return Type and Value: number – The modified internal rate of return for a series of periodic cash flows.

However, if *values* does not contain at least one positive value and one negative value, #DIV/0! is returned.

[Example:

MIRR({-120000, 39000, 30000, 21000, 37000, 46000}, 0.1, 0.12) results in 12.6094%

MIRR({-120000, 39000, 30000, 21000}, 0.1, 0.12) results in -4.8045%

MIRR({-120000, 39000, 30000, 21000, 37000, 46000}, 0.1, 0.14) results in 13.4759%

end example]

18.17.7.217 MMULT

Syntax:

MMULT (*array-1* , *array-2*)

Description: Computes the product of the matrices of numbers designated by *array-1* and *array-2*.

Mathematical Formula:

The matrix product array *a* of two arrays *b* and *c* is:

$$a_{ij} = \sum_{k=1}^n b_{ik} c_{kj}$$

Where:

- b_{ik} = the element in the *i*-th row and *k*-th column in argument *array-1*
- c_{kj} = the element in the *k*-th row and *j*-th column in argument *array-2*
- *i* = the row number
- *j* = the column number

Arguments:

Name	Type	Description
<i>array-1</i>	array, reference, name	Designate the matrices of numbers to be multiplied.
<i>array-2</i>		

Return Type and Value: number – The product of the matrices of numbers designated by *array-1* and *array-2*.

However, if

- Any cells in *array-1* or *array-2* are empty or contain text, the return value is unspecified.
- The number of columns in *array-1* is different from the number of rows in *array-2*, #VALUE! is returned.

[Example:

MMULT({3,6,1;1,1,0},{5,7;4,6;2,5}) results in 41

end example]

18.17.7.218 MOD

Syntax:

MOD (*x* , *y*)

Description: Computes the remainder when *x* is divided by *y*. The result has the same sign as *y*.

Arguments:

Name	Type	Description
x	number	The number for which the remainder is being sought.
y	number	The number by which x is to be divided.

Return Type and Value: number – The remainder when x is divided by y . The result has the same sign as y . If y is 0, the return value is unspecified.

[Example:

MOD(3, 2) results in 1

MOD(-3, 2) results in 1

MOD(3, -2) results in -1

MOD(-3, -2) results in -1

end example]

18.17.7.219 MODE

Syntax:

MODE (*argument-list*)

Description: Computes the most frequently occurring of the numeric values of its arguments. If the set of values contains more than one most-frequent value, the first occurrence of any most-frequent value in the list is used as the result.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values whose mode is to be computed. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The most frequently occurring of the values of its arguments.

However, if the data set contains no duplicate data points, #N/A is returned.

[Example:

MODE(9,1,5,1,9,5,6,6) results in 9
MODE(1,9,5,1,9,5,6,6) results in 1
MODE(5,1,9,5,1,9,6,6) results in 5

end example]

18.17.7.220 MONTH

Syntax:

MONTH (*date-value*)

Description: Computes the numeric month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date system. That date and/or time shall be expressed either as a serial date-time, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Arguments:

Name	Type	Description
<i>date-value</i>	number, text	The date and/or time whose month is to be computed. That date and/or time shall be expressed either as a serial date-time, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, in the range 1–12.

However, if *date-value* is out of range for the current date system, #NUM! is returned.

[*Example:*

MONTH(DATE(2006,1,2)) results in 1
MONTH(DATE(2006,0,2)) results in 12
MONTH("2006/1/2 10:45 AM") results in 1
MONTH(30000) results in 2 for both the 1900 and 1904 date systems

end example]

18.17.7.221 MROUND

Syntax:

MROUND (*x* , *multiple*)

Description: Computes x rounded to *multiple*, away from zero. It rounds up if the remainder of dividing x by *multiple* is greater than or equal to half the value of *multiple*; otherwise, it rounds down.

Arguments:

Name	Type	Description
x	number	The value to round.
<i>multiple</i>	number	The multiple to which x is to be rounded.

Return Type and Value: number – x rounded to *multiple*.

However, if x and *multiple* have different signs, #NUM! is returned.

[Example:

MROUND(10, 3) rounds 10 to a nearest multiple of 3; that is, to 9

MROUND(-10, -3) rounds -10 to a nearest multiple of -3; that is, to -9

MROUND(1.3, 0.2) rounds 1.3 to a nearest multiple of 0.2; that is, to 1.4

end example]

18.17.7.222 MULTINOMIAL

Syntax:

MULTINOMIAL (*argument-list*)

Description: Computes the ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

Mathematical Formula:

The multinomial is:

$$MULTINOMIAL(a, b, c) = \frac{(a + b + c)!}{a! b! c!}$$

where:

- a, b, c, \dots = the elements in *argument-list*

Arguments:

Name	Type	Description
<i>argument-list</i>	number	The <i>arguments</i> in <i>argument-list</i> designate the numerical values for which the multinomial is desired.

Return Type and Value: number – The ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

However, if any *argument* is less than zero, #NUM! is returned.

[Example:

MULTINOMIAL(2) results in 1

MULTINOMIAL(2,3) results in 10

MULTINOMIAL(2,3,4) results in 1260

end example]

18.17.7.223 N

Syntax:

N (*value*)

Description: Converts *value* to a number or, if *value* is a reference to a single cell, converts the value of that cell to a number.

Arguments:

Name	Type	Description
<i>value</i>	any	Value to be converted.

Return Type and Value: number or error – An integer that is the converted value of *value*, or, if *value* is a reference to a single cell, the converted value of that cell, as follows:

<i>value</i>	Value Returned
number	That number
TRUE	1
FALSE	0
error value	That error value
Anything else (including array and text)	0

[Example:

N(10.5) results in 10.5

N(A10) results in -1234, when A10 contains the number -1234
 N("ABC") results in 0
 N(A10) results in 0, when A10 contains the string ABC
 N(TRUE) results in 1
 N(A10) results in 0, when A10 contains FALSE
 N(A10) results in #N/A, when A10 contains #N/A
 N({12.5, 13.6, 56.9}) results in 12.50
 N(A10:A11) results in 0, when A10 contains FALSE, and A11 contains 321

end example]

18.17.7.224 NA

Syntax:

NA ()

Description: Gets the error value #N/A. (The error value #N/A can be used instead of a call to this function; the result is the same.)

Arguments: None.

Return Type and Value: error – The error value #N/A.

[Example:

NA() results in #N/A
 IF(ISNA(NA()), "T", "F") results in T

end example]

18.17.7.225 NEGBINOMDIST

Syntax:

NEGBINOMDIST (*number-failures* , *number-successes* , *success-probability*)

Description: Computes the negative binomial distribution. NEGBINOMDIST returns the probability that there are *number-failures* failures before the *number-successes*th success, when the constant probability of a success is *success-probability*.

Mathematical Formula:

$$nb(x, r, p) = \binom{x + r - 1}{r - 1} p^r (1 - p)^x$$

where:

- p = the argument *success-probability*.

- r = the argument *number-successes*
- x = the argument *number-failures*

Arguments:

Name	Type	Description
<i>number-failures</i>	number	The number of failures, truncated to integer.
<i>number-successes</i>	number	The threshold number of successes, truncated to integer.
<i>success-probability</i>	number	The probability of a success.

Return Type and Value: number – The negative binomial distribution.

However, if

- *number-failures* < 0 or *number-successes* < 1, #NUM! is returned.
- *success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[Example:

NEGBINOMDIST(6,10,0.5) results in 0.076370239

end example]

18.17.7.226 NETWORKDAYS

Syntax:

NETWORKDAYS (*start-date* , *end-date* [, *holidays*])

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days (Saturday, Sunday) and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
<i>start-date</i>	number	The dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .
<i>end-date</i>	number	
<i>holidays</i>	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial date-times that represent those

Name	Type	Description
		dates. The ordering of dates or serial date-times in <i>holidays</i> can be arbitrary.

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date system, #NUM! is returned.
- *end-date* is out of range for the current date system, #NUM! is returned.

[Example:

NETWORKDAYS(DATE(2006,1,1),DATE(2006,1,31)) results in 23

NETWORKDAYS(DATE(2006,1,31),DATE(2006,1,1)) results in -23

NETWORKDAYS(DATE(2006,1,1),DATE(2006,2,1),{"2006/1/2","2006/1/16"}) results in 21

end example]

18.17.7.227 NETWORKDAYS.INTL

Syntax:

Number form: NETWORKDAYS.INTL (*start-date* , *end-date* [, [*weekend-number*][, *holidays*]])

String form: NETWORKDAYS.INTL (*start-date* , *end-date* [, [*weekend-string*][, *holidays*]])

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
<i>start-date</i>	Number	The dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .
<i>end-date</i>	Number	
<i>weekend-number</i>	Number	Indicates the days of the week that are weekend days and are not included in the number of whole working days between <i>start-date</i> and <i>end-date</i> . Values are shown in the table below.
<i>weekend-string</i>	String	Indicates the days of the week that are weekend days and are not included in the number of whole working days between <i>start-date</i> and <i>end-date</i> .

Name	Type	Description
		Values of <i>weekend-string</i> are seven characters long and each character in the string represents a day of the week, beginning with Monday. [Example: “0000011” would result in a weekend that is Saturday and Sunday. <i>end example</i>]
<i>holidays</i>	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial date-times that represent those dates. The ordering of dates or serial date-times in <i>holidays</i> can be arbitrary.

<i>weekend-number</i>	Weekend days
1 or omitted	Saturday, Sunday
2	Sunday, Monday
3	Monday, Tuesday
4	Tuesday, Wednesday
5	Wednesday, Thursday
6	Thursday, Friday
7	Friday, Saturday
11	Sunday only
12	Monday only
13	Tuesday only
14	Wednesday only
15	Thursday only
16	Friday only
17	Saturday only

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified weekend days and holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date system, #NUM! is returned.
- *end-date* is out of range for the current date system, #NUM! is returned.

[Example:

NETWORKDAYS.INTL (DATE (2006,1,1),DATE (2006,1,31)) results in 23

NETWORKDAYS.INTL (DATE (2006,1,31),DATE (2006,1,1)) results in -23

NETWORKDAYS.INTL (DATE (2006,1,1),DATE (2006,2,1),7,{"2006/1/2","2006/1/16"}) results in 21

NETWORKDAYS.INTL (DATE (2006,1,1),DATE (2006,2,1),"0000110",{"2006/1/2","2006/1/16"}) results in 21

end example]

18.17.7.228 NOMINAL

NOMINAL (*effect-rate* , *npery*)

Description: Computes the nominal annual interest rate, given the effective rate and the number of compounding periods per year.

Mathematical Formula:

NOMINAL is related to EFFECT:

$$EFFECT = \left(1 + \frac{Nominal_rate}{Npery} \right)^{Npery} - 1$$

where:

- *Nominal_rate* = argument *effect-rate*
- *Npery* = argument *npery*

Arguments:

Name	Type	Description
<i>effect-rate</i>	number	The effective interest rate.
<i>npery</i>	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: **number** – The nominal annual interest rate.

However, if

- *effect-rate* ≤ 0, #NUM! is returned.
- *npery* < 1, #NUM! is returned.

[Example:

NOMINAL(0.053543,4) results in 5.2500%

end example]

18.17.7.229 NORMDIST

Syntax:

NORMDIST (*x* , *mean* , *standard-deviation* , *cumulative-flag*)

Description: Computes the normal distribution for the specified mean and standard deviation.

Mathematical Formula:

The equation for the normal density function (*cumulative-flag* = FALSE) is:

$$f(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\left(\frac{(x-\mu)^2}{2\sigma^2}\right)}$$

When *cumulative-flag* = TRUE, the formula is the integral from negative infinity to *x* of the given formula.

where:

- *x* = argument *x*
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

Name	Type	Description
<i>x</i>	number	The value for which the distribution is to be computed.
<i>mean</i>	number	The arithmetic mean of the distribution.
<i>standard-deviation</i>	number	The standard deviation of the distribution.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned; if FALSE, the probability mass function is returned.

Return Type and Value: number – The normal distribution for the specified mean and standard deviation.

However, if *standard-deviation* ≤ 0, #NUM! is returned.

[Example:

NORMDIST(42,40,1.5,TRUE) results in 0.90878878

NORMDIST(42,40,1.5,FALSE) results in 0.10934005

end example]

18.17.7.230 NORMINV

Syntax:

NORMINV (*probability* , *mean* , *standard-deviation*)

Description: Computes the inverse of the normal distribution for the specified mean and standard deviation.**Arguments:**

Name	Type	Description
<i>probability</i>	number	The probability corresponding to the normal distribution.
<i>mean</i>	number	The arithmetic mean of the distribution.
<i>standard-deviation</i>	number	The standard deviation of the distribution.

Return Type and Value: number – The inverse of the normal distribution for the specified mean and standard deviation.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- *standard-deviation* ≤ 0, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned.

[Example:

NORMINV(0.908789,40,1.5) results in 42.00000201

end example]

18.17.7.231 NORMSDIST

Syntax:

NORMSDIST (*z*)

Description: Computes the standard normal distribution for the specified mean and standard deviation.

Mathematical Formula:

$$f(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}$$

where:

- z = argument z

Arguments:

Name	Type	Description
z	number	The value for which the distribution is to be computed.

Return Type and Value: number – The standard normal distribution for the specified mean and standard deviation.

[Example:

NORMSDIST(1.333333) results in 0.90878873

NORMSDIST(-1.5) results in 0.06680720

end example]

18.17.7.232 NORMSINV

Syntax:

NORMSINV (*probability*)

Description: Computes the inverse of the standard normal distribution. The distribution has a mean of zero and a standard deviation of 1.

Arguments:

Name	Type	Description
<i>probability</i>	number	The probability corresponding to the normal distribution.

Return Type and Value: number – The inverse of the standard normal distribution.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned.

[Example:

NORMSINV(0.945) results in 1.59819314

NORMSINV(0.13) results in -1.12639113

end example]

18.17.7.233 NOT

Syntax:

NOT (*logical-value*)

Description: Computes the logical negation of *logical-value*.

Arguments:

Name	Type	Description
<i>logical-value</i>	logical	The value to be negated.

Return Type and Value: logical – The logical negation of *logical-value*; that is, it returns TRUE if *logical-value* is FALSE, and FALSE if *logical-value* is TRUE.

[Example:

NOT(TRUE) results in FALSE

NOT(FALSE) results in TRUE

NOT(10>5) results in FALSE

NOT(16.567) results in FALSE

end example]

18.17.7.234 NOW

Syntax:

NOW ()

Description: Computes the serial date-time of the current date and time, taking into account the current date system.

Arguments: None.

Return Type and Value: number – The serial date-time of the current date and time.

[Example: On February 26, 2006, between 23:01 and 23:02, NOW() resulted in 38774.95958611110 for the 1900 date system. On February 26, 2006, between 23:02 and 23:03, NOW() resulted in 37312.95982569440 for the 1904 date system. end example]

18.17.7.235 NPER

Syntax:

NPER (*rate* , *pmt* , *pv* [, [*fv*] [, [*type*]]])

Description: Computes the number of periods for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate per period.						
<i>pmt</i>	number	The payment made each period; it cannot change over the life of the annuity. Typically, <i>pmt</i> contains principal and interest but no other fees or taxes.						
<i>pv</i>	number	The present value, or the lump-sum amount that a series of future payments is worth right now.						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If <i>fv</i> is omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Return Type and Value: number – The number of periods for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

NPV(0.12/12, -100, -1000, 10000, 1) results in 59.67

NPV(0.12/12, -100, -1000) results in -9.58

end example]

18.17.7.236 NPV

Syntax:

NPV (*rate* , *argument-list*)

Description: Calculates the net present value of an investment by using a discount rate and a series of future payments and income.

The NPV investment begins one period before the date of the first *argument* cash flow and ends with the last cash flow in the list. The calculation is based on future cash flows. If the first cash flow occurs at the beginning of the first period, the first value shall be added to the NPV result, not included in *argument-list*.

Mathematical Formula:

If n is the number of cash flows in the list of values:

$$NPV = \sum_{i=1}^n \frac{values_i}{(1 + rate)^i}$$

where:

n is the number of elements in *argument-list*.

$values_i$ is the value of the i -th element in *argument-list*.

$rate$ is the *rate* argument.

Arguments:

Name	Type	Description
<i>rate</i>	number	The rate of discount over the length of one period.
<i>argument-list</i>	number	The <i>arguments</i> in <i>argument-list</i> designate the series of future payments (negative values) and income (positive values). <i>arguments</i> shall be equally spaced in time and occur at the end of each period. The order of <i>arguments</i> is significant. <i>arguments</i> that are numbers, empty cells, logical values, or text representations of numbers are included; <i>arguments</i> that are error values or text that cannot be translated into numbers are ignored. If an <i>argument</i> is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – Net present value of an investment by using a discount rate and a series of future payments and income.

[Example:

NPV(0.1, -10000, 3000, 4200, 6800) results in 1188.44

end example]

18.17.7.237 OCT2BIN

Syntax:

OCT2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	text	A 10-digit octal number in a string that is to be converted to a binary string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
<i>num-bin - digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If <i>num-bin-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range "77777777000" (11111111111111111111000000000 binary, -512 decimal) to "777" (000000000000000000000111111111 binary, 511 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

OCT2BIN("67") results in 110111

OCT2BIN("7777777776") results in 1111111110

OCT2BIN("7",5) results in 00111

end example]

18.17.7.238 OCT2DEC

Syntax:

OCT2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
<i>number</i>	number	A 10-digit octal number in a string that is to be converted to a decimal number. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (-536,870,912 decimal) to "3777777777" (536,870,911 decimal), inclusive, #NUM! is returned.

[Example:

OCT2DEC("67") results in 55

OCT2DEC("7777777776") results in -2

OCT2DEC("7000000000") results in -134217728

end example]

18.17.7.239 OCT2HEX

Syntax:

OCT2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	text	A 10-digit octal number in a string that is to be converted to a hexadecimal string. If <i>number</i> has less than 10 digits,

Name	Type	Description
		leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
<i>num-hex-digits</i>	number	<i>num-hex-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer.

Return Type and Value: text – The hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (20000000 hex, -536,870,912 decimal) to "3777777777" (1FFFFFFF hex, 536,870,911 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

OCT2HEX("777") results in 1FF

OCT2HEX("7777777776") results in FFFFFFFFEE

OCT2HEX("7",5) results in 00007

end example]

18.17.7.240 ODD

Syntax:

ODD (*x*)

Description: Computes *x* rounded to the nearest odd integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded.

Return Type and Value: number – The rounded value of x .

[Example:

ODD(1.5) rounds 1.5 up to the nearest odd integer; that is, to 3

ODD(3) rounds 3 up to the nearest odd integer; that is, to 3

ODD(2) rounds 2 up to the nearest odd integer; that is, to 3

ODD(-1) rounds -1 up to the nearest odd integer; that is, to -1

ODD(-2) rounds -2 up to the nearest odd integer; that is, to -3

end example]

18.17.7.241 ODDFPRICE

Syntax:

ODDFPRICE (*settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *yld* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the price per \$100 face value of a security having an odd (short or long) first period.

Mathematical Formula:

Odd short first coupon:

$$\begin{aligned}
 ODDFPRICE = & \left[\frac{\text{redemption}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(N-1+\frac{DSC}{E}\right)}} \right] + \left[\frac{100 \times \frac{\text{rate}}{\text{frequency}} \times \frac{DFC}{E}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\frac{DSC}{E}}} \right] \\
 & + \left[\sum_{k=2} \frac{100 \times \frac{\text{rate}}{\text{frequency}}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(k-1+\frac{DSC}{E}\right)}} \right] - \left[100 \times \frac{\text{rate}}{\text{frequency}} \times \frac{A}{E} \right]
 \end{aligned}$$

where:

- A = number of days from the beginning of the coupon period to the settlement date (accrued days).
- DFC = number of days from the beginning of the odd first coupon to the first coupon date.
- DSC = number of days from the settlement to the next coupon date.
- E = number of days in the coupon period.
- frequency = argument *frequency*
- N = number of coupons payable between the settlement date and the redemption date. (If this number contains a fraction, it is raised to the next whole number.)
- rate = argument *rate*
- redemption = argument *redemption*

- yld = argument yld

Odd long first coupon:

$$\text{ODDFPRICE} = \left[\frac{\text{redemption}}{\left(1 + \frac{yld}{\text{frequency}}\right)^{\left(N + N_q + \frac{DSC}{E}\right)}} \right] + \left[\frac{100 \times \frac{\text{rate}}{\text{frequency}} \times \left[\sum_{i=1}^{NC} \frac{DC_i}{NL_i} \right]}{\left(1 + \frac{yld}{\text{frequency}}\right)^{N_q + \frac{DSC}{E}}} \right] \\ + \left[\sum_{k=1}^N \frac{100 \times \frac{\text{rate}}{\text{frequency}}}{\left(1 + \frac{yld}{\text{frequency}}\right)^{\left(k - N_q + \frac{DSC}{E}\right)}} \right] - \left[100 \times \frac{\text{rate}}{\text{frequency}} \times \sum_{i=1}^{NC} \frac{A_i}{NL_i} \right]$$

where:

- A_i = number of days from the beginning of the i th, or last, quasi-coupon period within odd period.
- DC_i = number of days from dated date (or issue date) to first quasi-coupon ($i = 1$) or number of days in quasi-coupon ($i = 2, \dots, i = NC$).
- DSC = number of days from settlement to next coupon date.
- E = number of days in coupon period.
- frequency = argument frequency
- N = number of coupons payable between the first real coupon date and redemption date. (If this number contains a fraction, it is raised to the next whole number.)
- NC = number of quasi-coupon periods that fit in odd period. (If this number contains a fraction, it is raised to the next whole number.)
- NL_i = normal length in days of the full i th, or last, quasi-coupon period within odd period.
- N_q = number of whole quasi-coupon periods between settlement date and first coupon.
- rate = argument rate
- redemption = argument redemption
- yld = argument yld

...Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>issue</i>	number	The security's issue date.
<i>first-coupon</i>	number	The security's first coupon date.
<i>rate</i>	number	The security's interest rate.
<i>yld</i>	number	The security's annual yield.

Name	Type	Description						
<i>redemption</i>	number	The security's redemption value per \$100 face value.						
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)						
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days;</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.	1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days;
Value	Day Count Basis							
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.							
1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days;							

Name	Type	Description	
			otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February..

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a security having an odd (short or long) first period.

However, if

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date system, #NUM! is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so #NUM! is returned.
- *rate* or *yld* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDFPRICE (DATE (2008, 11, 11), DATE (2021, 3, 1), DATE (2008, 10, 15), DATE (2009, 3, 1),
0.0785, 0.0625, 100, 2, 1) results in 113.5977

end example]

18.17.7.242 ODDFYIELD

Syntax:

ODDFYIELD (*settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *pr* , *redemption* ,
frequency [, [*basis*]])

Description: Computes the yield of a security that has an odd (short or long) first period.

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>issue</i>	number	The security's issue date.				
<i>first-coupon</i>	number	The security's first coupon date.				
<i>rate</i>	number	The security's interest rate.				
<i>pr</i>	number	The security's price.				
<i>redemption</i>	number	The security's redemption value per \$100 face value.				
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)

end example]

18.17.7.244 ODDLYIELD

Syntax:

ODDLYIELD (*settlement* , *maturity* , *last-interest* , *rate* , *pr* , *redemption* ,
frequency [, [*basis*]])

Description: Computes the yield of a security that has an odd (short or long) last period.

Mathematical Formula:

$$ODDLYIELD = \left[\frac{\left(redemption + \left(\left(\sum_{i=1}^{NC} \frac{DC_i}{NL_i} \right) \times \frac{100 \times rate}{frequency} \right) \right) - \left(par + \left(\left(\sum_{i=1}^{NC} \frac{A_i}{NL_i} \right) \times \frac{100 \times rate}{frequency} \right) \right)}{pr + \left(\left(\sum_{i=1}^{NC} \frac{A_i}{NL_i} \right) \times \frac{100 \times rate}{frequency} \right)} \right] \times \left[\frac{frequency}{\left(\sum_{i=1}^{NC} \frac{DSC_i}{NL_i} \right)} \right]$$

where:

- A_i = number of accrued days for the i^{th} , or last, quasi-coupon period within odd period counting forward from last interest date before redemption.
- DC_i = number of days counted in the i^{th} , or last, quasi-coupon period as delimited by the length of the actual coupon period.
- $frequency$ = argument *frequency*
- NC = number of quasi-coupon periods that fit in odd period; if this number contains a fraction it is raised to the next whole number.
- NL_i = normal length in days of the i^{th} , or last, quasi-coupon period within odd coupon period.
- par = argument *par*
- $rate$ = argument *rate*
- $redemption$ = argument *redemption*

•

Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>last-interest</i>	number	The security's last coupon date.
<i>rate</i>	number	The security's interest rate.
<i>pr</i>	number	The security's price.
<i>redemption</i>	number	The security's redemption value per \$100 face value.
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows:

Name	Type	Description										
		<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. 0.0575,84.5,100,2,0) results in 4.5192%

end example]

18.17.7.245 OFFSET

Syntax:

OFFSET (*reference* , *rows* , *cols* [, [*height*] [, [*width*]]])

Description: Gets a reference to a range that is a specified number of rows and columns from a cell or range of cells. The reference that is returned can be a single cell or a range of cells. You can specify the number of rows and the number of columns to be returned.

Arguments:

Name	Type	Description
<i>reference</i>	reference	Designates the base. <i>reference</i> shall refer to a cell or range of adjacent cells.
<i>rows</i>	number	The number of rows, up or down, that indicates the upper-left cell of the result to refer to. A positive value means below the starting reference; a negative value means above the starting reference.
<i>cols</i>	number	The number of columns, to the left or right, that the upper-left cell of the result to refer to. A positive value means to the right of the starting reference; a negative value means to the left of the starting reference.
<i>height</i>	number	The height, in rows, of the set of cells referred to by the resulting reference. This height shall be positive. If omitted, it is the same as the height of <i>reference</i> .
<i>width</i>	number	The width, in columns, of the set of cells referred to by the resulting reference. The width shall be positive. If omitted, it is the same as the width of <i>reference</i> .

Return Type and Value: reference – A reference to a range that is a specified size and number of rows and columns from a cell or range of cells.

However, if

- *reference* does not refer to a cell or range of adjacent cells, #VALUE! is returned.

- The combination of *rows* and *cols* results outside the worksheet, #REF! is returned.

[Example:

OFFSET(C3,2,3,1,1) results in the value in cell F5

SUM(OFFSET(C3:E5,-1,0,3,3)) results in the sum of the range C2:E4

end example]

18.17.7.246 OR

Syntax:

OR (*argument-list*)

Description: Tests if any one or more *arguments* in *argument-list* are TRUE. The function evaluates all arguments prior to returning a value.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, array, reference.	The <i>arguments</i> in <i>argument-list</i> designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

Return Type and Value: logical – TRUE if any one or more *arguments* in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, the return value is unspecified.

[Example:

OR(TRUE) results in TRUE

OR(FALSE, FALSE) results in FALSE

OR(10=5, 3=1+2, 0) results in TRUE

OR({10,5,6,7}, TRUE, E6:F6) results in TRUE, when E6 contains FALSE and F6 contains 0

end example]

18.17.7.247 PEARSON

Syntax:

PEARSON (*array-1* , *array-2*)

Description: Computes the Pearson product moment correlation coefficient, a dimensionless index that ranges from -1.0 to 1.0, inclusive, and reflects the extent of a linear relationship between two data sets.

Mathematical Formula:

The formula for the Pearson product moment correlation coefficient, r , is:

$$r = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where:

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(array-1)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(array-2)`

Arguments:

Name	Type	Description
<i>array-1</i>	number, name, array, reference to number	The set of independent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>	number, name, array, reference to number	The set of dependent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The Pearson product moment correlation coefficient.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[Example:

`PEARSON({9,7,5,3,1},{10,6,1,5,3})` results in 0.699378606

end example]

18.17.7.248 PERCENTILE

Syntax:

`PERCENTILE (array , k)`

Description: Computes the k^{th} percentile of a set of values in a range.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	The set of numerical data that defines relative standing.
<i>k</i>	number	The percentile value in the range 0–1, inclusive. If <i>k</i> is not a multiple of $1/(n - 1)$, PERCENTILE interpolates to determine the value at the k^{th} percentile.

Return Type and Value: number – The k^{th} percentile of a set of values in a range.

However, if

- *array* is empty, the return value is unspecified.
- *k* is < 0 or *k* > 1, #NUM! is returned.

[Example:

PERCENTILE({1,3,2,4},0.3) results in 1.9

PERCENTILE({1,3,2,4},0.75) results in 3.25

end example]

18.17.7.249 PERCENTRANK

Syntax:

PERCENTRANK (*array* , *x* [, *significance*])

Description: Computes the rank of a value in a data set as a percentage of the data set.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	<i>array</i> is the set of numerical data that defines relative standing.
<i>x</i>	number	The value for which the rank is to be computed. If <i>x</i> does not match one of the values in <i>array</i> , PERCENTRANK interpolates to return the correct percentage rank.
<i>significance</i>	number	The number of significant digits for the returned percentage value. If omitted, a value of 3 is used.

Return Type and Value: number – The rank of a value in a data set as a percentage of the data set.

However, if

- *array* is empty, the return value is unspecified.
- *significance* < 1, #NUM! is returned.

[Example:

PERCENTRANK({12,6,7,9,3,8},4) results in 0.066
PERCENTRANK({12,6,7,9,3,8},5) results in 0.133

end example]

18.17.7.250 PERMUT

Syntax:

PERMUT (*number* , *number-chosen*)

Description: Computes the number of permutations for *number-chosen* objects that can be selected from *number* objects. [Note: A permutation is any set or subset of objects or events where internal order is significant. Permutations are different from combinations, for which the internal order is not significant. Use this function for lottery-style probability calculations. end note]

Mathematical Formula:

$$P_{k,n} = \frac{n!}{(n - k)!}$$

where:

- *k* = argument *number-chosen*
- *n* = argument *number*

Arguments:

Name	Type	Description
<i>number</i>	number	The total number of items available, truncated to integer.
<i>number-chosen</i>	number	The number of items in each permutation, truncated to integer.

Return Type and Value: number – The number of different permutations of *number-chosen* in *number*.

However, if

- *number* < 0, #NUM! is returned.
- *number-chosen* < 0, #NUM! is returned.
- *number* < *number-chosen*, #NUM! is returned.

[Example:

PERMUT(8,2) results in 56

PERMUT(10,4) results in 5040

PERMUT(6,5) results in 720

end example]

18.17.7.251 PHONETIC

Syntax:

PHONETIC (*string*)

Description: Extracts the phonetic (furigana) characters from *string*. [Note: Furigana are aids used to indicate correct pronunciation of Japanese text. *end note*]

Arguments:

Name	Type	Description
<i>string</i>	text, reference	Designates a furigana string. If <i>string</i> is a cell range, the furigana string in the upper-left corner cell of that range is returned.

Return Type and Value: text – The phonetic (furigana) characters from *string*.

However, if *string* is a range of non-contiguous cells, #N/A is returned.

18.17.7.252 PI

Syntax:

PI ()

Description: Computes the value π .

Arguments: None.

Return Type and Value: number – The value π .

[Example: The following results are displayed using 10 significant digits

PI() results in 3.141592654

PI()/2 results in 1.570796327

PI()*(2.5^2) results in 19.63495408

end example]

18.17.7.253 PMT

Syntax:

PMT (*rate* , *nper* , *pv* [, [*fv*] [, [*type*]]])

Description: Computes the payment for a loan based on constant payments and a constant interest rate.

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate for the loan.						
<i>nper</i>	number	The total number of payment for the loan.						
<i>pv</i>	number	The present value, or the total amount that a series of future payments is worth now; also known as the principal.						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Return Type and Value: number – The payment for a loan based on constant payments and a constant interest rate. (The payment returned by PMT includes principal and interest but no taxes, reserve payments, or fees sometimes associated with loans.)

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

PMT(0.08/12,10,10000) results in -1,037.03

PMT(0.08/12,10,10000,0,1) results in -1,030.16

end example]

18.17.7.254 POISSON

Syntax:

POISSON (*x* , *mean* , *cumulative-flag*)

Description: Computes the Poisson distribution.

Mathematical Formula:

For *cumulative-flag* = FALSE:

$$POISSON = \frac{e^{-\lambda} \lambda^x}{x!}$$

For *cumulative-flag* = TRUE:

$$CUMPOISSON = \sum_{k=0}^x \frac{e^{-\lambda} \lambda^k}{k!}$$

where:

- x = argument *x*
- λ = argument *mean*

Arguments:

Name	Type	Description
<i>x</i>	number	The number of events, truncated to an integer.
<i>mean</i>	number	The expected numeric value.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, POISSON returns the cumulative Poisson probability that the number of random events occurring are between zero and <i>x</i> , inclusive; if FALSE, it returns the Poisson probability mass function that the number of events occurring is exactly <i>x</i> .

Return Type and Value: number – The Poisson distribution.

However, if

- $x < 0$, #NUM! is returned.
- $mean \leq 0$, #NUM! is returned.

[Example:

POISSON(2,5,TRUE) results in 0.124652019

POISSON(2,5,FALSE) results in 0.084224337

end example]

18.17.7.255 POWER

Syntax:

POWER (x , y)

Description: Computes x raised to the power y .

Arguments:

Name	Type	Description
x	number	The base and the number y is the exponent to which that base is raised.
y	number	The exponent to which the base is raised.

Return Type and Value: number – x^y .

However, if

- The value of x is negative and y is not a whole number, #NUM! is returned.
- x is zero and y is less than or equal to zero, #DIV/0! is returned.
- The result cannot be represented as a number, #NUM! is returned.

[Example:

POWER(2,3) results in 8

POWER(2,0.5) results in 1.414213562

POWER(-1.234,5.0) results in -2.861381721

POWER(1.234,5.1) results in 2.922182358

end example]

18.17.7.256 PPMT

Syntax:

PPMT ($rate$, per , $nper$, p_v [, [f_v] [, [$type$]]])

Description: Computes the payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate per period.						
<i>per</i>	number	The the period and shall be in the range 1– <i>nper</i> .						
<i>nper</i>	number	The total number of payment in an annuity.						
<i>pv</i>	number	The present value, or the total amount that a series of future payments is worth now.						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).						
<i>type</i>	number	<div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Return Type and Value: number – The payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

PPMT(0.1/12,1,2*12,2000) results in -75.62

PPMT(0.08,10,10,200000) results in -27,598.05

end example]

18.17.7.257 PRICE

Syntax:

PRICE (*settlement* , *maturity* , *rate* , *yld* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the price per \$100 face value of a security that pays periodic interest.

Mathematical Formula:

$$PRICE = \left[\frac{redemption}{\left(1 + \frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}} \right] + \left[\sum_{k=1}^N \frac{100 \times \frac{rate}{frequency}}{\left(1 + \frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}} \right] - \left(100 \times \frac{rate}{frequency} \times \frac{A}{E} \right)$$

where:

- *A* = number of days from beginning of coupon period to settlement date.
- *DSC* = number of days from settlement to next coupon date.
- *E* = number of days in coupon period in which the settlement date falls.
- *frequency* = argument *frequency*
- *N* = number of coupons payable between settlement date and redemption date.
- *rate* = argument *rate*
- *redemption* = argument *redemption*
- *yld* = argument *yld*

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>rate</i>	number	The security's interest rate.				
<i>yield</i>	number	The security's annual yield.				
<i>redemption</i>	number	The security's redemption value per \$100 face value.				
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to
Value	Day Count Basis					
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to					

Name	Type	Description	
			<p>30 February.</p> <ul style="list-style-type: none"> For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> If the date

Name	Type	Description		
				<p>is 28 or 29 February, it is adjusted to 30 February.</p> <ul style="list-style-type: none"> For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* or *yld* < 0 , #NUM! is returned.
- *redemption* ≤ 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

PRICE (DATE (2008, 2, 15), DATE (2017, 11, 15), 0.0575, 0.065, 100, 2, 0) results in 94.6344

end example]

18.17.7.258 PRICEDISC

Syntax:

PRICEDISC (*settlement* , *maturity* , *discount* , *redemption* [, [*basis*]])

Description: Computes the price per \$100 face value of a discounted security.

Mathematical Formula:

$$PRICEDISC = redemption - discount \times redemption \times \frac{DSM}{B}$$

where:

- B = number of days in year, depending on year basis.
- DSM = number of days from settlement to maturity.
- $discount$ = argument *discount*
- $redemption$ = argument *redemption*

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>discount</i>	number	The security's discount rate.				
<i>redemption</i>	number	The security's redemption value per \$100 face value.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date</div></td></tr></table></div>	Value	Day Count Basis	0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date</div>
Value	Day Count Basis					
0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date</div>					

Name	Type	Description	
			has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Name	Type	Description		
				a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a discounted security.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *discount* or *redemption* ≤ 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

PRICEDISC (DATE (2008, 2, 16), DATE (2008, 3, 1), 0.0525, 100, 2) results in 99.7958

end example]

18.17.7.259 PRICEMAT

Syntax:

PRICEMAT (*settlement* , *maturity* , *issue* , *rate* , *yld* [, [*basis*]])

Description: Computes the price per \$100 face value of a security that pays interest at maturity.

Mathematical Formula:

$$PRICEMAT = \frac{100 + \left(\frac{IM}{B} \times rate \times 100\right)}{1 + \left(\frac{DSM}{B} \times yld\right)} - \left(\frac{A}{B} \times rate \times 100\right)$$

where:

- A = number of days from issue to settlement.
- B = number of days in year, depending on year basis.
- DIM = number of days from issue to maturity.
- DSM = number of days from settlement to maturity.
- $rate$ = argument $rate$
- yld = argument yld

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>issue</i>	number	The security's issue date.				
<i>rate</i>	number	The security's interest rate.				
<i>yld</i>	number	The security's annual yield.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. Name	Type	Description	
			where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* or *yld* < 0 , #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

PRICEMAT (DATE (2008,2,15),DATE (2008,4,13),DATE (2007,11,11),0.061,0.061,0)
results in 99.9845

end example]

18.17.7.260 PROB

Syntax:

PROB (*x-range* , *probability-range* , *lower-limit* [, *upper-limit*])

Description: Computes the probability that values in a range are between two limits.

Arguments:

Name	Type	Description
<i>x-range</i>	array, reference	The set of numeric values of <i>x</i> with which there are associated probabilities.
<i>probability-range</i>	array, reference	A set of numeric probabilities associated with the values in <i>x-range</i> .
<i>lower-limit</i>	number	The lower bound on the value for which the probability is to be computed.
<i>upper-limit</i>	number	The upper bound on the value for which the probability is to be computed. If omitted, the probability that values in <i>x-range</i> are equal to <i>lower-limit</i> is returned.

Return Type and Value: number – The probability that values in a range are between two limits.

However, if

- Any value in *probability-range* ≤ 0 or any value in *probability-range* > 1 , #NUM! is returned.
- The sum of the values in *probability-range* < 1 , #NUM! is returned.
- *x-range* and *probability-range* contain a different number of data points, the return value is unspecified.

[Example:

PROB({0,1,2,3},{0.2,0.3,0.1,0.4},2) results in 0.1

PROB({0,1,2,3},{0.2,0.3,0.1,0.4},1,4) results in 0.8

end example]

18.17.7.261 PRODUCT

Syntax:

PRODUCT (*argument-list*)

Description: Multiplies the numeric values of *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers to be multiplied. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The product of the values of its arguments.

[Example:

PRODUCT(1) results in 1

PRODUCT(1,2,3,4,5) results in 120

PRODUCT({1,2;3,4}) results in 24

PRODUCT({2,3},4,"5") results in 120

end example]

18.17.7.262 PROPER

Syntax:

PROPER (*string*)

Description: Makes a lowercase version of *string* except that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase.

Arguments:

Name	Type	Description
<i>string</i>	text, reference	Designates the string to be converted.

Return Type and Value: text – A version of *string* such that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase. All other letters are converted to lowercase, and all other non-letters are unchanged.

[Example:

PROPER("12aBC d123aD#\$\$%sd^") results in 12Abc D123Ad#\$\$%Sd^

PROPER(A10) results in 12Abc D123Ad#\$\$%Sd^, when A10 contains 12aBC d123aD#\$\$%sd^

end example]

18.17.7.263 PV

Syntax:

PV (*rate* , *nper* , *pmt* [, [*fv*] [, [*type*]]])

Description: Computes the present value of an investment. (The present value is the total amount that a series of future payments is worth now.)

Mathematical Formula:

If *rate* is not 0, then:

$$pv * (1 + rate)^{nper} + pmt(1 + rate * type) * \left(\frac{(1 + rate)^{nper} - 1}{rate} \right) + fv = 0$$

If *rate* is 0, then:

$$(pmt \times nper) + pv + fv = 0(pmt * nper) + pv + fv = 0$$

where:

- *fv* = *fv* argument

- *nper* = *nper* argument
- *pmt* = *pmt* argument
- *rate* = *rate* argument
- *type* = *type* argument

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate per period.						
<i>nper</i>	number	The total number of payment in an annuity.						
<i>pmt</i>	number	The payment made each period and cannot change over the life of the annuity. If is omitted, <i>fv</i> shall be provided. [Note: Typically, <i>pmt</i> includes principal and interest but no other fees or taxes. <i>end note</i>]						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, <i>pmt</i> shall be provided.						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Return Type and Value: number – The present value of an investment.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

PV(0.08/12,12*20,500,,0) results in -59,777.15

end example]

18.17.7.264 QUARTILE

Syntax:

QUARTILE (*array* , *result-category*)

Description: Computes the quartile of a data set.

Arguments:

Name	Type	Description												
<i>array</i>	array, reference	The set of numeric values for which the quartile value is to be computed.												
<i>result-category</i>	number	When truncated to an integer, specifies which value is to be returned, as follows: <table><tr><th>Value</th><th>Value Returned</th></tr><tr><td>0</td><td>Minimum value</td></tr><tr><td>1</td><td>First quartile (25th percentile)</td></tr><tr><td>2</td><td>Median value (50th percentile)</td></tr><tr><td>3</td><td>Third quartile (75th percentile)</td></tr><tr><td>4</td><td>Maximum value</td></tr></table>	Value	Value Returned	0	Minimum value	1	First quartile (25th percentile)	2	Median value (50th percentile)	3	Third quartile (75th percentile)	4	Maximum value
Value	Value Returned													
0	Minimum value													
1	First quartile (25th percentile)													
2	Median value (50th percentile)													
3	Third quartile (75th percentile)													
4	Maximum value													

Return Type and Value: number – The quartile of a data set.

However, if

- *array* is empty, the return value is unspecified.
- *result-category* < 0 or *result-category* > 4, #NUM! is returned.

[Example:

QUARTILE({1,2,4,7,8,9,10,12},1) results in 3.5

end example]

18.17.7.265 QUOTIENT

Syntax:

QUOTIENT (*dividend* , *divisor*)

Description: Computes the integer portion of the division of *dividend* by *divisor*.

Arguments:

Name	Type	Description
<i>dividend</i>	number	The dividend
<i>divisor</i>	number	The divisor.

Return Type and Value: number – The integer portion of the division of *dividend* by *divisor*.

[Example:

QUOTIENT(5,2) results in 2

QUOTIENT(4.5,3.1) results in 1

QUOTIENT(-10,3) results in -3

end example]

18.17.7.266 RADIANS

Syntax:

RADIANS (*angle*)

Description: Converts *angle* in degrees into radians.

Arguments:

Name	Type	Description
<i>angle</i>	number	The angle expressed in degrees that is to be converted into radians.

Return Type and Value: number – *angle* in radians.

[Example:

RADIANS(360) results in 6.283185307

RADIANS(270) results in 4.71238898

RADIANS(45) results in 0.785398163

RADIANS(8.5) results in 0.148352986

end example]

18.17.7.267 RAND

Syntax:

RAND ()

Description: Computes an evenly distributed random real number greater than or equal to 0 and less than 1. A new random real number is returned every time the cell's value is calculated.

Arguments: None.

Return Type and Value: number – An evenly distributed random real number greater than or equal to 0 and less than 1.

[Example:

RAND() results in 0.437337454

INT(RAND()*(6-1)+1) might result in 3

end example]

18.17.7.268 RANDBETWEEN

Syntax:

RANDBETWEEN (*lower-bound* , *upper-bound*)

Description: Computes a random integer number in the range *lower-bound*–*upper-bound*. A new random integer number is returned every time the cell's value is calculated.

Arguments:

Name	Type	Description
<i>lower-bound</i>	number	The smallest integer that is returned.
<i>upper-bound</i>	number	The largest integer that is returned.

Return Type and Value: number – A random integer number in the range specified.

However, if *lower-bound* is greater than *upper-bound*, #NUM! is returned.

[Example:

RANDBETWEEN(1,6) results in an integer between 1 and 6, inclusive

RANDBETWEEN(-10,10) results in an integer between -10 and 10, inclusive

end example]

18.17.7.269 RANK

Syntax:

RANK (*number* , *number-list* [, *order*])

Description: Computes the rank of a number in a list of numbers. RANK gives duplicate numbers the same rank. However, the presence of duplicate numbers affects the ranks of subsequent numbers.

Arguments:

Name	Type	Description
<i>number</i>	number	The number whose rank is to be found.

Name	Type	Description
<i>number-list</i>	reference	Designates the list of numbers. Non-numeric values in this list are ignored.
<i>order</i>	number	Specifies how <i>number</i> is to be ranked. If zero or omitted, <i>number</i> is ranked as if the list were sorted in descending order. If <i>order</i> is any non-zero value, <i>number</i> is ranked as if the list were sorted in ascending order.

Return Type and Value: number – The rank of a number in a list of numbers.

[Example:

When the cells E1:I1 contain 7, 3.5, 3.5, 1, and 2

RANK(E2,E1:I1,1) results in 3

RANK(E2,E1:I1,1,0) results in 2

RANK(E2,E1:I1,1) results in 2

RANK(E1,E1:I1,1) results in 5, as the two 3.5 values both have a rank of 3; no value has rank 4.

end example]

18.17.7.270 RATE

Syntax:

RATE (*nper* , *pmt* , *pv* [, [*fv*] [, [*type*] [, [*guess*]]]])

Description: Computes the interest rate per period of an annuity, using iteration, which can result in zero or more solutions.

Arguments:

Name	Type	Description
<i>nper</i>	number	The total number of payment periods.
<i>pmt</i>	number	The payment made each period and cannot change over the life of the annuity. (Typically, <i>pmt</i> includes principal and interest but no other fees or taxes.) If omitted, <i>fv</i> shall be present.
<i>pv</i>	number	The present value.
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
<i>type</i>	number	The timing of the payment, truncated to integer, as follows:

Name	Type	Description						
settlement	number	The security's settlement date.						
maturity	number	The security's maturity date.						
investment	number	The amount invested in the security.						
discount	number	The security's discount rate.						
basis	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div></td></tr><tr><td>1</td><td><div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</div></td></tr></table></div>	Value	Day Count Basis	0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div>	1	<div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</div>
Value	Day Count Basis							
0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div>							
1	<div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</div>							

Name	Type	Description	
			year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The amount received at maturity for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *investment* or *discount* \leq 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

RECEIVED(DATE(2008,2,15),DATE(2008,5,15),1000000,0.0575,2) results in 1014584.65

end example]

18.17.7.272 REPLACE

Syntax:

REPLACE (*string-1* , *start-pos* , *number-chars* , *string-2*)

Description: Produces a new string that is *string-1* with *number-chars* characters starting at position *start-pos*, replaced by *string-2*. (REPLACE is intended for use with languages that use the single-byte character set (SBCS), whereas REPLACEB (§18.17.7.273) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string-1</i>	text	Designates a string.
<i>start-pos</i>	number	The number of the start position within <i>string-1</i> from which characters in <i>string-1</i> are to be replaced. The start position of the first character is 1. <i>start-pos</i> shall be at least 0. If <i>start-pos</i> is beyond the end of <i>string-1</i> , the result is a new string that is <i>string-2</i> appended to <i>string-1</i> . If <i>start-pos</i> is within the bounds of <i>string-1</i> , but <i>number-chars</i> goes beyond the end of <i>string-1</i> , the characters starting at position <i>start-pos</i> through to the end of <i>string-1</i> shall be replaced by <i>string-2</i> .
<i>number-chars</i>	number	The number of characters within <i>string-1</i> that are to be replaced by the string designated by <i>string-2</i> .
<i>string-2</i>	text	Designates a string.

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[Example:

REPLACE("abcdefghijk",3,4,"XY") results in abXYghijk

REPLACE("abcdefghijk",3,1,"12345") results in ab12345defghijk

REPLACE("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

18.17.7.273 REPLACEB

Syntax:

REPLACEB (*string-1* , *start-pos* , *number-bytes* , *string-2*)

Description: Produces a new string that is *string-1* with *number-bytes* bytes starting at position *start-pos*, replaced by *string-2*. (REPLACEB is intended for use with languages that use the double-byte character set (DBCS), whereas REPLACE (§18.17.7.272) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string-1</i>	text	Designates a string.
<i>start-pos</i>	number	The number of the start position within <i>string-1</i> from which characters in <i>string-1</i> are to be replaced. The start position of the first character is 1. <i>start-pos</i> shall be at least 0. If <i>start-pos</i> is beyond the end of <i>string-1</i> , the result is a new string that is <i>string-2</i> appended to <i>string-1</i> . If <i>start-pos</i> is within the bounds of <i>string-1</i> , but <i>number-bytes</i> goes beyond the end of <i>string-1</i> , the characters starting at position <i>start-pos</i> through to the end of <i>string-1</i> shall be replaced by <i>string-2</i> .
<i>number-bytes</i>	number	The number of characters within <i>string-1</i> that are to be replaced by the string designated by <i>string-2</i> .
<i>string-2</i>	text	Designates a string.

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

REPLACEB("abcdefghijk",3,4,"XY") results in abXYghijk

REPLACEB("abcdefghijk",3,1,"12345") results in ab12345defghijk

REPLACEB("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

18.17.7.274 REPT

Syntax:

REPT (*string* , *replication-count*)

Description: Creates a string that is *replication-count* number of occurrences of *string* concatenated together.

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string to be replicated.
<i>replication-count</i>	number	The number of times <i>string</i> is to be replicated, truncated to integer. If <i>replication-count</i> is 0, the resulting string is empty.

Return Type and Value: text – The final replicated string.

However, if *replication-count* < 0, #VALUE! is returned.

[Example:

REPT("ABC",3) results in ABCABCABC

LEN(REPT("ABC",0)) results in 0

end example]

18.17.7.275 RIGHT

Syntax:

RIGHT (*string* [, *number-chars*])

Description: Extracts the right-most *number-chars* characters from *string*. (RIGHT is intended for use with languages that use the single-byte character set (SBCS), whereas RIGHTB (§18.17.7.276) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-chars</i>	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. <i>number-chars</i> shall be at least 0. If <i>number-chars</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

Return Type and Value: text – A string containing the right-most *number-chars* characters from *string*.

However, if *number-chars* < 0, #VALUE! is returned.

[Example:

RIGHT("abcdef",2) results in ef

RIGHT(A10,4) results in z123, when A10 contains xyz123

end example]

18.17.7.276 RIGHTB

Syntax:

RIGHTB (*string* , [*number-bytes*])

Description: Extracts the right-most *number-bytes*-worth of characters from *string*. (RIGHTB is intended for use with languages that use the double-byte character set (DBCS), whereas RIGHT (§18.17.7.275) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-bytes</i>	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. <i>number-bytes</i> shall be at least 0. If <i>number-bytes</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

Return Type and Value: text – A string containing the right-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

RIGHTB("abcdef",2) results in ef

RIGHTB(A10,4) results in z123, when A10 contains xyz123

end example]

18.17.7.277 ROMAN

Syntax:

ROMAN (*number* , *form*)

Description: Converts the Arabic number, *number*, to a Roman number according to *form*.

Arguments:

Name	Type	Description										
<i>number</i>	number	The Arabic number to be converted.										
<i>form</i>	number	<div>Specifies the type of Roman numeral to be produced. The Roman numeral style ranges from Classic to Simplified, becoming more concise as the value of <i>form</i> increases, as follows:</div> <table><tr><th>Value</th><th>Type</th></tr><tr><td>0, omitted, or TRUE</td><td>Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.</td></tr><tr><td>1</td><td>Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.</td></tr><tr><td>2</td><td>More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.</td></tr><tr><td>3</td><td>Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that</td></tr></table>	Value	Type	0, omitted, or TRUE	Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.	1	Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.	2	More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.	3	Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that
Value	Type											
0, omitted, or TRUE	Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.											
1	Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.											
2	More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.											
3	Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that											

Name	Type	Description	
			is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.
		4 or FALSE	Simplified. Produce the fewest Roman digits.

Return Type and Value: text – The corresponding Roman number.

However, if

- *number* < 0 or > 3999, #VALUE! is returned.
- *form* is not one of the values listed above, #VALUE! is returned.

[Example:

ROMAN(499,0) results in CDXCIX, which is 100 less than 500, plus 10 less than 100, plus one less than 10.

ROMAN(499,1) results in LDVLIV, which is 50 less than 500, plus 5 less than 50, plus one less than 5.

ROMAN(499,2) results in XDIX, which is 10 less than 500, plus one less than 10.

ROMAN(499,3) results in VDIV, which is 5 less than 500, plus one less than 5.

ROMAN(499,4) results in ID, which is 1 less than 500.

ROMAN(2013,0) results in MMXIII, which is 2,000, plus 10, plus 3.

end example]

18.17.7.278 ROUND

Syntax:

ROUND (*x* , *number-digits*)

Description: Rounds *x* to the number of digits specified by *number-digits*.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded.
<i>number-digits</i>	number	The number of digits to which <i>x</i> is to be rounded. If <i>number-digits</i> is greater than 0, <i>x</i> is rounded to the specified number of decimal places. If <i>number-digits</i> is 0, <i>x</i> is rounded to the nearest integer. If <i>number-digits</i> is less than 0, <i>x</i> is rounded to the left of the decimal point.

Return Type and Value: number – The rounded value of x . When rounding, digits 0–4 round down, while digits 5–9 round up.

[Example:

ROUND(2.15,1) results in 2.2

ROUND(2.149,1) results in 2.1

ROUND(-1.475,2) results in -1.48

ROUND(21.5,-1) results in 20

end example]

18.17.7.279 ROUNDDOWN

Syntax:

ROUNDDOWN (x , *number-digits*)

Description: Computes x rounded down, toward zero, to the number of digits specified by *number-digits*. [Note: ROUNDDOWN behaves like ROUND (§18.17.7.278), except that ROUNDDOWN always rounds a number down. end note]

Arguments:

Name	Type	Description
x	number	The value to be rounded down.
<i>number-digits</i>	number	The number of digits to which x is to be rounded. If <i>number-digits</i> is greater than 0, x is rounded to the specified number of decimal places. If <i>number-digits</i> is 0, x is rounded to the nearest integer. If <i>number-digits</i> is less than 0, x is rounded to the left of the decimal point.

Return Type and Value: number – The rounded-down value of x .

[Example:

ROUNDDOWN(3.2,0) rounds 3.2 down to zero decimal places; that is, to 3

ROUNDDOWN(76.9,0) rounds 76.9 down to zero decimal places; that is, to 76

ROUNDDOWN(3.14159,3) rounds 3.14159 down to three decimal places; that is, to 3.141

ROUNDDOWN(-3.14159,1) rounds -3.14159 down to one decimal place; that is, to -3.1

ROUNDDOWN(31415.92654,-2) rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to 31400

end example]

18.17.7.280 ROUNDUP

Syntax:

ROUNDUP (*x* , *number-digits*)

Description: Computes *x* rounded up, away from zero, to the number of digits specified by *number-digits*. [Note: ROUNDUP behaves like ROUND (§18.17.7.278), except that ROUNDUP always rounds a number up. *end note*]

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded up.
<i>number-digits</i>	number	The number of digits to which <i>x</i> is to be rounded. If <i>number-digits</i> is greater than 0, <i>x</i> is rounded up to the specified number of decimal places. If <i>number-digits</i> is 0, <i>x</i> is rounded up to the nearest integer. If <i>number-digits</i> is less than 0, <i>x</i> is rounded up to the left of the decimal point.

Return Type and Value: number – The rounded-up value of *x*.

[Example:

ROUNDDOWN(3.2,0) rounds 3.2 down to zero decimal places; that is, to 3

ROUNDDOWN(76.9,0) rounds 76.9 down to zero decimal places; that is, to 76

ROUNDDOWN(3.14159,3) rounds 3.14159 down to three decimal places; that is, to 3.142

ROUNDDOWN(-3.14159,1) rounds -3.14159 down to one decimal place; that is, to -3.2

ROUNDDOWN(31415.92654,-2) rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to 31500

end example]

18.17.7.281 ROW

Syntax:

ROW ([*reference*])

Description: Finds the number of the row(s) corresponding to *reference*.

Arguments:

Name	Type	Description
<i>reference</i>	reference to a single cell or to a range of	If omitted, the behavior is as if <i>reference</i> referred to the cell containing the formula.

Name	Type	Description
	contiguous cells	

Return Type and Value: number – If *reference* refers to a single cell or to a single row of cells, the corresponding row is returned. If *reference* refers to a range of cells involving multiple rows, a vertical array of the corresponding rows as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[Example:

ROW() results in 16, when the cell containing the formula is in row 16

ROW(E17:G17) results in 17

ROW(E16:G17) results in a vertical array containing 16 and 17, respectively

end example]

18.17.7.282 ROWS

Syntax:

ROWS (*array*)

Description: Finds the number of rows corresponding to *array*.

Arguments:

Name	Type	Description
<i>array</i>	array, reference to a single cell, or a reference to a range of contiguous cells	A set of rows.

Return Type and Value: number – The number of rows corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, #NULL! is returned.

[Example:

ROWS(E16:H16) results in 1

ROWS(E16:G18) results in 3

ROWS({1,2;3,4}) results in 2

end example]

18.17.7.283 RSQ

Syntax:

RSQ (*known-ys* , *known-xs*)

Description: Computes the square of the Pearson product moment correlation coefficient through data points in known ys and known xs.

Mathematical Formula:

The equation for the Pearson product moment correlation coefficient, *r*, is:

$$r = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where:

- *x* = a sample value
- \bar{x} = the sample mean AVERAGE(*known-xs*)
- *y* = a sample value
- \bar{y} = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
<i>known-xs</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-ys</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The square of the Pearson product moment correlation coefficient.

However, if

- *known-ys* and *known-xs* are empty or have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* contain only one data point, the return value is unspecified.

[Example:

RSQ({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 0.057950192

end example]

18.17.7.284 RTD

Syntax:

RTD (*progID* , [*rtd-server*] , *argument-list*)

Description: Retrieves data from a program in real-time. Periodically, this function returns new values and causes recalculation of the expression containing the call to it.

Arguments:

Name	Type	Description
<i>progID</i>	text	The name of the program from which the data is to be retrieved.
<i>rtd-server</i>	text	An optional string that is specific to the program with which RTD is communicating.
<i>argument list</i>	any	The presence and meaning of each <i>argument</i> in <i>argument-list</i> is specific to the program with which RTD is communicating.

Return Type and Value: array – The set of values returned by the program with which RTD is communicating.

[Example: Consider a stockprice program that is called as follows:

RTD("stockprice.rtd","NASD","MSFT")

The result it returns—the price of the stock MSFT according to NASD—changes over time, often every few seconds.

The *rtd-server* program could also be written to accept multiple arguments, allowing calls like the following::

RTD("stockprice.rtd","NASD","MSFT","GOOG","AMZN")

where three stock values are requested.

end example]

18.17.7.285 SEARCH

Syntax:

SEARCH (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search, using a lexical comparison, for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (SEARCH is intended for use with languages that use the single-byte character set (SBCS), whereas SEARCHB (§18.17.7.286) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> . <i>string-1</i> can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example:

SEARCH("de", "abcdeF") results in 4

SEARCH("?c*e", "abcdeF") results in 2

end example]

18.17.7.286 SEARCHB

Syntax:

SEARCHB (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search, using a lexical comparison, for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (SEARCHB is intended for use with languages that use the double-byte character set (DBCS), whereas SEARCH (§18.17.7.285) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> . <i>string-1</i> can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example: Assuming 1-byte characters

SEARCHB("de", "abcdeF") results in 4

SEARCHB("?c*e", "abcdeF") results in 2

end example]

18.17.7.287 SECOND

Syntax:

SECOND (*time-value*)

Description: Computes the second for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
<i>time-value</i>	number	The date and/or time whose second is to be computed. That date and/or time shall be expressed either as a serial date-time, in which case, its integer part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The second for the date and/or time having the given *time-value*.

However, if *time-value* is out of range for the current date system, #NUM! is returned.

[Example:

SECOND (DATE (2006, 2, 26) + TIME (2, 10, 20)) results in 20

SECOND (TIME (22, 56, 34)) results in 34

SECOND (0) results in 0, since serial date-time 0 represents 00:00:00

SECOND (10.5) results in 0, since serial date-time .5 represents 12:00:00

SECOND ("22-Oct-2001 10:53:12") results in 12

SECOND ("10:53:12 pm") results in 12

SECOND ("22:53:12") results in 12

end example]

18.17.7.288 **SERIESSUM**

Syntax:

SERIESSUM (*input-value* , *initial-power* , *step* , *coefficients*)

Description: Computes the sum of a power series.

Mathematical Formula:

The sum of a power series is based on the formula:

$$SERIES(x, n, m, a) = a_1 x^n + a_2 x^{(n+m)} + a_3 x^{(n+2m)} + \dots + a_i x^{(n+(i-1)m)}$$

where:

- *a* = argument *coefficients*
- *m* = argument *step*

- n = argument *initial-power*
- x = argument *input-value*

Arguments:

Name	Type	Description
<i>input-value</i>	number	The input value to the power series;
<i>initial-power</i>	number	The initial power to which <i>input-value</i> is to be raised.
<i>step</i>	number	The step by which to increase <i>initial-power</i> for each term in the series;
<i>coefficients</i>	reference	A set of coefficients by which each successive power of <i>input-value</i> is multiplied. The number of values in <i>coefficients</i> determines the number of terms in the power series.

Return Type and Value: number – The sum of a power series.

[Example: Given the following data:

	A
1	1
2	=-1/FACT(2)
3	=1/FACT(4)
4	=-1/FACT(6)

SERIESSUM(PI()/4,0,2,A1:A4) results in 0.707103, an approximation to the cosine of $\pi/4$ radians

end example]

18.17.7.289 SIGN

Syntax:

SIGN (x)

Description: Determines the sign of x .

Arguments:

Name	Type	Description
x	number	The number whose sign is to be determined.

Return Type and Value: number – 1 if x is positive, 0 if x is 0, and -1 if x is negative.

[Example:

SIGN(10.5) results in 1

SIGN(0) results in 0

SIGN(-5.4) results in -1

end example]

18.17.7.290 SIN

Syntax:

SIN (x)

Description: Computes the sine of x .

Arguments:

Name	Type	Description
x	number	The number, in radians, whose sine is to be computed.

Return Type and Value: number – The sine of x .

[Example:

SIN(-1) results in -0.841470985

SIN(0) results in 0

SIN(1) results in 0.841470985

end example]

18.17.7.291 SINH

Syntax:

SINH (x)

Description: Computes the hyperbolic sine of x .

Arguments:

Name	Type	Description
x	number	The number whose hyperbolic sine is to be computed.

Return Type and Value: number – The hyperbolic sine of x .

However, if the magnitude of x is too large for the result to be represented, #NUM! is returned.

[*Example:*

SINH(1) results in 1.175201194

SINH(10) results in 11013.23287

SINH(100) results in 1.34406E+43

end example]

18.17.7.292 SKEW

Syntax:

SKEW (*argument-list*)

Description: Computes the skewness of a distribution. [*Note:* Skewness characterizes the degree of asymmetry of a distribution around its mean. Positive skewness indicates a distribution with an asymmetric tail extending toward more positive values. Negative skewness indicates a distribution with an asymmetric tail extending toward more negative values. *end note*]

Mathematical Formula:

$$\frac{n}{(n-1)(n-2)} \sum \left(\frac{x_i - \bar{x}}{s} \right)^3$$

where:

- n = the number of elements in *argument-list*
- s = standard deviation of the values in *argument-list*
- x_i = value of each element in *argument-list*
- \bar{x} = mean of the values in *argument-list*

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers for which the skewness is to be computed. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The skewness of a distribution.

However, if

- There are fewer than three data points, the return value is unspecified.
- The sample standard deviation is zero, the return value is unspecified.

[Example:

SKEW(3,4,5,2,3,4,5,6,4,7) results in 0.359543071

end example]

18.17.7.293 SLN

SLN (*cost* , *salvage* , *life*)

Description: Computes the straight-line depreciation of an asset for one period.

Arguments:

Name	Type	Description
<i>cost</i>	number	The number <i>cost</i> is the initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)

Return Type and Value: number – The straight-line depreciation of an asset for one period.

[Example:

SLN(30000,7500,10) results in 2,250.00

end example]

18.17.7.294 SLOPE

Syntax:

SLOPE (*known-ys* , *known-xs*)

Description: Computes the slope of the linear regression line through data points in known ys and known xs. The slope is the vertical distance divided by the horizontal distance between any two points on the line, which is the rate of change along the regression line.

Mathematical Formula:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(known-xs)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(known-ys)`

Arguments:

Name	Type	Description
<i>known-xs</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-ys</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The slope of the linear regression line through data points in known ys and known xs.

However, if

- *known-ys* and *known-xs* are empty, the return value is unspecified.
- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.

[Example:

`SLOPE({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in 0.305555556

end example]

18.17.7.295 SMALL

Syntax:

`SMALL (array , k)`

Description: Computes the k^{th} smallest value in a data set.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	The set of numbers from which the k^{th} -smallest value is to be determined.
<i>k</i>	number	The position (from the smallest) in the array or cell range of data to return.

Return Type and Value: number – The k^{th} smallest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$ or k is greater than the number of data points, #NUM! is returned.

[Example:

SMALL({3,5,3,5,4;4,2,4,6,7},3) results in 3

SMALL({3,5,3,5,4;4,2,4,6,7},7) results in 5

end example]

18.17.7.296 SQRT

Syntax:

SQRT (*x*)

Description: Computes the positive square root of *x*.

Arguments:

Name	Type	Description
<i>x</i>	number	The number whose positive root is to be found.

Return Type and Value: number – The positive square root of *x*.

However, if *x* is negative, #NUM! is returned.

[Example:

SQRT(2) results in 1.414213562

SQRT(5) results in 2.236067977

end example]

18.17.7.297 SQRTPI

Syntax:

SQRTPI (x)

Description: Computes the positive square root of $x \times \pi$.

Arguments:

Name	Type	Description
x	number	The number, which when multiplied by π , whose positive root is to be found.

Return Type and Value: number – The positive square root of $x \times \pi$.

However, if x is negative, #NUM! is returned.

[*Example:*

SQRTPI(1) results in 1.772453851

SQRTPI(2) results in 2.506628275

end example]

18.17.7.298 STANDARDIZE

Syntax:

STANDARDIZE (x , *mean* , *standard-dev*)

Description: Computes a normalized value from a distribution characterized by *mean* and *standard-dev*.

Mathematical Formula:

$$Z = \frac{X - \mu}{\sigma}$$

where:

- X = argument x
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

Name	Type	Description
x	number	The number whose value is to be normalized. Represented by X in the mathematical formula presented.
<i>mean</i>	number	The arithmetic mean of the distribution. Represented by μ (μ) in the mathematical formula presented.
<i>standard-dev</i>	number	The standard deviation of the distribution. Represented by σ (σ) in the mathematical formula presented.

Return Type and Value: number – A normalized value from a distribution.

However, if *standard-dev* ≤ 0 , #NUM! is returned.

[Example:

STANDARDIZE(42,40,1.5) results in 1.333333333

end example]

18.17.7.299 STDEV

Syntax:

STDEV (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [Note: STDEV assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVA instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{(n - 1)}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. <i>argument-list</i> can also be an array of numbers. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[Example:

STDEV(123,134,143,173,112,109) results in 23.72902583

end example]

18.17.7.300 STDEVA

Syntax:

STDEVA (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [Note: STDEVA assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEV instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{(n - 1)}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number,	The <i>arguments</i> in <i>argument-list</i> designate the numbers

Name	Type	Description
	name, text, array, reference. The argument list can also be an array of numbers.	that are samples of the population. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[Example:

STDEVA(123,134,143,173,112,109) results in 23.72902583

end example]

18.17.7.301 STDEVP

Syntax:

STDEVP (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [Note: STDEVP assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVPA instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{n}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference.	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered

Name	Type	Description
	The argument list can also be an array of numbers.	directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – The standard deviation of an entire population.

[Example:

STDEVP(123,134,143,173,112,109) results in 21.66153785

end example]

18.17.7.302 STDEVPA

Syntax:

STDEVPA (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [Note: STDEVPA assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEVP instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{n}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference. The argument list can also be an	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population.

Name	Type	Description
	array of numbers.	

Return Type and Value: number – The standard deviation of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Example:

STDEVPA(123,134,143,173,112,109) results in 21.66153785

end example]

18.17.7.303 STEYX

Syntax:

STEYX (*known-ys* , *known-xs*)

Description: Computes the standard error of the predicted *y*-value for each *x* in the regression. The standard error is a measure of the amount of error in the prediction of *y* for an individual *x*.

Mathematical Formula:

$$\sqrt{\frac{1}{(n-2)} \left[\sum (y - \bar{y})^2 - \frac{[\sum (x - \bar{x})(y - \bar{y})]^2}{\sum (x - \bar{x})^2} \right]}$$

where:

- *x* = a sample value
- \bar{x} = the sample mean AVERAGE(*known-xs*)
- *y* = a sample value
- \bar{y} = the sample mean AVERAGE(*known-ys*)

Arguments:

Name	Type	Description
<i>known-xs</i>	number, name, array, or reference to	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If

Name	Type	Description
	number, text, logical	an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-ys</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The standard error of the predicted y -value for each x in the regression.

However, if

- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* are empty or have less than three data points, the return value is unspecified.

[Example:

STEYX({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 3.30571895

end example]

18.17.7.304 SUBSTITUTE

Syntax:

SUBSTITUTE (*string* , *old-string* , *new-string* [, *occurrence*])

Description: Produces a new string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

Arguments:

Name	Type	Description
<i>string</i>	text	Designates a string.
<i>old-string</i>	text	Designates a string.
<i>new string</i>	text	Designates a string.
<i>occurrence</i>	number	The occurrence number of the <i>old-string</i> characters within <i>string-1</i> that is to be replaced by the string designated by <i>new-string</i> . If omitted, all occurrences of <i>old-string</i> characters shall be replaced.

Return Type and Value: text – A string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

However, if *occurrence* < 0, #VALUE! is returned.

[Example:

SUBSTITUTE("abcaaabca", "a", "xx") results in xxbcxxxxxxbcxx

SUBSTITUTE("abcaaabca", "a", "", 10) results in bcbc

SUBSTITUTE("abcaaabca", "a", "xx", 3) results in abcaxxabca

end example]

18.17.7.305 SUBTOTAL

Syntax:

SUBTOTAL (*function-number* , *argument-list*)

Description: Computes a value using the function designated by *function-number*, using the *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>function-number</i>	number	Indicates the function to be called, as shown in the table below.
<i>argument-list</i>	number	Each <i>argument</i> in <i>argument-list</i> is passed to the called function, in the order specified. That shall be no more than 254 <i>arguments</i> .

<i>function-number</i> (includes hidden values)	<i>function-number</i> (excludes hidden values)	Function
1	101	AVERAGE
2	102	COUNT
3	103	COUNTA
4	104	MAX
5	105	MIN
6	106	PRODUCT
7	107	STDEV
8	108	STDEVP
9	109	SUM

<i>function-number</i> (includes hidden values)	<i>function-number</i> (excludes hidden values)	Function
10	110	VAR
11	111	VARP

If any argument contains a SUBTOTAL function call, that call shall be ignored to avoid double counting.

For the *function-number* values 1–11, the values of hidden rows are included. For the *function-number* values 101–111, the values of hidden rows are excluded.

The SUBTOTAL function shall ignore any rows that are not included in the result of a filter, regardless of which *function-number* value is used.

The SUBTOTAL function is designed for columns of data, or vertical ranges. It is not designed for rows of data, or horizontal ranges. [Example: When a horizontal range is subtotaled using a *function-number* of 101 or greater, hiding a column does not affect the subtotal. However, hiding a row in a subtotal of a vertical range does affect the subtotal. end example]

Return Type and Value: number – The result from calling the function designated by *function-number*, using the *arguments* in *argument-list*.

However, if *function-number* does not have one of the values specified above, #NUM! is returned.

[Example:

SUBTOTAL (2, E5:E15) counts the number of values in the cell range E5:E15, including hidden values

SUBTOTAL (4, E5:E15) finds the maximum value of the values in the cell range E5: E15, including hidden values

SUBTOTAL (106, E5:E15) finds the product of the values in the cell range E5: E15, excluding hidden values

end example]

18.17.7.306 SUM

Syntax:

SUM (*argument-list*)

Description: Adds the numeric values of *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference.	The <i>arguments</i> in <i>argument-list</i> designate the numeric values to be added. Arguments that are numbers, logical values, or text representations of numbers shall be

Name	Type	Description
		counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The sum of the values of its arguments.

[Example:

SUM(1,2,3,4,5) results in 15

SUM({1,2;3,4}) results in 10

SUM({1,2,3,4,5},6,"7") results in 28

SUM({1,"2",TRUE,4}) results in 5, as the logical value and numeric text are ignored

end example]

18.17.7.307 SUMIF

Syntax:

SUMIF (*cell-range* , *selection-criteria* [, *sum-range*])

Description: Applies selection criteria on the values in one range of cells and sums the values of the cells in a corresponding range.

Arguments:

Name	Type	Description
<i>cell-range</i>	reference	Designates the range of cells to be inspected.
<i>selection-criteria</i>	number, expression, reference, text	Defines which cells are counted. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>sum-range</i>	reference	If present, <i>sum-range</i> designates the cells whose values are summed. In this case, <i>sum-range</i> does not have to have the same size and shape as <i>cell-range</i> . The actual cells that are added are determined by using the top, left cell in <i>sum-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range</i> . If

Name	Type	Description
		omitted, <i>cell-range</i> also designates the cells whose values are summed.

Return Type and Value: number – The sum of the cells corresponding to those selected.

[Example: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

SUMIF(A1:D1, "=10") results in 20

SUMIF(A1:D1, ">5") results in 27

SUMIF(A1:D1, "<>10") results in 10

Given that A2, B2, C2, and D2, respectively, contain the values apples, melons, 10, and 15

SUMIF(A2:B2, "*es", C2:D2) results in 10

end example]

18.17.7.308 SUMIFS

Syntax:

SUMIFS (*sum-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, ...]])

Description: Adds the cells in a range that meet multiple criteria.

Arguments:

Name	Type	Description
<i>sum-range</i>	reference	Designates the cells whose values are summed. In this case, <i>sum-range</i> does not have to have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>sum-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . Each cell in <i>sum-range</i> is summed only if all of the corresponding criteria specified are true for that cell. Cells in <i>sum-range</i> that contain TRUE evaluate to 1; cells in <i>sum-range</i> that contain FALSE evaluate to 0.
<i>cell-range-1</i>	reference	Designates the first range of cells to be inspected.
<i>selection-criteria-1</i>	number, expression, reference, text	Specifies the criteria for the first range of cells that is counted. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be

Name	Type	Description
		compared. <i>selection-criteria-1</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>cell-range-n</i>	reference	The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively.
<i>selection-criteria-n</i>	number, expression, reference, text	

Return Type and Value: number – The sum of the cells corresponding to those selected.

[Example: Given the following data:

	A	B	C	D
1	Sales Person	Tables	Chairs	Desks
2	Emilio	34	85	97
3	Julie	353	23	18
4	Hans	13	67	14
5	Frederique	0	98	0

SUMIFS(B2:C5,A2:A5,"=Julie") results in 353 (the sum of the number of tables and chairs sold by Julie)

SUMIFS(B2:B5,A2:A5,"=Julie",A2:A5,"=Hans") results in 0 (the sum of the number of tables sold by Julie and Hans)

SUMIFS(B2:B5,A3,"=Julie",A4,"=Hans") results in 34 (the sum of the the number of tables sold by Julie and Hans)

SUMIFS(B2:D5,A2:A5,"<>Emilio") results in 768 (the sum of the number of tables, chairs, and desks sold by all sales persons except Emilio)

end example]

18.17.7.309 SUMPRODUCT

Syntax:

SUMPRODUCT (*argument-list*)

Description: Multiplies the corresponding elements in the array *arguments* in *argument-list*, and returns the sum of those products. An array element that is not numeric is treated as if it contained 0.

Arguments:

Name	Type	Description
<i>argument-list</i>	array of numbers	The <i>arguments</i> in <i>argument-list</i> designate the numeric values to be multiplied.

Return Type and Value: number – The sum of the products of the corresponding elements in the *arguments* in *argument-list*.

However, if the array arguments do not have the same dimensions, #NUM! is returned.

[Example:

SUMPRODUCT({2,3}) results in 5

SUMPRODUCT({2,3},{4,5}) results in 23

SUMPRODUCT({2,3},{4,5},{2,2}) results in 46

SUMPRODUCT({2,3;4,5},{2,2;3,4}) results in 42

end example]

18.17.7.310 SUMSQ

Syntax:

SUMSQ (*argument-list*)

Description: Adds the squares of *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the values whose squares are to be summed. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The sum of the squares of its arguments.

[Example:

SUMSQ(2) results in 4
SUMSQ(2.5, -3.6)) results in 19.21
SUMSQ({2.5, -3.6}), 2.4) results in 24.97

end example]

18.17.7.311 SUMX2MY2

Syntax:

SUMX2MY2 (array-1 , array-2)

Description: Computes the sum of the difference of squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2MY2 = \sum (x^2 - y^2)$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

Name	Type	Description
<i>array-1</i>	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
<i>array-2</i>		

Return Type and Value: number – The sum of the difference of squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMX2MY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 55
SUMX2MY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in -64
end example]

18.17.7.312 SUMX2PY2

Syntax:

SUMX2PY2 (*array-1* , *array-2*)

Description: Computes the sum of the sum of the squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2PY2 = \sum (x^2 + y^2)$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

Name	Type	Description
<i>array-1</i>	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
<i>array-2</i>		

Return Type and Value: number – The sum of the sum of the squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMX2PY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 521

SUMX2PY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 480

end example]

18.17.7.313 SUMXMY2

Syntax:

SUMXMY2 (*array-1* , *array-2*)

Description: Computes the sum of the squares of the difference between corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMXMY2 = \sum (x - y)^2$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

Name	Type	Description
<i>array-1</i>	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
<i>array-2</i>		

Return Type and Value: number – The sum of the squares of the difference between the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMXMY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 79

SUMXMY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 78

end example]

18.17.7.314 SYD

SYD (*cost* , *salvage* , *life* , *per*)

Description: Computes the sum-of-years' digits depreciation of an asset for a specified period.

Mathematical Formula:

$$SYD = \frac{(cost - salvage) * (life - per + 1) * 2}{(life)(life + 1)}$$

where:

- *cost* = argument *cost*
- *life* = argument *life*
- *per* = argument *per*
- *salvage* = argument *salvage*

Arguments:

Name	Type	Description
<i>cost</i>	number	The initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>per</i>	number	The period and shall have the same units as <i>life</i> .

Return Type and Value: number – The sum-of-years' digits depreciation of an asset for a specified period.

[Example:

SYD(30000,7500,10,1) results in 4,090.91

SYD(30000,7500,10,10) results in 409.09

end example]

18.17.7.315 T

Syntax:

T (*value*)

Description: Retrieves the text referenced by *value*.

Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested for text. No conversion to text shall take place on an argument passed to this function.

Return Type and Value: text – *value* if *value* designates text; otherwise, "". [Note: T cannot differentiate between text that is an empty string, and any *value* of non-text type. end note]

[Example:

T("Hello") results in Hello

T(123) results in an empty string

LEN(T(123)) results in 0

*end example]***18.17.7.316 TAN****Syntax:**TAN (x)**Description:** Computes the tangent of x .**Arguments:**

Name	Type	Description
x	number	The number, in radians, whose tangent is to be computed.

Return Type and Value: number – The tangent of x .*[Example:*

TAN(-1) results in -1.557407725

TAN(0) results in 0

TAN(1) results in 1.557407725

*end example]***18.17.7.317 TANH****Syntax:**TANH (x)**Description:** Computes the hyperbolic tangent of x .**Arguments:**

Name	Type	Description
x	number	The number whose hyperbolic tangent is to be computed.

Return Type and Value: number – The hyperbolic tangent of x *[Example:*

TANH(-1) results in -0.761594156

TANH(0) results in 0

TANH(1) results in 0.761594156

end example]

18.17.7.318 TBILLEQ

TBILLEQ (*settlement* , *maturity* , *discount*)

Description: Computes the bond-equivalent yield for a U.S. Treasury bill.

Arguments:

Name	Type	Description
<i>settlement</i>	number	The Treasury bill's settlement date. Any time information in the date is ignored.
<i>maturity</i>	number	The Treasury bill's maturity date. Any time information in the date is ignored.
<i>discount</i>	number	The Treasury bill's discount rate.

Return Type and Value: number – The bond-equivalent yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- *discount* ≤ 0, #NUM! is returned.

[Example:

TBILLEQ(DATE(2008,3,31),DATE(2008,6,1),0.0914) results in 9.4151%

end example]

18.17.7.319 TBILLPRICE

TBILLPRICE (*settlement* , *maturity* , *discount*)

Description: Computes the price per \$100 face value for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLPRICE = 100 \times \left(1 - \frac{discount \times DSM}{360} \right)$$

where:

- *discount* = argument *discount*
- *DSM* = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.

Arguments:

Name	Type	Description
<i>settlement</i>	number	The Treasury bill's settlement date. Any time information in the date is ignored.
<i>maturity</i>	number	The Treasury bill's maturity date. Any time information in the date is ignored.
<i>discount</i>	number	The Treasury bill's discount rate.

Return Type and Value: number – The price per \$100 face value for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- *discount* ≤ 0, #NUM! is returned.

[Example:

TBILLPRICE (DATE (2008, 3, 31), DATE (2008, 6, 1), 0.09) results in 98.4500

end example]

18.17.7.320 TBILLYIELD

TBILLYIELD (*settlement* , *maturity* , *pr*)

Description: Computes the yield for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLYIELD = \frac{100 - pr.}{pr.} \times \frac{360}{DSM}$$

where:

- *DSM* = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.
- *pr.* = argument *pr*

Arguments:

Name	Type	Description
<i>settlement</i>	number	The Treasury bill's settlement date. Any time information in the date is ignored.
<i>maturity</i>	number	The Treasury bill's maturity date. Any time information in the date is ignored.
<i>pr</i>	number	The Treasury bill's price per \$100 face value.

Return Type and Value: number – The yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- $pr \leq 0$, #NUM! is returned.

[Example:

TBILLYIELD(DATE(2008,3,31),DATE(2008,6,1),98.45) results in 9.1417%

end example]

18.17.7.321 TDIST

Syntax:

TDIST (*x* , *degrees-freedom* , *distribution-tails*)

Description: Computes the Percentage Points (probability) for the Student t-distribution where a numeric value, *x*, is a calculated value of *t* for which the Percentage Points are to be computed.

Mathematical Formula:

If *distribution-tails* = 1, $TDIST = P(X > x)$, where *X* is a random variable that follows the t-distribution.

If *distribution-tails* = 2, $TDIST = P(|X| > x) = P(X > x \text{ or } X < -x)$

Arguments:

Name	Type	Description
<i>x</i>	number	The value at which to evaluate the distribution.
<i>degrees-freedom</i>	number	The number of degrees of freedom, truncated to an integer.
<i>distribution-tails</i>	number	The number of distribution tails to return, truncated to an integer. If 1, TDIST returns the one-tailed distribution.

Name	Type	Description
		If 2, TDIST returns the two-tailed distribution.

Return Type and Value: number – The Percentage Points (probability) for the Student t-distribution.

However, if

- *degrees-freedom* < 1, #NUM! is returned.
- *tails* has any value other than 1 or 2, #NUM! is returned.
- *x* < 0, #NUM! is returned.

[Example:

TDIST(1.959999998,60,1) results in 0.027322464

TDIST(1.959999998,60,2) results in 0.054644927

end example]

18.17.7.322 TEXT

Syntax:

TEXT (*value* , *format*)

Description: Produces a string containing *value* formatted according to *format*.

Arguments:

Name	Type	Description
<i>value</i>	number	The number that is to be formatted.
<i>format</i>	text	Designates the number, currency, date, or time format to be used. (See §18.8.31 for the set of formats.)

Return Type and Value: text – The string containing *number* formatted according to *format*.

[Example:

TEXT(1234.567,"\$0.00") results in \$1234.57

TEXT(.125,"\$0.0%") results in 12.5%

TEXT(1234.567,"YYYY-MM-DD HH:MM:SS") results in 1903-05-18 13:36:29 in the 1900 date system.

end example]

18.17.7.323 TIME

Syntax:

TIME (*hour* , *minute* , *second*)

Description: Computes the serial date-time for the given time.

Arguments:

Name	Type	Description
<i>hour</i>	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the hour. Any value greater than 23 shall be divided by 24 and the remainder shall be treated as the hour value.
<i>minute</i>	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the minute. Any value greater than 59 shall be converted to the corresponding number of hours and minutes.
<i>second</i>	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the second. Any value greater than 59 shall be converted to the corresponding number of hours, minutes, and seconds.

Return Type and Value: number – The serial date-time for the given time, as a value greater than or equal to 0 and less than or equal to 1.

However, if *hour*, *minute*, or *second* are out of range, #NUM! is returned.

[Example: The following serial date-times are displayed with 16 decimal places.

TIME(0,0,0) results in a serial date-time of 0.0000000000000000

TIME(0,0,1) results in a serial date-time of 0.0000115740740741

TIME(0,0,2) results in a serial date-time of 0.0000231481481481

TIME(0,0,20) results in a serial date-time of 0.0002314814814815

TIME(2,3,20) results in a serial date-time of 0.0856481481481481

TIME(12,0,0) results in a serial date-time of 0.5000000000000000

TIME(23,59,59) results in a serial date-time of 0.9999884259259260

TIME(26,120,240) results in a serial date-time of 0.1694444444444450

end example]

18.17.7.324 TIMEVALUE

Syntax:

TIMEVALUE (*date-time-string*)

Description: Computes the serial date-time of the time represented by the string *date-time-string*.

Arguments:

Name	Type	Description
<i>date-time-string</i>	text	The date and/or time whose time component serial date-time is to be computed. <i>date-time-string</i> can have any date and/or time format. Any date information in <i>date-time-string</i> shall be ignored.

Return Type and Value: number – The serial date-time of the time represented by the string *date-time-string*, as a value greater than or equal to 0 and less than or equal to 1.

However, if *date-time-string* is ill-formed, #VALUE! is returned.

[Example: The following serial date-times are displayed with 16 decimal places.

TIMEVALUE("10:02:34 ") results in 0.4184490740740740

TIMEVALUE("01-Feb-2006 10:15:29 AM") results in 0.4274189814823330

TIMEVALUE("22:02") results in 0.9180555555555560

end example]

18.17.7.325 TINV

Syntax:

TINV (*probability* , *degrees-freedom*)

Description: Computes the t-value of the Student's t-distribution as a function of the probability and the degrees of freedom.

Arguments:

Name	Type	Description
<i>probability</i>	number	A probability associated with the two-tailed Student's t-distribution.
<i>degrees-freedom</i>	number	The number of degrees of freedom with which to characterize the distribution, truncated to an integer.

Return Type and Value: number – The t-value of the Student's t-distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom* < 1, #NUM! is returned.

[Example:

TINV(0.054644927,60) results in 1.95999999

end example]

18.17.7.326 TODAY

Syntax:

TODAY ()

Description: Computes the serial date-time of the current date, taking into account the current date base system.

Arguments: None.

Return Type and Value: number – The serial date-time of the current date.

[Example:

On February 25, 2006, TODAY() results in 38773 for the 1900 date system, or 37311 for the 1904 date system

end example]

18.17.7.327 TRANSPOSE

Syntax:

TRANSPOSE (*array*)

Description: Creates a new array that is the transpose of an existing array, by copying the first row of the existing array to the first column of the new array, the second row of the existing array as the second column of the new array, and so on. The formula containing the call to TRANSPOSE shall be an array formula in a range that has the same number of rows and columns, respectively, as *array* has columns and rows.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	The set of values to be transposed.

Return Type and Value: array – The new array.

[Example:

TRANSPOSE({10,20,30}) results in the array {10;20;30}

end example]

18.17.7.328 TREND

Syntax:

TREND (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes values along a linear trend. Fits a straight line (using the method of least squares) to the arrays *known-ys* and *known-xs*. The y-values along that line for the array of *new-xs* specified.

Arguments:

Name	Type	Description
<i>known-ys</i>	array	The set of y-values already known in the relationship $y=mx+b$. If that array is in a single column, each column of <i>known-xs</i> is interpreted as a separate variable. If that array is in a single row, each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	An optional set of x-values that might already be known in the relationship $y=mx+b$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector. If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>new-xs</i>	array	New x-values for which TREND is to return corresponding y-values. <i>new-xs</i> shall include a column (or row) for each independent variable, just as <i>known-xs</i> does. So, if <i>known-ys</i> is in a single column, <i>known-xs</i> and <i>new-xs</i> shall have the same number of columns. If <i>known-ys</i> is in a single row, <i>known-xs</i> and <i>new-xs</i> shall have the same number of rows. If <i>new-xs</i> is omitted, it is assumed to be the same as <i>known-xs</i> . If both <i>known-xs</i> and <i>new-xs</i> are omitted, they are assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant b to equal 0. If TRUE or omitted, b is calculated normally. If FALSE, b is set equal to 0 and the m-values are adjusted so that $y=mx$.

Return Type and Value: array – The values along a linear trend, as an array of numbers.

18.17.7.329 TRIM

Syntax:

TRIM (*string*)

Description: Makes a string that is a copy of *string* with the leading and trailing space characters removed, and each sequence of embedded spaces reduced to a single space. The space character referred to here is character U+0020.

Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string to be trimmed.

Return Type and Value: text – The trimmed copy of *string*.

[Example:

TRIM(" abc def ") results in abc def

end example]

18.17.7.330 TRIMMEAN

Syntax:

TRIMMEAN (*array* , *percent*)

Description: Computes the mean of the interior of a data set by excluding a percentage of data points from the top and bottom tails of a data set. TRIMMEAN rounds the number of excluded data points down to the nearest multiple of 2. For symmetry, TRIMMEAN excludes a single value from the top and bottom of the data set.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	The numeric values to trim and average.
<i>percent</i>	number	The fractional number of data points to exclude from the calculation. [Example: If <i>percent</i> = 0.2, 4 points are trimmed from a data set of 20 points (20x0.2): 2 from the top and 2 from the bottom of the set. end example]

Return Type and Value: number – The mean of the interior of a data set.

However, if *percen* < 0 or *percen* > 1, #NUM! is returned.

[Example:

TRIMMEAN({4,6,2,5,7,8,9},0.2) results in 5.857142857

end example]

18.17.7.331 TRUE

Syntax:

TRUE ()

Description: Computes the value TRUE. (A call to function TRUE is equivalent to using the *logical-constant* TRUE.)

Arguments: None.

Return Type and Value: logical – The value TRUE.

[Example:

TRUE() results in TRUE

end example]

18.17.7.332 TRUNC

Syntax:

TRUNC (*x* [, *number-digits*])

Description: Truncates *x* to the number of fractional digits by *number-digits*.

Arguments:

Name	Type	Description
<i>x</i>	array, reference	The value to be rounded down.
<i>number-digits</i>	number	The number of fractional digits to which <i>x</i> is to be truncated. The default value for <i>number-digits</i> is 0.

Return Type and Value: number – The truncated value of *x*.

[Example:

TRUNC(PI()) results in 3

TRUNC(PI(),1) results in 3.1

TRUNC(PI(),3) results in 3.141

TRUNC(PI(),5) results in 3.14159

end example]

18.17.7.333 TTEST

Syntax:

TTEST (*array-1* , *array-2* , *distribution-tails* , *test-type*)

Description: Computes the probability associated with a Student's t-Test.

Arguments:

Name	Type	Description								
<i>array-1</i>	array, reference	The first numerical data set.								
<i>array-1</i>	array, reference	The first numerical data set.								
<i>distribution-tails</i>	number	Specifies the number of distribution tails, truncated to an integer. If 1, TTEST uses the one-tailed distribution. If 2, TTEST uses the two-tailed distribution.								
<i>test-type</i>	number	The truncated-to-integer kind of t-Test to perform, as follows: <table><tr><th>Value</th><th>Test Performed</th></tr><tr><td>1</td><td>Paired</td></tr><tr><td>2</td><td>Two-sample equal variance (homoscedastic)</td></tr><tr><td>3</td><td>Two-sample unequal variance (heteroscedastic)</td></tr></table>	Value	Test Performed	1	Paired	2	Two-sample equal variance (homoscedastic)	3	Two-sample unequal variance (heteroscedastic)
Value	Test Performed									
1	Paired									
2	Two-sample equal variance (homoscedastic)									
3	Two-sample unequal variance (heteroscedastic)									

Return Type and Value: number – The probability associated with a Student's t-Test.

However, if

- *array-1* and *array-2* have a different number of data points, and *test-type* is 1, the return value is unspecified.
- *distribution-tails* is any value other than 1 or 2, #NUM! is returned.

[Example: Given the following data:

	A	B
1	Data 1	Data 2

	A	B
2	3	6
3	4	19
4	5	3
5	8	2
6	9	14
7	1	4
8	2	5
9	4	17
10	5	1

TTEST(A2:A10,B2:B10,2,1) results in 0.196016

end example]

18.17.7.334 TYPE

Syntax:

TYPE (*value*)

Description: Computes the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell.

Arguments:

Name	Type	Description
<i>value</i>	any	The value whose type is to be determined. No conversion shall take place on an argument passed to this function.

Return Type and Value: number – An integer that indicates the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell, as follows:

Type of <i>value</i>	Value Returned
number	1
text	2
logical	4
error value	16
array of any kind	64

[Example:

TYPE(10.5) results in 1

TYPE(A10) results in 1, when A10 contains a number

TYPE("ABC") results in 2

TYPE(A10) results in 2, when A10 contains a string

TYPE(TRUE) results in 4

TYPE(A10) results in 4, when A10 contains a logical value

TYPE(5/0) results in 16

TYPE(A10) results in 16, when A10 contains any error value

TYPE({1,2,3}) results in 64

TYPE({TRUE,2.5,#N/A}) results in 64

TYPE(IF(10>5,"Yes",20)) results in 2

TYPE(IF(10<5,"Yes",20)) results in 1

end example]

18.17.7.335 UPPER

Syntax:

UPPER (*string*)

Description: Makes an uppercase version of *string*.

Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string to be converted.

Return Type and Value: text – The uppercase version of *string*.

[Example:

UPPER("AbCd123#\$\$%^") results in ABCD123#\$\$%^

UPPER(A10) results in 234FRTQWC\$##, when A10 contains 234FRTqwc\$##

end example]

18.17.7.336 USDOLLAR

Syntax:

USDOLLAR (*number* [, *num-decimal*])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands separator is the comma, the radix point is the period, and the currency symbol is "\$". The format used is \$#,##0.00;(\$#,##0.00).

Arguments:

Name	Type	Description
<i>number</i>	number	The number that is to be formatted.
<i>num-decimal</i>	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If <i>num-decimal</i> is negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[Example:

USDOLLAR(1234.567) results in \$1,234.57

USDOLLAR(1234.567, -2) results in \$1,200

USDOLLAR(-1234.567, 4) results in (\$1,234.5670)

end example]

18.17.7.337 VALUE

Syntax:

VALUE (*string*)

Description: Converts *string* to a number.

Arguments:

Name	Type	Description
<i>string</i>	text	Designates a string that contains a number formatted using any number, currency, date, or time format. (See §18.8.31 for the set of formats.) Date and time strings are converted to their equivalent serial date-time.

Return Type and Value: number – The number represented by *string*.

[Example:

VALUE("123.456") results in 123.456

VALUE("\$1,000") results in 1000

VALUE("23-Mar-2002") results in the corresponding serial date-time

VALUE("16:48:00")-VALUE("12:17:12") results in 0.188056

end example]

18.17.7.338 VAR

Syntax:

VAR (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note:* VAR assumes that its arguments are a sample of the population. If the data represents the entire population, VARP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARA instead. *end note*]

Mathematical Formula:

$$\frac{\sum (x - \bar{x})^2}{(n - 1)}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example:*

VAR(1202,1220,1323,1254,1302) results in 2683.2

end example]

18.17.7.339 VARA

Syntax:

VARA (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note:* VARA assumes that its arguments are a sample of the population. If the data represents the entire population, VARPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VAR instead. *end note]*

Mathematical Formula:

$$\frac{\sum(x - \bar{x})^2}{(n - 1)}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Logical values and text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example:*

VARA(1202,1220,1323,1254,1302) results in 2683.2

end example]

18.17.7.340 VARP

Syntax:

VARP (*argument-list*)

Description: Computes the variance of an entire population. [Note: VARP assumes that its arguments are the total population. If the data represents a population sample only, VAR should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARPA instead. *end note*]

Mathematical Formula:

$$\frac{\sum(-\bar{x})^2}{n}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – The variance of an entire population.

[Example:

VARP(1202,1220,1323,1254,1302) results in 2146.56

end example]

18.17.7.341 VARPA

Syntax:

VARPA (*argument-list*)

Description: Makes the variance of an entire population. [Note: VARPA assumes that its arguments are the total population. If the data represents a population sample only, VARA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VARP instead. end note]

Mathematical Formula:

$$\frac{\sum(x - \bar{x})^2}{n}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population.

Return Type and Value: number – The variance of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Example:

VARPA(1202,1220,1323,1254,1302) results in 2146.56

end example]

18.17.7.342 VDB

VDB (*cost* , *salvage* , *life* , *start-period* , *end-period* [, [[*factor*]
[, [*no-switch-flag*]]]])

Description: Computes the depreciation of an asset for the period specified, including partial periods, using the double-declining balance or some other specified method.

Arguments:

Name	Type	Description
<i>cost</i>	number	The number <i>cost</i> is the initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) This value can be 0.
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>start-period</i>	number	The starting period for which the depreciation is to be calculated. (<i>start-period</i> shall use the same units as <i>life</i> .)
<i>end-period</i>	number	The ending period for which the depreciation is to be calculated. (<i>end-period</i> shall use the same units as <i>life</i> .)
<i>factor</i>	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).
<i>no-switch-flag</i>	logical	Specifies whether to switch to straight-line depreciation when depreciation is greater than the declining balance calculation. If TRUE, straight-line depreciation is not used even when the depreciation is greater than the declining balance calculation. If FALSE or omitted, the straight-line depreciation is used when depreciation is greater than the declining balance calculation.

Return Type and Value: number – The depreciation of an asset for the period specified.

However, if any numerical argument value is non-positive, #NUM! is returned.

[Example:

VDB(2400,300,10*365,0,1) results in 1.32

VDB(2400,300,10*12,0,1) results in 40.00

VDB(2400,300,10*12,6,18) results in 396.31

end example]

18.17.7.343 VLOOKUP

Syntax:

VLOOKUP (*lookup-value* , *table-array* , *col-index-num* [, [*range-lookup-flag*]])

Description: Performs a vertical search for a value in the left-most column of a table or an array, noting the row in which the matching value is found. From that row, the value from a given column is returned.

Arguments:

Name	Type	Description
<i>lookup-value</i>	value of any type or a reference to a value of any type.	The value to be located in the left-most column of the table. If <i>range-lookup</i> is FALSE and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, use a tilde (~) before the character.
<i>table-array</i>	array, reference, name	Designates the table of information to be searched. The values in the left-most column of <i>table-array</i> can be text, numbers, or logical values. The values in the left-most column of <i>table-array</i> shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. Uppercase and lowercase text is treated as equivalent.
<i>col-index-num</i>	number	The column number in <i>table-array</i> from which the matching value is to be returned. (A <i>col-index-num</i> of 1 returns the left-most column value in <i>table-array</i> , a <i>col-index-num</i> of 2 returns the next column in <i>table-array</i> , and so on.)
<i>range-lookup-flag</i>	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than <i>lookup-value</i> is returned. If FALSE, an exact match is performed, in which case, the values in the left-most column of <i>table-array</i> need not be sorted. If there are two or more values in the left-most column of <i>table-array</i> that match <i>lookup-value</i> , the top-most value found is used.

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *col-index-num* is less than 1, #VALUE! is returned.
- *col-index-num* is greater than the number of columns in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the left-most column of *table-array*, #N/A is returned.

[Example: Given the following data:

	A	B	C
1	Density	Bearings	Bolts
2	0.457	3.55	500

	A	B	C
3	0.525	3.25	400
4	0.616	2.93	300
5	0.675	2.75	250
6	0.746	2.57	200
7	0.835	2.38	150
8	0.946	2.17	100
9	1.09	1.95	50
10	1.29	1.71	0

VLOOKUP(1,A2:C10,2) results in 2.17

VLOOKUP(1,A2:C10,3,TRUE) results in 100.00

VLOOKUP(2,A2:C10,2,TRUE) results in 1.71

end example]

18.17.7.344 WEEKDAY

Syntax:

WEEKDAY (*serial-value* [, *weekday-start-flag*])

Description: Computes the weekday number for the date having the given *serial-value*, taking into account the current date system and *weekday-start-flag*, if present. See §18.17.4.1 for special handling of certain days in 1900.

Arguments:

Name	Type	Description												
<i>serial-value</i>	number	The date whose weekday number is to be computed. The value of <i>serial-value</i> is truncated to an integer.												
<i>weekday-start-flag</i>	number	When truncated to integer, indicates the weekday numbering convention to be used, as follows: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>1 or omitted</td><td>1 (Sunday) through 7 (Saturday)</td></tr><tr><td>2</td><td>1 (Monday) through 7 (Sunday)</td></tr><tr><td>3</td><td>0 (Monday) through 6 (Sunday)</td></tr><tr><td>11</td><td>1 (Monday) through 7 (Sunday)</td></tr><tr><td>12</td><td>1 (Tuesday) through 7 (Monday)</td></tr></table>	Value	Meaning	1 or omitted	1 (Sunday) through 7 (Saturday)	2	1 (Monday) through 7 (Sunday)	3	0 (Monday) through 6 (Sunday)	11	1 (Monday) through 7 (Sunday)	12	1 (Tuesday) through 7 (Monday)
Value	Meaning													
1 or omitted	1 (Sunday) through 7 (Saturday)													
2	1 (Monday) through 7 (Sunday)													
3	0 (Monday) through 6 (Sunday)													
11	1 (Monday) through 7 (Sunday)													
12	1 (Tuesday) through 7 (Monday)													

Name	Type	Description		
			13	1 (Wednesday) through 7 (Tuesday)
			14	1 (Thursday) through 7 (Wednesday)
			15	1 (Friday) through 7 (Thursday)
			16	1 (Saturday) through 7 (Friday)
			17	1 (Sunday) through 7 (Saturday)

Return Type and Value: number – The weekday number for the date having the given serial date-time.

However, if

- *serial-value* is out of range for the current date system, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[Example:

WEEKDAY(DATE(2006,2,1)) results in 4 (Wednesday)

WEEKDAY(DATE(2006,2,1),11) results in 3 (Wednesday)

WEEKDAY(DATE(2006,2,1),12) results in 2 (Wednesday)

WEEKDAY(DATE(2006,2,1),3) results in 2 (Wednesday)

end example]

18.17.7.345 WEEKNUM

Syntax:

WEEKNUM (*serial-value* [, *weekday-start-flag*])

Description: Computes the week number of the date corresponding to *serial-value*. The function allows two number systems:

- System 1: The week containing January 1 is the first week of the year, and is numbered week 1.
- System 2: The week containing the first Thursday of the year is the first week of the year, and is numbered as week 1 [ISO 8601].

Arguments:

Name	Type	Description
<i>serial-value</i>	number	The date whose week number is to be computed. The value of <i>serial-value</i> is truncated to an integer.

Name	Type	Description																																	
<i>weekday-start-flag</i>	number	<p>When truncated to integer, indicates the weekday on which the week begins, as follows:</p> <table> <tr> <th><i>weekday-start-flag</i></th><th>Meaning</th><th>Number System</th></tr> <tr> <td>1 or omitted</td><td>Week begins on Sunday.</td><td>System 1</td></tr> <tr> <td>2</td><td>Week begins on Monday.</td><td>System 1</td></tr> <tr> <td>11</td><td>Week begins on Monday.</td><td>System 1</td></tr> <tr> <td>12</td><td>Week begins on Tuesday.</td><td>System 1</td></tr> <tr> <td>13</td><td>Week begins on Wednesday.</td><td>System 1</td></tr> <tr> <td>14</td><td>Week begins on Thursday.</td><td>System 1</td></tr> <tr> <td>15</td><td>Week begins on Friday.</td><td>System 1</td></tr> <tr> <td>16</td><td>Week begins on Saturday.</td><td>System 1</td></tr> <tr> <td>17</td><td>Week begins on Sunday.</td><td>System 1</td></tr> <tr> <td>21</td><td>Week begins on Monday.</td><td>System 2</td></tr> </table>	<i>weekday-start-flag</i>	Meaning	Number System	1 or omitted	Week begins on Sunday.	System 1	2	Week begins on Monday.	System 1	11	Week begins on Monday.	System 1	12	Week begins on Tuesday.	System 1	13	Week begins on Wednesday.	System 1	14	Week begins on Thursday.	System 1	15	Week begins on Friday.	System 1	16	Week begins on Saturday.	System 1	17	Week begins on Sunday.	System 1	21	Week begins on Monday.	System 2
<i>weekday-start-flag</i>	Meaning	Number System																																	
1 or omitted	Week begins on Sunday.	System 1																																	
2	Week begins on Monday.	System 1																																	
11	Week begins on Monday.	System 1																																	
12	Week begins on Tuesday.	System 1																																	
13	Week begins on Wednesday.	System 1																																	
14	Week begins on Thursday.	System 1																																	
15	Week begins on Friday.	System 1																																	
16	Week begins on Saturday.	System 1																																	
17	Week begins on Sunday.	System 1																																	
21	Week begins on Monday.	System 2																																	

Return Type and Value: number – The week number of the date corresponding to *serial-value*.

However, if

- *serial-value* is out of range for the current date system, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[Example:

WEEKNUM(DATE(2006,1,1) results in 1
WEEKNUM(DATE(2006,1,1),1) results in 1
WEEKNUM(DATE(2006,1,1),17) results in 1
WEEKNUM(DATE(2006,1,1),21) results in 1
WEEKNUM(DATE(2006,2,1),1) results in 5

WEEKNUM(DATE(2006,2,1),2) results in 6

WEEKNUM(DATE(2006,2,1),11) results in 6

end example]

18.17.7.346 WEIBULL

Syntax:

WEIBULL (*x* , *alpha* , *beta* , *cumulative-flag*)

Description: Computes the Weibull distribution.

Mathematical Formula:

The equation for the Weibull cumulative distribution function is:

$$F(x, \alpha, \beta) = 1 - e^{-(x/\beta)^\alpha}$$

The equation for the Weibull probability density function is:

$$f(x, \alpha, \beta) = \frac{1}{\beta^\alpha} x^{\alpha-1} e^{-(x/\beta)^\alpha}$$

When *alpha* = 1, WEIBULL returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

where:

- *x* = argument *x*
- *α* = argument *alpha*
- *β* = argument *beta*

Arguments:

Name	Type	Description
<i>x</i>	number	The value at which the distribution is to be evaluated.
<i>alpha</i>	number	A parameter of the distribution.
<i>beta</i>	number	A parameter of the distribution.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function.

Return Type and Value: number – The Weibull distribution.

However, if

- $x < 0$, #NUM! is returned.
- $\alpha \leq 0$, #NUM! is returned.
- $\beta \leq 0$, #NUM! is returned.

[Example:

WEIBULL(105,20,100,TRUE) results in 0.92958139

WEIBULL(105,20,100,FALSE) results in 0.035588864

end example]

18.17.7.347 WORKDAY

Syntax:

WORKDAY (*start-date* , *day-offset* [, *holidays*])

Description: Computes the serial date-time of the date that is *day-offset* working days offset from *start-date*. Weekend days (Saturday and Sunday) and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
<i>start-date</i>	number	The start date, truncated to integer.
<i>day-offset</i>	number	The number of working days before or after <i>start-date</i> . A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . <i>day-offset</i> is truncated to an integer.
<i>holidays</i>	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial date-times that represent those dates. The ordering of dates or serial date-times in <i>holidays</i> can be arbitrary.

Return Type and Value: number – The serial date-time of the date that is *day-offset* working days offset from *start-date*, excluding the specified holidays.

However, if

- *start-date* is out of range for the current date system, #NUM! is returned.
- Any date in *holidays* is out of range for the current date system, #NUM! is returned.

- *start-date* plus *day-offset* does not yield a date, #NUM! is returned.

[Example:

WORKDAY(DATE(2006,1,1),0) results in a serial date-time corresponding to 1-Jan-2006

WORKDAY(DATE(2006,1,1),10) results in a serial date-time corresponding to 13-Jan-2006

WORKDAY(DATE(2006,1,1),-10) results in a serial date-time corresponding to 19-Dec-2005

WORKDAY(DATE(2006,1,1),20,{"2006/1/2","2006/1/16"}) results in a serial date-time corresponding to 31-Jan-2006

end example]

18.17.7.348 WORKDAY.INTL

Syntax:

Number form: WORKDAY.INTL (*start-date* , *day-offset* [, *weekend-number*] [, *holidays*])

String form: WORKDAY.INTL (*start-date* , *day-offset* [, *weekend-string*] [, *holidays*])

Description: Computes the serial date-time of the date that is *day-offset* working days offset from *start-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
<i>start-date</i>	number	The start date, truncated to integer.
<i>day-offset</i>	number	The number of working days before or after <i>start-date</i> . A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . <i>day-offset</i> is truncated to an integer.
<i>weekend-number</i>	number	Indicates the days of the week that are weekend days and are not considered working days. Values are shown in the table below
<i>weekend-string</i>	string	Indicates the days of the week that are weekend days and are not considered working days. Values of <i>weekend-string</i> are seven characters long and each character in the string represents a day of the week, beginning with Monday. [Example: "0000011" would result in a weekend that is Saturday and Sunday. end example]
<i>holidays</i>	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial date-times that represent those

Name	Type	Description
		dates. The ordering of dates or serial date-times in <i>holidays</i> can be arbitrary.

<i>weekend-number</i>	Weekend days
1 or omitted	Saturday, Sunday
2	Sunday, Monday
3	Monday, Tuesday
4	Tuesday, Wednesday
5	Wednesday, Thursday
6	Thursday, Friday
7	Friday, Saturday
11	Sunday only
12	Monday only
13	Tuesday only
14	Wednesday only
15	Thursday only
16	Friday only
17	Saturday only

Return Type and Value: number – The serial date-time of the date that is *day-offset* working days offset from *start-date*, excluding the specified weekend days and holidays.

However, if

- *start-date* is out of range for the current date system, #NUM! is returned.
- Any date in *holidays* is out of range for the current date system, #NUM! is returned.
- *start-date* plus *day-offset* does not yield a date, #NUM! is returned.

[Example:

WORKDAY.INTL (DATE (2006,1,1),0) results in a serial date-time corresponding to 1-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),10) results in a serial date-time corresponding to 13-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),10,7) results in a serial date-time corresponding to 13-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),-10) results in a serial date-time corresponding to 19-Dec-2005

WORKDAY.INTL (DATE (2006,1,1),20,1,{"2006/1/2","2006/1/16"}) results in a serial date-time corresponding to 31-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),20,"0000011",{"2006/1/2","2006/1/16"}) results in a serial date-

time corresponding to 31-Jan-2006

end example]

18.17.7.349 XIRR

XIRR (*values* , *dates* [, [*guess*]])

Description: Computes the internal rate of return for a schedule of cash flows that is not necessarily periodic. XIRR uses an iterative calculation technique that cycles through the calculation until the result is accurate within 0.000001 percent.

Mathematical Formula:

Using a changing rate (starting with *guess*), XIRR cycles through the calculation until the result is accurate within 0.000001 percent. The rate is changed until:

$$0 = \sum_{i=1}^N \frac{P_i}{(1 + \text{rate})^{\frac{(d_i - d_1)}{365}}}$$

where:

- d_i = the i^{th} , or last, payment date.
- d_1 = the 0^{th} payment date.
- P_i = the i^{th} , or last, payment.

Arguments:

Name	Type	Description
<i>values</i>	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in <i>dates</i> . The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.
<i>dates</i>	reference	A schedule of payment dates that corresponds to the cash flow payments in <i>values</i> . The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.
<i>guess</i>	number	An estimate of the result of XIRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

Return Type and Value: number – The internal rate of return for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date system, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.
- *values* and *dates* contain different numbers of values, #NUM! is returned.
- The calculation has not converged after an implementation-defined number of tries, #NUM! is returned.

[Example: When the cells F2397:J2397 contain the dates January 1, 2008; March 1, 2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XIRR({-10000,2750,4250,3250,2750},F2397:J2397,0.1) results in 37.34%

end example]

18.17.7.350 XNPV

XNPV (*rate* , *values* , *dates*)

Description: Computes the net present value for a schedule of cash flows that is not necessarily periodic.

Mathematical Formula:

$$XNPV = \sum_{i=1}^N \frac{P_i}{(1 + rte)^{\frac{(d_i - d_1)}{365}}}$$

where:

- d_i = the i^{th} , or last, payment date.
- d_1 = the 0^{th} payment date.
- P_i = the i^{th} , or last, payment.

Arguments:

Name	Type	Description
<i>rate</i>	number	The discount rate to apply to the cash flows.
<i>values</i>	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in <i>dates</i> . The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.

Name	Type	Description
<i>dates</i>	reference	A schedule of payment dates that corresponds to the cash flow payments in <i>values</i> . The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.

Return Type and Value: number – The net present value for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date system, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.
- *values* and *dates* contain different numbers of values, #NUM! is returned.

[*Example:* When the cells F2397:J2397 contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XNPV(0.09, {-10000, 2750, 4250, 3250, 2750}, F2397:J2397) results in 2086.65

end example]

18.17.7.351 YEAR

Syntax:

YEAR (*date-value*)

Description: Computes the numeric year in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date system. That date and/or time shall be expressed either as a serial date-time, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Arguments:

Name	Type	Description
<i>date-value</i>	number, text	The date and/or time whose year is to be computed. That date and/or time shall be expressed either as a serial date-time, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The year in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*. The range of return values is determined by the date system currently in use (§18.17.4).

However, if *date-value* is out of range for the current date system, #NUM! is returned.

[Example:

YEAR(DATE(2006,1,2)) results in 2006

YEAR(DATE(2006,0,2)) results in 2005

YEAR("2006/1/2 10:45 AM") results in 2006

YEAR(30000) results in 1982 for the 1900 date system, or 1986 for the 1904 date system

end example]

18.17.7.352 YEARFRAC

Syntax:

YEARFRAC (*start-date* , *end-date* [, *basis*])

Description: Computes the fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*.

Arguments:

Name	Type	Description				
<i>start-date</i>	number	The period's starting date. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .				
<i>end-date</i>	number	The period's ending date.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months</div></td></tr></table></div>	Value	Day Count Basis	0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months</div>
Value	Day Count Basis					
0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months</div>					

Name	Type	Description	
			with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it

Name	Type	Description		
				<p>is adjusted to 30 February.</p> <ul style="list-style-type: none"> For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

All arguments are truncated to integers.

Return Type and Value: number – The fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*. If the Actual/actual basis is used, the year length used is the average length of the years that the range crosses, regardless of where *start-date* and *end-date* fall in their respective years.

However, if the value of *basis* is out of range, #NUM! is returned.

[Example:

YEARFRAC(DATE(2006,1,1),DATE(2006,3,26)) results in 0.236111111
 YEARFRAC(DATE(2006,3,26),DATE(2006,1,1)) results in 0.236111111
 YEARFRAC(DATE(2006,1,1),DATE(2006,7,1)) results in 0.5
 YEARFRAC(DATE(2006,1,1),DATE(2007,9,1)) results in 1.666666667
 YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),0) results in 0.5
 YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),1) results in 0.495890411
 YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),2) results in 0.502777778
 YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),3) results in 0.495890411
 YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),4) results in 0.5
 YEARFRAC(DATE(2004,3,1),DATE(2006,3,1),1) results in 1.998175 (because 2004 is a leap year and Actual/actual basis is used, the average year length is 365.3333)

end example]

18.17.7.353 YIELD

Syntax:

YIELD (*settlement* , *maturity* , *rate* , *pr* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the yield on a security that pays periodic interest.

Mathematical Formula:

If there is one coupon period or less until redemption, YIELD is calculated as follows:

$$YIELD = \frac{\left(\frac{redemption}{100} + \frac{rate}{frequency} \right) - \left(\frac{par}{100} + \left(\frac{A}{E} \times \frac{rate}{frequency} \right) \right)}{\frac{par}{100} + \left(\frac{A}{E} \times \frac{rate}{frequency} \right)} \times \frac{frequency \times E}{DSR}$$

where:

- *A* = number of days from the beginning of the coupon period to the settlement date (accrued days).
- *DSR* = number of days from the settlement date to the redemption date.
- *E* = number of days in the coupon period.
- *frequency* = argument *frequency*
- *par* = argument *pr*
- *rate* = argument *rate*
- *redemption* = argument *redemption*

If there is more than one coupon period until redemption, YIELD is calculated through some number of iterations. The resolution uses the Newton method, based on the formula used for the function PRICE. The yield is changed until the estimated price given the yield is close to price.

Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>rate</i>	number	The security's interest rate.
<i>pr</i>	number	The security's price.
<i>redemption</i>	number	The security's redemption value per \$100 face value.
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer.

Name	Type	Description								
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows:								
		<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.</td></tr><tr><td>2</td><td>Actual/360. Similar to Basis 1, but only has</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.	1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.	2	Actual/360. Similar to Basis 1, but only has
		Value	Day Count Basis							
		0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.							
1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.									
2	Actual/360. Similar to Basis 1, but only has									

Name	Type	Description	
			360 days per year.
			Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The yield on a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* < 0 , #NUM! is returned.

- *pr* or *redemption* ≤ 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

YIELD(DATE(2008,2,15),DATE(2016,11,15),0.0575,95.04287,100,2,0) results in 6.5000%

end example]

18.17.7.354 YIELDDISC

Syntax:

YIELDDISC (*settlement* , *maturity* , *pr* , *redemption* [, [*basis*]])

Description: Computes the annual yield for a discounted security.

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>pr</i>	number	The security's price.				
<i>redemption</i>	number	The security's redemption value per \$100 face value.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date</div></td></tr></table></div>	Value	Day Count Basis	0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date</div>
Value	Day Count Basis					
0 or omitted	<div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date</div>					

Name	Type	Description	
			is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.

Name	Type	Description	
			with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The annual yield for a discounted security.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *pr* or *redemption* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

YIELDDISC (DATE (2008,2,16),DATE (2008,3,1),99.795,100,2) results in 5.2823%

end example]

18.17.7.355 YIELDMAT

Syntax:

YIELDMAT (*settlement* , *maturity* , *issue* , *rate* , *pr* [, [*basis*]])

Description: Computes the annual yield of a security that pays interest at maturity.

Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.

Name	Type	Description						
maturity	number	The security's maturity date.						
issue	number	The security's issue date.						
rate	number	The security's interest rate.						
pr	number	The security's price.						
basis	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the
Value	Day Count Basis							
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.							
1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the							

Name	Type	Description	
			year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The annual yield of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* or *pr* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

YIELDMAT (DATE (2008, 3, 15), DATE (2008, 11, 3), DATE (2007, 11, 8), 0.0625, 100.0123, 0) results in 6.0954%

end example]

18.17.7.356 ZTEST

Syntax:

ZTEST (*array* , *test-value* [, *sigma*])

Description: Computes the one-tailed probability-value of a z-test. For a given hypothesized population mean, *test-value*, ZTEST returns the probability that the sample mean would be greater than the average of observations in the data set *array*; that is, the observed sample mean.

Mathematical Formula:

When *sigma* is present:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST \left((\bar{x} - \mu_0) / (\sigma / \sqrt{n}) \right)$$

When *sigma* is omitted:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST \left((\bar{x} - \mu_0) / (s / \sqrt{n}) \right)$$

where:

- *n* = the number of observations in the sample COUNT (*array*)
- *s* = the sample standard deviation STDEV (*array*)
- *x* = a sample value
- \bar{x} = the sample mean AVERAGE (*array*)
- μ_0 = the argument *test-value*

Arguments:

Name	Type	Description
<i>array</i>	array	The set of numerical data against which to test <i>test-value</i> .

Name	Type	Description
<i>test-value</i>	number	The number to test.
<i>sigma</i>	number	The number is the population (known) standard deviation. If omitted, the sample standard deviation is used.

Return Type and Value: number – The one-tailed probability-value of a z-test.

However, if *array* is empty, the return value is unspecified.

[Example:

ZTEST({3,6,7,8,6,5,4,2,1,9},4) results in 0.090574197

ZTEST({3,6,7,8,6,5,4,2,1,9},6) results in 0.863043389

end example]

18.18 Simple Types

This is the complete list of simple types dedicated to SpreadsheetML.

18.18.1 ST_Axis (PivotTable Axis)

This simple type defines the axes for a PivotTable selection.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
axisCol (Column Axis)	Column axis
axisPage (Include Count Filter)	Page axis
axisRow (Row Axis)	Row axis
axisValues (Values Axis)	Values axis

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Axis](#)) is located in §A.2. end note]

18.18.2 ST_BorderId (Border Id)

Zero-based index of the border record used by this cell format.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

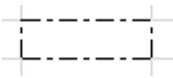

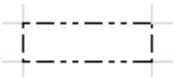

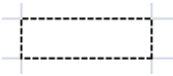

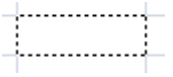

[Note: The W3C XML Schema definition of this simple type's content model ([ST_BorderId](#)) is located in §A.2. *end note*]

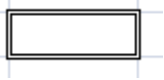

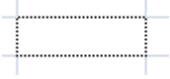

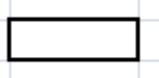

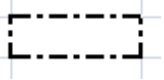

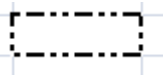

18.18.3 ST_BorderStyle (Border Line Styles)

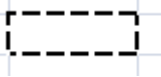

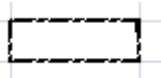

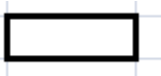

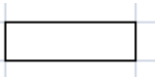

The line style of a border in a cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dashDot (Dash Dot)	<div>The line style of a border is dash-dot.</div> <div>[Example:</div> <div></div> <div>end example]</div>
dashDotDot (Dash Dot Dot)	<div>The line style of a border is dash-dot-dot.</div> <div>[Example:</div> <div></div> <div>end example]</div>
dashed (Dashed)	<div>The line style of a border is dashed.</div> <div>[Example:</div> <div></div> <div>end example]</div>
dotted (Dotted)	<div>The line style of a border is dotted.</div> <div>[Example:</div> <div></div> <div>end example]</div>
double (Double Line)	<div>The line style of a border is double line.</div>

Enumeration Value	Description
	<p>[Example:</p>  <p>end example]</p>
hair (Hairline Border)	<p>The line style of a border is hairline.</p> <p>[Example:</p>  <p>end example]</p>
medium (Medium Border)	<p>The line style of a border is medium.</p> <p>[Example:</p>  <p>end example]</p>
mediumDashDot (Medium Dash Dot)	<p>The line style of a border is medium dash-dot.</p> <p>[Example:</p>  <p>end example]</p>
mediumDashDotDot (Medium Dash Dot Dot)	<p>The line style of a border is medium dash-dot-dot.</p> <p>[Example:</p>  <p>end example]</p>
mediumDashed (Medium Dashed)	<p>The line style of a border is medium dashed.</p> <p>[Example:</p>

Enumeration Value	Description
	 <i>end example]</i>
none (None)	The line style of a border is none (no border visible). [Example:  <i>end example]</i>
slantDashDot (Slant Dash Dot)	The line style of a border is slant-dash-dot. [Example:  <i>end example]</i>
thick (Thick Line Border)	The line style of a border is 'thick'. [Example:  <i>end example]</i>
thin (Thin Border)	The line style of a border is thin. [Example:  <i>end example]</i>

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_BorderStyle](#)) is located in §A.2.
end note]

18.18.4 ST_CalcMode (Calculation Mode)

This simple type defines the supported modes for performing calculations on workbook data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatic)	Indicates that calculations in the workbook are performed automatically when cell values change. The application recalculates those cells that are dependent on other cells that contain changed values. This mode of calculation helps to avoid unnecessary calculations.
autoNoTable (Automatic Calculation (No Tables))	Indicates tables be excluded during automatic calculation.
manual (Manual Calculation Mode)	Indicates that calculations in the workbook be triggered manually by the user. For example, the application might expose a command in the user interface.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CalcMode](#)) is located in §A.2. *end note*]

18.18.5 ST_CellComments (Cell Comments)

These enumerations specify how cell comments shall be displayed for paper printing purposes.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
asDisplayed (Print Comments As Displayed)	Print cell comments as displayed.
atEnd (Print At End)	Print cell comments at end of document.
none (None)	Do not print cell comments.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellComments](#)) is located in §A.2. *end note*]

18.18.6 ST_CellFormulaType (Formula Type)

Indicates the type of formula in the cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
array (Array Formula)	Formula is an array formula.

Enumeration Value	Description
dataTable (Table Formula)	Formula is a data table formula.
normal (Normal)	Formula is a regular cell formula.
shared (Shared Formula)	Formula is part of a shared formula.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CellFormulaType](#)) is located in §A.2. *end note*]

18.18.7 ST_CellRef (Cell Reference)

Represents a single cell reference in a SpreadsheetML document.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CellRef](#)) is located in §A.2. *end note*]

18.18.8 ST_CellSpan (Cell Span Type)

A single cell span item.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CellSpan](#)) is located in §A.2. *end note*]

18.18.9 ST_CellSpans (Cell Spans)

List of the cell spans of the item.

This simple type allows a list of items of the ST_CellSpan simple type (§18.18.8).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CellSpans](#)) is located in §A.2. *end note*]

18.18.10 ST_CellStyleXfId (Cell Style Format Id)

Used by xf records and cellStyle records to reference xf records defined in the cellStyleXfs collection.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CellStyleXfId](#)) is located in §A.2. *end note*]

18.18.11 ST_CellType (Cell Type)

Indicates the cell's data type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Boolean)	Cell containing a boolean.
d (Date)	Cell contains a date in the ISO 8601 format.
e (Error)	Cell containing an error.
inlineStr (Inline String)	Cell containing an (inline) rich string, i.e., one not in the shared string table. If this cell type is used, then the cell value is in the <code>is</code> element rather than the <code>v</code> element in the cell (<code>c</code> element).
n (Number)	Cell containing a number.
s (Shared String)	Cell containing a shared string.
str (String)	Cell containing a formula string.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellType](#)) is located in §A.2. *end note*]

18.18.12 ST_CfType (Conditional Format Type)

Conditional format rule type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aboveAverage (Above or Below Average)	This conditional formatting rule highlights cells that are above or below the average for all values in the range.
beginsWith (Begins With)	This conditional formatting rule highlights cells in the range that begin with the given text. Equivalent to using the <code>LEFT()</code> sheet function and comparing values.
cellIs (Cell Is)	This conditional formatting rule compares a cell value to a formula calculated result, using an operator.
colorScale (Color Scale)	This conditional formatting rule creates a graduated color scale on the cells.
containsBlanks (Contains Blanks)	This conditional formatting rule highlights cells that are completely blank. Equivalent of using <code>LEN(TRIM())</code> . This means that if the cell contains only characters that <code>TRIM()</code> would remove, then it is considered blank. An empty cell is also considered blank.

Enumeration Value	Description
containsErrors (Contains Errors)	This conditional formatting rule highlights cells with formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
containsText (Contains Text)	This conditional formatting rule highlights cells containing given text. Equivalent to using the SEARCH() sheet function to determine whether the cell contains the text.
dataBar (Data Bar)	This conditional formatting rule displays a graduated data bar in the range of cells.
duplicateValues (Duplicate Values)	This conditional formatting rule highlights duplicated values.
endsWith (Ends With)	This conditional formatting rule highlights cells ending with given text. Equivalent to using the RIGHT() sheet function and comparing values.
expression (Expression)	This conditional formatting rule contains a formula to evaluate. When the formula result is true, the cell is highlighted.
iconSet (Icon Set)	This conditional formatting rule applies icons to cells according to their values.
notContainsBlanks (Contains No Blanks)	This conditional formatting rule highlights cells that are not blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank.
notContainsErrors (Contains No Errors)	This conditional formatting rule highlights cells without formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
notContainsText (Does Not Contain Text)	This conditional formatting rule highlights cells that do not contain given text. Equivalent to using the SEARCH() sheet function.
timePeriod (Time Period)	This conditional formatting rule highlights cells containing dates in the specified time period. The underlying value of the cell is evaluated, therefore the cell does not need to be formatted as a date to be evaluated. For example, with a cell containing the value 38913 the conditional format shall be applied if the rule requires a value of 7/14/2006.
top10 (Top 10)	This conditional formatting rule highlights cells whose values fall in the top N or bottom N bracket, as specified.
uniqueValues (Unique Values)	This conditional formatting rule highlights unique values in the range.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CfType](#)) is located in §A.2. *end note*]

18.18.13 ST_CfvoType (Conditional Format Value Object Type)

This simple type expresses the type of the conditional formatting value object (cfvo). In general the cfvo specifies one value used in the graduated scale (max, min, midpoint, etc).

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
formula (Formula)	The minimum/ midpoint / maximum value for the gradient is determined by a formula.
max (Maximum)	Indicates that the maximum value in the range shall be used as the maximum value for the gradient.
min (Minimum)	Indicates that the minimum value in the range shall be used as the minimum value for the gradient.
num (Number)	Indicates that the minimum / midpoint / maximum value for the gradient is specified by a constant numeric value.
percent (Percent)	Value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum / midpoint / maximum value for the gradient.
percentile (Percentile)	Value indicates a percentile ranking in the range shall be used as the minimum / midpoint / maximum value for the gradient.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CfvoType](#)) is located in §A.2. *end note*]

18.18.14 ST_Comments (Comment Display Types)

This simple type defines options for displaying comments in the user interface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
commIndAndComment (Show Comment & Indicator)	Indicates that both the comment indicator and comment text be show in the user interface.

Enumeration Value	Description
commIndicator (Show Comment Indicator)	Indicates that only the comment indicator be shown in the user interface.
commNone (No Comments)	Indicates that comments not be shown in the user interface.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Comments](#)) is located in §A.2. *end note*]

18.18.15 ST_ConditionalFormattingOperator (Conditional Format Operators)

These conditional format operators are used for "Highlight Cells That Contain..." rules. For example, "highlight cells that begin with "M2" and contain "Mountain Gear"".

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
beginsWith (Begins With)	'Begins with' operator
between (Between)	'Between' operator
containsText (Contains)	'Contains' operator
endsWith (Ends With)	'Ends with' operator
equal (Equal)	'Equal to' operator
greaterThan (Greater Than)	'Greater than' operator
greaterThanOrEqual (Greater Than Or Equal)	'Greater than or equal to' operator
lessThan (Less Than)	'Less than' operator
lessThanOrEqual (Less Than Or Equal)	'Less than or equal to' operator
notBetween (Not Between)	'Not between' operator
notContains (Does Not Contain)	'Does not contain' operator
notEqual (Not Equal)	'Not equal to' operator

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ConditionalFormattingOperator](#)) is located in §A.2. *end note*]

18.18.16 ST_CredMethod (Credentials Method)

Credentials method used for server access.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
integrated (Integrated Authentication)	Integrated authentication.
none (No Credentials)	Use no credentials at all.
prompt (Prompt Credentials)	Prompt for credentials.
stored (Stored Credentials)	Use stored credentials.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_CredMethod](#)) is located in §A.2. *end note*]

18.18.17 ST_DataConsolidateFunction (Data Consolidation Functions)

Data consolidation functions specified by the user and used to consolidate ranges of data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
average (Average)	The average of the values.
count (Count)	The number of data values. The Count consolidation function works the same as the COUNTA worksheet function.
countNums (CountNums)	The number of data values that are numbers. The Count Nums consolidation function works the same as the COUNT worksheet function.
max (Maximum)	The largest value.
min (Minimum)	The smallest value.
product (Product)	The product of the values.
stdDev (StdDev)	An estimate of the standard deviation of a population, where the sample is a subset of the entire population.
stdDevp (StdDevP)	The standard deviation of a population, where the population is all of the data to be summarized.
sum (Sum)	The sum of the values.
var (Variance)	An estimate of the variance of a population, where the sample is a subset of the entire population.
varp (VarP)	The variance of a population, where the population is all of the data to be summarized.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_DataConsolidateFunction](#)) is located in §A.2. *end note*]

18.18.18 ST_DataValidationErrorStyle (Data Validation Error Styles)

The style of data validation error alert.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
information (Information Icon)	<p>This data validation error style uses an information icon in the error alert.</p> 
stop (Stop Icon)	<p>This data validation error style uses a stop icon in the error alert.</p> 
warning (Warning Icon)	<p>This data validation error style uses a warning icon in the error alert.</p> 

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationErrorStyle](#)) is located in §A.2. *end note*]

18.18.19 ST_DataValidationImeMode (Data Validation IME Mode)

These values specify that the IME (input method editor) mode is controlled by data validation.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
disabled (Disabled IME Mode)	IME mode is disabled. Forces the IME control to be disabled when this cell is selected.
fullAlpha (Full-Width Alpha-Numeric IME Mode)	Forces the IME control to be on and in full-width alphanumeric input mode when the cell is first selected.
fullHangul (Full Width Hangul)	Forces the IME control to be on and in full-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and

Enumeration Value	Description
	a Korean IME control is selected.
fullKatakana (Full Katakana IME Mode)	Forces the IME control to be on and in full-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
halfAlpha (Half Alpha IME)	Forces the IME control to be on and in half-width alphanumeric input mode when the cell is first selected.
halfHangul (Half-Width Hangul IME Mode)	Forces the IME control to be on and in half-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.
halfKatakana (Half-Width Katakana)	Forces the IME control to be on and in half-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
hiragana (Hiragana IME Mode)	Forces the IME control to be on and in Hiragana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
noControl (IME Mode Not Controlled)	Data validation does not control the IME control's mode.
off (IME Off)	Forces the IME control to be off when first selecting the cell (goes to direct cell input mode).
on (IME On)	Forces the IME control to be on when first selecting the cell.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationImeMode](#)) is located in §A.2. *end note*]

18.18.20 ST_DataValidationOperator (Data Validation Operator)

The relational operator used in data validation.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
between (Between)	Data validation which checks if a value is between two other values.
equal (Equal)	Data validation which checks if a value is equal to a specified value.

Enumeration Value	Description
greaterThan (Greater Than)	Data validation which checks if a value is greater than a specified value.
greaterThanOrEqualTo (Greater Than Or Equal)	Data validation which checks if a value is greater than or equal to a specified value.
lessThan (Less Than)	Data validation which checks if a value is less than a specified value.
lessThanOrEqualTo (Less Than Or Equal)	Data validation which checks if a value is less than or equal to a specified value.
notBetween (Not Between)	Data validation which checks if a value is not between two other values.
notEqual (Not Equal)	Data validation which checks if a value is not equal to a specified value.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationOperator](#)) is located in §A.2. *end note*]

18.18.21 ST_DataValidationType (Data Validation Type)

Specifies the type of data validation used to validate user input.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
custom (Custom)	Data validation which uses a custom formula to check the cell value.
date (Date)	Data validation which checks for date values satisfying the given condition.
decimal (Decimal)	Data validation which checks for decimal values satisfying the given condition.
list (List)	Data validation which checks for a value matching one of list of values.
none (None)	No data validation.
textLength (Text Length)	Data validation which checks for text values, whose length satisfies the given condition.
time (Time)	Data validation which checks for time values satisfying the given condition.
whole (Whole Number)	Data validation which checks for whole number values satisfying the given condition.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationType](#)) is located in §A.2. *end note*]

18.18.22 ST_DateTimeGrouping (Date Time Grouping)

Specifies how to group dateTime values.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
day (Day)	Group by day
hour (Group by Hour)	Group by hour
minute (Group by Minute)	Group by minute
month (Month)	Group by month
second (Second)	Group by second
year (Group by Year)	Group by year

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DateTimeGrouping](#)) is located in §A.2. *end note*]

18.18.23 ST_DdeValueType (DDE Value Types)

This simple type indicates the type of the DDE value.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Boolean)	Indicates that the value is a boolean.
e (Error)	Indicates that the value is an error.
n (Real Number)	Indicates that the value is a real number.
nil (Nil)	Indicates that the value is nil.
str (String)	Indicates that the value is a string.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DdeValueType](#)) is located in §A.2. *end note*]

18.18.24 ST_DvAspect (Data View Aspect Type)

Specifies the desired data or view aspect of the object when drawing or getting data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
DVASPECT_CONTENT (Object Display Content)	Provides a representation of an object so it can be displayed as an embedded object inside of a container.
DVASPECT_ICON (Object Display Icon)	Provides an iconic representation of an object.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DvAspect](#)) is located in §A.2. *end note*]

18.18.25 ST_DxfId (Format Id)

This simple type defines the identifier to CT_Dxfs in the styles part. This a zero-based index. See §18.8.30 in Style for more information on formats.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DxfId](#)) is located in §A.2. *end note*]

18.18.26 ST_DynamicFilterType (Dynamic Filter)

These are the dynamic filter types. A dynamic filter returns a result set which might vary due to a change in the data itself or a change in the date on which the filter is being applied. For example, for a set of data {1,1,2,3}, the aboveAverage filter would return or highlight the last two values in the set. If the data is refreshed or changed to {1,1,1,2}, then only the last value would be highlighted. Similarly, the meaning of "lastQuarter" shall be the same for the dates in January, February, and March, but shall change meaning once the date advances from March to April.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aboveAverage (Above Average)	Shows values that are above average.
belowAverage (Below Average)	Shows values that are below average.
lastMonth (Last Month)	Shows last month's dates.
lastQuarter (Last Quarter)	Shows last calendar quarter's dates.
lastWeek (Last Week)	Shows last week's dates, using Sunday as the first weekday.
lastYear (Last Year)	Shows last year's dates.
M1 (1st Month)	Shows the dates that are in January, regardless of year.

Enumeration Value	Description
M10 (10th Month)	Shows the dates that are in October, regardless of year.
M11 (11th Month)	Shows the dates that are in November, regardless of year.
M12 (12th Month)	Shows the dates that are in December, regardless of year.
M2 (2nd Month)	Shows the dates that are in February, regardless of year.
M3 (3rd Month)	Shows the dates that are in March, regardless of year.
M4 (4th Month)	Shows the dates that are in April, regardless of year.
M5 (5th Month)	Shows the dates that are in May, regardless of year.
M6 (6th Month)	Shows the dates that are in June, regardless of year.
M7 (7th Month)	Shows the dates that are in July, regardless of year.
M8 (8th Month)	Shows the dates that are in August, regardless of year.
M9 (9th Month)	Shows the dates that are in September, regardless of year.
nextMonth (Next Month)	Shows next month's dates.
nextQuarter (Next Quarter)	Shows next calendar quarter's dates.
nextWeek (Next Week)	Shows next week's dates, using Sunday as the first weekday.
nextYear (Next Year)	Shows next year's dates.
null (Null)	Common filter type not available.
Q1 (1st Quarter)	Shows the dates that are in the 1st calendar quarter, regardless of year.
Q2 (2nd Quarter)	Shows the dates that are in the 2nd calendar quarter, regardless of year.
Q3 (3rd Quarter)	Shows the dates that are in the 3rd calendar quarter, regardless of year.
Q4 (4th Quarter)	Shows the dates that are in the 4th calendar quarter, regardless of year.
thisMonth (This Month)	Shows this month's dates.
thisQuarter (This Quarter)	Shows this calendar quarter's dates.
thisWeek (This Week)	Shows this week's dates, using Sunday as the first weekday.
thisYear (This Year)	Shows this year's dates.
today (Today)	Shows today's dates.
tomorrow (Tomorrow)	Shows tomorrow's dates.

Enumeration Value	Description
yearToDate (Year To Date)	Shows the dates between the beginning of the year and today, inclusive.
yesterday (Yesterday)	Shows yesterday's dates.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DynamicFilterType](#)) is located in §A.2. *end note*]

18.18.27 ST_ExternalConnectionType (Text Field Datatype)

These are the possible data types to use when importing text into the SpreadsheetML document. Strings are converted to these data types in the worksheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
DMY (Day Month Year)	Field contains a date in the order: day, month, year.
DYM (Day Year Month)	Field contains a date in the order: day, year, month.
EMD (East Asian Year Month Day)	Field contains an East Asian date in the order: EA era year, month, day.
general (General)	The SpreadsheetML application decides the best fit data type based on the content.
MDY (Month Day Year)	Field contains a date in the order: month, day, year.
MYD (Month Day Year)	Field contains a date in the order: month, year, day.
skip (Skip Field)	Don't import this field at all.
text (Text)	Field contains text.
YDM (Year Day Month)	Field contains a date in the order: year, day, month.
YMD (Year Month Day)	Field contains a date in the order: year, month, day.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ExternalConnectionType](#)) is located in §A.2. *end note*]

18.18.28 ST_FieldSortType (Field Sort Type)

This simple type defines the sort orders that can be applied to fields in a PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ascending (Ascending)	Indicates the field is sorted in ascending order.
descending (Descending)	Indicates the field is sorted in descending order.
manual (Manual Sort)	Indicates the field is sorted manually.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FieldSortType](#)) is located in §A.2. *end note*]

18.18.29 ST_FileType (File Type)

The file type being used for text import.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dos (DOS)	DOS (PC-8).
lin (Linux)	Linux
mac (Macintosh)	Macintosh.
other (Other Non-Specified Values)	Other non-specified values at the time of writing.
win (Windows (ANSI))	Windows (ANSI).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FileType](#)) is located in §A.2. *end note*]

18.18.30 ST_FillId (Fill Id)

Zero-based index used to reference a fill record.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FillId](#)) is located in §A.2. *end note*]

18.18.31 ST_FilterOperator (Filter Operator)

Operator enumerations for filtering.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
equal (Equal)	Show results which are equal to criteria.
greaterThan (Greater Than)	Show results which are greater than criteria.
greaterThanOrEqualTo (Greater Than Or Equal)	Show results which are greater than or equal to criteria.
lessThan (Less Than)	Show results which are less than criteria.
lessThanOrEqualTo (Less Than Or Equal)	Show results which are less than or equal to criteria.
notEqual (Not Equal)	Show results which are not equal to criteria.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FilterOperator](#)) is located in §A.2. *end note*]

18.18.32 ST_FontId (Font Id)

An integer that represents a zero based index into the collection in the style sheet.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FontId](#)) is located in §A.2. *end note*]

18.18.33 ST_FontScheme (Font scheme Styles)

Defines the font scheme, if any, to which this font belongs.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
major (Major Font)	This font is the major font for this theme.
minor (Minor Font)	This font is the minor font for this theme.
none (None)	This font is not a theme font.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FontScheme](#)) is located in §A.2. *end note*]

18.18.34 ST_FormatAction (PivotTable Format Types)

This simple type defines the type of formats that can be applied to PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blank (Blank)	Indicates no format is applied to the PivotTable. This value is used when formatting is cleared from already formatted cells in the PivotTable.
drill (Drill Type)	Indicates the PivotTable has drill-through format.
formatting (Formatting)	Indicates the PivotTable has formatting.
formula (Formula Type)	Indicates the PivotTable has formulas.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FormatAction](#)) is located in §A.2. *end note*]

18.18.35 ST_Formula (Formula)

A formula

This simple type's contents are a restriction of the ST_Xstring datatype (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Formula](#)) is located in §A.2. *end note*]

18.18.36 ST_FormulaExpression (Formula Expression Type)

This simple type specifies an expression type that can comprise a formula.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
area (Area)	Reference to a range of cells.
areaError (Area Error)	Reference to a range of cells that now evaluates to an error.
computedArea (Computed Area)	Computed area reference.
ref (Reference)	Single cell reference.
refError (Reference Is Error)	Single cell reference that now evaluates to an error.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FormulaExpression](#)) is located in §A.2. *end note*]

18.18.37 ST_GradientType (Gradient Type)

Type of gradient fill being used, either linear or path.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
linear (Linear Gradient)	This gradient fill is of linear gradient type. Linear gradient type means that the transition from one color to the next is along a line (e.g., horizontal, vertical, diagonal, etc.).
path (Path)	This gradient fill is of path gradient type. Path gradient type means the that the boundary of transition from one color to the next is a rectangle, defined by top, bottom, left, and right attributes on the gradientFill element.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GradientType](#)) is located in §A.2. *end note*]

18.18.38 ST_GroupBy (Values Group By)

This simple type defines types of data grouping that can be performed on a PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
days (Days)	Indicates a grouping on "days" for date values.
hours (Hours)	Indicates a grouping on "hours" for date values.
minutes (Minutes)	Indicates a grouping on "minutes" for date values.
months (Months)	Indicates a grouping on "months" for date values.
quarters (Quarters)	Indicates a grouping on "quarters" for date values.
range (Group By Numeric Ranges)	Indicates a grouping by numeric ranges for numeric values.
seconds (Seconds)	Indicates a grouping on "seconds" for date values.
years (Years)	Indicates a grouping on "years" for date values.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GroupBy](#)) is located in §A.2. *end note*]

18.18.39 ST_GrowShrinkType (Grow Shrink Type)

This type enumerates behavior patterns for refreshing external data in a query table.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
insertClear (Insert & Clear On Refresh)	Insert entire rows for new data, clear unused cells.
insertDelete (Insert & Delete On Refresh)	Insert cells for new data, delete unused cells.
overwriteClear (Overwrite & Clear On Refresh)	Overwrite existing cells with new data, clear unused cells.

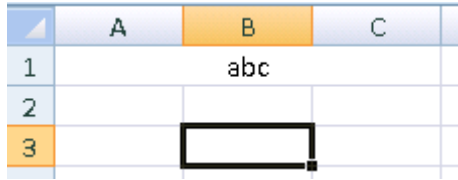

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GrowShrinkType](#)) is located in §A.2. end note]

18.18.40 ST_HorizontalAlignment (Horizontal Alignment Type)

The enumeration value indicating the portion of Cell Alignment in a cell format (XF) that is horizontal alignment, i.e., whether it is aligned general, left, right, horizontally centered, filled (replicated), justified, centered across multiple cells, or distributed.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Centered Horizontal Alignment)	The horizontal alignment is centered, meaning the text is centered across the cell.
centerContinuous (Center Continuous Horizontal Alignment)	<p>The horizontal alignment is centered across multiple cells. The information about how many cells to span is expressed in the Sheet Part, in the row of the cell in question. For each cell that is spanned in the alignment, a cell element needs to be written out, with the same style Id which references the centerContinuous alignment.</p> <p>[Example: This shows the value of A1 centered across A1:C1:</p>  <p>The XML from the Sheet Part:</p> <pre><row r="1" spans="1:3"></pre>

Enumeration Value	Description												
	<pre><c r="A1" s="1" t="s"> <v>0</v> </c> <c r="B1" s="1"/> <c r="C1" s="1"/> </row></pre> <p>The XML from the Styles Part:</p> <pre><cellXfs count="2"> <xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0"/> <xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0" applyAlignment="1"> <alignment horizontal="centerContinuous"/> </xf> </cellXfs></pre> <p><i>end example]</i></p>												
distributed (Distributed Horizontal Alignment)	<p>l/ndicates that each 'word' in each line of text inside the cell is evenly distributed across the width of the cell, with flush right and left margins.</p> <p>When there is also an indent value to apply, both the left and right side of the cell are padded by the indent value.</p> <p>A 'word' is a set of characters with no space character in them.</p> <p>Two lines inside a cell are separated by a carriage return.</p> <p>[<i>Example:</i> This shows three lines of text evenly distributed horizontally across the cell. The first line is "abc def ghi", the second line is blank, and the third line is "jkl mno".</p> <table><tr><td></td><td>A</td><td>B</td><td></td></tr><tr><td>1</td><td></td><td>abc def ghi</td><td></td></tr><tr><td></td><td></td><td>jkl mno</td><td></td></tr></table>		A	B		1		abc def ghi				jkl mno	
	A	B											
1		abc def ghi											
		jkl mno											

Enumeration Value	Description									
	<p>This shows the same example, with an indent value of 2:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td>abc def ghi</td></tr><tr><td>2</td><td></td><td>jkl mno</td></tr></table> <p>There is no vertical component to the alignment being shown here. The row has been manually adjusted to display the text. <i>end example]</i></p>		A	B	1		abc def ghi	2		jkl mno
	A	B								
1		abc def ghi								
2		jkl mno								
fill (Fill)	<p>Indicates that the value of the cell should be filled across the entire width of the cell. If blank cells to the right also have the fill alignment, they are also filled with the value, using a convention similar to centerContinuous.</p> <p>Additional rules:</p> <ul style="list-style-type: none">• Only whole values can be appended, not partial values.• The column will not be widened to 'best fit' the filled value• If appending an additional occurrence of the value exceeds the boundary of the cell left/right edge, don't append the additional occurrence of the value.• The display value of the cell is filled, not the underlying raw number. <p>[Example: This cell is filled with the value 1.2345 and has a width of 15 characters:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td>2</td><td></td><td>1.23451.2345</td></tr></table> <p>This cell is filled with the value abc and has width of 15 characters:</p>		A	B	1			2		1.23451.2345
	A	B								
1										
2		1.23451.2345								

Enumeration Value	Description									
	<table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td>2</td><td></td><td>abcbabcbabcbabc</td></tr></table> <ul style="list-style-type: none">• <i>end example]</i>•		A	B	1			2		abcbabcbabcbabc
	A	B								
1										
2		abcbabcbabcbabc								
general (General Horizontal Alignment)	<p>The horizontal alignment is general-aligned. Text data is left-aligned. Numbers, dates, and times are right-aligned. Boolean types are centered. Changing the alignment does not change the type of data.</p> <p>[<i>Example:</i> These cells are general aligned:</p> <table><tr><td>1-Jan</td></tr><tr><td>45</td></tr><tr><td>abc</td></tr><tr><td>TRUE</td></tr></table> <p><i>end example]</i></p>	1-Jan	45	abc	TRUE					
1-Jan										
45										
abc										
TRUE										
justify (Justify)	<p>The horizontal alignment is justified (flush left and right). For each line of text, aligns each line of the wrapped text in a cell to the right and left (except the last line). If no single line of text wraps in the cell, then the text is not justified.</p> <p>[<i>Example:</i> There are two lines of text in this cell, and the cell's horizontal alignment is justify:</p> <table><tr><td>one two three four five six seven eight nine ten eleven twelve thirteen fourteen fifteen sixteen seventeen eighteen nineteen</td></tr><tr><td>six seven eight nine ten eleven twelve</td></tr></table> <p><i>end example]</i></p>	one two three four five six seven eight nine ten eleven twelve thirteen fourteen fifteen sixteen seventeen eighteen nineteen	six seven eight nine ten eleven twelve							
one two three four five six seven eight nine ten eleven twelve thirteen fourteen fifteen sixteen seventeen eighteen nineteen										
six seven eight nine ten eleven twelve										
left (Left Horizontal Alignment)	<p>The horizontal alignment is left-aligned, even in Right-</p>									

Enumeration Value	Description
	to-Left mode. Aligns contents at the left edge of the cell. If an indent amount is specified, the contents of the cell is indented from the left by the specified number of character spaces. The character spaces are based on the default font and font size for the workbook.
right (Right Horizontal Alignment)	The horizontal alignment is right-aligned, meaning that cell contents are aligned at the right edge of the cell, even in Right-to-Left mode.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_HorizontalAlignment](#)) is located in §A.2. *end note*]

18.18.41 ST_HtmlFmt (HTML Formatting Handling)

How to handle formatting from the HTML source.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Transfer all HTML formatting into the worksheet along with data.
none (No Formatting)	Bring data in as unformatted text (setting data types still occurs).
rtf (Honor Rich Text)	Translate HTML formatting to rich text formatting on the data brought into the worksheet.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_HtmlFmt](#)) is located in §A.2. *end note*]

18.18.42 ST_IconSetType (Icon Set Type)

Icon set type for conditional formatting. The threshold values for triggering the different icons within a set are configurable, and the icon order is reversible. See element `iconSet` for more information.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
3Arrows (3 Arrows)	3 arrows icon set.

Enumeration Value	Description
	
3ArrowsGray (3 Arrows (Gray))	3 gray arrows icon set. 
3Flags (3 Flags)	3 flags icon set. 
3Signs (3 Signs)	3 signs icon set. 
3Symbols (3 Symbols Circled)	3 symbols icon set. 
3Symbols2 (3 Symbols)	3 Symbols icon set. 
3TrafficLights1 (3 Traffic Lights)	3 traffic lights icon set (#1). 
3TrafficLights2 (3 Traffic Lights Black)	3 traffic lights icon set with thick black border. 
4Arrows (4 Arrows)	4 arrows icon set. 

Enumeration Value	Description
4ArrowsGray (4 Arrows (Gray))	4 gray arrows icon set. 
4Rating (4 Ratings)	4 ratings icon set. 
4RedToBlack (4 Red To Black)	4 'red to black' icon set. 
4TrafficLights (4 Traffic Lights)	4 traffic lights icon set. 
5Arrows (5 Arrows)	5 arrows icon set. 
5ArrowsGray (5 Arrows (Gray))	5 gray arrows icon set. 
5Quarters (5 Quarters)	5 quarters icon set. 
5Rating (5 Ratings Icon Set)	5 rating icon set. 

[Note: The W3C XML Schema definition of this simple type's content model ([ST_IconSetType](#)) is located in §A.2. end note]

18.18.43 ST_ItemType (PivotItem Type)

This simple type defines the pivot type for a pivotItem.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
avg (Average)	Indicates the pivot item represents an "average" aggregate function.
blank (Blank Pivot Item)	Indicates the pivot item represents a blank line.
count (Count)	Indicates the pivot item represents custom the "count" aggregate."
countA (CountA)	Indicates the pivot item represents the "count numbers" aggregate function.
data (Data)	Indicate the pivot item represents data.
default (Default)	Indicates the pivot item represents the default type for this PivotTable. The default pivot item type is the "total" aggregate function.
grand (Grand Total Item)	Indicates the pivot items represents the grand total line.
max (Max)	Indicates the pivot item represents the "maximum" aggregate function.
min (Min)	Indicates the pivot item represents the "minimum" aggregate function.
product (Product)	Indicates the pivot item represents the "product" function.
stdDev (stdDev)	Indicates the pivot item represents the "standard deviation" aggregate function.
stdDevP (StdDevP)	Indicates the pivot item represents the "standard deviation population" aggregate function.
sum (Sum)	Indicates the pivot item represents the "sum" aggregate value.
var (Var)	Indicates the pivot item represents the "variance" aggregate value.
varP (VarP)	Indicates the pivot item represents the "variance population" aggregate value.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ItemType](#)) is located in §A.2. *end note*]

18.18.44 ST_MdxFunctionType (MDX Function Type)

This simple type is an enumeration representing different MDX function types.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
c (Cube Set Count)	CUBESETCOUNT
k (Cube KPI Member)	CUBEKPIMEMBER
m (Cube Member)	CUBEMEMBER
p (Cube Member Property)	CUBEMEMBERPROPERTY
r (Cube Ranked Member)	CUBERANKEDMEMBER
s (Cube Set)	CUBESET
v (Cube Value)	CUBEVALUE

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MdxFunctionType](#)) is located in §A.2. *end note*]

18.18.45 ST_MdxKPIProperty (MDX KPI Property)

An enumeration representing the different types of KPI properties.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
g (Goal)	Goal.
m (Current Time Member)	Current time member.
s (Status)	Status.
t (Trend)	Trend.
v (Value)	Value.
w (Weight)	Weight.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MdxKPIProperty](#)) is located in §A.2. *end note*]

18.18.46 ST_MdxSetOrder (MDX Set Order)

This simple type represents an enumeration specifying an MDX set order.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
a (Ascending)	Sort ascending.
aa (Alpha Ascending Sort Order)	Sorted alphabetically in ascending order by the caption.
ad (Alpha Descending Sort Order)	Sort in descending order alphabetically by the caption.
d (Descending)	Sort descending.
na (Natural Ascending)	Sorted in ascending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this might be in order of account number.
nd (Natural Descending)	Sorted in descending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this might be in order of account number.
u (Unsorted)	Unsorted.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MdxSetOrder](#)) is located in §A.2.
end note]

18.18.47 ST_NumFmtId (Number Format Id)

This simple type defines the identifier to a style sheet number format entry in CT_NumFmts. Number formats are written to the styles part. See §18.8.31 for more information on number formats.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_NumFmtId](#)) is located in §A.2.
end note]

18.18.48 ST_Objects (Object Display Types)

This simple type defines how the application displays objects in this workbook. Objects might include charts, images, and other object data that the application supports.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Indicates that all objects be shown in the workbook.
none (None)	Indicates that all objects be hidden in the workbook.
placeholders (Show Placeholders)	Indicates that the application show placeholders for objects in the workbook.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Objects](#)) is located in §A.2. *end note*]

18.18.49 ST_OleUpdate (OLE Update Types)

Indicates whether the linked object updates the cached data for the linked object automatically or only when the container calls IOleObject::Update or IOleLink::Update methods.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
OLEUPDATE_ALWAYS (Always Update OLE)	Update the link object whenever possible, this option corresponds to the 'automatic update' option in the Links dialog box.
OLEUPDATE_ONCALL (Update OLE On Call)	Update the link object only when IOleObject::Update or IOleLink::Update is called, this option corresponds to the Manual update option in the Links dialog box.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_OleUpdate](#)) is located in §A.2. *end note*]

18.18.50 ST_Orientation (Orientation)

Print orientation for this sheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
default (Default)	Orientation not specified, use the default.
landscape (Landscape)	Landscape orientation.
portrait (Portrait)	Portrait orientation.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_Orientation](#)) is located in §A.2. end note*]

18.18.51 ST_PageOrder (Page Order)

Specifies printed page order.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
downThenOver (Down Then Over)	Order pages vertically first, then move horizontally.
overThenDown (Over Then Down)	Order pages horizontally first, then move vertically

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PageOrder](#)) is located in §A.2. end note*]

18.18.52 ST_Pane (Pane Types)

Defines the names of the four possible panes into which the view of a workbook in the application can be split.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottomLeft (Bottom Left Pane)	<p>Bottom left pane, when both vertical and horizontal splits are applied.</p> <p>This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the bottom pane.</p>
bottomRight (Bottom Right Pane)	<p>Bottom right pane, when both vertical and horizontal splits are applied.</p>
topLeft (Top Left Pane)	<p>Top left pane, when both vertical and horizontal splits are applied.</p> <p>This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the top pane.</p> <p>This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the left pane</p>

Enumeration Value	Description
topRight (Top Right Pane)	<p>Top right pane, when both vertical and horizontal splits are applied.</p> <p>This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the right pane.</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Pane](#)) is located in §A.2. *end note*]

18.18.53 ST_PaneState (Pane State)

State of the sheet's pane.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
frozen (Frozen)	<p>Panes are frozen, but were not split being frozen. In this state, when the panes are unfrozen again, a single pane results, with no split.</p> <p>In this state, the split bars are not adjustable.</p>
frozenSplit (Frozen Split)	Panes are frozen and were split before being frozen. In this state, when the panes are unfrozen again, the split remains, but is adjustable.
split (Split)	Panes are split, but not frozen. In this state, the split bars are adjustable by the user.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PaneState](#)) is located in §A.2. *end note*]

18.18.54 ST_ParameterType (Parameter Type)

Parameter Type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cell (Parameter From Cell)	Get the parameter value from a cell on each refresh.

Enumeration Value	Description
prompt (Prompt on Refresh)	Prompt the user on each refresh for a parameter value.
value (Value)	Use a constant value on each refresh for the parameter value.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ParameterType](#)) is located in §A.2. end note]

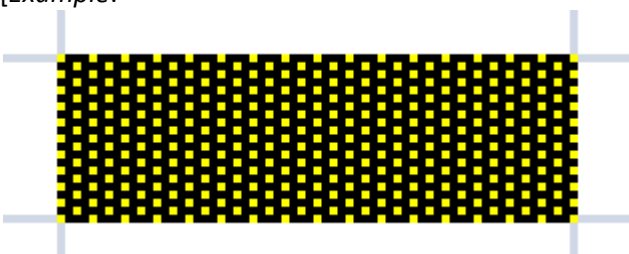

18.18.55 ST_PatternType (Pattern Type)

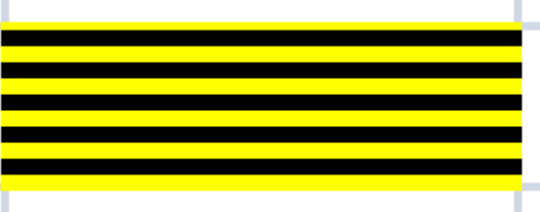

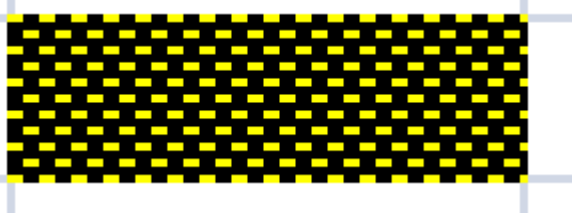

Indicates the style of fill pattern being used for a cell format.

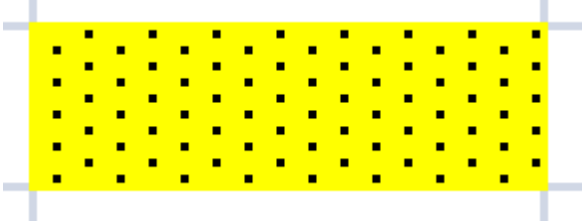

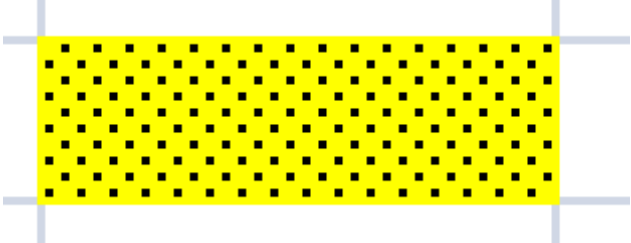

The examples below use yellow background and black foreground colors.

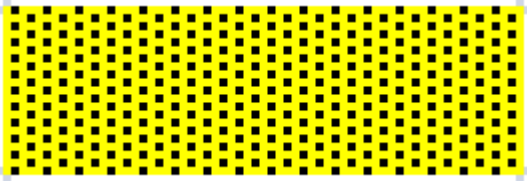

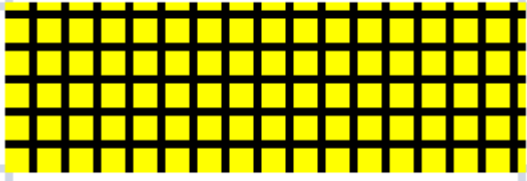

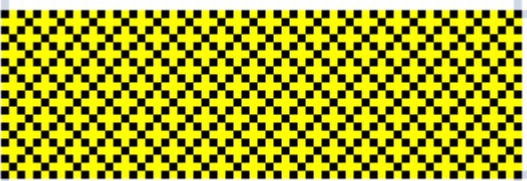

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
darkDown (Dark Down)	The fill style is 'dark down'. [Example:  end example]
darkGray (Dary Gray)	The fill style is 'dark gray'. [Example:  end example]
darkGrid (Dark Grid)	The fill style is 'dark grid'. [Example:

Enumeration Value	Description
	 <i>end example]</i>
darkHorizontal (Dark Horizontal)	The fill style is dark horizontal. [Example:  <i>end example]</i>
darkTrellis (Dark Trellis)	The fill style is 'dark trellis'. [Example:  <i>end example]</i>
darkUp (Dark Up)	The fill style is 'dark up'. [Example:  <i>end example]</i>
darkVertical (Dark Vertical)	The fill style is 'dark vertical'. [Example:

Enumeration Value	Description
	 <p><i>end example]</i></p>
gray0625 (Gray 0.0625)	<p>The fill style is grayscale of 0.0625 (1/16) value. [Example:</p>  <p><i>end example]</i></p>
gray125 (Gray 0.125)	<p>The fill style is grayscale of 0.125 (1/8) value. [Example:</p>  <p><i>end example]</i></p>
lightDown (Light Down)	<p>The fill style is 'light down'. [Example:</p>  <p><i>end example]</i></p>
lightGray (Light Gray)	<p>The fill style is light gray. [Example:</p>

Enumeration Value	Description
	 <i>end example]</i>
lightGrid (Light Grid)	The fill style is 'light grid'. [Example:  <i>end example]</i>
lightHorizontal (Light Horizontal)	The fill style is light horizontal. [Example:  <i>end example]</i>
lightTrellis (Light Trellis)	The fill style is 'light trellis'. [Example:  <i>end example]</i>
lightUp (Light Up)	The fill style is light up. [Example:

Enumeration Value	Description
	 <p><i>end example]</i></p>
lightVertical (Light Vertical)	The fill style is light vertical.
mediumGray (Medium Gray)	<p>The fill style is medium gray.</p> <p>[Example:</p>  <p><i>end example]</i></p>
none (None)	<p>The fill style is none (no fill). When foreground and/or background colors are specified, a pattern of 'none' overrides and means the cell has no fill.</p> <p>[Example:</p>  <p><i>end example]</i></p>
solid (Solid)	<p>The fill style is solid. When solid is specified, the foreground color (fgColor) is the only color rendered, even when a background color (bgColor) is also specified.</p> <p>[Example:</p>

Enumeration Value	Description
	 <i>end example]</i>

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_PatternType](#)) is located in §A.2. *end note*]

18.18.56 ST_PhoneticAlignment (Phonetic Alignment Types)

Phonetic alignment settings. These specify how to align the phonetic text, which represent the sounds, above the base text or base word.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center Alignment)	Center the phonetic characters over the base word, per word.
distributed (Distributed)	Each phonetic character is distributed above each base word character, per word.
left (Left Alignment)	Each phonetic character is left justified with respect to the base text., per word.
noControl (No Control)	Each phonetic character is left justified without respect to the base text (so it is not per word).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_PhoneticAlignment](#)) is located in §A.2. *end note*]

18.18.57 ST_PhoneticType (Phonetic Type)

Represents the different East Asian character sets that shall be used for displaying phonetic hints.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fullwidthKatakana (Full-Width Katakana)	Full-width Katakana is used

Enumeration Value	Description
halfwidthKatakana (Half-Width Katakana)	Half-width Katakana is used, this is the same Katakana character set, just half as wide so it takes up less space.
Hiragana (Hiragana)	Hiragana is used
noConversion (No Conversion)	Any characters are allowed. In this case the spreadsheet application shall leave the text as entered.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PhoneticType](#)) is located in §A.2. *end note*]

18.18.58 ST_PivotAreaType (Rule Type)

Indicates the type of rule being used to describe an area or aspect of the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Refers to the whole PivotTable.
button (Field Button)	Refers to a field button.
data (Data)	Refers to something in the data area.
none (None)	Refers to no Pivot area.
normal (Normal)	Refers to a header or item.
origin (Origin)	Refers to the blank cells at the top-left of the PivotTable (top-left to LTR sheets, top-right for RTL sheets).
topEnd (Top End)	Refers to the blank cells at the top of the PivotTable, on its trailing edge (top-right for LTR sheets, top-left for RTL sheets).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PivotAreaType](#)) is located in §A.2. *end note*]

18.18.59 ST_PivotFilterType (Pivot Filter Types)

This simple type defines filters that can be applied to PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
captionBeginsWith (Caption Begins With)	Indicates the "begins with" filter for field captions.
captionBetween (Caption Is Between)	Indicates the "is between" filter for field captions.
captionContains (Caption Contains)	Indicates the "contains" filter for field captions.
captionEndsWith (Caption Ends With)	Indicates the "ends with" filter for field captions.
captionEqual (Caption Equals)	Indicates the "equal" filter for field captions.
captionGreaterThan (Caption Is Greater Than)	Indicates the "is greater than" filter for field captions.
captionGreaterThanOrEqual (Caption Is Greater Than Or Equal To)	Indicates the "is greater than or equal to" filter for field captions.
captionLessThan (Caption Is Less Than)	Indicates the "is less than" filter for field captions.
captionLessThanOrEqual (Caption Is Less Than Or Equal To)	Indicates the "is less than or equal to" filter for field captions.
captionNotBeginsWith (Caption Does Not Begin With)	Indicates the "does not begin with" filter for field captions.
captionNotBetween (Caption Is Not Between)	Indicates the "is not between" filter for field captions.
captionNotContains (Caption Does Not Contain)	Indicates the "does not contain" filter for field captions.
captionNotEndsWith (Caption Does Not End With)	Indicates the "does not end with" filter for field captions.
captionNotEqual (Caption Not Equal)	Indicates the "not equal" filter for field captions.
count (Count)	Indicates the "count" filter.
dateBetween (Date Between)	Indicates the "between" filter for date values.
dateEqual (Date Equals)	Indicates the "equals" filter for date values.
dateNewerThan (Date Newer Than)	Indicates the "newer than" filter for date values.
dateNewerThanOrEqual (Date Newer Than or Equal To)	Indicates the "newer than or equal to" filter for date values.
dateNotBetween (Date Not Between)	Indicates the "not between" filter for date values.
dateNotEqual (Date Does Not Equal)	Indicates the "does not equal" filter for date values.
dateOlderThan (Date Older Than)	Indicates the "older than" filter for date values.
dateOlderThanOrEqual (Date Older Than Or Equal)	Indicates the "older than or equal to" filter for date values.
lastMonth (Last Month)	Indicates the "last month" filter for date values.
lastQuarter (Last Quarter)	Indicates the "last quarter" filter for date values.
lastWeek (Last Week)	Indicates the "last week" filter for date values.
lastYear (Last Year)	Indicates the "last year" filter for date values.
M1 (January)	Indicates the "January" filter for date values.

Enumeration Value	Description
M10 (Dates in October)	Indicates the "October" filter for date values.
M11 (Dates in November)	Indicates the "November" filter for date values.
M12 (Dates in December)	Indicates the "December" filter for date values.
M2 (Dates in February)	Indicates the "February" filter for date values.
M3 (Dates in March)	Indicates the "March" filter for date values.
M4 (Dates in April)	Indicates the "April" filter for date values.
M5 (Dates in May)	Indicates the "May" filter for date values.
M6 (Dates in June)	Indicates the "June" filter for date values.
M7 (Dates in July)	Indicates the "July" filter for date values.
M8 (Dates in August)	Indicates the "August" filter for date values.
M9 (Dates in September)	Indicates the "September" filter for date values.
nextMonth (Next Month)	Indicates the "next month" filter for date values.
nextQuarter (Next Quarter)	Indicates the "next quarter" for date values.
nextWeek (Next Week)	Indicates the "next week" for date values.
nextYear (Next Year)	Indicates the "next year" filter for date values.
percent (Percent)	Indicates the "percent" filter for numeric values.
Q1 (First Quarter)	Indicates the "first quarter" filter for date values.
Q2 (Second Quarter)	Indicates the "second quarter" filter for date values.
Q3 (Third Quarter)	Indicates the "third quarter" filter for date values.
Q4 (Fourth Quarter)	Indicates the "fourth quarter" filter for date values.
sum (Sum)	Indicates the "sum" filter for numeric values.
thisMonth (This Month)	Indicates the "this month" filter for date values.
thisQuarter (This Quarter)	Indicates the "this quarter" filter for date values.
thisWeek (This Week)	Indicates the "this week" filter for date values.
thisYear (This Year)	Indicate the "this year" filter for date values.
today (Today)	Indicates the "today" filter for date values.
tomorrow (Tomorrow)	Indicates the "tomorrow" filter for date values.
unknown (Unknown)	Indicates the PivotTable filter is unknown to the application.
valueBetween (Value Between)	Indicates the "Value between" filter for text and numeric values.
valueEqual (Value Equal)	Indicates the "value equal" filter for text and numeric values.
valueGreaterThan (Value Greater Than)	Indicates the "value greater than" filter for text and numeric values.

Enumeration Value	Description
valueGreaterThanOrEqual (Value Greater Than Or Equal To)	Indicates the "value greater than or equal to" filter for text and numeric values.
valueLessThan (Value Less Than)	Indicates the "value less than" filter for text and numeric values.
valueLessThanOrEqual (Value Less Than Or Equal To)	Indicates the "value less than or equal to" filter for text and numeric values
valueNotBetween (Value Not Between)	Indicates the "value not between" filter for text and numeric values.
valueNotEqual (Value Not Equal)	Indicates the "value not equal" filter for text and numeric values.
yearToDate (Year-To-Date)	Indicates the "year-to-date" filter for date values.
yesterday (Yesterday)	Indicates the "yesterday" filter for date values.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PivotFilterType](#)) is located in §A.2. *end note*]

18.18.60 ST_PrintError (Print Errors)

This enumeration specifies how to display cells with errors when printing the worksheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blank (Show Cell Errors As Blank)	Display cell errors as blank.
dash (Dash Cell Errors)	Display cell errors as dashes.
displayed (Display Cell Errors)	Display cell errors as displayed on screen.
NA (NA)	Display cell errors as #N/A.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PrintError](#)) is located in §A.2. *end note*]

18.18.61 ST_Qualifier (Qualifier)

Qualifier to use to denote string data types in when text is imported from an external file.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
doubleQuote (Double Quote)	Quotation mark -- double quote (").
none (No Text Qualifier)	No text string qualifier used.
singleQuote (Single Quote)	Apostrophe mark -- single quote (').

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Qualifier](#)) is located in §A.2. *end note*]

18.18.62 ST_Ref (Cell References)

This simple type defines a reference to a range of cells within a sheet in the workbook. A reference identifies a cell or a range of cells on a worksheet and tells the application where to look for the values or data you want to use in a formula. With references, you can use data contained in different parts of a worksheet in one formula or use the value from one cell in several formulas. You can also refer to cells on other sheets in the same workbook, and to other workbooks. References to cells in other workbooks are called links.

SpreadsheetML defines two reference styles defined in the ST_RefMode simple type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Ref](#)) is located in §A.2. *end note*]

18.18.63 ST_RefA (Single Cell Reference)

This simple type specifies a single cell reference that might be absolute.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RefA](#)) is located in §A.2. *end note*]

18.18.64 ST_RefMode (Reference Mode)

This simple type defines the supported reference styles or modes for a workbook in SpreadsheetML.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
A1 (A1 Mode)	Indicates that the workbook uses A1 reference style. This is the default for SpreadsheetML. A1 reference style refers to columns with letters and refers to rows with numbers. For example, A1 refers to the cell at the intersection of column A and row 1.

Enumeration Value	Description
R1C1 (R1C1 Reference Mode)	Indicates that the workbook uses the R1C1 reference style. R1C1 reference style refers to both the rows and the columns on the worksheet with numbers. The location of a cell is indicated with an "R" followed by a row number and a "C" followed by a column number. For example, R1C1 refers to the cell at the intersection of row R1 and column C1.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RefMode](#)) is located in §A.2. *end note*]

18.18.65 ST_RevisionAction (Revision Action Types)

Identifies what kind of action the user performed. Applies to Comment and Custom View revision record.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
add (Add)	Add action.
delete (Delete)	Delete action.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RevisionAction](#)) is located in §A.2. *end note*]

18.18.66 ST_rwColActionType (Row Column Action Type)

Identifies what kind of an action was applied to a row or column.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
deleteCol (Delete Column)	Column delete revision.
deleteRow (Delete Row)	Row delete revision.
insertCol (Column Insert)	Column insert revision.
insertRow (Insert Row)	Row insert revision.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_rwColActionType](#)) is located in §A.2. *end note*]

18.18.67 ST_Scope (Conditional Formatting Scope)

This simple type defines the scope of conditional formatting applied in the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
data (Data Fields)	Indicates that conditional formatting is applied to the selected data fields.
field (Field Intersections)	Indicates that conditional formatting is applied to the selected PivotTable field intersections.
selection (Selection)	Indicates that conditional formatting is applied to the selected cells.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Scope](#)) is located in §A.2. *end note*]

18.18.68 ST_SheetState (Sheet Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hidden (Hidden)	Indicates the workbook window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the sheet is visible.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SheetState](#)) is located in §A.2. *end note*]

18.18.69 ST_SheetViewType (Sheet View Type)

Defines the view setting of the sheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
normal (Normal View)	Normal view
pageBreakPreview (Page Break Preview)	Page break preview
pageLayout (Page Layout View)	Page Layout View

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SheetViewType](#)) is located in §A.2. *end note*]

18.18.70 ST_ShowDataAs (Show Data As)

This simple type defines the data formats for a field in the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
difference (Difference)	Indicates the field is shown as the "difference from" a value.
index (Index)	Indicates the field is shown as the "index."
normal (Normal Data Type)	Indicates that the field is shown as its normal data type.
percent (Percentage Of)	Indicates the field is show as the "percentage of
percentDiff (Percentage Difference)	Indicates the field is shown as the "percentage difference from" a value.
percentOfCol (Percent of Column)	Indicates the field is shown as the percentage of column.
percentOfRow (Percentage of Row)	Indicates the field is shown as the percentage of row
percentOfTotal (Percentage of Total)	Indicates the field is shown as percentage of total.
runTotal (Running Total)	Indicates the field is shown as running total in the table.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ShowDataAs](#)) is located in §A.2. *end note*]

18.18.71 ST_SmartTagShow (Smart Tag Display Types)

This simple type defines options for displaying smart tags in the user interface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Indicates that smart tags are enabled and shown in the user interface.
noIndicator (No Smart Tag Indicator)	Indicates that the smart tags are enabled but the indicator not be shown in the user interface.
none (None)	Indicates that smart tags are disabled and not displayed in the user interface.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_SmartTagShow](#)) is located in §A.2. *end note*]

18.18.72 ST_SortBy (Sort By)

Specifies what to sort by. In many cases a range of cells are sorted by their values. However, cells can also be sorted by their background color, font color, and type of icon in the cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cellColor (Sort by Cell Color)	Sort by cell color
fontColor (Sort by Font Color)	Sort by font color
icon (Sort by Icon)	Sort by icon
value (Value)	Sort by value

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_SortBy](#)) is located in §A.2. *end note*]

18.18.73 ST_SortMethod (Sort Method)

Sort method. Chinese Simplified, Chinese Traditional, and Japanese support alternate sort methods (multiple sort options are available). All other languages support only 1 sort option. In that case, the value pinYin is used.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (None)	Not specified, use default sort method.
pinYin (PinYin Sort)	Default sort method. This is the only sort option for most languages.

Enumeration Value	Description
	For Chinese Simplified, Chinese Traditional, and Japanese, pinYin means sort by phonetic value. •
stroke (Sort by Stroke)	Sort by stroke count of the characters. Only applies to Chinese Simplified, Chinese Traditional, and Japanese.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SortMethod](#)) is located in §A.2. *end note*]

18.18.74 ST_SortType (Set Sort Order)

This simple type defines the possible sort order for the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ascending (Ascending)	Indicates that the PivotTable data is sorted in ascending order.
ascendingAlpha (Ascending Alpha)	Indicates that the PivotTable data is sorted in alphabetic order with ascending values.
ascendingNatural (Ascending Natural)	Indicates that the PivotTable data is sorted in natural order with ascending.
descending (Descending)	Indicates that the PivotTable data is sorted in descending.
descendingAlpha (Alphabetic Order Descending)	Indicates that the PivotTable data is sorted in alphabetic order with descending values.
descendingNatural (Natural Order Descending)	Indicates that the PivotTable data is sorted in natural order with descending values.
none (None)	Indicates that the PivotTable data is not sorted.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SortType](#)) is located in §A.2. *end note*]

18.18.75 ST_SourceType (PivotCache Type)

This simple type defines the cache types for PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
consolidation (Consolidation Ranges)	Indicates that the cache contains data that consolidates ranges.
external (External)	Indicates that the cache contains data from an external data source.
scenario (Scenario Summary Report)	Indicates that the cache contains a scenario summary report
worksheet (Worksheet)	Indicates that the cache contains worksheet data.

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_SourceType](#)) is located in §A.2. *end note*]

18.18.76 ST_Sqref (Reference Sequence)

A sequence of cell references, space delimited.

This simple type allows a list of items of the ST_Ref simple type (§18.18.62).

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_Sqref](#)) is located in §A.2. *end note*]

18.18.77 ST_TableStyleType (Table Style Type)

Enumeration of the different structured regions of a Table or PivotTable which can be formatted. Specifies which region is being formatted by this table style element.

Table Regions

Diagram illustrating the structure of a PivotTable with various regions and cells highlighted:

- First Column Stripe**: The first column of the table.
- Second Column Stripe**: The second column of the table.
- First Column**: The first column of the table.
- Second Column**: The second column of the table.
- Last Column**: The last column of the table.
- First Header Cell**: The first cell in the header row.
- Last Header Cell**: The last cell in the header row.
- Header Row**: The row containing the headers.
- Whole Table**: The entire data area.
- Total Row**: The row containing the totals.
- First Total Cell**: The first cell in the total row.
- Last Total Cell**: The last cell in the total row.
- First Row Stripe**: The first row of the table.
- Second Row Stripe**: The second row of the table.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blankRow (Blank Row Style)	Table style element that applies to PivotTable's blank rows.
firstColumn (First Column Style)	Table style element that applies to table's first column.
firstColumnStripe (First Column Stripe Style)	Table style element that applies to table's first column stripes.
firstColumnSubheading (First Column Subheading Style)	Table style element that applies to PivotTable's first column subheading.
firstHeaderCell (First Header Row Style)	Table style element that applies to table's first header row cell.
firstRowStripe (First Row Stripe Style)	Table style element that applies to table's first row stripes.
firstRowSubheading (First Row Subheading Style)	Table style element that applies to PivotTable's first row subheading.
firstSubtotalColumn (First Subtotal Column Style)	Table style element that applies to PivotTable's first subtotal column.
firstSubtotalRow (First Subtotal Row Style)	Table style element that applies to pivot table's first subtotal row.
firstTotalCell (First Total Row Style)	Table style element that applies to table's first total row cell.

Enumeration Value	Description
headerRow (Header Row Style)	Table style element that applies to table's header row.
lastColumn (Last Column Style)	Table style element that applies to table's last column.
lastHeaderCell (Last Header Style)	Table style element that applies to table's last header row cell.
lastTotalCell (Last Total Row Style)	Table style element that applies to table's last total row cell.
pageFieldLabels (Page Field Labels Style)	Table style element that applies to pivot table's page field labels.
pageFieldValues (Page Field Values Style)	Table style element that applies to pivot table's page field values.
secondColumnStripe (Second Column Stipe Style)	Table style element that applies to table's second column stripes.
secondColumnSubheading (Second Column Subheading Style)	Table style element that applies to pivot table's second column subheading.
secondRowStripe (Second Row Stripe Style)	Table style element that applies to table's second row stripes.
secondRowSubheading (Second Row Subheading Style)	Table style element that applies to pivot table's second row subheading.
secondSubtotalColumn (Second Subtotal Column Style)	Table style element that applies to PivotTable's second subtotal column.
secondSubtotalRow (Second Subtotal Row Style)	Table style element that applies to PivotTable's second subtotal row.
thirdColumnSubheading (Third Column Subheading Style)	Table style element that applies to PivotTable's third column subheading.
thirdRowSubheading (Third Row Subheading Style)	Table style element that applies to PivotTable's third row subheading.
thirdSubtotalColumn (Third Subtotal Column Style)	Table style element that applies to pivot table's third subtotal column.
thirdSubtotalRow (Third Subtotal Row Style)	Table style element that applies to PivotTable's third subtotal row.
totalRow (Total Row Style)	Table style element that applies to table's total row.
wholeTable (Whole Table Style)	Table style element that applies to table's entire content.

[Note: The W3C XML Schema definition of this simple type's content model ([ST TableStyleType](#)) is located in §A.2. *end note*]

18.18.78 ST_TableType (Table Type)

An enumeration that specifies what the table data is based on.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
queryTable (Query Table)	A table based on an external data query.
worksheet (Worksheet)	A table based on a worksheet data range.
xml (XML)	A table based on an XML mapping.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TableType](#)) is located in §A.2. *end note*]

18.18.79 ST_TargetScreenSize (Target Screen Size Types)

This simple type defines the collection of screen resolutions that are supported for this workbook.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1024x768 (1024 x 768 Resolution)	Sets the target screen resolution to 1024x768 pixels.
1152x882 (1152 x 882 Resolution)	Sets the target screen resolution to 1152x882 pixels.
1152x900 (1152 x 900 Resolution)	Sets the target screen resolution to 1152x900 pixels
1280x1024 (1280 x 1024 Resolution)	Sets the target screen resolution to 1280x1024 pixels.
1600x1200 (1600 x 1200 Resolution)	Sets the target screen resolution to 1600x1200 pixels.
1800x1440 (1800 x 1440 Resolution)	Sets the target screen resolution to 1800x1440 pixels.
1920x1200 (1920 x 1200 Resolution)	Sets the target screen resolution to 1920x1200 pixels.
544x376 (544 x 376 Resolution)	Sets the target screen resolution to 544x376 pixels.
640x480 (640 x 480 Resolution)	Sets the target screen resolution to 640x480 pixels.
720x512 (720 x 512 Resolution)	Sets the target screen resolution to 720x512 pixels.
800x600 (800 x 600 Resolution)	Sets the target screen resolution to 800x600 pixels.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TargetScreenSize](#)) is located in §A.2. *end note*]

18.18.80 ST_TextHAlign (Comment Text Horizontal Alignment)

This simple type specifies the horizontal alignment of the text within a comment text field.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center Alignment)	Specifies that the text is centered horizontally.
distributed (Distributed Alignment)	Specifies that the text is distributed horizontally.
justify (Justify Alignment)	Specifies that the text is justified horizontally.
left (Left Alignment)	Specifies that the text is left-aligned.
right (Right Alignment)	Specifies that the text is right-aligned.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextHAlign](#)) is located in §A.2.
end note]

18.18.81 ST_TextVAlign (Comment Text Vertical Alignment)

This simple type specifies the vertical alignment of the text within a comment text field.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottom (Bottom Alignment)	Specifies that the text is bottom-aligned.
center (Center Alignment)	Specifies that the text is centered vertically.
distributed (Distributed Alignment)	Specifies that the text is distributed vertically.
justify (Justify Alignment)	Specifies that the text is justified vertically.
top (Top Alignment)	Specifies that the text is top-aligned.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextVAlign](#)) is located in §A.2.
end note]

18.18.82 ST_TimePeriod (Time Period Types)

Used in a "contains dates" conditional formatting rule. These are dynamic time periods, which change based on the date the conditional formatting is refreshed / applied.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
last7Days (Last 7 Days)	A date in the last seven days.
lastMonth (Last Month)	A date occurring in the last calendar month.

Enumeration Value	Description
lastWeek (Last Week)	A date occurring last week.
nextMonth (Next Month)	A date occurring in the next calendar month.
nextWeek (Next Week)	A date occurring next week.
thisMonth (This Month)	A date occurring in this calendar month.
thisWeek (This Week)	A date occurring this week.
today (Today)	Today's date.
tomorrow (Tomorrow)	Tomorrow's date.
yesterday (Yesterday)	Yesterday's date.

[Note: The W3C XML Schema definition of this simple type's content model ([ST TimePeriod](#)) is located in §A.2. *end note*]

18.18.83 ST_TotalsRowFunction (Totals Row Function Types)

An enumeration that specifies what function is used to aggregate the data in a column before it is displayed in the totals row.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
average (Average)	Represents the arithmetic mean.
count (Non Empty Cell Count)	Represents a count of the number of non-empty cells.
countNums (Count Numbers)	Represents the number of cells that contain numbers.
custom (Custom Formula)	Represents the formula provided in <code>totalsRowFormula</code> .
max (Maximum)	Represents the largest value.
min (Minimum)	Represents the smallest value.
none (None)	No total row.
stdDev (StdDev)	Represents the estimated standard deviation.
sum (Sum)	Represents the arithmetic sum.
var (Var)	Represents the estimated variance.

[Note: The W3C XML Schema definition of this simple type's content model ([ST TotalsRowFunction](#)) is located in §A.2. *end note*]

18.18.84 ST_Type (Top N Evaluation Type)

This simple type defines the values for the Top N conditional formatting evaluation for the PivotTable. For more information on Top N conditional formatting, see the Sheet (§18.3.1) reference material.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (All)	Indicates that Top N conditional formatting is evaluated across the entire scope range.
column (Column Top N)	Indicates that Top N conditional formatting is evaluated for each column.
none (Top N None)	Indicates that Top N conditional formatting is not evaluated
row (Row Top N)	Indicates that Top N conditional formatting is evaluated for each row.

[Note: The W3C XML Schema definition of this simple type's content model (ST_Type) is located in §A.2. *end note*]

18.18.85 ST_UnderlineValues (Underline Types)

Represents the different types of possible underline formatting.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
double (Double Underline)	Double-line underlining under each character in the cell. underlines are drawn through the descenders of characters such as g and p. 
doubleAccounting (Accounting Double Underline)	Double-line accounting underlining under each character in the cell. The underlines are drawn under the descenders of characters such as g and p. 
none (None)	No underline.
single (Single Underline)	Single-line underlining under each character in the cell. The underline is drawn through the descenders of characters such as g and p. 
singleAccounting (Accounting Single Underline)	Single-line accounting underlining under each

Enumeration Value	Description
	character in the cell. The underline is drawn under the descenders of characters such as g and p. 

[Note: The W3C XML Schema definition of this simple type's content model ([ST_UnderlineValues](#)) is located in §A.2. *end note*]

18.18.86 ST_UnsignedIntHex (Hex Unsigned Integer)

This simple type represents the Hex representation of an unsigned integer.

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 8 hexadecimal digit(s).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_UnsignedIntHex](#)) is located in §A.2. *end note*]

18.18.87 ST_UpdateLinks (Update Links Behavior Types)

This simple type defines when the application updates links to other workbooks when the workbook is opened.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Always Update Links)	Indicates that links to other workbooks are always updated when the workbook is opened. The application will not display an alert in the user interface (UI).
never (Never Update Links)	Indicates that links to other workbooks are never updated when the workbook is opened. The application will not display an alert in the user interface.
userSet (User Set)	Indicates that the end-user specified whether they receive an alert to update links to other workbooks when the workbook is opened. [Example: The application can expose this option in an application settings dialog. <i>end example</i>]

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_UpdateLinks](#)) is located in §A.2.
end note]

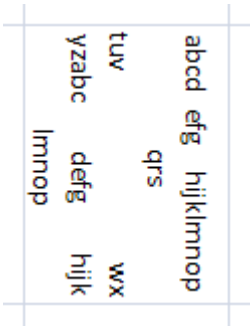

18.18.88 ST_VerticalAlignment (Vertical Alignment Types)

This enumeration value indicates the type of vertical alignment for a cell, i.e., whether it is aligned top, bottom, vertically centered, justified or distributed.

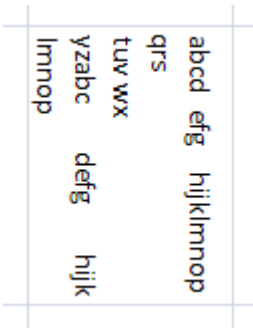

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottom (Aligned To Bottom)	The vertical alignment is aligned-to-bottom.
center (Centered Vertical Alignment)	The vertical alignment is centered across the height of the cell.
distributed (Distributed Vertical Alignment)	<p>When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top and bottom margins.</p> <p>When text direction is vertical: behaves exactly as distributed horizontal alignment. The first words in a line of text (appearing at the top of the cell) are flush with the top edge of the cell, and the last words of a line of text are flush with the bottom edge of the cell, and the line of text is distributed evenly from top to bottom.</p> <p>[<i>Example</i>: Horizontal text: this first example shows four lines of text (read horizontally from left to right) distributed vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".</p>

Enumeration Value	Description
	<div></div> <p>Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are:</p> <p>abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop</p> <p>The rendering looks like this:</p> <div></div> <p><i>end example]</i></p>
justify (Justified Vertically)	<p>When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top</p>

Enumeration Value	Description																		
	<p>and bottom margins.</p> <p>When text direction is vertical: similar behavior as horizontal justification. The alignment is justified (flush top and bottom in this case). For each line of text, each line of the wrapped text in a cell is aligned to the top and bottom (except the last line). If no single line of text wraps in the cell, then the text is not justified.</p> <p>[<i>Example:</i> Horizontal text: this first example shows four lines of text (read horizontally from left to right) justified vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td></td><td></td><td>abc</td></tr><tr><td></td><td></td><td>def</td></tr><tr><td></td><td></td><td>ghi</td></tr><tr><td>2</td><td></td><td>jkl</td></tr></table> <p>Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are:</p> <p>abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop</p> <p>The rendering looks like this:</p>		A	B	1					abc			def			ghi	2		jkl
	A	B																	
1																			
		abc																	
		def																	
		ghi																	
2		jkl																	

Enumeration Value	Description
	 <p><i>end example]</i></p>
top (Align Top)	The vertical alignment is aligned-to-top.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_VerticalAlignment](#)) is located in §A.2. *end note*]

18.18.89 ST_Visibility (Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hidden (Hidden)	Indicates the workbook window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the workbook window is visible.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Visibility](#)) is located in §A.2. *end note*]

18.18.90 ST_VolDepType (Volatile Dependency Types)

This simple type defines the dependency types available for this workbook.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
olapFunctions (OLAP Formulas)	Indicates that the type is Cube Functions.
realTimeData (Real Time Data)	Indicates that the type is Real Time Data (RTD).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_VolDepType](#)) is located in §A.2.
end note]

18.18.91 ST_VolValueType (Volatile Dependency Value Types)

This simple type defines the data type of the values in the dependency cache.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Boolean)	Indicates topic value is a boolean.
e (Error)	Indicates topic value is an error.
n (Real Number)	Indicates topic value is a real number.
s (String)	Indicates topic value is a string.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_VolValueType](#)) is located in §A.2.
end note]

18.18.92 ST_WebSourceType (Web Source Type)

This is an enumeration of types of objects which can be selected from the workbook to be published as HTML. For example, the entire sheet can be published, or a narrower set of objects on the sheet can be published, like a chart or a range.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
autoFilter (AutoFilter)	Auto filter
chart (Chart)	Chart
label (Label)	Label
pivotTable (PivotTable)	PivotTable
printArea (Print Area)	Print area
query (QueryTable)	Query Table

Enumeration Value	Description
range (Range)	Range of cells
sheet (All Sheet Content)	All content of a sheet

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_WebSourceType](#)) is located in §A.2. *end note*]

18.18.93 ST_XmlDataType (XML Data Types)

Represents a W3C XML built-in datatype name (<http://www.w3.org/TR/xmlschema-2/>). The values permitted by this type are the names of the simple datatypes defined by the XMLSchema Library, <http://www.w3.org/2001/XML-Schema-datatypes>.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

Note: The W3C XML Schema definition of this simple type's content model ([ST_XmlDataType](#)) is located in §A.2. *end note*]

18.18.94 ST_FontFamily (Font Family)

This simple type specifies a font family. A font family is a set of fonts having common stroke width and serif characteristics. This is system-level font information.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type is restricted to the values listed in the following table:

Value	Font Family
0	Not applicable.
1	Roman
2	Swiss
3	Modern
4	Script
5	Decorative
6	Reserved for future use
7	Reserved for future use
8	Reserved for future use
9	Reserved for future use
10	Reserved for future use
11	Reserved for future use
12	Reserved for future use
13	Reserved for future use

Value	Font Family
14	Reserved for future use

[*Note*: The W3C XML Schema definition of this simple type’s content model (ST_FontFamily) is located in §A.2.
end note]

19. PresentationML Reference Material

[Note: For further information on the mapping of elements and attributes to OPC parts, see the Bibliography entry, “Information on elements, attributes, and OPC parts in ECMA-376 (OOXML)”. *end note*]

The subordinate subclauses specify the semantics for the XML markup comprising a PresentationML document, as defined by §13 of this Part of ECMA-376.

19.1 Table of Contents

This subclause is informative.

19.7.52	ST_TransitionInOutDirectionType (Transition In/Out Direction Type)	2706
19.7.53	ST_TransitionSideDirectionType (Transition Side Direction Type).....	2707
19.7.54	ST_TransitionSpeed (Transition Speed).....	2707
19.7.55	ST_ViewType (List of View Types)	2708

End of informative text.

19.2 Presentation

The Presentation portion of the PresentationML framework houses a set of elements that describe the storing of presentation-wide and view-specific properties. The presentation-wide properties are those that pertain to the entire presentation. The view-specific properties assist the generating application and viewing application by storing parameters that pertain to the final delivery of the presentation.

19.2.1 Presentation Properties

This section contains all presentation-level properties that pertain to a presentation document:

19.2.1.1 bold (Bold Embedded Font)

This element specifies a bold embedded font that is linked to a parent typeface. Once specified, this bold version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example:* Consider the following embedded font with a bold version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:bold r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note*]

19.2.1.2 **boldItalic (Bold Italic Embedded Font)**

This element specifies a bold italic embedded font that is linked to a parent typeface. Once specified, this bold italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a bold italic version specified.

```
<p:embeddedFont>  
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>  
  <p:boldItalic r:id="rId2"/>  
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note*]

19.2.1.3 browse (Browse Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a single window or browse mode, instead of full screen.

[*Example:* Consider the following presentation that is to be viewed in a browse mode.

```
<p:presentationPr xmlns:a="..." xmlns:r="..." xmlns:p="...">
  <p:showPr>
    ...
    <p:browse showScrollbar="0"/>
    ...
  </p:showPr>
</p:presentationPr>
```

end example]

Attributes	Description
showScrollbar (Show Scroll Bar in Window)	Specifies whether to show the scroll bar in the viewing window. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ShowInfoBrowse](#)) is located in §A.3. *end note*]

19.2.1.4 clrMru (Color MRU)

This specifies the most recently used user-selected colors within the presentation. This list contains custom user-selected colors outside the presentation's theme colors, enabling the application to expose these additional color choices for easy reuse. The first item in the list is the most recently used color.

[*Example:* Consider the following presentation with two user-selected colors in the color MRU list.

```
<p:presentationPr xmlns:a="..." xmlns:r="..." xmlns:p="...">
  ...
  <p:clrMru>
    <a:srgbClr val="5361EB"/>
    <a:srgbClr val="CCECFF"/>
  </p:clrMru>
  ...
</p:presentationPr>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorMRU](#)) is located in §A.4.1. *end note]*

19.2.1.5 `custShow` (Custom Show)

This element specifies a custom show which is an ordered list of a group of slides that are contained within the presentation. The custom show element allows for the specification of a presentation order that is different from the order in which the slides themselves are stored.

[*Example:* Consider the following custom show list that outlines a couple custom shows for a given set of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
  <p:custShow name="Custom Show 2" id="1">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>
```

In the above example there are two custom shows specified. The first specifies to present the slides in the order of 4, 3, 2 then 5 while the second specifies to play only slide 4 then 5. *end example]*

Attributes	Description
id (Custom Show Identifier)	<p>This attribute specifies the custom show identification number. This is a number given that should be unique within the presentation document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomShowId](#)) is located in §A.3. *end note]*

19.2.1.6 `custShow` (Custom Show)

This element specifies a custom show that defines a specific slide sequence that the slides are displayed in. This allows for many variants of the same set of slides to be presented.

[*Example:* Consider the following custom show using three slides.

```
<p:custShow name="Custom Show 1" id="0">
  <p:sldLst>
    <p:sld r:id="rId5"/>
    <p:sld r:id="rId2"/>
    <p:sld r:id="rId4"/>
  </p:sldLst>
</p:custShow>
```

Notice here that the custom show specifies a show, or presentation, where slide 5 is shown first, then slide 2 and finally slide 4. *end example*

Attributes	Description
id (Custom Show ID)	Specifies the identification number for this custom show. This should be unique among all the custom shows within the corresponding presentation. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Custom Show Name)	Specifies a name for the custom show. The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomShow](#)) is located in §A.3. *end note*]

19.2.1.7 `custShowLst` (List of Custom Shows)

This element specifies a list of all custom shows that are available within the corresponding presentation. A custom show is a defined slide sequence that allows for the displaying of the slides with the presentation in any arbitrary order.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomShowList](#)) is located in §A.3. *end note*]

19.2.1.8 `defaultTextStyle` (Presentation Default Text Style)

This element specifies the default text styles that are to be used within the presentation. The text style defined here can be referenced when inserting a new slide if that slide is not associated with a master slide or if no styling information has been otherwise specified for the text within the presentation slide.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. *end note*]

19.2.1.9 [embeddedFont \(Embedded Font\)](#)

This element specifies an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example*: Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontListEntry](#)) is located in §A.3. *end note*]

19.2.1.10 [embeddedFontLst \(Embedded Font List\)](#)

This element specifies a list of fonts that are embedded within the corresponding presentation. The font data for these fonts is stored alongside the other document parts within the document container. The actual font data is referenced within the `embeddedFont` element.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontList](#)) is located in §A.3. *end note*]

19.2.1.11 [ext \(Extension\)](#)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements for later versions of generating applications.

[*Note*: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Attributes	Description
uri (Uniform Resource Identifier)	This attribute specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Extension](#)) is located in §A.3. *end note*]

19.2.1.12 [extLst \(Extension List\)](#)

This element specifies the extension list within which all future extensions of element type `ext` are defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new kinds of data to be stored natively within the framework.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExtensionList](#)) is located in §A.3. *end note*]

19.2.1.13 [font \(Embedded Font Name\)](#)

This element specifies specific properties describing an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example:* Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

Font Substitution Logic:

If the specified font is not available on a system being used for rendering, then the attributes of this element are to be utilized in selecting an alternate font.

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Attributes	Description
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/drawingml/main	not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font. The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).

[Note: The W3C XML Schema definition of this element's content model ([CT_TextFont](#)) is located in §A.4.1. *end note*]

19.2.1.14 [handoutMasterId](#) (Handout Master ID)

This element specifies a handout master that is available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[Example: Consider the following specification of a handout master within a presentation

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
...
  <p:handoutMasterIdLst>
    <p:handoutMasterId r:id="rId8"/>
  </p:handoutMasterIdLst>
...
</p:presentation>
```

end example]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the handoutMaster element defining this handout master. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_HandoutMasterIdListEntry](#)) is located in §A.3. *end note*]

19.2.1.15 [handoutMasterIdLst](#) (List of Handout Master IDs)

This element specifies a list of identification information for the handout master slides that are available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_HandoutMasterIdList](#)) is located in §A.3. *end note*]

19.2.1.16 *italic* (Italic Embedded Font)

This element specifies an italic embedded font that is linked to a parent typeface. Once specified, this italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example:* Consider the following embedded font with a italic version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:italic r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note*]

19.2.1.17 *kinsoku* (Kinsoku Settings)

This element specifies the presentation-wide kinsoku settings that define the line breaking behaviour of East Asian text within the corresponding presentation.

Attributes	Description
invalEndChars (Invalid Kinsoku End Characters)	Specifies the characters that cannot end a line of text. The possible values for this attribute are defined by the W3C XML Schema string datatype.
invalStChars	Specifies the characters that cannot start a line of text.

Attributes	Description
(Invalid Kinsoku Start Characters)	The possible values for this attribute are defined by the W3C XML Schema string datatype.
lang (Language)	Specifies the corresponding East Asian language that these settings apply to. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Kinsoku](#)) is located in §A.3. *end note*]

19.2.1.18 kiosk (Kiosk Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen kiosk mode. A presentation viewed in kiosk mode should have user input disabled and restarts after a specified interval.

[*Example:* Consider the following presentation that is set to be viewed in a looping kiosk mode.

```
<p:presentationPr xmlns:a="..." xmlns:r="..." xmlns:p="...">
  <p:showPr loop="1" showNarration="1">
    ...
  <p:kiosk/>
  ...
</p:showPr>
</p:presentationPr>
```

end example]

Attributes	Description
restart (Restart Show)	Specifies the time length that the presentation should run until it is to be restarted. That is, the presentation should loop back to the first slide specified in the presentation or custom show. This value is specified in 1/1000ths of a second and measured from the most recent time the presentation started or restarted. [<i>Note:</i> The counter is reset when a presentation is restarted due to automatic looping at the end of a show, if specified by the loop attribute of showPr. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ShowInfoKiosk](#)) is located in §A.3. *end note*]

19.2.1.19 `modifyVerifier` (Modification Verifier)

This element specifies the write protection settings which have been applied to a PresentationML document. *Write protection* refers to a mode in which the document's contents should not be modified, and the document should not be resaved using the same file name.

When present, the application shall require a password to enable modifications to the document. If the supplied password does not match the hash value in this attribute, then write protection shall be enabled. If this element is omitted, then no write protection shall be applied to the current document. Since this protection does not encrypt the document, malicious applications might circumvent its use.

The password supplied to the algorithm is to be a UTF-16LE encoded string; strings longer than 510 octets are truncated to 510 octets. If there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation. The attributes of this element specify the algorithm to be used to verify the password provided by the user.

[*Example:* Consider a PresentationML document that can only be opened in a write protected state unless a password is provided, in which case the file would be opened in an editable state. This requirement would be specified using the following PresentationML:

```
<p:modifyVerifier p:algorithmName="SHA-512" ...  
p:hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" ... />
```

...In order for the hosting application to enable edits to the document, the hosting application would have to be provided with a password that the hosting application would then hash using the algorithm specified by the algorithm attributes and compare to the value of the hashValue attribute (9oN7nWkCAyEZib1RomSJTjmPpCY=). If the two values matched, the file would be opened in an editable state. *end example*]

Attributes	Description						
algorithmName (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value.</p> <p>The following values are reserved:</p> <table> <tr> <th>Value</th><th>Algorithm</th></tr> <tr> <td>MD2</td><td> <p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note:</i> It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>MD4</td><td> <p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note:</i> It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known</p> </td></tr> </table>	Value	Algorithm	MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note:</i> It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note:</i> It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known</p>
Value	Algorithm						
MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note:</i> It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>						
MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note:</i> It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known</p>						

Attributes	Description
	breaks. <i>end note</i>]
	MD5 Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>
	RIPEMD-128 Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>
	RIPEMD-160 Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-1 Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-256 Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-384 Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-512 Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	WHIRLPOOL Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	<p><i>[Example: Consider an Office Open XML document with the following information stored in one of its protection elements:</i></p> <pre>< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
hashValue (Password Hash Value)	Specifies the hash value for the password required to edit this chartsheet. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.

Attributes	Description
	<p>If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
saltValue (Salt Value for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The saltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
spinValue (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute.</p>

Attributes	Description
	<p>[<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ModifyVerifier](#)) is located in §A.3. *end note*]

19.2.1.20 notesMasterId (Notes Master ID)

This element specifies a notes master that is available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

[*Example*: Consider the following specification of a notes master within a presentation

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
...
<p:notesMasterIdLst>
  <p:notesMasterId r:id="rId8"/>
</p:notesMasterIdLst>
...
</p:presentation>
```

end example]

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the notesMaster element defining this notes master.
Namespace: http://purl.oclc.org	The possible values for this attribute are defined by the ST_RelationshipId simple type

Attributes	Description
g/ooxml/officeDocument/relationships	(§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NotesMasterIdListEntry](#)) is located in §A.3. *end note*]

19.2.1.21 notesMasterIdLst (List of Notes Master IDs)

This element specifies a list of identification information for the notes master slides that are available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NotesMasterIdList](#)) is located in §A.3. *end note*]

19.2.1.22 notesSz (Notes Slide Size)

This element specifies the size of slide surface used for notes slides and handout slides. Objects within a notes slide can be specified outside these extents, but the notes slide has a background surface of the specified size when presented or printed. This element is intended to specify the region to which content is fitted in any special format of printout the application might choose to generate, such as an outline handout.

[*Example*: Consider the following specifying of the size of a notes slide.

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
...
<p:notesSz cx="9144000" cy="6858000"/>
...
</p:presentation>
```

end example]

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple</p>

Attributes	Description
	type (§20.1.10.41).
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

19.2.1.23 penClr (Pen Color for Slide Show)

This element specifies the pen color that should be used to make markings on the slides while in a presentation.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.2.1.24 photoAlbum (Photo Album Information)

This element specifies that the corresponding presentation contains a photo album. A photo album specifies a list of images within the presentation that spread across one or more slides, all of which share a consistent layout. Each image in the album is formatted with a consistent style. This functionality enables the application to manage all of the images together and modify their ordering, layout, and formatting as a set.

This element does not enforce the specified properties on individual photo album images; rather, it specifies common settings that should be applied by default to all photo album images and their containing slides. Images that are part of the photo album are identified by the presence of the isPhoto element in the definition of the picture.

[*Example*: Consider the following presentation that has been specified as a photo album

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
...
<p:photoAlbum bw="1" layout="2pic"/>
...
</p:presentation>
```

end example]

Attributes	Description
bw (Black and White)	Specifies whether all pictures in the photo album are to be displayed as black and white. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
frame (Frame Type)	Specifies the frame type that is to be used on all the pictures in the photo album. The possible values for this attribute are defined by the ST_PhotoAlbumFrameShape simple type (§19.7.7).
layout (Photo Album Layout)	Specifies the layout that is to be used to arrange the pictures in the photo album on individual slides. The possible values for this attribute are defined by the ST_PhotoAlbumLayout simple type (§19.7.8).
showCaptions (Show/Hide Captions)	Specifies whether to show captions for pictures in the photo album. Captions are text boxes grouped with each image, with the group set to not allow ungrouping. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PhotoAlbum](#)) is located in §A.3. *end note*]

19.2.1.25 **present** (Presenter Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen presenter mode. In this mode, the presentation is displayed on one monitor while a different monitor displays notes and provides navigation controls intended to be viewed only by the presenter.

[Example: Consider the following presentation that is set to be viewed in a present mode.

```
<p:presentationPr xmlns:a="..." xmlns:r="..." xmlns:p="...">
  <p:showPr>
    ...
    <p:present/>
    ...
  </p:showPr>
</p:presentationPr>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.2.1.26 **presentation** (Presentation)

This element specifies within it fundamental presentation-wide properties.

[*Example:* Consider the following presentation with a single slide master and two slides. In addition to these commonly used elements there can also be the specification of other properties such as slide size, notes size and default text styles.

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="...">
  <p:sldMasterIdLst>
    <p:sldMasterId id="2147483648" r:id="rId1"/>
  </p:sldMasterIdLst>
  <p:sldIdLst>
    <p:sldId id="256" r:id="rId3"/>
    <p:sldId id="257" r:id="rId4"/>
  </p:sldIdLst>
  <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
  <p:notesSz cx="6858000" cy="9144000"/>
  <p:defaultTextStyle>
    ...
  </p:defaultTextStyle>
</p:presentation>
```

end example]

Attributes	Description
autoCompressPictures (Automatically Compress Pictures)	<p>Specifies whether the generating application should automatically compress all pictures for this presentation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bookmarkIdSeed (Bookmark ID Seed)	<p>Specifies a seed for generating bookmark IDs to ensure IDs remain unique across the document. This value specifies the number to be used as the ID for the next new bookmark created.</p> <p>The possible values for this attribute are defined by the ST_BookmarkIdSeed simple type (§19.7.1).</p>
compatMode (Compatibility Mode)	<p>Specifies whether the generating application is to be in a compatibility mode which serves to inform the user of any loss of content or functionality when working with older formats.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
conformance (Document Conformance Class)	<p>Specifies the conformance class (§2.1) to which the PresentationML document conforms.</p> <p>If this attribute is omitted, its default value is <code>transitional</code>.</p> <p>[<i>Example:</i> Consider the following PresentationML Presentation part markup:</p>

Attributes	Description
	<p><p:presentation conformance="strict"> ... </p:presentation></p> <p>This document has a conformance attribute value of <code>strict</code>, therefore it conforms to the PML Strict conformance class. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_ConformanceClass</code> simple type (§22.9.2.2).</p>
embedTrueTypeFonts (Embed True Type Fonts)	<p>Specifies whether the generating application should automatically embed true type fonts or not.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
firstSlideNum (First Slide Number)	<p>Specifies the first slide number in the presentation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>int</code> datatype.</p>
removePersonalInfoOnSave (Remove Personal Information on Save)	<p>Specifies whether to automatically remove personal information when the presentation document is saved.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rtl (Right-To-Left Views)	<p>Specifies if the current view of the user interface is oriented right-to-left or left-to-right. The view is right-to-left if this value is set to <code>true</code>, and left-to-right otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saveSubsetFonts (Save Subset Fonts)	<p>Specifies to save only the subset of characters used in the presentation when a font is embedded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
serverZoom (Server Zoom)	<p>Specifies the scaling to be used when the presentation is embedded in another document. The embedded slides are to be scaled by this percentage.</p> <p>The possible values for this attribute are defined by the <code>ST_Percentage</code> simple type (§20.1.10.40).</p>
showSpecialPlsOnTitleSld (Show Header and Footer Placeholders on Titles)	<p>Specifies whether to show the header and footer placeholders on the title slides.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
strictFirstAndLastC	<p>Specifies whether to use strict characters for starting and ending lines of Japanese text.</p>

Attributes	Description
hars (Strict First and Last Characters)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT Presentation](#)) is located in §A.3. *end note*]

19.2.1.27 presentationPr (Presentation-wide Properties)

This element functions as a parent element within which additional presentation-wide document properties are contained. All properties and their corresponding settings are defined within the child elements.

[Note: The W3C XML Schema definition of this element's content model ([CT PresentationProperties](#)) is located in §A.3. *end note*]

19.2.1.28 prnPr (Printing Properties)

This element specifies the default printing properties associated with this presentation document.

Attributes	Description
clrMode (Print Color Mode)	Specifies the color mode to be used when printing. The possible values for this attribute are defined by the ST_PrintColorMode simple type (§19.7.11).
frameSlides (Frame slides when printing)	Specifies whether slides should be framed when printing. When framed, an outline border is printed for each slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
hiddenSlides (Print Hidden Slides)	Specifies whether hidden slides should be printed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
prnWhat (Print Output)	Specifies what the default print output is in terms of content layout. The possible values for this attribute are defined by the ST_PrintWhat simple type (§19.7.12).
scaleToFitPaper (Scale to Fit Paper when printing)	Specifies whether the print output should be scaled to fit the paper being used. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PrintProperties](#)) is located in §A.3. *end note*]

19.2.1.29 regular (Regular Embedded Font)

This element specifies a regular embedded font that is linked to a parent typeface. Once specified, this regular version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example:* Consider the following embedded font with a regular version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note*]

19.2.1.30 showPr (Presentation-wide Show Properties)

This element functions as a parent element within which all presentation-wide show properties are contained. All properties and their corresponding settings are defined within the child elements.

Attributes	Description
loop (Loop Slide Show)	Specifies whether the slide show should be set to loop at the end. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showAnimation	Specifies whether slide show animation should be shown when presenting.

Attributes	Description
(Show Animation in Slide Show)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showNarration (Show Narration in Slide Show)	Specifies whether slide show narration should be played when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
useTimings (Use Timings in Slide Show)	Specifies whether slide transition timings should be used to advance slides when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_ShowProperties](#)) is located in §A.3. end note]

19.2.1.31 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[Example: Consider the following custom show with an ordering of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. end example]

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This attribute specifies the relationship id that is used to reference to the actual slide XML file that contains all the information to the slide listed within the slide list. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideRelationshipListEntry](#)) is located in §A.3. *end note*]

19.2.1.32 sldAll (All Slides)

This attribute specifies all slides instead of a given range of slides for use within the html publishing properties as well as the show properties.

[Note: The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.2.1.33 sldId (Slide ID)

This element specifies a presentation slide that is available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[Example: Consider the following specification of a slide master within a presentation]

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
..
<p:sldIdLst>
  <p:sldId id="256" r:id="rId3"/>
  <p:sldId id="257" r:id="rId4"/>
  <p:sldId id="258" r:id="rId5"/>
  <p:sldId id="259" r:id="rId6"/>
  <p:sldId id="260" r:id="rId7"/>
</p:sldIdLst>
..
</p:presentation>
```

end example]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sld element defining this slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
id (Slide Identifier)	Specifies the slide identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideId simple type (§19.7.13).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SlideIdListEntry](#)) is located in §A.3. *end note*]

19.2.1.34 **sldIdLst (List of Slide IDs)**

This element specifies a list of identification information for the slides that are available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SlideIdList](#)) is located in §A.3. *end note*]

19.2.1.35 **sldLst (List of Presentation Slides)**

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SlideRelationshipList](#)) is located in §A.3. *end note*]

19.2.1.36 **sldMasterId (Slide Master ID)**

This element specifies a slide master that is available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

[*Example*: Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
...
  <p:sldMasterIdLst>
    <p:sldMasterId id="2147483648" r:id="rId1"/>
  </p:sldMasterIdLst>
...
</p:presentation>
```

end example]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sldMaster element defining this slide master. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
id (Slide Master Identifier)	Specifies the slide master identifier that is to contain a value that is unique throughout the presentation.

Attributes	Description
	The possible values for this attribute are defined by the ST_SlideMasterId simple type (§19.7.16).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideMasterIdListEntry](#)) is located in §A.3. *end note*]

19.2.1.37 sldMasterIdLst (List of Slide Master IDs)

This element specifies a list of identification information for the slide master slides that are available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideMasterIdList](#)) is located in §A.3. *end note*]

19.2.1.38 sldRg (Slide Range)

This element specifies a slide range for use within the html publishing properties as well as the show properties.

[*Note:* The indexes used here correlate directly with the presentation slide numbers which they reference to. That is the slide range must be greater than or equal to 1 and also less than or equal to the number of slides in the presentation document. *end note*]

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_IndexRange](#)) is located in §A.3. *end note*]

19.2.1.39 sldSz (Presentation Slide Size)

This element specifies the size of the presentation slide surface. Objects within a presentation slide can be specified outside these extents, but this is the size of background surface that is shown when the slide is presented or printed..

[*Example:* Consider the following specifying of the size of a presentation slide.

```
<p:presentation xmlns:a="..." xmlns:r="..." xmlns:p="..." embedTrueTypeFonts="1">
```

```
...  
<p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>  
...  
</p:presentation>
```

end example]

Attributes	Description
cx (Extent Length)	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§19.7.17).</p>
cy (Extent Width)	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§19.7.17).</p>
type (Type of Size)	<p>Specifies the kind of slide size that should be used. This identifies in particular the expected delivery platform for this presentation.</p> <p>The possible values for this attribute are defined by the ST_SlideSizeType simple type (§19.7.18).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SlideSize](#)) is located in §A.3. *end note]*

19.2.1.40 smartTags (Smart Tags)

This element specifies that references to smart tags exist within this document. [*Note: For a complete definition of smart tags, which are semantically identical throughout Office Open XML, see §17.5.1. end note*] To denote the location of smart tags on individual runs of text, there smart tag identifier attributes are specified for each run to which a smart tag applies. These are further specified in the run property attributes within DrawingML.

[*Example: Consider the following PresentationML markup:*

```
<p:presentation>
...
<p:smartTags r:id="rId1"/>
</p:presentation>
```

The presence of the smartTags element specifies that there is smart tag information within the PresentationML package. Individual runs are then inspected for the value of the smtId attribute to determine where smart tags might apply, for example:

```
<p:txBody>
  <a:bodyPr/>
  <a:lstStyle/>
  <a:p>
    <a:r>
      <a:rPr lang="en-US" dirty="0" smtId="1"/>
      <a:t>CNTS</a:t>
    </a:r>
    <a:endParaRPr lang="en-US" dirty="0"/>
  </a:p>
</p:txBody>
```

In the sample above there is a smart tag identifier of 1 specified for this run of text to denote that the text should be inspected for smart tag information. *end example*]

Attributes	Description
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this smart tag. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note: The W3C XML Schema definition of this element's content model ([CT_SmartTags](#)) is located in §A.3. end note*]

19.2.2 View Properties

This section contains all properties that pertain to the viewing of the presentation.

19.2.2.1 cSldViewPr (Common Slide View Properties)

This element functions as a container for slide view properties that are common across multiple view property elements. The specific properties and associated values for these view properties reside within the child elements and attributes.

Attributes	Description
showGuides (Show Guides in View)	Specifies whether to show guides when editing the presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
snapToGrid (Snap Objects to Grid)	Specifies whether objects should snap to underlying presentation grid when editing. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
snapToObjects (Snap Objects to Objects)	Specifies whether objects should snap to other objects when editing the presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CommonSlideViewProperties](#)) is located in §A.3. *end note*]

19.2.2.2 cViewPr (Common View Properties)

This element specifies the view properties that are common across multiple view property elements.

Attributes	Description
varScale (Variable Scale)	Specifies that the view content should automatically scale to best fit the current window size. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CommonViewProperties](#)) is located in §A.3. *end note*]

19.2.2.3 gridSpacing (Grid Spacing)

This element specifies the grid spacing that should be used for the grid underlying the presentation document. The grid can be used to align objects on the slide and to display visual positioning cues.

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

19.2.2.4 [guide \(A Guide\)](#)

This element specifies a guide within the presentation. Guides are lines used for arranging layouts and content and never appear except as an aid in editing slides.

Attributes	Description
orient (Guide Orientation)	<p>Specifies the orientation for a guide.</p> <p>The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).</p>
pos (Guide Position)	<p>Specifies the position information for a guide.</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Guide](#)) is located in §A.3. *end note*]

19.2.2.5 [guideLst \(List of Guides\)](#)

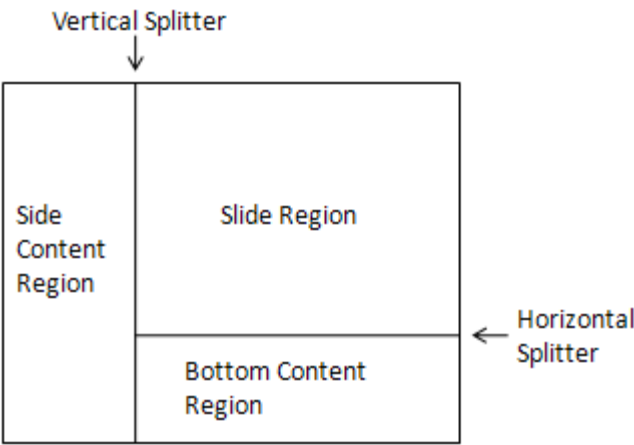

This element specifies a list of guides for a particular view of the presentation.

[Note: The W3C XML Schema definition of this element’s content model ([CT_GuideList](#)) is located in §A.3. *end note*]

19.2.2.6 [normalViewPr \(Normal View Properties\)](#)

This element specifies the view properties associated with the normal view mode. The normal view consists of three content regions: the slide itself, a side content region, and a bottom content region. The content of the side content region and bottom content region is determined by the generating application. Properties pertaining to the positioning of the different content regions are stored in this element. This information allows the application to save its view state to the file, so that when reopened the view is in the same state as when the presentation was last saved.

A vertical splitter bar separates the slide from the side content region. A horizontal splitter bar separates the slide from the content region below the slide. If the presentation is set to left-to-right, the side content region is to the left of the slide. If the presentation is set to right-to-left, the side content region is to the right of the slide.

Attributes	Description
horzBarState (State of the Horizontal Splitter Bar)	Specifies the state that the horizontal splitter bar should be in when in normal view mode. The region to be maximized or minimized is the side content region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§19.7.19).
preferSingleView (Prefer Single View)	Specifies whether the user prefers to see a full-window single-content region over the standard normal view with three content regions. If enabled, the application can choose to display one of the content regions in the entire window.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showOutlineIcons (Show Outline Icons in Normal View)	Specifies whether the application should show icons if displaying outline content in any of the content regions of normal view mode. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
snapVertSplitter (Snap Vertical Splitter)	Specifies whether the vertical splitter should snap to a minimized state when the side region is sufficiently small. The specific parameters of this behaviour are left to the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
vertBarState (State of the Vertical Splitter Bar)	Specifies the state that the vertical splitter bar should be in when in normal view mode. The region to be maximized or minimized is the slide region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§19.7.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_NormalViewProperties](#)) is located in §A.3. *end note*]

19.2.2.7 [notesTextViewPr \(Notes Text View Properties\)](#)

This element functions as a parent element within which all properties associated with the notes text view are contained. All properties are defined within the child elements.

[Note: The W3C XML Schema definition of this element's content model ([CT_NotesTextViewProperties](#)) is located in §A.3. *end note*]

19.2.2.8 [notesViewPr \(Notes View Properties\)](#)

This element functions as a parent element within which all view properties associated with notes are contained. All properties are defined within the child elements.

[Note: The W3C XML Schema definition of this element's content model ([CT_NotesViewProperties](#)) is located in §A.3. *end note*]

19.2.2.9 [origin \(View Origin\)](#)

This element specifies the origin of the slide when it is being viewed with various scaling factors using the scale element.

Attributes	Description
x (X-Axis)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified

Attributes	Description
Coordinate)	by the parent XML element.
Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	<p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
y (Y-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.
Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	<p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

19.2.2.10 outlineViewPr (Outline View Properties)

This element functions as a parent element within which all view properties associated with the outline view mode are contained. All properties are defined within the child elements.

Outline view displays only the textual content of a presentation. The presentation is formatted as an outline, with slide titles as the first level of the outline. Body text on slides is indented below the slide title.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OutlineViewProperties](#)) is located in §A.3. *end note*]

19.2.2.11 restoredLeft (Normal View Restored Left Properties)

This element specifies the sizing of the side content region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

Attributes	Description
autoAdjust (Auto	Specifies whether the size of the side content region should compensate for the new size

Attributes	Description
Adjust Normal View)	when resizing the window containing the view within the application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[Note: The W3C XML Schema definition of this element's content model ([CT_NormalViewPortion](#)) is located in §A.3. *end note*]

19.2.2.12 [restoredTop \(Normal View Restored Top Properties\)](#)

This element specifies the sizing of the top slide region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[Note: The W3C XML Schema definition of this element's content model ([CT_NormalViewPortion](#)) is located in §A.3. *end note*]

19.2.2.13 [scale \(View Scale\)](#)

This element specifies the view scaling factors that the presentation was last viewed with.

[Note: The W3C XML Schema definition of this element's content model ([CT_Scale2D](#)) is located in §A.4.1. *end note*]

19.2.2.14 [sld \(Presentation Slide\)](#)

This element specifies a presentation slide and properties specific to the slide's appearance in outline view.

[Example: Consider the following presentation slide that has been collapsed in outline view.

```
<p:viewPr xmlns:a="..." xmlns:r="..." xmlns:p="..." lastView="outlineView">
...
<p:outlineViewPr>
...
<p:sldLst>
  <p:sld r:id="rId1" collapse="1"/>
</p:sldLst>
...
</p:outlineViewPr>
...
</p:viewPr>
```

end example]

Attributes	Description
collapse (Collapsed)	Specifies whether this presentation slide is to be shown as collapsed within outline view. That is, all text other than the slide title is not shown to the user. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this presentation slide within a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element’s content model ([CT_OutlineViewSlideEntry](#)) is located in §A.3. end note]

19.2.2.15 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[Note: The W3C XML Schema definition of this element’s content model ([CT_OutlineViewSlideList](#)) is located in §A.3. end note]

19.2.2.16 slideViewPr (Slide View Properties)

This element functions as a parent element within which all view properties associated with the slide view mode are contained. All properties are defined within the child elements.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideViewProperties](#)) is located in §A.3. *end note*]

19.2.2.17 [sorterViewPr \(Slide Sorter View Properties\)](#)

This element functions as a parent element within which all view properties associated with the slide sorter view mode are contained. All properties are defined within the child elements.

The slide sorter view displays thumbnails of multiple slides at once; the number of slides and size of thumbnails depends on the scaling factor of the view.

Attributes	Description
showFormatting (Show Formatting)	Specifies whether to show associated slide formatting when in slide sorter view mode. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideSorterViewProperties](#)) is located in §A.3. *end note*]

19.2.2.18 [viewPr \(Presentation-wide View Properties\)](#)

This element functions as a parent element within which all presentation-wide view properties are contained. All properties and their corresponding settings are defined within the child elements.

Attributes	Description
lastView (Last View)	Specifies the view mode that was used when the presentation document was last saved. The possible values for this attribute are defined by the ST_ViewType simple type (§19.7.55).
showComments (Show Comments)	Specifies whether the slide comments should be shown. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ViewProperties](#)) is located in §A.3. *end note*]

19.3 Slides

The Slides portion of the PresentationML framework stores all information pertaining specifically to slides of various slide types. These slide types and corresponding parts can be broken down into three distinct parts, namely slides, embedded objects, and programmable tags.

19.3.1 Slides

Being the main segment of this section of PresentationML, the slides elements encompass all data that is to be contained within a slide. The best way to think of a slide is a container for all data that is to be on that slide. The specific shapes, images and relations within a slide do not come into play here. The elements here pertain to the six different slide types that can be described within PresentationML, namely slide, slide layout, slide master, handout master, notes master and notes slide.

19.3.1.1 **bg** (Slide Background)

This element specifies the background appearance information for a slide. The slide background covers the entire slide and is visible where no objects exist and as the background for transparent objects.

Attributes	Description
bwMode (Black and White Mode)	<p>Specifies that the background should be rendered using only black and white coloring. That is, the coloring information for the background should be converted to either black or white when rendering the picture.</p> <p>[<i>Note</i>: No gray is to be used in rendering this background, only stark black and stark white. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Background](#)) is located in §A.3. *end note*]

19.3.1.2 **bgPr** (Background Properties)

This element specifies visual effects used to render the slide background. This includes any fill, image, or effects that are to make up the background of the slide.

Attributes	Description
shadeToTitle (Shade to Title)	<p>Specifies whether the background of the slide is of a shade to title background type. This kind of gradient fill is on the slide background and changes based on the placement of the slide title placeholder. An example is shown below.</p>

Attributes	Description
	<div></div> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_BackgroundProperties](#)) is located in §A.3. end note]

19.3.1.3 **bgRef (Background Style Reference)**

This element specifies the slide background is to use a fill style defined in the style matrix. The `idx` attribute refers to the index of a background fill style or fill style within the presentation's style matrix, defined by the `fmtScheme` element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the `fillStyleLst` element, and values 1001 and above refer to the index of a background fill style within the `bgFillStyleLst` element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[Example:

```
<p:bgRef idx="2">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's second fill style using the second background color of the color scheme.

end example]

[Example:

```
<p:bgRef idx="1001">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's first background fill style using the second background color of the color scheme.

end example]

Attributes	Description
idx (Style Matrix Index) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

19.3.1.4 **blipFill (Picture Fill)**

This element specifies the kind of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example:* Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
...
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example:* Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
<p:spPr>
  <a:gradFill>
    <a:gsLst>
      <a:gs pos="0">
        <a:schemeClr val="tx2">
          <a:shade val="50000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="39999">
        <a:schemeClr val="tx2">
          <a:tint val="20000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="70000">
        <a:srgbClr val="C4D6EB"/>
      </a:gs>
      <a:gs pos="100000">
        <a:schemeClr val="bg1"/>
      </a:gs>
    </a:gsLst>
  </a:gradFill>
</p:spPr>
```

```
</a:gs>
</a:gsLst>
</a:gradFill>
</p:spPr>
...
</p:pic>
```

The above picture object is shown as an example of this double fill type. *end example*]

Attributes	Description
dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [<i>Note</i> : This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_BlipFillProperties](#)) is located in §A.4.1. *end note*]

19.3.1.5 bodyStyle (Slide Master Body Text Style)

This element specifies the text formatting style for all body text within a master slide. This formatting is used on all body text within presentation slides related to this master. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the bodyStyle element there can be many different style types defined as there are different kinds of text stored within the body of a slide.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. *end note*]

19.3.1.6 clrMap (Color Scheme Map)

This element specifies the mapping layer that transforms one color scheme definition to another. Each attribute represents a color name that can be referenced in this master, and the value is the corresponding color in the theme.

[*Example:* Consider the following mapping of colors that applies to a slide master:

```
<p:clrMap bg1="dk1" tx1="lt1" bg2="dk2" tx2="lt2" accent1="accent1"
accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

Attributes	Description
accent1 (Accent 1) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent2 (Accent 2) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent3 (Accent 3) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color.

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent5 (Accent 5) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent6 (Accent 6) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg1 (Background 1) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg2 (Background 2) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
folHlink (Followed Hyperlink) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
hlink (Hyperlink) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx1 (Text 1) Namespace:	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple

Attributes	Description
http://purl.oclc.org/ooxml/drawingml/main	type (§20.1.10.14).
tx2 (Text 2) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1. *end note*]

19.3.1.7 clrMapOvr (Color Scheme Map Override)

This element provides a mechanism with which to override the color schemes listed within the ClrMap element. If the masterClrMapping element is present, the color scheme defined by the master is used. If the overrideClrMapping element is present, it defines a new color scheme specific to the parent notes slide, presentation slide, or slide layout.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ColorMappingOverride](#)) is located in §A.4.1. *end note*]

19.3.1.8 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties specific to a connector shape. This includes information specifying the shapes to which the connector shape is connected.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualConnectorProperties](#)) is located in §A.4.1. *end note*]

19.3.1.9 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualGraphicFrameProperties](#)) is located in §A.4.1. *end note*]

19.3.1.10 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualGroupDrawingShapeProps](#)) is located in §A.4.1. *end note*]

19.3.1.11 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[Example: Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  <p:cNvPicPr>
    <a:picLocks noChangeAspect="1"/>
  </p:cNvPicPr>
</p:nvPicPr>
...
</p:pic>
```

end example]

Attributes	Description
preferRelativeResi ze (Relative Resize Preferred) Namespace: http://purl.oclc.or g/ooxml/drawing ml/main	<p>Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.</p> <p>[Example: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_NonVisualPictureProperties](#)) is located in §A.4.1. end note]

19.3.1.12 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
</p:nvPicPr>
...
</p:pic>
```

end example]

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note</i>: An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><... hidden="true" /></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Unique	Specifies a unique identifier for the current DrawingML object within the current

Attributes	Description
<p>Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 531 678 562"><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
<p>name (Name)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 972 776 1003">< ... name="foo.jpg" ></pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>title (Title)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 1444 971 1476"><... title="Process Flow Diagram"></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

19.3.1.13 cNvSpPr (Non-Visual Drawing Properties for a Shape)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example:* Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
  ...
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

Attributes	Description
txBox (Text Box) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [Note: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingShapeProps](#)) is located in §A.4.1. *end note*]

19.3.1.14 contentPart (Content Part)

This element specifies a reference to XML content in a format not defined by ECMA-376. [Note: This part allows the native use of other commonly used interchange formats, such as:

- MathML (<http://www.w3.org/TR/MathML2/>)
- SMIL (<http://www.w3.org/TR/REC-smil/>)
- SVG (<http://www.w3.org/TR/SVG11/>)

end note]

The relationship type of the explicit relationship specified by this element shall be <http://purl.oclc.org/ooxml/officeDocument/relationships/customXml> and have a TargetMode attribute value of Internal. If an application cannot process content of the content type specified by the targeted part, then it should continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[Note: For better interoperability, only standard XML formats should be used. *end note*]

[Example: Consider a PresentationML document which includes the following SMIL markup in a part named smil1.xml:

```
<!--
    Copyright: Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights
    Reserved.
    See http://www.w3.org/Consortium/Legal/.
    Author: Aaron Cohen (Intel)
        Version: February 7, 2001
        Module: Animation Module
        Feature: animation
        File Name: animation-add-BE-05.smil
    Media Components: none
    Expected Behavior: Nine red rectangles numbered 1 to 9 shrink to squares
                      over 2s as follows:
                        at 2s #1 shrinks.
                        at 5s #2 shrinks, 1s after #1 completes
                        at 8s #3 shrinks.
                        #4 shrinks when it is clicked on.
                        #5 shrinks 1s after it is clicked on.
                        #6 shrinks 2s after it is clicked on.
                        #7 shrinks when the accesskey '1' is pressed.
                        #8 should be shrunk from 0s since it's wallclock time is in
the past.
                        #9 will not shrink unless a DOM call causes it to begin.

    <animate id="anim9" targetElement="rect9" attributeName="width" from="30"
to="30" begin="indefinite" dur="1s" fill="freeze"/>
  </par>
</body>

```

</smil>

A Slide Part would reference this content as follows:

```
<p:spTree>
...
<p:contentPart r:id="smil01"/>
...
</p:spTree>
```

The contentPart element specifies that the content targeted by the relationship with an ID of `smil01` is part of the PresentationML document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships ... >
...
<Relationship Id="smil01" TargetMode="Internal"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/customXml"
Target="smil1.xml" />
...
</Relationships>
```

The corresponding relationship part item shows that the SMIL content is located next to the slide and is named `smil1.xml`. *end example*]

ttributes	Description
id (Relationship to Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the relationship ID to a content part.</p> <p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId1" /></pre> <p>The markup specifies the associated relationship part with relationship ID <code>rId1</code> contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Rel](#)) is located in §A.3. *end note*]

19.3.1.15 controls (List of controls)

This element specifies a list of embedded controls for the corresponding slide. Custom embedded controls can be embedded on slides.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ControlList](#)) is located in §A.3. *end note*]

19.3.1.16 cSld (Common Slide Data)

This element specifies a container for slide information that is relevant to all of the slide types. All slides share a common set of properties that is independent of the slide type; the description of these properties for any particular slide is stored within the slide's cSld container. Slide data specific to the slide type indicated by the parent element is stored elsewhere.

[*Note*: The actual data in cSld describe only the particular parent slide; it is only the kind of information stored that is common across all slides. *end note*]

[*Example*: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
      ...
    </p:spTree>
  </p:cSld>
  ...
</p:sld>
```

As the above example shows, the shape tree of a slide (spTree) is a child element of cSld because all slide types can contain a shape tree. Other slide properties specific to the slide type (such as transitions for sld slides) are specified elsewhere. *end example*]

Attributes	Description
name (Name)	Specifies the slide name property that is used to further identify this unique configuration of common slide data. This might be used to aid in distinguishing different slide layouts or various other slide types. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_CommonSlideData](#)) is located in §A.3. *end note*]

19.3.1.17 custData (Customer Data)

This element specifies customer data which allows for the specifying and persistence of customer specific data within the presentation.

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This attribute specifies the relationship id for referencing other resources outside the scope of the current PresentationML file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element’s content model ([CT_CustomerData](#)) is located in §A.3. end note]

19.3.1.18 [custDataLst \(Customer Data List\)](#)

This element allows for the specifying of customer defined data within the PresentationML framework. References to custom data or tags can be defined within this list.

[Note: The W3C XML Schema definition of this element’s content model ([CT_CustomerDataList](#)) is located in §A.3. end note]

19.3.1.19 [cxnSp \(Connection Shape\)](#)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[Example: Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
...
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="1" name="Rectangle 1"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  ...
</p:sp>
<p:sp>
  <p:nvSpPr>
```

```

    <p:cNvPr id="2" name="Rectangle 2"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  ...
</p:sp>
<p:cxnSp>
  <p:nvCxnSpPr>
    <p:cNvPr id="3" name="Elbow Connector 3"/>
    <p:cNvCxnSpPr>
      <a:stCxn id="1" idx="3"/>
      <a:endCxn id="2" idx="1"/>
    </p:cNvCxnSpPr>
    <p:nvPr/>
  </p:nvCxnSpPr>
  ...
</p:cxnSp>
</p:spTree>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Connector](#)) is located in §A.3. *end note*]

19.3.1.20 extLst (Extension List with Modification Flag)

This element specifies the extension list with modification ability within which all future extensions of element type `ext` are defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new kinds of data to be stored natively within the framework.

[*Note:* Using this `extLst` element allows the generating application to store whether this extension property has been modified. *end note*]

Attributes	Description
mod (Modify)	<p>This attribute specifies whether the data contained within this element has been modified and should thus be processed again by the generating application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExtensionListModify](#)) is located in §A.3. *end note*]

19.3.1.21 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies how the graphical object should be rendered, using color, black or white, or grayscale. [Note: This does not mean that the graphical object itself is stored with only black and white or grayscale information. This attribute instead sets the rendering mode that the graphical object uses. <i>end note</i>] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

[Note: The W3C XML Schema definition of this element’s content model ([CT_GraphicalObjectFrame](#)) is located in §A.3. *end note*]

19.3.1.22 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
  <p:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
    </a:xfrm>
  </p:grpSpPr>
</p:sp>
...
```

```

</p:sp>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
</p:grpSp>

```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShape](#)) is located in §A.3. *end note*]

19.3.1.23 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShapeProperties](#)) is located in §A.4.1. *end note*]

19.3.1.24 handoutMaster (Handout Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached

text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_HandoutMaster](#)) is located in §A.3.
end note]

19.3.1.25 hf (Header/Footer information for a slide master)

This element specifies the header and footer information for a slide. Headers and footers consist of placeholders for text that should be consistent across all slides and slide types, such as a date and time, slide numbering, and custom header and footer text.

Attributes	Description
dt (Date/Time Placeholder)	<p>Specifies whether the Date/Time placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fttr (Footer Placeholder)	<p>Specifies whether the Footer placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hdr (Header Placeholder)	<p>Specifies whether the Header placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sldNum (Slide Number Placeholder)	<p>Specifies whether the slide number placeholder is enabled. If this attribute is not specified, a value of true should be assumed by the generating application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_HeaderFooter](#)) is located in §A.3.
end note]

19.3.1.26 notes (Notes Slide)

This element specifies the existence of a notes slide along with its corresponding data. Contained within a notes slide are all the common slide elements along with addition properties that are specific to the notes element.

[*Example*: Consider the following PresentationML notes slide

```
<p:notes>  
  <p:cSld>
```

```

...
</p:cSld>
...
</p:notes>

```

In the above example a notes element specifies the existence of a notes slide with all of its parts. Notice the cSld element, that specifies the common elements that can appear on any slide type and then any elements specify additional non-common properties for this notes slide. *end example]*

Attributes	Description
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NotesSlide](#)) is located in §A.3. *end note]*

19.3.1.27 notesMaster (Notes Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NotesMaster](#)) is located in §A.3. *end note]*

19.3.1.28 notesStyle (Notes Text Style)

This element specifies the text formatting style for the all other text within a notes slide. This formatting is used on all text within the corresponding notes slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the notesStyle element there can be many different style types defined as there are different kinds of text stored within a notes slide.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. *end note]*

19.3.1.29 `nvCxnSpPr` (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ConnectorNonVisual](#)) is located in §A.3. *end note*]

19.3.1.30 `nvGraphicFramePr` (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GraphicalObjectFrameNonVisual](#)) is located in §A.3. *end note*]

19.3.1.31 `nvGrpSpPr` (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShapeNonVisual](#)) is located in §A.3. *end note*]

19.3.1.32 `nvPicPr` (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following PresentationML.

```
<p:pic>
...
<p:nvPicPr>
...
</p:nvPicPr>
...
</p:pic>
```

end example]

[*Note: The W3C XML Schema definition of this element's content model ([CT_PictureNonVisual](#)) is located in §A.3. end note*]

19.3.1.33 [nvPr \(Non-Visual Properties\)](#)

This element specifies non-visual properties for objects. These properties include multimedia content associated with an object and properties indicating how the object is to be used or displayed in different contexts.

Attributes	Description
isPhoto (Is a Photo Album)	Specifies whether the picture belongs to a photo album and should thus be included when editing a photo album within the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note: The W3C XML Schema definition of this element's content model ([CT_ApplicationNonVisualDrawingProps](#)) is located in §A.3. end note*]

19.3.1.34 [nvSpPr \(Non-Visual Properties for a Shape\)](#)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

[*Note: The W3C XML Schema definition of this element's content model ([CT_ShapeNonVisual](#)) is located in §A.3. end note*]

19.3.1.35 [otherStyle \(Slide Master Other Text Style\)](#)

This element specifies the text formatting style for the all other text within a master slide. This formatting is used on all text not covered by the titleStyle or bodyStyle elements within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the otherStyle element there can be many different style types defined as there are different kinds of text stored within a slide.

[*Note: The otherStyle element is to be used for specifying the text formatting of text within a slide shape but not within a text box. Text box styling is handled from within the bodyStyle element. end note*]

[*Note: The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. end note*]

19.3.1.36 **ph (Placeholder Shape)**

This element specifies that the corresponding shape should be represented by the generating application as a placeholder. When a shape is considered a placeholder by the generating application it can have special properties to alert the user that they can enter content into the shape. Different placeholder types are allowed and can be specified by using the placeholder type attribute for this element.

Attributes	Description
hasCustomPrompt (Placeholder has custom prompt)	Specifies whether the corresponding placeholder should have a custom prompt or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
idx (Placeholder Index)	Specifies the placeholder index. This is used when applying templates or changing layouts to match a placeholder on one template/master to another. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
orient (Placeholder Orientation)	Specifies the orientation of a placeholder. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).
sz (Placeholder Size)	Specifies the size of a placeholder. The possible values for this attribute are defined by the ST_PlaceholderSize simple type (§19.7.9).
type (Placeholder Type)	Specifies what content type a placeholder is intended to contain. The possible values for this attribute are defined by the ST_PlaceholderType simple type (§19.7.10).

[Note: The W3C XML Schema definition of this element’s content model ([CT_Placeholder](#)) is located in §A.3. *end note*]

19.3.1.37 **pic (Picture)**

This element specifies the existence of a picture object within the document.

[Example: Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
  </p:nvPicPr>
</p:pic>
```

```

    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  <p:blipFill>
    ...
  </p:blipFill>
  <p:spPr>
    ...
  </p:spPr>
</p:pic>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Picture](#)) is located in §A.3. *end note]*

19.3.1.38 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[*Example:* Consider the following custom show with an ordering of slides.

```

<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>

```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example]*

Attributes	Description
show (Show Slide in Slide Show)	Specifies that the current slide should be shown in slide show. If this attribute is omitted then a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterPhAnim (Show Master Placeholder)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean

Attributes	Description
Animations)	datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Slide](#)) is located in §A.3. *end note*]

19.3.1.39 sldLayout (Slide Layout)

This element specifies an instance of a slide layout. The slide layout contains in essence a template slide design that can be applied to any existing slide. When applied to an existing slide all corresponding content should be mapped to the new slide layout.

Attributes	Description
matchingName (Matching Name)	Specifies a name to be used in place of the name attribute within the cSld element. This is used for layout matching in response to layout changes and template applications. The possible values for this attribute are defined by the W3C XML Schema string datatype.
preserve (Preserve Slide Layout)	Specifies whether the corresponding slide layout is deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
type (Slide Layout Type)	Specifies the slide layout type that is used by this slide. The possible values for this attribute are defined by the ST_SlideLayoutType simple type (§19.7.15).
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideLayout](#)) is located in §A.3. *end note*]

19.3.1.40 [sldLayoutId \(Slide Layout Id\)](#)

This element specifies the relationship information for each slide layout that is used within the slide master. The slide master has relationship identifiers that it uses internally for determining the slide layouts that should be used. Then, to resolve what these slide layouts should be the `sldLayoutId` elements in the `sldLayoutIdLst` are utilized.

Attributes	Description
id (ID Tag) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id value that the generating application can use to resolve which slide layout is used in the creation of the slide. This relationship id is used within the relationship file for the master slide to expose the location of the corresponding layout file within the presentation. The possible values for this attribute are defined by the <code>ST_RelationshipId</code> simple type (§22.8.2.1).
id (ID Tag)	Specifies the identification number that uniquely identifies this slide layout within the presentation file. The possible values for this attribute are defined by the <code>ST_SlideLayoutId</code> simple type (§19.7.14).

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideLayoutIdListEntry](#)) is located in §A.3. *end note*]

19.3.1.41 [sldLayoutIdLst \(List of Slide Layouts\)](#)

This element specifies the existence of the slide layout identification list. This list is contained within the slide master and is used to determine which layouts are being used within the slide master file. Each layout within the list of slide layouts has its own identification number and relationship identifier that uniquely identifies it within both the presentation document and the particular master slide within which it is used.

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideLayoutIdList](#)) is located in §A.3. *end note*]

19.3.1.42 `sldMaster` (Slide Master)

This element specifies an instance of a slide master slide. Within a slide master slide are contained all elements that describe the objects and their corresponding formatting for within a presentation slide. Within a slide master slide are two main elements. The `cSld` element specifies the common slide elements such as shapes and their attached text bodies. Then the `txStyles` element specifies the formatting for the text within each of these shapes. The other properties within a slide master slide specify other properties for within a presentation slide such as color information, headers and footers, as well as timing and transition information for all corresponding presentation slides.

Attributes	Description
<code>preserve</code> (Preserve Slide Master)	<p>Specifies whether the corresponding slide layout is deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_SlideMaster](#)) is located in §A.3. *end note*]

19.3.1.43 `sp` (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[Note: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

Attributes	Description
<code>useBgFill</code> (Use Background Fill)	<p>Specifies that the shape fill should be set to that of the slide background surface.</p> <p>[Note: This attribute does not set the fill of the shape to be transparent but instead sets it to be filled with the portion of the slide background that is directly behind it. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Shape](#)) is located in §A.3. *end note*]

19.3.1.44 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a shape. These properties include the shape fill, outline, geometry, effects, and 3D orientation.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ShapeProperties](#)) is located in §A.4.1. *end note*]

19.3.1.45 spTree (Shape Tree)

This element specifies all shape-based objects, either grouped or not, that can be referenced on a given slide. As most objects within a slide are shapes, this represents the majority of content within a slide. Text and effects are attached to shapes that are contained within the spTree element.

[*Example*: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
      <p:nvGrpSpPr>
        ...
      </p:nvGrpSpPr>
      <p:grpSpPr>
        ...
      </p:grpSpPr>
      <p:sp>
        ...
      </p:sp>
    </p:spTree>
  </p:cSld>
  ...
</p:sld>
```

</p:sld>

In the above example the shape tree specifies all the shape properties for this slide. *end example*

Each shape-based object within the shape tree, whether grouped or not, shall represent one unique level of z-ordering on the slide. The z-order for each shape-based object shall be determined by the lexical ordering of each shape-based object within the shape tree: the first shape-based object shall have the lowest z-order, while the last shape-based object shall have the highest z-order.

The z-ordering of shape-based objects within the shape tree shall also determine the navigation (tab) order of the shape-based objects: the shape-based object with the lowest z-order (the first shape in lexical order) shall be first in navigation order, with objects being navigated in ascending z-order.

[*Example*: Consider the following PresentationML slide with two shapes

```
<p:sld>
  <p:cSld>
    <p:spTree>
      ...
      <p:sp>
        <p:nvSpPr>
          <p:cNvPr id="5" name="Oval 4" />
          ...
        </p:nvSpPr>
        ...
      </p:sp>
      <p:sp>
        <p:nvSpPr>
          <p:cNvPr id="4" name="Isosceles Triangle 3" />
          ...
        </p:nvSpPr>
        ...
      </p:sp>
    </p:spTree>
  </p:cSld>
  ...
</p:sld>
```

In the above example the shape with name `Oval 4` has the lowest z-order value since that shape is the first shape in the shape tree. `Oval 4` is also the first shape in navigation order. The shape with name `Isosceles Triangle 3` has the highest z positioning value since that shape is the last shape in the shape tree. `Isosceles Triangle 3` is also the last shape in navigation order. *end example*

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShape](#)) is located in §A.3. *end note*]

19.3.1.46 style (Shape Style)

This element specifies the style information for a shape. This is used to define a shape's appearance in terms of the preset styles defined by the style matrix for the theme.

[Example:

```
<p:style>
  <a:lnRef idx="3">
    <a:schemeClr val="lt1"/>
  </a:lnRef>
  <a:fillRef idx="1">
    <a:schemeClr val="accent3"/>
  </a:fillRef>
  <a:effectRef idx="1">
    <a:schemeClr val="accent3"/>
  </a:effectRef>
  <a:fontRef idx="minor">
    <a:schemeClr val="lt1"/>
  </a:fontRef>
</p:style>
```

The parent shape of the above code is to have an outline that uses the third line style defined by the theme, use the first fill defined by the scheme, and be rendered with the first effect defined by the theme. Text inside the shape is to use the minor font defined by the theme.

end example]

[Note: The W3C XML Schema definition of this element’s content model ([CT_ShapeStyle](#)) is located in §A.4.1.
end note]

19.3.1.47 tags (Customer Data Tags)

This element specifies the existence of customer data in the form of tags. This allows for the storage of customer data within the PresentationML framework. While this is similar to the ext tag in that it can be used store information, this tag mainly focuses on referencing to other parts of the presentation document. This is accomplished via the relationship identification attribute that is required for all specified tags.

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This attribute specifies the relationship identifier for the customer data tag. This allows for a link to a resource that is external from the current XML document but still contained within the presentation document. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TagsData](#)) is located in §A.3. *end note*]

19.3.1.48 **timing** (Slide Timing Information for a Slide Layout)

This element specifies the timing information for handling all animations and timed events within the corresponding slide. This information is tracked via time nodes within the timing element. More information on the specifics of these time nodes and how they are to be defined can be found within the Animation section of the PresentationML framework.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideTiming](#)) is located in §A.3. *end note*]

19.3.1.49 **titleStyle** (Slide Master Title Text Style)

This element specifies the text formatting style for the title text within a master slide. This formatting is used on all title text within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within a title style there can be many different style types defined as there are different kinds of text stored within a slide title.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. *end note*]

19.3.1.50 **transition** (Slide Transition for a Slide Layout)

This element specifies the kind of slide transition that should be used to transition to the current slide from the previous slide. That is, the transition information is stored on the slide that appears after the transition is complete.

Attributes	Description
advClick (Advance on Click)	Specifies whether a mouse click advances the slide or not. If this attribute is not specified then a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
advTm (Advance after time)	Specifies the time, in milliseconds, after which the transition should start. This setting can be used in conjunction with the advClick attribute. If this attribute is not specified then it is assumed that no auto-advance occurs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
spd (Transition Speed)	Specifies the transition speed that is to be used when transitioning from the current slide to the next. The possible values for this attribute are defined by the ST_TransitionSpeed simple type (§19.7.54).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideTransition](#)) is located in §A.3. *end note*]

19.3.1.51 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextBody](#)) is located in §A.4.1. *end note*]

19.3.1.52 txStyles (Slide Master Text Styles)

This element specifies the text styles within a slide master. Within this element is the styling information for title text, the body text and other slide text as well. This element is only for use within the Slide Master and thus sets the text styles for the corresponding presentation slides.

[*Example:* Consider the case where we would like to specify the title text for a master slide.

```
<p:txStyles>
  <p:titleStyle>
    <a:lvl1pPr algn="ctr" rtl="0" latinLnBrk="0">
      <a:spcBef>
        <a:spcPct val="0"/>
      </a:spcBef>
      <a:buNone/>
      <a:defRPr sz="4400" kern="1200">
        <a:solidFill>
          <a:schemeClr val="tx1"/>
        </a:solidFill>
        <a:latin typeface="+mj-lt"/>
        <a:ea typeface="+mj-ea"/>
        <a:cs typeface="+mj-cs"/>
      </a:defRPr>
    </a:lvl1pPr>
  </p:titleStyle>
</p:txStyles>
```

In the above example the title text is set according to the above formatting for all related slides within the presentation. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideMasterTextStyles](#)) is located in §A.3. *end note*]

19.3.1.53 xfrm (2D Transform for Graphic Frame)

This element specifies the transform to be applied to the corresponding graphic frame. This transformation is applied to the graphic frame just as it would be for a shape or group shape.

Attributes	Description
<p>flipH (Horizontal Flip)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p> <div></div> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>flipV (Vertical Flip)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.</p> <div></div> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>rot (Rotation)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Transform2D](#)) is located in §A.4.1.
end note]

19.3.2 Embedded Objects

Within the slides portion of PresentationML, there are the embedded elements. These are objects that can be embedded within a slide. As we defined a slide to be a container it can be seen that it does not just contain shapes, pictures and text but embedded objects as well that are not necessarily native to the PresentationML platform.

19.3.2.1 control (Embedded Control)

This element specifies the existence of an embedded control in the slide.

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
imgW (Image Width)	Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the W3C XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object shows as an icon or using its native representation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Control](#)) is located in §A.3. *end note*]

19.3.2.2 embed (Embedded Object or Control)

This element specifies an Embedded object or Control that is embedded within the presentation.

Attributes	Description
followColorScheme (Color Scheme Properties for Embedded object)	Specifies the Color Scheme Properties for the corresponding Embedded object being specified. The possible values for this attribute are defined by the ST_OleObjectFollowColorScheme simple type (§19.7.6).

[Note: The W3C XML Schema definition of this element's content model ([CT_OleObjectEmbed](#)) is located in §A.3. *end note*]

19.3.2.3 link (Linked Object or Control)

This element specifies a link to an external Embedded object or Control.

Attributes	Description
updateAutomatic (Update Linked Embedded Objects Automatically)	This attribute determines if linked embedded objects are automatically updated when the presentation is opened or printed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_OleObjectLink](#)) is located in §A.3. *end note*]

19.3.2.4 oleObj (Global Element for Embedded objects and Controls)

This element specifies a global element to be used for an Embedded object and Control.

When the oleObject element contains a pic child element, the identifier specified by the pic/nvPicPr/cNvPr@id attribute shall be ignored and the identifier specified by the graphicFrame/nvGraphicFramePr/cNvPr@id attribute shall be used when deciding which identifier to use for the OLE object.

Attributes	Description
id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple

Attributes	Description
	type (§20.1.10.42).
imgW (Image Width)	Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the W3C XML Schema string datatype.
progId (Embedded Object ProgID)	Specifies the progid for an Embedded object. The possible values for this attribute are defined by the W3C XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object shows as an icon or using its native representation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_OleObject](#)) is located in §A.3. *end note*]

19.3.3 Programmable Tags

Within the slides portion of PresentationML there are the tag elements. These are extensibility names and values that assist in the storage of legacy variables from older file formats.

19.3.3.1 tag (Programmable Extensibility Tag)

This element specifies a programmable extensibility tag to be used for storage of legacy variables.

Attributes	Description
name (Name)	Specifies the name associated with this specific programmable tag. The possible values for this attribute are defined by the W3C XML Schema string datatype.
val (Value)	Specifies the value associated with this specific programmable tag. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_StringTag](#)) is located in §A.3. *end note*]

19.3.3.2 tagLst (Programmable Tab List)

This element specifies the list of programmable extensibility tags that are used to store variables from legacy file formats.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TagList](#)) is located in §A.3. *end note*]

19.4 Comments

A comment is a text note attached to a slide, with the primary purpose of allowing readers of a presentation to provide feedback to the presentation author. Each comment contains an unformatted text string and information about its author, and is attached to a particular location on a slide. Comments can be visible while editing the presentation, but do not appear when a slide show is given. The displaying application decides when to display comments and determines their visual appearance.

19.4.1 cm (Comment)

This element specifies a single comment attached to a slide. It contains the text of the comment, its position on the slide, and attributes referring to its author and date.

[*Example:*

```
<p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
  <p:pos x="10" y="10"/>
  <p:text>Add diagram to clarify.</p:text>
</p:cm>
```

end example]

Attributes	Description
authorId (Comment Author ID)	<p>This attribute specifies the author of the comment. It refers to the ID of an author in the comment author list for the document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
dt (Comment Date/Time)	<p>This attribute specifies the date and time this comment was last modified.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>
idx (Comment Index)	<p>This attribute specifies an identifier for this comment that is unique within a list of all comments by this author in this document. An author's first comment in a document has index 1.</p>

Attributes	Description
	<p>[<i>Note</i>: Because the index is unique only for the comment author, a document can contain multiple comments with the same index created by different authors. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Comment](#)) is located in §A.3. *end note*]

19.4.2 cmAuthor (Comment Author)

This element specifies a single author with comments in the document. It contains a unique author ID, the author's name and initials, the index of the author's last comment, and the index of a color associated with the author.

[*Example*:

```
<p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

end example]

Attributes	Description
clrIdx (Comment Author Color Index)	<p>This attribute specifies an index into the generating application's comments color table to allow for visual (color) differentiation of different author's comments. This color is used for all comments by this author. If more authors exist than there are entries in the color table, the color index wraps around to the beginning of the table.</p> <p>[<i>Note</i>: It is left entirely up to the generating application to determine the amount of colors used in the comments color table and in what order these are used when rendering comments on a slide surface. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
id (Comment Author ID)	<p>This attribute specifies a unique (within the document) zero-based identifier that refers to a single comment author.</p> <p>[<i>Note</i>: The method of generating an author id is determined by the application and need not be sequential, provided each id is unique within the list of comment authors for the document. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
initials (Comment Author Initials)	<p>This attribute specifies a string that represents the initials of this particular author. The value is not necessarily unique. It is intended for use by the application as an abbreviated version of the comment author's name.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).
lastIdx (Index of Comment Author's last comment)	<p>Index of the last comment added to this document by this author. New comments by this author are counted starting with the value one greater than this index.</p> <p>[<i>Note:</i> The index of a deleted comment is not reused; therefore, this value is not an accurate count of the total number of comments by the author. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
name (Comment Author Name)	<p>This attribute specifies the full name of this particular author. As a string, it has no security or authentication data. This value is not guaranteed to be unique across all document authors.</p> <p>The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CommentAuthor](#)) is located in §A.3. *end note*]

19.4.3 cmAuthorLst (List of Comment Authors)

This element specifies a list of authors with comments in the current document. Each comment in a document shall refer to an author in this list. To determine if a new author is in this list, the author's name and initials shall both match; otherwise, the new author is considered unique and a separate cmAuthor element is added.

[*Example:* A document contains comments left by two authors.

```
<p:cmAuthorLst>
  <p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
  <p:cmAuthor id="1" name="Fred Jones" initials="FJ" lastIdx="2" clrIdx="1"/>
</p:cmAuthorLst>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CommentAuthorList](#)) is located in §A.3. *end note*]

19.4.4 cmLst (Comment List)

This element specifies a list of comments for a particular slide.

[*Example:* A slide contains two comments, each left by a different author. This example demonstrates that two comments can have the same index if they are created by different authors.

```
<p:cmLst>
```

```

<p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
  <p:pos x="10" y="10"/>
  <p:text>Add diagram to clarify.</p:text>
</p:cm>
<p:cm authorId="1" dt="2006-08-28T17:44:19.679" idx="1">
  <p:pos x="1426" y="660"/>
  <p:text>Clean up this text.</p:text>
</p:cm>
</p:cmLst>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CommentList](#)) is located in §A.3.
end note]

19.4.5 pos (Comment Position)

This element specifies the positioning information for the placement of a comment on a slide surface. In LTR versions of the generating application, this position information should refer to the upper left point of the comment shape. In RTL versions of the generating application, this position information should refer to the upper right point of the comment shape.

[*Note:* The anchoring point on the slide surface is unaffected by a right-to-left or left-to-right layout change. That is the anchoring point remains the same for all language versions. *end note]*

[*Note:* Because there is no specified size or formatting for comments, this UI widget used to display a comment can be any size and thus the lower right point of the comment shape is determined by how the viewing application chooses to display comments. *end note]*

[*Example:*

```
<p:pos x="1426" y="660"/>
```

end example]

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type</p>

Attributes	Description
	(§20.1.10.16).
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

19.4.6 text (Comment's Text Content)

This element specifies the content of a comment. This is the text with which the author has annotated the slide.

[*Example:*

```
<p:text>Add diagram to clarify.</p:text>
```

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

19.5 Animation

The Animation section of the PresentationML framework stores the movement and related information of objects.

This schema is loosely based on the syntax and concepts from the Synchronized Multimedia Integration Language (SMIL), a W3C Recommendation for describing multimedia presentations using XML.

The schema describes all the animations effects that reside on a slide and also the animation that occurs when going from slide to slide (slide transition).

Animations on a slide are inherently time-based and consist of an animation effects on an object or text. Slide transitions however do not follow this concept and always appear before any animation on a slide.

All elements described in this schema are contained within the slide XML file. More specifically they are in the <transition> and the <timing> element as shown below:

```

<p:sld>
  <p:cSld> ... </p:cSld>
  <p:clrMapOvr> ... </p:clrMapOvr>
  <p:transition> ... </p:transition>
  <p:timing> ... </p:timing>
</p:sld>

```

19.5.1 anim (Animate)

This element is a generic animation element that requires little or no semantic understanding of the attribute being animated. It can animate text within a shape or even the shape itself.

[*Example:* Consider trying to emphasize text within a shape by changing the size of its font by 150%. The <anim> element should be used as follows:

```

<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1">
        <p:txEl>
          <p:charRg st="1" end="4"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>

```

end example]

Attributes	Description
by (By)	<p>This attribute specifies a relative offset value for the animation with respect to its position before the start of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
calcmode (Calculation Mode)	<p>This attribute specifies the interpolation mode for the animation.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateBehaviorCalcMode simple type (§19.7.20).</p>
from (From)	This attribute specifies the starting value of the animation.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.
to (To)	This attribute specifies the ending value for the animation as a percentage. The possible values for this attribute are defined by the W3C XML Schema string datatype.
valueType (Value Type)	This attribute specifies the type of property value. The possible values for this attribute are defined by the ST_TLAnimateBehaviorValueType simple type (§19.7.21).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimateBehavior](#)) is located in §A.3. *end note*]

19.5.2 animClr (Animate Color Behavior)

This animation element is responsible for animating the color of an object.

[*Example:* Consider trying to emphasize a shape by changing its fill color to scheme color accent2. The <animClr> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

Attributes	Description
clrSpc (Color Space)	This attribute specifies the color space in which to interpolate the animation. Values for example can be HSL & RGB.

Attributes	Description
	<p>The values for from/to/by/etc. can still be specified in any supported color format without affecting the color space within which the animation happens.</p> <p>The RGB color space is best used for doing animations between two different colors since it doesn't require going through any other hues between the two colors specified. The HSL space is useful for animating through a rainbow of colors or for modifying just the saturation by 30% for example.</p> <p>The possible values for this attribute are defined by the <code>ST_TLAnimateColorSpace</code> simple type (§19.7.23).</p>
dir (Direction)	<p>This attribute specifies which direction to cycle the hue around the color wheel. Values are clockwise or counter clockwise. Default is clockwise.</p> <p>The possible values for this attribute are defined by the <code>ST_TLAnimateColorDirection</code> simple type (§19.7.22).</p>

[*Note:* The W3C XML Schema definition of this element's content model (`CT_TLAnimateColorBehavior`) is located in §A.3. *end note*]

19.5.3 animEffect (Animate Effect)

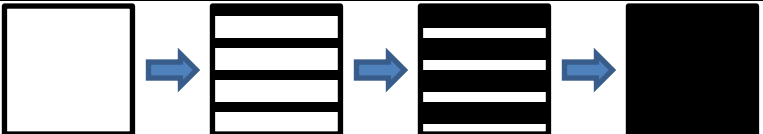

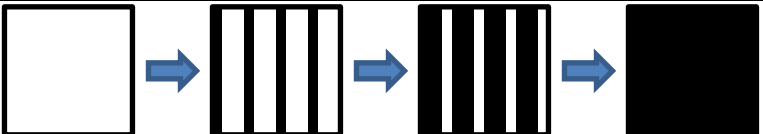

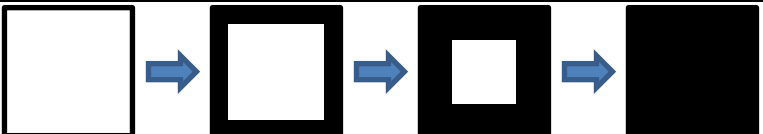

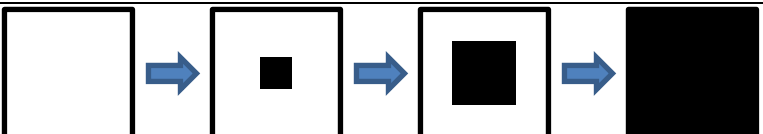

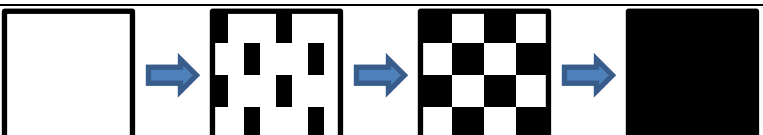

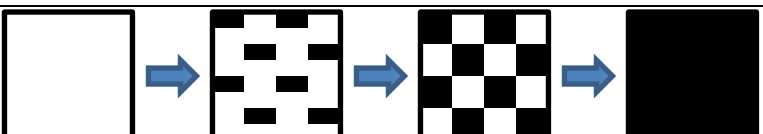

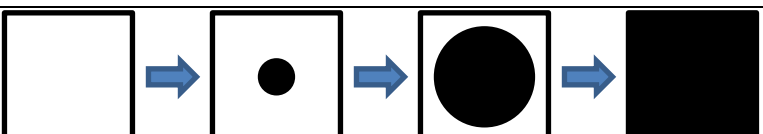

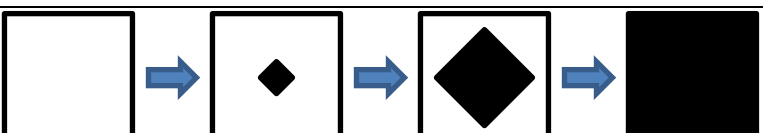

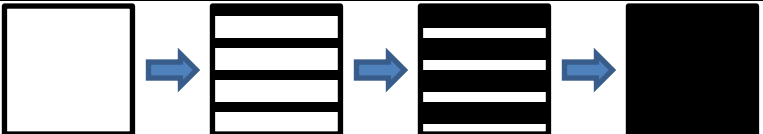

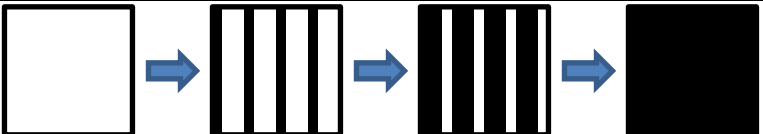

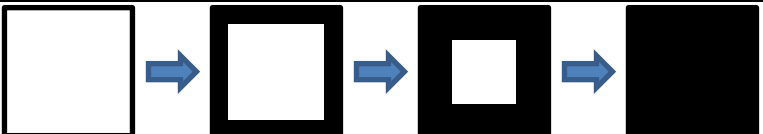

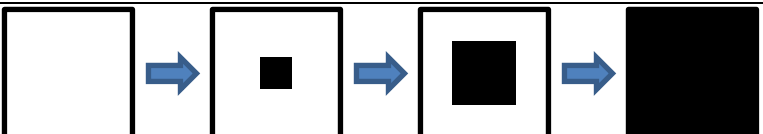

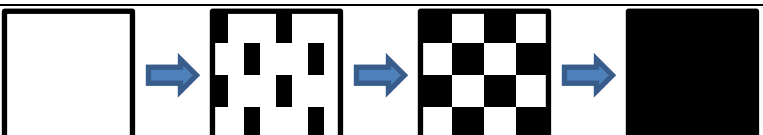

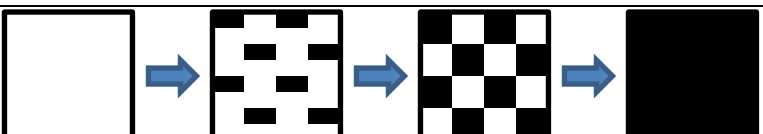

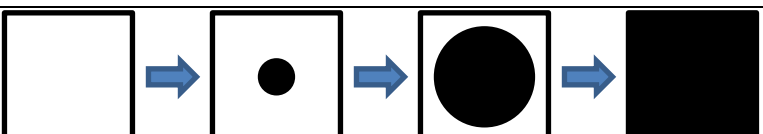

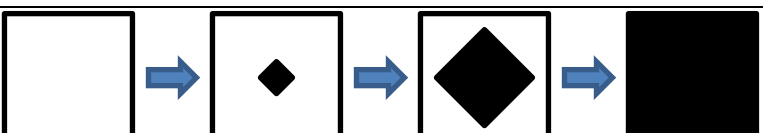

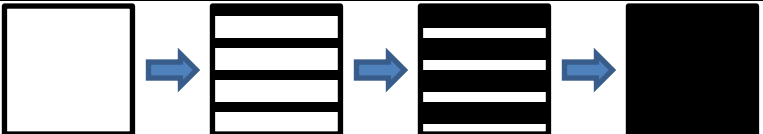

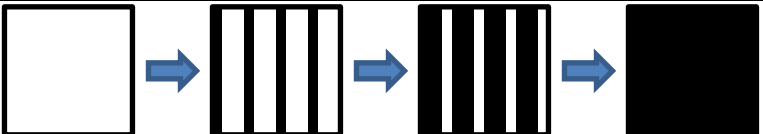

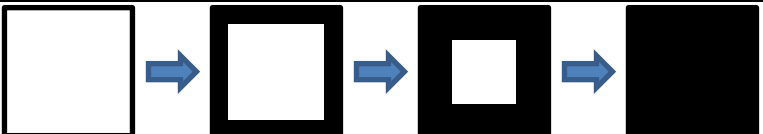

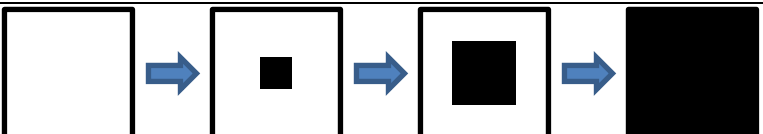

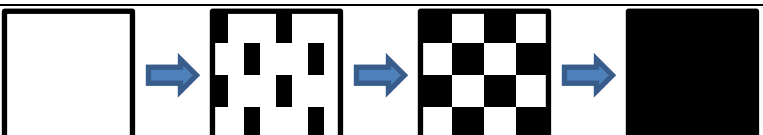

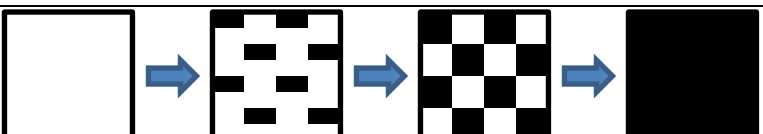

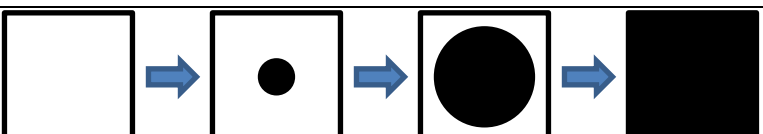

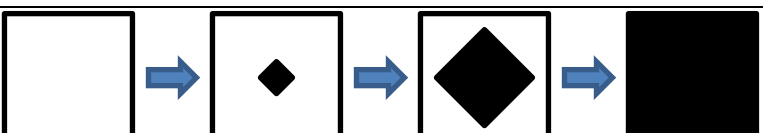

This animation behavior provides the ability to do image transform/filter effects on elements. Some visual effects are dynamic in nature and have a progress that animates from 0 to 1 over a period of time to do visual transitions between hidden and visible states. Other filters are static and apply a effects like a blur or drop-shadow which aren't inherently time-based.

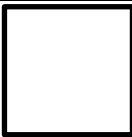

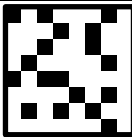

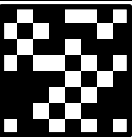

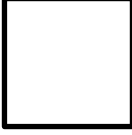

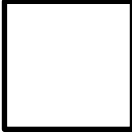

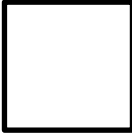

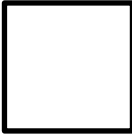

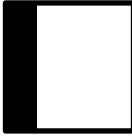

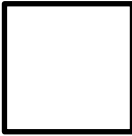

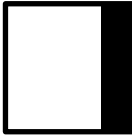

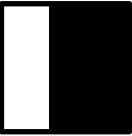

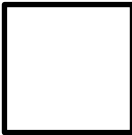

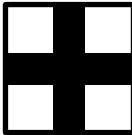

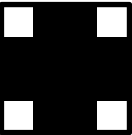

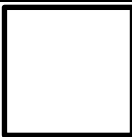

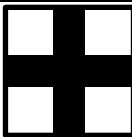

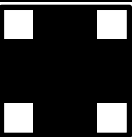

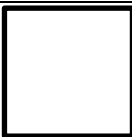

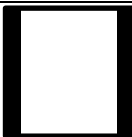

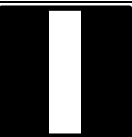

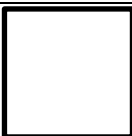

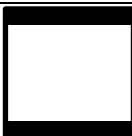

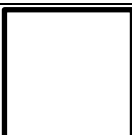

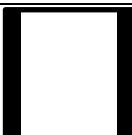

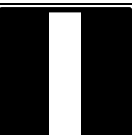

[*Example:* Consider trying to emphasize a shape by creating an entrance animation using a "blinds" motion.

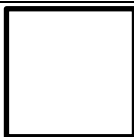

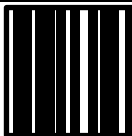

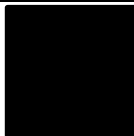

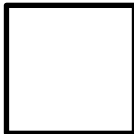

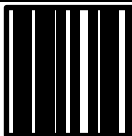

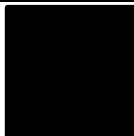

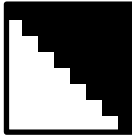

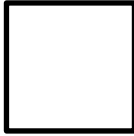

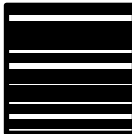

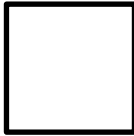

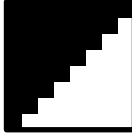

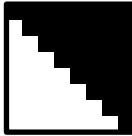

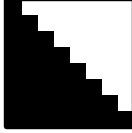

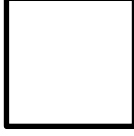

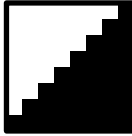

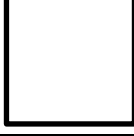

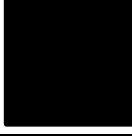

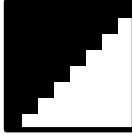

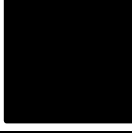

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

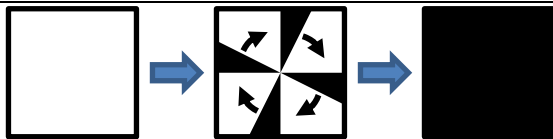

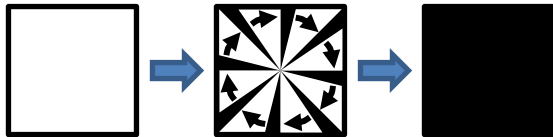

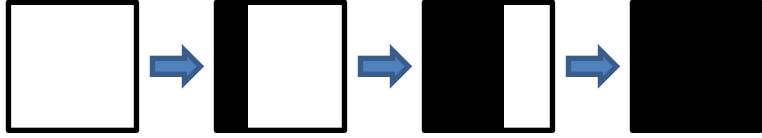

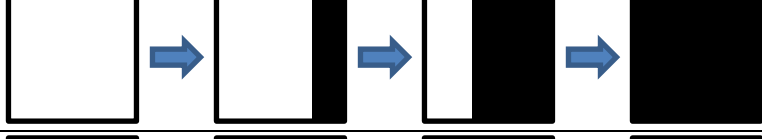

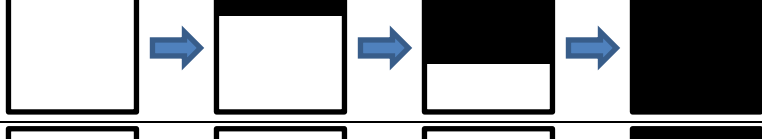

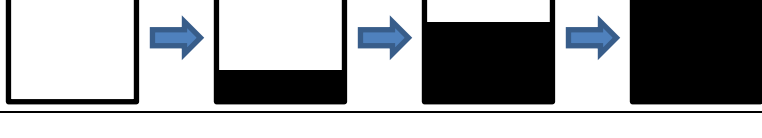

end example]

Attributes	Description
filter (Filter)	

Attributes	Description																		
	<p>This attribute specifies the animation types and subtypes to be used for the effect. Multiple animations are allowed to be listed so that in the event that a superseding animation (leftmost) cannot be rendered, a fallback animation is available. That is, the rendering application parses the list from left to right until a supported animation is found.</p> <p>The syntax used for the filter attribute value is as follows: "type(subtype);type(subtype)". Subtype can be a string value such as "fromLeft" or a numerical value depending on the type specified.</p> <p>Reserved Animation Types(subtypes):</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>blinds(horizontal)</td><td></td></tr><tr><td>blinds(vertical)</td><td></td></tr><tr><td>box(in)</td><td></td></tr><tr><td>box(out)</td><td></td></tr><tr><td>checkerboard(across)</td><td></td></tr><tr><td>checkerboard(down)</td><td></td></tr><tr><td>circle</td><td></td></tr><tr><td>diamond</td><td></td></tr></table>	Value	Description	blinds(horizontal)		blinds(vertical)		box(in)		box(out)		checkerboard(across)		checkerboard(down)		circle		diamond	
Value	Description																		
blinds(horizontal)																			
blinds(vertical)																			
box(in)																			
box(out)																			
checkerboard(across)																			
checkerboard(down)																			
circle																			
diamond																			

Attributes	Description			
	dissolve		 	 
	fade		 	 
	slide(fromTop)		 	 
	slide(fromBottom)		 	 
	slide(fromLeft)		 	 
	slide(fromRight)		 	 
	plus(in)		 	 
	plus(out)		 	 
	barn(inVertical)		 	 
	barn(inHorizontal)		 	 
	barn(outVertical)		 	 

Attributes	Description							
	barn(outHorizontal)		→		→		→	
	randomBars(horizontal)		→		→		→	
	randomBars(vertical)		→		→		→	
	strips(downLeft)		→		→		→	
	strips(upLeft)		→		→		→	
	strips(downRight)		→		→		→	
	strips(upRight)		→		→		→	
	wedge		→		→		→	
	wheel(1)		→		→			
	wheel(2)		→		→			
	wheel(3)		→		→			

Attributes	Description			
	wheel(4)			
	wheel(8)			
	wipe(right)			
	wipe(left)			
	wipe(down)			
	wipe(up)			
<p>[Note: The renderings shown above are for example purposes only. Exact rendering of any animation is determined by the rendering application. As such, the same animation can have many variations, depending on the implementation. More detail for each rendering above can be found in transition (§19.3.1.50). <i>end note</i>]</p> <p>[Example: Consider the following animation effect:</p> <pre><p:animEffect transition="in" filter="blinds(horizontal);blinds(vertical)"> <p:CBhvr> <p:cTn id="7" dur="500"/> <p:tgtEl> <p:spTgtspid="5"/> </p:tgtEl> </p:CBhvr> </p:animEffect></pre> <p>There are two animation filters shown in this example. The first is the blinds (horizontal), which the rendering application is to use as the primary animation effect. If, however, the rendering application does not support this animation, the blinds (vertical) animation is used. In this example there are only two animation filters listed, a primary and a</p>				

Attributes	Description
	<p>fallback, but it is possible to list multiple fallback filters using the syntax defined above.</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
prLst (Property List)	<p>This attribute specifies a list of properties that coincide with the effect specified. Although there are many animation types allowed, this attribute allows the setting of specific property settings in order to describe an even wider variety of animation types.</p> <p>The syntax used for the prLst attribute value is as follows: "name:value;name:value". When multiple animation types are listed in the filter attribute, the rendering application attempts to apply each property value even though some might not apply to it.</p> <p>Reserved Names(values):</p> <ul style="list-style-type: none"> • opacity (float values of 0.0 - 1.0) <p>[<i>Example:</i> Consider the following animation effect:</p> <pre><p:animEffect filter="image" prLst="opacity: 0.5"> <p:cBhvr rctx="IE"> <p:cTn id="7" dur="indefinite"/> <p:tgtEl> <p:spTgtspid="3"/> </p:tgtEl> </p:cBhvr> </p:animEffect></pre> <p>The animation filter specified is an image filter type that has a specific property called opacity set to a value of 0.5. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
transition (Transition)	<p>This attribute specifies whether to transition the element in or out or treat it as a static filter. The values are "none", "in" and "out", and the default value is "in".</p> <p>When a value of "in" is specified, the element is not visible at the start of the animation and is completely visible be the end of the duration. When "out" is specified, the element is visible at the start and not visible at the end of the effect. This visibility is in addition to the effect of setting CSS visibility or display attributes.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateEffectTransition simple type (§19.7.24).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimateEffectBehavior](#)) is located in §A.3. *end note*]

19.5.4 animMotion (Animate Motion)

Animate motion provides an abstracted way to move positioned elements. It provides the ability to specify from/to/by motion as well as to use more detailed path descriptions for motion over polylines or bezier curves.

[Example: Consider animating a shape from its original position to the right.. The <animMotion> element should be used as follows:

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0 E" pathEditMode="relative">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animMotion>
```

end example]

Attributes	Description
origin (Origin)	<p>Specifies what the origin of the motion path is relative to such as the layout of the slide, or the parent.</p> <p>The possible values for this attribute are defined by the <code>ST_TLAnimateMotionBehaviorOrigin</code> simple type (§19.7.25).</p>
path (Path)	<p>Specifies the path primitive followed by coordinates for the animation motion. The allowed values that are understood within a path are as follows:</p> <p>M = move to, L = line to, C = curve to, Z=close loop, E=end UPPERCASE = absolute coords, lowercase = relative coords Thus total allowed set = {M,L,C,Z,E,m,l,c,z,e}</p> <p>[Example: The following string is a sample path. path: "M 0 0 L 1 1 c 1 2 3 4 4 4 Z" <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string</p>

Attributes	Description
	datatype.
pathEditMode (Path Edit Mode)	This attribute specifies how the motion path moves when the target element is moved. The possible values for this attribute are defined by the ST_TLAnimateMotionPathEditMode simple type (§19.7.26).
ptsTypes (Points Types)	This attribute describes the point type of the points in the path attribute. The allowed values that are understood for the ptsTypes attribute are as follows: A = Auto, F = Corner, T = Straight, S = Smooth UPPERCASE = Straight Line follows point, lowercase = curve follows point. Thus, the total allowed set = {A,F,T,S,a,f,t,s} The possible values for this attribute are defined by the W3C XML Schema string datatype.
rAng (Relative Angle)	The attribute describes the relative angle of the motion path. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimateMotionBehavior](#)) is located in §A.3. *end note*]

19.5.5 animRot (Animate Rotation)

This animation element is responsible for animating the rotation of an object. Rotation values set in the "by" , "to, and "from" attributes are specified in degrees measured to a 60,000th, i.e 1 degree is 60,000. Rotation values can be larger than 360°.

The sign of the rotation angle specifies the direction for rotation. A negative rotation specifies that the rotation should appear in the host to go counter-clockwise".

[Example: Consider trying to emphasize a shape by rotating it 360 degrees clockwise. The <animRot> element should be used as follows:

```
<p:animRot by="21600000">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="5"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>r</p:attrName>
    </p:attrNameLst>
```

```

    </p:cBhvr>
  </p:animRot>

```

end example]

Attributes	Description
by (By)	This attribute describes the relative offset value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).
from (From)	This attribute describes the starting value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).
to (To)	This attribute describes the ending value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimateRotationBehavior](#)) is located in §A.3. *end note*]

19.5.6 animScale (Animate Scale)

This animation element is responsible for animating the scale of an object. When animating the scale, the element shall scale around the reference point of the element and the positioning system used should be consistent with the one used for motion paths. When animating the width and height of an element, all of the width/height animation values are calculated first then the scale animations are applied on top of that. So for example, an animation from 0 to 100 of the width with a concurrent scale from 100% to 200% would result in the element appearing to scale from 0 to 200.

[*Example:* Consider trying to emphasize a shape by scaling it larger by 150%. The <animScale> element should be used as follows:

```

<p:childTnLst>
  <p:animScale>
    <p:cBhvr>
      <p:cTn id="6" dur="2000" fill="hold"/>
      <p:tgtEl>
        <p:spTgt spid="5"/>
      </p:tgtEl>
    </p:cBhvr>
    <p:by x="150000" y="150000"/>
  </p:animScale>

```

</p:childTnLst>

end example]

Attributes	Description
zoomContents (Zoom Content)	This attribute specifies whether to zoom the contents of an object when doing a scaling animation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLAnimateScaleBehavior](#)) is located in §A.3. *end note*]

19.5.7 attrName (Attribute Name)

This element is used to contain an attribute value for an Attribute Name List. This value defines the specific attribute that an animation should be applied to, such as fill, style, and shadow, etc. A specific property is defined by using a "property.sub-property" format which is often extended to multiple sub properties as seen in the allowed values below.

Allowed property values:

style.opacity, style.rotation, style.visibility, style.color, style.fontSize, style.fontWeight, style.fontStyle, style.fontFamily, style.textEffectEmboss, style.textShadow, style.textTransform, style.textDecorationUnderline, style.textEffectOutline, style.textDecorationLineThrough, style.sRotation, imageData.cropTop, imageData.cropBottom, imageData.cropLeft, imageData.cropRight, imageData.cropRight, imageData.gain, imageData.blacklevel, imageData.gamma, imageData.grayscale, imageData.chromakey, fill.on, fill.type, fill.color, fill.opacity, fill.color2, fill.method, fill.opacity2, fill.angle, fill.focus, fill.focusposition.x, fill.focusposition.y, fill.focussize.x, fill.focussize.y, stroke.on, stroke.color, stroke.weight, stroke.opacity, stroke.linestyle, stroke.dashstyle, stroke.filltype, stroke.src, stroke.color2, stroke.imagesize.x, stroke.imagesize.y, stroke.startArrow, stroke.endArrow, stroke.startArrowWidth, stroke.startArrowLength, stroke.endArrowWidth, stroke.endArrowLength, shadow.on, shadow.type, shadow.color, shadow.color2, shadow.opacity, shadow.offset.x, shadow.offset.y, shadow.offset2.x, shadow.offset2.y, shadow.origin.x, shadow.origin.y, shadow.matrix.xtox, shadow.matrix.ytox, shadow.matrix.xtoy, shadow.matrix.ytoy, shadow.matrix.perspectiveX, shadow.matrix.perspectiveY, skew.on, skew.offset.x, skew.offset.y, skew.origin.x, skew.origin.y, skew.matrix.xtox, skew.matrix.ytox, skew.matrix.xtoy, skew.matrix.ytoy, skew.matrix.perspectiveX,

skew.matrix.perspectiveY, extrusion.on, extrusion.type, extrusion.render, extrusion.viewpointorigin.x, extrusion.viewpointorigin.y, extrusion.viewpoint.x, extrusion.viewpoint.y, extrusion.viewpoint.z, extrusion.plane, extrusion.skewangle, extrusion.skewamt, extrusion.backdepth, extrusion.foredepth, extrusion.orientation.x, extrusion.orientation.y, extrusion.orientation.z, extrusion.orientationangle, extrusion.color, extrusion.rotationangle.x, extrusion.rotationangle.y, extrusion.lockrotationcenter, extrusion.autorotationcenter, extrusion.rotationcenter.x, extrusion.rotationcenter.y, extrusion.rotationcenter.z, and extrusion.colormode.

[*Example:* Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

19.5.8 attrNameLst (Attribute Name List)

This element is used to describe a list of attributes in which to apply an animation to.

[*Example:* Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
```

```
<p:txEl>
  <p:charRg st="4294967295" end="4294967295"/>
</p:txEl>
</p:spTgt>
</p:tgtEl>
<p:attrNameLst>
  <p:attrName>style.fontSize</p:attrName>
</p:attrNameLst>
</p:cBhvr>
</p:anim>
```

end example]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLBehaviorAttributeNameList](#)) is located in §A.3. *end note*]

19.5.9 audio (Audio)

This element is used to include audio during an animation. This element specifies that this node within the animation tree triggers the playback of an audio file; the actual audio file used is specified by the `sndTgt` element (§19.5.70).

[*Example:* Consider adding applause sound to an animation sequence. The audio element is used as follows:

```
<p:cTn ...>
  <p:stCondLst>...</p:stCondLst>
  <p:childTnLst>...</p:childTnLst>
  <p:subTnLst>
    <p:audio>
      <p:cMediaNode vol="50%">...
        <p:tgtEl>
          <p:sndTgt r:embed="rId2" />
        </p:tgtEl>
      </p:cMediaNode>
    </p:audio>
  </p:subTnLst>
</p:cTn>
```

The audio element specifies the location of the audio playback within the animation; its child `sndTgt` element specifies that the audio to be played is the target of the relationship with ID `rId2`.

end example]

Attributes	Description
isNarration (Is Narration)	This attribute indicates whether the audio is a narration for the slide.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLMediaNodeAudio](#)) is located in §A.3. *end note*]

19.5.10 **bg (Background)**

This element is used to specify animating the background of an object.

[*Example:* Consider adding animation to the background of Shape Id 3. The <bg> tag can be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="3">
    <p:bg/>
  </p:spTgt>
</p:tgtEl>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.11 **bldAsOne (Build As One)**

This element specifies in the build list to build the entire graphical object as one entity.

[*Example:* Consider having a graph appear as on entity as opposed to by category. The <bldAsOne> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldAsOne/>
  </p:bldGraphic>
</p:bldLst>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.12 **bldDgm (Build Diagram)**

This element specifies how to build the animation for a diagram.

[*Example:* Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
```

```

    <p:bldGraphic spid="4" grpId="0">
      <p:bldSub>
        <a:bldChart bld="category"/>
      </p:bldSub>
    </p:bldGraphic>
  </p:bldLst>

```

end example]

Attributes	Description
bld (Diagram Build Types)	<p>This attribute describes how the diagram is built. The animation animates the sub-elements in the container in the particular order defined by this attribute.</p> <p>The possible values for this attribute are defined by the ST_TLDiagramBuildType simple type (§19.7.33).</p>
grpId (Group ID)	<p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
spid (Shape ID)	<p>This attribute specifies the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
uiExpand (Expand UI)	<p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLBuildDiagram](#)) is located in §A.3.
end note]

19.5.13 bldGraphic (Build Graphics)

This element specifies how to build a graphical element.

[Example: Consider having a chart graphical element appear as a whole as opposed to by a category. The <bldGraphic> element should be used as follows:

```

  <p:bldLdst>
    <p:bldGraphic spid="3" grpId="0">
      <p:bldSub>

```

```

        <a:bldChart bld="category"/>
    </p:bldSub>
</p:bldGraphic>
</p:bldLst>

```

end example]

Attributes	Description
grpId (Group ID)	<p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
spid (Shape ID)	<p>This attribute specifies the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
uiExpand (Expand UI)	<p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLGraphicalObjectBuild](#)) is located in §A.3. *end note*]

19.5.14 bldLst (Build List)

This element specifies the list of graphic elements to build. This refers to how the different sub-shapes or sub-components of a object are displayed. The different objects that can have build properties are text, diagrams, and charts.

[*Example:* Consider animating a pie chart but based on category as shown below:

The <bldList> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="1" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_BuildList](#)) is located in §A.3. *end note]*

19.5.15 bldOleChart (Build Embedded Chart)

This element describes animation on a embedded Chart.

[Example: Consider displaying animation on a embedded graphical chart. The <bldOleChart>element should be use as follows:

```
<p:bldLst>
```

```
<p:bldOleChart spid="1025" grpId="0"/>
</p:bldLst>
```

end example]

Attributes	Description
animBg (Animate Background)	This attribute describes whether to animate the background of the shape. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bld (Build)	This attribute describes how the diagram is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_TLOleChartBuildType simple type (§19.7.35).
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute specifies the shape to which the build applies. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_TLOleBuildChart](#)) is located in §A.3.
end note]

19.5.16 bldP (Build Paragraph)

This element specifies how to build paragraph level properties.

[Example: Consider having animation applied only to 1st level paragraphs. The <bldP> element should be used as follows:

```
<p:bldLst>
  <p:bldP spid="3" grpId="0" build="p"/>
</p:bldLst>
```

end example]

Attributes	Description
advAuto (Auto Advance Time)	<p>This attribute specifies time after which to automatically advance the build to the next step.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p>
animBg (Animate Background)	<p>This attribute indicates whether to animate the background of the shape associated with the text.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoUpdateAnimBg (Auto Update Animation Background)	<p>This attribute indicates whether to automatically update the "animateBg" setting to true when the shape associated with the text has a fill or line.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bldLvl (Build Level)	<p>This attribute describes the build level for the paragraph. It is only supported in paragraph type builds i.e the build attribute shall also be set to "byParagraph" for this attribute to apply.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
build (Build Types)	<p>This attribute describe the build types.</p> <p>The possible values for this attribute are defined by the ST_TLParaBuildType simple type (§19.7.36).</p>
grpId (Group ID)	<p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rev (Reverse)	<p>This attribute is only supported in paragraph type builds. This specifies the direction of the build relative to the order of the elements in the container. When this is set to "true", the animations for the paragraphs are persisted in reverse order to the order of the paragraphs themselves such that the last paragraph animates first. Default value is "false".</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
spid (Shape ID)	<p>This attribute specifies the shape to which the build applies.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
uiExpand (Expand UI)	<p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLBuildParagraph](#)) is located in §A.3. *end note*]

19.5.17 bldSub (Build Sub Elements)

This element specifies the animation properties of a graphical object's sub-elements.

[Example: Consider applying animation to a graphical element consisting of a diagram. The <bldSub> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="5" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationGraphicalObjectBuildProperties](#)) is located in §A.4.1. *end note*]

19.5.18 blinds (Blinds Slide Transition)

This element describes the blinds slide transition effect, which uses a set of horizontal or vertical bars and wipes them either left-to-right or top-to-bottom, respectively, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified.

[Example: Consider the following cases in which the “blinds” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:blinds dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:blinds dir="vert"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Transition Direction)	<p>This attribute specifies a horizontal or vertical transition.</p> <p>The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. *end note]*

19.5.19 boolVal (Boolean Variant)

This element specifies a boolean value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Attributes	Description
val (Value)	<p>This attribute specifies the boolean value that this element contains and that should be used in evaluating this element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLAnimVariantBooleanVal](#)) is located in §A.3. *end note]*

19.5.20 **by (By)**

This element describes the relative offset value for the color animation.

[*Example:* Consider a shape with a lightening emphasis animation applied to it. The `<by>` element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:hsl h="0" s="0" l="0"/>
  </p:by>
</p:animClr>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLByAnimateColorTransform](#)) is located in §A.3. *end note]*

19.5.21 **by (By)**

This element describes the relative offset value for the animation.

[*Example:* Consider a shape with an animation effect that scales the size of an object by 150%. The `<by>` element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:by x="150.000%" y="150.000%"/>
</p:animScale>
```

end example]

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note*]

19.5.22 cBhvr (Common Behavior)

This element describes the common behaviors of animations.

[Example: Consider trying to emphasize text within a shape by changing the size of its font. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

Attributes	Description
accumulate (Accumulate)	This attribute makes a repeating animation build with each iteration when set to "always." The possible values for this attribute are defined by the ST_TLBehaviorAccumulateType simple type (§19.7.27).

Attributes	Description
additive (Additive)	<p>This attribute specifies how to apply the animation values to the original value for the property.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorAdditiveType simple type (§19.7.28).</p>
by (By)	<p>This attribute specifies a relative offset value for the animation..</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
from (From)	<p>This attribute specifies the starting value of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
override (Override)	<p>This attribute specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" clears the attributes on the children contained inside the target element.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorOverrideType simple type (§19.7.29).</p>
rctx (Runtime Context)	<p>This attribute describes the runtime context of the animation. The currently-understood values are "PPT" and "IE." This is used to specify the behavior used when animating in the PPT slideshow vs. IE HTML runtime. An example can be seen with the transparency effect. In IE, the transparency is animated as a bitmap, where in PPT, the style.opacity property of a shape is used to animate the transparency.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
to (To)	<p>This attribute specifies the ending value of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
xfrmType (Transform Type)	<p>This attribute specifies the kind of transform to be used.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorTransformType simple type (§19.7.30).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLCommonBehaviorData](#)) is located in §A.3. end note]

19.5.23 charRg (Character Range)

This element specifies animation on a character range defined by a start and end character position.

[Example: Consider animating the first word (characters 1 through 9) within a sentence. The <charRg> element should be used as follows:

```
<p:animMotion>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="0" end="9"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animMotion>
```

end example]

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[Note: The W3C XML Schema definition of this element’s content model ([CT_IndexRange](#)) is located in §A.3. end note]

19.5.24 checker (Checker Slide Transition)

This element describes the checker slide transition effect, which uses a set of horizontal or vertical checkerboard squares and wipes them either left-to-right or top-to-bottom, respectively, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified.

[*Example:* Consider the following cases in which the “checker” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:checker dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:checker dir="vert"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Transition Direction)	<p>This attribute specifies a horizontal or vertical transition.</p> <p>The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. *end note]*

19.5.25 childTnLst (Children Time Node List)

This element describes the list of time nodes that have a fixed location in the timing tree based on their parent time node. The children’s start time is defined relative to their parent time node’s start.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TimeNodeList](#)) is located in §A.3. *end note]*

19.5.26 circle (Circle Slide Transition)

This element describes the circle slide transition effect, which uses a circle pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “circle” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:circle/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.27 clrVal (Color Value)

This element describes the color variant. This is used to specify a color that is to be used for animating the color property of an object.

[*Example:* Consider trying to emphasize text within a shape by changing the color its font.

```
<p:set>
  <p:cBhvr override="childStyle">
    ...
  </p:cBhvr>
  <p:to>
    <p:clrVal>
      <a:schemeClr val="accent2"/>
    </p:clrVal>
  </p:to>
</p:set>
```

end example]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Color](#)) is located in §A.4.1. *end note]*

19.5.28 cmd (Command)

This element describes the several non-durational commands that can be executed within a timeline. This can be used to send events, call functions on elements, and send verbs to embedded objects. For example “Object Action” effects for Embedded objects and Media commands for sounds/movies such as "PlayFrom(0.0)" and "togglePause".

Attributes	Description																								
cmd (Command)	<p>This attribute defines the actual command to be issued. Depending on the command specified, the actual command can be made to invoke a wide range of actions on the linked or embedded object.</p> <p>Reserved Values (when type = “call”):</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>play</td><td>play corresponding media</td></tr> <tr> <td>playFrom(s)</td><td>play corresponding media starting from s, where s is the number of seconds from the beginning of the clip</td></tr> <tr> <td>pause</td><td>pause corresponding media</td></tr> <tr> <td>resume</td><td>resume play of corresponding media</td></tr> <tr> <td>stop</td><td>stop play of corresponding media</td></tr> <tr> <td>togglePause</td><td>play corresponding media if media is already paused, pause corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning.</td></tr> </table> <p>Reserved Values (when type = “evt”):</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>onstopaudio</td><td>stop play of all audio</td></tr> </table> <p>Reserved Values (when type = “verb”):</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Open the object for editing</td></tr> <tr> <td>1</td><td>Open the object for viewing</td></tr> </table> <p>The value of the cmd attribute shall be the string representation of an integer that represents the embedded object verb number. This verb number determines the action that the rendering application should take corresponding to this object when this point in the animation is reached.</p> <p>[Example: Consider the following command</p>	Value	Description	play	play corresponding media	playFrom(s)	play corresponding media starting from s, where s is the number of seconds from the beginning of the clip	pause	pause corresponding media	resume	resume play of corresponding media	stop	stop play of corresponding media	togglePause	play corresponding media if media is already paused, pause corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning.	Value	Description	onstopaudio	stop play of all audio	Value	Description	0	Open the object for editing	1	Open the object for viewing
Value	Description																								
play	play corresponding media																								
playFrom(s)	play corresponding media starting from s, where s is the number of seconds from the beginning of the clip																								
pause	pause corresponding media																								
resume	resume play of corresponding media																								
stop	stop play of corresponding media																								
togglePause	play corresponding media if media is already paused, pause corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning.																								
Value	Description																								
onstopaudio	stop play of all audio																								
Value	Description																								
0	Open the object for editing																								
1	Open the object for viewing																								

Attributes	Description
	<pre> <p:cmd type="evt" cmd="onstopaudio"> <p:cBhvr> <p:cTn display="0" masterRel="sameClick"> <p:stCondLst> <p:cond evt="begin" delay="0"> <p:tn val="5"/> </p:cond> </p:stCondLst> </p:cTn> <p:tgtEl> <p:sldTgt/> </p:tgtEl> </p:cBhvr> </p:cmd> </pre> <p><i>end example]</i></p> <p>In the above example, the event of onstopaudio stops all audio from playing once this particular animation is reached in the timeline.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
type (Command Type)	<p>This attribute specifies the kind of command that is issued by the rendering application to the appropriate target application or object.</p> <p>There are three possible values, call, evt, and verb. A call command type is used to specify the class of commands that can then be issued.</p> <p>Call commands (type="call"): This command type is used to call methods on the object specified (play(), pause(), etc.)</p> <p>Event Commands (type="evt"): This command type is used to set an event for the object at this point in the timeline (onstopaudio, etc.)</p> <p>Verb Commands (type="verb"): This command type is used to set verbs for the object to occur at this point in the timeline (0, 1, etc.)</p> <p>The possible values for this attribute are defined by the ST_TLCommandType simple type (§19.7.32).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLCommandBehavior](#)) is located in §A.3. *end note*]

19.5.29 cMediaNode (Common Media Node Properties)

This element is used to describe behavior of media elements, such as sound or movies, in an animation.

[*Example:* Consider a shape with a sound effect attached to its animation. The <cMediaNode> element should be used as follows:

```
<p:audio>
  <p:cMediaNode mute="1">
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst> ... </p:stCondLst>
      <p:endCondLst> ... </p:endCondLst>
    </p:cTn>
    <p:tgtEl> ... </p:tgtEl>
  </p:cMediaNode>
</p:audio>
```

end example]

Attributes	Description
mute (Mute)	<p>This attribute describes whether the media should be mute.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
numSld (Number of Slides)	<p>This attribute describes the numbers of slides across which the media should play.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
showWhenStopped (Show When Stopped)	<p>This attribute describes whether the media should be displayed when it is stopped.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
vol (Volume)	<p>This attribute describes the volume of the media element.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLCommonMediaNodeData](#)) is located in §A.3. *end note]*

19.5.30 comb (Comb Slide Transition)

This element describes the comb slide transition effect, which uses a set of horizontal or vertical bars and wipes them from one end of the slide to the other until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “comb” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:comb dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:comb dir="vert"/>
</p:transition>
```

end example]

[Note: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. end note]

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[Note: The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. end note]

19.5.31 cond (Condition)

This element specifies conditions on time nodes in a timeline. It is used within a list of start condition or list of end condition elements.

[Example: For example, suppose we have a shape with a two second delay after the animation is started.

```
<p:cTn>
  <p:stCondLst>
    <p:cond delay="2000"/>
  </p:stCondLst>
  <p:childTnLst>
    <p:set> ... </p:set>
    <p:animEffect transition="in" filter="blinds(horizontal)">
      <p:cBhvr>
        <p:cTn id="7" dur="1000"/>
        <p:tgtEl>
          <p:spTgt spid="4"/>
        </p:tgtEl>
      </p:cBhvr>
    </p:animEffect>
  </p:childTnLst>
</p:cTn>
```

end example]

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).
evt (Trigger Event)	This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§19.7.48).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeCondition](#)) is located in §A.3. *end note*]

19.5.32 cover (Cover Slide Transition)

This element describes the cover slide transition effect, which moves the new slide in from an off-screen location, continually covering more of the previous slide until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “cover” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
```

```
<p:cover dir="d"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="l"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="r"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="u"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="ld"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="lu"/>
</p:transition>
```

```
<p:transition>  
  <p:cover dir="rd"/>  
</p:transition>
```

```
<p:transition>  
  <p:cover dir="ru"/>  
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Direction)	<p>This attribute specifies if the direction of the transition.</p> <p>The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§19.7.51).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_EightDirectionTransition](#)) is located in §A.3. *end note]*

19.5.33 cTn (Common Time Node Properties)

This element describes the properties that are common for time nodes.

Attributes	Description
accel (Acceleration)	<p>This attribute describes the percentage of specified duration over which the element's time takes to accelerate from 0 up to the "run rate."</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage</p>

Attributes	Description
	simple type (§20.1.10.44).
afterEffect (After Effect)	<p>This attribute specifies whether there is an after effect applied to the time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoRev (Auto Reverse)	<p>This attribute describes whether to automatically play the animation in reverse after playing it in the forward direction.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bldLvl (Build level)	<p>This attribute describes the build level of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
decel (Deceleration)	<p>This attribute describes the percentage of specified duration over which the element's time takes to decelerate from the "run rate" down to 0.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>
display (Display)	<p>This attribute describes whether the state of the time node is visible or hidden.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dur (Duration)	<p>This attribute describes the duration of the time node, expressed as unit time.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p>
evtFilter (Event Filter)	<p>This attribute describes the event filter for this time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
fill (Fill)	<p>This attribute describes the fill type for the time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeFillType simple type (§19.7.41).</p>
grpId (Group ID)	<p>This attribute describes the Group ID of the time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
id (ID)	<p>This attribute specifies the identifier for the timenode.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeID simple type</p>

Attributes	Description
	(§19.7.42).
masterRel (Master Relation)	<p>This attribute specifies how the time node plays back relative to its master time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeMasterRelation simple type (§19.7.43).</p>
nodePh (Node Placeholder)	<p>This attribute describes whether this node is a placeholder.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
nodeType (Node Type)	<p>This attribute specifies the type of time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeType simple type (§19.7.47).</p>
presetClass (Preset Types)	<p>This attribute describes the class of effect in which it belongs.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodePresetClassType simple type (§19.7.44).</p>
presetID (Preset ID)	<p>This attribute describes the preset identifier for the time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
presetSubtype (Preset SubType)	<p>This attribute is a bitflag that specifies a direction or some other attribute of the effect. For example it can be set to specify a “From Bottom” for the Fly In effect, or “Bold” for the Change Font Style effect.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
repeatCount (Repeat Count)	<p>This attribute describes the number of times the element should repeat, in units of thousandths.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p>
repeatDur (Repeat Duration)	<p>This attribute describes the amount of time over which the element should repeat. If absent, the attribute is taken to be the same as the specified duration.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p>
restart (Restart)	<p>This attribute specifies if a node is to restart when it completes its action.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeRestartType simple type (§19.7.45).</p>
spd (Speed)	<p>This attribute specifies the percentage by which to speed up (or slow down) the timing. If negative, the timing is reversed. <i>[Example: if speed is 200% and the specified duration is 10 seconds, the actual duration is 5 seconds. end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
syncBehavior (Synchronization Behavior)	This attribute specifies how the time node synchronizes to its group. The possible values for this attribute are defined by the ST_TLTimeNodeSyncType simple type (§19.7.46).
tmFilter (Time Filter)	This attribute specifies the time filter for the time node. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_TLCommonTimeNodeData](#)) is located in §A.3. *end note*]

19.5.34 cut (Cut Slide Transition)

This element describes the cut slide transition effect, which simply replaces the previous slide with the new slide instantaneously. No animation is used, but an option exists to cut to a black screen before showing the new slide. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “cut” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:cut thruBlk="0"/>
</p:transition>
```

```
<p:transition>
  <p:cut thruBlk="1"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
thruBlk (Transition Through Black)	<p>This attribute specifies if the transition starts from a black screen (and then transition the new slide over black).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OptionalBlackTransition](#)) is located in §A.3. *end note]*

19.5.35 diamond (Diamond Slide Transition)

This element describes the diamond slide transition effect, which uses a diamond pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “diamond” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>  
  <p:diamond/>  
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.36 dissolve (Dissolve Slide Transition)

This element describes the dissolve slide transition effect, which uses a set of randomly placed squares on the slide that continue to be added to until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “dissolve” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:dissolve/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.37 **endCondLst (End Conditions List)**

This element describes a list of the end conditions that shall be met in order to stop the time node.

[*Example:* Consider a shape a shape with an audio attached to the animation. The <endCondList> element should be used as follows to specifies when the sound is done:

```
<p:audio>
  <p:cMediaNode>
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst> ... </p:stCondLst>
      <p:endCondLst>
        <p:cond evt="onStopAudio" delay="0">
          <p:tgtEl>
            <p:sldTgt/>
          </p:tgtEl>
        </p:cond>
      </p:endCondLst>
    </p:cTn>
    <p:tgtEl> ... </p:tgtEl>
  </p:cMediaNode>
</p:audio>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.38 endSnd (Stop Sound Action)

This element stops all previous sounds during a slide transition.

[*Example:* Consider a slide transition that stops all previous sounds. The <endSnd> element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:endSnd/>
  </p:sndAc>
</p:transition>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.39 endSync (EndSync)

This element is used to synchronizes the stopping of parallel elements in the timing tree. It is used on interactive timeline sequences to specify that the interactive sequence's duration ends when all of the child timenodes have ended. It is also used to make interactive sequences restart-able (so that the entire interactive sequence can be repeated if the trigger object is clicked on repeatedly).

[*Example:* Consider a shape with a fill change animation. The <endSync> element should be used as follows:

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn>
    <p:stCondLst/>
    <p:endSync evt="end" delay="0">
      <p:rtn val="all"/>
    </p:endSync>
    <p:childTnLst/>
  </p:cTn>
  <p:nextCondLst/>
</p:seq>
```

end example]

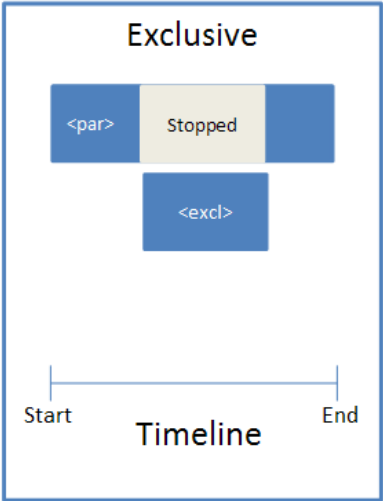

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).

Attributes	Description
evt (Trigger Event)	This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§19.7.48).

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTimeCondition](#)) is located in §A.3. end note]

19.5.40 excl (Exclusive)

This element describes the Exclusive time node. This time node is used to pause all other timelines when it is activated. Conceptually it can be though of as follows:

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTimeNodeExclusive](#)) is located in §A.3. end note]

19.5.41 fade (Fade Slide Transition)

This element describes the fade slide transition effect, which smoothly fades the previous slide either directly to the new slide or first to a black screen and then to the new slide. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “fade” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>  
  <p:fade thruBlk="0"/>
```

</p:transition>

<p:transition>
 <p:fade thruBlk="1"/>
</p:transition>

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
thruBlk (Transition Through Black)	<p>This attribute specifies if the transition starts from a black screen (and then transition the new slide over black).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OptionalBlackTransition](#)) is located in §A.3. *end note]*

19.5.42 **fltVal (Float Value)**

This element specifies a floating point value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Attributes	Description
val (Value)	<p>This attribute specifies the floating point value that this element contains and that should be used in evaluating this element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema float datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimVariantFloatVal](#)) is located in §A.3. *end note*]

19.5.43 from (From)

This element is used to specify the starting color of the target element.

[*Example:* Consider a shape with an animation fill change from one accent color to another. The <from> element should be used as follows:

```
<p:animClr clrSpc="rgb" dir="cw">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl> ... </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:from>
    <a:schemeClr val="accent3"/>
  </p:from>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.5.44 from (From)

This element specifies an x/y co-ordinate to start the animation from.

[*Example:* Consider a shape with an animation sequence that needs to start at a certain coordinate. The <from> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn> ... </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100%" y="100%"/>
  <p:to x="80%" y="100%"/>
```

</p:animScale>

end example]

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note]*

19.5.45 graphicEl (Graphic Element)

This element specifies a graphical element which to animate.

[Example: Consider a diagram with an animation effect applied to it. The <graphicEl> element should be used as follows:

```
<p:set>
  <p:cBhvr>
    <p:cTn id="6" dur="1" fill="hold"> ... </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4">
        <p:graphicEl>
          <a:dgm id="{87C2C707-C3F4-4E81-A967-A8B8AE13E575}"/>
        </p:graphicEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst> ... </p:attrNameLst>
  </p:cBhvr>
  <p:to> ... </p:to>
</p:set>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationElementChoice](#)) is located in §A.4.1. *end note]*

19.5.46 hsl (HSL)

This element specifies an incremental HSL (Hue, Saturation, Lightness) value to add to a color animation.

[Example: Consider a shape with a lightening emphasis animation. The <hsl> element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:hsl h="0" s="0" l="0"/>
  </p:by>
</p:animClr>
```

end example]

Attributes	Description
h (Hue)	Specifies hue as an angle. The values range from [0, 360] degrees. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).
l (Lightness)	Specifies a lightness as a percentage. The values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
s (Saturation)	Specifies a saturation as a percentage. The values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLByHslColorTransform](#)) is located in §A.3. end note]

19.5.47 inkTgt (Ink Target)

This element specifies an animation target element that is represented by a sub-shape in a legacy graphical object.

[*Example:* Consider an ink diagram with an animation blinds transition effect applied to it. The <inkTgt> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:inkTgt spid="_x0000_s2057"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLSubShapeId](#)) is located in §A.3. *end note]*

19.5.48 intVal (Integer)

This element specifies an integer value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Attributes	Description
val (Value)	This attribute specifies the integer value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimVariantIntegerVal](#)) is located in §A.3. *end note]*

19.5.49 iterate (Iterate)

This element specifies how the animation should be successively applied to sub elements of the target element for a repeated effect. It can be applied to contained timing and animation structures over the letters, words, or shapes within a target element.

[*Example:* Consider a text animation where the words appear letter by letter. The <iterate> element should be used as follows:

```
<p:par>
  <p:cTn id="1" >
    <p:stCondLst> ... </p:stCondLst>
    <p:iterate type="lt">
      <p:tmPct val="10000"/>
    </p:iterate>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>
```

end example]

Attributes	Description
backwards (Backwards)	This attribute specifies whether to go backwards in the timeline to the previous node. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
type (Iterate Type)	This attribute specifies the iteration behavior and applies it to each letter, word or shape within a container element. Values are by word, by letter, or by element. If there is no text or block elements such as shapes within the container or a single word, letter, or shape (depending on iterate type) then no iteration happens and the behavior is applied to the element itself instead. The possible values for this attribute are defined by the ST_IterateType simple type (§19.7.4).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLIterateData](#)) is located in §A.3.
end note]

19.5.50 newsflash (Newsflash Slide Transition)

This element describes the newsflash slide transition effect, which grows and spins the new slide counter-clockwise into place over the previous slide. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “newsflash” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
```

```
<p:newsflash/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.51 nextCondLst (Next Conditions List)

This element describes a list of conditions that shall be met to advance to the next animation sequence.

[*Example:* Consider a shape with a text emphasis changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq"> ... </p:cTn>
  <p:prevCondLst> ... </p:prevCondLst>
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note]*

19.5.52 oleChartEl (Embedded Chart Element)

This element specifies the subelement of an embedded chart to animate.

[*Example:* Consider an embedded Chart with a entrance animation effect applied to each of the graph's categories. The <oleChartEl> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
```

```
<p:cTn id="12" dur="500"/>
<p:tgtEl>
  <p:spTgt spid="19460">
    <p:oleChartEl type="category" lvl="1"/>
  </p:spTgt>
</p:tgtEl>
</p:cBhvr>
</p:animEffect>
```

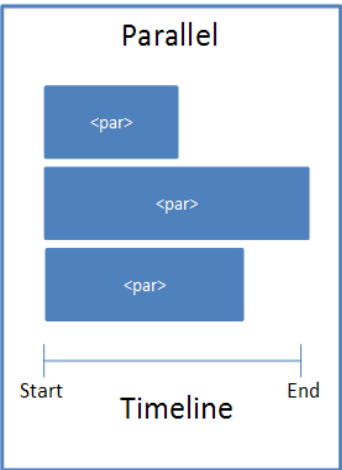

end example]

Attributes	Description
lvl (Level)	This attribute describes the element levels to animate. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Type)	This attribute specifies how to chart should be built during its animation. The possible values for this attribute are defined by the ST_TLChartSubelementType simple type (§19.7.31).

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLOleChartTargetElement](#)) is located in §A.3. *end note*]

19.5.53 par (Parallel Time Node)

This element describes the Parallel time node which can be activated along with other parallel time node containers. Conceptually it can be thought of as follows:

[Example: Consider a simple animation with a blind entrance. The <par> element should be used as follows:

```

<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            ...
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTimeNodeParallel](#)) is located in §A.3. *end note*]

19.5.54 plus (Plus Slide Transition)

This element describes the plus slide transition effect, which uses a plus pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “plus” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```

<p:transition>
  <p:plus/>
</p:transition>

```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.55 prevCondLst (Previous Conditions List)

This element describes a list of conditions that shall be met in order to go backwards in an animation sequence.

[*Example:* Consider trying to emphasize text within a shape by changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq">
    </p:cTn>
    <p:prevCondLst>
      <p:cond evt="onPrev" delay="0">
        <p:tgtEl>
          <p:sldTgt/>
        </p:tgtEl>
      </p:cond>
    </p:prevCondLst>
    <p:nextCondLst>
    </p:nextCondLst>
  </p:seq>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.56 pRg (Paragraph Text Range)

This element specifies a text range to animate based on starting and ending paragraph number.

[*Example:* Consider an animation entrance of the first 3 text paragraphs. The <pRg> element should be used as follows:

```
<p:animEffect transition="in" filter="checkerboard(across)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:pRg st="0" end="2"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_IndexRange](#)) is located in §A.3. *end note]*

19.5.57 progress (Progress)

This element defines the progression of an animation. The default for the way animation progress happens through an animEffect is a linear ramp from 0 to 1, starting at the effect’s begin time & ending at the effect’s end time. When you specify a value for the progress attribute, you are overriding this default behaviour. The value between 0 and 1 represents a percentage through the effect, where 0 is 0% and 1 is 100%.

Each animEffect is in fact an object-based transition. These transitions can be specified as “In” (where the object is not visible at 0% and becomes completely visible at 100%) or “Out” (where the object is visible at 0% and becomes completely invisible at 100%). You would set the progress attribute if you want to use the animEffect as a “static” effect, where the transition properties do not actually change over time. As an alternative to using the progress attribute, you can use the tmFilter (time filter), which is a base attribute of any effect/timenode, to specify the way that progress through an effect should be performed dynamically.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLAnimVariant](#)) is located in §A.3. *end note]*

19.5.58 pull (Pull Slide Transition)

This element describes the pull slide transition effect, which moves the previous slide to an off-screen location, continually revealing more of the new slide until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “pull” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:pull dir="d"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="l"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="r"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="u"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="ld"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="lu"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="rd"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="ru"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Direction)	<p>This attribute specifies if the direction of the transition.</p> <p>The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§19.7.51).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_EightDirectionTransition](#)) is located in §A.3. *end note]*

19.5.59 push (Push Slide Transition)

This element describes the push slide transition effect, which moves the new slide in from an off-screen location, continually pushing the previous slide to an opposite off-screen location until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “push” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:push dir="d"/>
```

</p:transition>

<p:transition>

<p:push dir="l"/>

</p:transition>

<p:transition>

<p:push dir="r"/>

</p:transition>

<p:transition>

<p:push dir="u"/>

</p:transition>

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§19.7.53).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SideDirectionTransition](#)) is located in §A.3. *end note]*

19.5.60 random (Random Slide Transition)

This element describes the random slide transition effect, which chooses a random transition from the set available in the rendering application. This transition thus can be different each time it is used.

[*Example:* Consider the following case in which the “random” slide transition is applied to a slide, along with a set of attributes. The proper usage is shown below:

```
<p:transition>
  <p:random/>
</p:transition>
```

end example]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.61 randomBar (Random Bar Slide Transition)

This element describes the randomBar slide transition effect, which uses a set of randomly placed horizontal or vertical bars on the slide that continue to be added to until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “randomBar” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:randomBar dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:randomBar dir="vert"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. *end note]*

19.5.62 rCtr (Rotation Center)

This element describes the center of the rotation used to rotate a motion path by X angle.

[*Example:* For example, suppose we have a simple animation with a checkbox text entrance.

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0.33333 E"
pathEditMode="relative" rAng="0" ptsTypes="">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:rCtr x="56.7%" y="83.4%"/>
</p:animMotion>
```

end example]

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate.

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note*]

19.5.63 rgb (RGB)

The element specifies an incremental RGB value to add to the color property.

[Example: Consider a shape with a color emphasis animation. The <rgb> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:rgb r="10" g="20" b="30"/>
  </p:by>
</p:animClr>
```

end example]

Attributes	Description
b (Blue)	This attribute specifies a blue component luminance as a percentage. Values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
g (Green)	This attribute specifies a green component luminance as a percentage. Values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
r (Red)	This attribute specifies a red component luminance as a percentage. Values are in the range [-100%, 100%].

Attributes	Description
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLByRgbColorTransform](#)) is located in §A.3. *end note*]

19.5.64 rtn (Runtime Node Trigger Choice)

This element specifies the child time node that triggers a time condition. References a child time node or all child nodes. Order is based on the child's end time.

[*Example:* Consider an animation which ends the synchronization of all parallel time nodes when all the child nodes have ended their animation. The <rtn> element should be used as follows:

```
<p:cTn>
  <p:stCondLst> ... </p:stCondLst>
  <p:endSync evt="end" delay="0">
    <p:rtn val="all"/>
  </p:endSync>
  <p:childTnLst> ... </p:childTnLst>
</p:cTn>
```

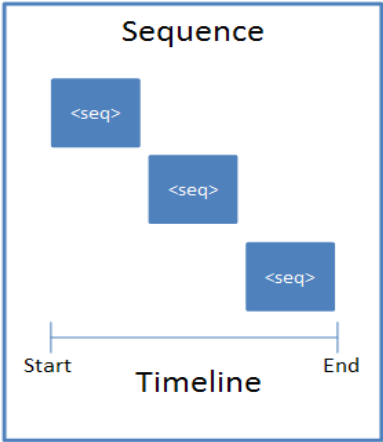

end example]

Attributes	Description
val (Value)	This attribute describes the value that triggers the runtime node. The possible values for this attribute are defined by the ST_TLTriggerRuntimeNode simple type (§19.7.49).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTriggerRuntimeNode](#)) is located in §A.3. *end note*]

19.5.65 seq (Sequence Time Node)

This element describes the Sequence time node and it can only be activated when the one before it finishes. Conceptually it can be thought of as follows:

[Example: For example, suppose we have a simple animation with a blind entrance.

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            ...
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

end example]

Attributes	Description
concurrent (Concurrent)	<p>This attribute specifies if concurrency is enabled or disabled. By default this attribute has a value of "disabled". When the value is set to "enabled", the previous element is left enabled when advancing to the next element in a sequence instead of being ended. This is only relevant for advancing via the next condition element being triggered. The only other way to advance to the next element would be to have the current element end, which implies it is no longer concurrent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
nextAc (Next Action)	<p>This attribute specifies what to do when going forward in sequence. By default this attribute has a value of "none". When this is set to seek it seeks the element to a natural end time (not necessarily the actual end time).</p>

Attributes	Description
	<p>The natural end position is defined as the latest non-infinite end time of the children. If a child loops forever, the end of its first loop is used as its "end time" for the purposes of this calculation.</p> <p>Some container elements can have infinite durations due to an infinite-duration child element. The engine needs to recurse down through all infinite duration containers to calculate their natural duration in case a child might have non-infinite duration within it that needs to be taken into account.</p> <p>The possible values for this attribute are defined by the ST_TLNextActionType simple type (§19.7.34).</p>
prevAc (Previous Action)	<p>This attribute specifies what to do when going backwards in a sequence. By default it is set to "none" and nothing special is done. When the value is "skipTimed", the sequence continues to go backwards until it reaches a sequence element that was defined to begin only on the next condition element.</p> <p>The possible values for this attribute are defined by the ST_TLPreviousActionType simple type (§19.7.37).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeNodeSequence](#)) is located in §A.3. end note]

19.5.66 set (Set Time Node Behavior)

This element allows the setting of a particular property value to a fixed value while the behavior is active and restores the value when the behavior is reset or turned off.

[Example: For example, suppose we want to set certain properties during an animation effect. The <set> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr>
      <p:cTn id="6" dur="1" fill="hold"> ... </p:cTn>
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
      <p:attrNameLst>
        <p:attrName>style.visibility</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
  <p:to>
    <p:strVal val="visible"/>
  </p:to>
</p:set>
</p:childTnLst>
```

```

    </p:to>
  </p:set>
  <p:animEffect transition="in" filter="blinds(horizontal)">
    ...
  </p:animEffect>
</p:childTnLst>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLSetBehavior](#)) is located in §A.3. *end note]*

19.5.67 sldTgt (Slide Target)

This element specifies the slide as the target element.

[*Example:* For example, suppose we have a simple animation with a blind entrance.

```

<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq"> ... </p:cTn>
  <p:prevCondLst> ... </p:prevCondLst>
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.68 snd (Sound)

This element specifies the audio information to play during a slide transition.

[*Example:* Consider a slide transition with an audio effect. The <snd> element should be used as follows:

```

<p:transition>
  <p:sndAc>
    <p:stSnd>
      <p:snd r:embed="rId2"/>
    </p:stSnd>
  </p:sndAc>
</p:transition>

```

end example]

Attributes	Description
embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [Note: A list of suggested audio types is provided in §15.2.2. <i>end note</i>] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

19.5.69 **sndAc (Sound Action)**

This element describes a sound action for slide transition. This element specifies that the start of the slide transition is accompanied by the playback of an audio file; the actual audio file used is specified by the `snd` element (§19.5.68).

[Example: Consider a slide transition with a sound effect. The `<sndAc>` element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:stSnd>
      <p:snd r:embed="rId2"/>
    </p:stSnd>
  </p:sndAc>
</p:transition>
```

end example]

[Note: The W3C XML Schema definition of this element’s content model ([CT_TransitionSoundAction](#)) is located in §A.3. *end note*]

19.5.70 sndTgt (Sound Target)

This element describes the sound information for a target object.

[*Example:* Consider a shape with a sound effect animation. The <sndTgt> element should be used as follows:

```
<p:subTnLst>
  <p:audio>
    <p:cMediaNode>
      <p:cTn display="0" masterRel="sameClick"> ... </p:cTn>
      <p:tgtEl>
        <p:sndTgt r:embed="rId2" r:link="rId3"/>
      </p:tgtEl>
    </p:cMediaNode>
  </p:audio>
</p:subTnLst>
```

end example]

Attributes	Description
embed (Embedded Audio File Relationship ID)	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [<i>Note:</i> A list of suggested audio types is provided in §15.2.2. <i>end note</i>]
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.
Namespace: http://purl.oclc.org/ooxml/drawingml/main	The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

19.5.71 split (Split Slide Transition)

This element describes the split slide transition effect, which reveals the new slide directly on top of the previous one by wiping either horizontal or vertical from the outside in, or from the inside out, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “split” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:split orient="horz" dir="in"/>
</p:transition>
```

```
<p:transition>
  <p:split orient="horz" dir="out"/>
</p:transition>
```

```
<p:transition>
  <p:split orient="vert" dir="in"/>
</p:transition>
```

```
<p:transition>
  <p:split orient="vert" dir="out"/>
</p:transition>
```

end example]

[Note: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Direction)	This attribute specifies the direction of a "split" slide transition.

Attributes	Description
	The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§19.7.52).
orient (Orientation)	This attribute specifies the orientation of a "split" slide transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SplitTransition](#)) is located in §A.3. *end note*]

19.5.72 spTgt (Shape Target)

The element specifies the shape in which to apply a certain animation to.

[*Example:* Consider a shape whose id is 3 in which we want to apply a fade animation effect. The <spTgt> should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLShapeTargetElement](#)) is located in §A.3. *end note*]

19.5.73 stCondLst (Start Conditions List)

This element contains a list conditions that shall be met for a time node to be activated.

[Example: For example, suppose we have a shape with an entrance appearance after 5 seconds. The <stCondLst>element should be used as follows:

```
<p:par>
  <p:cTn id="5" nodeType="clickEffect">
    <p:stCondLst>
      <p:cond delay="5000"/>
    </p:stCondLst>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.74 strips (Strips Slide Transition)

This element describes the strips slide transition effect, which uses a set of bars that are arranged in a staggered fashion and wipes them across the screen until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “strips” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:strips dir="ld"/>
</p:transition>
```

```
<p:transition>
  <p:strips dir="lu"/>
</p:transition>
```

```
<p:transition>
  <p:strips dir="rd"/>
</p:transition>
```

```
<p:transition>
  <p:strips dir="ru"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionCornerDirectionType simple type (§19.7.50).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_CornerDirectionTransition](#)) is located in §A.3. *end note]*

19.5.75 strVal (String Value)

This element specifies a string value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

Attributes	Description
val (Value)	This attribute specifies the string value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLAnimVariantStringVal](#)) is located in §A.3. *end note]*

19.5.76 **stSnd (Start Sound Action)**

This element describes the sound that starts playing during a slide transition.

[*Example:* Consider a slide transition that starts with a sound effect. The <stSnd> element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:stSnd>
      <p:snd r:embed="rId2"/>
    </p:stSnd>
  </p:sndAc>
</p:transition>
```

end example]

Attributes	Description
loop (Loop Sound)	This attribute specifies if the sound loops until the next sound event occurs in slideshow. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TransitionStartSoundAction](#)) is located in §A.3. *end note]*

19.5.77 **subSp (Subshape)**

This element specifies the subshape of a legacy graphical object to animate.

[*Example:* Consider adding animation to a legacy diagram. The <subSp> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="2053">
        <p:subSp spid="_x0000_s70664"/>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

Attributes	Description
spid (Shape ID)	<p>This attribute specifies the shape identifier.</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLSubShapeId](#)) is located in §A.3.
end note]

19.5.78 subTnLst (Sub-TimeNodes List)

This element describes time nodes that have a start time which is not based on the containing timenode. It is instead based on their master relationship (masterRel). At runtime, they are inserted dynamically into the timing tree as child timenodes for playback, based on the logic defined by the master relationship. These elements are used for animations such as "dim after" and "play sound effects"

[Example: Consider an animation with a "Fly In" effect on paragraphs so that each paragraph flies in on a separate click. Then the "Dim After" effect for paragraph 1 does not happen until paragraph 2 flies in. The <subTnLst> element should be used as follows:

```
<p:par>
  <p:cTn id="5" grpId="0" nodeType="clickEffect">
    <p:stCondLst> ... </p:stCondLst>
    <p:childTnLst> ... </p:childTnLst>
    <p:subTnLst>
      <p:set>
        <p:cBhvr override="childStyle">
          <p:cTn fill="hold" masterRel="nextClick" afterEffect="1"/>
          <p:tgtEl> ... </p:tgtEl>
          <p:attrNameLst> ... </p:attrNameLst>
        </p:cBhvr>
        <p:to> ... </p:to>
      </p:set>
    </p:subTnLst>
  </p:cTn>
</p:par>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_TimeNodeList](#)) is located in §A.3.
end note]

19.5.79 tav (Time Animate Value)

This element defines a "keypoint" in animation interpolation.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> ... </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="1+#ppt_h/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100%">
      <p:val>
        <p:strVal val="#ppt_y"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

end example]

Attributes	Description
fmla (Formula)	<p>This attribute allows for the specification of a formula to be used for describing a complex motion for an animated object. The formula manipulates the motion of the object by modifying a property of the object over a specified period of time. Each formula has zero or more inputs specified by the (\$) symbol, zero or more variables specified by the (#) symbol pre-pended to the variable name and a target variable which is specified by the previously specified attrName element. The formula can contain one or more of any of the constants, operators or functions listed below. In addition to this, the formula can also contain floating point numbers and parentheses.</p> <p>Mathematical operations have the following order of precedence, listed from lowest to highest. Operators listed on the same line have equal precedence.</p> <ul style="list-style-type: none">• "+", "-"• "*", "/", "%"• "^"• Unary minus, Unary plus (e.g. -2, meaning 3*-2 is the same as 3*(-2))• Variables, Constants (including numbers) and Functions (as listed previously) <p>Language Description:</p> <p>Digit = '0' '1' '2' '3' '4' '5' '6' '7' '8' '9' ;</p>

Attributes	Description

If another calcMode is specified or no calcMode is specified then a calcMode of linear is assumed. <i>end note</i>]</p> <p>[Note: Any additional characters in the formula string that are not contained within the set described are considered invalid. <i>end note</i>]</p> <p>Variables:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>\$</td><td>Formula input</td></tr><tr><td>ppt_x</td><td>Pre-animation x position of the object on the slide</td></tr><tr><td>ppt_y</td><td>Pre-animation y position of the object on the slide</td></tr><tr><td>ppt_w</td><td>Pre-animation width of the object</td></tr><tr><td>ppt_h</td><td>Pre-animation height of the object</td></tr></table> <p>Constants:</p> <table><tr><th>Name</th><th>Description</th></tr><tr><td>pi</td><td>Mathematical constant pi</td></tr><tr><td>e</td><td>Mathematical constant e</td></tr></table> <p>Operators:</p> <table><tr><th>Name</th><th>Description</th><th>Usage</th></tr><tr><td>+</td><td>Addition</td><td>“x+y”, adds x to the value y</td></tr><tr><td>-</td><td>Subtraction</td><td>“x-y”, subtracts y from the value x</td></tr><tr><td>*</td><td>Multiplication</td><td>“x*y”, multiplies x by the value y</td></tr></table>	Name	Description	\$	Formula input	ppt_x	Pre-animation x position of the object on the slide	ppt_y	Pre-animation y position of the object on the slide	ppt_w	Pre-animation width of the object	ppt_h	Pre-animation height of the object	Name	Description	pi	Mathematical constant pi	e	Mathematical constant e	Name	Description	Usage	+	Addition	“x+y”, adds x to the value y	-	Subtraction	“x-y”, subtracts y from the value x	*	Multiplication	“x*y”, multiplies x by the value y
Name	Description																														
\$	Formula input																														
ppt_x	Pre-animation x position of the object on the slide																														
ppt_y	Pre-animation y position of the object on the slide																														
ppt_w	Pre-animation width of the object																														
ppt_h	Pre-animation height of the object																														
Name	Description																														
pi	Mathematical constant pi																														
e	Mathematical constant e																														
Name	Description	Usage																													
+	Addition	“x+y”, adds x to the value y																													
-	Subtraction	“x-y”, subtracts y from the value x																													
*	Multiplication	“x*y”, multiplies x by the value y																													

Attributes	Description		
	/	Division	"x/y", divides x by the value y
	%	Modulus	"x%y", the remainder of x/y
	^	Power	"x^y", x raised to the power y
	Functions:		
	Name	Description	Usage
	abs	Absolute value	"abs(x)", absolute value of x
	acos	Arc Cosine	"acos(x)", arc cosine of the value x
	asin	Arc Sine	"asin(x)", arc sine of the value x
	atan	Arc Tangent	"atan(x)", arc tangent of the value x
	ceil	Ceil value	"ceil(x)", value of x rounded up
	cos	Cosine	"cos(x)", cosine of the value of x
	cosh	Hyperbolic Cosine	"cosh(x)", hyperbolic cosine of the value x
	deg	Radiant to Degree convert	"deg(x)", the degree value of radiant value x
	exp	Exponent	"exp(x)", value of constant e raised to the power of x
	floor	Floor value	"floor(x)", value of x rounded down
	ln	Natural logarithm	"ln(x)", natural logarithm of x
	max	Maximum of two values	"max(x,y)", returns x if (x > y) or returns y if (y > x)
	min	Minimum of two values	"min(x,y)", returns x if (x < y) or returns y if (y < x)
	rad	Degree to Radiant convert	"rad(x)", the radiant value of degree value x
	rand	Random value	"rand(x)", returns a random floating point value between 0 and x
	sin	Sine	"sin(x)", sine of the value x
	sinh	Hyperbolic Sine	"sinh(x)", hyperbolic sine of the value x
	sqrt	Square root	"sqrt(x)", square root of the value x
	tan	Tangent	"tan(x)", tangent of the value x
	tanh	Hyperbolic Tangent	"tanh(x)", hyperbolic tangent of the value x
[Example: Consider the following animation path:			

Attributes	Description
	<pre> <p:animcalcmode="lin" valueType="num"> <p:CBhvr> <p:cTn id="9" dur="664" tmFilter="0.0,0.0; 0.25,0.07; 0.50,0.2; 0.75,0.467; 1.0,1.0"> <p:stCondLst> <p:cond delay="0"/> </p:stCondLst> </p:cTn> <p:tgtEl> <p:spTgtspid="4"/> </p:tgtEl> <p:attrNameLst> <p:attrName>ppt_y</p:attrName> </p:attrNameLst> </p:CBhvr> <p:tavLst> <p:tav tm="0%" fmla="#ppt_y-sin(pi*\$)/3"> <p:val> <p:fltValval="0.5"/> </p:val> </p:tav> <p:tav tm="100%"> <p:val> <p:fltValval="1"/> </p:val> </p:tav> </p:tavLst> </p:anim> </pre> <p>The animation example above modifies the ppt_y variable of the object by subtracting $\sin(\pi * \\$)/3$ from the non-animated value of ppt_y. The start value is 0.5 and the end value is 1 specified in each of the val elements. The total time for this animation is specified within the dur attribute and the filtered time graph is specified by the tmFilter attribute. The end result is that the object moves from a point above its non-animated position back to its non-animated position. With the specification of the tmFilter it has a modified time graph such that it also appears to accelerate as it reaches its final position.</p> <p>[Note: For this example, the non-animated value of ppt_y is the value of this variable if the object were to be statically rendered on the slide without animation properties. <i>end note</i>]</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
tm (Time)	This attribute specifies the time at which the attribute being animated takes on the value.

Attributes	Description
	The possible values for this attribute are defined by the ST_TLTimeAnimateValueTime simple type (§19.7.39).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeAnimateValue](#)) is located in §A.3. *end note*]

19.5.80 **tavLst (Time Animated Value List)**

This element specifies a list of time animated value elements.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> ... </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="1+#ppt_h/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100000">
      <p:val>
        <p:strVal val="#ppt_y"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeAnimateValueList](#)) is located in §A.3. *end note*]

19.5.81 **tgtEl (Target Element)**

This element specifies the target children elements which have the animation effects applied to.

[Example: Consider a shape with ID 3 with a fade effect animation applied to it. The <tgtEl> element should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
```

```

    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTimeTargetElement](#)) is located in §A.3. *end note*]

19.5.82 tmAbs (Time Absolute)

This element describes the duration of the iteration interval in absolute time.

[*Example:* Consider a text animation where the words appear letter by letter every 10 seconds. The <tmAbs> element should be used as follows:

```

<p:par>
  <p:cTn id="5" >
    <p:stCondLst> ... </p:stCondLst>
    <p:iterate type="lt">
      <p:tmAbs val="10000"/>
    </p:iterate>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>

```

end example]

Attributes	Description
val (Time)	<p>This attribute describes an amount of time, in milliseconds.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLIterateIntervalTime](#)) is located in §A.3. *end note*]

19.5.83 tmPct (Time Percentage)

This element describes the duration of the iteration interval in a percentage of time.

[*Example:* Consider a text animation where the words appear letter by letter every 10th of the animation duration. The <tmPct> element should be used as follows:

```
<p:par>
  <p:cTn id="5" >
    <p:stCondLst> ... </p:stCondLst>
    <p:iterate type="lt">
      <p:tmPct val="10%"/>
    </p:iterate>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>
```

end example]

Attributes	Description
val (Value)	This attribute specifies the time expressed as a percentage. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLiterateIntervalPercentage](#)) is located in §A.3. *end note*]

19.5.84 [tmpl \(Template Effects\)](#)

This element specifies the "template" effects that are used by the build element. Template effects are used in text builds on the master slide. They define the rules of what effect should be applied to the 1st level paragraph, 2nd level paragraph, etc.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst> ... </p:tnLst>
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
        </p:tmpl>
      </p:tmplLst>
    </p:bldP>
  </p:bldLst>
</p:timing>
```

end example]

Attributes	Description
lvl (Level)	<p>This attribute describes the paragraph indent level to which this template effect applies.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTemplate](#)) is located in §A.3. *end note*]

19.5.85 **tmplLst (Template effects)**

This element describes a list of template effects that describe what kind of effects should be applied to a paragraph level properties.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst> ... </p:tnLst>
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
          </p:tmpl>
        </p:tmplLst>
      </p:bldP>
    </p:bldLst>
  </p:timing>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTemplateList](#)) is located in §A.3. *end note*]

19.5.86 **tn (Time Node)**

This element describes the time node trigger choice.

[Example: Consider a time node with an event condition. The <tn> element should be used as follows:

```
<p:par>
  <p:cTn id="5">
    <p:stCondLst>
      <p:cond delay="0"/>
    </p:stCondLst>
    <p:endCondLst>
      <p:cond evt="begin" delay="0">
    </p:endCondLst>
  </p:cTn>
</p:par>
```

```

        <p:tn val="5"/>
      </p:cond>
    </p:endCondLst>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>

```

end example]

Attributes	Description
val (Value)	This attribute specifies a time node identifier. The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§19.7.42).

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTriggerTimeNodeID](#)) is located in §A.3. *end note*]

19.5.87 tnLst (Time Node List)

This element specifies a list of time node elements used in an animation sequence.

[Example: Consider a simple animation sequence. The <tnLst> element should be used as follows:

```

<p:timing>
  <p:tnLst>
    <p:par> ... </p:par>
  </p:tnLst>
</p:timing>

```

end example]

[Note: The W3C XML Schema definition of this element’s content model ([CT_TimeNodeList](#)) is located in §A.3. *end note*]

19.5.88 to (To)

This element specifies the target location for an animation motion or animation scale effect

[Example: Consider an animation with a "light speed" entrance effect.

```

<p:animScale>
  <p:cBhvr>
    <p:cTn id="9" dur="200" decel="10.5%" autoRev="1" fill="hold">
      <p:stCondLst>
        <p:cond delay="600"/>
      </p:stCondLst>
    </p:cTn>
  </p:cBhvr>
</p:animScale>

```

```

    </p:stCondLst>
  </p:cTn>
  <p:tgtEl>
    <p:spTgt spid="4"/>
  </p:tgtEl>
</p:cBhvr>
<p:from x="100%" y="100%"/>
<p:to x="80%" y="100%"/>
</p:animScale>

```

end example]

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note]*

19.5.89 to (To)

The element specifies the certain attribute of a time node after an animation effect.

[Example: Consider an animation effect that leaves a string value visible afterwards. The <to> element should be used as follows:

```

<p:childTnLst>
  <p:set>
    <p:cBhvr> ... </p:cBhvr>
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:anim calcmode="lin" valueType="num"> ... </p:anim>
...</p:childTnLst>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimVariant](#)) is located in §A.3. *end note*]

19.5.90 to (To)

This element specifies the resulting color for the animation color change.

[*Example:* Consider emphasize a shape by changing its fill color from blue to red. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:animClr clrSpc="rgb">
    <p:cBhvr> ... </p:cBhvr>
    <p:to>
      <a:schemeClr val="accent2"/>
    </p:to>
  </p:animClr>
</p:childTnLst>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.5.91 txEl (Text Element)

This element specifies a text element to animate.

[*Example:* Consider a shape containing text to be animated. The <txEl> should be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="5">
    <p:txEl>
      <p:pRg st="1" end="1"/>
    </p:txEl>
  </p:spTgt>
</p:tgtEl>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTextTargetElement](#)) is located in §A.3. *end note*]

19.5.92 val (Value)

The element specifies a value for a time animate.

[*Example:* Consider a shape with a fade in animation effect. The <val> element should be used as follows:

```

<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> ... </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="0-#ppt_w/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100%">
      <p:val>
        <p:strVal val="#ppt_x"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimVariant](#)) is located in §A.3.
end note]

19.5.93 video (Video)

This element specifies video information in an animation sequence. This element specifies that this node within the animation tree triggers the playback of a video file; the actual video file used is specified by the `videoFile` element (§20.1.3.6).

[*Example:* Consider a slide with an animated video content. The `<video>` element is used as follows:

```

<p:cSld>
  <p:spTree>
    <p:pic>
      <p:nvPicPr>
        <p:cNvPr id="4"/>
        ...
        <p:nvPr>
          <a:videoFile r:link="rId1" contentType="video/ogg"/>
        </p:nvPr>
      </p:nvPicPr>
      ...
    </p:pic>
  </p:spTree>
</p:cSld>
...
<p:childTnLst>

```

```
<p:seq concurrent="1" nextAc="seek">
...
</p:seq>
<p:video>
  <p:cMediaNode>
    ...
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cMediaNode>
</p:video>
</p:childTnLst>
```

The video element specifies the location of the video playback within the animation sequence; its child spTgt element specifies that the shape which contains the video to be played has a shape ID of 4. If we look at the shape with that ID value, its child videoFile element references an external video file of content type video/ogg located at the target of the relationship with ID rId1.*end example*

Attributes	Description
fullScrn (Full Screen)	This attribute specifies if the video is displayed in full-screen. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLMediaNodeVideo](#)) is located in §A.3. *end note*]

19.5.94 wedge (Wedge Slide Transition)

This element describes the wedge slide transition effect, which uses two radial edges that wipe from top to bottom in opposite directions until the new slide is fully shown. The rendering of this transition has been shown below.

[Example: Consider the following case in which the “wedge” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wedge/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.95 wheel (Wheel Slide Transition)

This element describes the wheel slide transition effect, which uses a set of radial edges and wipes them in the clockwise direction until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “wheel” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wheel spokes="1"/>
</p:transition>
```

```
<p:transition>
  <p:wheel spokes="2"/>
</p:transition>
```

```
<p:transition>
  <p:wheel spokes="3"/>
</p:transition>
```

```
<p:transition>
```

```
<p:wheel spokes="4"/>
</p:transition>
```

```
<p:transition>
  <p:wheel spokes="8"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
spokes (Spokes)	This attributes specifies the number of spokes ("pie pieces") in the wheel The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_WheelTransition](#)) is located in §A.3. *end note]*

19.5.96 wipe (Wipe Slide Transition)

This element describes the wipe slide transition effect, which wipes the new slide over the previous slide from one edge of the screen to the opposite until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “wipe” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wipe dir="d"/>
```

</p:transition>

<p:transition>
 <p:wipe dir="t"/>
</p:transition>

<p:transition>
 <p:wipe dir="l"/>
</p:transition>

<p:transition>
 <p:wipe dir="r"/>
</p:transition>

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§19.7.53).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SideDirectionTransition](#)) is located in §A.3. *end note]*

19.5.97 zoom (Zoom Slide Transition)

This element describes the zoom slide transition effect, which uses a box pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “zoom” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:zoom dir="in"/>
</p:transition>
```

```
<p:transition>
  <p:zoom dir="out"/>
</p:transition>
```

end example]

[Note: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. end note]

Attributes	Description
dir (Direction)	This attribute specifies the direction of an "in/out" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§19.7.52).

[Note: The W3C XML Schema definition of this element’s content model ([CT_InOutTransition](#)) is located in §A.3. end note]

19.6 Slide Synchronization Data

It is often the case that slides are repurposed from existing presentations to be used in other presentations. In such cases, it is often beneficial for there to be an association, or a pairing, between the original slide and all

copied instances of it. In the presence of such a pairing, applications can enable a variety of time-saving features, including the automatic updates of copied slides when the original slide changes. The Slide Synchronization Data part is designed to enable such application-defined functionality.

This information is stored in the Slide Synchronization Data part, which is referenced via an implicit relationship from the associated Slide part.

19.6.1 sldSyncPr (Slide Synchronization Properties)

This element specifies the information needed to associate the original slide with all copied instances of it.

Attributes	Description
clientInsertedTime (Client Slide Insertion date/time)	<p>The date and time that the original slide was last updated in the current presentation.</p> <p>The date/time is stored in ISO 8601 format.</p> <p>[<i>Note</i>: This value can be used to inform the user of when the last synchronization was, as well as to determine when to next check for an updated version. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>
serverSldId (Server's Slide File ID)	<p>A string that, when paired with the target of the Slide Synchronization Data part's external relationship, uniquely identifies the original slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
serverSldModified Time (Server's Slide File's modification date/time)	<p>The date and time that the original slide was last modified in its location as defined by the target of the Slide Synchronization Data part's external relationship.</p> <p>The date and time are stored in ISO 8601 format.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SlideSyncProperties](#)) is located in §A.3. *end note*]

19.7 Simple Types

This is the complete list of simple types dedicated to PresentationML.

19.7.1 ST_BookmarkIdSeed (Bookmark ID Seed)

This simple type specifies constraints for value of the Bookmark ID seed.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than 2147483648.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_BookmarkIdSeed](#)) is located in §A.3. end note*]

19.7.2 ST_Direction (Direction)

This simple type defines a direction of either horizontal or vertical.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
horz (Horizontal)	Defines a horizontal direction.
vert (Vertical)	Defines a vertical direction.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_Direction](#)) is located in §A.3. end note*]

19.7.3 ST_Index (Index)

This simple type defines the position of an object in an ordered list.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_Index](#)) is located in §A.3. end note*]

19.7.4 ST_IterateType (Iterate Type)

This simple type specifies how the animation is applied over subelements of the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
el (Element)	Iterate by element.

Enumeration Value	Description
lt (Letter)	Iterate by Letter.
wd (Word)	Iterate by Word.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_IterateType](#)) is located in §A.3. *end note*]

19.7.5 ST_Name (Name string)

This simple type specifies a name, such as for a comment author or custom show.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Name](#)) is located in §A.3. *end note*]

19.7.6 ST_OleObjectFollowColorScheme (Embedded object to Follow Color Scheme)

This simple type determines if the Embedded object is re-colored to reflect changes to the color schemes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
full (Full)	Setting this enumeration causes the Embedded object to respond to all changes in the color scheme in the presentation.
none (None)	Setting this enumeration causes the Embedded object to not respond to changes in the color scheme in the presentation.
textAndBackground (Text and Background)	Setting this enumeration causes the Embedded object to respond only to changes in the text and background colors of the color scheme in the presentation.

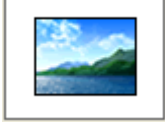

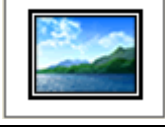

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_OleObjectFollowColorScheme](#)) is located in §A.3. *end note*]

19.7.7 ST_PhotoAlbumFrameShape (Photo Album Shape for Photo Mask)

This simple type specifies the values for photo frame types within a photo album presentation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
frameStyle1 (Rectangle Photo Frame)	
frameStyle2 (Rounded Rectangle Photo Frame)	
frameStyle3 (Simple White Photo Frame)	
frameStyle4 (Simple Black Photo Frame)	
frameStyle5 (Compound Black Photo Frame)	
frameStyle6 (Center Shadow Photo Frame)	
frameStyle7 (Soft Edge Photo Frame)	

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PhotoAlbumFrameShape](#)) is located in §A.3. *end note*]

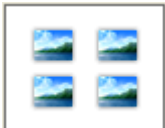

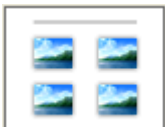

19.7.8 ST_PhotoAlbumLayout (Photo Album Layout Definition)

This simple type specifies the values for photo layouts within a photo album presentation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1pic (1 Photo per Slide)	

Enumeration Value	Description
	Specifies that photo album slides should have a single picture, centered horizontally and vertically, on the slide with no title.
1picTitle (1 Photo per Slide with Titles)	 <p>Specifies that photo album slides should have a single picture and a single title text box, centered horizontally and vertically, on the slide.</p>
2pic (2 Photos per Slide)	 <p>Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, centered horizontally and vertically, on the slide with no title.</p>
2picTitle (2 Photos per Slide with Titles)	 <p>Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, with a single title text box centered over them, collectively centered horizontally and vertically, on the slide.</p>
4pic (4 Photos per Slide)	 <p>Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, centered horizontally and vertically, on the slide with no title.</p>
4picTitle (4 Photos per Slide with Titles)	 <p>Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, with a single title text box centered over the matrix, centered horizontally and vertically, on the slide.</p>

Enumeration Value	Description
fitToSlide (Fit Photos to Slide)	 <p>Specifies that photo album slides should have a single picture, stretched to fit the entire slide size, with no title.</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PhotoAlbumLayout](#)) is located in §A.3. *end note*]

19.7.9 ST_PlaceholderSize (Placeholder Size)

This simple type facilitates the storing of the size of the placeholder. This size is described relative to the body placeholder on the master.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
full (Full)	Specifies that the placeholder should take the full size of the body placeholder on the master.
half (Half)	Specifies that the placeholder should take the half size of the body placeholder on the master. Half size vertically or horizontally? Needs a picture.
quarter (Quarter)	Specifies that the placeholder should take a quarter of the size of the body placeholder on the master. Picture would be helpful

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PlaceholderSize](#)) is located in §A.3. *end note*]

19.7.10 ST_PlaceholderType (Placeholder IDs)

This simple type facilitates the storing of the content type a placeholder should contain.

[Note: Some placeholder types are not allowed for all SlideBase types. *end note*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
body (Body)	Contains body text. Allowed for Slide, Slide Layout,

Enumeration Value	Description
	Slide Master, Notes, Notes Master. Can be horizontal or vertical on Slide and Slide Layout.
chart (Chart)	Contains a chart or graph. Special type. Allowed for Slide and Slide Layout.
clipArt (Clip Art)	Contains a single clip art image. Special type. Allowed for Slide and Slide Layout.
ctrTitle (Centered Title)	Contains a title intended to be centered on the slide. Allowed for Slide and Slide Layout.
dgm (Diagram)	Contains a diagram. Special type. Allowed for Slide and Slide Layout.
dt (Date and Time)	Contains the date and time. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
fttr (Footer)	Contains text to be used as a footer in the document. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
hdr (Header)	Contains text to be used as a header for the document. Allowed for Notes, Notes Master, Handout Master .
media (Media)	Contains multimedia content such as audio or a movie clip. Special type. Allowed for Slide and Slide Layout.
obj (Object)	Contains any content type. Special type. Allowed for Slide and Slide Layout.
pic (Picture)	Contains a picture. Special type. Allowed for Slide and Slide Layout.
sldImg (Slide Image)	Contains an image of the slide. Allowed for Notes and Notes Master.
sldNum (Slide Number)	Contains the number of a slide. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
subTitle (Subtitle)	Contains a subtitle. Allowed for Slide and Slide Layout.
tbl (Table)	Contains a table. Special type. Allowed for Slide and Slide Layout.
title (Title)	Contains a slide title. Allowed for Slide, Slide Layout and Slide Master. Can be horizontal or vertical on Slide and Slide Layout.

[Note: The W3C XML Schema definition of this simple type's content model ([ST PlaceholderType](#)) is located in §A.3. end note]

19.7.11 ST_PrintColorMode (Print Color Mode)

This simple type specifies the color mode that should be used when printing a presentation document.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bw (Black and White Mode)	Print should be in Black and White only
clr (Color Mode)	Print should be in Full Color
gray (Grayscale Mode)	Print should be in Grayscale only

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PrintColorMode](#)) is located in §A.3. *end note*]

19.7.12 ST_PrintWhat (Default print output)

This simple type specifies the default print layout that should be used when printing

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
handouts1 (1 Slide / Handout Page)	1 Slide and Handout Page layout should be used.
handouts2 (2 Slides / Handout Page)	2 Slides and Handout Page layout should be used.
handouts3 (3 Slides / Handout Page)	3 Slides and Handout Page layout should be used.
handouts4 (4 Slides / Handout Page)	4 Slides and Handout Page layout should be used.
handouts6 (6 Slides / Handout Page)	6 Slides and Handout Page layout should be used.
handouts9 (9 Slides / Handout Page)	9 Slides and Handout Page layout should be used.
notes (Notes)	Notes layout should be used.
outline (Outline)	Outline layout should be used.
slides (Slides)	Slides layout should be used.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PrintWhat](#)) is located in §A.3. *end note*]

19.7.13 ST_SlideId (Slide Identifier)

This simple type specifies the allowed numbering for the slide identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than 2147483648.
- This simple type has a minimum value of greater than or equal to 256.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideId](#)) is located in §A.3. *end note*]

19.7.14 ST_SlideLayoutId (Slide Layout ID)

This simple type sets the bounds for the slide layout id value. This layout id is used to identify the different slide layout designs.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideLayoutId](#)) is located in §A.3. *end note*]

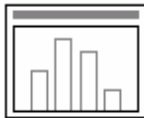

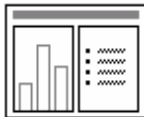

19.7.15 ST_SlideLayoutType (Slide Layout Type)

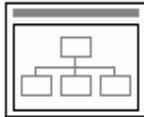

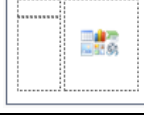

This simple type defines an arrangement of content on a slide. Each layout type is not tied to an exact positioning of placeholders, but rather provides a higher-level description of the content type and positioning of placeholders. This information can be used by the application to aid in mapping between different layouts. The application can choose which, if any, of these layouts to make available through its user interface.

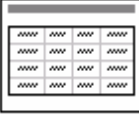

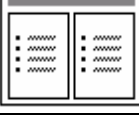

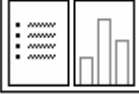

Each layout contains zero or more placeholders, each with a specific content type. An "object" placeholder can contain any kind of data. Media placeholders are intended to hold video or audio clips. The enumeration value descriptions include illustrations of sample layouts for each value of the simple type.

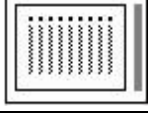

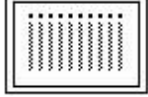

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
blank (Slide Layout Type Enumeration (Blank))	 Blank
chart (Chart)	 Title and chart
chartAndTx (Slide Layout Type Enumeration (Chart and Text))	 Title, chart on left and text on right

Enumeration Value	Description
clipArtAndTx (Clip Art and Text)	 Title, clipart on left, text on right
clipArtAndVertTx (Clip Art and Vertical Text)	 Title, clip art on left, vertical text on right
cust (Slide Layout Type Enumeration (Custom))	Custom layout defined by user
dgm (Slide Layout Type Enumeration (Diagram))	 Title and diagram
fourObj (Four Objects)	 Title and four objects
mediaAndTx (Slide Layout Type Enumeration (Media and Text))	 Title, media on left, text on right
obj (Title and Object)	 Title and object
objAndTwoObj (Object and Two Object)	 Title, one object on left, two objects on right
objAndTx (Slide Layout Type Enumeration (Object and Text))	 Title, object on left, text on right
objOnly (Object)	 Object only
objOverTx (Slide Layout Type Enumeration (Object over Text))	 Title, object on top, text on bottom
objTx (Title, Object, and Caption)	 Title, object and caption text
picTx (Picture and Caption)	 Title, picture, and caption text
secHead (Section Header)	Section header title and subtitle text

Enumeration Value	Description
	
tbl (Slide Layout Type Enumeration (Table))	 Title and table
title (Slide Layout Type Enumeration (Title))	 Title layout with centered title and subtitle placeholders
titleOnly (Slide Layout Type Enumeration (Title Only))	 Title only
twoColTx (Slide Layout Type Enumeration (Two Column Text))	 Title, text on left, text on right
twoObj (Two Objects)	 Title, object on left, object on right
twoObjAndObj (Two Objects and Object)	 Title, two objects on left, one object on right
twoObjAndTx (Two Objects and Text)	 Title, two objects on left, text on right
twoObjOverTx (Two Objects over Text)	 Title, two objects on top, text on bottom
twoTxTwoObj (Two Text and Two Objects)	 Title, two objects each with text
tx (Slide Layout Type Enumeration (Text))	 Title and text
txAndChart (Slide Layout Type Enumeration (Text and Chart))	 Title, text on left and chart on right

Enumeration Value	Description
txAndClipArt (Text and Clip Art)	 Title, text on left, clip art on right
txAndMedia (Slide Layout Type Enumeration (Text and Media))	 Title, text on left, media on right
txAndObj (Slide Layout Type Enumeration (Text and Object))	 Title, text on left, object on right
txAndTwoObj (Text and Two Objects)	 Title, text on left, two objects on right
txOverObj (Slide Layout Type Enumeration (Text over Object))	 Title, text on top, object on bottom
vertTitleAndTx (Vertical Title and Text)	 Vertical title on right, vertical text on left
vertTitleAndTxOverChart (Vertical Title and Text Over Chart)	 Vertical title on right, vertical text on top, chart on bottom
vertTx (Vertical Text)	 Title and vertical text body

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideLayoutType](#)) is located in §A.3. end note]

19.7.16 ST_SlideMasterId (Slide Master ID)

This simple type specifies the allowed numbering for the slide master identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideMasterId](#)) is located in §A.3. end note]

19.7.17 ST_SlideSizeCoordinate (Slide Size Coordinate)

This simple type specifies the slide size coordinate in EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_PositiveCoordinate32 datatype (§20.1.10.42).

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than or equal to 51206400.
- This simple type has a minimum value of greater than or equal to 914400.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideSizeCoordinate](#)) is located in §A.3. *end note*]

19.7.18 ST_SlideSizeType (Slide Size Type)

This simple type specifies the kind of slide size that the slide should be optimized for.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
35mm (35mm Film)	Slide size should be optimized for 35mm film output
A3 (A3)	Slide size should be optimized for A3 output
A4 (A4)	Slide size should be optimized for A4 output
B4ISO (B4ISO)	Slide size should be optimized for B4ISO output
B4JIS (B4JIS)	Slide size should be optimized for B4JIS output
B5ISO (B5ISO)	Slide size should be optimized for B5ISO output
B5JIS (B5JIS)	Slide size should be optimized for B5JIS output
banner (Banner)	Slide size should be optimized for banner output
custom (Custom)	Slide size should be optimized for custom output
hagakiCard (Hagaki Card)	Slide size should be optimized for hagaki card output
ledger (Ledger)	Slide size should be optimized for ledger output
letter (Letter)	Slide size should be optimized for letter output
overhead (Overhead)	Slide size should be optimized for overhead output
screen16x10 (Screen 16x10)	Slide size should be optimized for 16x10 screen output
screen16x9 (Screen 16x9)	Slide size should be optimized for 16x9 screen output
screen4x3 (Screen 4x3)	Slide size should be optimized for 4x3 screen output

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideSizeType](#)) is located in §A.3. *end note*]

19.7.19 ST_SplitterBarState (Splitter Bar State)

This simple type specifies the state that the splitter bar should be shown in. The splitter bar separates a primary and secondary region within a viewing area.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
maximized (Max)	The primary region occupies the greatest amount of the viewing area allowed by the application.
minimized (Min)	The primary region occupies the least amount of the viewing area allowed by the application.
restored (Restored)	The primary region has a specific intermediate size.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SplitterBarState](#)) is located in §A.3. *end note*]

19.7.20 ST_TLAnimateBehaviorCalcMode (Time List Animate Behavior Calculate Mode)

This simple type specifies how the animation flows from point to point.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
discrete (Calc Mode Enum (Discrete))	Discrete
fm1a (Calc Mode Enum (Formula))	Formula
lin (Calc Mode Enum (Linear))	Linear

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateBehaviorCalcMode](#)) is located in §A.3. *end note*]

19.7.21 ST_TLAnimateBehaviorValueType (Time List Animate Behavior Value Types)

This simple type specifies the type of property value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clr (Value Type Enum (Color))	Color
num (Value Type Enum (Number))	Number
str (Value Type Enum (String))	String

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateBehaviorValueType](#)) is located in §A.3. *end note*]

19.7.22 ST_TLAnimateColorDirection (Time List Animate Color Direction)

This simple type specifies the direction in which to interpolate the animation (clockwise or counterclockwise).

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ccw (Counter-Clockwise)	Counter-Clockwise
cw (Direction Enum (Clockwise))	Clockwise

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateColorDirection](#)) is located in §A.3. *end note*]

19.7.23 ST_TLAnimateColorSpace (Time List Animate Color Space)

This simple type specifies the color space of the animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hsl (Color Space Enum (HSL))	Hue, Saturation, Luminance
rgb (Color Space Enum (RGB))	Red, Green, Blue

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateColorSpace](#)) is located in §A.3. *end note*]

19.7.24 ST_TLAnimateEffectTransition (Time List Animate Effect Transition)

This simple type specifies whether the effect is a transition in, transition out, or neither.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
in (Transition Enum (In))	In
none (Transition Enum (None))	None
out (Transition Enum (Out))	Out

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateEffectTransition](#)) is located in §A.3. *end note*]

19.7.25 ST_TLAnimateMotionBehaviorOrigin (Time List Animate Motion Behavior Origin)

This simple type specifies what the origin of the motion path is relative to.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
layout (Origin Enum (Layout))	Layout
parent (Origin Enum (Parent))	Parent

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateMotionBehaviorOrigin](#)) is located in §A.3. *end note*]

19.7.26 ST_TLAnimateMotionPathEditMode (Time List Animate Motion Path Edit Mode)

This simple type specifies how the motion path moves when the target element is moved.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fixed (Path Edit Mode Enum (Fixed))	Fixed
relative (Path Edit Mode Enum (Relative))	Relative

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateMotionPathEditMode](#)) is located in §A.3. *end note*]

19.7.27 ST_TLBehaviorAccumulateType (Behavior Accumulate Type)

This simple type makes a repeating animation build with each iteration when set to "always."

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Accumulate Enum (Always))	Always
none (Accumulate Enum (None))	None

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorAccumulateType](#)) is located in §A.3. *end note*]

19.7.28 ST_TLBehaviorAdditiveType (Behavior Additive Type)

This simple type specifies how to apply the animation values to the original value for the property.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
base (Additive Enum (Base))	Base
mult (Additive Enum (Multiply))	Multiply
none (None)	None
repl (Additive Enum (Replace))	Replace
sum (Additive Enum (Sum))	Sum

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorAdditiveType](#)) is located in §A.3. *end note*]

19.7.29 ST_TLBehaviorOverrideType (Behavior Override Type)

This simple type specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" clears the attributes on the children contained inside the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
childStyle (Override Enum (Child Style))	Child Style
normal (Override Enum (Normal))	Normal

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorOverrideType](#)) is located in §A.3. *end note*]

19.7.30 ST_TLBehaviorTransformType (Behavior Transform Type)

This simple type specifies how the behavior animates the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
img (Image)	Image transform
pt (Point)	Point transform

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorTransformType](#)) is located in §A.3. *end note*]

19.7.31 ST_TLChartSubelementType (Chart Subelement Type)

This simple type defines an animation target element that is represented by a subelement of a chart.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
category (Category Axis)	Category
gridLegend (Grid Legend)	Background Element (Grid and Legend)
ptInCategory (Single Point in Category)	Category Element
ptInSeries (Single Point in Data Series)	Series Element
series (Data Series)	Series

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLChartSubelementType](#)) is located in §A.3. *end note*]

19.7.32 ST_TLCommandType (Command Type)

This simple type specifies a command type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
call (Command Type Enum (Call))	Call
evt (Command Type Enum (Event))	Event
verb (Command Type Enum (Verb))	Verb

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLCommandType](#)) is located in §A.3. *end note*]

19.7.33 ST_TLDiagramBuildType (Diagram Build Types)

This simple type specifies the different diagram build types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (Diagram Build Type Enum (All At Once))	All At Once
breadthByLvl (Diagram Build Type Enum (Breadth By Level))	Breadth By Level
breadthByNode (Diagram Build Type Enum (Breadth By Node))	Breadth By Node
ccw (Diagram Build Type Enum (Counter-Clockwise))	Counter-Clockwise
ccwIn (Diagram Build Type Enum (Counter-Clockwise-In))	Counter-Clockwise-In
ccwOut (Diagram Build Type Enum (Counter-Clockwise-Out))	Counter-Clockwise-Out
cust (Diagram Build Type Enum (Custom))	Custom
cw (Diagram Build Type Enum (Clockwise))	Clockwise
cwIn (Diagram Build Type Enum (Clockwise-In))	Clockwise-In
cwOut (Diagram Build Type Enum (Clockwise-Out))	Clockwise-Out
depthByBranch (Diagram Build Type Enum (Depth By Branch))	Depth By Branch
depthByNode (Diagram Build Type Enum (Depth By Node))	Depth By Node
down (Diagram Build Type Enum (Down))	Down
inByRing (Diagram Build Type Enum (In-By-Ring))	In-By-Ring
outByRing (Diagram Build Type Enum (Out-By-Ring))	Out-By-Ring
up (Diagram Build Type Enum (Up))	Up
whole (Diagram Build Type Enum (Whole))	Whole

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLDiagramBuildType](#)) is located in §A.3. *end note*]

19.7.34 ST_TLNextActionType (Next Action Type)

This simple type specifies what to do when going forward in a sequence. When the value is "seek," it seeks the current child element to its natural end time before advancing to the next element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (Next Action Type Enum (None))	None
seek (Next Action Type Enum (Seek))	Seek

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLNextActionType](#)) is located in §A.3. *end note*]

19.7.35 ST_TLOleChartBuildType (Embedded Chart Build Type)

This simple type describes how to build an embedded Chart.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (Chart Build Type Enum (All At Once))	All At Once
category (Chart Build Type Enum (Category))	By Category
categoryEl (Chart Build Type Enum (Category Element))	By Category Element
series (Chart Build Type Enum (Series))	By Series
seriesEl (Chart Build Type Enum (Series Element))	By Series Element

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLOleChartBuildType](#)) is located in §A.3. *end note*]

19.7.36 ST_TLParaBuildType (Paragraph Build Type)

This simple type describes how to build a paragraph.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (All At Once)	Specifies to animate all paragraphs at once.

Enumeration Value	Description
cust (Custom)	Specifies the build has custom user settings.
p (Paragraph)	Specifies to animate paragraphs grouped by bullet level.
whole (Whole)	Specifies to animate the entire body of text as one block.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLParaBuildType](#)) is located in §A.3. *end note*]

19.7.37 ST_TLPreviousActionType (Previous Action Type)

This simple type specifies what to do when going backwards in a sequence. When the value is "skipTimed," the sequence continues to go backwards until it reaches a sequence element that was defined to being only on a "next" event.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (Previous Action Type Enum (None))	None
skipTimed (Previous Action Type Enum (Skip Timed))	Skip Timed

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLPreviousActionType](#)) is located in §A.3. *end note*]

19.7.38 ST_TLTime (Time)

This simple type specifies time after which to automatically advance the build to the next step. An amount of time, in milliseconds.

This simple type is a union of the following types:

- The ST_TLTimeIndefinite simple type (§19.7.40).
- The W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTime](#)) is located in §A.3. *end note*]

19.7.39 ST_TLTimeAnimateValueTime (Animation Time)

This simple type specifies a percentage within the time span of the element. A value of indefinite means the attribute should be ignored.

This simple type is a union of the following types:

- The ST_PositiveFixedPercentage simple type (§20.1.10.44).
- The ST_TLTimeIndefinite simple type (§19.7.40).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeAnimateValueTime](#)) is located in §A.3. *end note*]

19.7.40 ST_TLTimeIndefinite (Indefinite Time Declaration)

This simple type specifies a value that designates an "indefinite" amount time -- typically means this property is subordinate to other, defined properties.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
indefinite (Indefinite Type Enum)	Specifies Indefinite Time

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeIndefinite](#)) is located in §A.3. *end note*]

19.7.41 ST_TLTimeNodeFillType (Time Node Fill Type)

This simple type specifies what modifications the effect leaves on the target element's properties when the effect ends.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
freeze (Freeze)	Freeze
hold (TimeNode Fill Type Enum (Hold))	Hold
remove (Remove)	Remove
transition (Transition)	Transition

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeFillType](#)) is located in §A.3. *end note*]

19.7.42 ST_TLTimeNodeID (Time Node ID)

This simple type represents a node or event on the timeline by its identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeID](#)) is located in §A.3. end note*]

19.7.43 ST_TLTimeNodeMasterRelation (Time Node Master Relation)

This simple type specifies how the time node plays back relative to its master time node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lastClick (TimeNode Master Relation Enum (Last Click))	Last Click
nextClick (TimeNode Master Relation Enum (Next Click))	Next Click
sameClick (TimeNode Master Relation Enum (Same Click))	Same Click

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeMasterRelation](#)) is located in §A.3. end note*]

19.7.44 ST_TLTimeNodePresetClassType (Time Node Preset Class Type)

This simple type specifies the class of effect in which this effect belongs.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
emph (Preset Type Enum (Emphasis))	Emphasis Preset
entr (Preset Type Enum (Entrance))	Entrance Preset
exit (Exit)	Exit Preset
mediacall (Preset Type Enum (Media Call))	Media Call Preset
path (Preset Type Enum (Path))	Path Preset
verb (Preset Type Enum (Verb))	Verb Preset

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodePresetClassType](#)) is located in §A.3. end note*]

19.7.45 ST_TLTimeNodeRestartType (Time Node Restart Type)

This simple type determines whether an effect can play more than once.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Restart Enum (Always))	Always restart node
never (Restart Enum (Never))	Never restart node
whenNotActive (Restart Enum (When Not Active))	Restart when node is not active

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeRestartType](#)) is located in §A.3. *end note*]

19.7.46 ST_TLTimeNodeSyncType (Time Node Sync Type)

This simple type specifies how the time node synchronizes to its group.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
canSlip (TimeNode Sync Enum (Can Slip))	Can Slip
locked (TimeNode Sync Enum (Locked))	Locked

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeSyncType](#)) is located in §A.3. *end note*]

19.7.47 ST_TLTimeNodeType (Time Node Type)

This simple type specifies time node types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
afterEffect (Node Type Enum (After Effect))	After Effect
afterGroup (Node Type Enum (After Group))	After Group
clickEffect (Node Type Enum (Click Effect))	Click Effect
clickPar (Node Type Enum (Click Paragraph))	Click Paragraph
interactiveSeq (Node Type Enum (Interactive Sequence))	Interactive Sequence
mainSeq (Node Type Enum (Main Sequence))	Main Sequence
tmRoot (Node Type Enum (Timing Root))	Timing Root

Enumeration Value	Description
withEffect (Node Type Enum (With Effect))	With Effect
withGroup (Node Type Enum (With Group))	With Group

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeType](#)) is located in §A.3. *end note*]

19.7.48 ST_TLTriggerEvent (Trigger Event)

This simple type specifies a particular event that causes the time condition to be true.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
begin (Trigger Event Enum (Begin))	Fire trigger at the beginning
end (Trigger Event Enum (End))	Fire trigger at the end
onBegin (Trigger Event Enum (On Begin))	Fire trigger at the beginning
onClick (Trigger Event Enum (On Click))	Fire trigger on a mouse click
onDbClick (Trigger Event Enum (On Double Click))	Fire trigger on double-mouse click
onEnd (Trigger Event Enum (On End))	Fire trigger at the end
onMouseOut (Trigger Event Enum (On Mouse Out))	Fire trigger on mouse out
onMouseOver (Trigger Event Enum (On Mouse Over))	Fire trigger on mouse over
onNext (Trigger Event Enum (On Next))	Fire trigger on next node
onPrev (Trigger Event Enum (On Previous))	Fire trigger on previous node
onStopAudio (Trigger Event Enum (On Stop Audio))	Fire trigger on stop audio

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTriggerEvent](#)) is located in §A.3. *end note*]

19.7.49 ST_TLTriggerRuntimeNode (Trigger RunTime Node)

This simple type specifies the child time node that triggers a time condition. References a child TimeNode or all child nodes. Order is based on the child's end time.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (Trigger RunTime Node Enum (All))	All
first (Trigger RunTime Node (First))	First
last (Trigger RunTime Node (Last))	Last

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTriggerRuntimeNode](#)) is located in §A.3. *end note*]

19.7.50 ST_TransitionCornerDirectionType (Transition Corner Direction Type)

This simple type specifies diagonal directions for slide transitions.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ld (Transition Corner Direction Enum (Left-Down))	Specifies the slide transition direction of left-down
lu (Transition Corner Direction Enum (Left-Up))	Specifies the slide transition direction of left-up
rd (Transition Corner Direction Enum (Right-Down))	Specifies the slide transition direction of right-down
ru (Transition Corner Direction Enum (Right-Up))	Specifies the slide transition direction of right-up

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionCornerDirectionType](#)) is located in §A.3. *end note*]

19.7.51 ST_TransitionEightDirectionType (Transition Eight Direction)

This simple type specifies the direction of an animation.

This simple type is a union of the following types:

- The ST_TransitionCornerDirectionType simple type (§19.7.50).
- The ST_TransitionSideDirectionType simple type (§19.7.53).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionEightDirectionType](#)) is located in §A.3. *end note*]

19.7.52 ST_TransitionInOutDirectionType (Transition In/Out Direction Type)

This simple type specifies if a slide transition should go in or out.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
in (Transition In/Out Direction Enum (In))	Specifies the slide transition should go in
out (Transition In/Out Direction Enum (Out))	Specifies the slide transition should go out

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionInOutDirectionType](#)) is located in §A.3. *end note*]

19.7.53 ST_TransitionSideDirectionType (Transition Side Direction Type)

This simple type defines a set of slide transition directions.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
d (Transition Side Direction Enum (Down))	Specifies that the transition direction is down
l (Transition Side Direction Enum (Left))	Specifies that the transition direction is left
r (Transition Side Direction (Right))	Specifies that the transition direction is right
u (Transition Side Direction Enum (Up))	Specifies that the transition direction is up

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionSideDirectionType](#)) is located in §A.3. *end note*]

19.7.54 ST_TransitionSpeed (Transition Speed)

This simple type defines the allowed transition speeds for transitioning from the current slide to the next.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
fast (Fast)	Fast slide transition.
med (Medium)	Medium slide transition.
slow (low)	Slow slide transition.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionSpeed](#)) is located in §A.3. *end note*]

19.7.55 ST_ViewType (List of View Types)

This simple type specifies the kind of view that should be used when displaying the presentation document to the user.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
handoutView (Handout View)	Handout View mode should be used.
notesMasterView (Notes Master View)	Notes Master View mode should be used.
notesView (Notes View)	Notes View mode should be used.
outlineView (Outline View)	Outline View mode should be used.
sldMasterView (Slide Master View)	Slide Master View mode should be used.
sldSorterView (Slide Sorter View)	Slide Sorter View mode should be used.
sldThumbnailView (Slide Thumbnail View)	Slide Thumbnail View mode should be used.
sldView (Normal Slide View)	Normal Slide View mode should be used.

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_ViewType](#)) is located in §A.3.
end note]

20. DrawingML - Framework Reference Material

[Note: For further information on the mapping of elements and attributes to OPC parts, see the Bibliography entry, “Information on elements, attributes, and OPC parts in ECMA-376 (OOXML)” . *end note*]

The subordinate subclauses specify the semantics for the XML markup comprising DrawingML content, which can be used within the contents of WordprocessingML, SpreadsheetML, or PresentationML documents.

This portion of DrawingML defines its core pieces.

20.1 DrawingML - Main

The DrawingML Main namespace defines all of the base constructs for all kinds of DrawingML objects (charts, diagrams, shapes, pictures, and so on). These constructs and primitives are defined below.

20.1.1 Table of Contents

This subclause is informative.

20.1.2 Basics.....	2717
20.1.2.1 EMU Unit of Measurement	2717
20.1.2.2 Core Drawing Object Information	2717
20.1.2.2.1 bldChart (Build Chart).....	2717
20.1.2.2.2 bldDgm (Build Diagram)	2718
20.1.2.2.3 chart (Chart to Animate)	2719
20.1.2.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties).....	2719
20.1.2.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties).....	2720
20.1.2.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties).....	2720
20.1.2.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)	2720
20.1.2.2.8 cNvPr (Non-Visual Drawing Properties)	2721
20.1.2.2.9 cNvSpPr (Non-Visual Shape Drawing Properties).....	2723
20.1.2.2.10 cxnSp (Connection Shape)	2724
20.1.2.2.11 cxnSpLocks (Connection Shape Locks)	2725
20.1.2.2.12 dgm (Diagram to Animate)	2727
20.1.2.2.13 endCxn (Connection End)	2727
20.1.2.2.14 ext (Extension)	2727
20.1.2.2.15 extLst (Extension List)	2728
20.1.2.2.16 graphic (Graphic Object).....	2728
20.1.2.2.17 graphicData (Graphic Object Data)	2728
20.1.2.2.18 graphicFrame (Graphic Frame).....	2729
20.1.2.2.19 graphicFrameLocks (Graphic Frame Locks)	2729
20.1.2.2.20 grpSp (Group shape).....	2730
20.1.2.2.21 grpSpLocks (Group Shape Locks).....	2731

20.1.2.2.22	grpSpPr (Visual Group Shape Properties).....	2732
20.1.2.2.23	hlinkHover (Hyperlink for Hover)	2733
20.1.2.2.24	ln (Outline).....	2734
20.1.2.2.25	nvCxnSpPr (Non-Visual Properties for a Connection Shape).....	2735
20.1.2.2.26	nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	2735
20.1.2.2.27	nvGrpSpPr (Non-Visual Properties for a Group Shape).....	2735
20.1.2.2.28	nvPicPr (Non-Visual Properties for a Picture).....	2736
20.1.2.2.29	nvSpPr (Non-Visual Properties for a Shape).....	2736
20.1.2.2.30	pic (Picture).....	2736
20.1.2.2.31	picLocks (Picture Locks)	2737
20.1.2.2.32	snd (Hyperlink Sound)	2739
20.1.2.2.33	sp (Shape)	2739
20.1.2.2.34	spLocks (Shape Locks).....	2740
20.1.2.2.35	spPr (Shape Properties)	2741
20.1.2.2.36	stCxn (Connection Start).....	2742
20.1.2.2.37	style (Shape Style)	2742
20.1.2.2.38	sx (Horizontal Ratio)	2742
20.1.2.2.39	sy (Vertical Ratio).....	2743
20.1.2.2.40	txBody (Shape Text Body).....	2743
20.1.2.2.41	txSp (Text Shape)	2743
20.1.2.2.42	useSpRect (Use Shape Text Rectangle)	2744
20.1.2.2.43	cpLocks (Content Part Locks).....	2744
20.1.2.3	Colors.....	2745
20.1.2.3.1	alpha (Alpha)	2745
20.1.2.3.2	alphaMod (Alpha Modulation)	2746
20.1.2.3.3	alphaOff (Alpha Offset).....	2747
20.1.2.3.4	blue (Blue)	2747
20.1.2.3.5	blueMod (Blue Modulation)	2748
20.1.2.3.6	blueOff (Blue Offset).....	2748
20.1.2.3.7	comp (Complement).....	2749
20.1.2.3.8	gamma (Gamma)	2750
20.1.2.3.9	gray (Gray)	2750
20.1.2.3.10	green (Green)	2750
20.1.2.3.11	greenMod (Green Modulation)	2750
20.1.2.3.12	greenOff (Green Offset).....	2751
20.1.2.3.13	hslClr (Hue, Saturation, Luminance Color Model)	2752
20.1.2.3.14	hue (Hue)	2752
20.1.2.3.15	hueMod (Hue Modulate).....	2753
20.1.2.3.16	hueOff (Hue Offset)	2754
20.1.2.3.17	inv (Inverse)	2754
20.1.2.3.18	invGamma (Inverse Gamma)	2755
20.1.2.3.19	lum (Luminance)	2755
20.1.2.3.20	lumMod (Luminance Modulation)	2756
20.1.2.3.21	lumOff (Luminance Offset)	2756
20.1.2.3.22	prstClr (Preset Color)	2757
20.1.2.3.23	red (Red)	2757
20.1.2.3.24	redMod (Red Modulation).....	2758
20.1.2.3.25	redOff (Red Offset)	2758

20.1.2.3.26	sat (Saturation)	2759
20.1.2.3.27	satMod (Saturation Modulation).....	2760
20.1.2.3.28	satOff (Saturation Offset)	2761
20.1.2.3.29	schemeClr (Scheme Color).....	2761
20.1.2.3.30	scrgbClr (RGB Color Model - Percentage Variant)	2762
20.1.2.3.31	shade (Shade)	2762
20.1.2.3.32	srgbClr (RGB Color Model - Hex Variant).....	2763
20.1.2.3.33	sysClr (System Color)	2764
20.1.2.3.34	tint (Tint).....	2764
20.1.3	Audio and Video.....	2765
20.1.3.1	audioCd (Audio from CD).....	2765
20.1.3.2	audioFile (Audio from File)	2766
20.1.3.3	end (Audio End Time)	2767
20.1.3.4	quickTimeFile (QuickTime from File)	2768
20.1.3.5	st (Audio Start Time).....	2769
20.1.3.6	videoFile (Video from File)	2769
20.1.3.7	wavAudioFile (Audio from WAV File)	2770
20.1.4	Styles.....	2772
20.1.4.1	Styles.....	2772
20.1.4.1.1	accent1 (Accent 1)	2772
20.1.4.1.2	accent2 (Accent 2)	2772
20.1.4.1.3	accent3 (Accent 3)	2773
20.1.4.1.4	accent4 (Accent 4)	2774
20.1.4.1.5	accent5 (Accent 5)	2774
20.1.4.1.6	accent6 (Accent 6)	2775
20.1.4.1.7	bgFillStyleLst (Background Fill Style List)	2775
20.1.4.1.8	custClr (Custom color)	2776
20.1.4.1.9	dk1 (Dark 1)	2776
20.1.4.1.10	dk2 (Dark 2)	2777
20.1.4.1.11	effectStyle (Effect Style)	2778
20.1.4.1.12	effectStyleLst (Effect Style List)	2778
20.1.4.1.13	fillStyleLst (Fill Style List).....	2779
20.1.4.1.14	fmtScheme (Format Scheme).....	2780
20.1.4.1.15	folHlink (Followed Hyperlink)	2781
20.1.4.1.16	font (Font).....	2781
20.1.4.1.17	fontRef (Font Reference)	2782
20.1.4.1.18	fontScheme (Font Scheme)	2782
20.1.4.1.19	hlink (Hyperlink)	2783
20.1.4.1.20	lnDef (Line Default).....	2784
20.1.4.1.21	lnStyleLst (Line Style List)	2784
20.1.4.1.22	lt1 (Light 1).....	2785
20.1.4.1.23	lt2 (Light 2).....	2786
20.1.4.1.24	majorFont (Major Font).....	2787
20.1.4.1.25	minorFont (Minor fonts).....	2787
20.1.4.1.26	scene3d (3D Scene Properties).....	2788
20.1.4.1.27	spDef (Shape Default).....	2788
20.1.4.1.28	txDef (Text Default)	2789

20.1.4.2	Table Styles	2790
20.1.4.2.1	band1H (Band 1 Horizontal)	2790

20.1.8.10	bgClr (Background color)	2842
20.1.8.11	biLevel (Bi-Level (Black/White) Effect)	2842
20.1.8.12	blend (Blend Effect)	2843
20.1.8.13	blip (Blip).....	2843
20.1.8.14	blipFill (Picture Fill)	2844
20.1.8.15	blur (Blur Effect)	2846
20.1.8.16	clrChange (Color Change Effect).....	2847
20.1.8.17	clrFrom (Change Color From)	2848
20.1.8.18	clrRepl (Solid Color Replacement)	2848
20.1.8.19	clrTo (Change Color To)	2848
20.1.8.20	cont (Effect Container)	2848
20.1.8.21	custDash (Custom Dash).....	2848
20.1.8.22	ds (Dash Stop).....	2849
20.1.8.23	duotone (Duotone Effect)	2849

20.1.8.24	effect (Effect)	2849
20.1.8.25	effectDag (Effect Container)	2850
20.1.8.26	effectLst (Effect Container)	2850
20.1.8.27	fgClr (Foreground color)	2852
20.1.8.28	fill (Fill)	2853
20.1.8.29	fillOverlay (Fill Overlay Effect)	2853
20.1.8.30	fillRect (Fill Rectangle)	2853
20.1.8.31	fillToRect (Fill To Rectangle)	2854
20.1.8.32	glow (Glow Effect)	2856
20.1.8.33	gradFill (Gradient Fill)	2856
20.1.8.34	grayscale (Gray Scale Effect)	2858
20.1.8.35	grpFill (Group Fill)	2858
20.1.8.36	gs (Gradient stops)	2858
20.1.8.37	gsLst (Gradient Stop List)	2858
20.1.8.38	headEnd (Line Head/End Style)	2858
20.1.8.39	hsl (Hue Saturation Luminance Effect)	2859
20.1.8.40	innerShdw (Inner Shadow Effect)	2860
20.1.8.41	lin (Linear Gradient Fill)	2860
20.1.8.42	lum (Luminance Effect)	2861
20.1.8.43	miter (Miter Line Join)	2861
20.1.8.44	noFill (No Fill)	2862
20.1.8.45	outerShdw (Outer Shadow Effect)	2862
20.1.8.46	path (Path Gradient)	2863
20.1.8.47	pattFill (Pattern Fill)	2864
20.1.8.48	prstDash (Preset Dash)	2864
20.1.8.49	prstShdw (Preset Shadow)	2865
20.1.8.50	reflection (Reflection Effect)	2865
20.1.8.51	relOff (Relative Offset Effect)	2868
20.1.8.52	round (Round Line Join)	2868
20.1.8.53	softEdge (Soft Edge Effect)	2868
20.1.8.54	solidFill (Solid Fill)	2869
20.1.8.55	srcRect (Source Rectangle)	2869
20.1.8.56	stretch (Stretch)	2869
20.1.8.57	tailEnd (Tail line end style)	2870
20.1.8.58	tile (Tile)	2870
20.1.8.59	tileRect (Tile Rectangle)	2872
20.1.8.60	tint (Tint Effect)	2873
20.1.8.61	xfrm (Transform Effect)	2873
20.1.9	Shape Definitions and Attributes	2874
20.1.9.1	ahLst (List of Shape Adjust Handles)	2875
20.1.9.2	ahPolar (Polar Adjust Handle)	2875
20.1.9.3	ahXY (XY Adjust Handle)	2876
20.1.9.4	arcTo (Draw Arc To)	2877
20.1.9.5	avLst (List of Shape Adjust Values)	2879
20.1.9.6	close (Close Shape Path)	2880
20.1.9.7	cubicBezTo (Draw Cubic Bezier Curve To)	2881
20.1.9.8	custGeom (Custom Geometry)	2882

20.1.9.9	cxn (Shape Connection Site)	2883
20.1.9.10	cxnLst (List of Shape Connection Sites)	2885

End of informative text.

20.1.2 Basics

This section describes all the basic common elements associated with the DrawingML framework.

20.1.2.1 EMU Unit of Measurement

Throughout ECMA-376, the EMU is used as a unit of measurement for length. An *EMU* is defined as follows:

$$1 \text{ emu} = \frac{1}{914400} \text{ US inch} = \frac{1}{360000} \text{ cm}$$

[*Rationale*: The EMU was created in order to be able to evenly divide in both English and Metric units, in order to avoid rounding errors during the calculation. The usage of EMUs also facilitates a more seamless system switch and interoperability between different locales utilizing different units of measurement. EMUs define an integer based, high precision coordinate system. *end rationale*]

20.1.2.2 Core Drawing Object Information

Within DrawingML, there is the notion of core drawing elements. These are elements that both are vital to and common across the DrawingML framework. These elements denote the most integral pieces of the DrawingML document structure and thus are among the most widely used.

[*Note*: Measurement Units - Length units must be expressed in device-independent physical units: English Metric units (EMUs), points, picas, and inches. Device-dependent units such as pixels must not be used. *end note*]

20.1.2.2.1 bldChart (Build Chart)

This element specifies how to build the animation for a diagram.

[*Example*: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bdldLst>
```

end example]

Attributes	Description
animBg (Animate Background)	Specifies whether or not the chart background elements should be animated as well. [Note: An example of background elements are grid lines and the chart legend. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bld (Build)	Specifies how the chart is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_AnimationChartBuildType simple type (§20.1.10.5).

[Note: The W3C XML Schema definition of this element’s content model ([CT_AnimationChartBuildProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.2 **bldDgm (Build Diagram)**

This element specifies how to build the animation for a diagram.

[Example: Consider having a diagram appear as on entity as opposed to by section. The bldDgm element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bdldLst>
```

end example]

Attributes	Description
bld (Build)	Specifies how the chart is built. The animation animates the sub-elements in the container in the particular order defined by this attribute.

Attributes	Description
	The possible values for this attribute are defined by the ST_AnimationDgmBuildType simple type (§20.1.10.7).
rev (Reverse Animation)	Specifies whether the animation of the objects in this diagram should be reversed or not. If this attribute is not specified, a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationDgmBuildProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.3 chart (Chart to Animate)

This element specifies a reference to a chart that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a chart there is also animation build steps defined.

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the chart should be built using. For instance the chart can be built as one object meaning it is animated as a single graphic. Alternatively the chart can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_ChartBuildStep simple type (§20.1.10.13).
categoryIdx (Category Index)	Specifies the index of the category within the corresponding chart that should be animated. The possible values for this attribute are defined by the W3C XML Schema int datatype.
seriesIdx (Series Index)	Specifies the index of the series within the corresponding chart that should be animated. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationChartElement](#)) is located in §A.4.1. *end note*]

20.1.2.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

[Note: The W3C XML Schema definition of this element's content model ([CT_NonVisualConnectorProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualGraphicFrameProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualGroupDrawingShapeProps](#)) is located in §A.4.1. *end note*]

20.1.2.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  <p:cNvPicPr>
    <a:picLocks noChangeAspect="1"/>
  </p:cNvPicPr>
  <p:nvPr/>
</p:nvPicPr>
...
</p:pic>
```

end example]

Attributes	Description
preferRelativeResize (Relative Resize Preferred)	<p>Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.</p> <p>[<i>Example</i>: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set</p>

Attributes	Description
	<p>to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualPictureProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.8 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example:* Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
</p:nvPicPr>
...
</p:pic>
```

end example]

Attributes	Description
descr (Alternative Text for Object)	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example:</i> Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
hidden (Hidden)	<p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note:</i> An</p>

Attributes	Description
	<p>application can have settings which allow this object to be viewed. <i>end note</i></p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre data-bbox="456 533 760 562"><... hidden="true" /></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Unique Identifier)	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="456 1115 678 1144"><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
name (Name)	<p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="456 1556 776 1585">< ... name="foo.jpg" ></pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
title (Title)	<p>Specifies the title (caption) of the current DrawingML object.</p>

Attributes	Description
	<p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre><... title="Process Flow Diagram"></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

20.1.2.2.9 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example*: Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
  ...
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

Attributes	Description
txBox (Text Box)	<p>Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.</p> <p>[<i>Note</i>: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_NonVisualDrawingShapeProps](#)) is located in §A.4.1. *end note*]

20.1.2.2.10 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[*Example:* Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
  ...
  <p:sp>
    <p:nvSpPr>
      <p:cNvPr id="1" name="Rectangle 1"/>
      <p:cNvSpPr/>
      <p:nvPr/>
    </p:nvSpPr>
    ...
  </p:sp>
  <p:sp>
    <p:nvSpPr>
      <p:cNvPr id="2" name="Rectangle 2"/>
      <p:cNvSpPr/>
      <p:nvPr/>
    </p:nvSpPr>
    ...
  </p:sp>
  <p:cxnSp>
```

```

<p:nvCxnSpPr>
  <p:cNvPr id="3" name="Elbow Connector 3"/>
  <p:cNvCxnSpPr>
    <a:stCxn id="1" idx="3"/>
    <a:endCxn id="2" idx="1"/>
  </p:cNvCxnSpPr>
</p:nvPr>
</p:nvCxnSpPr>
...
</p:cxnSp>
</p:spTree>

```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlConnector](#)) is located in §A.4.1. *end note*]

20.1.2.2.11 cxnSpLocks (Connection Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeShapeType (Disallow Shape Type Change)	Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean

Attributes	Description
	datatype.
noEditPoints (Disallow Shape Point Editing)	<p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ConnectorLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.12 dgm (Diagram to Animate)

This element specifies a reference to a diagram that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a diagram there is also animation build steps defined.

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the diagram should be built using. For instance the diagram can be built as one object meaning it is animated as a single graphic. Alternatively the diagram can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_DgmBuildStep simple type (§20.1.10.20).
id (Identifier)	Specifies the GUID of the shape for this build step in the animation. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationDgmElement](#)) is located in §A.4.1. *end note*]

20.1.2.2.13 endCxn (Connection End)

This element specifies the ending connection that should be made by the corresponding connector shape. This connects the end tail of the connector to the final destination shape.

Attributes	Description
id (Identifier)	Specifies the id of the shape to make the final connection to. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).
idx (Index)	Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it shall be specified which connection site the corresponding connector shape should connect to. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Connection](#)) is located in §A.4.1. *end note*]

20.1.2.2.14 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that is used for later versions of generating applications.

[*Note: This element is not intended to reintroduce transitional schema into the strict conformance class. end note*]

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note: The W3C XML Schema definition of this element's content model ([CT_OfficeArtExtension](#)) is located in §A.4.1. end note*]

20.1.2.2.15 extLst (Extension List)

This element specifies the extension list within which all future extensions of element type ext is defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the framework.

[*Note: The W3C XML Schema definition of this element's content model ([CT_OfficeArtExtensionList](#)) is located in §A.4.1. end note*]

20.1.2.2.16 graphic (Graphic Object)

This element specifies the existence of a single graphic object. Document authors should refer to this element when they wish to persist a graphical object of some kind. The specification for this graphical object is provided entirely by the document author and referenced within the graphicData child element.

[*Note: The W3C XML Schema definition of this element's content model ([CT_GraphicalObject](#)) is located in §A.4.1. end note*]

20.1.2.2.17 graphicData (Graphic Object Data)

This element specifies the reference to a graphic object within the document. This graphic object is provided entirely by the document authors who choose to persist this data within the document.

[*Note: Depending on the kind of graphical object used not every generating application that supports the OOXML framework has the ability to render the graphical object. end note*]

[*Note: This element is not intended to reintroduce transitional schema into the strict conformance class. end note*]

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of

Attributes	Description
	<p>this tag.</p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GraphicalObjectData](#)) is located in §A.4.1. *end note*]

20.1.2.2.18 **graphicFrame** (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlGraphicalObjectFrame](#)) is located in §A.4.1. *end note*]

20.1.2.2.19 **graphicFrameLocks** (Graphic Frame Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	<p>Specifies that the generating application should not allow aspect ratio changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noDrilldown (Disallow Selection of Child Shapes)	<p>Specifies that the generating application should not allow selecting of objects within the corresponding graphic frame but allow selecting of the graphic frame itself. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding graphic frame. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding picture. That means also that no picture, shapes or text attached to this picture can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>[<i>Note</i>: If this attribute is specified to be true then the graphic frame cannot be selected and the objects within the graphic frame cannot be selected as well. That is the entire graphic frame including all sub-parts are considered un-selectable. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GraphicalObjectFrameLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.20 grpSp (Group shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example*: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
```

```

<p:grpSpPr>
  <a:xfrm>
    <a:off x="838200" y="990600"/>
    <a:ext cx="2426208" cy="978408"/>
    <a:chOff x="838200" y="990600"/>
    <a:chExt cx="2426208" cy="978408"/>
  </a:xfrm>
</p:grpSpPr>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
</p:grpSp>

```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlGroupShape](#)) is located in §A.4.1. *end note*]

20.1.2.2.21 grpSpLocks (Group Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	<p>Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the corresponding group shape cannot be grouped. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noMove (Disallow	Specifies that the corresponding graphic frame cannot be moved. Objects that reside

Attributes	Description
Moving Shape)	<p>within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noResize (Disallow Shape Resizing)	<p>Specifies that the corresponding group shape cannot be resized. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the corresponding group shape cannot be rotated Objects that reside within the group can still be rotated unless they also have been locked. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the corresponding group shape cannot have any part of it be selected. That means that no picture, shapes or attached text can be selected either if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>[Note: This property is inherited by sub-elements and thus all shapes within the group shape cannot be selected when this attribute is set to a value of true. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noUnggrp (Disallow Shape Ungrouping)	<p>Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.22 grpSpPr (Visual Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Attributes	Description
bwMode (Black and	Specifies that the group shape should be rendered using only black and white coloring.

Attributes	Description
White Mode)	<p>That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShapeProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.23 [hlinkHover](#) (Hyperlink for Hover)

This element specifies the hyperlink information to be activated when the user's mouse is hovered over the corresponding object. The operation of the hyperlink is to have the specified action be activated when the mouse of the user hovers over the object. When this action is activated then additional attributes can be used to specify other tasks that should be performed along with the action.

Attributes	Description
action (Action Setting)	<p>Specifies an action that is to be taken when this hyperlink is activated. This can be used to specify a slide to be navigated to or a script of code to be run.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
endSnd (End Sounds)	<p>Specifies if the URL in question should stop all sounds that are playing when it is clicked.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
highlightClick (Highlight Click)	<p>Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application can determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
history (Add Hyperlink to Page History)	<p>Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1 or true is assumed.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
id (Drawing Object Hyperlink Target) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
invalidUrl (Invalid URL)	Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application can still store the URL but it is known that this URL is not correct. The possible values for this attribute are defined by the W3C XML Schema string datatype.
tgtFrame (Target Frame)	Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute is used to determine if a new window is launched for viewing or if an existing one can be used. If this attribute is omitted, than a new window is opened. The possible values for this attribute are defined by the W3C XML Schema string datatype.
tooltip (Hyperlink Tooltip)	Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, than the hyperlink text itself can be displayed. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Hyperlink](#)) is located in §A.4.1. *end note*]

20.1.2.2.24 [ln \(Outline\)](#)

This element specifies an outline style that can be applied to a number of different objects such as shapes and text. The line allows for the specifying of many different types of outlines including even line dashes and bevels.

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).

Attributes	Description
cap (Line Ending Cap Type)	<p>Specifies the ending caps that should be used for this line. [<i>Note</i>: Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, then a value of square is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).</p>
cmpd (Compound Line Type)	<p>Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.</p> <p>The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).</p>
w (Line Width)	<p>Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.25 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GvmlConnectorNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.26 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GvmlGraphicFrameNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.27 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group

shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlGroupShapeNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.28 **nvPicPr (Non-Visual Properties for a Picture)**

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example:* Consider the following PresentationML.

```
<p:pic>
  ...
  <p:nvPicPr>
    ...
  </p:nvPicPr>
  ...
</p:pic>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlPictureNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.29 **nvSpPr (Non-Visual Properties for a Shape)**

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlShapeNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.30 **pic (Picture)**

This element specifies the existence of a picture object within the document.

[*Example:* Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```

<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  <p:blipFill>
    ...
  </p:blipFill>
  <p:spPr>
    ...
  </p:spPr>
</p:pic>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlPicture](#)) is located in §A.4.1.
end note]

20.1.2.2.31 picLocks (Picture Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

Attributes	Description
noChangeShapeType (Disallow Shape Type Change)	<p>Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noCrop (Disallow Crop Changes)	<p>Specifies that the generating application should not allow cropping for the corresponding picture. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noEditPoints (Disallow Shape Point Editing)	<p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is</p>

Attributes	Description
	not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PictureLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.32 **snd** (Hyperlink Sound)

This element specifies a sound to be played when a hyperlink within the document is activated. This sound is specified from within the parent hyperlink element.

Attributes	Description
embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [<i>Note:</i> A list of suggested audio types is provided in §15.2.2. <i>end note</i>] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

20.1.2.2.33 **sp** (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[*Note:* Shapes are the preferred mechanism for specifying text on a slide. *end note*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlShape](#)) is located in §A.4.1. *end note*]

20.1.2.2.34 spLocks (Shape Locks)

This element specifies all locking properties for a shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	<p>Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noChangeArrowheads (Disallow Arrowhead Changes)	<p>Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noChangeAspect (Disallow Aspect Ratio Change)	<p>Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noChangeShapeType (Disallow Shape Type Change)	<p>Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noEditPoints (Disallow Shape Point Editing)	<p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noTextEdit (Disallow Shape Text Editing)	<p>Specifies that the generating application should not allow editing of the shape text for the corresponding shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ShapeLocking](#)) is located in §A.4.1. end note]

20.1.2.2.35 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a shape.

Attributes	Description
bwMode (Black and White Mode)	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p>

Attributes	Description
	<p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ShapeProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.36 stCxn (Connection Start)

This element specifies the starting connection that should be made by the corresponding connector shape. This connects the head of the connector to the first shape.

Attributes	Description
id (Identifier)	<p>Specifies the id of the shape to make the final connection to.</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
idx (Index)	<p>Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it shall be specified which connection site the corresponding connector shape should connect to.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Connection](#)) is located in §A.4.1. *end note*]

20.1.2.2.37 style (Shape Style)

This element specifies the style information for a shape.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ShapeStyle](#)) is located in §A.4.1. *end note*]

20.1.2.2.38 sx (Horizontal Ratio)

This element specifies the horizontal ratio for use within a scaling calculation.

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Ratio](#)) is located in §A.4.1. *end note*]

20.1.2.2.39 [sy](#) (Vertical Ratio)

This element specifies the vertical ratio for use within a scaling calculation.

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Ratio](#)) is located in §A.4.1. *end note*]

20.1.2.2.40 [txBody](#) (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

[Note: The W3C XML Schema definition of this element's content model ([CT_TextBody](#)) is located in §A.4.1. *end note*]

20.1.2.2.41 [txSp](#) (Text Shape)

This element specifies the existence of a text shape within a parent shape. This text shape is specifically used for displaying text as it has only text related child elements.

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlTextShape](#)) is located in §A.4.1. *end note*]

20.1.2.2.42 useSpRect (Use Shape Text Rectangle)

This element specifies that the text rectangle from the parent shape should be used for this text shape. If this attribute is specified then the text rectangle, or text bounding box as it is also called should have the same dimensions as the text bounding box of the parent shape within which this text shape resides.

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlUseShapeRectangle](#)) is located in §A.4.1. *end note*]

20.1.2.2.43 cpLocks (Content Part Locks)

This element specifies all locking properties for a content part. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	<p>Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noChangeArrowheads (Disallow Arrowhead Changes)	<p>Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noChangeAspect (Disallow Aspect Ratio Change)	<p>Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noChangeShapeType (Disallow Shape Type Change)	<p>Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noEditPoints (Disallow Shape Point Editing)	<p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noGrp (Disallow	Specifies that the generating application should not allow shape grouping for the

Attributes	Description
Shape Grouping)	<p>corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes, or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_ContentPartLocking) is located in §A.4.1. *end note*]

20.1.2.3 Colors

Given its own section within DrawingML Basics, colors are an integral part of the DrawingML framework. Colors are used in virtually every object to help describe its appearance when it is rendered on the screen. Since not every generating application wishes to represent color in the same manner, it is possible to specify color in a number of different ways.

20.1.2.3.1 alpha (Alpha)

This element specifies its input color with the specific opacity, but with its color unchanged.

Attributes	Description
val (Value)	<p>Specifies the opacity as expressed by a percentage value.</p> <p><i>[Example: The following represents a green solid fill which is 50% opaque</i></p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alpha val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedPercentage](#)) is located in §A.4.1. end note]

20.1.2.3.2 alphaMod (Alpha Modulation)

This element specifies a more or less opaque version of its input color. An alpha modulate never increases the alpha beyond 100%. A 200% alpha modulate makes a input color twice as opaque as before. A 50% alpha modulate makes a input color half as opaque as before.

Attributes	Description
val (Value)	<p>Specifies the opacity as expressed by a percentage relative to the input color.</p> <p><i>[Example: The following represents a green solid fill which is 50% opaque</i></p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alphaMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PositivePercentage](#)) is located in §A.4.1. end note]

20.1.2.3.3 alphaOff (Alpha Offset)

This element specifies a more or less opaque version of its input color. Increases or decreases the input alpha percentage by the specified percentage offset. A 10% alpha offset increases a 50% opacity to 60%. A -10% alpha offset decreases a 50% opacity to 40%. The transformed alpha values are limited to a range of 0 to 100%. A 10% alpha offset increase to a 100% opaque object still results in 100% opacity.

Attributes	Description
val (Value)	<p>Specifies the opacity as expressed by a percentage offset increase or decrease to the input color. Increases never increase the opacity beyond 100%, decreases never decrease the opacity below 0%.</p> <p>[Example: The following represents a green solid fill which is 90% opaque</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alphaOff val="-10%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.4 blue (Blue)

This element specifies the input color with the specific blue component, but with the red and green color components unchanged.

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:blue val="100%"/> </a:srgbClr> </a:solidFill></pre>

Attributes	Description
	<i>end example]</i> The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.5 blueMod (Blue Modulation)

This element specifies the input color with its blue component modulated by the given percentage. A 50% blue modulate reduces the blue component by half. A 200% blue modulate doubles the blue component.

Attributes	Description
val (Value)	Specifies the blue component as expressed by a percentage relative to the input color component. Increases never increase the blue component beyond 100%, decreases never decrease the blue component below 0%. [Example: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, 00, 80) <pre><a:solidFill> <a:srgbClr val="0000FF"> <a:blueMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <i>end example]</i> The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.6 blueOff (Blue Offset)

This element specifies the input color with its blue component shifted, but with its red and green color components unchanged.

Attributes	Description
val (Value)	Specifies the blue component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the blue component beyond 100%, decreases never decrease the blue component below 0%.

Attributes	Description
	<p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, 00, CC)</p> <pre> <a:solidFill> <a:srgbClr val="00FF00"> <a:blueOff val="-20%"/> </a:srgbClr> </a:solidFill> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1. *end note]*

20.1.2.3.7 comp (Complement)

This element specifies that the color rendered should be the complement of its input color with the complement being defined as such. Two colors are called complementary if, when mixed they produce a shade of grey. For instance, the complement of red which is RGB (255, 0, 0) is cyan which is RGB (0, 255, 255).

Primary colors and secondary colors are typically paired in this way:

- red and cyan (where cyan is the mixture of green and blue)
- green and magenta (where magenta is the mixture of red and blue)
- blue and yellow (where yellow is the mixture of red and green)

[Example:

The following represents the complement of red:

```

<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:comp/>
  </a:srgbClr>
</a:solidFill>

```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_ComplementTransform](#)) is located in §A.4.1. *end note]*

20.1.2.3.8 gamma (Gamma)

This element specifies that the output color rendered by the generating application should be the sRGB gamma shift of the input color.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_GammaTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.9 gray (Gray)

This element specifies a grayscale of its input color, taking into relative intensities of the red, green, and blue primaries.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_GrayscaleTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.10 green (Green)

This elements specifies the input color with the specified green component, but with its red and blue color components unchanged.

Attributes	Description
val (Value)	<p>Specifies the value of the green component. The assigned value is specified as a percentage with 0% indicating minimal green and 100% indicating maximum green.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, FF, FF)</p> <pre><a:solidFill> <a:srgbClr val="0000FF"> <a:green val="100%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Percentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.11 greenMod (Green Modulation)

This element specifies the input color with its green component modulated by the given percentage. A 50% green modulate reduces the green component by half. A 200% green modulate doubles the green component.

Attributes	Description
val (Value)	<p>Specifies the green component as expressed by a percentage relative to the input color component. Increases never increase the green component beyond 100%, decreases never decrease the green component below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 80, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:greenMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.12 greenOff (Green Offset)

This element specifies the input color with its green component shifted, but with its red and blue color components unchanged.

Attributes	Description
val (Value)	<p>Specifies the green component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the green component beyond 100%, decreases never decrease the green component below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, CC, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:greenOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Percentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.13 **hslClr (Hue, Saturation, Luminance Color Model)**

This element specifies a color using the HSL color model. A perceptual gamma of 2.2 is assumed.

Hue refers to the dominant wavelength of color, saturation refers to the purity of its hue, and luminance refers to its lightness or darkness.

As with all colors, colors defined with the HSL color model can have color transforms applied to it.

[Example:

The color blue having RGB value RRGGBB = (00, 00, 80) is equivalent to

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
```

end example]

Attributes	Description
hue (Hue)	<p>Specifies the angular value describing the wavelength. Expressed in 1/6000ths of a degree.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p>
lum (Luminance)	<p>Specifies the luminance referring to the lightness or darkness of the color. Expressed as a percentage with 0% referring to maximal dark (black) and 100% referring to maximal white.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
sat (Saturation)	<p>Specifies the saturation referring to the purity of the hue. Expressed as a percentage with 0% referring to grey, 100% referring to the purest form of the hue.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_HslColor](#)) is located in §A.4.1. *end note*]

20.1.2.3.14 **hue (Hue)**

This element specifies the input color with the specified hue, but with its saturation and luminance unchanged.

[Example: The following two solid fills are equivalent.

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="0" sat="100%" lum="50%">
    <a:hue val="14400000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Attributes	Description
val (Value)	Specifies the actual angle value to be used with the input color's hue component. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedAngle](#)) is located in §A.4.1. *end note*]

20.1.2.3.15 hueMod (Hue Modulate)

This element specifies the input color with its hue modulated by the given percentage. A 50% hue modulate decreases the angular hue value by half. A 200% hue modulate doubles the angular hue value.

Attributes	Description
val (Value)	Specifies the opacity as expressed by a percentage relative to the input color. [Example: The following represents a green solid fill which is 50% opaque <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alphaMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <i>end example]</i> The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[Note: The W3C XML Schema definition of this element's content model ([CT_PositivePercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.16 hueOff (Hue Offset)

This element specifies the input color with its hue shifted, but with its saturation and luminance unchanged.

Attributes	Description
val (Value)	<p>Specifies the actual angular value of the shift. The result of the shift shall be between 0 and 360 degrees. Shifts resulting in angular values less than 0 are treated as 0. Shifts resulting in angular values greater than 360 are treated as 360.</p> <p>[Example: The following increases the hue angular value by 10 degrees.</p> <pre><a:solidFill> <a:hslClr hue="0" sat="100%" lum="50%"/> <a:hueOff val="600000"/> </a:solidFill></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>

[Note: The W3C XML Schema definition of this element’s content model (CT_Angle) is located in §A.4.1. end note]

20.1.2.3.17 inv (Inverse)

This element specifies the inverse of its input color.

[Example:

The inverse of red (1, 0, 0) is cyan (0, 1, 1).

The following represents cyan, the inverse of red:

```
<a:solidFill>  
  <a:srgbClr val="FF0000">  
    <a:inv/>  
  </a:srgbClr>  
</a:solidFill>
```

end example]

[Note: The W3C XML Schema definition of this element’s content model (CT_InverseTransform) is located in §A.4.1. end note]

20.1.2.3.18 `invGamma` (Inverse Gamma)

This element specifies that the output color rendered by the generating application should be the inverse sRGB gamma shift of the input color.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_InverseGammaTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.19 `lum` (Luminance)

This element specifies the input color with the specified luminance, but with its hue and saturation unchanged. Typically luminance values fall in the range [0%, 100%].

[*Example:*

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="0%">
    <a:lum val="50%"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Attributes	Description
val (Value)	<p>Specifies the value of the luminance. The assigned value is specified as a percentage with 0% indicating minimal luminance and 100% indicating maximum luminance.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 66, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:lum val="20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.20 lumMod (Luminance Modulation)

This element specifies the input color with its luminance modulated by the given percentage. A 50% luminance modulate reduces the luminance by half. A 200% luminance modulate doubles the luminance.

Attributes	Description
val (Value)	<p>Specifies the luminance as expressed by a percentage relative to the input color. Increases never increase the luminance beyond 100%, decreases never decrease the luminance below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 75, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:lumMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.21 lumOff (Luminance Offset)

This element specifies the input color with its luminance shifted, but with its hue and saturation unchanged.

Attributes	Description
val (Value)	<p>Specifies the luminance as expressed by a percentage offset increase or decrease to the input color. Increases never increase the luminance beyond 100%, decreases never decrease the luminance below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 99, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:lumOff val="-20%"/> </a:srgbClr> </a:solidFill></pre>

Attributes	Description
	<i>end example]</i> The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.22 prstClr (Preset Color)

This element specifies a color which is bound to one of a predefined collection of colors.

[*Example:*

The following defines a solid fill bound to the "black" preset color.

```
<a:solidFill>
  <a:prstClr val="black">
</a:solidFill>
```

end example]

Attributes	Description
val (Value)	Specifies the actual preset color value. The possible values for this attribute are defined by the ST_PresetColorVal simple type (§20.1.10.47).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PresetColor](#)) is located in §A.4.1.
end note]

20.1.2.3.23 red (Red)

This element specifies the input color with the specified red component, but with its green and blue color components unchanged.

Attributes	Description
val (Value)	Specifies the value of the red component. The assigned value is specified as a percentage with 0% indicating minimal red and 100% indicating maximum red. [<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (FF, FF, 00)

Attributes	Description
	<pre> <a:solidFill> <a:srgbClr val="00FF00"> <a:red val="100%"/> </a:srgbClr> </a:solidFill> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.24 redMod (Red Modulation)

This element specifies the input color with its red component modulated by the given percentage. A 50% red modulate reduces the red component by half. A 200% red modulate doubles the red component.

Attributes	Description
val (Value)	<p>Specifies the red component as expressed by a percentage relative to the input color component. Increases never increase the red component beyond 100%, decreases never decrease the red component below 0%.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (FF, 00, 00) to value RRGGBB= (80, 00, 00)</p> <pre> <a:solidFill> <a:srgbClr val="FF0000"> <a:redMod val="50%"/> </a:srgbClr> </a:solidFill> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.25 redOff (Red Offset)

This element specifies the input color with its red component shifted, but with its green and blue color components unchanged.

Attributes	Description
val (Value)	<p>Specifies the red component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the red component beyond 100%, decreases never decrease the red component below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (FF, 00, 00) to value RRGGBB= (CC, 00, 00)</p> <pre> <a:solidFill> <a:srgbClr val="FF0000"> <a:redOff val="-20%"/> </a:srgbClr> </a:solidFill> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.26 sat (Saturation)

This element specifies the input color with the specified saturation, but with its hue and luminance unchanged. Typically saturation values fall in the range [0%, 100%].

[*Example:*

The following two solid fills are equivalent:

```

<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="14400000" sat="0%" lum="50%">
    <a:sat val="100000"/>
  <a:hslClr/>
</a:solidFill>

```

end example]

Attributes	Description
val (Value)	<p>Specifies the value of the saturation. The assigned value is specified as a percentage with 0% indicating minimal saturation and 100% indicating maximum saturation.</p>

Attributes	Description
	<p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (40, C0, 40)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:sat val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.27 satMod (Saturation Modulation)

This element specifies the input color with its saturation modulated by the given percentage. A 50% saturation modulate reduces the saturation by half. A 200% saturation modulate doubles the saturation.

Attributes	Description
val (Value)	<p>Specifies the saturation as expressed by a percentage relative to the input color. Increases never increase the saturation beyond 100%, decreases never decrease the saturation below 0%.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (66, 99, 66)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:satMod val="20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.28 satOff (Saturation Offset)

This element specifies the input color with its saturation shifted, but with its hue and luminance unchanged. A 10% offset to 20% saturation yields 30% saturation.

Attributes	Description
val (Value)	<p>Specifies the saturation as expressed by a percentage offset increase or decrease to the input color. Increases never increase the saturation beyond 100%, decreases never decrease the saturation below 0%.</p> <p>[<i>Example</i>: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (19, E5, 19)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:satOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.29 schemeClr (Scheme Color)

This element specifies a color bound to a user's theme. As with all elements which define a color, it is possible to apply a list of color transforms to the base color defined.

Attributes	Description
val (Value)	<p>Specifies the desired scheme.</p> <p>[<i>Example</i>: The following represents a color bound to the "lt1" theme color</p> <pre><a:solidFill> <a:schemeClr val="lt1"/> </a:solidFill></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_SchemeColorVal simple type (§20.1.10.53).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_SchemeColor](#)) is located in §A.4.1.
end note]

20.1.2.3.30 **scrgbClr (RGB Color Model - Percentage Variant)**

This element specifies a color using the red, green, blue RGB color model. Each component, red, green, and blue is expressed as a percentage from 0% to 100%. A linear gamma of 1.0 is assumed.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[*Example*: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50%" g="50%" b="50%"/>
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC"/>
</a:solidFill>
```

end example]

Attributes	Description
b (Blue)	Specifies the percentage of blue. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
g (Green)	Specifies the percentage of green. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Red)	Specifies the percentage of red. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ScRgbColor](#)) is located in §A.4.1.
end note]

20.1.2.3.31 **shade (Shade)**

This element specifies a darker version of its input color. A 10% shade is 10% of the input color combined with 90% black.

Attributes	Description
val (Value)	Specifies the shade as expressed by a percentage value.

Attributes	Description
	<p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, BC, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:shade val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.32 srgbClr (RGB Color Model - Hex Variant)

This element specifies a color using the red, green, blue RGB color model. Red, green, and blue is expressed as sequence of hex digits, RRGGBB. A perceptual gamma of 2.2 is used.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[Example: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50%" g="50%" b="50%"/>
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC"/>
</a:solidFill>
```

end example]

Attributes	Description
val (Value)	<p>The actual color value. Expressed as a sequence of hex digits RRGGBB.</p> <p>The possible values for this attribute are defined by the ST_HexColorRGB simple type (§22.9.2.5).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_SRgbColor](#)) is located in §A.4.1. *end note*]

20.1.2.3.33 sysClr (System Color)

This element specifies a color bound to predefined operating system elements.

[Example: The following represents the default color used for displaying text in a window.

```
<a:solidFill>
  <a:sysClr val="windowText"/>
</a:solidFill>
```

end example]

Attributes	Description
lastClr (Last Color)	Specifies the color value that was last computed by the generating application. The possible values for this attribute are defined by the ST_HexColorRGB simple type (§22.9.2.5).
val (Value)	Specifies the system color value. The possible values for this attribute are defined by the ST_SystemColorVal simple type (§20.1.10.57).

[Note: The W3C XML Schema definition of this element’s content model ([CT_SystemColor](#)) is located in §A.4.1.
end note]

20.1.2.3.34 tint (Tint)

This element specifies a lighter version of its input color. A 10% tint is 10% of the input color combined with 90% white.

Attributes	Description
val (Value)	Specifies the tint as expressed by a percentage value. [Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (BC, FF, BC) <a:solidFill> <a:srgbClr val="00FF00"> <a:tint val="50%"/> </a:srgbClr> </a:solidFill> end example] The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.3 Audio and Video

The Audio and Video portion of the DrawingML framework deals with all media of these two kinds that can be attached to objects within a document. Types of audio that can be represented within a file are CD audio, QuickTime audio, and any other generic audio. When dealing with generic audio there is the option for embedding it within the file and also linking it. The linking option is preferable if the size of the audio file is too large and thus increases the size of the document by an undesirable amount. For video there are two kinds that can be represented and that is either a QuickTime movie or any other generic movie. When dealing with generic video there is only the option of linking to the media as video is too large to embed within a document.

20.1.3.1 audioCd (Audio from CD)

This element specifies the existence of Audio from a CD. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the sound however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has an audio from a CD attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioCd>
        <a:st track="1"/>
        <a:end track="3" time="65"/>
      </a:audioCd>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single audioCD element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this audioCD element from within the timing node list. For this example we see that the audio for this CD starts playing at the 0 second mark on the first track and ends on the 1 minute 5 second mark of the third track. *end example*]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_AudioCD](#)) is located in §A.4.1. *end note*]

20.1.3.2 **audioFile (Audio from File)**

This element specifies the existence of an audio file. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example:* Consider the following picture object that has an audio file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single audioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this audioFile element from within the timing node list. The Linked relationship id is used to retrieve the actual audio file for playback purposes. *end example*]

Attributes	Description
contentType (Content Type of Linked Audio File)	<p>Specifies the content type for the external file that is referenced by this element. Content types define a media type, a subtype, and an optional set of parameters, as defined in Part 2. If a rendering application cannot process external content of the content type specified, then the specified content can be ignored. [<i>Note:</i> A list of suggested audio types is provided in §15.2.2. <i>end note</i>]</p> <p>If this attribute is omitted, application should attempt to determine the content type by reading the contents of the relationship’s target.</p> <p>A producer that wants interoperability should use the following standard format:</p> <ul style="list-style-type: none">• audio/mpeg ISO/IEC 11172-3 <p>The possible values for this attribute are defined by the W3C XML Schema string</p>

Attributes	Description
	datatype.
link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_AudioFile](#)) is located in §A.4.1. *end note*]

20.1.3.3 end (Audio End Time)

This element specifies the end point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should halt its playback. This element is used in conjunction with an Audio Start Time element to specify the time span for an entire audioCD sound element.

[Example: Consider the following DrawingML.

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown specifies for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio begins playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_AudioCDTime](#)) is located in §A.4.1. *end note*]

20.1.3.4 quickTimeFile (QuickTime from File)

This element specifies the existence of a QuickTime file, as defined in the 2007-09-04 version of the QuickTime File Format Specification: <http://developer.apple.com/documentation/QuickTime/QTFF/qtff.pdf>. [Note: For more information on the QuickTime format: <http://developer.apple.com/reference/QuickTime/>. end note]. This element is specified within the non-visual properties of an object. The QuickTime file shall be attached to an object as this is how it is represented within the document. The actual playing of the QuickTime however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has a QuickTime file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:quickTimeFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single quickTimeFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this quickTimeFile element from within the timing node list. The Linked relationship id is used to retrieve the actual video file for playback purposes. end example]

Attributes	Description
link (Linked Relationship ID)	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file.
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element’s content model ([CT_QuickTimeFile](#)) is located in §A.4.1. end note]

20.1.3.5 `st` (Audio Start Time)

This element specifies the start point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should begin its playback. This element is used in conjunction with an Audio End Time element to specify the time span for an entire audioCD sound element.

[*Example:* Consider the following DrawingML.

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown specifies for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio begins playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AudioCDTime](#)) is located in §A.4.1. *end note*]

20.1.3.6 `videoFile` (Video from File)

This element specifies the existence of a video file. This element is specified within the non-visual properties of an object. The video shall be attached to an object as this is how it is represented within the document. The actual playing of the video however is done within the timing node list that is specified under the timing element.

[*Example:* Consider the following picture object that has a video attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
```

```
<p:cNvPicPr>
  <a:picLocks noRot="1"/>
</p:cNvPicPr>
<p:nvPr>
  <a:videoFile r:link="rId1"/>
</p:nvPr>
</p:nvPicPr>
...
</p:pic>
```

In the above example, we see that there is a single videoFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this videoFile element from within the timing node list. The Linked relationship id is used to retrieve the actual video file for playback purposes. *end example*]

Attributes	Description
contentType (Content Type of Linked Video File)	<p>Specifies the content type for the external file that is referenced by this element. Content types define a media type, a subtype, and an optional set of parameters, as defined in Part 2. If a rendering application cannot process external content of the content type specified, then the specified content can be ignored. [<i>Note</i>: A list of suggested video types is provided in §15.2.17. <i>end note</i>]</p> <p>If this attribute is omitted, application should attempt to determine the content type by reading the contents of the relationship's target.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the identification information for a linked video file. This attribute is used to specify the location of an object that does not reside within this file.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[*Note*: The W3C XML Schema definition of this element's content model (CT_VideoFile) is located in §A.4.1. *end note*]

20.1.3.7 wavAudioFile (Audio from WAV File)

This element specifies the existence of an audio WAV file. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has an audio WAV file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:wavAudioFile r:embed="rId2"/>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single wavAudioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this wavAudioFile element from within the timing node list. The Embedded relationship id is used to retrieve the actual audio file for playback purposes. *end example*

[Note: This element is generally used for the purposes of embedding audio files within the document. For linking to generic audio files the audioFile element should be used. *end note*]

Attributes	Description
embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [Note: A list of suggested audio types is provided in §15.2.2. <i>end note</i>] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

20.1.4 Styles

Styles within DrawingML refer to the way a particular object (be it text or a shape, or anything else) is formatted. Different aspects, ranging from color, line type, fill, and effects applied to the object can be predefined within a theme. The main purpose of a theme is to define a style matrix from which a document can pull style information from in order to format the visual look of objects in a document.

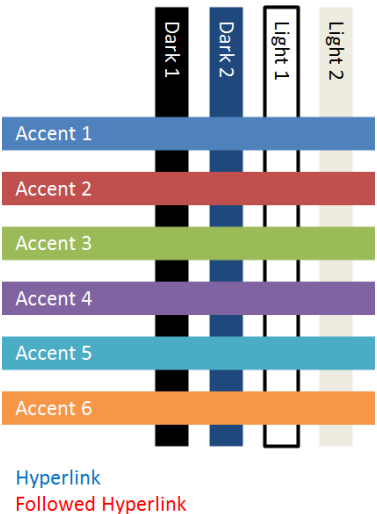

20.1.4.1 Styles

The elements in this section compose the basic definition of a style, including its associated colors, effect styles, line styles, fill styles, background styles, and font scheme.

20.1.4.1.1 accent1 (Accent 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.2 accent2 (Accent 2)

This element defines a color that happens to be the accent 2 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note]*

20.1.4.1.3 accent3 (Accent 3)

This element defines a color that happens to be the accent 3 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note]*

20.1.4.1.4 `accent4` (Accent 4)

This element defines a color that happens to be the accent 4 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element’s content model (`CT_Color`) is located in §A.4.1. *end note]*

20.1.4.1.5 `accent5` (Accent 5)

This element defines a color that happens to be the accent 5 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[Note: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.6 accent6 (Accent 6)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

[Note: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.7 bgFillStyleLst (Background Fill Style List)

This element defines a list of background fills that are used within a theme. The background fills consist of three fills, arranged in order from subtle to moderate to intense.

[Example: Consider the following example of a background fill style list within DrawingML:

```
<bgFillStyleLst>
  <solidFill>
...
  </solidFill>
  <gradFill rotWithShape="1">
...
  </gradFill>
  <blipFill>
...
  </blipFill>
</bgFillStyleLst>
```

In this example, we see that the list contains a solid fill for the subtle fill, a gradient fill for the moderate fill and an image fill for the intense background fill. *end example]*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_BackgroundFillStyleList](#)) is located in §A.4.1. *end note]*

20.1.4.1.8 **custClr (Custom color)**

This element defines a custom color. The custom colors are used within a custom color list to define custom colors that are extra colors that can be appended to a theme. This is useful within corporate scenarios where there is a set corporate color palette from which to work.

Attributes	Description
name (Name)	The name of the color shown in the color picker. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_CustomColor](#)) is located in §A.4.1. *end note]*

20.1.4.1.9 **dk1 (Dark 1)**

This element defines a color that happens to be the dark 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note]*

20.1.4.1.10 dk2 (Dark 2)

This element defines a color that happens to be the dark 2 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

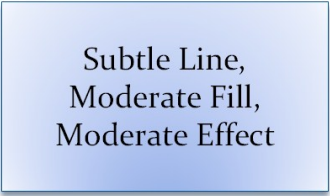

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note]*

20.1.4.1.11 effectStyle (Effect Style)

This element defines a set of effects and 3D properties that can be applied to an object.

[Example: Consider the following example of an effect style within DrawingML:

```
<effectStyle>
  <effectLst>
    <outerShdw blurRad="57150" dist="38100" dir="5400000" align="ctr"
      rotWithShape="0">
      <schemeClr val="phClr">
        <shade val="9000"/>
        <satMod val="105000"/>
        <alpha val="48000"/>
      </schemeClr>
    </outerShdw>
  </effectLst>
</effectStyle>
```

Subtle Line,
Moderate Fill,
Moderate Effect

In this example, an outer shadow is being applied to a shape as the moderate effect. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_EffectStyleItem](#)) is located in §A.4.1. *end note*]

20.1.4.1.12 effectStyleLst (Effect Style List)

This element defines a set of three effect styles that create the effect style list for a theme. The effect styles are arranged in order of subtle to moderate to intense.

[Example: Consider the following example of an effect style list within DrawingML:

```
<effectStyleLst>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        align="ctr" rotWithShape="0">
      ...
    </outerShdw>
  </effectLst>
</effectStyle>
```

```

<effectStyle>
  <effectLst>
    <outerShdw blurRad="57150" dist="38100" dir="5400000"
      align="ctr" rotWithShape="0">
...
    </outerShdw>
  </effectLst>
</effectStyle>
<effectStyle>
  <effectLst>
    <outerShdw blurRad="57150" dist="38100" dir="5400000"
      align="ctr" rotWithShape="0">
...
    </outerShdw>
  </effectLst>
<scene3d>
...
</scene3d>
<sp3d prstMaterial="powder">
...
</sp3d>
</effectStyle>
</effectStyleLst>

```

In this example, we see three effect styles defined. The first two (subtle and moderate) define an outer shadow as the effect, while the third effect style (intense) defines an outer shadow along with 3D properties which are to be applied to the object as well. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EffectStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.13 fillStyleLst (Fill Style List)

This element defines a set of three fill styles that are used within a theme. The three fill styles are arranged in order from subtle to moderate to intense.

[*Example:* Consider the following example of a fill style list within DrawingML:

```

<fillStyleLst>
  <solidFill>
...
  </solidFill>
  <gradFill rotWithShape="1">
...
  </gradFill>

```

```
<gradFill rotWithShape="1">
...
</gradFill>
</fillStyleLst>
```

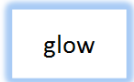

In this example, we see three fill styles being defined within the fill style list. The first style is the subtle style and defines simply a solid fill. The second and third styles (moderate and intense fills respectively) define gradient fills. *end example*]

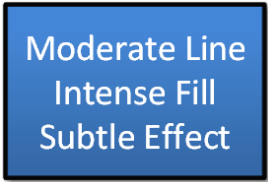

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_FillStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.14 **fmtScheme (Format Scheme)**

This element contains the background fill styles, effect styles, fill styles, and line styles which define the style matrix for a theme. The style matrix consists of subtle, moderate, and intense fills, lines, and effects. The background fills are not generally thought of to directly be associated with the matrix, but do play a role in the style of the overall document. Usually, a given object chooses a single line style, a single fill style, and a single effect style in order to define the overall final look of the object.

[*Example:* Consider the following example of the style matrix in use within DrawingML:

	Line	Fill	Effect
Subtle			
Moderate			
Intense			

In this example, we see a shape styled which utilizes different aspects from the above defined style matrix. *end example*]

Attributes	Description
name (Name)	<p>Defines the name for the format scheme. The name is simply a human readable string which identifies the format scheme in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_StyleMatrix](#)) is located in §A.4.1. *end note*]

20.1.4.1.15 folHlink (Followed Hyperlink)

This element defines a color that happens to be the followed hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.4.1.16 font (Font)

This element defines a font within the styles area of DrawingML. A font is defined by a script along with a typeface.

[Example: Consider the following example of a font in DrawingML:

```
<font script="Thai" typeface="Cordia New"/>
```

In this example, we see that the script 'Thai' is supposed to use the font face 'Cordia New'. *end example*]

Attributes	Description
script (Script)	<p>Specifies the script, or language, in which the typeface is supposed to be used.</p> <p>[<i>Note</i>: It is recommended that script names as specified in ISO 15924 are used. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
typeface (Typeface)	<p>Specifies the font face to use.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SupplementalFont](#)) is located in §A.4.1. *end note*]

20.1.4.1.17 fontRef (Font Reference)

This element represents a reference to a themed font. When used it specifies which themed font to use along with a choice of color.

[*Example*: Consider the following example of a font reference within DrawingML:

```
<fontRef idx="minor">
  <schemeClr val="tx1"/>
</fontRef>
```

In this example, we see a font referencing the minor font defined within the theme. *end example*]

Attributes	Description
idx (Identifier)	<p>Specifies the identifier of the font to reference.</p> <p>The possible values for this attribute are defined by the ST_FontCollectionIndex simple type (§20.1.10.25).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_FontReference](#)) is located in §A.4.1. *end note*]

20.1.4.1.18 fontScheme (Font Scheme)

This element defines the font scheme within the theme. The font scheme consists of a pair of major and minor fonts for which to use in a document. The major font corresponds well with the heading areas of a document, and the minor font corresponds well with the normal text or paragraph areas.

[*Example*: Consider the following example of a font scheme within DrawingML:

```

<fontScheme name="sample">
  <majorFont>
...
  </majorFont>
  <minorFont>
...
  </minorFont>
</fontScheme>

```

In this example, we see the major and minor font lists within the font scheme that is named 'sample'. *end example]*

Attributes	Description
name (Name)	<p>The name of the font scheme shown in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FontScheme](#)) is located in §A.4.1. *end note]*

20.1.4.1.19 hlink (Hyperlink)

This element defines a color that happens to be the hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.4.1.20 `lnDef` (Line Default)

This element defines a default line that is used within a document.

[*Example:* Consider the following example of a default line defined in DrawingML:

```
<lnDef>
  <spPr/>
  <bodyPr/>
  <lstStyle/>
  <style>
    <lnRef idx="1">
      <schemeClr val="accent2"/>
    </lnRef>
    <fillRef idx="0">
      <schemeClr val="accent2"/>
    </fillRef>
    <effectRef idx="0">
      <schemeClr val="accent2"/>
    </effectRef>
    <fontRef idx="minor">
      <schemeClr val="tx1"/>
    </fontRef>
  </style>
</lnDef>
```

In this example, we see that the default line for the document is being defined as a themed line which references the subtle line style with idx equal to 1. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DefaultShapeDefinition](#)) is located in §A.4.1. *end note*]

20.1.4.1.21 `lnStyleLst` (Line Style List)

This element defines a list of three line styles for use within a theme. The three line styles are arranged in order from subtle to moderate to intense versions of lines. This list makes up part of the style matrix.

[*Example:* Consider the following example of a line style list within DrawingML:

```

<lnStyleLst>
  <ln w="9525" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr">
        <shade val="50000"/>
        <satMod val="103000"/>
      </schemeClr>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="25400" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="38100" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
</lnStyleLst>

```

In this example, we see three lines defined within a line style list. The first line corresponds to the subtle line, the second to the moderate, and the third corresponds to the intense line defined in the theme. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_LineStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.22 lt1 (Light 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.23 lt2 (Light 2)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.24 **majorFont** (Major Font)

This element defines the set of major fonts which are to be used under different languages or locals.

[*Example:* Consider the following example of the major fonts being defined within DrawingML:

```
<majorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="MS Pゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>

  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</majorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FontCollection](#)) is located in §A.4.1. *end note*]

20.1.4.1.25 **minorFont** (Minor fonts)

This element defines the set of minor fonts that are to be used under different languages or locals.

[*Example:* Consider the following example of the minor fonts being defined within DrawingML:

```

<minorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="MS Pゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</minorFont>

```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*]

[Note: The W3C XML Schema definition of this element's content model ([CT_FontCollection](#)) is located in §A.4.1. *end note*]

20.1.4.1.26 scene3d (3D Scene Properties)

This element defines optional scene-level 3D properties to apply to an object.

[Note: The W3C XML Schema definition of this element's content model ([CT_Scene3D](#)) is located in §A.4.1. *end note*]

20.1.4.1.27 spDef (Shape Default)

This element defines the formatting that is associated with the default shape. The default formatting can be applied to a shape when it is initially inserted into a document.

[Example: Consider the following example of a shape default being used within DrawingML:

```

<spDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>

```

```

<bodyPr rtlCol="0" anchor="ctr"/>
<lstStyle>
  <defPPr align="ctr">
    <defRPr/>
  </defPPr>
</lstStyle>
<style>
  <lnRef idx="1">
    <schemeClr val="accent1"/>
  </lnRef>
  <fillRef idx="2">
    <schemeClr val="accent1"/>
  </fillRef>
  <effectRef idx="1">
    <schemeClr val="accent1"/>
  </effectRef>
  <fontRef idx="minor">
    <schemeClr val="dk1"/>
  </fontRef>
</style>
</spDef>

```

In this example, we see a default shape which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DefaultShapeDefinition](#)) is located in §A.4.1. *end note*]

20.1.4.1.28 txDef (Text Default)

This element defines the default formatting which is applied to text in a document by default. The default formatting can and should be applied to the shape when it is initially inserted into a document.

[*Example:* Consider the following example of a text default being used within DrawingML:

```

<txDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
</bodyPr rtlCol="0" anchor="ctr"/>

```

```

<lstStyle>
  <defPPr align="ctr">
    <defRPr/>
  </defPPr>
</lstStyle>
<style>
  <lnRef idx="1">
    <schemeClr val="accent1"/>
  </lnRef>
  <fillRef idx="2">
    <schemeClr val="accent1"/>
  </fillRef>
  <effectRef idx="1">
    <schemeClr val="accent1"/>
  </effectRef>
  <fontRef idx="minor">
    <schemeClr val="dk1"/>
  </fontRef>
</style>
</txDef>

```

In this example, we see a default text which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_DefaultShapeDefinition](#)) is located in §A.4.1. *end note*]

20.1.4.2 Table Styles

Table styles are responsible for the rapid formatting that can be applied to a table. This rapid formatting takes different parts of a table into account, such as if the first row or last row should be emphasized, or if there is some type of banding (row for example) present on the table. All of these different types of formatting can be defined within a table style

20.1.4.2.1 band1H (Band 1 Horizontal)

This element describes the formatting for the first row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 1 horizontal being used within DrawingML:

```

<band1H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1H>

```

Band 1
Horizontal

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.2 band1V (Band 1 Vertical)

This element describes the formatting for the first row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example:* Consider the following example of band 1 vertical being used within DrawingML:

```

<band1V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1V>

```

Band 1 Vertical

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example]*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.3 band2H (Band 2 Horizontal)

This element describes the formatting for the second row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example:* Consider the following example of band 2 horizontal being used within DrawingML:

```
<band2H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2H>
```

Band 2 Horizontal

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example]*

[Note: The W3C XML Schema definition of this element's content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.4 band2V (Band 2 Vertical)

This element describes the formatting for the second row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 2 vertical being used within DrawingML:

```
<band2V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2V>
```

Band 2 Vertical

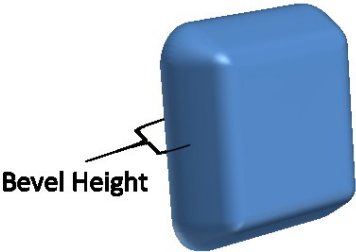

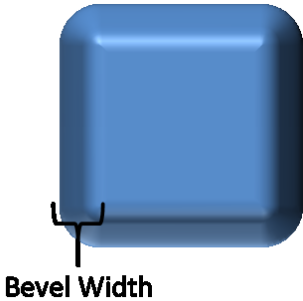

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example]*

[Note: The W3C XML Schema definition of this element's content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.5 bevel (Bevel)

This element defines the properties of the bevel associated with the 3D effect applied to a cell in a table.

Attributes	Description
h (Height)	<p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="431 512 784 762"></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
prst (Preset Bevel)	<p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).</p>
w (Width)	<p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="431 1266 732 1564"></div> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Bevel](#)) is located in §A.4.1. *end note*]

20.1.4.2.6 bottom (Bottom Border)

This element defines the line properties associated with the bottom border in a table cell.

[*Example:* Consider the following example of the bottom border in use within DrawingML:

```
<bottom>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</bottom>
```

In this example, we see the bottom border on a table cell to be a single 1pt line which is colored accent 1. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.7 effect (Effect)

This element defines the effect that can be applied to a table as a whole through a table style.

[*Example:* Consider the following example of an effect in use within DrawingML:

```
<effect>
  <effectLst>
    <glow rad="228600">
      <schemeClr val="accent1">
        <satMod val="175000"/>
        <alpha val="40000"/>
      </schemeClr>
    </glow>
  </effectLst>
</effect>
```

In this example, we see a glow being defined within the table style that is applied to the table as a whole. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EffectProperties](#)) is located in §A.4.1. *end note]*

20.1.4.2.8 effectRef (Effect Reference)

This element defines a reference to an effect style within the style matrix. The `idx` attribute refers the index of an effect style within the `effectStyleLst` element.

Attributes	Description
idx (Style Matrix Index)	<p>Specifies the style matrix index of the style referred to.</p> <p>The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

20.1.4.2.9 fill (Fill)

This element defines the fill that is applied to the table as a whole. The background of the table can contain a single fill that is the entire size of the table. This can allow for gradient fills, or image fills, which span the entire size of the table.

[Example: Consider the following example of a fill on a table background in DrawingML:

```
<fill>
  <gradFill flip="none" rotWithShape="1">
    <gsLst>
      <gs pos="0">
        <schemeClr val="accent2">
          <shade val="75000"/>
        </schemeClr>
      </gs>
      <gs pos="100000">
        <schemeClr val="accent2">
          <shade val="75000"/>
          <tint val="20000"/>
        </schemeClr>
      </gs>
    </gsLst>
    <lin ang="2700000" scaled="1"/>
    <tileRect/>
  </gradFill>
</fill>
```

In this example, we apply a gradient fill to the entire table on the background shape of the table. *end example*]

[Note: The W3C XML Schema definition of this element’s content model ([CT_FillProperties](#)) is located in §A.4.1. *end note*]

20.1.4.2.10 fillRef (Fill Reference)

This element defines a reference to a fill style within the style matrix. The `idx` attribute refers to the index of a fill style or background fill style within the presentation's style matrix, defined by the `fmtScheme` element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the `fillStyleLst` element, and values 1001 and above refer to the index of a background fill style within the `bgFillStyleLst` element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[Example:

```
<a:fillRef idx="2">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's second fill style using the `accent2` color of the color scheme.

end example]

[Example:

```
<a:fillRef idx="1001">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's first background fill style using the `accent2` color of the color scheme.

end example]

Attributes	Description
<code>idx</code> (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the <code>ST_StyleMatrixColumnIndex</code> simple type (§20.1.10.56).

[Note: The W3C XML Schema definition of this element's content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

20.1.4.2.11 firstCol (First Column)

This element defines the cell formatting which can be applied to the first column of the table.

[Example: Consider the following example of first column formatting within DrawingML:

```
<firstCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</firstCol>
```

First Column

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we define the first column cell fills to be accent 1 along with the text properties to be bold when first column formatting is enabled through the user interface. *end example*]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.12 firstRow (First Row)

This element defines the cell formatting which can be applied to the first row of the table.

[*Example:* Consider the following example of first row formatting within DrawingML:

```

<firstRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</firstRow>

```

First Row 

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we define the first row cell fills to be accent 1 along with the text properties to be bold when first row formatting is enabled through the user interface. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.13 font (Font)

This element defines the font to be used within a given table cell text style. This element allows for exact definition of the font within the table style instead of referencing a themed font.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FontCollection](#)) is located in §A.4.1. *end note*]

20.1.4.2.14 insideH (Inside Horizontal Border)

This element defines the line properties associated with the inner horizontal borders in a table.

[*Example:* Consider the following example of the inner horizontal borders in use within DrawingML:

```

<insideH>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideH>

```

In this example, we see the inner horizontal borders in a table to be a single 1pt line which is colored accent 1. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.15 `insideV` (Inside Vertical Border)

This element defines the line properties associated with the inner vertical borders in a table.

[Example: Consider the following example of the inside vertical borders in use within DrawingML:

```

<insideV>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideV>

```

In this example, we see the inner vertical borders in a table to be a single 1pt line which is colored accent 1. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.16 `lastCol` (Last Column)

This element defines the cell formatting which can be applied to the last column of the table.

[Example: Consider the following example of last column formatting within DrawingML:

```

<lastCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>

```

```

<tcStyle>
  <tcBdr/>
  <fill>
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </fill>
</tcStyle>
</lastCol>

```

Last Column

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we define the last column cell fills to be accent 1 along with the text properties to be bold when last column formatting is enabled through the user interface. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.17 lastRow (Last Row)

This element defines the cell formatting which can be applied to the last row of the table.

[*Example:* Consider the following example of last row formatting within DrawingML:

```

<lastRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>

```

```
<tcStyle>
  <tcBdr/>
  <fill>
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </fill>
</tcStyle>
</lastRow>
```

Last Row 

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we define the last row cell fills to be accent 1 along with the text properties to be bold when last row formatting is enabled through the user interface. *end example*]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.18 left (Left Border)

This element defines the line properties associated with the left border in a table cell.

[*Example:* Consider the following example of the left border in use within DrawingML:

```
<left>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</left>
```

In this example, we see the left border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.19 **lnRef (Line Reference)**

This element defines a reference to a line style within the style matrix. The `idx` attribute refers the index of a line style within the `fillStyleLst` element.

Attributes	Description
<code>idx</code> (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the <code>ST_StyleMatrixColumnIndex</code> simple type (§20.1.10.56).

[Note: The W3C XML Schema definition of this element's content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

20.1.4.2.20 **neCell (Northeast Cell)**

This element defines the formatting for the cell in the northeast corner of a table when both the first row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[Example: Consider the following example of the northeast cell formatting within DrawingML:

```
<neCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</neCell>
```

In this example, we specifically set the northeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

[Note: The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.21 nwCell (Northwest Cell)

This element defines the formatting for the cell in the northwest corner of a table when both the first row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example:* Consider the following example of the northwest cell formatting within DrawingML:

```
<nwCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</nwCell>
```

In this example, we specifically set the northwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.22 right (Right Border)

This element defines the line properties associated with the right border in a table cell.

[*Example:* Consider the following example of the right border in use within DrawingML:

```
<right>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</right>
```

In this example, we see the right border on a table cell to be a single 1pt line which is colored accent 1. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.23 seCell (Southeast Cell)

This element defines the formatting for the cell in the southeast corner of a table when both the last row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example:* Consider the following example of the southeast cell formatting within DrawingML:

```
<seCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</seCell>
```

In this example, we specifically set the southeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.24 swCell (Southwest Cell)

This element defines the formatting for the cell in the southwest corner of a table when both the last row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example:* Consider the following example of the southwest cell formatting within DrawingML:

```

<swCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</swCell>

```

In this example, we specifically set the southwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.25 tblBg (Table Background)

This element defines the formatting options which can be applied to the table background shape. The background shape is the same size as the entire table and can hold a fill or an effect which spans the entire table.

[Example: Consider the following example of a table background in use within DrawingML:

```

<tblBg>
  <fillRef idx="2">
    <schemeClr val="accent1"/>
  </fillRef>
  <effectRef idx="1">
    <schemeClr val="accent1"/>
  </effectRef>
</tblBg>

```

In this example, we see that there is a themed fill and themed effect being applied to the table background through the table style. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_TableBackgroundStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.26 `tblStyle` (Table Style)

This is the root element for a table style. Within the table style are different formatting options available in order to apply a table.

Attributes	Description
<code>styleId</code> (Style ID)	Specifies a GUID identifying the table style in a unique manner. The possible values for this attribute are defined by the <code>ST_Guid</code> simple type (§22.9.2.4).
<code>styleName</code> (Name)	Specifies the name of the table style which can show up in the user interface identifying the style to a user. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model (`CT_TableStyle`) is located in §A.4.1. *end note*]

20.1.4.2.27 `tblStyleLst` (Table Style List)

This element is simply a list of table styles which are used within a document.

[Example: Consider the following example of a table style list within DrawingML:

```
<tblStyleLst def="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}">
  <tblStyle styleId="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}"
    styleName="Medium Style 2 - Accent 1">
    ...
  </tblStyle>
  <tblStyle styleId="{3C2FFA5D-87B4-456A-9821-1D502468CF0F}"
    styleName="Themed Style 1 - Accent 1">
    ...
  </tblStyle>
</tblStyleLst>
```

In this example, we see two table styles defined along with the default being specified. *end example*]

Attributes	Description
<code>def</code> (Default)	The GUID corresponding to the default table style in the list of table styles. This default can be used when a table is initially inserted into a document. The possible values for this attribute are defined by the <code>ST_Guid</code> simple type (§22.9.2.4).

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.2.28 tcBdr (Table Cell Borders)

This element defines the borders for the cells within a table.

[Example: Consider the following example of table cell borders being used within DrawingML:

```
<tcBdr>
  <left>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </left>
  <right>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </right>
  <top>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </top>
  <bottom>
    <lnRef idx="2">
      <schemeClr val="lt1"/>
    </lnRef>
  </bottom>
  <insideH>
    <ln>
      <noFill/>
    </ln>
  </insideH>
  <insideV>
    <ln>
      <noFill/>
    </ln>
  </insideV>
</tcBdr>
```

In this example, we define borders for the bottom, top, right, and left borders of the table cells. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableCellStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.29 `tcStyle` (Table Cell Style)

This element defines the style for a give cell in a table.

[*Example:* Consider the following example of a table cell style in use within DrawingML:

```
<tcStyle>
  <tcBdr>
    ...
  </tcBdr>
  <fill>
    ...
  </fill>
</tcStyle>
```

In this example, we see that a set of borders for the cell along with a cell fill are being defined. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableStyleCellStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.30 `tcTxStyle` (Table Cell Text Style)

This element defines the text properties associated with the text contained within a table cell.

[*Example:* Consider the following example of a table cell text style in use within DrawingML:

```
<tcTxStyle b="on">
  <fontRef idx="minor">
    <scrgbClr r="0" g="0" b="0"/>
  </fontRef>
  <schemeClr val="lt1"/>
</tcTxStyle>
```

In this example, we define the text within the cell to be bold and reference the themed minor font and to also be the light 1 color. *end example*]

Attributes	Description
b (Bold)	Specifies if the text is to be bolded. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§20.1.10.36).
i (Italic)	Specifies if the text is to be italicized. The possible values for this attribute are defined by the ST_OnOffStyleType simple type

Attributes	Description
	(§20.1.10.36).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableStyleTextStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.31 `tl2br` (Top Left to Bottom Right Border)

This element defines the line properties associated with the border which goes from the top-left to the bottom-right corner in a table cell.

[*Example:* Consider the following example of the top border in use within DrawingML:

```
<tl2br>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tl2br>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.32 `top` (Top Border)

This element defines the line properties associated with the top border in a table cell.

[*Example:* Consider the following example of the top border in use within DrawingML:

```
<top>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</top>
```

In this example, we see the top border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.33 `tr2bl` (Top Right to Bottom Left Border)

This element defines the line properties associated with the border which goes from the top-right to the bottom-left corner in a table cell.

[*Example:* Consider the following example of the top border in use within DrawingML:

```
<tr2bl>
  <ln w="12700" compd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tr2bl>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.34 `wholeTbl` (Whole Table)

This element contains formatting options which are applied to the table as a whole when it is in its default state with no formatting options (first row, last row, etc) enabled.

[*Example:* Consider the following example of whole table being used within DrawingML:

```
<wholeTbl>
  <tcTxStyle>
    ...
  </tcTxStyle>
  <tcStyle>
    ...
  </tcStyle>
</wholeTbl>
```

In this example, we see definitions for the text and the cells within the table. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note]*

20.1.5 3D

The 3D portion of the DrawingML framework allows for the describing of a 3D scene to be placed within a document. This 3D scene can be described using text and shape objects along with various lighting, material and camera settings.

20.1.5.1 anchor (Anchor Point)

This element specifies a point in 3D space. This point is the point in space that anchors the backdrop plane. Please see the example in the backdrop (§20.1.5.2) definition for an in depth explanation of this element.

Attributes	Description
x (X-Coordinate in 3D)	X-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
y (Y-Coordinate in 3D)	Y-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
z (Z-Coordinate in 3D)	Z-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[Note: The W3C XML Schema definition of this element’s content model ([CT_Point3D](#)) is located in §A.4.1. end note]

20.1.5.2 backdrop (Backdrop Plane)

This element defines a plane in which effects, such as glow and shadow, are applied in relation to the shape they are being applied to. The points and vectors contained within the backdrop define a plane in 3D space.

[Example: Consider the following image as an explanation of the backdrop plane definition:

In this image we see a plane being defined by an anchor point, the vector normal to the face of the plane and a vector pointing up in relation to the plane. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_Backdrop](#)) is located in §A.4.1. *end note*]

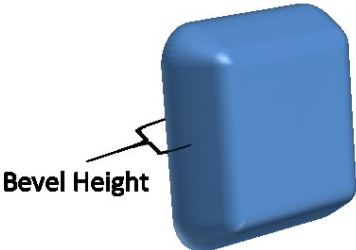

20.1.5.3 bevelB (Bottom Bevel)

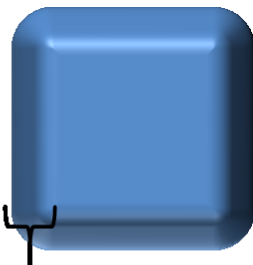

This element holds the properties associated with defining a bevel on the bottom or back face of a shape.

[Example: Consider the following example of an sp3d containing a bottom bevel.

```
<a:sp3d>
  <a:bevelB w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a bottom bevel being defined with a preset bevel type along with a custom width and height. *end example*

Attributes	Description
h (Height)	<p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[Example: Consider the following example bevel</p>  <p>In this example, we see the height of an example bevel on a shape. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
prst (Preset Bevel)	<p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).</p>
w (Width)	<p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel</p>

Attributes	Description
	<div><p>Bevel Width</p></div> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Bevel](#)) is located in §A.4.1. *end note*]

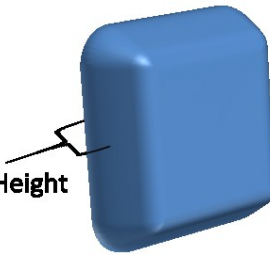

20.1.5.4 [bevelT \(Top Bevel\)](#)

This element holds the properties associated with defining a bevel on the top or front face of a shape.

[Example: Consider the following example of an sp3d containing a top bevel.

```
<a:sp3d>
  <a:bevelT w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a top bevel being defined with a preset bevel type along with a custom width and height. *end example*

Attributes	Description
h (Height)	<p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div><p>Bevel Height</p></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
prst (Preset Bevel)	<p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).</p>
w (Width)	<p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel]</p> <div data-bbox="477 659 732 919" data-label="Image"> </div> <p>Bevel Width</p> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Bevel](#)) is located in §A.4.1. *end note*]

20.1.5.5 camera (Camera)

This element defines the placement and properties of the camera in the 3D scene. The camera position and properties modify the view of the scene.

[Example: Consider the following example of a camera in DrawingML:

```
<a:camera prst="orthographicFront">
  <a:rot lat="19902513" lon="17826689" rev="1362739"/>
</a:camera>
```

In this example, we see a preset camera being defined along with a rotation containing latitude, longitude, and revolution overrides provided that further rotate the camera around the scene. The effect of this camera can be seen on the following shape:

end example]

Attributes	Description
fov (Field of View)	<p>Provides an override for the default field of view for the camera. Different perspectives can be obtained by modifying this attribute.</p> <p>[<i>Example:</i> Consider the following example of a fov in DrawingML:</p> <pre><a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera></pre> <p>In this example, we see a fov being defined which modifies the default fov for the preset camera. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FOVAngle simple type (§20.1.10.26).</p>
prst (Preset Camera Type)	<p>Defines the preset camera that is being used by the camera element. The preset camera defines a starting point for common preset rotations in space.</p> <p>[<i>Example:</i> Consider the following example of a prst in DrawingML:</p> <pre><a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera></pre> <p>In this example, we see a prst being defined as perspectiveContrastingRightFacing. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PresetCameraType simple type (§20.1.10.46).</p>
zoom (Zoom)	<p>Defines the zoom factor of a given camera element. The zoom modifies the scene as a whole and zooms in or out accordingly.</p> <p>[<i>Example:</i> Consider the following example of a zoom in DrawingML:</p>

Attributes	Description
	<pre data-bbox="456 285 1304 415"><a:camera prst="perspectiveContrastingRightFacing" fov="6900000" zoom="200%"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> /a:camera></pre> <p data-bbox="415 457 1377 520">In this example, we see a zoom being used which zooms the scene by 200%. <i>end example</i></p> <p data-bbox="415 562 1446 632">The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Camera](#)) is located in §A.4.1. *end note*]

20.1.5.6 contourClr (Contour Color)

This element defines the color for the contour on a shape. The contour of a shape is a solid filled line which surrounds the outer edges of the shape.

[Example: Consider the following example of a contour defined on a shape which includes a contourClr. Lighting characteristics applied to the shape are ignored when it comes to the contour on the shape.

```
<a:sp3d contourW="101600" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:contourClr>
    <a:schemeClr val="bg1"/>
  </a:contourClr>
</a:sp3d>
```

In this example, we see a contour defined on a shape with a top and bottom bevel defined. In the image below, the contour is the white ring around the shape.

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.5.7 [extrusionClr](#) (Extrusion Color)

This element defines the color of the extrusion applied to a shape. The extrusion on a shape is an artificial height applied to the geometry.

[*Example:* Consider the following example of an extrusion which takes advantage of the `extrusionClr`. Lighting characteristics that are applied to the shape are also applied to the extrusion on the shape.

```
<a:sp3d extrusionH="139700" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
    <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
</a:sp3d>
```

In this example, we see the extrusion color defined as red which can also be shown applied to the shape in the following image:

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note]*

20.1.5.8 flatTx (No text in 3D scene)

Keep text out of 3D scene entirely.

Attributes	Description
z (Z Coordinate)	Specifies the Z coordinate to be used in positioning the flat text within the 3D scene. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FlatText](#)) is located in §A.4.1. *end note]*

20.1.5.9 lightRig (Light Rig)

This element defines the light rig associated with the table. The light rig comes into play when there is a 3D bevel applied to a cell. When 3D is used, the light rig defines the lighting properties associated with the scene.

Attributes	Description
dir (Direction)	Defines the direction from which the light rig is oriented in relation to the scene. [<i>Example:</i> Consider the following example of dir being used in a light rig: <pre><a:lightRig rig="threePt" dir="t"/></pre> In this example, we define the direction to be top. <i>end example]</i>

Attributes	Description
	The possible values for this attribute are defined by the ST_LightRigDirection simple type (§20.1.10.29).
rig (Rig Preset)	<p>Defines the preset type of light rig which is to be applied to the scene.</p> <p>[<i>Example:</i> Consider the following example of rig being used in a light rig:</p> <pre><a:lightRig rig="threePt" dir="t"/></pre> <p>In this example, we define the rig to be a threePt rig. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_LightRigType simple type (§20.1.10.30).</p>

[*Note:* The W3C XML Schema definition of this element’s content model (CT_LightRig) is located in §A.4.1. *end note*]

20.1.5.10 **norm (Normal)**

This element defines a normal vector. To be more precise, this attribute defines a vector normal to the face of the backdrop plane.

[*Example:* Consider the following image as an example of what a normal vector is in relation to the backdrop plane:

end example]

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[Note: The W3C XML Schema definition of this element's content model ([CT_Vector3D](#)) is located in §A.4.1. *end note*]

20.1.5.11 rot (Rotation)

This element defines a rotation in 3D space. A rotation in DrawingML is defined through the use of a latitude coordinate, a longitude coordinate, and a revolution about the axis as the latitude and longitude coordinates.

[Example: Consider the following example of a rotation defined by the rot elements being used in a lightRig in DrawingML:

```
<a:lightRig rig="twoPt" dir="t">
  <a:rot lat="0" lon="0" rev="6000000"/>
</a:lightRig>
```

In this example, we have only a revolution applied to the light rig which rotates it around it's center axis. *end example*]

Attributes	Description
lat (Latitude)	Defines the latitude value of the rotation. [Example: Consider the following example of a rot in DrawingML: <pre><a:rot lat="0" lon="0" rev="6000000"/></pre> In this example, we set the lat to be equal to 0. <i>end example</i>] The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
lon (Longitude)	Defines the longitude value of the rotation.

Attributes	Description
	<p>[<i>Example:</i> Consider the following example of a rot in DrawingML:</p> <pre data-bbox="456 321 1062 352"><a:rot lat="0" lon="0" rev="6000000"/></pre> <p>In this example, we set the lon to be equal to 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p>
rev (Revolution)	<p>This attributes defines the revolution around the central axis in the rotation.</p> <p>[<i>Example:</i> Consider the following example of a rot in DrawingML:</p> <pre data-bbox="456 688 1062 720"><a:rot lat="0" lon="0" rev="6000000"/></pre> <p>In this example, we set the rev to be equal to 6000000. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SphereCoords](#)) is located in §A.4.1. *end note*]

20.1.5.12 sp3d (Apply 3D shape properties)

This element defines the 3D properties associated with a particular shape in DrawingML. The 3D properties which can be applied to a shape are top and bottom bevels, a contour and an extrusion.

[*Example:* Consider the following example of an sp3d in DrawingML:

```
<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
    <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
  <a:contourClr>
    <a:schemeClr val="accent3"/>
  </a:contourClr>
</a:sp3d>
```

In this example, we see an sp3d defined which contains information defining both a top and bottom bevel, along with an extrusion and contour on the shape. The following image illustrates a shape with the applied sp3d:

end example]

Attributes	Description
contourW (Contour Width)	<p>Defines the width of the contour on the shape.</p> <p>[<i>Example:</i> Consider the following example of a contourW in use within the sp3d element:</p> <pre> <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> </pre> <p>In this example, we see a countourW defined as 50800. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
extrusionH (Extrusion Height)	<p>Defines the height of the extrusion applied to the shape.</p> <p>[<i>Example:</i> Consider the following example of an extrusionH in use within the sp3d element:</p> <pre> <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </pre>

Attributes	Description
	<pre> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> </pre> <p>In this example, we see a extrusionH defined as 165100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
prstMaterial (Preset Material Type)	<p>Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape.</p> <p>[<i>Example:</i> Consider the following example of a prstMaterial in use within the sp3d element:</p> <pre> <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> </pre> <p>In this example, we see a prstMaterial defined as plastic. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§20.1.10.49).</p>
z (Shape Depth)	<p>Defines the z coordinate for the 3D shape.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Shape3D](#)) is located in §A.4.1. *end note*]

20.1.5.13 up (Up Vector)

This element defines a vector representing up. To be more precise, this attribute defines a vector representing up in relation to the face of the backdrop plane.

[Example: Consider the following image as an example of what an up vector is in relation to the backdrop plane:

end example]

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[Note: The W3C XML Schema definition of this element's content model ([CT_Vector3D](#)) is located in §A.4.1. *end note]*

20.1.6 Shared Style Sheet

The shared style sheet aspects contained within DrawingML are responsible for containing formatting options and styles which can be used by applications to define a certain look or feel to documents. The shared style sheet can be used by any document category ([Note: For example, a presentation. *end note]*) to pull visual information from which formats the document in a certain way, or theme. The shared style sheet contains information that is not document-category specific.

20.1.6.1 clrMap (Color Map)

This element specifies the color mapping layer which allows a user to define colors for background and text. This allows for swapping out of light/dark colors for backgrounds and the text on top of the background in order to maintain readability of the text. On a deeper level, this specifies exactly which colors the first 12 values refer to in the color scheme.

[*Example:* Consider the following example of a color map in use:

```
<clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

In this example, we see that bg1 is mapped to lt1, tx1 is mapped to dk1, and so on. *end example]*

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent5 (Accent 5)	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent6 (Accent 6)	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg1 (Background 1)	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg2 (Background 2)	Specifies a color defined which is associated as the second background color.

Attributes	Description
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
folHlink (Followed Hyperlink)	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
hlink (Hyperlink)	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx1 (Text 1)	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1. *end note*]

20.1.6.2 clrScheme (Color Scheme)

This element defines a set of colors which are referred to as a color scheme. The color scheme is responsible for defining a list of twelve colors. The twelve colors consist of six accent colors, two dark colors, two light colors and a color for each of a hyperlink and followed hyperlink.

The Color Scheme Color elements appear in a sequence. The following listing shows the index value and corresponding Color Name.

Sequence Index	Element (Color) Name
0	dk1 (Dark 1)
1	lt1 (Light 1)
2	dk2 (Dark 2)
3	lt2 (Light 2)
4	accent1 (Accent 1)
5	accent2 (Accent 2)
6	accent3 (Accent 3)
7	accent4 (Accent 4)

Sequence Index	Element (Color) Name
8	accent5 (Accent 5)
9	accent6 (Accent 6)
10	hlink (Hyperlink)
11	folHlink (Followed Hyperlink)

[Example: Consider the following example of a color scheme defined in DrawingML:

```

<clrScheme name="sample">
  <dk1>
    <sysClr val="windowText"/>
  </dk1>
  <lt1>
    <sysClr val="window"/>
  </lt1>
  <dk2>
    <srgbClr val="04617B"/>
  </dk2>
  <lt2>
    <srgbClr val="DBF5F9"/>
  </lt2>
  <accent1>
    <srgbClr val="0F6FC6"/>
  </accent1>
  <accent2>
    <srgbClr val="009DD9"/>
  </accent2>
  <accent3>
    <srgbClr val="0BD0D9"/>
  </accent3>
  <accent4>
    <srgbClr val="10CF9B"/>
  </accent4>
  <accent5>
    <srgbClr val="7CCA62"/>
  </accent5>
  <accent6>
    <srgbClr val="A5C249"/>
  </accent6>
  <hlink>
    <srgbClr val="FF9800"/>
  </hlink>

```

```

<folHlink>
  <srgbClr val="F45511"/>
</folHlink>
</clrScheme>

```

In this example, are defined the 12 theme colors in the sample color scheme. *end example]*

Attributes	Description
name (Name)	<p>The common name for this color scheme. This name can show up in the user interface in a list of color schemes.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorScheme](#)) is located in §A.4.1. *end note]*

20.1.6.3 [custClrLst \(Custom Color List\)](#)

This element allows for a custom color palette to be created and which shows up alongside other color schemes. This can be very useful, for example, when someone would like to maintain a corporate color palette.

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomColorList](#)) is located in §A.4.1. *end note]*

20.1.6.4 [extraClrScheme \(Extra Color Scheme\)](#)

This element defines an auxiliary color scheme, which includes both a color scheme and color mapping. This is mainly used for backward compatibility concerns and roundtrips information required by earlier versions.

[Example: Consider the following example of an extra color scheme in use in DrawingML:

```

<extraClrScheme>
  <clrScheme name="extraColorSchemeSample">
    <dk1>
      <sysClr val="windowText"/>
    </dk1>
    <lt1>
      <sysClr val="window"/>
    </lt1>
    <dk2>
      <srgbClr val="04617B"/>
    </dk2>
    <lt2>
      <srgbClr val="DBF5F9"/>
    </lt2>
  </clrScheme>
</extraClrScheme>

```

```

    <accent1>
      <srgbClr val="0F6FC6"/>
    </accent1>
    <accent2>
      <srgbClr val="009DD9"/>
    </accent2>
    <accent3>
      <srgbClr val="0BD0D9"/>
    </accent3>
    <accent4>
      <srgbClr val="10CF9B"/>
    </accent4>
    <accent5>
      <srgbClr val="7CCA62"/>
    </accent5>
    <accent6>
      <srgbClr val="A5C249"/>
    </accent6>
    <hlink>
      <srgbClr val="FF9800"/>
    </hlink>
    <folHlink>
      <srgbClr val="F45511"/>
    </folHlink>
  </clrScheme>
  <clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
</extraClrScheme>

```

In this example, the extra color scheme contains a color scheme and a color map for that color scheme. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorSchemeAndMapping](#)) is located in §A.4.1. *end note*]

20.1.6.5 [extraClrSchemeLst](#) (Extra Color Scheme List)

This element is a container for the list of extra color schemes present in a document.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorSchemeList](#)) is located in §A.4.1. *end note*]

20.1.6.6 masterClrMapping (Master Color Mapping)

This element is a part of a choice for which color mapping is used within the document. There is also defined an `overrideClrMapping` (§20.1.6.8) element which, when specified, the override is used rather than the color mapping defined in the master. If this element is specified, then we specifically use the color mapping defined in the master.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmptyElement](#)) is located in §A.4.1. *end note*]

20.1.6.7 objectDefaults (Object Defaults)

This element allows for the definition of default shape, line, and textbox formatting properties. An application can use this information to format a shape (or text) initially on insertion into a document.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ObjectStyleDefaults](#)) is located in §A.4.1. *end note*]

20.1.6.8 overrideClrMapping (Override Color Mapping)

This element provides an override for the color mapping in a document. When defined, this color mapping is used in place of the already defined color mapping, or master color mapping. This color mapping is defined in the same manner as the other mappings within this document.

[*Example:* Consider the following example of an override color mapping in DrawingML:

```
<overrideClrMapping bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the <code>ST_ColorSchemeIndex</code> simple type (§20.1.10.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the <code>ST_ColorSchemeIndex</code> simple type (§20.1.10.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the <code>ST_ColorSchemeIndex</code> simple type (§20.1.10.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color.

Attributes	Description
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent5 (Accent 5)	<p>Specifies a color defined which is associated as the accent 5 color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
accent6 (Accent 6)	<p>Specifies a color defined which is associated as the accent 6 color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
bg1 (Background 1)	<p>A color defined which is associated as the first background color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
bg2 (Background 2)	<p>Specifies a color defined which is associated as the second background color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
folHlink (Followed Hyperlink)	<p>Specifies a color defined which is associated as the color for a followed hyperlink.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
hlink (Hyperlink)	<p>Specifies a color defined which is associated as the color for a hyperlink.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
tx1 (Text 1)	<p>Specifies a color defined which is associated as the first text color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
tx2 (Text 2)	<p>Specifies a color defined which is associated as the second text color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1.
end note]

20.1.6.9 theme (Theme)

This element defines the root level complex type associated with a shared style sheet (or theme). This element holds all the different formatting options available to a document through a theme and defines the overall look and feel of the document when themed objects are used within the document.

[Example: Consider the following image as an example of different themes in use applied to a presentation:

In this example, we see how a theme can affect font, colors, backgrounds, fills, and effects for different objects in a presentation. *end example*]

Attributes	Description
name (Name)	Specifies the name given to the theme. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_OfficeStyleSheet](#)) is located in §A.4.1. *end note*]

20.1.6.10 themeElements (Theme Elements)

This element defines the theme formatting options for the theme and is the workhorse of the theme. This is where the bulk of the shared theme information is contained and used by a document. This element contains the color scheme, font scheme, and format scheme elements which define the different formatting aspects of what a theme defines.

[Example: Consider the following example of a theme elements defined in DrawingML:

```

<themeElements>
  <clrScheme name="sample">
...
  </clrScheme>
  <fontScheme name="sample">
...
  </fontScheme>
  <fmtScheme name="sample">
    <fillStyleLst>
...
    </fillStyleLst>
    <lnStyleLst>
...
    </lnStyleLst>
    <effectStyleLst>
...
    </effectStyleLst>
    <bgFillStyleLst>
...
    </bgFillStyleLst>
  </fmtScheme>
</themeElements>

```

In this example, we see the basic structure of how a theme elements is defined and have left out the true guts of each individual piece to save room. Each part (color scheme, font scheme, format scheme) is defined elsewhere within DrawingML. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BaseStyles](#)) is located in §A.4.1. *end note*]

20.1.6.11 `themeManager` (Theme Manager)

The starting part for a theme file.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmptyElement](#)) is located in §A.4.1. *end note*]

20.1.6.12 `themeOverride` (Theme Override)

This element allows for an override which changes just the colors, fonts, or effects of a single object, like a table for example. Currently it is used only to control overrides on the non-top-level masters within a presentation.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BaseStylesOverride](#)) is located in §A.4.1. *end note*]

20.1.7 Coordinate Systems and Transformations

The following elements are used to reflect dimensions, scaling, location, rotation, and flip information on groups and individual shapes respectively.

20.1.7.1 chExt (Child Extents)

This element specifies the size dimensions of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Attributes	Description
cx (Extent Length)	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
cy (Extent Width)	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

20.1.7.2 chOff (Child Offset)

This element specifies the location of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Attributes	Description
x (X-Axis)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified

Attributes	Description
Coordinate)	<p>by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
y (Y-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.1.7.3 [ext \(Extents\)](#)

This element specifies the size of the bounding box enclosing the referenced object.

Attributes	Description
cx (Extent Length)	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

Attributes	Description
cy (Extent Width)	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000" /></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

20.1.7.4 off (Offset)

This element specifies the location of the bounding box of an object. Effects on an object are not included in this bounding box.

Attributes	Description
x (X-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
y (Y-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type</p>

Attributes	Description
	(§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.1.7.5 **xfrm (2D Transform for Grouped Objects)**

This element is nearly identical to the representation of 2-D transforms for ordinary shapes (§20.1.7.6). The only addition is a member to represent the Child offset and the Child extents.

Attributes	Description
flipH (Horizontal Flip)	<p>Horizontal flip. When true, this attribute defines that the group is flipped horizontally about the center of its bounding box.</p> <p>[<i>Example</i>: The following illustrates the effect of a horizontal flip.</p> <div></div> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
flipV (Vertical Flip)	<p>Vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[<i>Example</i>: The following illustrates the effect of a vertical flip.</p> <div></div> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rot (Rotation)	<p>Rotation. Specifies the clockwise rotation of a group in 1/64000 of a degree.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupTransform2D](#)) is located in §A.4.1. *end note*]

20.1.7.6 xfrm (2D Transform for Individual Objects)

This element represents 2-D transforms for ordinary shapes.

Attributes	Description
flipH (Horizontal Flip)	<p>Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p>  <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
flipV (Vertical Flip)	<p>Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.</p>  <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rot (Rotation)	<p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Transform2D](#)) is located in §A.4.1. *end note*]

20.1.8 Shape Fills, Effects, and Line Properties

This portion of the DrawingML framework describes effects defining the visual appearance of shapes and lines. Shapes can be filled in a variety of ways, with images, solid colors, gradients, or pattern fills. In addition, several visual effects can alter the appearance of a shape, and multiple effects can be combined together. Lines also can have special properties defining how they are rendered, including a dashed appearance or decorations at the line ends. This section documents the elements that define these properties and effects for shapes and lines.

20.1.8.1 `alphaBiLevel` (Alpha Bi-Level Effect)

This element represents an Alpha Bi-Level Effect.

Alpha (Opacity) values less than the threshold are changed to 0 (fully transparent) and alpha values greater than or equal to the threshold are changed to 100% (fully opaque).

Attributes	Description
thresh (Threshold)	Specifies the threshold value for the alpha bi-level effect. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[Note: The W3C XML Schema definition of this element's content model ([CT_AlphaBiLevelEffect](#)) is located in §A.4.1. *end note*]

20.1.8.2 `alphaCeiling` (Alpha Ceiling Effect)

This element represents an alpha ceiling effect.

Alpha (opacity) values greater than zero are changed to 100%. In other words, anything partially opaque becomes fully opaque.

[Note: The W3C XML Schema definition of this element's content model ([CT_AlphaCeilingEffect](#)) is located in §A.4.1. *end note*]

20.1.8.3 `alphaFloor` (Alpha Floor Effect)

This element represents an alpha floor effect.

Alpha (opacity) values less than 100% are changed to zero. In other words, anything partially transparent becomes fully transparent.

[Note: The W3C XML Schema definition of this element's content model ([CT_AlphaFloorEffect](#)) is located in §A.4.1. *end note*]

20.1.8.4 `alphaInv` (Alpha Inverse Effect)

This element represents an alpha inverse effect.

Alpha (opacity) values are inverted by subtracting from 100%.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AlphaInverseEffect](#)) is located in §A.4.1. *end note*]

20.1.8.5 [alphaMod \(Alpha Modulate Effect\)](#)

This element represents an alpha modulate effect.

Effect alpha (opacity) values are multiplied by a fixed percentage. The effect container specifies an effect containing alpha values to modulate.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AlphaModulateEffect](#)) is located in §A.4.1. *end note*]

20.1.8.6 [alphaModFix \(Alpha Modulate Fixed Effect\)](#)

This element represents an alpha modulate fixed effect.

Effect alpha (opacity) values are multiplied by a fixed percentage.

Attributes	Description
amt (Amount)	Specifies the percentage amount to scale the alpha. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AlphaModulateFixedEffect](#)) is located in §A.4.1. *end note*]

20.1.8.7 [alphaOutset \(Alpha Inset/Outset Effect\)](#)

This element specifies an alpha outset/inset effect.

This is equivalent to an alpha ceiling, followed by alpha blur, followed by either an alpha ceiling (positive radius) or alpha floor (negative radius).

Attributes	Description
rad (Radius)	Specifies the radius of outset/inset. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AlphaOutsetEffect](#)) is located in §A.4.1. *end note*]

20.1.8.8 [alphaRepl \(Alpha Replace Effect\)](#)

This element specifies an alpha replace effect.

Effect alpha (opacity) values are replaced by a fixed alpha.

Attributes	Description
a (Alpha)	Specifies the new opacity value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[Note: The W3C XML Schema definition of this element’s content model ([CT_AlphaReplaceEffect](#)) is located in §A.4.1. *end note*]

20.1.8.9 [bevel \(Line Join Bevel\)](#)

This element specifies a Bevel Line Join.

A bevel joint specifies that an angle joint is used to connect lines.

[Example:

end example]

[Note: The W3C XML Schema definition of this element’s content model ([CT_LineJoinBevel](#)) is located in §A.4.1. *end note*]

20.1.8.10 [bgClr \(Background color\)](#)

This element specifies the background color of a Pattern fill.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.8.11 [biLevel \(Bi-Level \(Black/White\) Effect\)](#)

This element specifies a bi-level (black/white) effect. Input colors whose luminance is less than the specified threshold value are changed to black. Input colors whose luminance are greater than or equal the specified value are set to white. The alpha effect values are unaffected by this effect.

Attributes	Description
thresh (Threshold)	Specifies the luminance threshold for the Bi-Level effect. Values greater than or equal to the threshold are set to white. Values lesser than the threshold are set to black.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).

[Note: The W3C XML Schema definition of this element's content model ([CT_BiLevelEffect](#)) is located in §A.4.1.
end note]

20.1.8.12 [blend \(Blend Effect\)](#)

This element specifies a blend of several effects. The container specifies the raw effects to blend while the blend mode specifies how the effects are to be blended.

Attributes	Description
blend (Blend Mode)	Specifies how to blend the two effects. The possible values for this attribute are defined by the ST_BlendMode simple type (§20.1.10.11).

[Note: The W3C XML Schema definition of this element's content model ([CT_BlendEffect](#)) is located in §A.4.1.
end note]

20.1.8.13 [blip \(Blip\)](#)

This element specifies the existence of an image (binary large image or picture) and contains a reference to the image data.

Attributes	Description
cstate (Compression State)	Specifies the compression state with which the picture is stored. This allows the application to specify the amount of compression that has been applied to a picture. The possible values for this attribute are defined by the ST_BlipCompression simple type (§20.1.10.12).
embed (Embedded Picture Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identification information for an embedded picture. This attribute is used to specify an image that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
link (Linked Picture Reference)	Specifies the identification information for a linked picture. This attribute is used to specify an image that does not reside within this file.

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element’s content model ([CT_Blip](#)) is located in §A.4.1. *end note*]

20.1.8.14 [blipFill \(Picture Fill\)](#)

This element specifies the type of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
...
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[Example: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
<p:spPr>
  <a:gradFill>
    <a:gsLst>
      <a:gs pos="0">
        <a:schemeClr val="tx2">
          <a:shade val="50000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="39999">
        <a:schemeClr val="tx2">
          <a:tint val="20000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="70000">
        <a:srgbClr val="C4D6EB"/>
      </a:gs>
      <a:gs pos="100000">
        <a:schemeClr val="bg1"/>
      </a:gs>
    </a:gsLst>
  </a:gradFill>
</p:spPr>
...
</p:pic>
```

The above picture object is shown as an example of this double fill type. *end example*]

Attributes	Description
dpi (DPI Setting)	<p>Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.</p> <p>[<i>Note</i>: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rotWithShape (Rotate With Shape)	<p>Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_BlipFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.15 blur (Blur Effect)

This element specifies a blur effect that is applied to the entire shape, including its fill. All color channels, including alpha, are affected.

Attributes	Description
grow (Grow Bounds)	<p>Specifies whether the bounds of the object should be grown as a result of the blurring. True indicates the bounds are grown while false indicates that they are not.</p> <p>[<i>Example</i>:</p>

Attributes	Description
	<p>With grow set to false, the blur effect does not extend beyond the original bounds of the object:</p>  <p>With grow set to true, the blur effect can extend beyond the original bounds of the object:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rad (Radius)	<p>Specifies the radius of blur.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_BlurEffect](#)) is located in §A.4.1. *end note*]

20.1.8.16 [clrChange \(Color Change Effect\)](#)

This element specifies a Color Change Effect. Instances of clrFrom are replaced with instances of clrTo.

Attributes	Description
useA (Consider Alpha Values)	<p>Specifies whether alpha values are considered for the effect. Effect alpha values are considered if useA is true, else they are ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorChangeEffect](#)) is located in §A.4.1. *end note*]

20.1.8.17 **clrFrom (Change Color From)**

This element specifies a color getting removed in a color change effect. It is the "from" or source input color.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.8.18 **clrRepl (Solid Color Replacement)**

This element specifies a solid color replacement value. All effect colors are changed to a fixed color. Alpha values are unaffected.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorReplaceEffect](#)) is located in §A.4.1. *end note*]

20.1.8.19 **clrTo (Change Color To)**

This element specifies the color which replaces the clrFrom in a clrChange effect. This is the "target" or "to" color in the color change effect.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.8.20 **cont (Effect Container)**

This element specifies an Effect Container. It is a list of effects.

Attributes	Description
name (Name)	<p>Specifies an optional name for this list of effects, so that it can be referred to later. Shall be unique across all effect trees and effect containers.</p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p>
type (Effect Container Type)	<p>Specifies the kind of container, either sibling or tree.</p> <p>The possible values for this attribute are defined by the ST_EffectContainerType simple type (§20.1.10.22).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EffectContainer](#)) is located in §A.4.1. *end note*]

20.1.8.21 **custDash (Custom Dash)**

This element specifies a custom dashing scheme. It is a list of dash stop elements which represent building block atoms upon which the custom dashing scheme is built.

[*Note: The W3C XML Schema definition of this element's content model ([CT_DashStopList](#)) is located in §A.4.1. end note*]

20.1.8.22 [ds \(Dash Stop\)](#)

This element specifies a dash stop primitive. Dashing schemes are built by specifying an ordered list of dash stop primitive. A dash stop primitive consists of a dash and a space.

Attributes	Description
d (Dash Length)	Specifies the length of the dash relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).
sp (Space Length)	Specifies the length of the space relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[*Note: The W3C XML Schema definition of this element's content model ([CT_DashStop](#)) is located in §A.4.1. end note*]

20.1.8.23 [duotone \(Duotone Effect\)](#)

This element specifies a duotone effect.

For each pixel, combines clr1 and clr2 through a linear interpolation to determine the new color for that pixel.

[*Note: The W3C XML Schema definition of this element's content model ([CT_DuotoneEffect](#)) is located in §A.4.1. end note*]

20.1.8.24 [effect \(Effect\)](#)

This element specifies a reference to an existing effect container.

Attributes	Description
ref (Reference)	Specifies the reference. Its value can be the name of an effect container, or one of four special references: fill - refers to the fill effect line - refers to the line effect fillLine - refers to the combined fill and line effects children - refers to the combined effects from logical child shapes or text The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EffectReference](#)) is located in §A.4.1. *end note*]

20.1.8.25 [effectDag \(Effect Container\)](#)

This element specifies a list of effects. Effects are applied in the order specified by the container type (sibling or tree).

[*Note:* An effectDag element can contain multiple effect containers as child elements. Effect containers with different styles can be combined in an effectDag to define a directed acyclic graph (DAG) that specifies the order in which all effects are applied. *end note*]

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Shall be unique across all effect trees and effect containers. The possible values for this attribute are defined by the W3C XML Schema token datatype.
type (Effect Container Type)	Specifies the kind of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§20.1.10.22).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EffectContainer](#)) is located in §A.4.1. *end note*]

20.1.8.26 [effectLst \(Effect Container\)](#)

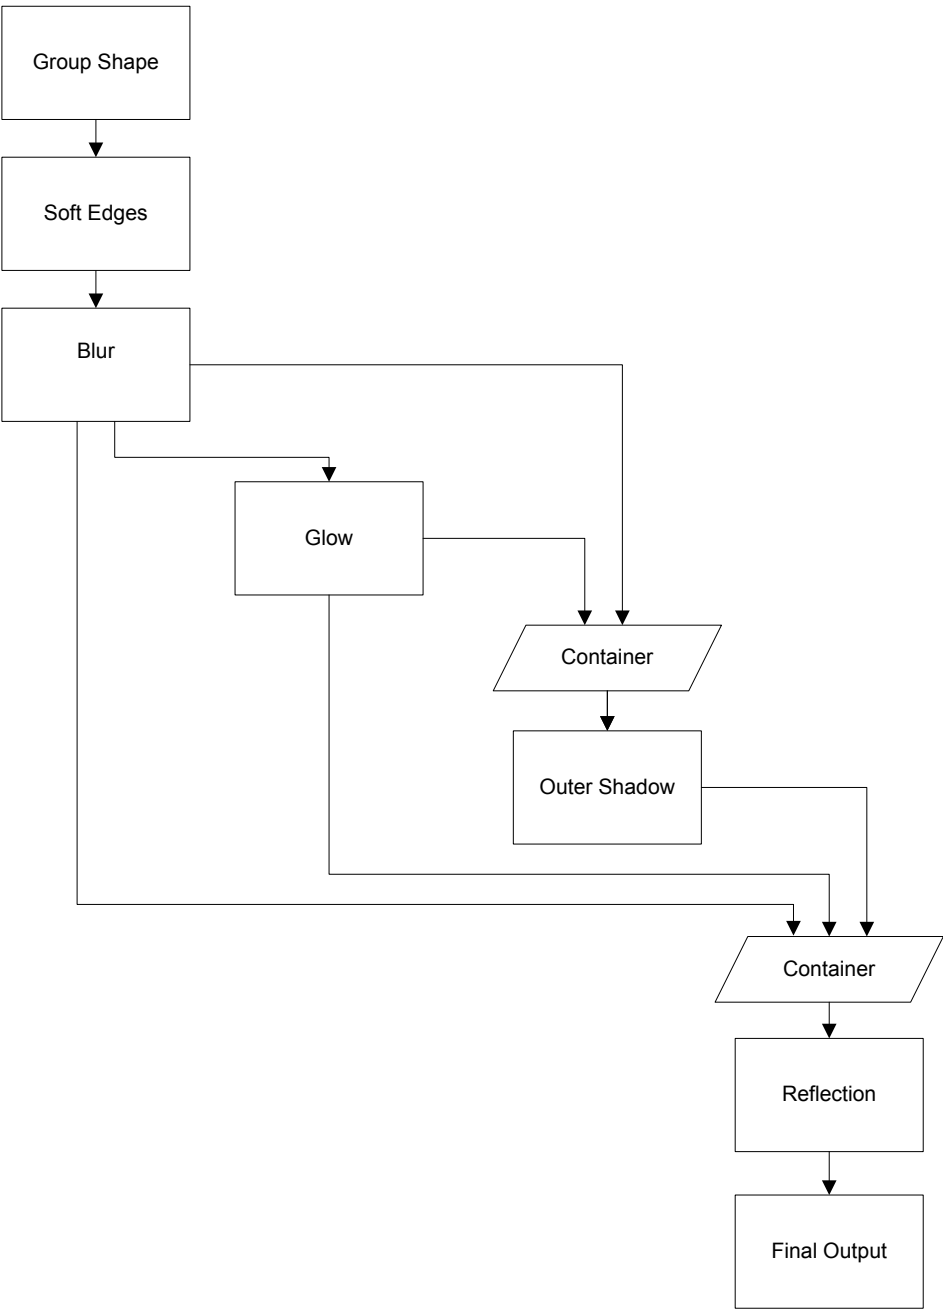

This element specifies a list of effects. Effects in an effectLst are applied in the default order by the rendering engine. The following diagrams illustrate the order in which effects are applied, both for shapes and for group shapes.

[*Note:* The output of many effects does not include the input shape. For effects that should be applied to the result of previous effects as well as the original shape, a container is used to group the inputs together. *end note*]

[*Example:* Outer Shadow is applied both to the original shape and the original shape's glow. The result of blur contains the original shape, while the result of glow contains only the added glow. Therefore, a container that groups the blur result with the glow result is used as the input to Outer Shadow. *end example*]

effectLst Processing for Shapes

effectLst Processing for Group Shapes

[Note: The W3C XML Schema definition of this element’s content model (CT_EffectList) is located in §A.4.1. *end note*]

20.1.8.27 fgClr (Foreground color)

This element specifies the foreground color of a pattern fill.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.8.28 fill (Fill)

This element specifies a fill which is one of blipFill, gradFill, grpFill, noFill, pattFill or solidFill.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FillEffect](#)) is located in §A.4.1. *end note*]

20.1.8.29 fillOverlay (Fill Overlay Effect)

This element specifies a fill overlay effect. A fill overlay can be used to specify an additional fill for an object and blend the two fills together.

Attributes	Description
blend (Blend)	Specifies how to blend the fill with the base effect. The possible values for this attribute are defined by the ST_BlendMode simple type (§20.1.10.11).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FillOverlayEffect](#)) is located in §A.4.1. *end note*]

20.1.8.30 fillRect (Fill Rectangle)

This element specifies a fill rectangle. When stretching of an image is specified, a source rectangle, srcRect, is scaled to fit the specified fill rectangle.

Each edge of the fill rectangle is defined by a percentage offset from the corresponding edge of the shape's bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note:* For example, a left offset of 25% specifies that the left edge of the fill rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

[*Example:*

```
<a:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect b="10000" r="25000"/>
  </a:stretch>
</a:blipFill>
```

```
</a:stretch>
</a:blipFill>
```

The above image is stretched to fill the entire rectangle except for the bottom 10% and rightmost 25%.

end example]

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_RelativeRect](#)) is located in §A.4.1.
end note]

20.1.8.31 [fillToRect \(Fill To Rectangle\)](#)

This element defines the "focus" rectangle for the center shade, specified relative to the fill tile rectangle. The center shade fills the entire tile except the margins specified by each attribute.

Each edge of the center shade rectangle is defined by a percentage offset from the corresponding edge of the tile rectangle. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note:* For example, a left offset of 25% specifies that the left edge of the center shade rectangle is located to the right of the tile rectangle's left edge by an amount equal to 25% of the tile rectangle's width. *end note]*

[*Example:*

```
<a:path path="rect">
  <a:fillToRect l="50000" r="50000" t="50000" b="50000"/>
</a:path>
```

In the above shape, the rectangle defined by fillToRect is a single point in the center of the shape. This creates the effect of the center shade focusing at a point in the center of the region.

end example]

[Example:

```
<a:path path="rect">
  <a:fillToRect l="25000" t="25000" r="25000" b="0"/>
</a:path>
```

The center shade occupies the rectangle defined by excluding the topmost, leftmost, and rightmost 25% of the region. Therefore, the gradient fills the remaining leftmost 25%, topmost 25%, and rightmost 25% of the region.

end example]

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_RelativeRect](#)) is located in §A.4.1.
end note]

20.1.8.32 glow (Glow Effect)

This element specifies a glow effect, in which a color blurred outline is added outside the edges of the object.

Attributes	Description
rad (Radius)	<p>Specifies the radius of the glow.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_GlowEffect](#)) is located in §A.4.1.
end note]

20.1.8.33 gradFill (Gradient Fill)

This element defines a gradient fill.

A gradient fill is a fill which is characterized by a smooth gradual transition from one color to the next. At its simplest, it is a fill which transitions between two colors; or more generally, it can be a transition of any number of colors.

The desired transition colors and locations are defined in the gradient stop list (gsLst) child element.

The other child element defines the properties of the gradient fill (there are two styles-- a linear shade style as well as a path shade style)

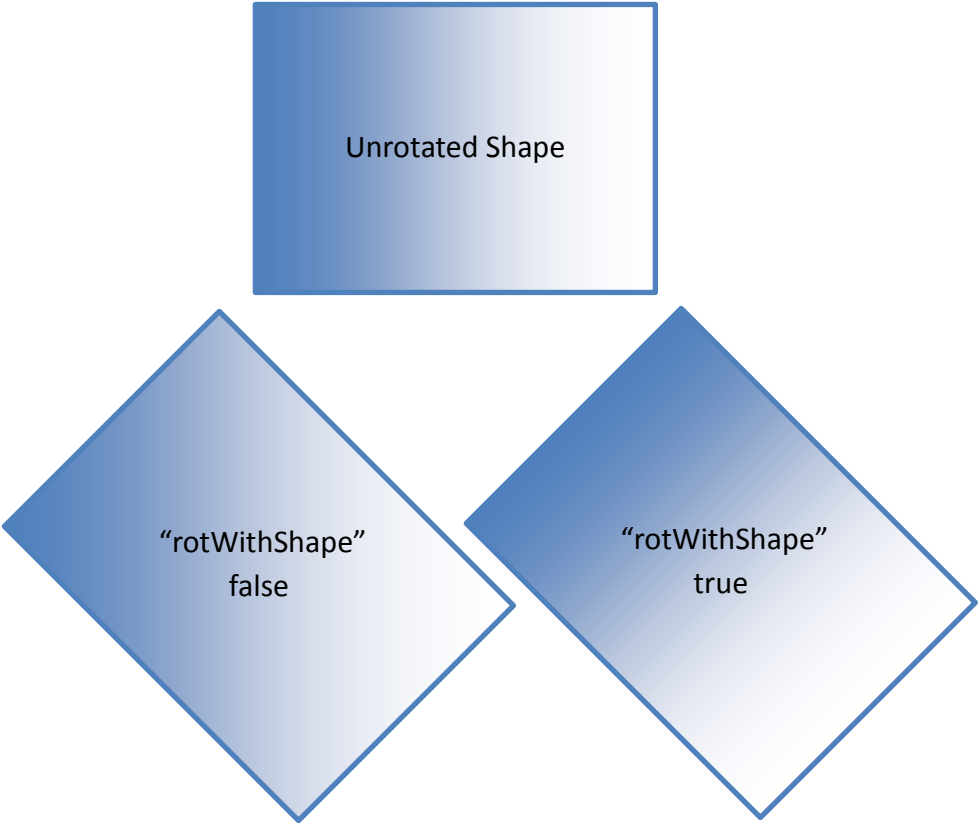

[Example:

The following is a sample gradient fill, varying from blue to white:

end example]

Attributes	Description
flip (Tile Flip)	<p>Specifies the direction(s) in which to flip the gradient while tiling.</p> <p>Normally a gradient fill encompasses the entire bounding box of the shape which contains the fill. However, with the tileRect element, it is possible to define a "tile" rectangle which is smaller than the bounding box. In this situation, the gradient fill is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TileFlipMode simple type (§20.1.10.85).
rotWithShape (Rotate With Shape)	<p>Specifies if a fill rotates along with a shape when the shape is rotated.</p> <p><i>[Example:</i></p> <p>The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_GradientFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.34 **grayscale** (Gray Scale Effect)

This element specifies a gray scale effect. Converts all effect color values to a shade of gray, corresponding to their luminance. Effect alpha (opacity) values are unaffected.

[Note: The W3C XML Schema definition of this element’s content model ([CT_GrayscaleEffect](#)) is located in §A.4.1. *end note*]

20.1.8.35 **groupFill** (Group Fill)

This element specifies a group fill. When specified, this setting indicates that the parent element is part of a group and should inherit the fill properties of the group.

[Note: The W3C XML Schema definition of this element’s content model ([CT_GroupFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.36 **gradientStops** (Gradient stops)

This element defines a gradient stop. A gradient stop consists of a position where the stop appears in the color band.

Attributes	Description
pos (Position)	<p>Specifies where this gradient stop should appear in the color band. This position is specified in the range [0%, 100%], which corresponds to the beginning and the end of the color band respectively.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_GradientStop](#)) is located in §A.4.1. *end note*]

20.1.8.37 **gradientStopsList** (Gradient Stop List)

The list of gradient stops that specifies the gradient colors and their relative positions in the color band.

[Note: The W3C XML Schema definition of this element’s content model ([CT_GradientStopList](#)) is located in §A.4.1. *end note*]

20.1.8.38 **lineHeadEnd** (Line Head/End Style)

This element specifies decorations which can be added to the head of a line.

[Example:

end exmaple]

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width. The possible values for this attribute are defined by the ST_LineEndLength simple type (§20.1.10.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§20.1.10.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§20.1.10.34).

[Note: The W3C XML Schema definition of this element's content model ([CT_LineEndProperties](#)) is located in §A.4.1. *end note*]

20.1.8.39 hsl (Hue Saturation Luminance Effect)

This element specifies a hue/saturation/luminance effect. The hue, saturation, and luminance can each be adjusted relative to its current value.

Attributes	Description
hue (Hue)	Specifies the number of degrees by which the hue is adjusted. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
lum (Luminance)	Specifies the percentage by which the luminance is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
sat (Saturation)	Specifies the percentage by which the saturation is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).

[Note: The W3C XML Schema definition of this element's content model ([CT_HSLEffect](#)) is located in §A.4.1. *end note*]

20.1.8.40 innerShdw (Inner Shadow Effect)

This element specifies an inner shadow effect. A shadow is applied within the edges of the object according to the parameters given by the attributes.

Attributes	Description
blurRad (Blur Radius)	Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
dir (Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
dist (Distance)	Specifies how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[Note: The W3C XML Schema definition of this element’s content model ([CT_InnerShadowEffect](#)) is located in §A.4.1. *end note*]

20.1.8.41 lin (Linear Gradient Fill)

This element specifies a linear gradient.

Attributes	Description
ang (Angle)	Specifies the direction of color change for the gradient. To define this angle, let its value be x measured clockwise. Then $(-\sin x, \cos x)$ is a vector parallel to the line of constant color in the gradient fill. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
scaled (Scaled)	Whether the gradient angle scales with the fill region. Mathematically, if this flag is true, then the gradient vector $(\cos x, \sin x)$ is scaled by the width (w) and height (h) of the fill region, so that the vector becomes $(w \cos x, h \sin x)$ (before normalization). Observe that now if the gradient angle is 45 degrees, the gradient vector is (w, h) , which goes

Attributes	Description
	<p>from top-left to bottom-right of the fill region. If this flag is false, the gradient angle is independent of the fill region and is not scaled using the manipulation described above. So a 45-degree gradient angle always give a gradient band whose line of constant color is parallel to the vector (1, -1).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_LinearShadeProperties](#)) is located in §A.4.1. *end note*]

20.1.8.42 lum (Luminance Effect)

This element specifies a luminance effect. Brightness linearly shifts all colors closer to white or black. Contrast scales all colors to be either closer or further apart.

Attributes	Description
bright (Brightness)	<p>Specifies the percent to change the brightness.</p> <p>The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).</p>
contrast (Contrast)	<p>Specifies the percent to change the contrast.</p> <p>The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_LuminanceEffect](#)) is located in §A.4.1. *end note*]

20.1.8.43 miter (Miter Line Join)

This element specifies that a line join shall be mitered.

[Example: The following sample illustrated two lines which are joined using a mitered style

end example]

Attributes	Description
lim (Miter Join)	Specifies the amount by which lines is extended to form a miter join - otherwise miter

Attributes	Description
Limit)	joins can extend infinitely far (for lines which are almost parallel). The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).

[Note: The W3C XML Schema definition of this element's content model ([CT_LineJoinMiterProperties](#)) is located in §A.4.1. *end note*]

20.1.8.44 noFill (No Fill)

This element specifies that no fill is applied to the parent element.

[Note: The W3C XML Schema definition of this element's content model ([CT_NoFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.45 outerShdw (Outer Shadow Effect)

This element specifies an Outer Shadow Effect.

[Example: The following is an example of an outer shadow effect.

end example]

Attributes	Description
aln (Shadow Alignment)	Specifies shadow alignment; alignment happens first, effectively setting the origin for scale, skew, and offset. The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52).
blurRad (Blur Radius)	Specifies the blur radius of the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
dir (Shadow Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple

Attributes	Description
	type (§20.1.10.43).
dist (Shadow Offset Distance)	Specifies the how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
kx (Horizontal Skew)	Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
ky (Vertical Skew)	Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).
rotWithShape (Rotate With Shape)	Specifies whether the shadow rotates with the shape if the shape is rotated. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sx (Horizontal Scaling Factor)	Specifies the horizontal scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
sy (Vertical Scaling Factor)	Specifies the vertical scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_OuterShadowEffect](#)) is located in §A.4.1. *end note*]

20.1.8.46 [path \(Path Gradient\)](#)

This element defines that a gradient fill follows a path vs. a linear line.

[Example:

The examples above illustrate gradient fills following a circular, rectangular or shape path.

end example]

Attributes	Description
path (Gradient Fill Path)	Specifies the shape of the path to follow. The possible values for this attribute are defined by the ST_PathShadeType simple type (§20.1.10.38).

[Note: The W3C XML Schema definition of this element’s content model ([CT_PathShadeProperties](#)) is located in §A.4.1. *end note*]

20.1.8.47 [pattFill \(Pattern Fill\)](#)

This element specifies a pattern fill. A repeated pattern is used to fill the object.

Attributes	Description
prst (Preset Pattern)	Specifies one of a set of preset patterns to fill the object. The possible values for this attribute are defined by the ST_PresetPatternVal simple type (§20.1.10.50).

[Note: The W3C XML Schema definition of this element’s content model ([CT_PatternFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.48 [prstDash \(Preset Dash\)](#)

This element specifies that a preset line dashing scheme should be used.

Attributes	Description
val (Value)	Specifies which preset dashing scheme is to be used. The possible values for this attribute are defined by the ST_PresetLineDashVal simple type (§20.1.10.48).

[Note: The W3C XML Schema definition of this element's content model ([CT_PresetLineDashProperties](#)) is located in §A.4.1. *end note*]

20.1.8.49 `prstShdw` (Preset Shadow)

This element specifies that a preset shadow is to be used. Each preset shadow is equivalent to a specific outer shadow effect. For each preset shadow, the color element, direction attribute, and distance attribute represent the color, direction, and distance parameters of the corresponding outer shadow. Additionally, the `rotateWithShape` attribute of corresponding outer shadow is always false. Other non-default parameters of the outer shadow are dependent on the `prst` attribute.

Attributes	Description
<code>dir</code> (Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the <code>ST_PositiveFixedAngle</code> simple type (§20.1.10.43).
<code>dist</code> (Distance)	Specifies how far to offset the shadow. The possible values for this attribute are defined by the <code>ST_PositiveCoordinate</code> simple type (§20.1.10.41).
<code>prst</code> (Preset Shadow)	Specifies which preset shadow to use. The possible values for this attribute are defined by the <code>ST_PresetShadowVal</code> simple type (§20.1.10.51).

[Note: The W3C XML Schema definition of this element's content model ([CT_PresetShadowEffect](#)) is located in §A.4.1. *end note*]

20.1.8.50 `reflection` (Reflection Effect)

This element specifies a reflection effect.

[Example:

Attributes	Description
align (Shadow Alignment)	Specifies shadow alignment. The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52).
blurRad (Blur Radius)	Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
dir (Direction)	Specifies the direction of the alpha gradient ramp relative to the shape itself. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).
dist (Distance)	Specifies how far to distance the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
endA (End Alpha)	Specifies the ending reflection opacity.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).
endPos (End Position)	<p>Specifies the end position (along the alpha gradient ramp) of the end alpha value.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>
fadeDir (Fade Direction)	<p>Specifies the direction to offset the reflection.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p>
kx (Horizontal Skew)	<p>Specifies the horizontal skew angle.</p> <p>The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).</p>
ky (Vertical Skew)	<p>Specifies the vertical skew angle.</p> <p>The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).</p>
rotWithShape (Rotate With Shape)	<p>Specifies if the reflection rotates with the shape.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
stA (Start Opacity)	<p>starting reflection opacity.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>
stPos (Start Position)	<p>Specifies the start position (along the alpha gradient ramp) of the start alpha value.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p>
sx (Horizontal Ratio)	<p>Specifies the horizontal scaling factor.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
sy (Vertical Ratio)	<p>Specifies the vertical scaling factor.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ReflectionEffect](#)) is located in §A.4.1. *end note*]

20.1.8.51 relOff (Relative Offset Effect)

This element specifies a relative offset effect. Sets up a new origin by offsetting relative to the size of the previous effect.

Attributes	Description
tx (Offset X)	Specifies the X offset. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
ty (Offset Y)	Specifies the Y offset. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[Note: The W3C XML Schema definition of this element's content model ([CT_RelativeOffsetEffect](#)) is located in §A.4.1. *end note*]

20.1.8.52 round (Round Line Join)

This element specifies that lines joined together have a round join.

[Example:

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_LineJoinRound](#)) is located in §A.4.1. *end note*]

20.1.8.53 softEdge (Soft Edge Effect)

This element specifies a soft edge effect. The edges of the shape are blurred, while the fill is not affected.

Attributes	Description
rad (Radius)	Specifies the radius of blur to apply to the edges. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[Note: The W3C XML Schema definition of this element's content model ([CT_SoftEdgesEffect](#)) is located in §A.4.1. *end note*]

20.1.8.54 `solidFill` (Solid Fill)

This element specifies a solid color fill. The shape is filled entirely with the specified color.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SolidColorFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.55 `srcRect` (Source Rectangle)

This element specifies the portion of the blip used for the fill.

Each edge of the source rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note:* For example, a left offset of 25% specifies that the left edge of the source rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RelativeRect](#)) is located in §A.4.1. *end note*]

20.1.8.56 `stretch` (Stretch)

This element specifies that a BLIP should be stretched to fill the target rectangle. The other option is a tile where a BLIP is tiled to fill the available area.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_StretchInfoProperties](#)) is located in §A.4.1. *end note*]

20.1.8.57 **tailEnd (Tail line end style)**

This element specifies decorations which can be added to the tail of a line.

[Example:

end example]

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width. The possible values for this attribute are defined by the ST_LineEndLength simple type (§20.1.10.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§20.1.10.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§20.1.10.34).

[Note: The W3C XML Schema definition of this element’s content model ([CT_LineEndProperties](#)) is located in §A.4.1. end note]

20.1.8.58 **tile (Tile)**

This element specifies that a BLIP should be tiled to fill the available space. This element defines a "tile" rectangle within the bounding box. The image is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.

[Example:

The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

end example]

Attributes	Description
align (Alignment)	<p>Specifies where to align the first tile with respect to the shape. Alignment happens after the scaling, but before the additional offset.</p> <p>The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52).</p>
flip (Tile Flipping)	<p>Specifies the direction(s) in which to flip the source image while tiling. Images can be flipped horizontally, vertically, or in both directions to fill the entire region.</p> <p>The possible values for this attribute are defined by the ST_TileFlipMode simple type (§20.1.10.85).</p>
sx (Horizontal Ratio)	<p>Specifies the amount to horizontally scale the srcRect.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
sy (Vertical Ratio)	<p>Specifies the amount to vertically scale the srcRect.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
tx (Horizontal Offset)	<p>Specifies additional horizontal offset after alignment.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
ty (Vertical Offset)	<p>Specifies additional vertical offset after alignment.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TileInfoProperties](#)) is located in §A.4.1. *end note*]

20.1.8.59 tileRect (Tile Rectangle)

This element specifies a rectangular region of the shape to which the gradient is applied. This region is then tiled across the remaining area of the shape to complete the fill. The tile rectangle is defined by percentage offsets from the sides of the shape's bounding box.

Each edge of the tile rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note*: For example, a left offset of 25% specifies that the left edge of the tile rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

[*Example*:

The image above depicts a horizontal gradient with no tileRect element.

The image above depicts the same gradient with a tileRect element specifying l="50000" (50%). The right half of the shape is the tile to which the gradient is applied, and the left half of the shape contains a tiled copy of that gradient fill.

The image above depicts the same gradient with a tileRect element specifying l="75000" (75%). The rightmost 25% of the shape contains the tile rectangle to which the gradient is applied. This gradient is tiled three times to cover the leftmost 75% of the shape. The tile rectangle is flipped horizontally when covering the shape.

end example]

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§20.1.10.40).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_RelativeRect](#)) is located in §A.4.1. *end note*]

20.1.8.60 tint (Tint Effect)

This element specifies a tint effect. Shifts effect color values towards/away from hue by the specified amount.

Attributes	Description
amt (Amount)	Specifies by how much the color value is shifted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).
hue (Hue)	Specifies the hue towards which to tint. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TintEffect](#)) is located in §A.4.1. *end note*]

20.1.8.61 xfrm (Transform Effect)

This element specifies a transform effect. The transform is applied to each point in the shape's geometry using the following matrix:

$$\begin{bmatrix} sx & \tan(kx) & tx \\ \tan(ky) & sy & ty \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Attributes	Description
kx (Horizontal Skew)	<p>Specifies the horizontal skew angle, defined as the angle between the top-left corner and bottom-left corner of the object's original bounding box. If positive, the bottom edge of the shape is positioned to the right relative to the top edge.</p> <p>The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).</p>
ky (Vertical Skew)	<p>Specifies the vertical skew angle, defined as the angle between the top-left corner and top-right corner of the object's original bounding box. If positive, the right edge of the object is positioned lower relative to the left edge.</p> <p>The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23).</p>
sx (Horizontal Ratio)	<p>Specifies a percentage by which to horizontally scale the object.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
sy (Vertical Ratio)	<p>Specifies a percentage by which to vertically scale the object.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
tx (Horizontal Shift)	<p>Specifies an amount by which to shift the object along the x-axis.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
ty (Vertical Shift)	<p>Specifies an amount by which to shift the object along the y-axis.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TransformEffect](#)) is located in §A.4.1. *end note*]

20.1.9 Shape Definitions and Attributes

The Shape Definitions and Attributes portion of the DrawingML framework deals with all geometric properties for shapes within a document. This includes both preset geometries that publicly are interpreted by the generating application and custom geometries that have their points and curves explicitly specified. In addition to the underlying geometry of the shape there are also other coordinate-based properties for each shape that this framework describes.

20.1.9.1 ahLst (List of Shape Adjust Handles)

This element specifies the adjust handles that are applied to a custom geometry. These adjust handles specify points within the geometric shape that can be used to perform certain transform operations on the shape.

[Example: Consider the scenario where a custom geometry, an arrow in this case, has been drawn and adjust handles have been placed at the top left corner of both the arrow head and arrow body. The user interface can then be made to transform only certain parts of the shape by using the corresponding adjust handle.

For instance if the user wished to change only the width of the arrow head then they would use the adjust handle located on the top left of the arrow head. The result of adjusting this transforms the shape as shown below.

end example]

[Note: The W3C XML Schema definition of this element’s content model ([CT AdjustHandleList](#)) is located in §A.4.1. end note]

20.1.9.2 ahPolar (Polar Adjust Handle)

This element specifies a polar adjust handle for a custom shape. The position of this adjust handle is specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it’s min and max attributes. Based on the adjustment of this adjust handle certain corresponding guides are updated to contain these values.

Attributes	Description
gdRefAng (Angle Adjustment Guide)	Specifies the name of the guide that is updated with the adjustment angle from this adjust handle.

Attributes	Description
	The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).
gdRefR (Radial Adjustment Guide)	<p>Specifies the name of the guide that is updated with the adjustment radius from this adjust handle.</p> <p>The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).</p>
maxAng (Maximum Angle Adjustment)	<p>Specifies the maximum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move angularly. That is the maxAng and minAng are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p>
maxR (Maximum Radial Adjustment)	<p>Specifies the maximum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move radially. That is the maxR and minR are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
minAng (Minimum Angle Adjustment)	<p>Specifies the minimum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move angularly. That is the maxAng and minAng are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p>
minR (Minimum Radial Adjustment)	<p>Specifies the minimum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move radially. That is the maxR and minR are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PolarAdjustHandle](#)) is located in §A.4.1. *end note*]

20.1.9.3 ahXY (XY Adjust Handle)

This element specifies an XY-based adjust handle for a custom shape. The position of this adjust handle is specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via its min and max type attributes. Based on the adjustment of this adjust handle certain corresponding guides are updated to contain these values.

Attributes	Description
gdRefX (Horizontal Adjustment Guide)	<p>Specifies the name of the guide that is updated with the adjustment x position from this adjust handle.</p> <p>The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).</p>
gdRefY (Vertical Adjustment Guide)	<p>Specifies the name of the guide that is updated with the adjustment y position from this adjust handle.</p> <p>The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).</p>
maxX (Maximum Horizontal Adjustment)	<p>Specifies the maximum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the x direction. That is the maxX and minX are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
maxY (Maximum Vertical Adjustment)	<p>Specifies the maximum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the y direction. That is the maxY and minY are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
minX (Minimum Horizontal Adjustment)	<p>Specifies the minimum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the x direction. That is the maxX and minX are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
minY (Minimum Vertical Adjustment)	<p>Specifies the minimum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the y direction. That is the maxY and minY are equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_XYAdjustHandle](#)) is located in §A.4.1. *end note*]

20.1.9.4 [arcTo \(Draw Arc To\)](#)

This element specifies the existence of an arc within a shape path. It draws an arc with the specified parameters from the current pen position to the new point specified. An arc is a line that is bent based on the shape of a

supposed circle. The length of this arc is determined by specifying both a start angle and an ending angle that act together to effectively specify an end point for the arc.

[Example: The diagram shown below represents a single arc that has a start angle of 300 degrees and a swing angle of 150 degrees. This arc is drawn using the supposed circle that is described using the hR and wR attributes as shown below. The degrees by which the stAng must abide is shown along the circumference of the circle. These degrees are to be specified in 60,000ths of a degree. If this arc were part of a shape the start angle point along the circle would be the starting point along the path and the ending point would be the ending of the angle swing along this supposed circle. That is any shape geometry coming before this arc in the shape path would be joined with the upper point of this arc and consequently any geometry coming after this arc in the path would be joined with the lower point of this arc.

end example]

Attributes	Description
hR (Shape Arc Height Radius)	<p>This attribute specifies the height radius of the supposed circle being used to draw the arc. This gives the circle a total height of (2 * hR). This total height could also be called it's vertical diameter as it is the diameter for the y axis only.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
stAng (Shape Arc Start Angle)	<p>Specifies the start angle for an arc. This angle specifies what angle along the supposed circle path is used as the start position for drawing the arc. This start angle is locked to the last known pen position in the shape path. Thus guaranteeing a continuos shape path.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p>
swAng (Shape Arc Swing Angle)	<p>Specifies the swing angle for an arc. This angle specifies how far angle-wise along the supposed cicle path the arc is extended. The extension from the start angle is always in the clockwise direction around the supposed circle.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p>

Attributes	Description
wR (Shape Arc Width Radius)	<p>This attribute specifies the width radius of the supposed circle being used to draw the arc. This gives the circle a total width of $(2 * wR)$. This total width could also be called it's horizontal diameter as it is the diameter for the x axis only.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2DArcTo](#)) is located in §A.4.1. end note]

20.1.9.5 avLst (List of Shape Adjust Values)

This element specifies the adjust values that are applied to the specified shape. An adjust value is simply a guide that has a value based formula specified. That is, no calculation takes place for an adjust value guide. Instead, this guide specifies a parameter value that is used for calculations within the shape guides.

[Example: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an adjust value. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the height, namely 2. Thus we see in the figure below that the bottom of the triangle matches the bottom of the shape bounding box.

```

<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst>
    <a:gd name="myGuide" fmla="val 2"/>
  </a:avLst>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>

```

```

<a:pathLst>
  <a:path w="2" h="2">
    <a:moveTo>
      <a:pt x="0" y="myGuide"/>
    </a:moveTo>
    <a:lnTo>
      <a:pt x="2" y="myGuide"/>
    </a:lnTo>
    <a:lnTo>
      <a:pt x="1" y="0"/>
    </a:lnTo>
    <a:close/>
  </a:path>
</a:pathLst>
</a:custGeom>

```

If however we change the adjust value to half that, namely 1. Then we see the entire bottom edge of the triangle move to now be placed along the vertical midpoint within the shape bounding box. This is because both of the bottom points in this triangle depend on this adjust value for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.

```

<a:avLst>
  <a:gd name="myGuide" fmla="val 1"/>
</a:avLst>

```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GeomGuideList](#)) is located in §A.4.1. *end note*]

20.1.9.6 close (Close Shape Path)

This element specifies the ending of a series of lines and curves in the creation path of a custom geometric shape. When this element is encountered, the generating application should consider the corresponding path closed. That is, any further lines or curves that follow this element should be ignored.

[*Note:* A path can be specified and not closed. A path such as this cannot however have any fill associated with it as it has not been considered a closed geometric path. *end note*]

[Example: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

[Note: When the last point in the creation path does not meet with the first point in the creation path the generating application should connect the last point with the first via a straight line, thus creating a closed shape geometry. *end note*]

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2DClose](#)) is located in §A.4.1. *end note*]

20.1.9.7 [cubicBezTo \(Draw Cubic Bezier Curve To\)](#)

This element specifies to draw a cubic bezier curve along the specified points. To specify a cubic bezier curve there needs to be 3 points specified. The first two are control points used in the cubic bezier calculation and the last is the ending point for the curve. The coordinate system used for this kind of curve is the path coordinate system as this element is path specific.

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2DCubicBezierTo](#)) is located in §A.4.1. *end note*]

20.1.9.8 custGeom (Custom Geometry)

This element specifies the existence of a custom geometric shape. This shape consists of a series of lines and curves described within a creation path. In addition to this there can also be adjust values, guides, adjust handles, connection sites and an inscribed rectangle specified for this custom geometric shape.

[*Example:* Consider the scenario when a preset geometry does not accurately depict what must be displayed in the document. For this a custom geometry can be used to define most any 2-dimensional geometric shape. Shown below is an example of such a custom geometry.

```
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2650602" h="1261641">
      <a:moveTo>
        <a:pt x="0" y="1261641"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2650602" y="1261641"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1226916" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

The custom geometry above is drawn by first moving to a specific starting point with the `moveTo` element. Then a series of `lnTo` elements in the creation path specify the lines that make up the borders of the shape and finally a `close` element is used to specify the end of the creation path. The resulting shape is shown above. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomGeometry2D](#)) is located in §A.4.1. *end note*]

20.1.9.9 cxn (Shape Connection Site)

This element specifies the existence of a connection site on a custom shape. A connection site allows a `cxnSp` to be attached to this shape. This connection is maintained when the shape is repositioned within the document. It should be noted that this connection is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the `ext` transform element.

[*Note:* The transform coordinate system is different from a path coordinate system as it is per shape instead of per path within the shape. *end note*]

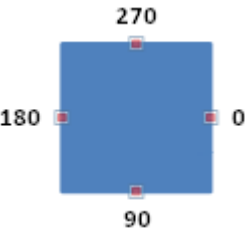

[*Example:* Consider the following custom geometry that has two connection sites specified. One connection is located at the bottom left of the shape and the other at the bottom right. The following DrawingML would describe such a custom geometry.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst>
    <a:cxn ang="0">
      <a:pos x="0" y="679622"/>
    </a:cxn>
    <a:cxn ang="0">
      <a:pos x="1705233" y="679622"/>
    </a:cxn>
  </a:cxnLst>
```

```
<a:rect l="0" t="0" r="0" b="0"/>
<a:pathLst>
  <a:path w="2" h="2">
    <a:moveTo>
      <a:pt x="0" y="2"/>
    </a:moveTo>
    <a:lnTo>
      <a:pt x="2" y="2"/>
    </a:lnTo>
    <a:lnTo>
      <a:pt x="1" y="0"/>
    </a:lnTo>
    <a:close/>
  </a:path>
</a:pathLst>
</a:custGeom>
```

end example]

Attributes	Description
ang (Connection Site Angle)	<p>Specifies the incoming connector angle. This angle is the angle around the connection site that an incoming connector tries to be routed to. This allows connectors to know where the shape is in relation to the connection site and route connectors so as to avoid any overlap with the shape.</p> <p>[<i>Example:</i> Consider a simple square. In order to not have any connectors routed over the shape, the collowing angles would be specified for their respective connection sites.</p> <div data-bbox="435 1226 678 1453" data-label="Image"></div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_ConnectionSite](#)) is located in §A.4.1. *end note]*

20.1.9.10 cxnLst (List of Shape Connection Sites)

This element specifies all the connection sites that are used for this shape. A connection site is specified by defining a point within the shape bounding box that can have a cxnSp element attached to it. These connection sites are specified using the shape coordinate system that is specified within the ext transform element.

[Note: The W3C XML Schema definition of this element's content model ([CT_ConnectionSiteList](#)) is located in §A.4.1. *end note*]

20.1.9.11 gd (Shape Guide)

This element specifies the presence of a shape guide that is used to govern the geometry of the specified shape. A shape guide consists of a formula and a name that the result of the formula is assigned to. Recognized formulas are listed with the fmla attribute documentation for this element.

[Note: The order in which guides are specified determines the order in which their values are calculated. For instance it is not possible to specify a guide that uses another guides result when that guide has not yet been calculated. *end note*]

[Example: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an guide. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the $\frac{2}{3}$ the value of the shape height. Thus we see in the figure below that the triangle appears to occupy $\frac{2}{3}$ of the vertical space within the shape bounding box.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst>
    <a:gd name="myGuide" fmla="*/ h 2 3"/>
  </a:gdLst>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
```

```
<a:path w="1705233" h="679622">
  <a:moveTo>
    <a:pt x="0" y="myGuide"/>
  </a:moveTo>
  <a:lnTo>
    <a:pt x="1705233" y="myGuide"/>
  </a:lnTo>
  <a:lnTo>
    <a:pt x="852616" y="0"/>
  </a:lnTo>
  <a:close/>
</a:path>
</a:pathLst>
</a:custGeom>
```

If however we change the guide to half that, namely 1/3. Then we see the entire bottom edge of the triangle move to now only occupy 1/3 of the total space within the shape bounding box. This is because both of the bottom points in this triangle depend on this guide for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.

```
<a:gdLst>
  <a:gd name="myGuide" fmla="*/ h 1 3"/>
</a:gdLst>
```

end example]

Attributes	Description
fmla (Shape Guide Formula)	<p>Specifies the formula that is used to calculate the value for a guide. Each formula has a certain number of arguments and a specific set of operations to perform on these arguments in order to generate a value for a guide. There are a total of 17 different formulas available. These are shown below with the usage for each defined.</p> <p>(<i>*/</i>) - Multiply Divide Formula Arguments: 3 (fmla="<i>*/</i> x y z") Usage: "<i>*/</i> x y z" = ((x * y) / z) = value of this guide</p> <p>(<i>+ -</i>) - Add Subtract Formula Arguments: 3 (fmla="<i>+ -</i> x y z") Usage: "<i>+ -</i> x y z" = ((x + y) - z) = value of this guide</p>

Attributes	Description
	<p>('+/') - Add Divide Formula Arguments: 3 (fmla="+ / x y z") Usage: "+ / x y z" = $((x + y) / z)$ = value of this guide</p> <p>('?:') - If Else Formula Arguments: 3 (fmla="?: x y z") Usage: "?: x y z" = if $(x > 0)$, then y = value of this guide, else z = value of this guide</p> <p>('abs') - Absolute Value Formula Arguments: 1 (fmla="abs x") Usage: "abs x" = if $(x < 0)$, then $(-1) * x$ = value of this guide else x = value of this guide</p> <p>('at2') - ArcTan Formula Arguments: 2 (fmla="at2 x y") Usage: "at2 x y" = $\arctan(y / x)$ = value of this guide</p> <p>('cat2') - Cosine ArcTan Formula Arguments: 3 (fmla="cat2 x y z") Usage: "cat2 x y z" = $(x * (\cos(\arctan(z / y))))$ = value of this guide</p> <p>('cos') - Cosine Formula Arguments: 2 (fmla="cos x y") Usage: "cos x y" = $(x * \cos(y))$ = value of this guide</p> <p>('max') - Maximum Value Formula Arguments: 2 (fmla="max x y") Usage: "max x y" = if $(x > y)$, then x = value of this guide else y = value of this guide</p> <p>('min') - Minimum Value Formula Arguments: 2 (fmla="min x y") Usage: "min x y" = if $(x < y)$, then x = value of this guide else y = value of this guide</p> <p>('mod') - Modulo Formula Arguments: 3 (fmla="mod x y z") Usage: "mod x y z" = $\sqrt{x^2 + b^2 + c^2}$ = value of this guide</p> <p>('pin') - Pin To Formula Arguments: 3 (fmla="pin x y z") Usage: "pin x y z" = if $(y < x)$, then x = value of this guide else if $(y > z)$, then z = value of this guide else y = value of this guide</p> <p>('sat2') - Sine ArcTan Formula Arguments: 3 (fmla="sat2 x y z") Usage: "sat2 x y z" = $(x * \sin(\arctan(z / y)))$ = value of this guide</p> <p>('sin') - Sine Formula Arguments: 2 (fmla="sin x y")</p>

Attributes	Description
	<p>Usage: "sin x y" = $(x * \sin(y))$ = value of this guide</p> <p>('sqrt') - Square Root Formula Arguments: 1 (fm1a="sqrt x") Usage: "sqrt x" = \sqrt{x} = value of this guide</p> <p>('tan') - Tangent Formula Arguments: 2 (fm1a="tan x y") Usage: "tan x y" = $(x * \tan(y))$ = value of this guide</p> <p>('val') - Literal Value Formula Arguments: 1 (fm1a="val x") Usage: "val x" = x = value of this guide</p> <p>[<i>Note</i>: Guides that have a literal value formula specified via fm1a="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_GeomGuideFormula simple type (§20.1.10.27).</p>
name (Shape Guide Name)	<p>Specifies the name that is used to reference to this guide. This name can be used just as a variable would within an equation. That is this name can be substituted for literal values within other guides or the specification of the shape path.</p> <p>The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GeomGuide](#)) is located in §A.4.1. *end note*]

20.1.9.12 [gdLst \(List of Shape Guides\)](#)

This element specifies all the guides that are used for this shape. A guide is specified by the gd element and defines a calculated value that can be used for the construction of the corresponding shape.

[*Note*: Guides that have a literal value formula specified via fm1a="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. *end note*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GeomGuideList](#)) is located in §A.4.1. *end note*]

20.1.9.13 [lnTo \(Draw Line To\)](#)

This element specifies the drawing of a straight line from the current pen position to the new point specified. This line becomes part of the shape geometry, representing a side of the shape. The coordinate system used when specifying this line is the path coordinate system.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Path2DLineTo](#)) is located in §A.4.1. *end note*]

20.1.9.14 moveTo (Move Path To)

This element specifies a set of new coordinates to move the shape cursor to. This element is only used for drawing a custom geometry. When this element is utilized the pt element is used to specify a new set of shape coordinates that the shape cursor should be moved to. This does not draw a line or curve to this new position from the old position but simply move the cursor to a new starting position. It is only when a path drawing element such as lnTo is used that a portion of the path is drawn.

[*Example:* Consider the case where a user wishes to begin drawing a custom geometry not at the default starting coordinates of x=0 , y=0 but at coordinates further inset into the shape coordinate space. The following DrawingML would specify such a case.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

Notice the moveTo element advances the y coordinates before any actual lines are drawn. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Path2DMoveTo](#)) is located in §A.4.1. *end note*]

20.1.9.15 path (Shape Path)

This element specifies a creation path consisting of a series of moves, lines and curves that when combined forms a geometric shape. This element is only utilized if a custom geometry is specified.

[*Note:* Since multiple paths are allowed the rules for drawing are that the path specified later in the pathLst is drawn on top of all previous paths. *end note*]

[*Example:* Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

Attributes	Description
extrusionOk (3D Extrusion Allowed)	<p>Specifies that the use of 3D extrusions are possible on this path. This allows the generating application to know whether 3D extrusion can be applied in any form. If this attribute is omitted then a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fill (Path Fill)	<p>Specifies how the corresponding path should be filled. If this attribute is omitted, a value of "norm" is assumed.</p> <p>The possible values for this attribute are defined by the ST_PathFillMode simple type (§20.1.10.37).</p>
h (Path Height)	<p>Specifies the height, or maximum y coordinate that should be used for within the path coordinate system. This value determines the vertical placement of all points within the corresponding path as they are all calculated using this height attribute as the max y</p>

Attributes	Description
	coordinate. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).
stroke (Path Stroke)	Specifies if the corresponding path should have a path stroke shown. This is a boolean value that affect the outline of the path. If this attribute is omitted, a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
w (Path Width)	Specifies the width, or maximum x coordinate that should be used for within the path coordinate system. This value determines the horizontal placement of all points within the corresponding path as they are all calculated using this width attribute as the max x coordinate. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2D](#)) is located in §A.4.1. *end note*]

20.1.9.16 pathLst (List of Shape Paths)

This element specifies the entire path that is to make up a single geometric shape. The pathLst can consist of many individual paths within it.

[Example: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

```
<a:close/>
</a:path>
</a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the `lnTo` element there are actually four sides because the last point of ($x=1562585, y=0$) is connected to the first point in the creation path via a `lnTo` element. *end example*

[*Note*: A geometry with multiple paths within it should be treated visually as if each path were a distinct shape. That is each creation path has its first point and last point joined to form a closed shape. However, the generating application should then connect the last point to the first point of the new shape. If a `close` element is encountered at the end of the previous creation path then this joining line should not be rendered by the generating application. The rendering should resume with the first line or curve on the new creation path. *end note*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Path2DList](#)) is located in §A.4.1. *end note*]

20.1.9.17 pos (Shape Position Coordinate)

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the `ext transform` element.

[*Note*: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is $x=0, y=0$ and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.

end note]

[*Example:* To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system specifies a y coordinate of 679622 within the shape coordinate system for this particular case.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2" h="2">
      <a:moveTo>
        <a:pt x="0" y="2"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2" y="2"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

end example]

Attributes	Description
x (X-Coordinate)	<p>Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
y (Y-Coordinate)	<p>Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_AdjPoint2D](#)) is located in §A.4.1.
end note]

20.1.9.18 prstGeom (Preset geometry)

This element specifies when a preset geometric shape should be used instead of a custom geometric shape. The generating application should be able to render all preset geometries enumerated in the ST_ShapeType list.

[Example: Consider the scenario when a user does not wish to specify all the lines and curves that make up the desired shape but instead chooses to use a preset geometry. The following DrawingML would specify such a case.

```

<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="4" name="My Preset Shape"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  <p:spPr>
    <a:xfrm>
      <a:off x="1981200" y="533400"/>
      <a:ext cx="1143000" cy="1066800"/>
    </a:xfrm>
    <a:prstGeom prst="heart">
      </a:prstGeom>
    </p:spPr>
  </p:sp>

```

The output shape rendered by this DrawingML is shown above. *end example*]

Attributes	Description
prst (Preset Shape)	<p>Specifies the preset geometry that is used for this shape. This preset can have any of the values in the enumerated list for ST_ShapeType. This attribute is required in order for a preset geometry to be rendered.</p> <p>[Example: Consider the sample DrawingML below.</p> <pre><p:sp> <p:nvSpPr> <p:cNvPr id="4" name="Sun 3"/> <p:cNvSpPr/> <p:nvPr/> </p:nvSpPr> <p:spPr> <a:xfrm> <a:off x="1981200" y="533400"/> <a:ext cx="1143000" cy="1066800"/> </a:xfrm> <a:prstGeom prst="sun"> </a:prstGeom> </p:spPr> </p:sp></pre> <p>In the above example a preset geometry has been used to define a shape. The shape utilized here is the sun shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ShapeType simple type (§20.1.10.55).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_PresetGeometry2D](#)) is located in §A.4.1. *end note*]

20.1.9.19 prstTxWarp (Preset Text Warp)

This element specifies when a preset geometric shape should be used to transform a piece of text. This operation is known formally as a text warp. The generating application should be able to render all preset geometries enumerated in the ST_TextShapeType list.

[*Example:* Consider the case where the user wishes to accent a piece of text by warping it's shape. For this to occur a preset shape is chosen from the ST_TextShapeType list and applied to the entire body of text.

```
<p:sp>
  <p:txBody>
    <a:bodyPr wrap="none" rtlCol="0">
      <a:prstTxWarp prst="textInflate">
        </a:prstTxWarp>
        <a:spAutoFit/>
      </a:bodyPr>
      <a:l1stStyle/>
      <a:p>
...
        <a:t>Sample Text</a:t>
...
      </a:p>
    </p:txBody>
  </p:sp>
```

No Warp: Sample Text Inflate Warp: Sample Text

The resulting text that has now had the Inflate text warp applied to it is shown above. *end example]*

Using any of the presets listed under the ST_TextShapeType list below it is possible to apply a text warp to a run of DrawingML text via the following steps.

If you look at any of the text warps in the file format you notice that each consists of two paths. This corresponds to a top path (first one specified) and a bottom path (second one specified). Now the top path and the bottom path represent the top line and base line that the text needs to be warped to. This is done in the following way:

1. Compute the rectangle that the unwarped text resides in. (tightest possible rectangle around text, no white space except for "space characters")
2. Take each of the quadratic and cubic Bezier curves that are used to calculate the original character and change their end points and control points by the following method...
3. Move a vertical line horizontally along the original text rectangle and find the horizontal percentage that a given end point or control point lives at. (.5 for the middle for instance)
4. Now do the same thing for this point vertically. Find the vertical percentage that this point lives at with the top and bottom of this text rectangle being the respective top and bottom bounds. (0.0 and 1.0 respectively)

5. Now that we have the percentages for a given point in a Bezier equation we can map that to the new point in the warped text environment.
6. Going back to the top and bottom paths specified in the file format we can take these and flatten them out to a straight arc (top and bottom might be different lengths)
7. After they are straight we can measure them both horizontally to find the same percentage point that we found within the original text rectangle. (0.5 let's say)
8. So then we measure 50% along the top path and 50% along the bottom path, putting the paths back to their original curvy shapes.
9. Once we have these two points we can draw a line between them that serves as our vertical line in the original text rectangle [*Note: This might not be truly vertical as 50% on the top does not always line up with 50% on the bottom. end note*]
10. Taking this new line we then follow it from top to bottom the vertical percentage amount that we got from step 4.
11. This is then the new point that should be used in place of the old point in the original text rectangle.
12. We then continue doing these same steps for each of the end points and control points within the body of text. (is applied to a whole body of text only)

[*Note: Horizontal percentages begin at 0.0 and continue to 1.0, left to right. Vertical percentages begin at 0.0 and continue to 1.0, top to bottom. end note*]

[*Note: Since this is a shape it does have both a shape coordinate system and a path coordinate system. end note*]

Attributes	Description
prst (Preset Warp Shape)	<p>Specifies the preset geometry that is used for a shape warp on a piece of text. This preset can have any of the values in the enumerated list for ST_TextShapeType. This attribute is required in order for a text warp to be rendered.</p> <p>[<i>Example: Consider the sample DrawingML below.</i></p> <pre> <p:sp> <p:txBody> <a:bodyPr wrap="none" rtlCol="0"> <a:prstTxWarp prst="textInflate"> </a:prstTxWarp> <a:spAutoFit/> </a:bodyPr> <a:lstStyle/> <a:p> ... <a:t>Sample Text</a:t> ... </a:p> </p:txBody> </p:sp> </pre> <p>In the above example a preset text shape geometry has been used to define the warping</p>

Attributes	Description
	shape. The shape utilized here is the sun shape. <i>end example</i> The possible values for this attribute are defined by the ST_TextShapeType simple type (§20.1.10.75).

[Note: The W3C XML Schema definition of this element’s content model ([CT_PresetTextShape](#)) is located in §A.4.1. *end note*]

20.1.9.20 pt (Shape Path Point)

This element specifies an x-y coordinate within the path coordinate space. This coordinate space is determined by the width and height attributes defined within the path element. A point is utilized by one of it's parent elements to specify the next point of interest in custom geometry shape. Depending on the parent element used the point can either have a line drawn to it or the cursor can simply be moved to this new location.

[Note: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.

end note]

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[Example: To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and

2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system specifies a y coordinate of 679622 within the shape coordinate system for this particular case.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2" h="2">
      <a:moveTo>
        <a:pt x="0" y="2"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2" y="2"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

end example]

Attributes	Description
x (X-Coordinate)	Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlaid on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here.

Attributes	Description
	The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).
y (Y-Coordinate)	<p>Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_AdjPoint2D](#)) is located in §A.4.1. *end note*]

20.1.9.21 [quadBezTo \(Draw Quadratic Bezier Curve To\)](#)

This element specifies to draw a quadratic bezier curve along the specified points. To specify a quadratic bezier curve there needs to be 2 points specified. The first is a control point used in the quadratic bezier calculation and the last is the ending point for the curve. The coordinate system used for this type of curve is the path coordinate system as this element is path specific.

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2DQuadBezierTo](#)) is located in §A.4.1. *end note*]

20.1.9.22 [rect \(Shape Text Rectangle\)](#)

This element specifies the rectangular bounding box for text within a custGeom shape. The default for this rectangle is the bounding box for the shape. This can be modified using this elements four attributes to inset or extend the text bounding box.

[Note: Text specified to reside within this shape text rectangle can flow outside this bounding box. Depending on the autofit options within the txBody element the text might not entirely reside within this shape text rectangle. *end note*]

Attributes	Description
b (Bottom Position)	<p>Specifies the y coordinate of the bottom edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
l (Left)	Specifies the x coordinate of the left edge for a shape text rectangle. The units for this

Attributes	Description
	<p>edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
r (Right)	<p>Specifies the x coordinate of the right edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>
t (Top)	<p>Specifies the y coordinate of the top edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GeomRect](#)) is located in §A.4.1. *end note*]

20.1.10 Simple Types

This is the complete list of simple types dedicated to DrawingML framework.

20.1.10.1 ST_AdjAngle (Adjustable Angle Methods)

This simple type is an adjustable angle, either an absolute angle or a reference to a geometry guide. The units for an adjustable angle are 60,000ths of a degree.

This simple type is a union of the following types:

- The ST_Angle simple type (§20.1.10.3).
- The ST_GeomGuideName simple type (§20.1.10.28).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_AdjAngle](#)) is located in §A.4.1. *end note*]

20.1.10.2 ST_AdjCoordinate (Adjustable Coordinate Methods)

This simple type is an adjustable coordinate is either an absolute coordinate position or a reference to a geometry guide.

This simple type is a union of the following types:

- The ST_Coordinate simple type (§20.1.10.16).
- The ST_GeomGuideName simple type (§20.1.10.28).

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_AdjCoordinate](#)) is located in §A.4.1. *end note*]

20.1.10.3 ST_Angle (Angle)

This simple type represents an angle in 60,000ths of a degree. Positive angles are clockwise (i.e., towards the positive y axis); negative angles are counter-clockwise (i.e., towards the negative y axis).

This simple type's contents are a restriction of the W3C XML Schema int datatype.

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_Angle](#)) is located in §A.4.1. *end note*]

20.1.10.4 ST_AnimationBuildType (Animation Build Type)

This simple type specifies the ways that an animation can be built, or animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allAtOnce (Animate At Once)	Animate all objects as one.

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_AnimationBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.5 ST_AnimationChartBuildType (Chart Animation Build Type)

This simple type specifies the ways that a chart animation can be built. That is, it specifies the way in which the objects within the chart should be animated.

This simple type is a union of the following types:

- The ST_AnimationBuildType simple type (§20.1.10.4).
- The ST_AnimationChartOnlyBuildType simple type (§20.1.10.6).

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_AnimationChartBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.6 ST_AnimationChartOnlyBuildType (Chart only Animation Types)

This simple type specifies the build options available only for animating a chart. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
category (Category)	Animate by each category
categoryEl (Category Element)	Animate by each element within the category
series (Series)	Animate by each series.
seriesEl (Series Element)	Animate by each element within the series

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_AnimationChartOnlyBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.7 ST_AnimationDgmBuildType (Diagram Animation Build Type)

This simple type specifies the ways that a diagram animation can be built. That is, it specifies the way in which the objects within the diagram graphical object should be animated.

This simple type is a union of the following types:

- The ST_AnimationBuildType simple type (§20.1.10.4).
- The ST_AnimationDgmOnlyBuildType simple type (§20.1.10.8).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_AnimationDgmBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.8 ST_AnimationDgmOnlyBuildType (Diagram only Animation Types)

This simple type specifies the build options available only for animating a diagram. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lvlAtOnce (Each Level at Once)	Animate the diagram one level at a time, animating the whole level as one object
lvlOne (Level One-by-One)	Animate the diagram by the elements within a level, animating them one level element at a time.
one (Elements One-by-One)	Animate the diagram by elements. For a tree diagram the animation occurs by branch within the diagram tree.

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_AnimationDgmOnlyBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.9 [ST_BevelPresetType \(Bevel Presets\)](#)

Represents a preset for a type of bevel which can be applied to a shape in 3D. The bevel properties are applied differently depending on the type of bevel defined for a shape.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
angle (Angle)	<p>[<i>Example</i>: Consider the following example of an angle bevel type applied to a shape:</p>  <p><i>end example</i>]</p>
artDeco (Art Deco)	<p>[<i>Example</i>: Consider the following example of an artDeco bevel type applied to a shape:</p>  <p><i>end example</i>]</p>
circle (Circle)	<p>[<i>Example</i>: Consider the following example of an circle bevel type applied to a shape:</p>

Enumeration Value	Description
	 <i>end example]</i>
convex (Convex)	<p>[Example: Consider the following example of an convex bevel type applied to a shape:</p>  <i>end example]</i>
coolSlant (Cool Slant)	<p>[Example: Consider the following example of an coolSlant bevel type applied to a shape:</p>  <i>end example]</i>
cross (Cross)	<p>[Example: Consider the following example of an cross bevel type applied to a shape:</p>

Enumeration Value	Description
	 <i>end example]</i>
divot (Divot)	<p data-bbox="824 730 1403 802"><i>[Example:</i> Consider the following example of an divot bevel type applied to a shape:</p>  <i>end example]</i>
hardEdge (Hard Edge)	<p data-bbox="824 1285 1403 1356"><i>[Example:</i> Consider the following example of an hardEdge bevel type applied to a shape:</p>  <i>end example]</i>
relaxedInset (Relaxed Inset)	<p data-bbox="824 1839 1403 1873"><i>[Example:</i> Consider the following example of an</p>

Enumeration Value	Description
	<p>relaxedInset bevel type applied to a shape:</p>  <p><i>end example]</i></p>
ribblet (Ribblet)	<p>[<i>Example:</i> Consider the following example of an ribblet bevel type applied to a shape:</p>  <p><i>end example]</i></p>
slope (Slope)	<p>[<i>Example:</i> Consider the following example of an slope bevel type applied to a shape:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
softRound (Soft Round)	<p>[<i>Example:</i> Consider the following example of an softRound bevel type applied to a shape:</p>  <p><i>end example]</i></p>

[*Note:* The W3C XML Schema definition of this simple type’s content model ([ST_BevelPresetType](#)) is located in §A.4.1. *end note*]

20.1.10.10 ST_BlackWhiteMode (Black and White Mode)

This simple type specifies how an object should be rendered when specified to be in black and white mode.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatic)	Object rendered with automatic coloring
black (Black)	Object rendered with black-only coloring
blackGray (Black and Gray)	Object rendered with black and gray coloring
blackWhite (Black and White)	Object rendered within black and white coloring
clr (Color)	Object rendered with normal coloring
gray (Gray)	Object rendered with gray coloring
grayWhite (Gray and White)	Object rendered within gray and white coloring
hidden (Hidden)	Object rendered with hidden coloring
invGray (Inverse Gray)	Object rendered with inverse gray coloring
ltGray (Light Gray)	Object rendered with light gray coloring
white (White)	Object rendered within white coloring

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_BlackWhiteMode](#)) is located in §A.4.1. end note*]

20.1.10.11 [ST_BlendMode \(Blend Mode\)](#)

This simple type describes how to render effects one on top of another.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
darken (Darken)	Darken
lighten (Lighten)	Lighten
mult (Multiply)	Multiply
over (Overlay)	Overlay
screen (Screen)	Screen

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_BlendMode](#)) is located in §A.4.1. end note*]

20.1.10.12 [ST_BlipCompression \(Blip Compression Type\)](#)

This type specifies the amount of compression that has been used for a particular binary large image or picture (blip).

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
email (Email Compression)	Compression size suitable for inclusion with email
hqprint (High Quality Printing Compression)	Compression size suitable for high quality printing
none (No Compression)	No compression was used
print (Printing Compression)	Compression size suitable for printing
screen (Screen Viewing Compression)	Compression size suitable for viewing on screen

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_BlipCompression](#)) is located in §A.4.1. end note*]

20.1.10.13 [ST_ChartBuildStep \(Chart Animation Build Step\)](#)

This simple type specifies an animation build step within a chart animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allPts (All Points)	Animate all points within the chart for this animation build step
category (Category)	Animate a chart category for this animation build step
gridLegend (Grid and Legend)	Animate the chart grid and legend for this animation build step
ptInCategory (Category Points)	Animate a point in a chart category for this animation build step
ptInSeries (Series Points)	Animate a point in a chart series for this animation build step
series (Series)	Animate a chart series for this animation build step

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ChartBuildStep](#)) is located in §A.4.1. *end note*]

20.1.10.14 [ST_ColorSchemeIndex](#) (Theme Color Reference)

A reference to a color in the color scheme.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accent1 (Accent 1)	Represents the accent 1 color.
accent2 (Accent 2)	Represents the accent 2 color.
accent3 (Accent 3)	Represents the accent 3 color.
accent4 (Accent 4)	Represents the accent 4 color.
accent5 (Accent 5)	Represents the accent 5 color.
accent6 (Accent 6)	Represents the accent 6 color.
dk1 (Dark 1)	Represents the first dark color.
dk2 (Dark 2)	Represents the second dark color.
folHlink (Followed Hyperlink)	Represents the followed hyperlink color.
hlink (Hyperlink)	Represents the hyperlink color.
lt1 (Light 1)	Represents the first light color.
lt2 (Light 2)	Represents the second light color.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ColorSchemeIndex](#)) is located in §A.4.1. *end note*]

20.1.10.15 ST_CompoundLine (Compound Line Type)

This simple type specifies the compound line type that is to be used for lines with text such as underlines.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dbl (Double Lines)	Double lines of equal width
sng (Single Line)	Single line: one normal width
thickThin (Thick Thin Double Lines)	Double lines: one thick, one thin
thinThick (Thin Thick Double Lines)	Double lines: one thin, one thick
tri (Thin Thick Thin Triple Lines)	Three lines: thin, thick, thin

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CompoundLine](#)) is located in §A.4.1. *end note*]

20.1.10.16 ST_Coordinate (Coordinate)

This simple type represents a one dimensional position or length as either:

- EMUs.
- A number followed immediately by a unit identifier.

This simple type is a union of the following types:

- The ST_CoordinateUnqualified simple type (§20.1.10.19).
- The ST_UniversalMeasure simple type (§22.9.2.15).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Coordinate](#)) is located in §A.4.1. *end note*]

20.1.10.17 ST_Coordinate32 (Coordinate Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing; its maximum size is 2147483647 EMUs.

Its contents can contain either:

- A whole number, whose contents consist of a measurement in EMUs (English Metric Units)
- A number immediately followed by a unit identifier

This simple type is a union of the following types:

- The ST_Coordinate32Unqualified simple type (§20.1.10.18).
- The ST_UniversalMeasure simple type (§22.9.2.15).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Coordinate32](#)) is located in §A.4.1. *end note*]

20.1.10.18 ST_Coordinate32Unqualified (Coordinate Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing with the maximum size requirement being a 32 bit integer.

The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the W3C XML Schema int datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Coordinate32Unqualified](#)) is located in §A.4.1. *end note*]

20.1.10.19 ST_CoordinateUnqualified (Coordinate)

This simple type represents a one dimensional position or length in EMUs.

This simple type's contents are a restriction of the W3C XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -27273042329600.
- This simple type has a maximum value of less than or equal to 27273042316900.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CoordinateUnqualified](#)) is located in §A.4.1. *end note*]

20.1.10.20 ST_DgmBuildStep (Diagram Animation Build Steps)

This simple type specifies an animation build step within a diagram animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bg (Background)	Animate the diagram background for this animation build step
sp (Shape)	Animate a diagram shape for this animation build step

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DgmBuildStep](#)) is located in §A.4.1. *end note*]

20.1.10.21 ST_DrawingElementId (Drawing Element ID)

This simple type specifies a unique integer identifier for each drawing element.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DrawingElementId](#)) is located in §A.4.1. *end note*]

20.1.10.22 ST_EffectContainerType (Effect Container Type)

This simple type determines the relationship between effects in a container, either sibling or tree.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
sib (Sibling)	Each effect is separately applied to the parent object. [Example: If the parent element contains an outer shadow and a reflection, the resulting effect is a shadow around the parent object and a reflection of the object. The reflection does not have a shadow. <i>end example</i>]
tree (Tree)	Each effect is applied to the result of the previous effect. [Example: If the parent element contains an outer shadow followed by a glow, the shadow is first applied to the parent object. Then, the glow is applied to the shadow (rather than the original object). The resulting effect would be a glowing shadow. <i>end example</i>]

[Note: The W3C XML Schema definition of this simple type's content model ([ST_EffectContainerType](#)) is located in §A.4.1. *end note*]

20.1.10.23 ST_FixedAngle (Fixed Angle)

This simple type represents a fixed range angle in 60000ths of a degree. Range from (-90, 90 degrees).

This simple type's contents are a restriction of the ST_Angle datatype (§20.1.10.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than -5400000.
- This simple type has a maximum value of less than 5400000.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_FixedAngle](#)) is located in §A.4.1. *end note*]

20.1.10.24 [ST_FixedPercentage \(Fixed Percentage\)](#)

This simple type represents a fixed percentage from negative one hundred to positive one hundred percent. See the union's member types for details.

This simple type is a union of the following types:

- The ST_FixedPercentage simple type (§22.9.2.3).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_FixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.10.25 [ST_FontCollectionIndex \(Font Collection Index\)](#)

This simple type represents one of the fonts associated with the style.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
major (Major Font)	The major font of the style's font scheme.
minor (Minor Font)	The minor font of the style's font scheme.
none (None)	No font reference.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_FontCollectionIndex](#)) is located in §A.4.1. *end note*]

20.1.10.26 [ST_FOVAngle \(Field of View Angle\)](#)

Represents a positive angle in 60000ths of a degree. Range from [0, 180] degrees.

This simple type's contents are a restriction of the ST_Angle datatype (§20.1.10.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 10800000.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_FOVAngle](#)) is located in §A.4.1. *end note*]

20.1.10.27 [ST_GeomGuideFormula \(Geometry Guide Formula Properties\)](#)

This simple type specifies a geometry guide formula.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GeomGuideFormula](#)) is located in §A.4.1. *end note*]

20.1.10.28 ST_GeomGuideName (Geometry Guide Name Properties)

This simple type specifies a geometry guide name.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GeomGuideName](#)) is located in §A.4.1. *end note*]

20.1.10.29 ST_LightRigDirection (Light Rig Direction)

Represents the direction from which the light rig is positioned relative to the scene. The light rig, itself, can be made up of multiple lights in any orientation around a given shape. This simple type defines the orientation of the light rig as a whole, and not the individual lights within the rig. This means that because the direction of the light rig is left, that does not guarantee the light is coming from the left side of the shape, but rather the orientation of the rig as a whole is rotated to the left.

[Example: Consider the following example as a visual representation of a light rig oriented from the top of the shape in the center:

In this example we see that the light rig defines three lights (all in a single plane as represented by the black circular line). The lights defined in this representation can all have different intensities, which means, for this example, Light 3 and Light 2 look to have a more intense effect (or could even be a different color) than Light 1. One can imagine rotating this rig so that Light 1 is to the right of the shape when the light rig direction is defined to be right. *end example*]

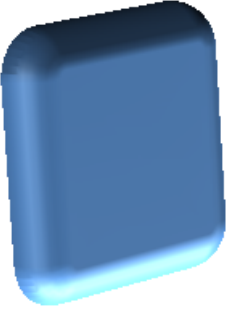

The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Three Point light rig type
- Circle bevel type
- Plastic material type
- Camera type defined by the orthographicFront preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Bottom)	<p>[<i>Example:</i> Consider the following example of a light direction from the bottom:</p>  <p><i>end example]</i></p>
bl (Bottom Left)	<p>[<i>Example:</i> Consider the following example of a light direction from the bottom left:</p>  <p><i>end example]</i></p>
br (Bottom Right)	<p>[<i>Example:</i> Consider the following example of a light direction from the bottom right:</p>

Enumeration Value	Description
	 <i>end example]</i>
l (Left)	<p data-bbox="824 730 1446 800"><i>[Example:</i> Consider the following example of a light direction from the left:</p>  <i>end example]</i>
r (Right)	<p data-bbox="824 1287 1446 1356"><i>[Example:</i> Consider the following example of a light direction from the right:</p>  <i>end example]</i>
t (Top)	<p data-bbox="824 1843 1446 1877"><i>[Example:</i> Consider the following example of a light</p>

Enumeration Value	Description
	<p>direction from the top:</p>  <p><i>end example]</i></p>
tl (Top Left)	<p>[<i>Example:</i> Consider the following example of a light direction from the top left:</p>  <p><i>end example]</i></p>
tr (Top Right)	<p>[<i>Example:</i> Consider the following example of a light direction from the top right:</p>  <p><i>end example]</i></p>

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_LightRigDirection](#)) is located in §A.4.1. *end note*]

20.1.10.30 ST_LightRigType (Light Rig Type)

Represents a preset light right that can be applied to a shape. The light rig represents a group of lights oriented in a specific way relative to a 3D scene. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Circle bevel type
- Warm Matte material type
- Camera type defined by the perspectiveContrastingRightFacing preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

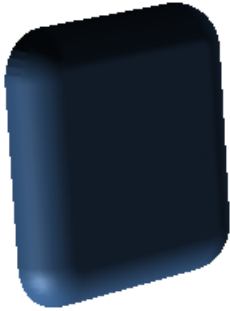

Enumeration Value	Description
balanced (Light Rig Enum (Balanced))	Balanced
brightRoom (Bright Room)	<p>[<i>Example:</i> Consider the following example of the brightRoom light rig applied to a basic shape:</p>  <p><i>end example</i>]</p>
chilly (Chilly)	<p>[<i>Example:</i> Consider the following example of the chilly light rig applied to a basic shape:</p>

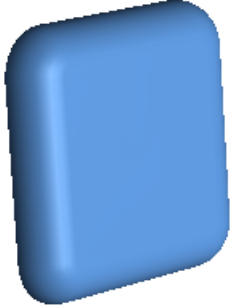

Enumeration Value	Description
	 <i>end example]</i>
contrasting (Contrasting)	<p>[Example: Consider the following example of the contrasting light rig applied to a basic shape:</p>  <i>end example]</i>
flat (Flat)	<p>[Example: Consider the following example of the flat light rig applied to a basic shape:</p>  <i>end example]</i>
flood (Flood)	<p>[Example: Consider the following example of the flood light rig applied to a basic shape:</p>

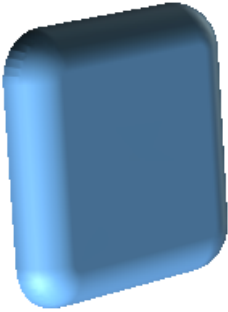

Enumeration Value	Description
	 <i>end example]</i>
freezing (Freezing)	<p>[<i>Example:</i> Consider the following example of the freezing light rig applied to a basic shape:</p>  <i>end example]</i>
glow (Glow)	<p>[<i>Example:</i> Consider the following example of the glow light rig applied to a basic shape:</p>  <i>end example]</i>
harsh (Harsh)	<p>[<i>Example:</i> Consider the following example of the</p>

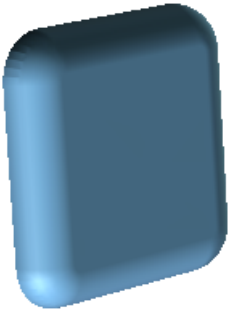

Enumeration Value	Description
	<p>harsh light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyFlat1 (Legacy Flat 1)	<p>[<i>Example:</i> Consider the following example of the legacyFlat1 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyFlat2 (Legacy Flat 2)	<p>[<i>Example:</i> Consider the following example of the legacyFlat2 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyFlat3 (Legacy Flat 3)	<p>[<i>Example:</i> Consider the following example of the</p>

Enumeration Value	Description
	<p>legacyFlat3 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyFlat4 (Legacy Flat 4)	<p>[<i>Example:</i> Consider the following example of the legacyFlat4 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyHarsh1 (Legacy Harsh 1)	<p>[<i>Example:</i> Consider the following example of the legacyHarsh1 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
legacyHarsh2 (Legacy Harsh 2)	<p>[Example: Consider the following example of the legacyHarsh2 light rig applied to a basic shape:</p>  <p>end example]</p>
legacyHarsh3 (Legacy Harsh 3)	<p>[Example: Consider the following example of the legacyHarsh3 light rig applied to a basic shape:</p>  <p>end example]</p>
legacyHarsh4 (Legacy Harsh 4)	<p>[Example: Consider the following example of the legacyHarsh4 light rig applied to a basic shape:</p>  <p>end example]</p>

Enumeration Value	Description
legacyNormal1 (Legacy Normal 1)	<p>[<i>Example:</i> Consider the following example of the legacyNormal1 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyNormal2 (Legacy Normal 2)	<p>[<i>Example:</i> Consider the following example of the legacyNormal2 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
legacyNormal3 (Legacy Normal 3)	<p>[<i>Example:</i> Consider the following example of the legacyNormal3 light rig applied to a basic shape:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
legacyNormal4 (Legacy Normal 4)	<p data-bbox="824 247 1430 317"><i>[Example:</i> Consider the following example of the legacyNormal4 light rig applied to a basic shape:</p>  <p data-bbox="824 720 987 751"><i>end example]</i></p>
morning (Morning)	<p data-bbox="824 804 1409 873"><i>[Example:</i> Consider the following example of the morning light rig applied to a basic shape:</p>  <p data-bbox="824 1276 987 1308"><i>end example]</i></p>
soft (Soft)	<p data-bbox="824 1360 1479 1430"><i>[Example:</i> Consider the following example of the soft light rig applied to a basic shape:</p>  <p data-bbox="824 1833 987 1864"><i>end example]</i></p>

Enumeration Value	Description
sunrise (Sunrise)	<p data-bbox="824 247 1409 317"><i>[Example: Consider the following example of the sunrise light rig applied to a basic shape:</i></p>  <p data-bbox="824 720 987 751"><i>end example]</i></p>
sunset (Sunset)	<p data-bbox="824 804 1409 873"><i>[Example: Consider the following example of the sunset light rig applied to a basic shape:</i></p>  <p data-bbox="824 1276 987 1308"><i>end example]</i></p>
threePt (Three Point)	<p data-bbox="824 1360 1409 1430"><i>[Example: Consider the following example of the threePt light rig applied to a basic shape:</i></p>  <p data-bbox="824 1833 987 1864"><i>end example]</i></p>

Enumeration Value	Description
twoPt (Two Point)	<p>[<i>Example:</i> Consider the following example of the twoPt light rig applied to a basic shape:</p>  <p><i>end example]</i></p>

[*Note:* The W3C XML Schema definition of this simple type’s content model ([ST_LightRigType](#)) is located in §A.4.1. *end note]*

20.1.10.31 [ST_LineCap \(End Line Cap\)](#)

This simple type specifies how to cap the ends of lines. This also affects the ends of line segments for dashed lines.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
flat (Flat Line Cap)	Line ends at end point.
rnd (Round Line Cap)	Rounded ends. Semi-circle protrudes by half line width.
sq (Square Line Cap)	Square protrudes by half line width.

[*Note:* The W3C XML Schema definition of this simple type’s content model ([ST_LineCap](#)) is located in §A.4.1. *end note]*

20.1.10.32 [ST_LineEndLength \(Line End Length\)](#)

This simple type represents the length of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[*Example:* See the example images below. These samples have an arrow line end type and medium line end width. *end example]*

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lg (Large)	 Large
med (Medium)	 Medium
sm (Small)	 Small

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LineEndLength](#)) is located in §A.4.1. *end note*]

20.1.10.33 ST_LineEndType (Line End Type)

This simple type represents the shape decoration that appears at the ends of lines. For example, one choice is an arrow head.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
arrow (Arrow Head)	 Line arrow head
diamond (Diamond)	 Diamond
none (None)	 No end
oval (Oval)	 Oval
stealth (Stealth Arrow)	 Stealth arrow head
triangle (Triangle Arrow Head)	 Triangle arrow head

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LineEndType](#)) is located in §A.4.1. *end note*]

20.1.10.34 ST_LineEndWidth (Line End Width)

This simple type represents the width of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[Example: See the example images below. These samples have an arrow line end type and medium line end length. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lg (Large)	→ Large
med (Medium)	→ Medium
sm (Small)	→ Small

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LineEndWidth](#)) is located in §A.4.1. *end note*]

20.1.10.35 ST_LineWidth (Line Width)

This simple type specifies the width of a line in EMUs. 1 pt = 12700 EMUs.

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 20116800.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LineWidth](#)) is located in §A.4.1. *end note*]

20.1.10.36 ST_OnOffStyleType (On/Off Style Type)

This simple type represents whether a style property should be applied.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
def (Default)	Follow parent settings. For a themed property, follow the theme settings. For an unthemed property, follow the parent setting in the property inheritance chain.
off (Off)	Property is off.
on (On)	Property is on.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_OnOffStyleType](#)) is located in §A.4.1. *end note*]

20.1.10.37 ST_PathFillMode (Path Fill Mode)

This simple type specifies the manner in which a path should be filled. The lightening and darkening of a path allow for certain parts of the shape to be colored lighter or darker depending on user preference.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
darken (Darken Path Fill)	This specifies that the corresponding path should have a darker shaded color applied to its fill.
darkenLess (Darken Path Fill Less)	This specifies that the corresponding path should have a slightly darker shaded color applied to its fill.
lighten (Lighten Path Fill)	This specifies that the corresponding path should have a lightly shaded color applied to its fill.
lightenLess (Lighten Path Fill Less)	This specifies that the corresponding path should have a slightly lighter shaded color applied to its fill.
none (No Path Fill)	This specifies that the corresponding path should have no fill.
norm (Normal Path Fill)	This specifies that the corresponding path should have a normally shaded color applied to its fill.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PathFillMode](#)) is located in §A.4.1. *end note*]

20.1.10.38 ST_PathShadeType (Path Shade Type)

This simple type describes the shape of path to follow for a path gradient shade.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
circle (Circle)	Gradient follows a circular path
rect (Rectangle)	Gradient follows a rectangular path
shape (Shape)	Gradient follows the shape

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PathShadeType](#)) is located in §A.4.1. *end note*]

20.1.10.39 ST_PenAlignment (Alignment Type)

This simple type specifies the Pen Alignment type for use within a text body.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Center Alignment)	Center pen (line drawn at center of path stroke).
in (Inset Alignment)	Inset pen (the pen is aligned on the inside of the edge of the path).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PenAlignment](#)) is located in §A.4.1. *end note*]

20.1.10.40 ST_Percentage (Percentage)

This simple type specifies that its contents will contain a percentage value. See the union's member types for details.

This simple type is a union of the following types:

- The ST_Percentage simple type (§22.9.2.9).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Percentage](#)) is located in §A.4.1. *end note*]

20.1.10.41 ST_PositiveCoordinate (Positive Coordinate)

This simple type represents a positive position or length in EMUs.

This simple type's contents are a restriction of the W3C XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 27273042316900.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PositiveCoordinate](#)) is located in §A.4.1. *end note*]

20.1.10.42 ST_PositiveCoordinate32 (Positive Coordinate Point)

This simple type specifies the a positive coordinate point that has a maximum size of 32 bits.

The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PositiveCoordinate32](#)) is located in §A.4.1. end note*]

20.1.10.43 ST_PositiveFixedAngle (Positive Fixed Angle)

This simple type represents a positive angle in 60000ths of a degree. Range from [0, 360 degrees).

This simple type's contents are a restriction of the ST_Angle datatype (§20.1.10.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than 21600000.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PositiveFixedAngle](#)) is located in §A.4.1. end note*]

20.1.10.44 ST_PositiveFixedPercentage (Positive Fixed Percentage)

This simple type specifies that its contents will contain a positive percentage value from zero through one hundred percent. See the union's member types for details.

This simple type is a union of the following types:

- The ST_PositiveFixedPercentage simple type (§22.9.2.10).

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PositiveFixedPercentage](#)) is located in §A.4.1. end note*]

20.1.10.45 ST_PositivePercentage (Positive Percentage Value with Sign)

This simple type specifies that its contents will contain a positive percentage value. See the union's member types for details.

This simple type is a union of the following types:

- The ST_PositivePercentage simple type (§22.9.2.11).

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PositivePercentage](#)) is located in §A.4.1. end note*]

20.1.10.46 ST_PresetCameraType (Preset Camera Type)

These enumeration values represent different algorithmic methods for setting all camera properties, including position. The following example images below are all based off the following shape:

In this image, we can see the shape has a camera pointing directly at the front face.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
isometricBottomDown (Isometric Bottom Down)	<div><p>[<i>Example:</i> Consider the following example of the camera preset type:</p><p><i>end example]</i></p></div>
isometricBottomUp (Isometric Bottom Up)	<div><p>[<i>Example:</i> Consider the following example of the camera preset type:</p><p><i>end example]</i></p></div>
isometricLeftDown (Isometric Left Down)	<div><p>[<i>Example:</i> Consider the following example of the camera preset type:</p></div>

Enumeration Value	Description
	 <i>end example]</i>
isometricLeftUp (Isometric Left Up)	<p>[Example: Consider the following example of the camera preset type:</p>  <i>end example]</i>
isometricOffAxis1Left (Isometric Off Axis 1 Left)	<p>[Example: Consider the following example of the camera preset type:</p>  <i>end example]</i>

Enumeration Value	Description
isometricOffAxis1Right (Isometric Off Axis 1 Right)	<p data-bbox="824 296 1409 363"><i>[Example: Consider the following example of the camera preset type:</i></p>  <p data-bbox="824 768 987 800"><i>end example]</i></p>
isometricOffAxis1Top (Isometric Off Axis 1 Top)	<p data-bbox="824 852 1409 919"><i>[Example: Consider the following example of the camera preset type:</i></p>  <p data-bbox="824 1171 987 1203"><i>end example]</i></p>
isometricOffAxis2Left (Isometric Off Axis 2 Left)	<p data-bbox="824 1255 1409 1323"><i>[Example: Consider the following example of the camera preset type:</i></p>  <p data-bbox="824 1724 987 1755"><i>end example]</i></p>
isometricOffAxis2Right (Isometric Off Axis 2 Right)	<p data-bbox="824 1812 1409 1879"><i>[Example: Consider the following example of the camera preset type:</i></p>

Enumeration Value	Description
	 <p><i>end example]</i></p>
isometricOffAxis2Top (Isometric Off Axis 2 Top)	<p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p>
isometricOffAxis3Bottom (Isometric Off Axis 3 Bottom)	<p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p>
isometricOffAxis3Left (Isometric Off Axis 3 Left)	<p>[<i>Example:</i> Consider the following example of the camera preset type:</p>

Enumeration Value	Description
	 <i>end example]</i>
isometricOffAxis3Right (Isometric Off Axis 3 Right)	<p>[Example: Consider the following example of the camera preset type:</p>  <i>end example]</i>

[*Note:* The W3C XML Schema definition of this simple type’s content model ([ST_PresetCameraType](#)) is located in §A.4.1. *end note*]

20.1.10.47 [ST_PresetColorVal](#) (Preset Color Value)

This simple type represents a preset color value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aliceBlue (Alice Blue Preset Color)	Specifies a color with RGB value (240,248,255)
antiqueWhite (Antique White Preset Color)	Specifies a color with RGB value (250,235,215)
aqua (Aqua Preset Color)	Specifies a color with RGB value (0,255,255)
aquamarine (Aquamarine Preset Color)	Specifies a color with RGB value (127,255,212)
azure (Azure Preset Color)	Specifies a color with RGB value (240,255,255)
beige (Beige Preset Color)	Specifies a color with RGB value (245,245,220)
bisque (Bisque Preset Color)	Specifies a color with RGB value (255,228,196)
black (Black Preset Color)	Specifies a color with RGB value (0,0,0)
blanchedAlmond (Blanched Almond Preset Color)	Specifies a color with RGB value (255,235,205)
blue (Blue Preset Color)	Specifies a color with RGB value (0,0,255)
blueViolet (Blue Violet Preset Color)	Specifies a color with RGB value (138,43,226)
brown (Brown Preset Color)	Specifies a color with RGB value (165,42,42)
burlyWood (Burly Wood Preset Color)	Specifies a color with RGB value (222,184,135)
cadetBlue (Cadet Blue Preset Color)	Specifies a color with RGB value (95,158,160)
chartreuse (Chartreuse Preset Color)	Specifies a color with RGB value (127,255,0)
chocolate (Chocolate Preset Color)	Specifies a color with RGB value (210,105,30)
coral (Coral Preset Color)	Specifies a color with RGB value (255,127,80)
cornflowerBlue (Cornflower Blue Preset Color)	Specifies a color with RGB value (100,149,237)
cornsilk (Cornsilk Preset Color)	Specifies a color with RGB value (255,248,220)
crimson (Crimson Preset Color)	Specifies a color with RGB value (220,20,60)
cyan (Cyan Preset Color)	Specifies a color with RGB value (0,255,255)
darkBlue (Dark Blue Preset Color)	Specifies a color with RGB value (0,0,139)
darkCyan (Dark Cyan Preset Color)	Specifies a color with RGB value (0,139,139)
darkGoldenrod (Dark Goldenrod Preset Color)	Specifies a color with RGB value (184,134,11)
darkGray (Dark Gray Preset Color)	Specifies a color with RGB value (169,169,169)
darkGreen (Dark Green Preset Color)	Specifies a color with RGB value (0,100,0)
darkGrey (Dark Gray Preset Color)	Specifies a color with RGB value (169,169,169)
darkKhaki (Dark Khaki Preset Color)	Specifies a color with RGB value (189,183,107)
darkMagenta (Dark Magenta Preset Color)	Specifies a color with RGB value (139,0,139)
darkOliveGreen (Dark Olive Green Preset Color)	Specifies a color with RGB value (85,107,47)
darkOrange (Dark Orange Preset Color)	Specifies a color with RGB value (255,140,0)
darkOrchid (Dark Orchid Preset Color)	Specifies a color with RGB value (153,50,204)

Enumeration Value	Description
darkRed (Dark Red Preset Color)	Specifies a color with RGB value (139,0,0)
darkSalmon (Dark Salmon Preset Color)	Specifies a color with RGB value (233,150,122)
darkSeaGreen (Dark Sea Green Preset Color)	Specifies a color with RGB value (143,188,143)
darkSlateBlue (Dark Slate Blue Preset Color)	Specifies a color with RGB value (72,61,139)
darkSlateGray (Dark Slate Gray Preset Color)	Specifies a color with RGB value (47,79,79)
darkSlateGrey (Dark Slate Gray Preset Color)	Specifies a color with RGB value (47,79,79)
darkTurquoise (Dark Turquoise Preset Color)	Specifies a color with RGB value (0,206,209)
darkViolet (Dark Violet Preset Color)	Specifies a color with RGB value (148,0,211)
deepPink (Deep Pink Preset Color)	Specifies a color with RGB value (255,20,147)
deepSkyBlue (Deep Sky Blue Preset Color)	Specifies a color with RGB value (0,191,255)
dimGray (Dim Gray Preset Color)	Specifies a color with RGB value (105,105,105)
dimGrey (Dim Gray Preset Color)	Specifies a color with RGB value (105,105,105)
dkBlue (Dark Blue Preset Color)	Specifies a color with RGB value (0,0,139)
dkCyan (Dark Cyan Preset Color)	Specifies a color with RGB value (0,139,139)
dkGoldenrod (Dark Goldenrod Preset Color)	Specifies a color with RGB value (184,134,11)
dkGray (Dark Gray Preset Color)	Specifies a color with RGB value (169,169,169)
dkGreen (Dark Green Preset Color)	Specifies a color with RGB value (0,100,0)
dkGrey (Dark Gray Preset Color)	Specifies a color with RGB value (169,169,169)
dkKhaki (Dark Khaki Preset Color)	Specifies a color with RGB value (189,183,107)
dkMagenta (Dark Magenta Preset Color)	Specifies a color with RGB value (139,0,139)
dkOliveGreen (Dark Olive Green Preset Color)	Specifies a color with RGB value (85,107,47)
dkOrange (Dark Orange Preset Color)	Specifies a color with RGB value (255,140,0)

yellow (Yellow Preset Color)	Specifies a color with RGB value (255,255,0)
yellowGreen (Yellow Green Preset Color)	Specifies a color with RGB value (154,205,50)

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PresetColorVal](#)) is located in §A.4.1. *end note*]

20.1.10.48 ST_PresetLineDashVal (Preset Line Dash Value)

This simple type represents preset line dash values. The description for each style shows an illustration of the line style. Each style also contains a precise binary representation of the repeating dash style. Each 1 corresponds to a line segment of the same length as the line width, and each 0 corresponds to a space of the same length as the line width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dash (Dash)	 1111000
dashDot (Dash Dot)	 11110001000
dot (Dot)	 1000
lgDash (Large Dash)	 11111111000
lgDashDot (Large Dash Dot)	 111111110001000
lgDashDotDot (Large Dash Dot Dot)	 1111111100010001000
solid (Solid)	 1
sysDash (System Dash)	 1110
sysDashDot (System Dash Dot)	 111010
sysDashDotDot (System Dash Dot Dot)	 11101010
sysDot (System Dot)	 10

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PresetLineDashVal](#)) is located in §A.4.1. *end note*]

20.1.10.49 ST_PresetMaterialType (Preset Material Type)

Describes surface appearance of a shape. The material type combines with lighting characteristics to create the final look and feel of a shape. The set of material properties which can be combined together to create the presets below consist of the following characteristics:

- Specular color – This defines the color of the highlight associated with the material.
- Specular power – This defines the size and how intense the highlight is. Smaller values provide a larger, but less intense highlight, while larger values provide a smaller, but more intense highlight.
- Diffuse color – This defines the perceived color of the material where an object is directly illuminated by a light source. Generally speaking, the default color here would be based on the shape fill color.

- Ambient color – This defines the perceived color of the material where an object is not directly illuminated by a light source. Generally speaking, the default color here would be based on the shape fill color.
- Emissive color – This defines the color of a light which is perceived to be given off by an object.
- Diffuse Fresnel effect – This is an effect that either darkens (approaches black) or lightens (approaches white) the diffuse color of the material type at glancing angles. Positive values cause the material to become brighter, negative values cause the material to become darker.
- Alpha Fresnel effect – This is an effect that either makes the material more opaque or more transparent at glancing angles. Positive values cause the material to become more opaque, negative values cause the material to become more transparent.

In the following examples, the exact values given for certain properties should be understood to be relative values in order to provide a reference. These values could be different depending upon technologies used to render the material types. The following properties were used to define the shape used in the image examples below:

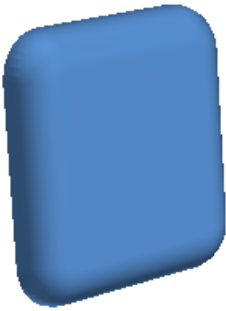

- Rounded rectangle shape
- Circle bevel type
- Three Point light rig type
- Camera type defined by the perspectiveContrastingRightFacing preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the W3C XML Schema token datatype.

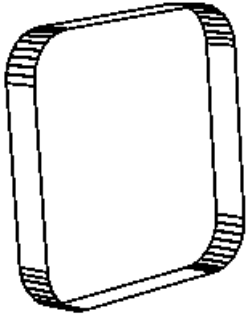

This simple type is restricted to the values listed in the following table:

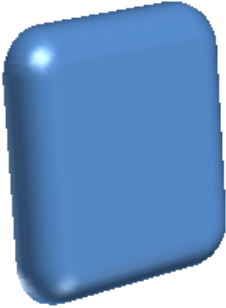

Enumeration Value	Description
clear (Clear)	<p>The <code>clear</code> material type has the following characteristics:</p> <ul style="list-style-type: none">• Specular Color: light gray• Diffuse Color: shape fill color with 90% alpha• Ambient Color: shape fill color with 90% alpha• Emissive Color: black• Diffuse Fresnel value: -8• Alpha Fresnel value: 1 <p>[Example: Consider the following example of the <code>clear</code> material type:</p>

Enumeration Value	Description
	 <p><i>end example]</i></p>

matte (Matte)	<p>The matte material type has the following characteristics:</p> <ul style="list-style-type: none">• Specular Color: black• Ambient Color: shape fill color• Emissive Color: black <p>[<i>Example:</i> Consider the following example of the matte material type:</p>  <p><i>end example]</i></p>
metal (Metal)	<p>The metal material type has the following characteristics:</p> <ul style="list-style-type: none">• Specular Color: shape fill color plus white, which is brightened by 1.5 times the normal value• Specular Power value: 12• Ambient Color: shape fill color• Emissive Color: black• Diffuse Fresnel value: 4 <p>[<i>Example:</i> Consider the following example of the</p>

Enumeration Value	Description
	<p>metal material type:</p>  <p><i>end example]</i></p>
plastic (Plastic)	<p>The plastic material type has the following characteristics:</p> <ul style="list-style-type: none"> • Specular Color: light gray • Specular Power value: 12 • Ambient Color: shape fill color • Emissive Color: black <p>[<i>Example:</i> Consider the following example of the plastic material type:</p>  <p><i>end example]</i></p>
powder (Powder)	<p>The powder material type has the following characteristics:</p> <ul style="list-style-type: none"> • Specular Color: dark gray • Specular Power value: 10 • Diffuse Color: gray • Ambient Color: gray • Emissive Color: black • Diffuse Fresnel value: 2

Enumeration Value	Description
	<p>[Example: Consider the following example of the powder material type:</p>  <p>end example]</p>
softEdge (Soft Edge)	<p>The softEdge material type has the following characteristics:</p> <ul style="list-style-type: none">• Specular Color: white• Specular Power value: 35• Ambient Color: shape fill color• Emissive Color: black• Diffuse Fresnel value: 4• Alpha Fresnel value: -10 <p>[Example: Consider the following example of the softEdge material type:</p>  <p>end example]</p>
softmetal (Soft Metal)	<p>The softMetal material type has the following characteristics:</p> <ul style="list-style-type: none">• Specular Color: shape fill color lightened with white by 50%• Specular Power value: 8

Enumeration Value	Description
	<ul style="list-style-type: none"> • Ambient Color: shape fill color • Emissive Color: black <p>[Example: Consider the following example of the <code>softmetal</code> material type:</p>  <p><i>end example]</i></p>
translucentPowder (Translucent Powder)	<p>The <code>translucentPowder</code> material type has the following characteristics:</p> <ul style="list-style-type: none"> • Specular Color: dark gray • Specular Power value: 10 • Diffuse Color: shape fill color with 30% transparency • Ambient Color: shape fill color with 30% transparency • Emissive Color: black • Diffuse Fresnel value: 2 • Alpha Fresnel value: -1 <p>[Example: Consider the following example of the <code>translucentPowder</code> material type:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
warmMatte (Warm Matte)	<p>The warmMatte material type has the following characteristics:</p> <ul style="list-style-type: none">• Specular Color: dark gray• Specular Power value: 8• Ambient Color: shape fill color• Emissive Color: black <p>[Example: Consider the following example of the warmMatte material type:</p>  <p>end example]</p>

[Note: The W3C XML Schema definition of this simple type’s content model (ST_PresetMaterialType) is located in §A.4.1. end note]

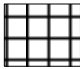

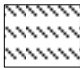

20.1.10.50 ST_PresetPatternVal (Preset Pattern Value)

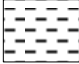

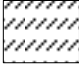

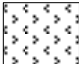

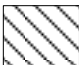

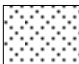

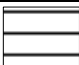

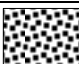

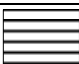

This simple type indicates a preset type of pattern fill. The description of each value contains an illustration of the fill type.

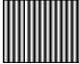

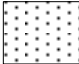

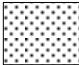

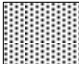

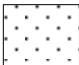

[Note: These presets correspond to members of the HatchStyle enumeration in the Microsoft .NET Framework. A reference for this type can be found at <http://msdn2.microsoft.com/en-us/library/system.drawing.drawing2d.hatchstyle.aspx>. end note]

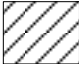

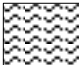

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cross (Cross)	
dashDnDiag (Dashed Downward Diagonal)	

Enumeration Value	Description
dashHorz (Dashed Horizontal)	
dashUpDiag (Dashed Upward Diagonal)	
dashVert (Dashed Vertical)	
diagBrick (Diagonal Brick)	
diagCross (Diagonal Cross)

20.1.10.51 ST_PresetShadowVal (Preset Shadow Type)

This simple type indicates one of 20 preset shadow types. Each enumeration value description illustrates the type of shadow represented by the value. Each description contains the parameters to the outer shadow effect represented by the preset, in addition to those attributes common to all `prstShdw` effects.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
shdw1 (Top Left Drop Shadow)	 No additional attributes specified.

Enumeration Value	Description
shdw10 (Top Left Large Drop Shadow)	 align = "br" sx = 125% sy = 125%
shdw11 (Back Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = 50%
shdw12 (Back Right Long Perspective Shadow)	 align = "b" kx = -40.89° sy = 50%
shdw13 (Top Left Double Drop Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified. Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dist = 2 * shadow 1's distance
shdw14 (Bottom Right Small Drop Shadow)	 No additional attributes specified.
shdw15 (Front Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw16 (Front Right Long Perspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw17 (3D Outer Box Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified.

Enumeration Value	Description
	Shadow 2: $\text{color} = \min(1, \text{shadow 1's color } (0 \leq r, g, b \leq 1) + 102/255)$, per r, g, b component $\text{dir} = \text{shadow 1's direction} + 180^\circ$
shdw18 (3D Inner Box Shadow)	 <p>Equivalent to two outer shadow effects.</p> <p>Shadow 1: No additional attributes specified.</p> <p>Shadow 2: $\text{color} = \min(1, \text{shadow 1's color } (0 \leq r, g, b \leq 1) + 102/255)$, per r, g, b component $\text{dir} = \text{shadow 1's direction} + 180^\circ$ </p>
shdw19 (Back Center Perspective Shadow)	 <p>align = "b" sy = 50°</p>
shdw2 (Top Right Drop Shadow)	 <p>No additional attributes specified.</p>
shdw20 (Front Bottom Shadow)	 <p>align = "b" sy = -100°</p>
shdw3 (Back Left Perspective Shadow)	 <p>align = "b" ky = 40.89° sy = 50%</p>
shdw4 (Back Right Perspective Shadow)	 <p>align = "b" kx = -40.89° sy = 50%</p>
shdw5 (Bottom Left Drop Shadow)	 <p>No additional attributes specified.</p>
shdw6 (Bottom Right Drop Shadow)	 <p>No additional attributes specified.</p>
shdw7 (Front Left Perspective Shadow)	

Enumeration Value	Description
	align = "b" kx = 40.89° sy = -50%
shdw8 (Front Right Perspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw9 (Top Left Small Drop Shadow)	 align = "tl" sx = 75% sy = 75%

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PresetShadowVal](#)) is located in §A.4.1. *end note*]

20.1.10.52 ST_RectAlignment (Rectangle Alignments)

This simple type describes how to position two rectangles relative to each other.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Rectangle Alignment Enum (Bottom))	Bottom
bl (Rectangle Alignment Enum (Bottom Left))	Bottom Left
br (Rectangle Alignment Enum (Bottom Right))	Bottom Right
ctr (Rectangle Alignment Enum (Center))	Center
l (Rectangle Alignment Enum (Left))	Left
r (Rectangle Alignment Enum (Right))	Right
t (Rectangle Alignment Enum (Top))	Top
tl (Rectangle Alignment Enum (Top Left))	Top Left
tr (Rectangle Alignment Enum (Top Right))	Top Right

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RectAlignment](#)) is located in §A.4.1. *end note*]

20.1.10.53 ST_SchemeColorVal (Scheme Color)

This simple type represents a scheme color value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accent1 (Accent Color 1)	Extra scheme color 1
accent2 (Accent Color 2)	Extra scheme color 2
accent3 (Accent Color 3)	Extra scheme color 3
accent4 (Accent Color 4)	Extra scheme color 4
accent5 (Accent Color 5)	Extra scheme color 5
accent6 (Accent Color 6)	Extra scheme color 6
bg1 (Background Color 1)	Semantic background color
bg2 (Background Color 2)	Semantic additional background color
dk1 (Dark Color 1)	Main dark color 1
dk2 (Dark Color 2)	Main dark color 2
folHlink (Followed Hyperlink Color)	Followed Hyperlink Color
hlink (Hyperlink Color)	Regular Hyperlink Color
lt1 (Light Color 1)	Main Light Color 1
lt2 (Light Color 2)	Main Light Color 2
phClr (Style Color)	A color used in theme definitions which means to use the color of the style.
tx1 (Text Color 1)	Semantic text color
tx2 (Text Color 2)	Semantic additional text color

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SchemeColorVal](#)) is located in §A.4.1. *end note*]

20.1.10.54 ST_ShapeID (Shape ID)

Specifies the shape ID for legacy shape identification purposes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ShapeID](#)) is located in §A.4.1. *end note*]

20.1.10.55 ST_ShapeType (Preset Shape Types)

This simple type specifies the preset shape geometry that is to be used for a shape. An enumeration of this simple type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction

code for each of these preset shapes there are predefined guides that the generating application shall maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*" / w 1.0 2.0"

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*" / h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*" / h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*" / h 1.0 5.0"

This is 1/5 the shape height.

1/6 of Shape Height ('hd6') - Calculated value of "*" / h 1.0 6.0"

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of "*" / h 1.0 8.0"

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of "0"

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of "max w h"

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of "w"

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of "min w h"

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of "*/ ss 1.0 2.0"

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of "*/ ss 1.0 4.0"

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of "*/ ss 1.0 6.0"

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of "*/ ss 1.0 8.0"

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of "0"

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of "*/ h 1.0 2.0"

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

1/2 of Shape Width ('wd2') - Calculated value of "*/ w 1.0 2.0"

This is 1/2 the shape width.

1/4 of Shape Width ('wd4') - Calculated value of "*/ w 1.0 4.0"

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of "*/ w 1.0 5.0"

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of "*/ w 1.0 6.0"

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of "*/ w 1.0 8.0"

This is 1/8 the shape width.

1/10 of Shape Width ('wd10') - Calculated value of "*/ w 1.0 10.0"

This is 1/10 the shape width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accentBorderCallout1 (Callout 1 with Border and Accent Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentBorderCallout1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
accentBorderCallout2 (Callout 2 with Border and Accent Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentBorderCallout2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
accentBorderCallout3 (Callout 3 with Border and Accent Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentBorderCallout3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
accentCallout1 (Callout 1 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentCallout1 element in the preset shape geometries electronic addenda of Annex D. can (Can Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the can element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
chartPlus (Chart Plus Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the chartPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
chartStar (Chart Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the chartStar element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
chartX (Chart X Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the chartX element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
chevron (Chevron Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the chevron element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
chord (Chord Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the chord element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
circularArrow (Circular Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the circularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
cloud (Cloud Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the cloud element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
cloudCallout (Callout Cloud Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the cloudCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
corner (Corner Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the corner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
cornerTabs (Corner Tabs Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the cornerTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
cube (Cube Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the cube element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedConnector2 (Curved Connector 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedConnector2 element in the preset shape</p>

Enumeration Value	Description
	<p>geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>curvedConnector3 (Curved Connector 3 Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedConnector3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>curvedConnector4 (Curved Connector 4 Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedConnector4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>curvedConnector5 (Curved Connector 5 Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p>

Enumeration Value	Description
	<p>generate this preset shape definition is contained in the curvedConnector5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedDownArrow (Curved Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedDownArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedLeftArrow (Curved Left Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedLeftArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedRightArrow (Curved Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall

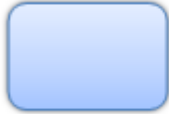

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedUpArrow (Curved Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the curvedUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
decagon (Decagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the decagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
diagStripe (Diagonal Stripe Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the diagStripe element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
diamond (Diamond Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the diamond element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
dodecagon (Dodecagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the dodecagon element in the preset shape</p>

Enumeration Value	Description
	<p>geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
donut (Donut Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the donut element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
doubleWave (Double Wave Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the doubleWave element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
downArrow (Down Arrow Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the downArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
downArrowCallout (Callout Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the downArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ellipse (Ellipse Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the ellipse element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
ellipseRibbon (Ellipse Ribbon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the ellipseRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ellipseRibbon2 (Ellipse Ribbon 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the ellipseRibbon2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartAlternateProcess (Alternate Process Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartAlternateProcess element in the preset shape geometries electronic addenda of Annex D. The</p>

Enumeration Value	Description
	<p>constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartCollate (Collate Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartCollate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartConnector (Connector Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartDecision (Decision Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDecision element in the preset shape geometries electronic addenda of Annex D. The</p>

Enumeration Value	Description
	<p>constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartDelay (Delay Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDelay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartDisplay (Display Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDisplay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartDocument (Document Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are</p>

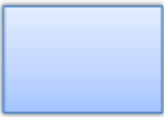

Enumeration Value	Description
	<p>described in further detail above. <i>end note</i>]</p> 
flowChartExtract (Extract Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartExtract element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartInputOutput (Input Output Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartInputOutput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartInternalStorage (Internal Storage Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartInternalStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are</p>

Enumeration Value	Description
	<p>described in further detail above. <i>end note</i>]</p> 
flowChartMagneticDisk (Magnetic Disk Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMagneticDisk element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartMagneticDrum (Magnetic Drum Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMagneticDrum element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartMagneticTape (Magnetic Tape Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMagneticTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are</p>

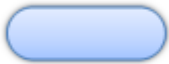

Enumeration Value	Description
	<p>described in further detail above. <i>end note</i>]</p> 
<p>flowChartManualInput (Manual Input Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartManualInput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartManualOperation (Manual Operation Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartManualOperation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartMerge (Merge Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMerge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
flowChartMultidocument (Multi-Document Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the <code>flowChartMultidocument</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartOfflineStorage (Offline Storage Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the <code>flowChartOfflineStorage</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartOffpageConnector (Off-Page Connector Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the <code>flowChartOffpageConnector</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that</p>

Enumeration Value	Description
	<p>are described in further detail above. <i>end note</i>]</p> 
<p>flowChartOnlineStorage (Online Storage Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartOnlineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartOr (Or Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartOr element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartPredefinedProcess (Predefined Process Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartPredefinedProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that</p>

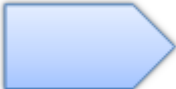

Enumeration Value	Description
	<p>are described in further detail above. <i>end note</i>]</p> 
flowChartPreparation (Preparation Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartPreparation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartProcess (Process Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartPunchedCard (Punched Card Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartPunchedCard element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are</p>

Enumeration Value	Description
	<p>described in further detail above. <i>end note</i>]</p> 
<p>flowChartPunchedTape (Punched Tape Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartPunchedTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartSort (Sort Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartSort element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartSummingJunction (Summing Junction Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the flowChartSummingJunction element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
flowChartTerminator (Terminator Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartTerminator element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
foldedCorner (Folded Corner Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the foldedCorner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
frame (Frame Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the frame element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
funnel (Funnel Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the funnel element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
gear6 (Gear 6 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the gear6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
gear9 (Gear 9 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in</p>

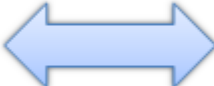

Enumeration Value	Description
	<p>the gear9 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
halfFrame (Half Frame Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the halfFrame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
heart (Heart Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the heart element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
heptagon (Heptagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the heptagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
hexagon (Hexagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the hexagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
homePlate (Home Plate Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the homePlate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
horizontalScroll (Horizontal Scroll Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the horizontalScroll element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
irregularSeal1 (Irregular Seal 1 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the irregularSeal1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
irregularSeal2 (Irregular Seal 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the irregularSeal2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

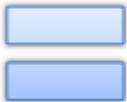

Enumeration Value	Description
	
leftArrow (Left Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftArrowCallout (Callout Left Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftBrace (Left Brace Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftBrace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
leftBracket (Left Bracket Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftBracket element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftCircularArrow (Left Circular Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftCircularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftRightArrow (Left Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are</p>

Enumeration Value	Description
	<p>described in further detail above. <i>end note</i>]</p> 
<p>leftRightArrowCallout (Callout Left Right Arrow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftRightArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>leftRightCircularArrow (Left Right Circular Arrow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftRightCircularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>leftRightRibbon (Left Right Ribbon Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftRightRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
leftRightUpArrow (Left Right Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftRightUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftUpArrow (Left Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the leftUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
lightningBolt (Lightning Bolt Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the lightningBolt element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
line (Line Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the line element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
lineInv (Line Inverse Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the lineInv element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathDivide (Divide Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in</p>

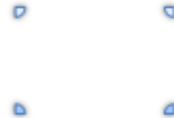

Enumeration Value	Description
	<p>the mathDivide element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
mathEqual (Equal Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the mathEqual element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathMinus (Minus Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the mathMinus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathMultiply (Multiply Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the mathMultiply element in the preset shape geometries electronic addenda of Annex D. The</p>

Enumeration Value	Description
	<p>constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathNotEqual (Not Equal Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the mathNotEqual element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathPlus (Plus Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the mathPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
moon (Moon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the moon element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>nonIsoscelesTrapezoid (Non-Isosceles Trapezoid Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the nonIsoscelesTrapezoid element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>noSmoking (No Smoking Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the noSmoking element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>notchedRightArrow (Notched Right Arrow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p>

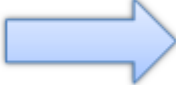

Enumeration Value	Description
	<p>generate this preset shape definition is contained in the notchedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
octagon (Octagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the octagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
parallelogram (Parallelogram Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the parallelogram element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
pentagon (Pentagon Shape)	Specifies a preset shape geometry. This geometry shall

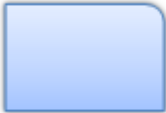

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the pentagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
pie (Pie Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the pie element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
pieWedge (Pie Wedge Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the pieWedge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

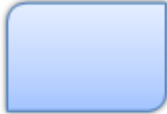

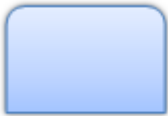

Enumeration Value	Description
	
plaque (Plaque Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the plaque element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
plaqueTabs (Plaque Tabs Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the plaqueTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
plus (Plus Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the plus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
quadArrow (Quad-Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the quadArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
quadArrowCallout (Callout Quad-Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the quadArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rect (Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ribbon (Ribbon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the ribbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ribbon2 (Ribbon 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the ribbon2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rightArrow (Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall</p>

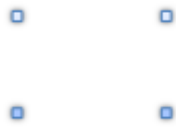

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the rightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rightArrowCallout (Callout Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the rightArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rightBrace (Right Brace Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the rightBrace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
rightBracket (Right Bracket Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the rightBracket element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
round1Rect (One Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the round1Rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
round2DiagRect (Two Diagonal Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the round2DiagRect element in the preset shape geometries electronic addenda of Annex D. The</p>

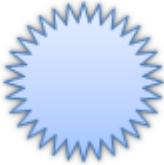

Enumeration Value	Description
	<p>constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>round2SameRect (Two Same-side Round Corner Rectangle Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the round2SameRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>roundRect (Round Corner Rectangle Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the roundRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>rtTriangle (Right Triangle Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the rtTriangle element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
smileyFace (Smiley Face Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the smileyFace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
snip1Rect (One Snip Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the snip1Rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
snip2DiagRect (Two Diagonal Snip Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the <code>snip2DiagRect</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p><code>snip2SameRect</code> (Two Same-side Snip Corner Rectangle Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the <code>snip2SameRect</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p><code>snipRoundRect</code> (One Snip One Round Corner Rectangle Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the <code>snipRoundRect</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
squareTabs (Square Tabs Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the squareTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star10 (Ten Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star10 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star12 (Twelve Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star12 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
star16 (Sixteen Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star16 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star24 (Twenty Four Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star24 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star32 (Thirty Two Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star32 element in the preset shape geometries electronic addenda of Annex D. The constants used in</p>

Enumeration Value	Description
	<p>that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star4 (Four Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star5 (Five Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the star5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star6 (Six Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the star6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star7 (Seven Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the star7 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star8 (Eight Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the star8 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
straightConnector1 (Straight Connector 1 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the straightConnector1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
stripedRightArrow (Striped Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the stripedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
sun (Sun Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the sun element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
swooshArrow (Swoosh Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the swooshArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
teardrop (Teardrop Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the teardrop element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
trapezoid (Trapezoid Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the trapezoid element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further</p>

Enumeration Value	Description
	<p>detail above. <i>end note</i>]</p> 
triangle (Triangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the triangle element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upArrow (Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the upArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upArrowCallout (Callout Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the upArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upDownArrow (Up Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the upDownArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upDownArrowCallout (Callout Up Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the upDownArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
uturnArrow (U-Turn Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the uturnArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
verticalScroll (Vertical Scroll Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the verticalScroll element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
wave (Wave Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the wave element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
wedgeEllipseCallout (Callout Wedge Ellipse Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the wedgeEllipseCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
wedgeRectCallout (Callout Wedge Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the wedgeRectCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
wedgeRoundRectCallout (Callout Wedge Round Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p>

Enumeration Value	Description
	<p>generate this preset shape definition is contained in the wedgeRoundRectCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_ShapeType](#)) is located in §A.4.1. *end note*]

20.1.10.56 [ST_StyleMatrixColumnIndex](#) ([Style Matrix Column Index](#))

This simple type specifies an index into one of the lists in the style matrix specified by the fmtScheme element (bgFillStyleLst, effectStyleLst, fillStyleLst, or lnStyleLst).

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_StyleMatrixColumnIndex](#)) is located in §A.4.1. *end note*]

20.1.10.57 [ST_SystemColorVal](#) ([System Color Value](#))

This simple type specifies a system color value. This color is based upon the value that this color currently has within the system on which the document is being viewed.

Applications shall use the lastClr attribute to determine the absolute value of the last color used if system colors are not supported.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
3dDkShadow (3D Dark System Color)	Specifies a Dark shadow color for three-dimensional display elements.
3dLight (3D Light System Color)	Specifies a Light color for three-dimensional display elements (for edges facing the light source).
activeBorder (Active Border System Color)	Specifies an Active Window Border Color.
activeCaption (Active Caption System Color)	Specifies the active window title bar color. In particular the left side color in the color gradient of an active

Enumeration Value	Description
	window's title bar if the gradient effect is enabled.
appWorkspace (Application Workspace System Color)	Specifies the Background color of multiple document interface (MDI) applications.
background (Background System Color)	Specifies the desktop background color.
btnFace (Button Face System Color)	Specifies the face color for three-dimensional display elements and for dialog box backgrounds.
btnHighlight (Button Highlight System Color)	Specifies the highlight color for three-dimensional display elements (for edges facing the light source).
btnShadow (Button Shadow System Color)	Specifies the shadow color for three-dimensional display elements (for edges facing away from the light source).
btnText (Button Text System Color)	Specifies the color of text on push buttons.
captionText (Caption Text System Color)	Specifies the color of text in the caption, size box, and scroll bar arrow box.
gradientActiveCaption (Gradient Active Caption System Color)	Specifies the right side color in the color gradient of an active window's title bar.
gradientInactiveCaption (Gradient Inactive Caption System Color)	Specifies the right side color in the color gradient of an inactive window's title bar.
grayText (Gray Text System Color)	Specifies a grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
highlight (Highlight System Color)	Specifies the color of Item(s) selected in a control.
highlightText (Highlight Text System Color)	Specifies the text color of item(s) selected in a control.
hotLight (Hot Light System Color)	Specifies the color for a hyperlink or hot-tracked item.
inactiveBorder (Inactive Border System Color)	Specifies the color of the Inactive window border.
inactiveCaption (Inactive Caption System Color)	Specifies the color of the Inactive window caption. Specifies the left side color in the color gradient of an inactive window's title bar if the gradient effect is enabled.
inactiveCaptionText (Inactive Caption Text System Color)	Specifies the color of text in an inactive caption.
infoBk (Info Back System Color)	Specifies the background color for tooltip controls.
infoText (Info Text System Color)	Specifies the text color for tooltip controls.
menu (Menu System Color)	Specifies the menu background color.
menuBar (Menu Bar System Color)	Specifies the background color for the menu bar when menus appear as flat menus.
menuHighlight (Menu Highlight System Color)	Specifies the color used to highlight menu items when the menu appears as a flat menu.

Enumeration Value	Description
menuText (Menu Text System Color)	Specifies the color of Text in menus.
scrollBar (Scroll Bar System Color)	Specifies the scroll bar gray area color.
window (Window System Color)	Specifies window background color.
windowFrame (Window Frame System Color)	Specifies the window frame color.
windowText (Window Text System Color)	Specifies the color of text in windows.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SystemColorVal](#)) is located in §A.4.1. *end note*]

20.1.10.58 ST_TextAlignType (Text Alignment Types)

This simple type specifies the text alignment types

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Text Alignment Enum (Center))	Align text in the center.
dist (Text Alignment Enum (Distributed))	Distributes the text words across an entire text line.
just (Text Alignment Enum (Justified))	Align text so that it is justified across the whole line. It is smart in the sense that it does not justify sentences which are short.
justLow (Text Alignment Enum (Justified Low))	Aligns the text with an adjusted kashida length for Arabic text.
l (Text Alignment Enum (Left))	Align text to the left margin.
r (Text Alignment Enum (Right))	Align text to the right margin.
thaiDist (Text Alignment Enum (Thai Distributed))	Distributes Thai text specially, because each character is treated as a word.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextAlignType](#)) is located in §A.4.1. *end note*]

20.1.10.59 ST_TextAnchoringType (Text Anchoring Types)

This simple type specifies a list of available anchoring types for text.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
b (Text Anchor Enum (Bottom))	Anchor the text at the bottom of the bounding rectangle.
ctr (Text Anchor Enum (Center))	Anchor the text at the middle of the bounding rectangle.
dist (Text Anchor Enum (Distributed))	Anchor the text so that it is distributed vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to anchorJustified (special case: if only 1 line, then anchored in middle). When text is vertical, then it distributes the letters vertically. This is different than anchorJustified, because it always forces distribution of the words, even if there are only one or two words in a line.
just (Text Anchor Enum (Justified))	Anchor the text so that it is justified vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to 'distrib' (special case: if only 1 line, then anchored at top). When text is vertical, then it justifies the letters vertically. This is different than anchorDistributed, because in some cases such as very little text in a line, it does not justify.
t (Text Anchoring Type Enum (Top))	Anchor the text at the top of the bounding rectangle.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextAnchoringType](#)) is located in §A.4.1. *end note*]

20.1.10.60 ST_TextAutonumberScheme (Text Auto-number Schemes)

This simple type specifies a list of automatic numbering schemes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
alphaLcParenBoth (Autonumber Enum (alphaLcParenBoth))	(a), (b), (c), ...
alphaLcParenR (Autonumbering Enum (alphaLcParenR))	a), b), c), ...
alphaLcPeriod (Autonumbering Enum (alphaLcPeriod))	a., b., c., ...
alphaUcParenBoth (Autonumbering Enum ((A), (B), (C), ...

Enumeration Value	Description
alphaUcParenBoth))	
alphaUcParenR (Autonumbering Enum (alphaUcParenR))	A), B), C), ...
alphaUcPeriod (Autonumbering Enum (alphaUcPeriod))	A., B., C., ...
arabic1Minus (Autonumbering Enum (arabic1Minus))	Bidi Arabic 1 (AraAlpha) with ANSI minus symbol
arabic2Minus (Autonumbering Enum (arabic2Minus))	Bidi Arabic 2 (AraAbjad) with ANSI minus symbol
arabicDbPeriod (Autonumbering Enum (arabicDbPeriod))	Dbl-byte Arabic numbers w/ double-byte period
arabicDbPlain (Autonumbering Enum (arabicDbPlain))	Dbl-byte Arabic numbers
arabicParenBoth (Autonumbering Enum (arabicParenBoth))	(1), (2), (3), ...
arabicParenR (Autonumbering Enum (arabicParenR))	1), 2), 3), ...
arabicPeriod (Autonumbering Enum (arabicPeriod))	1., 2., 3., ...
arabicPlain (Autonumbering Enum (arabicPlain))	1, 2, 3, ...
circleNumDbPlain (Autonumbering Enum (circleNumDbPlain))	Dbl-byte circle numbers (1-10 circle[0x2460-], 11- arabic numbers)
circleNumWdBlackPlain (Autonumbering Enum (circleNumWdBlackPlain))	Wingdings black circle numbers
circleNumWdWhitePlain (Autonumbering Enum (circleNumWdWhitePlain))	Wingdings white circle numbers (0-10 circle[0x0080-], 11- arabic numbers)
ea1ChsPeriod (Autonumbering Enum (ea1ChsPeriod))	EA: Simplified Chinese w/ single-byte period
ea1ChsPlain (Autonumbering Enum (ea1ChsPlain))	EA: Simplified Chinese (TypeA 1-99, TypeC 100-)
ea1ChtPeriod (Autonumbering Enum (ea1ChtPeriod))	EA: Traditional Chinese w/ single-byte period
ea1ChtPlain (Autonumbering Enum (ea1ChtPlain))	EA: Traditional Chinese (TypeA 1-19, TypeC 20-)
ea1JpnChsDbPeriod (Autonumbering Enum (ea1JpnChsDbPeriod))	EA: Japanese w/ double-byte period
ea1JpnKorPeriod (Autonumbering Enum (ea1JpnKorPeriod))	EA: Japanese/Korean w/ single-byte period
ea1JpnKorPlain (Autonumbering Enum (ea1JpnKorPlain))	EA: Japanese/Korean (TypeC 1-)
hebrew2Minus (Autonumbering Enum (hebrew2Minus))	Bidi Hebrew 2 with ANSI minus symbol

Enumeration Value	Description
hindiAlpha1Period (Autonumbering Enum (hindiAlpha1Period))	Hindi alphabet period - consonants
hindiAlphaPeriod (Autonumbering Enum (hindiAlphaPeriod))	Hindi alphabet period - vowels
hindiNumParenR (Autonumbering Enum (hindiNumParenR))	Hindi numerical parentheses - right
hindiNumPeriod (Autonumbering Enum (hindiNumPeriod))	Hindi numerical period
romanLcParenBoth (Autonumbering Enum (romanLcParenBoth))	(i), (ii), (iii), ...
romanLcParenR (Autonumbering Enum (romanLcParenR))	i), ii), iii), ...
romanLcPeriod (Autonumbering Enum (romanLcPeriod))	i., ii., iii., ...
romanUcParenBoth (Autonumbering Enum (romanUcParenBoth))	(I), (II), (III), ...
romanUcParenR (Autonumbering Enum (romanUcParenR))	I), II), III), ...
romanUcPeriod (Autonumbering Enum (romanUcPeriod))	I., II., III., ...
thaiAlphaParenBoth (Autonumbering Enum (thaiAlphaParenBoth))	Thai alphabet parentheses - both
thaiAlphaParenR (Autonumbering Enum (thaiAlphaParenR))	Thai alphabet parentheses - right
thaiAlphaPeriod (Autonumbering Enum (thaiAlphaPeriod))	Thai alphabet period
thaiNumParenBoth (Autonumbering Enum (thaiNumParenBoth))	Thai numerical parentheses - both
thaiNumParenR (Autonumbering Enum (thaiNumParenR))	Thai numerical parentheses - right
thaiNumPeriod (Autonumbering Enum (thaiNumPeriod))	Thai numerical period

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextAutonumberScheme](#)) is located in §A.4.1. *end note*]

20.1.10.61 ST_TextBulletSizePercent (Bullet Size Percentage)

This simple type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it.

This simple type also specifies the following restrictions:

- This simple type's contents shall match the following regular expression pattern:
`0*((2[5-9])|([3-9][0-9])|([1-3][0-9][0-9])|400)%`.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextBulletSizePercent](#)) is located in §A.4.1. *end note*]

20.1.10.62 [ST_TextBulletStartAtNum](#) (Start Bullet At Number)

This simple type specifies the range that the start at number for a bullet's auto-numbering sequence can begin at. When the numbering is alphabetical, then the numbers map to the appropriate letter. 1->a, 2->b, etc. If the numbers go above 26, then the numbers begin to double up. For example, 27->aa and 53->aaa.

This simple type's contents are a restriction of the W3C XML Schema `int` datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 32767.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextBulletStartAtNum](#)) is located in §A.4.1. *end note*]

20.1.10.63 [ST_TextCapsType](#) (Text Cap Types)

This simple type specifies the cap types of the text.

This simple type's contents are a restriction of the W3C XML Schema `token` datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (Text Caps Enum (All))	Apply all caps on the text. All lower case letters are converted to upper case even though they are stored differently in the backing store.
none (Text Caps Enum (None))	The reason we cannot implicitly have noCaps be the scenario where capitalization is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not have a capitalization scheme even though the style says otherwise.
small (Text Caps Enum (Small))	Apply small caps to the text. All letters are converted to lower case.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextCapsType](#)) is located in §A.4.1. *end note*]

20.1.10.64 ST_TextColumnCount (Text Column Count)

This simple type specifies the number of columns.

This simple type's contents are a restriction of the W3C XML Schema `int` datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 16.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextColumnCount](#)) is located in §A.4.1. *end note*]

20.1.10.65 ST_TextFontAlignType (Font Alignment Types)

This simple type specifies the different kinds of font alignment.

This simple type's contents are a restriction of the W3C XML Schema `token` datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Font Alignment Enum (Automatic))	When the text flow is horizontal or simple vertical same as fontBaseline but for other vertical modes same as fontCenter.
b (Font Alignment Enum (Bottom))	The letters are anchored to the very bottom of a single line. This is different than the bottom baseline because of letters such as "g," "q," "y," etc.
base (Font Alignment Enum (Baseline))	The letters are anchored to the bottom baseline of a single line.
ctr (Font Alignment Enum (Center))	The letters are anchored between the two baselines of a single line.
t (Font Alignment Enum (Top))	The letters are anchored to the top baseline of a single line.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextFontAlignType](#)) is located in §A.4.1. *end note*]

20.1.10.66 ST_TextFontScalePercentOrPercentString (Text Font Scale Percentage)

This simple type specifies that its contents will contain a text font scale percent percentage. See the union's member types for details.

This simple type is a union of the following types:

- The `ST_Percentage` simple type (§22.9.2.9).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextFontScalePercentOrPercentString](#)) is located in §A.4.1. *end note*]

20.1.10.67 ST_TextFontSize (Text Font Size)

This simple type specifies the size of any text in hundredths of a point. Shall be at least 1 point.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 100.
- This simple type has a maximum value of less than or equal to 400000.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextFontSize](#)) is located in §A.4.1. *end note*]

20.1.10.68 ST_TextHorzOverflowType (Text Horizontal Overflow Types)

This simple type specifies the text horizontal overflow types

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clip (Text Horizontal Overflow Enum (Clip))	When a big character does not fit into a line, clip it at the proper horizontal overflow.
overflow (Text Horizontal Overflow Enum (Overflow))	When a big character does not fit into a line, allow a horizontal overflow.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextHorzOverflowType](#)) is located in §A.4.1. *end note*]

20.1.10.69 ST_TextIndent (Text Indentation)

This simple type specifies the text indentation amount to be used.

The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -51206400.
- This simple type has a maximum value of less than or equal to 51206400.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TextIndent](#)) is located in §A.4.1. end note*]

20.1.10.70 [ST_TextIndentLevelType \(Text Indent Level Type\)](#)

This simple type specifies the indent level type. We support list level 0 to 8, and we use -1 and -2 for outline mode levels that should only exist in memory.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 8.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TextIndentLevelType](#)) is located in §A.4.1. end note*]

20.1.10.71 [ST_TextMargin \(Text Margin\)](#)

This simple type specifies the margin that is used and its corresponding size.

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 51206400.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TextMargin](#)) is located in §A.4.1. end note*]

20.1.10.72 [ST_TextNonNegativePoint \(Text Non-Negative Point\)](#)

This simple type specifies a non-negative font size in hundredths of a point. This is restricted to the range [0, 400000].

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 400000.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_TextNonNegativePoint](#)) is located in §A.4.1. end note*]

20.1.10.73 ST_TextPoint (Text Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing; its maximum size is +/- 4000 points.

Its contents can contain either:

- A whole number, whose contents consist of a measurement in hundredths of a point
- A number immediately followed by a unit identifier

This simple type is a union of the following types:

- The ST_TextPointUnqualified simple type (§20.1.10.74).
- The ST_UniversalMeasure simple type (§22.9.2.15).

[Note: The W3C XML Schema definition of this simple type's content model (ST_TextPoint) is located in §A.4.1. *end note*]

20.1.10.74 ST_TextPointUnqualified (Text Point)

This simple type specifies a font size in hundredths of a point. This is restricted to the range [-400000, 400000], i.e from -4000 pt to 4000 pt.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -400000.
- This simple type has a maximum value of less than or equal to 400000.

[Note: The W3C XML Schema definition of this simple type's content model (ST_TextPointUnqualified) is located in §A.4.1. *end note*]

20.1.10.75 ST_TextShapeType (Preset Text Shape Types)

This simple type specifies the preset text shape geometry that is to be used for a shape. An enumeration of this simple type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset text shapes there are predefined guides that the generating application shall maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*/ w 1.0 2.0"

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*/ h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*/ h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*/ h 1.0 5.0"

This is 1/5 the shape height.

1/6 of Shape Height ('hd6') - Calculated value of "*/ h 1.0 6.0"

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of "*/ h 1.0 8.0"

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of "0"

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of "max w h"

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of "w"

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of "min w h"

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of "*/ ss 1.0 2.0"

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of `"*/ ss 1.0 4.0"`

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of `"*/ ss 1.0 6.0"`

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of `"*/ ss 1.0 8.0"`

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of `"0"`

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of `"*/ h 1.0 2.0"`

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the `<spPr>` element.

1/2 of Shape Width ('wd2') - Calculated value of `"*/ w 1.0 2.0"`

This is 1/2 the shape width.

1/4 of Shape Width ('wd4') - Calculated value of `"*/ w 1.0 4.0"`

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of `"*/ w 1.0 5.0"`

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of `"*/ w 1.0 6.0"`

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of `"*/ w 1.0 8.0"`

This is 1/8 the shape width.

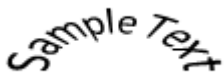

1/10 of Shape Width ('wd10') - Calculated value of `"*/ w 1.0 10.0"`

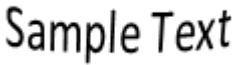

This is 1/10 the shape width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

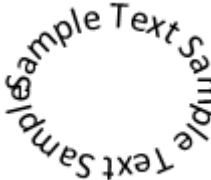

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
textArchDown (Downward Arch Text Shape)	<div></div> <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[Note: An example of DrawingML markup which can</p>

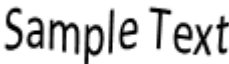

Enumeration Value	Description

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_TextShapeType](#)) is located in §A.4.1. *end note*]

20.1.10.76 [ST_TextSpacingPercentOrPercentString \(Text Spacing Percent\)](#)

This simple type specifies that its contents will contain a text font spacing percentage. See the union's member types for details.

This simple type is a union of the following types:

- The ST_Percentage simple type (§22.9.2.9).

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_TextSpacingPercentOrPercentString](#)) is located in §A.4.1. *end note*]

20.1.10.77 [ST_TextSpacingPoint \(Text Spacing Point\)](#)

This simple type specifies the Text Spacing that is used in terms of font point size.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 158400.

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_TextSpacingPoint](#)) is located in §A.4.1. *end note*]

20.1.10.78 [ST_TextStrikeType \(Text Strike Type\)](#)

This simple type specifies the strike type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dblStrike (Text Strike Enum (Double Strike))	A double strikethrough applied on the text
noStrike (Text Strike Enum (No Strike))	No strike is applied to the text
sngStrike (Text Strike Enum (Single Strike))	A single strikethrough is applied to the text

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextStrikeType](#)) is located in §A.4.1. *end note*]

20.1.10.79 ST_TextTabAlignType (Text Tab Alignment Types)

This simple type specifies the text tab alignment types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
ctr (Text Tab Alignment Enum (Center))	The text at this tab stop is center aligned.
dec (Text Tab Alignment Enum (Decimal))	At this tab stop, the decimals are lined up. From a user's point of view, the text here behaves as right aligned until the decimal, and then as left aligned after the decimal.
l (Text Tab Alignment Enum (Left))	The text at this tab stop is left aligned.
r (Text Tab Alignment Enum (Right))	The text at this tab stop is right aligned.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextTabAlignType](#)) is located in §A.4.1. *end note*]

20.1.10.80 ST_TextTypeface (Text Typeface)

This simple type specifies the way we represent a font typeface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextTypeface](#)) is located in §A.4.1. *end note*]

20.1.10.81 ST_TextUnderlineType (Text Underline Types)

This simple type specifies the text underline types that is used.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dash (Text Underline Enum (Dashed))	Underline the text with a single, dashed line of normal thickness.
dashHeavy (Text Underline Enum (Heavy Dashed))	Underline the text with a single, dashed, thick line.
dashLong (Text Underline Enum (Long Dashed))	Underline the text with a single line consisting of long dashes of normal thickness.
dashLongHeavy (Text Underline Enum (Heavy Long Dashed))	Underline the text with a single line consisting of long, thick dashes.
dbl (Text Underline Enum (Double))	Underline the text with two lines of normal thickness.
dotDash (Text Underline Enum (Dot Dash))	Underline the text with a single line of normal thickness consisting of repeating dots and dashes.
dotDashHeavy (Text Underline Enum (Heavy Dot Dash))	Underline the text with a single, thick line consisting of repeating dots and dashes.
dotDotDash (Text Underline Enum (Dot Dot Dash))	Underline the text with a single line of normal thickness consisting of repeating two dots and dashes.
dotDotDashHeavy (Text Underline Enum (Heavy Dot Dot Dash))	Underline the text with a single, thick line consisting of repeating two dots and dashes.
dotted (Text Underline Enum (Dotted))	Underline the text with a single, dotted line of normal thickness.
dottedHeavy (Text Underline Enum (Heavy Dotted))	Underline the text with a single, thick, dotted line.
heavy (Text Underline Enum (Heavy))	Underline the text with a single, thick line.
none (Text Underline Enum (None))	The reason we cannot implicitly have noUnderline be the scenario where underline is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not be underlined even though the style says otherwise.
sng (Text Underline Enum (Single))	Underline the text with a single line of normal thickness.
wavy (Text Underline Enum (Wavy))	Underline the text with a single wavy line of normal thickness.
wavyDbl (Text Underline Enum (Double Wavy))	Underline the text with two wavy lines of normal thickness.
wavyHeavy (Text Underline Enum (Heavy Wavy))	Underline the text with a single, thick wavy line.
words (Text Underline Enum (Words))	Underline just the words and not the spaces between them.

[Note: The W3C XML Schema definition of this simple type's content model ([ST TextUnderlineType](#)) is located in §A.4.1. *end note*]

20.1.10.82 [ST_TextVerticalType](#) (Vertical Text Types)

If there is vertical text, determines what kind of vertical text is going to be used.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
eaVert (Vertical Text Type Enum (East Asian Vertical))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical.
horz (Vertical Text Type Enum (Horizontal))	Horizontal text. This should be default.
mongolianVert (Vertical Text Type Enum (Mongolian Vertical))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical. The difference between this and the eastAsianVertical is the text flows top down then LEFT RIGHT, instead of RIGHT LEFT
vert (Vertical Text Type Enum (Vertical))	Determines if all of the text is vertical orientation (each line is 90 degrees rotated clockwise, so it goes from top to bottom; each next line is to the left from the previous one).
vert270 (Vertical Text Type Enum (Vertical 270))	Determines if all of the text is vertical orientation (each line is 270 degrees rotated clockwise, so it goes from bottom to top; each next line is to the right from the previous one).
wordArtVert (Vertical Text Type Enum (WordArt Vertical))	Determines if all of the text is vertical ("one letter on top of another").
wordArtVertRtl (Vertical WordArt Right to Left)	Specifies that vertical WordArt should be shown from right to left rather than left to right.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextVerticalType](#)) is located in §A.4.1. *end note*]

20.1.10.83 [ST_TextVertOverflowType](#) (Text Vertical Overflow)

This simple type specifies the text vertical overflow.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clip (Text Overflow Enum (Clip))	Pay attention to top and bottom barriers. Provide no indication that there is text which is not visible.

Enumeration Value	Description
ellipsis (Text Overflow Enum (Ellipsis))	Pay attention to top and bottom barriers. Use an ellipsis to denote that there is text which is not visible.
overflow (Text Overflow Enum (Overflow))	Overflow the text and pay no attention to top and bottom barriers.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TextVertOverflowType](#)) is located in §A.4.1. *end note*]

20.1.10.84 ST_TextWrappingType (Text Wrapping Types)

Text Wrapping Types

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (Text Wrapping Type Enum (None))	No wrapping occurs on this text body. Words spill out without paying attention to the bounding rectangle boundaries.
square (Text Wrapping Type Enum (Square))	Determines whether we wrap words within the bounding rectangle.

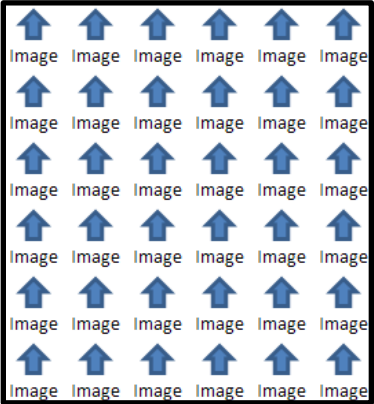

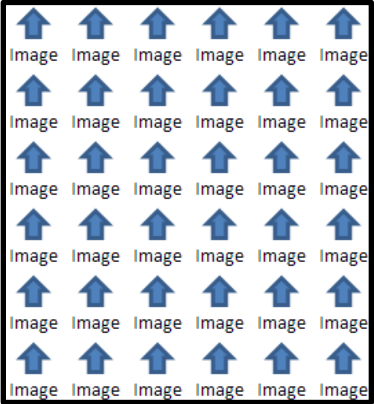

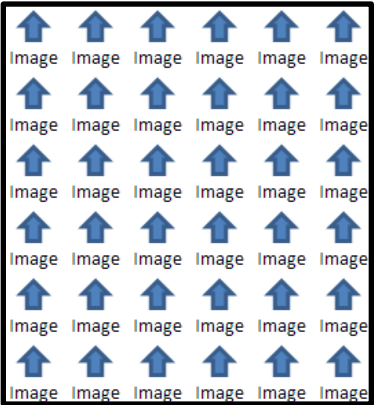

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TextWrappingType](#)) is located in §A.4.1. *end note*]

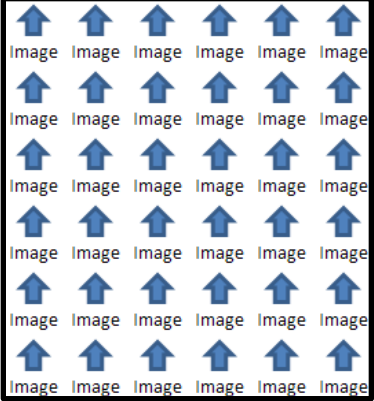

20.1.10.85 ST_TileFlipMode (Tile Flip Mode)

This simple type indicates whether/how to flip the contents of a tile region when using it to fill a larger fill region.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
none (None)	<div></div> <p>Tiles are not flipped.</p>
x (Horizontal)	<div></div> <p>Tiles are flipped horizontally.</p>
xy (Horizontal and Vertical)	<div></div> <p>Tiles are flipped both horizontally and vertically.</p>

Enumeration Value	Description
y (Vertical)	<div></div> <p>Tiles are flipped vertically.</p>

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_TileFlipMode](#)) is located in §A.4.1. *end note*]

20.1.10.86 **ST_TextBulletSize (Bullet Size Percentage)**

This simple type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it, with a minimum size of 25% and maximum size of 400%.

This simple type is a union of the following types:

- The ST_TextBulletSizePercent simple type (§20.1.10.62)

[Note: The W3C XML Schema definition of this simple type’s content model (ST_TextBulletSize) is located in §A.4.1. *end note*]

20.2 **DrawingML - Picture**

These elements encompass the definition of pictures within the DrawingML framework. While pictures are in many ways very similar to shapes they have specific properties that are unique in order to optimize for picture-specific scenarios. Some of these properties include Fill behavior, Border behavior and Resize behavior.

20.2.1 Table of Contents

This subclause is informative.

20.2.2	Elements	3077
20.2.2.1	blipFill (Picture Fill)	3077
20.2.2.2	cNvPicPr (Non-Visual Picture Drawing Properties)	3080
20.2.2.3	cNvPr (Non-Visual Drawing Properties)	3080
20.2.2.4	nvPicPr (Non-Visual Picture Properties)	3083
20.2.2.5	pic (Picture).....	3083
20.2.2.6	spPr (Shape Properties).....	3084

End of informative text.

20.2.2 Elements

The following section defines the Picture portion of the DrawingML framework.

20.2.2.1 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<pic:pic>
...
<pic:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</pic:blipFill>
...
</pic:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example:* Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<pic:pic>
...
<pic:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</pic:blipFill>
<pic:spPr>
  <a:gradFill>
    <a:gsLst>
      <a:gs pos="0">
        <a:schemeClr val="tx2">
          <a:shade val="50000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="39999">
        <a:schemeClr val="tx2">
          <a:tint val="20000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="70000">
        <a:srgbClr val="C4D6EB"/>
      </a:gs>
      <a:gs pos="100000">
        <a:schemeClr val="bg1"/>
      </a:gs>
    </a:gsLst>
  </a:gradFill>
</pic:spPr>
```

```

        </a:gs>
    </a:gsLst>
    </a:gradFill>
</pic:spPr>
...
</pic:pic>

```

The above picture object is shown as an example of this double fill type. *end example*]

Attributes	Description
dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_BlipFillProperties](#)) is located in §A.4.1. *end note*]

20.2.2.2 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[Example: Consider the following DrawingML.

```
<pic:pic>
...
<pic:nvPicPr>
  <pic:cNvPr id="4" name="Lilly.jpg"/>
  <pic:cNvPicPr>
    <a:picLocks noChangeAspect="1"/>
  </p:cNvPicPr>
  <pic:nvPr/>
</pic:nvPicPr>
...
</pic:pic>
```

end example]

Attributes	Description
preferRelativeResi ze (Relative Resize Preferred) Namespace: http://purl.oclc.or g/ooxml/drawing ml/main	<p>Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.</p> <p>[Example: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_NonVisualPictureProperties](#)) is located in §A.4.1. end note]

20.2.2.3 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<pic:pic>
...
<pic:nvPicPr>
  <p:cNvPr id="4" name="Lilly.jpg"/>
</pic:nvPicPr>
...
</pic:pic>
```

end example]

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note</i>: An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><... hidden="true" /></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Unique	Specifies a unique identifier for the current DrawingML object within the current

Attributes	Description
<p>Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="456 533 678 562"><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
<p>name (Name)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="456 972 776 1001">< ... name="foo.jpg" ></pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>title (Title)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="456 1446 967 1476"><... title="Process Flow Diagram"></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

20.2.2.4 `nvPicPr` (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example:* Consider the following DrawingML.

```
<pic:pic>
  ...
  <pic:nvPicPr>
    ...
  </pic:nvPicPr>
  ...
</pic:pic>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PictureNonVisual](#)) is located in §A.4.2. *end note*]

20.2.2.5 `pic` (Picture)

This element specifies the existence of a picture object within the document.

[*Example:* Consider the following DrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<pic:pic>
  <pic:nvPicPr>
    <pic:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <pic:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </pic:cNvPicPr>
    <pic:nvPr/>
  </pic:nvPicPr>
  <pic:blipFill>
    ...
  </pic:blipFill>
  <pic:spPr>
    ...
  </pic:spPr>
</pic:pic>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Picture](#)) is located in §A.4.2. *end note*]

20.2.2.6 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe the visual appearance of a picture within a document. This allows for a picture to have both the properties of a shape as well as picture specific properties that are allowed under the pic element.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ShapeProperties](#)) is located in §A.4.1. *end note*]

20.3 DrawingML - Locked Canvas

Within a DrawingML object, a *locked canvas* allows DrawingML objects to be placed in a format where they can be viewed but not edited by the hosting application. This allows DrawingML objects not supported by an application to be included and viewed in applications where they cannot be edited.

20.3.1 Table of Contents

This subclause is informative.

20.3.2 Basics	3084
20.3.2.1 lockedCanvas (Locked Canvas Container)	3084

End of informative text.

20.3.2 Basics

This section specifies a locked canvas within the basic DrawingML framework.

20.3.2.1 lockedCanvas (Locked Canvas Container)

The locked canvas element acts as a container for more advanced drawing objects. The notion of a locked canvas comes from the fact that the generating application opening the file cannot create this object and can

thus not perform edits either. Thus the drawing object is locked from all UI adjustments that would normally take place.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlGroupShape](#)) is located in §A.4.1. *end note*]

20.4 DrawingML - WordprocessingML Drawing

Within a WordprocessingML document, it is possible to include graphical DrawingML objects:

- Pictures (§20.2)
- Locked Canvases (§20.3)
- Diagrams (§21.4)
- Charts (§21.2)

When these objects are present in a word processing document, it is necessary to include information which specifies how the objects shall be positioned relative to the paginated document. [*Example:* Whether the object is displayed in line with text. *end example*]

The WordprocessingML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a word processing document.

[*Example:* Consider a DrawingML picture which must be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<w:r>
  <w:drawing>
    <wp:anchor relativeHeight="10" allowOverlap="true">
      <wp:positionH relativeFrom="margin">
        <wp:align>center</wp:align>
      </wp:positionH>
      <wp:positionV relativeFrom="margin">
        <wp:align>center</wp:align>
      </wp:positionV>
      <wp:extent cx="2441542" cy="1828800"/>
      <wp:wrapSquare wrapText="bothSides"/>
      <a:graphic>
        ...
      </a:graphic>
    </wp:anchor>
  </w:drawing>
</w:r>
```

The anchor element (§20.4.2.3) specifies that this object is not positioned in line with text, and its child elements specify that the object is centered on the page horizontally and vertically (§20.4.2.10; §20.4.2.11), and that text can wrap around it in a square (§20.4.2.17). *end example*

20.4.1 Table of Contents

End of informative text.

20.4.2 Elements

The following elements define the contents of the WordprocessingML Drawing namespace:

20.4.2.1 align (Relative Horizontal Alignment)

This element specifies how a DrawingML object shall be horizontally aligned relative to the horizontal alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example:* Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="page">
    <wp:align>left</wp:align>
  </wp:positionH>
  ...
</wp:anchor>
```

The align element with a value of `left` specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture must be aligned to the left edge of the page. *end example]*

The possible values for this element are defined by the ST_AlignH simple type (§20.4.3.1).

[*Note:* The W3C XML Schema definition of this element's content model ([ST_AlignH](#)) is located in §A.4.4. *end note]*

20.4.2.2 align (Relative Vertical Alignment)

This element specifies how a DrawingML object shall be vertically aligned relative to the vertical alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example:* Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor ... >
  <wp:positionV relativeFrom="page">
    <wp:align>top</wp:align>
  </wp:positionH>
  ...
</wp:anchor>
```

The align element with a value of top specifies that for the vertical positioning defined by the parent element (in this case, positioning relative to the page), the picture must be aligned to the top edge of the page. *end example]*

The possible values for this element are defined by the ST_AlignV simple type (§20.4.3.2).

[*Note:* The W3C XML Schema definition of this element's content model ([ST_AlignV](#)) is located in §A.4.4. *end note]*

20.4.2.3 anchor (Anchor for Floating DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is a floating object. Within a WordprocessingML document, drawing objects can exist in two states:

- *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).
- *Floating* - The drawing object is anchored within the text, but can be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object as a floating object on the page.

[*Example:* Consider a WordprocessingML document where the anchor for a floating DrawingML object must be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```

<w:p>
  <w:r>
    <w:drawing>
      <wp:anchor ... >
        ...
      </wp:anchor>
    </w:drawing>
  </w:r>
</w:p>

```

The anchor element, when present as the child element of the drawing element, specifies that this DrawingML object must be positioned as a floating object based on the values of its child elements. *end example*

Attributes	Description
allowOverlap (Allow Objects to Overlap)	<p>Specifies whether a DrawingML object which intersects another DrawingML object at display time is allowed to overlap the contents of the other DrawingML object. If a DrawingML object cannot overlap other DrawingML object, it shall be repositioned when displayed to prevent this overlap as needed.</p> <p>[<i>Example:</i> Consider a document with two DrawingML objects which are allowed to overlap each other. This would be specified as follows within each object's anchor markup:</p> <pre> <wp:anchor allowOverlap="true" ... > ... </wp:anchor> </pre> <p>The allowOverlap attribute has a value of true, which specifies that this object must be allowed to overlap other objects when it is displayed on the document. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
behindDoc (Display Behind Document Text)	<p>Specifies whether this floating DrawingML object is displayed behind the text of the document when the document is displayed. When a DrawingML object is displayed within a WordprocessingML document, that object can intersect with text in the document. This attribute shall determine whether the text or the object is rendered on top in case of overlapping.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must be displayed above any text which it intersects within the document's content. This setting would be specified as follows:</p> <pre> <wp:anchor behindDoc="false" ... > ... </wp:anchor> </pre>

Attributes	Description
	<p>The behindDoc attribute has a value of <code>false</code>, which specifies that the DrawingML object is displayed above the text of the document in z-order. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>distB (Distance From Text on Bottom Edge)</p>	<p>Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of <code>inline</code>), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example: Consider a floating DrawingML object which must have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:</i></p> <pre data-bbox="451 1003 922 1108"><wp:anchor distB="457200" ... > ... </wp:anchor></pre> <p>The distB attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>distL (Distance From Text on Left Edge)</p>	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of <code>inline</code>), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</i></p>

Attributes	Description
	<pre data-bbox="456 285 919 380"><wp:anchor distL="228600" ... > ... </wp:anchor></pre> <p data-bbox="415 422 1425 489">The distL attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. <i>end example</i>]</p> <p data-bbox="415 531 1442 598">The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distR (Distance From Text on Right Edge)	<p data-bbox="415 615 1474 716">Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p data-bbox="415 758 1162 787">The distance shall be measured in EMUs (English Metric Units).</p> <p data-bbox="415 829 1455 1001">If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p data-bbox="415 1043 1474 1144">[<i>Example: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</i></p> <pre data-bbox="456 1186 919 1281"><wp:anchor distR="228600" ... > ... </wp:anchor></pre> <p data-bbox="415 1323 1425 1390">The distR attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. <i>end example</i>]</p> <p data-bbox="415 1432 1442 1499">The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distT (Distance From Text on Top Edge)	<p data-bbox="415 1514 1474 1614">Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p data-bbox="415 1656 1162 1686">The distance shall be measured in EMUs (English Metric Units).</p> <p data-bbox="415 1728 1455 1900">If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor distT="457200" ... > ... </wp:anchor></pre> <p>The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
hidden (Hidden)	<p>Specifies whether this floating DrawingML object is displayed. When a DrawingML object is displayed within a WordprocessingML document, that object can be hidden (i.e. present, but not visible). This attribute shall determine whether the object is rendered or made hidden. [<i>Note</i>: An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e. not hidden).</p> <p>[<i>Example</i>: Consider a floating DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><wp:anchor hidden="true" ... > ... </wp:anchor></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
layoutInCell (Layout In Table Cell)	<p>Specifies how this DrawingML object behaves when its anchor is located in a table cell; and its specified position would cause it to intersect with a table cell displayed in the document. That behavior shall be as follows:</p> <ul style="list-style-type: none"> • When this attribute has a value of true, then the object shall be positioned within the existing table cell, causing the cell to be resized as needed. This means that all positioning shall be relative to the cell and not the line on which the table appears. • When this attribute has a value of false, then the object shall be positioned as specified, but the table shall be resized and/or relocated within the document as needed to accommodate the object. This means that all positioning shall be

Attributes	Description																								
	<p>relative to the line on which the table appears and not the cell in which the anchor is present.</p> <p>[Example: Consider a DrawingML picture which must be displayed in the center of the document. If the object is contained within a table and is defined as follows:</p> <pre><wp:anchor layoutInCell="true" ... > ... </wp:anchor></pre> <p>The layoutInCell attribute has a value of true, which specifies that the object can be placed within the cell if needed, for example:</p> <table><tr><td></td><td></td><td></td><td></td></tr><tr><td></td><td></td><td></td><td></td></tr><tr><td></td><td></td><td></td><td></td></tr></table> <p>If the layoutInCell attribute was now set to false, the object must be laid out outside of the cell, causing the table to be repositioned:</p> <table><tr><td></td><td></td><td></td><td></td></tr><tr><td></td><td></td><td></td><td></td></tr><tr><td></td><td></td><td></td><td></td></tr></table> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																								
																									
																									
locked (Lock	Specifies that the anchor location for this object shall not be modified at runtime when																								

Attributes	Description
Anchor)	<p>an application edits the contents of this document. [<i>Guidance</i>: An application might have automatic behaviors which reposition the anchor for a DrawingML object based on user interaction - for example, moving it from one page to another as needed. This element must tell applications not to perform any such behaviors. <i>end guidance</i>]</p> <p>[<i>Example</i>: Consider a floating DrawingML object which must have its anchor locked at the current location. This setting would be specified as follows:</p> <pre><wp:anchor locked="true" ... > ... </wp:anchor></pre> <p>The locked attribute has a value of <code>true</code>, which specifies that the DrawingML object's current anchor location must not be changed by applications editing this content. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
relativeHeight (Relative Z-Ordering Position)	<p>Specifies the relative Z-ordering of all DrawingML objects in this document. Each floating DrawingML object shall have a Z-ordering value, which determines which object is displayed when any two objects intersect. Higher values shall indicate higher Z-order; lower values shall indicate lower Z-order.</p> <p>This attribute shall only indicate the Z-order with respect to other objects in the document which have an identical <code>behindDoc</code> attribute value. All objects with a <code>behindDoc</code> value of <code>false</code> shall be displayed above elements with a value of <code>true</code>.</p> <p>[<i>Example</i>: Consider two floating DrawingML objects as follows:</p> <pre><wp:anchor relativeHeight="5" ... > ... </wp:anchor> ... <wp:anchor relativeHeight="8" ... > ... </wp:anchor></pre> <p>The <code>relativeHeight</code> attribute of the second object is 8, which specifies that the second DrawingML object must be at a higher Z-order than the first and must be displayed whenever the two overlap. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p>
simplePos (Page	Specifies that this object shall be positioned using the positioning information in the

Attributes	Description
Positioning)	<p>simplePos child element (§20.4.2.13). This positioning, when specified, positions the object on the page by placing its top left point at the x-y coordinates specified by that element.</p> <p>If this element is omitted, then this object shall not use the simple positioning information in the simplePos element, even when present.</p> <p>[<i>Example</i>: Consider a floating DrawingML object which must be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:</p> <pre><wp:anchor simplePos="true" ... > <wp:simplePos x="0" y="0" /> ... </wp:anchor></pre> <p>The simplePos attribute has a value of true, which specifies that the DrawingML object's current position must be dictated by the simplePos element, and hence placed at 0,0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Anchor](#)) is located in §A.4.4. *end note*]

20.4.2.4 cNvGraphicFramePr (Common DrawingML Non-Visual Properties)

This element specifies common non-visual DrawingML object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[*Example*: Consider a DrawingML object in a WordprocessingML document defined as follows:

```
<wp:inline>
  ...
  <wp:cNvGraphicFramePr>
    <a:graphicFrameLocks ... />
  </wp:cNvGraphicFramePr>
</wp:inline>
```

The cNvGraphicFramePr element contains a set of common non-visual properties as defined by DrawingML. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualGraphicFrameProperties](#)) is located in §A.4.1. *end note*]

20.4.2.5 docPr (Drawing Object Non-Visual Properties)

This element specifies non-visual object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[Example: Consider a DrawingML object in a WordprocessingML document defined as follows:

```
<wp:inline>
...
<wp:docPr id="1" name="Example Object">
  <a:hlinkClick ... />
  <a:hlinkHover ... />
</wp:docPr>
</wp:inline>
```

The docPr element contains a set of common non-visual properties for this object. *end example]*

Attributes	Description
descr (Alternative Text for Object) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
hidden (Hidden) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [Note: An application can have settings which allow this object to be viewed. <i>end note]</i></p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[Example: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><... hidden="true" /></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example]</i></p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
<p>name (Name)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the name of the object. [Note: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>< ... name="foo.jpg" ></pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>title (Title)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre><... title="Process Flow Diagram"></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

20.4.2.6 `effectExtent` (Object Extents Including Effects)

This element specifies the additional extent which shall be added to each edge of the image (top, bottom, left, right) in order to compensate for any drawing effects applied to the DrawingML object.

The extent element (§20.4.2.7) specifies the size of the actual DrawingML object; however, an object can have effects applied which change its overall size [*Example:* A reflection and/or shadow effect. *end example*]. The additional size for each edge of the shape shall be stored on this element, and used to calculate the appropriate wrapping for wrap types without a wrapping polygon and the appropriate line height for inline objects.

[*Example:* Consider the following DrawingML image:

This object has no effects, and hence would have the following effect extents:

```
<wp:effectExtents b="0" t="0" l="0" r="0" />
```

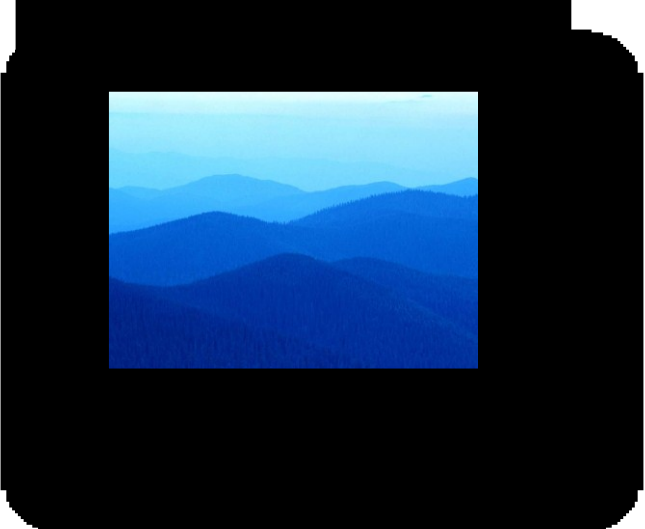

However, if a shadow effect was applied which added effects to the right of the image:

Then the additional extent the right side would be specified in the `r` attribute on this element:

```
<wp:effectExtents b="0" t="0" l="0" r="695325" />
```

The *r* attribute has a value of 695325, specifying that that 695325 EMUs must be added to the right side of the image. *end example*]

Attributes	Description
<p>b (Additional Extent on Bottom Edge)</p>	<p>Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p>[<i>Example</i>: Consider the following DrawingML image:</p>  <p>This image has an effect on all four sides, resulting in the following markup:</p> <pre><wp:effectExtent l="504825" t="447675" r="771525" b="809625" /></pre> <p>The <i>b</i> attribute value of 809625 specifies that 809625 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
<p>l (Additional Extent on Left Edge)</p>	<p>Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p>[<i>Example</i>: Consider the following DrawingML image:</p>

Attributes	Description
	<div data-bbox="414 239 1052 779"></div> <p data-bbox="414 785 1310 816">This image has an effect on all four sides, resulting in the following markup:</p> <pre data-bbox="453 856 1463 888"><wp:effectExtent l="504825" t="447675" r="771525" b="809625" /></pre> <p data-bbox="414 928 1463 993">The l attribute value of 504825 specifies that 504825 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. <i>end example</i>]</p> <p data-bbox="414 1033 1406 1098">The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
<p data-bbox="142 1119 378 1184">r (Additional Extent on Right Edge)</p>	<p data-bbox="414 1119 1463 1184">Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p data-bbox="414 1224 1036 1255"><i>[Example: Consider the following DrawingML image:</i></p> <div data-bbox="414 1289 1052 1829"></div> <p data-bbox="414 1835 1310 1866">This image has an effect on all four sides, resulting in the following markup:</p>

Attributes	Description
	<p><code><wp:effectExtent l="504825" t="447675" r="771525" b="809625" /></code></p> <p>The r attribute value of 771525 specifies that 771525 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
t (Additional Extent on Top Edge)	<p>Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p>[Example: Consider the following DrawingML image:</p>  <p>This image has an effect on all four sides, resulting in the following markup:</p> <p><code><wp:effectExtent l="504825" t="447675" r="771525" b="809625" /></code></p> <p>The t attribute value of 447675 specifies that 447675 additional EMUs must be added to the bottom of the image to compensate for the effects on the image. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_EffectExtent](#)) is located in §A.4.4. *end note]*

20.4.2.7 extent (Drawing Object Size)

This element specifies the extents of the parent DrawingML object within the document (i.e. its final height and width).

[*Example*: Consider a DrawingML picture which is present in a WordprocessingML document and has an equal height and width. This object would be specified as follows:

```
<wp:anchor relativeHeight="10" allowOverlap="true">
...
  <wp:extent cx="1828800" cy="1828800"/>
...
</wp:anchor>
```

The extent element specifies via its attributes that this object has a height and width of 1828800 EMUs (English Metric Units). *end example*]

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

20.4.2.8 inline (Inline DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is an inline object. Within a WordprocessingML document, drawing objects can exist in two states:

- *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).
- *Floating* - The drawing object is anchored within the text, but can be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object in line with text.

[*Example*: Consider a WordprocessingML document where an inline DrawingML object must be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```
<w:p>
  <w:r>
    <w:drawing>
      <wp:inline>
        ...
      </wp:inline>
    </w:drawing>
  </w:r>
</w:p>
```

The inline element, when present as the child element of the drawing element, specifies that this DrawingML object must be positioned in line with the text of this paragraph, modifying line heights, etc. as necessary. *end example*]

Attributes	Description
distB (Distance From Text on Bottom Edge)	<p>Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example</i>: wrapThrough or wrapSquare <i>end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example</i>: Consider a floating DrawingML object which must have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor distB="457200" ... > ... </wp:anchor></pre>

Attributes	Description
	<p>The distB attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>distL (Distance From Text on Left Edge)</p>	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</i></p> <pre data-bbox="451 1010 922 1108"><wp:anchor distL="228600" ... > ... </wp:anchor></pre> <p>The distL attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>distR (Distance From Text on Right Edge)</p>	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example: Consider a floating DrawingML object which must have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</i></p>

Attributes	Description
	<pre data-bbox="451 285 922 386"><wp:anchor distR="228600" ... > ... </wp:anchor></pre> <p data-bbox="415 424 1429 491">The distR attribute specifies that the padding distance must be 228600 EMUs or one-quarter of an inch. <i>end example</i>]</p> <p data-bbox="415 529 1445 596">The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distT (Distance From Text on Top Edge)	<p data-bbox="415 617 1468 718">Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p data-bbox="415 756 1162 789">The distance shall be measured in EMUs (English Metric Units).</p> <p data-bbox="415 827 1455 1003">If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but can be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p data-bbox="415 1041 1455 1142">[<i>Example: Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</i></p> <pre data-bbox="451 1180 922 1281"><wp:anchor distT="457200" ... > ... </wp:anchor></pre> <p data-bbox="415 1318 1474 1386">The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p data-bbox="415 1423 1445 1491">The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT Inline](#)) is located in §A.4.4. end note*]

20.4.2.9 [lineTo \(Wrapping Polygon Line End Position\)](#)

This element specifies a single point on the wrapping polygon for a DrawingML object. This point shall be the termination of the edge of the wrapping polygon started by the previous start or lineTo element in document order, and shall be the origin of the next edge on the same polygon.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example:* Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The lineTo element defines each point of the wrapping polygon (in this case, the four points of the wrapping square). *end example]*

Attributes	Description
<p>x (X-Axis Coordinate)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
<p>y (Y-Axis Coordinate)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Point2D) is located in §A.4.1. *end note]*

20.4.2.10 positionH (Horizontal Positioning)

This element specifies the horizontal positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example:* Consider a DrawingML picture which must be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionH>
  <wp:positionV relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionV>
</wp:anchor>
```

The positionH element specifies that the object is horizontally positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example]*

Attributes	Description
relativeFrom (Horizontal Position Relative Base)	<p>Specifies the base to which the relative horizontal positioning of this object shall be calculated.</p> <p>[<i>Example:</i> Consider a DrawingML picture which must be displayed at the bottom center of the page. This object would be specified as follows:</p> <pre><wp:anchor ... > <wp:positionH relativeFrom="page"> <wp:align>center</wp:align> </wp:positionH> ... </wp:anchor></pre> <p>The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelFromH simple type (§20.4.3.4).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_PosH](#)) is located in §A.4.4. *end note*]

20.4.2.11 **positionV (Vertical Positioning)**

This element specifies the vertical positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- **Positioning Base** - The `relativeFrom` attribute on this element specifies the part of the document from which the positioning shall be calculated.
- **Positioning** - The child element of this element (`align` or `posOffset`) specifies how the object is positioned relative to that base.

[*Example:* Consider a DrawingML picture which must be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionH>
  <wp:positionV relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionV>
</wp:anchor>
```

The `positionV` element specifies that the object is vertically positioned relative to the margin via the `relativeFrom` attribute; and that the alignment relative to the margin is centered via the `align` element. *end example*]

Attributes	Description
<code>relativeFrom</code> (Vertical Position Relative Base)	<p>Specifies the base to which the relative vertical positioning of this object shall be calculated.</p> <p>[<i>Example:</i> Consider a DrawingML picture which must be displayed at the bottom center of the page margins. This object would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:positionV relativeFrom="margin"> <wp:align>bottom</wp:align> </wp:positionV> </wp:anchor></pre> <p>The <code>relativeFrom</code> attribute specifies that the object is horizontally positioned relative to the margin. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_RelFromV simple type (§20.4.3.5).

[Note: The W3C XML Schema definition of this element's content model ([CT_PosV](#)) is located in §A.4.4. *end note*]

20.4.2.12 posOffset (Absolute Position Offset)

This element specifies an absolute measurement for the positioning of a floating DrawingML object within a WordprocessingML document. This measurement shall be calculated relative to the top left edge of the positioning base specified by the parent element's relativeFrom attribute.

[Example: Consider a DrawingML picture which must be displayed one inch from the top of the page, and one-half of an inch from the left edge of the page. This object would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="page">
    <wp:posOffset>914400</wp:posOffset>
  </wp:positionH>
  <wp:positionV relativeFrom="page">
    <wp:posOffset>457200</wp:posOffset>
  </wp:positionV>
</wp:anchor>
```

The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page in EMUs. *end example*]

The possible values for this element are defined by the ST_PositionOffset simple type (§20.4.3.3).

[Note: The W3C XML Schema definition of this element's content model ([ST_PositionOffset](#)) is located in §A.4.4. *end note*]

20.4.2.13 simplePos (Simple Positioning Coordinates)

This element specifies the coordinates at which a DrawingML object shall be positioned relative to the top-left edge of its page, when the simplePos attribute is specified on the anchor element (§20.4.2.3).

[Example: Consider a floating DrawingML object which must be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:

```
<wp:anchor simplePos="true" ... >
  <wp:simplePos x="0" y="0" />
  ...
</wp:anchor>
```

The simplePos attribute has a value of true, which specifies that the DrawingML object's current position must be dictated by the simplePos element, and hence placed at 0,0. *end example*]

Attributes	Description
<p>x (X-Axis Coordinate)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example</i>: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <p style="text-align: center;"><... x="0" y="100" /></p> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
<p>y (Y-Axis Coordinate)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example</i>: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <p style="text-align: center;"><... x="0" y="100" /></p> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.4.2.14 start (Wrapping Polygon Start)

This element specifies the starting point on the wrapping polygon for a DrawingML object. This point shall be the start and termination of the wrapping polygon for the parent object.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

```

<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>

```

The start element defines the start and end of the wrapping polygon (in this case, the four points of the wrapping square). *end example*

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.4.2.15 wrapNone (No Text Wrapping)

This element specifies that the parent DrawingML object shall not cause any text wrapping within the contents of the host WordprocessingML document based on its display location. In effect, this setting shall place the object in one of two locations:

- If the `behindDoc` attribute on the parent element is `true`, then the object shall be positioned behind the text as it is normally displayed.
- If the `behindDoc` attribute on the parent element is `false`, then the object shall be positioned in front of the text as it is normally displayed.

[*Example:* Consider a `DrawingML` picture which must be displayed in front of any text on the page. This object would be specified as follows:

```
<wp:anchor relativeHeight="10" behindDoc="false">
...
  <wp:wrapNone/>
</wp:anchor>
```

The `wrapNone` element specifies that the `DrawingML` object must not cause any text wrapping, and since the `behindDoc` attribute is `false`, the object must be displayed in front of the text of the document. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WrapNone](#)) is located in §A.4.4. *end note]*

20.4.2.16 `wrapPolygon` (Wrapping Polygon)

This element specifies the wrapping polygon which shall be used to determine the extents to which text can wrap around the specified object in the document. This polygon shall be defined by the following:

- The `start` element defines the coordinates of the origin of the wrap polygon
- Two or more `lineTo` elements define the point of the wrap polygon

If the set of child elements does not result in a closed polygon (the last `lineTo` element does not return to the position specified by the `start` element), then a single additional line shall be inferred as needed to close the wrapping polygon.

[*Example:* Consider the following basic wrapping polygon for a `DrawingML` object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The `wrapPolygon` element defines the object's text wrapping polygon (in this case, the four points of a square). *end example]*

Attributes	Description
edited (Wrapping	Specifies that the wrap points for the wrapping polygon have been edited, and the

Attributes	Description
Points Modified)	<p>resulting extents shall be recalculated to compensate when the document is next opened.</p> <p>[<i>Example:</i> Consider the following basic wrapping polygon for a DrawingML object:</p> <pre><wp:wrapPolygon edited="true"> <wp:start x="0" y="0" /> <wp:lineTo x="0" y="100" /> <wp:lineTo x="50" y="50" /> <wp:lineTo x="0" y="0" /> </wp:wrapPolygon></pre> <p>The edited attribute specifies that these wrap points have been changed since the document was last rendered. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WrapPath](#)) is located in §A.4.4. *end note*]

20.4.2.17 wrapSquare (Square Wrapping)

This element specifies that text shall wrap around a virtual rectangle bounding this object. The bounds of the wrapping rectangle shall be dictated by the extents including the addition of the effectExtent element as a child of this element (if present) or the effectExtent present on the parent element.

[*Example:* Consider a DrawingML object using square wrapping and defined as follows:

```
<wp:anchor ... >
  ...
  <wp:wrapSquare wrapText="bothSides" />
</wp:anchor>
```

The wrapSquare element specifies that text must wrap around both sides of a rectangle around this object which includes its effect extents. *end example*]

Attributes	Description
distB (Distance From Text on Bottom Edge)	<p>Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of</p>

Attributes	Description
	<p>padding between its bottom edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:wrapSquare distB="457200" ... /> </wp:anchor></pre> <p>The distB attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:wrapSquare distL="457200" ... /> </wp:anchor></pre> <p>The distL attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distR (Distance From Text on Right Edge)	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:wrapSquare distR="457200" ... /></pre>

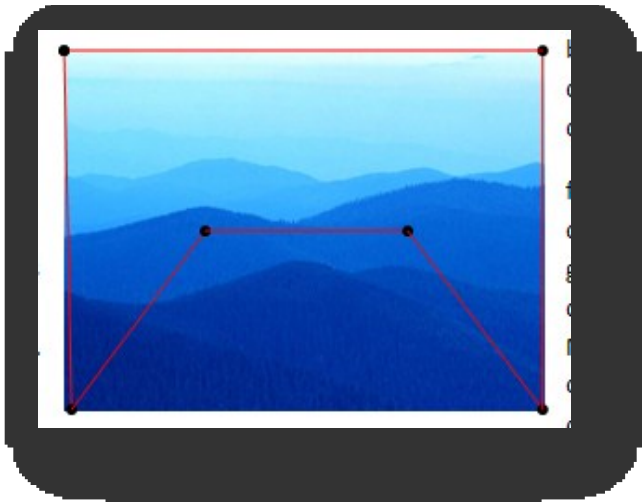

Attributes	Description
	<p><code></wp:anchor></code></p> <p>The distR attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distT (Distance From Text (Top))	<p>Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="451 867 1031 997"><wp:anchor ... > ... <wp:wrapSquare distT="457200" ... /> </wp:anchor></pre> <p>The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
wrapText (Text Wrapping Location)	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must allow text to wrap around its left side only. This setting would be specified as follows:</p> <pre data-bbox="451 1409 1047 1539"><wp:anchor ... > ... <wp:wrapSquare wrapText="left" ... /> </wp:anchor></pre> <p>The wrapText attribute value of <code>left</code> specifies that text must only wrap around the left side of the object. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapText simple type (§20.4.3.7).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WrapSquare](#)) is located in §A.4.4. *end note*]

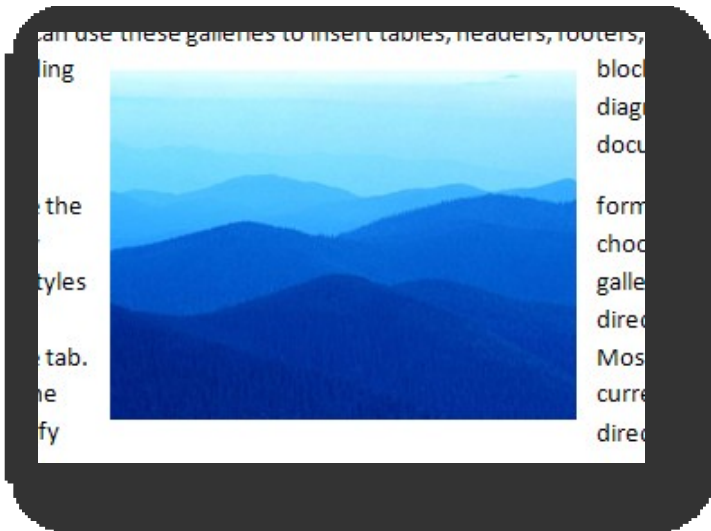

20.4.2.18 wrapThrough (Through Wrapping)

This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the child wrapPolygon element. When this element specifies a wrapping polygon, it shall allow text to wrap within the object's maximum left and right extents.

[Example: Consider an object with the following wrap points:

If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the wrap polygon at any location:

However, with through wrapping:

end example]

[*Example:* Consider a DrawingML object using through wrapping and defined as follows:

```
<wp:anchor ... >
...
<wp:wrapThrough wrapText="bothSides">
...
</wp:wrapThrough>
</wp:anchor>
```

The wrapThrough element specifies that text must wrap through this object as defined by its wrap polygon. *end example]*

Attributes	Description
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:wrapThrough distL="457200" ... /> </wp:anchor></pre> <p>The distL attribute specifies that the padding distance must be 457200 EMUs or one-half</p>

Attributes	Description
	<p>of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>distR (Distance From Text on Right Edge)</p>	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="451 762 1047 894"><wp:anchor ... > ... <wp:wrapThrough distR="457200" ... /> </wp:anchor></pre> <p>The distR attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>wrapText (Text Wrapping Location)</p>	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must allow text to wrap around its left side only. This setting would be specified as follows:</p> <pre data-bbox="451 1304 1063 1436"><wp:anchor ... > ... <wp:wrapThrough wrapText="left" ... /> </wp:anchor></pre> <p>The wrapText attribute value of left specifies that text must only wrap around the left side of the object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapText simple type (§20.4.3.7).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WrapThrough](#)) is located in §A.4.4. *end note*]

20.4.2.19 wrapTight (Tight Wrapping)

This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the child wrapPolygon element. When this element specifies a wrapping polygon, it shall not allow text to wrap within the object's maximum left and right extents.

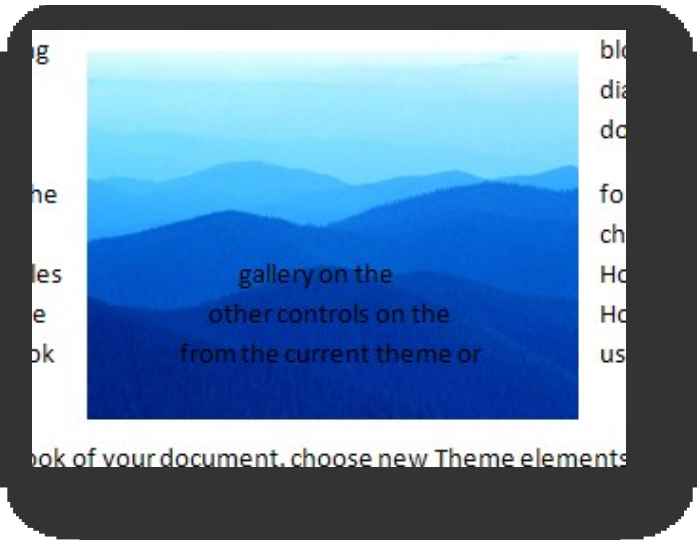

[Example: Consider an object with the following wrap points:

If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the wrap polygon at any location:

However, with through wrapping:

end example]

[*Example:* Consider a DrawingML object using tight wrapping and defined as follows:

```
<wp:anchor ... >
...
<wp:wrapTight wrapText="bothSides">
...
</wp:wrapTight>
</wp:anchor>
```

The wrapTight element specifies that text must wrap through this object as defined by its wrap polygon. *end example]*

Attributes	Description
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:wrapTight distL="457200" ... /> </wp:anchor></pre> <p>The distL attribute specifies that the padding distance must be 457200 EMUs or one-half</p>

Attributes	Description
	<p>of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>distR (Distance From Text on Right Edge)</p>	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="451 758 1015 892"><wp:anchor ... > ... <wp:wrapTight distR="457200" ... /> </wp:anchor></pre> <p>The distR attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
<p>wrapText (Text Wrapping Location)</p>	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which must allow text to wrap around its left side only. This setting would be specified as follows:</p> <pre data-bbox="451 1297 1031 1432"><wp:anchor ... > ... <wp:wrapTight wrapText="left" ... /> </wp:anchor></pre> <p>The wrapText attribute value of left specifies that text must only wrap around the left side of the object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapText simple type (§20.4.3.7).</p>

[*Note:* The W3C XML Schema definition of this element's content model (CT_WrapTight) is located in §A.4.4. *end note*]

20.4.2.20 wrapTopAndBottom (Top and Bottom Wrapping)

This element specifies that text shall wrap around the top and bottom of this object, but not its left or right edges.

[*Example*: Consider a DrawingML object using top and bottom wrapping and defined as follows:

```
<wp:anchor ... >
...
<wp:wrapTopAndBottom />
</wp:anchor>
```

The wrapTopAndBottom element specifies that text must wrap around neither side of this object. *end example*]

Attributes	Description
distB (Distance From Text on Bottom Edge)	<p>Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example</i>: Consider a floating DrawingML object which must have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... > ... <wp:wrapTopAndBottom distB="457200" ... /> </wp:anchor></pre> <p>The distB attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>
distT (Distance From Text on Top Edge)	<p>Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example</i>: Consider a floating DrawingML object which must have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</p> <pre><wp:anchor ... ></pre>

Attributes	Description
	<pre>... <wp:wrapTopAndBottom distT="457200" ... /> </wp:anchor></pre> <p>The distT attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§20.4.3.6).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_WrapTopBottom](#)) is located in §A.4.4. *end note*]

20.4.2.21 [bg \(Background Formatting\)](#)

This element defines formatting that can be applied to the background shape of the document. The background shape can hold formatting options just as a normal shape can hold within DrawingML.

20.4.2.22 [bodyPr \(Body Properties\)](#)

This element defines the body properties for the text body within a shape.

Attributes	Description
anchor (Anchor)	<p>Specifies the anchoring position of the txBody within the shape. If this attribute is omitted, then a value of t, or top is implied.</p> <p>The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§20.1.10.59).</p>
anchorCtr (Anchor Center)	<p>Specifies the centering of the text box. The way it works fundamentally is to determine the smallest possible "bounds box" for the text and then to center that "bounds box" accordingly. This is different than paragraph alignment, which aligns the text within the "bounds box" for the text. This flag is compatible with all of the different kinds of anchoring. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bIns (Bottom Inset)	<p>Specifies the bottom inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, a value of 45720 or 0.05 inches is implied.</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
compatLnSpc (Compatible Line)	<p>Specifies that the line spacing for this text body is decided in a simplistic manner using the font scene. If this attribute is omitted, a value of 0 or false is implied.</p>

Attributes	Description
Spacing)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
forceAA (Force Anti-Alias)	<p>Forces the text to be rendered anti-aliased regardless of the font size. Certain fonts can appear grainy around their edges unless they are anti-aliased. Therefore this attribute allows for the specifying of which bodies of text should always be anti-aliased and which ones should not. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fromWordArt (From WordArt)	<p>Specifies that text within this textbox is converted text from a WordArt object. This is more of a backwards compatibility attribute that is useful to the application from a tracking perspective. WordArt was the former way to apply text effects and therefore this attribute is useful in document conversion scenarios. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
horzOverflow (Text Horizontal Overflow)	<p>Determines whether the text can flow out of the bounding box horizontally. This is used to determine what happens in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied.</p> <p>The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§20.1.10.68).</p>
lIns (Left Inset)	<p>Specifies the left inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
numCol (Number of Columns)	<p>Specifies the number of columns of text in the bounding rectangle. When applied to a text run this property takes the width of the bounding box for the text and divides it by the number of columns specified. These columns are then treated as overflow containers in that when the previous column has been filled with text the next column acts as the repository for additional text. When all columns have been filled and text still remains then the overflow properties set for this text body are used and the text is reflowed to make room for additional text. If this attribute is omitted, then a value of 1 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextColumnCount simple type (§20.1.10.64).</p>
rIns (Right Inset)	Specifies the right inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
rot (Rotation)	<p>Specifies the rotation that is being applied to the text within the bounding box. If it not specified, the rotation of the accompanying shape is used. If it is specified, then this is applied independently from the shape. That is the shape can have a rotation applied in addition to the text itself having a rotation applied to it. If this attribute is omitted, then a value of 0, is implied.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>
rtlCol (Columns Right-To-Left)	<p>Specifies whether columns are used in a right-to-left or left-to-right order. The usage of this attribute only sets the column order that is used to determine which column overflow text should go to next. If this attribute is omitted, then a value of 0 or false is implied in which case text starts in the leftmost column and flow to the right.</p> <p>[<i>Note</i>: This attribute in no way determines the direction of text but merely the direction in which multiple columns are used. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
spcCol (Space Between Columns)	<p>Specifies the space between text columns in the text area. This should only apply when there is more than 1 column present. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).</p>
spcFirstLastPara (Paragraph Spacing)	<p>Specifies whether the before and after paragraph spacing defined by the user is to be respected. While the spacing between paragraphs is helpful, it is additionally useful to be able to set a flag as to whether this spacing is to be followed at the edges of the text body, in other words the first and last paragraphs in the text body. More precisely since this is a text body level property it should only effect the before paragraph spacing of the first paragraph and the after paragraph spacing of the last paragraph for a given text body. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tIns (Top Inset)	<p>Specifies the top inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 45720 or 0.05 inches is implied.</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
upright (Text	<p>Specifies whether text should remain upright, regardless of the transform applied to it</p>

Attributes	Description
Upright)	and the accompanying shape transform. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
vert (Vertical Text)	Determines if the text within the given text body should be displayed vertically. If this attribute is omitted, then a value of horz, or no vertical text is implied. The possible values for this attribute are defined by the ST_TextVerticalType simple type (§20.1.10.82).
vertOverflow (Text Vertical Overflow)	Determines whether the text can flow out of the bounding box vertically. This is used to determine what happens in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied. The possible values for this attribute are defined by the ST_TextVertOverflowType simple type (§20.1.10.83).
wrap (Text Wrapping Type)	Specifies the wrapping options to be used for this text body. If this attribute is omitted, then a value of square is implied which wraps the text using the bounding text box. The possible values for this attribute are defined by the ST_TextWrappingType simple type (§20.1.10.84).

20.4.2.23 cNvCnPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties specific to a connector shape. This includes information specifying the shapes to which the connector shape is connected.

[Note: The W3C XML Schema definition of this element's content model (CT_NonVisualConnectorProperties) is located in §A.4.4. *end note*]

20.4.2.24 cNvContentPartPr (Non-Visual Content Part Drawing Properties)

This element specifies the non-visual drawing properties for a content part. This allows for additional information that does not affect the appearance of the content part to be stored.

Attributes	Description
isComment (Is a Comment)	Specifies whether the content part is a comment or an annotation. If true, it is a comment; otherwise, it is a general annotation.
Namespace: http://purl.oclc.org/ooxml/drawingml/main	The default value for this attribute is true. [Example: Consider a WordprocessingDrawingML object defined as follows: <... isComment="false">

Attributes	Description
	<p>The content part shape does not represent a comment. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model (CT_NonVisualContentPartProperties) is located in §A.4.1. *end note*]

20.4.2.25 [cNvFrPr \(Non-Visual Graphic Frame Drawing Properties\)](#)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering.

[*Note:* The W3C XML Schema definition of this element's content model (CT_NonVisualGraphicFrameProperties) is located in §A.4.1. *end note*]

20.4.2.26 [cNvGrpSpPr \(Non-Visual Group Shape Drawing Properties\)](#)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering.

20.4.2.27 [cNvPr \(Non-Visual Drawing Properties\)](#)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example:* Consider the following WordprocessingDrawingML:

```
<wsp>
...
<cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
...
</wsp>
```

end example]

Attributes	Description
descr (Alternative Text for Object)	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications that do not display the current object.
Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example:</i> Consider a DrawingML object defined as follows:</p>

Attributes	Description
	<p><... descr="A picture of a bowl of fruit"></p> <p>The descr attribute contains alternative text that can be used in place of the actual DrawingML object. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [Note: An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[Example: Consider an inline DrawingML object that must be hidden within the document's content. This setting would be specified as follows:</p> <p><... hidden="true" /></p> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <p><... id="10" ... ></p> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
<p>name (Name)</p> <p>Namespace: http://purl.oclc.org</p>	<p>Specifies the name of the object. [Note: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[Example: Consider a DrawingML object defined as follows:</p>

Attributes	Description
g/ooxml/drawing ml/main	<p>< ... name="foo.jpg" ></p> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
title (Title) Namespace: http://purl.oclc.org/ooxml/drawing ml/main	<p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <p><... title="Process Flow Diagram"></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_NonVisualDrawingProps) is located in §A.4.1. *end note]*

20.4.2.28 [cNvSpPr \(Non-Visual Drawing Properties for a Shape\)](#)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with.

Attributes	Description
txBox (Text Box) Namespace: http://purl.oclc.org/ooxml/drawing ml/main	<p>Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.</p> <p>[Note: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

20.4.2.29 [contentPart \(Content Part\)](#)

This element specifies a reference to XML content in a format not defined by ECMA-376. [Note: This part allows the native use of other commonly used interchange formats, such as:

- MathML (<http://www.w3.org/TR/MathML2/>)
- SMIL (<http://www.w3.org/TR/REC-smil/>)
- SVG (<http://www.w3.org/TR/SVG11/>)

end note]

The relationship type of the explicit relationship specified by this element shall be <http://purl.oclc.org/ooxml/officeDocument/relationships/customXml> and have a TargetMode attribute value of Internal. If an application cannot process content of the content type specified by the targeted part, then it should continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

Attributes	Description
bwMode (Black and White Mode)	<p>Specifies how to interpret color information contained within a content part to achieve a color, black and white, or grayscale rendering of the content part. This attribute specifies only the rendering mode applied to the content part; it does not affect how the actual color information is persisted.</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>
<p>id (Relationship to Part)</p> <p>Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships</p>	<p>Specifies the relationship ID to a specified part.</p> <p>The specified relationship shall match the relationship type required by the parent element:</p> <ul style="list-style-type: none"> • http://purl.oclc.org/ooxml/officeDocument/customXml for the contentPart element • http://purl.oclc.org/ooxml/officeDocument/relationships/footer for the footerReference element • http://purl.oclc.org/ooxml/officeDocument/relationships/header for the headerReference element • http://purl.oclc.org/ooxml/officeDocument/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements • http://purl.oclc.org/ooxml/officeDocument/relationships/printerSettings for the printerSettings element • http://purl.oclc.org/ooxml/officeDocument/relationships/hyperlink for the longDesc or hyperlink element <p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre><... r:id="rld10" /></pre> <p>The markup specifies the associated relationship part with relationship ID rld1 contains the corresponding relationship information for the parent XML element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[*Note: The W3C XML Schema definition of this element's content model (CT_WordprocessingContentPart) is located in §A.4.4. end note*]

20.4.2.30 `extLst` (Extension List)

This element specifies an extension list, within which all future extensions are defined within `ext` elements.

The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the existing diagram syntax.

20.4.2.31 `graphicFrame` (Graphical object container)

This element specifies a container for a graphical object in WordprocessingML.

[*Note: The W3C XML Schema definition of this element's content model (CT_GraphicFrame) is located in §A.4.5. end note*]

20.4.2.32 `grpSp` (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

20.4.2.33 `grpSpPr` (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

20.4.2.34 linkedTxbx (Textual contents of shape)

This element specifies the textual contents of a shape that is not the first in the series of shapes for the same text box story.

Attributes	Description
id (ID)	Specifies the identity of the text box story begun by a txbx element. This value shall be unique across a document for each txbx element. The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.
seq (sequence index)	Specifies the position of the owning shape in the given text box story. The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.

[Note: The W3C XML Schema definition of this element's content model (CT_LinkedTextboxInformation) is located in §A.4.4. *end note*]

20.4.2.35 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a shape. These properties include the shape fill, outline, geometry, effects, and 3D orientation.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [Note: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).

20.4.2.36 style (Shape Style)

This element specifies the style information for a shape. This is used to define a shape's appearance in terms of the preset styles defined by the style matrix for the theme.

20.4.2.37 **txbx** (Textual contents of shape)

This element specifies the textual contents of a shape which is the first in the series of shapes for the same text box story. This element shall be present only in the CT_WordprocessingShape element that is the first in a series of CT_WordprocessingShape elements that refer to the same text box story.

Attributes	Description
id (ID)	<p>Specifies the identity of the text box story begun by a txbx element. This value shall be unique across a document for each txbx element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_TextboxInfo) is located in §A.4.4. *end note*]

20.4.2.38 **txbxContent** (Rich Text Box Content Container)

This element specifies that its contents shall be any rich WordprocessingML content, and that this content is the rich contents of a drawing object defined using DrawingML syntax.

If this element contains within any of its contents any of the following content, then the document shall be considered non-conformant:

- References to other WordprocessingML document stories (comments, footnotes, endnotes)
- Vector Markup Language (VML)
- Additional txbxContent elements (as part of nested DrawingML objects)

20.4.2.39 **wgp** (WordprocessingML Shape Group)

This element specifies a shape group in WordprocessingML.

[Note: The W3C XML Schema definition of this element's content model (CT_WordprocessingGroup) is located in §A.4.5. *end note*]

20.4.2.40 **whole** (Whole E2O Formatting)

Formatting that applies to the entire diagram object, and not just the background, includes line and effect properties.

20.4.2.41 **wpc** (WordprocessingML Drawing Canvas)

This element specifies a drawing canvas in WordprocessingML. A drawing canvas is a logical grouping of shapes.

[Note: A Drawing Canvas is typically used to allow grouping of shapes together for bulk operations. *end note*]

[Note: The W3C XML Schema definition of this element's content model (CT_WordprocessingCanvas) is located in §A.4.5. *end note*]

20.4.2.42 [wsp \(WordprocessingML Shape\)](#)

This element specifies a shape in WordprocessingML.

Attributes	Description
normalEastAsianFlow (East Asian Flow)	<p>Specifies that the text flow of the text contents of the shape shall ignore the text flow value specified by the vert attribute of the bodyPr element.</p> <p>If this attribute is set to TRUE then the text flows in the manner specified by the value "tbV" for ST_TextDirection (§17.18.93).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model (CT_ WordprocessingShape) is located in §A.4.5. *end note*]

20.4.2.43 [xfrm \(2D Transform for Graphic Frames\)](#)

This element specifies a two dimensional transform for a Graphic Frame.

Attributes	Description
<p>flipH (Horizontal Flip)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p> <div></div> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>flipV (Vertical Flip)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.</p> <div></div> <p><i>end example</i></p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rot (Rotation) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).

20.4.3 Simple Types

This is the complete list of simple types dedicated to DrawingML – WordprocessingML Drawing.

20.4.3.1 ST_AlignH (Relative Horizontal Alignment Positions)

This simple type contains the possible settings specifying how a DrawingML object can be horizontally aligned relative to the horizontal alignment base defined by the parent element.

[*Example:* Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="page">
    <wp:align>left</wp:align>
  </wp:positionH>
  ...
</wp:anchor>
```

The align element with a value of `left` specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture must be aligned to the left edge of the page.
end example]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center Alignment)	Specifies that the object shall be centered with respect to the horizontal alignment base. <i>[Example: Centered on the page. end example]</i>
inside (Inside)	Specifies that the object shall be inside of the horizontal alignment base.

Enumeration Value	Description
	<i>[Example: Inside the outside margin. end example]</i>
left (Left Alignment)	Specifies that the object shall be left aligned to the horizontal alignment base. <i>[Example: Left aligned relative to the margins. end example]</i>
outside (Outside)	Specifies that the object shall be outside of the horizontal alignment base. <i>[Example: Outside the left margin. end example]</i>
right (Right Alignment)	Specifies that the object shall be right aligned to the horizontal alignment base. <i>[Example: Right aligned relative to the margins. end example]</i>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_AlignH](#)) is located in §A.4.4. end note]

20.4.3.2 [ST_AlignV \(Vertical Alignment Definition\)](#)

This simple type contains the possible settings specifying how a DrawingML object can be vertically aligned relative to the vertical alignment base defined by the parent element.

[Example: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor ... >
  <wp:positionV relativeFrom="page">
    <wp:align>top</wp:align>
  </wp:positionH>
  ...
</wp:anchor>
```

The align element with a value of top specifies that for the vertical positioning defined by the parent element (in this case, positioning relative to the page), the picture must be aligned to the top edge of the page. *end example]*

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottom (Bottom)	Specifies that the object shall be at the bottom of the vertical alignment base. <i>[Example: Bottom of the page. end example]</i>
center (Center Alignment)	Specifies that the object shall be centered with respect to the vertical alignment base. <i>[Example: Centered on the page. end example]</i>
inside (Inside)	Specifies that the object shall be inside of the horizontal alignment base. <i>[Example: Inside the top margin. end example]</i>
outside (Outside)	Specifies that the object shall be outside of the vertical alignment base. <i>[Example: Outside the top margin. end example]</i>
top (Top)	Specifies that the object shall be at the top of the vertical alignment base. <i>[Example: Top of the page. end example]</i>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_AlignV](#)) is located in §A.4.4. end note]

20.4.3.3 [ST_PositionOffset](#) (Absolute Position Offset Value)

This simple type represents a one dimensional distance which shall be used to offset an object from its base positioning location stored in EMUs.

[Example: Consider a DrawingML picture which must be displayed one inch from the top of the page, and one-half of an inch from the left edge of the page. This object would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="page">
    <wp:posOffset>914400</wp:posOffset>
  </wp:positionH>
  <wp:positionV relativeFrom="page">
    <wp:posOffset>457200</wp:posOffset>
  </wp:positionV>
</wp:anchor>
```

The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page in EMUs. *end example*]

This simple type's contents are a restriction of the W3C XML Schema int datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_PositionOffset](#)) is located in §A.4.4. *end note*]

20.4.3.4 ST_RelFromH (Horizontal Relative Positioning)

This simple type specifies the possible values for the base from which the relative horizontal positioning of an object shall be calculated.

[*Example:* Consider a DrawingML picture which must be displayed at the bottom center of the page. This object would be specified as follows:

```
<wp:anchor ... >
  <wp:positionH relativeFrom="page">
    <wp:align>center</wp:align>
  </wp:positionH>
  ...
</wp:anchor>
```

The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
character (Character)	Specifies that the horizontal positioning shall be relative to the position of the anchor within its run content.
column (Column)	Specifies that the horizontal positioning shall be relative to the extents of the column which contains its anchor.
insideMargin (Inside Margin)	Specifies that the horizontal positioning shall be relative to the inside margin of the current page (the left margin on odd pages, right on even pages).
leftMargin (Left Margin)	Specifies that the horizontal positioning shall be relative to the left margin of the page.
margin (Page Margin)	Specifies that the horizontal positioning shall be relative to the page margins.
outsideMargin (Outside Margin)	Specifies that the horizontal positioning shall be relative to the outside margin of the current page (the

Enumeration Value	Description
	right margin on odd pages, left on even pages).
page (Page Edge)	Specifies that the horizontal positioning shall be relative to the edge of the page.
rightMargin (Right Margin)	Specifies that the horizontal positioning shall be relative to the right margin of the page.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_RelFromH](#)) is located in §A.4.4. *end note*]

20.4.3.5 ST_RelFromV (Vertical Relative Positioning)

This simple type specifies the possible values for the base from which the relative vertical positioning of an object shall be calculated.

[*Example:* Consider a DrawingML picture which must be displayed at the bottom center of the page. This object would be specified as follows:

```
<wp:anchor ... >
  <wp:positionV relativeFrom="page">
    <wp:align>bottom</wp:align>
  </wp:positionV>
  ...
</wp:anchor>
```

The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bottomMargin (Bottom Margin)	Specifies that the vertical positioning shall be relative to the bottom margin of the current page.
insideMargin (Inside Margin)	Specifies that the vertical positioning shall be relative to the inside margin of the current page.
line (Line)	Specifies that the vertical positioning shall be relative to the line containing the anchor character.
margin (Page Margin)	Specifies that the vertical positioning shall be relative to the page margins.
outsideMargin (Outside Margin)	Specifies that the vertical positioning shall be relative to the outside margin of the current page.
page (Page Edge)	Specifies that the vertical positioning shall be relative

Enumeration Value	Description
	to the edge of the page.
paragraph (Paragraph)	Specifies that the vertical positioning shall be relative to the paragraph which contains the drawing anchor.
topMargin (Top Margin)	Specifies that the vertical positioning shall be relative to the top margin of the current page.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_RelFromV](#)) is located in §A.4.4. *end note*]

20.4.3.6 ST_WrapDistance (Distance from Text)

This simple type represents a one dimensional distance which shall be used to offset an object from text, stored in EMUs.

[*Example*: Consider a floating DrawingML object which must have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:

```
<wp:anchor ... >
...
  <wp:wrapThrough distL="457200" ... />
</wp:anchor>
```

The distL attribute specifies that the padding distance must be 457200 EMUs or one-half of an inch. *end example*]

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_WrapDistance](#)) is located in §A.4.4. *end note*]

20.4.3.7 ST_WrapText (Text Wrapping Location)

This simple type specifies the possible settings for how text can wrap around the object's left and right sides.

[*Example*: Consider a floating DrawingML object which must allow text to wrap around its left side only. This setting would be specified as follows:

```
<wp:anchor ... >
...
  <wp:wrapTight wrapText="left" ... />
</wp:anchor>
```

The wrapText attribute value of left specifies that text must only wrap around the left side of the object. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bothSides (Both Sides)	Specifies that text shall wrap around both sides of the object.
largest (Largest Side Only)	<p>Specifies that text shall only wrap around the largest side of the object.</p> <p>If the object is positioned in the exact center of the page, the text shall wrap around the side on which text is first encountered:</p> <ul style="list-style-type: none"> • If the first line of text intersecting the object is using left-to-right reading order, the text shall wrap to the object's left. • If the first line of text intersecting the object is using right-to-left reading order, the text shall wrap to the object's right.
left (Left Side Only)	Specifies that text shall only wrap around the left side of the object.
right (Right Side Only)	Specifies that text shall only wrap around the right side of the object.

[Note: The W3C XML Schema definition of this simple type's content model (ST_WrapText) is located in §A.4.4. *end note*]

20.5 DrawingML - SpreadsheetML Drawing

Within a SpreadsheetML document, it is possible to include graphical DrawingML objects:

- Pictures (§20.2)
- Locked Canvases (§20.3)
- Diagrams (§21.4)
- Charts (§21.2)

When these objects are present in a spreadsheet document, it is necessary to include information which specifies how the objects shall be positioned relative to the parent worksheet. [*Example: Whether the object is anchored to a specific row, whether it resizes with cells, and so on. end example*]

The SpreadsheetML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a spreadsheet document.

[*Example: Consider a DrawingML picture which must be anchored to a specific cell for its top left and bottom right corners, resizing as those cells are relocated. This object would be specified as follows:*

```
<xdr:twoCellAnchor>
  <xdr:from>
    ...
  </xdr:from>
  <xdr:to>
    ...
  </xdr:to>
  <xdr:graphicFrame>
    ...
    <a:graphic>
      <a:graphicData
        uri="http://purl.oclc.org/ooxml/drawingml/diagram">
        <dgm:relIds xmlns:dgm="..." xmlns:r="..." r:dm="rId1" r:lo="rId2"
          r:qs="rId3" r:cs="rId4" />
        </a:graphicData>
      </a:graphic>
    </xdr:graphicFrame>
  </xdr:twoCellAnchor>
```

The twoCellAnchor element (§20.5.2.33) specifies that this object anchored to the cells specified by the to (§20.5.2.32) and from (§20.5.2.15) elements. *end example*

20.5.1 Table of Contents

This subclause is informative.

20.5.2 Elements 3143

20.5.2.1	absoluteAnchor (Absolute Anchor Shape Size)	3143
20.5.2.2	blipFill (Picture Fill)	3143
20.5.2.3	clientData (Client Data)	3146
20.5.2.4	cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties).....	3146
20.5.2.5	cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties).....	3146
20.5.2.6	cNvGrpSpPr (Non-Visual Group Shape Drawing Properties).....	3146
20.5.2.7	cNvPicPr (Non-Visual Picture Drawing Properties)	3147
20.5.2.8	cNvPr (Non-Visual Drawing Properties)	3148
20.5.2.9	cNvSpPr (Connection Non-Visual Shape Properties).....	3150
20.5.2.10	col (Column))	3150

End of informative text.

20.5.2 Elements

The following elements define the contents of the Spreadsheet Drawing namespace:

20.5.2.1 absoluteAnchor (Absolute Anchor Shape Size)

This element is used as an anchor placeholder for a shape or group of shapes. It anchors the object in the same position relative to sheet position and its extents are in EMU units.

[Note: The W3C XML Schema definition of this element's content model ([CT_AbsoluteAnchor](#)) is located in §A.4.5. *end note*]

20.5.2.2 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<xdr:pic>
  ..
```

```

<xdr:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</xdr:blipFill>
..
</xdr:pic>

```

The above picture object is shown as an example of this fill type. *end example*]

[*Example:* Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```

<xdr:pic>
..
<xdr:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</xdr:blipFill>
<xdr:spPr>
  <a:gradFill>
    <a:gsLst>
      <a:gs pos="0">
        <a:schemeClr val="tx2">
          <a:shade val="50000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="39999">
        <a:schemeClr val="tx2">

```

```

        <a:tint val="20000"/>
    </a:schemeClr>
</a:gs>
<a:gs pos="70000">
    <a:srgbClr val="C4D6EB"/>
</a:gs>
<a:gs pos="100000">
    <a:schemeClr val="bg1"/>
</a:gs>
</a:gsLst>
</a:gradFill>
</xdr:spPr>
..
</xdr:pic>

```

The above picture object is shown as an example of this double fill type. *end example*]

Attributes	Description
dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation. The possible values for this attribute are defined by the W3C XML Schema boolean

Attributes	Description
g/ooxml/drawing ml/main	datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BlipFillProperties](#)) is located in §A.4.1. *end note*]

20.5.2.3 [clientData \(Client Data\)](#)

This element is used to set certain properties related to a drawing element on the client spreadsheet application.

Attributes	Description
fLocksWithSheet (Locks With Sheet Flag)	This attribute indicates whether to disable selection on drawing elements when the sheet is protected. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
fPrintsWithSheet (Prints With Sheet Flag)	This attribute indicates whether to print drawing elements when printing the sheet. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AnchorClientData](#)) is located in §A.4.5. *end note*]

20.5.2.4 [cNvCxnSpPr \(Non-Visual Connector Shape Drawing Properties\)](#)

This element specifies the non-visual properties for a connector shape. These are the set of properties on a shape which do not affect its display within a spreadsheet.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualConnectorProperties](#)) is located in §A.4.1. *end note*]

20.5.2.5 [cNvGraphicFramePr \(Non-Visual Graphic Frame Drawing Properties\)](#)

This element specifies the non-visual properties for a single graphical object frame within a spreadsheet. These are the set of properties of a frame which do not affect its display within a spreadsheet.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualGraphicFrameProperties](#)) is located in §A.4.1. *end note*]

20.5.2.6 [cNvGrpSpPr \(Non-Visual Group Shape Drawing Properties\)](#)

This element specifies the non-visual properties of a hierarchical grouping of shapes, graphical object frames, and child groups. These are the set of properties of a group which do not affect its display within a spreadsheet.

[Note: The W3C XML Schema definition of this element's content model ([CT_NonVisualGroupDrawingShapeProps](#)) is located in §A.4.1. *end note*]

20.5.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element describes the non-visual properties of a picture within a spreadsheet. These are the set of properties of a picture which do not affect its display within a spreadsheet.

[Example: Consider the following SpreadsheetDrawingML.

```
<xdr:pic>
  ..
  <xdr:nvPicPr>
    <xdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <xdr:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </xdr:cNvPicPr>
    <xdr:nvPr/>
  </xdr:nvPicPr>
  ..
</xdr:pic>
```

The above example defines some non-visual picture drawing properties for the inserted picture. *end example*]

Attributes	Description
preferRelativeResize (Relative Resize Preferred)	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.
Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>[Example: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_NonVisualPictureProperties](#)) is located in §A.4.1. *end note*]

20.5.2.8 cNvPr (Non-Visual Drawing Properties)

This element specifies the set of non-visual properties for the parent element. These properties specify all the data about the parent which does not affect its display within the spreadsheet.

[*Example:* Consider the following SpreadSheetDrawingML.

```
<xdr:pic>
  ..
  <xdr:nvPicPr>
    <xdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </xdr:nvPicPr>
  ..
</xdr:pic>
```

The above example defines some non-visual drawing properties for the inserted picture. *end example*]

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example:</i> Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note:</i> An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example:</i> Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><... hidden="true" /></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p>
<p>name (Name)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the name of the object. [Note: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>< ... name="foo.jpg" ></pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
<p>title (Title)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre><... title="Process Flow Diagram"></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

20.5.2.9 **cNvSpPr (Connection Non-Visual Shape Properties)**

This element specifies the set of non-visual properties for a connection shape. These properties specify all data about the connection shape which do not affect its display within a spreadsheet.

[*Example:* Consider the shape that has a shape lock applied to it.

```
<xdr:sp>
  <xdr:nvSpPr>
    <xdr:cNvPr id="2" name="Rectangle 1"/>
    <xdr:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </xdr:cNvSpPr>
  </xdr:nvSpPr>
  ..
</xdr:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

Attributes	Description
txBox (Text Box) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [<i>Note:</i> Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_NonVisualDrawingShapeProps](#)) is located in §A.4.1. *end note*]

20.5.2.10 **col (Column))**

This element specifies the column that is used within the from and to elements to specify anchoring information for a shape within a spreadsheet

The possible values for this element are defined by the ST_ColID simple type (§20.5.3.1).

[*Note:* The W3C XML Schema definition of this element’s content model ([ST_ColID](#)) is located in §A.4.5. *end note*]

20.5.2.11 colOff (Column Offset)

This element is used to specify the column offset within a cell. The units for which this attribute is specified in reside within the simple type definition referenced below.

The possible values for this element are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note:* The W3C XML Schema definition of this element's content model (ST_Coordinate) is located in §A.4.1.
end note]

20.5.2.12 contentPart (Content Part)

This element specifies a reference to XML content in a format not defined by ECMA-376. [*Note:* This part allows the native use of other commonly used interchange formats, such as:

- MathML (<http://www.w3.org/TR/MathML2/>)
- SMIL (<http://www.w3.org/TR/REC-smil/>)
- SVG (<http://www.w3.org/TR/SVG11/>)

end note]

The relationship type of the explicit relationship specified by this element shall be <http://purl.oclc.org/ooxml/officeDocument/relationships/customXml> and have a TargetMode attribute value of Internal. If an application cannot process content of the content type specified by the targeted part, then it should continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[*Example:* Consider a SpreadsheetML document which includes the following SVG markup in a part named `svg1.xml`:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
"http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">

  </g>

```

```
</g>
<text id="revision" x="10" y="340" font-size="40" stroke="none"
fill="black">$Revision: 1.6 $</text>
<rect id="test-frame" x="1" y="1" width="478" height="358" fill="none"
stroke="#000000"/>
</svg>
```

The SpreadsheetML Drawing part would reference this content as follows:

```
<wsDr>
  <twoCellAnchor>
    <from>
      <col>3</col>
      <colOff>152400</colOff>
      <row>5</row>
      <rowOff>123825</rowOff>
    </from>
    <to>
      <col>8</col>
      <colOff>266700</colOff>
      <row>22</row>
      <rowOff>38100</rowOff>
    </to>
  </twoCellAnchor>
  <contentPart r:id="svg1"/>
</wsDr>
```

The contentPart element specifies that the SVG markup targeted by the relationship with an ID of svg1 is part of the SpreadsheetML document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships ... >
...
  <Relationship Id="svg1" TargetMode="Internal"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/customXml"
Target="svg1.xml" />
...
</Relationships>
```

The corresponding relationship part item shows that the file to be imported is named `svg1.xml`. *end example*]

Attributes	Description
id (Relationship to Part)	Specifies the relationship ID to a content part. [Example: Consider an XML element which has the following id attribute:

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p><code><... r:id="rId1" /></code></p> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Rel](#)) is located in §A.4.5. *end note*]

20.5.2.13 cxnSp (Connection Shape)

This element specifies the properties for a connection shape drawing element. A connection shape is a line, etc. that connects two other shapes in this drawing.

Attributes	Description
fPublished (Publish to Server Flag)	<p>This attribute indicates whether the shape shall be published with the worksheet when sent to the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the object. <i>[Example: A macro script, add-in function, and so on. end example]</i></p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p><i>[Example:</i></p> <p><code>< ... macro="DoWork()" /></code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Connector](#)) is located in §A.4.5. *end note*]

20.5.2.14 ext (Shape Extent)

This element describes the length and width properties for how far a drawing element should extend for.

Attributes	Description
cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>
cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

20.5.2.15 from (Starting Anchor Point)

This element specifies the first anchor point for the drawing element. This is used to anchor the top and left sides of the shape within the spreadsheet. That is when the cell that is specified in the from element is adjusted, the shape is also adjusted.

[*Example:* Consider the following SpreadsheetDrawingML

```
<xdr:twoCellAnchor>
  <xdr:from>
    <xdr:col>3</xdr:col>
    <xdr:colOff>447675</xdr:colOff>
    <xdr:row>8</xdr:row>
    <xdr:rowOff>28575</xdr:rowOff>
  </xdr:from>
  <xdr:to>
```

```

<xdr:col>5</xdr:col>
<xdr:colOff>466725</xdr:colOff>
<xdr:row>14</xdr:row>
<xdr:rowOff>9525</xdr:rowOff>
</xdr:to>
<xdr:sp macro="" textlink="">
...
</xdr:sp>
<xdr:clientData/>
</xdr:twoCellAnchor>

```

The above example shows the first anchor point being specified via the from element. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_Marker](#)) is located in §A.4.5. *end note*]

20.5.2.16 [graphicFrame](#) (Graphic Frame)

This element describes a single graphical object frame for a spreadsheet which contains a graphical object.

Attributes	Description
fPublished (Publish to Server Flag)	<p>This attribute indicates whether the shape shall be published with the worksheet when sent to the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
macro (Reference To Custom Function)	<p>This element specifies the custom function associated with the object. [<i>Example: A macro script, add-in function, and so on. end example</i>]</p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p>[<i>Example:</i></p> <pre>< ... macro="DoWork()" /></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GraphicalObjectFrame](#)) is located in §A.4.5. *end note*]

20.5.2.17 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example:* Consider the following group shape.

```
<xdr:grpSp>
  <xdr:nvGrpSpPr>
    <xdr:cNvPr id="10" name="Group 9"/>
    <xdr:cNvGrpSpPr/>
    <xdr:nvPr/>
  </xdr:nvGrpSpPr>
  <xdr:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
    </a:xfrm>
  </xdr:grpSpPr>
  <xdr:sp>
    ..
  </xdr:sp>
  <xdr:sp>
    ..
  </xdr:sp>
  <xdr:sp>
    ..
  </xdr:sp>
</xdr:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GroupShape](#)) is located in §A.4.5. *end note*]

20.5.2.18 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShapeProperties](#)) is located in §A.4.1. *end note*]

20.5.2.19 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ConnectorNonVisual](#)) is located in §A.4.5. *end note*]

20.5.2.20 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GraphicalObjectFrameNonVisual](#)) is located in §A.4.5. *end note*]

20.5.2.21 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group

shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GroupShapeNonVisual](#)) is located in §A.4.5. *end note*]

20.5.2.22 [nvPicPr \(Non-Visual Properties for a Picture\)](#)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example:* Consider the following SpreadsheetDrawingML.

```
<xdr:pic>
  ..
  <xdr:nvPicPr>
    ..
  </xdr:nvPicPr>
  ..
</xdr:pic>
```

The above example shows the defining of non-visual picture properties. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PictureNonVisual](#)) is located in §A.4.5. *end note*]

20.5.2.23 [nvSpPr \(Non-Visual Properties for a Shape\)](#)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ShapeNonVisual](#)) is located in §A.4.5. *end note*]

20.5.2.24 [oneCellAnchor \(One Cell Anchor Shape Size\)](#)

This element specifies a one cell anchor placeholder for a group, a shape, or a drawing element. It moves with the cell and its extents is in EMU units.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OneCellAnchor](#)) is located in §A.4.5. *end note*]

20.5.2.25 [pic \(Picture\)](#)

This element specifies the existence of a picture object within the spreadsheet.

[*Example:* Consider the following SpreadsheetDrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<xdr:pic>
  <xdr:nvPicPr>
    <xdr:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <xdr:cNvPicPr>
      <a:picLocks noChangeAspect="1" />
    </xdr:cNvPicPr>
    <xdr:nvPr />
  </xdr:nvPicPr>
  <xdr:blipFill>
    ...
  </xdr:blipFill>
  <xdr:spPr>
    ...
  </xdr:spPr>
</xdr:pic>
```

end example]

Attributes	Description
fPublished (Publish to Server Flag)	<p>This attribute indicates whether the shape shall be published with the worksheet when sent to the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
macro (Reference To Custom Function)	<p>This element specifies the custom function associated with the object. [<i>Example:</i> A macro script, add-in function, and so on. <i>end example]</i></p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p>[<i>Example:</i></p> <pre>< ... macro="DoWork()" /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Picture](#)) is located in §A.4.5. *end note]*

20.5.2.26 pos (Position)

This element describes the position of a drawing element within a spreadsheet.

Attributes	Description
x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>
y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.5.2.27 row (Row)

This element specifies the row that is used within the from and to elements to specify anchoring information for a shape within a spreadsheet.

The possible values for this element are defined by the ST_RowID simple type (§20.5.3.3).

[*Note:* The W3C XML Schema definition of this element's content model ([ST_RowID](#)) is located in §A.4.5. *end note*]

20.5.2.28 rowOff (Row Offset)

This element is used to specify the row offset within a cell. The units for which this attribute is specified reside within the simple type definition referenced below.

The possible values for this element are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note:* The W3C XML Schema definition of this element's content model ([ST_Coordinate](#)) is located in §A.4.1. *end note*]

20.5.2.29 [sp](#) (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the SpreadsheetDrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

Attributes	Description
fLocksText (Lock Text Flag)	<p>This attribute indicates whether to allow text editing within this drawing object when the parent worksheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fPublished (Publish to Server Flag)	<p>This attribute indicates whether the shape shall be published with the worksheet when sent to the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the object. [<i>Example:</i> A macro script, add-in function, and so on. <i>end example</i>]</p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p>[<i>Example:</i></p> <pre>< ... macro="DoWork()" /></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
textlink (Text Link)	<p>This attribute specifies a formula linking to spreadsheet cell data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Shape](#)) is located in §A.4.5. *end note*]

20.5.2.30 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a special shape such as a connector shape or picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe additional object-specific properties within a document. This allows for these shapes to have both the properties of a shape as well as specific properties that are unique to only them.

Attributes	Description
bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ShapeProperties](#)) is located in §A.4.1. *end note*]

20.5.2.31 style (Shape Style)

The element specifies the style that is applied to a shape and the corresponding references for each of the style components such as lines and fills.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ShapeStyle](#)) is located in §A.4.1. *end note*]

20.5.2.32 to (Ending Anchor Point)

This element specifies the second anchor point for the drawing element. This is used to anchor the bottom and right sides of the shape within the spreadsheet. That is when the cell that is specified in the to element is adjusted, the shape is also adjusted.

[*Example*: Consider the following SpreadsheetDrawingML

```
<xdr:twoCellAnchor>
  <xdr:from>
    <xdr:col>3</xdr:col>
    <xdr:colOff>447675</xdr:colOff>
    <xdr:row>8</xdr:row>
    <xdr:rowOff>28575</xdr:rowOff>
```

```

</xdr:from>
<xdr:to>
  <xdr:col>5</xdr:col>
  <xdr:colOff>466725</xdr:colOff>
  <xdr:row>14</xdr:row>
  <xdr:rowOff>9525</xdr:rowOff>
</xdr:to>
<xdr:sp macro="" textlink="">
...
</xdr:sp>
<xdr:clientData/>
</xdr:twoCellAnchor>

```

The above example shows the second anchor point being specified via the to element. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Marker](#)) is located in §A.4.5. *end note*]

20.5.2.33 twoCellAnchor (Two Cell Anchor Shape Size)

This element specifies a two cell anchor placeholder for a group, a shape, or a drawing element. It moves with cells and its extents are in EMU units.

Attributes	Description
editAs (Positioning and Resizing Behaviors)	<p>Specifies how the DrawingML contents shall be moved and/or resized when the rows and columns between its start and ending anchor (the from and to child elements) are resized, or have additional rows/columns inserted within them, or additional row/columns are added before them. The behaviors are discussed in the simple type referenced below.</p> <p>If this attribute is omitted, then its default value shall be assumed to be twoCell.</p> <p>[<i>Example:</i> Consider a drawing defined as follows:</p> <pre> <ws:twoCellAnchor editAs="absolute"> ... </ws:twoCellAnchor> </pre> <p>The editAs attribute has a value of absolute, which specifies that the sizing of this object must not change, instead the anchor locations should be moved as needed to maintain the same size and position. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_EditAs simple type (§20.5.3.2).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TwoCellAnchor](#)) is located in §A.4.5. *end note*]

20.5.2.34 **txBody (Shape Text Body)**

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TextBody](#)) is located in §A.4.1. *end note*]

20.5.2.35 **wsDr (Worksheet Drawing)**

This element specifies all drawing objects within the worksheet. It acts much like the spTree element within the DrawingML framework. Allowing for the specification of all shapes for a given part of a document, in this case a single Worksheet.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Drawing](#)) is located in §A.4.5. *end note*]

20.5.2.36 **xfrm (2D Transform for Graphic Frames)**

This element specifies a two dimensional transform for a Graphic Frame.

Attributes	Description
<p>flipH (Horizontal Flip)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box.</p> <p>[<i>Example</i>: The following illustrates the effect of a horizontal flip.</p> <div></div> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>flipV (Vertical Flip)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p>	<p>Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[<i>Example</i>: The following illustrates the effect of a vertical flip.</p>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rot (Rotation) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Transform2D](#)) is located in §A.4.1. *end note]*

20.5.3 Simple Types

This is the complete list of simple types dedicated to DrawingML – SpreadsheetML Drawing.

20.5.3.1 ST_ColID (Column ID)

This simple type specifies a column identification. The numerical value used for the column id should be non-negative and never exceed the number of total columns within the spreadsheet document.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ColID](#)) is located in §A.4.5. *end note]*

20.5.3.2 ST_EditAs (Resizing Behaviors)

This simple type specifies all possible settings for how DrawingML contents shall be resized when the rows and columns between its start and ending anchor (the from and to child elements) are resized, or have additional rows/columns inserted within them.

[Example: Consider a drawing defined as follows:

```
<ws:twoCellAnchor editAs="absolute">
...
</ws:twoCellAnchor>
```

The editAs attribute has a value of absolute, which specifies that the sizing of this object must not change, instead the anchor locations should be moved as needed to maintain the same size. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
absolute (Do Not Move or Resize With Underlying Rows/Columns)	<p>Specifies that the current start and end positions shall be maintained with respect to the distances from the absolute start point of the worksheet.</p> <p>If additional rows/columns are added before the drawing, the drawing shall move its anchors as needed to maintain this same absolute position.</p>
oneCell (Move With Cells but Do Not Resize)	<p>Specifies that the current drawing shall move with its row and column (i.e. the object is anchored to the actual from row and column), but that the size shall remain absolute.</p> <p>If additional rows/columns are added between the from and to locations of the drawing, the drawing shall move its to anchors as needed to maintain this same absolute size.</p>
twoCell (Move and Resize With Anchor Cells)	<p>Specifies that the current drawing shall move and resize to maintain its row and column anchors (i.e. the object is anchored to the actual from and to row and column).</p>

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_EditAs](#)) is located in §A.4.5. *end note*]

20.5.3.3 ST_RowID (Row ID)

This simple type specifies a row identification. The numerical value used for the row id should be non-negative and never exceed the number of total rows within the spreadsheet document.

This simple type's contents are a restriction of the W3C XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_RowID) is located in §A.4.5. *end note*]

21. DrawingML - Components Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising DrawingML content, which can be used within the contents of WordprocessingML, SpreadsheetML, or PresentationML documents.

This portion of DrawingML describes components built on top of the previously defined framework to create charts, diagrams, etc..

21.1 DrawingML - Main

The following parts of the DrawingML Main namespace define additional base constructs for all kinds of DrawingML objects (e.g., paragraphs, text, tables, etc.).

21.1.1 Table of Contents

This subclause is informative.

21.1.2 Paragraphs and Rich Formatting	3172
21.1.2.1 Body Formatting.....	3172
21.1.2.1.1 bodyPr (Body Properties)	3173
21.1.2.1.2 noAutofit (No AutoFit).....	3181
21.1.2.1.3 normAutofit (Normal AutoFit).....	3182
21.1.2.1.4 spAutoFit (Shape AutoFit)	3183
21.1.2.2 Paragraph Formatting.....	3184
21.1.2.2.1 br (Text Line Break).....	3185
21.1.2.2.2 defPPr (Default Paragraph Style).....	3186

End of informative text.

21.1.2 Paragraphs and Rich Formatting

The Paragraphs and Rich Formatting portion of the DrawingML framework stores text and related formatting information for a text body contained within a shape. Formatting for text within a shape can be broken down into three levels of precision, namely body, paragraph, and run formatting properties.

21.1.2.1 Body Formatting

Being the highest level of formatting available within a shape, the body properties allow for the manipulation of the text area as a whole. This means that all paragraphs and runs of text for the shape in question would be encompassed within here and, therefore, follow the text body style defined here.

[*Example:* Consider a shape that has three paragraphs within it, each with a different sized text. If this shape is resized to be smaller, then the text no longer fits the same way within the shape. Thus, we see that to maintain visual quality the size must be changed.

Rather than try to change each of the paragraphs to a smaller font size to fit in the shape, just use a body-level format property such as the normAutofit. This applies to all text within the shape and scale the text by a certain percentage in order to fit within the shape.

```
<p:txBody>
  <a:bodyPr>
    <a:normAutofit fontScale="20.000%" lnSpcReduction="20.000%"/>
  </a:bodyPr>
  ...
  <a:p>
  ...
</a:p>
<a:p>
  ...
</a:p>
<a:p>
  ...
</a:p>
</p:txBody>
```

end example]

21.1.2.1.1 bodyPr (Body Properties)

This element defines the body properties for the text body within a shape.

[*Example:* Consider a shape with a text body that has some formatting properties associated with it. For the formatting of text body properties, the bodyPr element should be used as follows:

```
<p:sp>
...
<p:txBody>
  <a:bodyPr>
    (text body properties)
  </a:bodyPr>
...
</p:txBody>
</p:sp>
```

end example]

Attributes	Description
anchor (Anchor)	<p>Specifies the anchoring position of the txBody within the shape. If this attribute is omitted, then a value of t, or top is implied.</p> <p>[<i>Example:</i> Consider the following DrawingML:</p> <pre><p:txBody> <a:bodyPr anchor="ctr" ... /> ... </p:txBody></pre> <p>Here the text is vertically aligned in the center of the shape within which it is contained. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§20.1.10.59).</p>
anchorCtr (Anchor Center)	<p>Specifies the centering of the text box. The way it works fundamentally is to determine the smallest possible "bounds box" for the text and then to center that "bounds box" accordingly. This is different than paragraph alignment, which aligns the text within the "bounds box" for the text. This flag is compatible with all of the different kinds of anchoring. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>[<i>Example:</i> The text within this shape has been both vertically centered with the anchor attribute and horizontally centered with the anchorCtr attribute.</p> <pre><p:txBody> <a:bodyPr anchor="ctr" anchorCtr="1" ... /> ... </pre>

Attributes	Description
	<p><code></p:txBody></code> <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bIns (Bottom Inset)	<p>Specifies the bottom inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, a value of 45720 or 0.05 inches is implied.</p> <p>[Example: Consider the following DrawingML:</p> <pre> <p:txBody> <a:bodyPr lIns="91440" tIns="91440" rIns="91440" bIns="91440" ... /> ... </p:txBody> </pre> <p>The text box having the above body properties has inset margins of 91440 or 0.1 inches on all four sides. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
compatLnSpc (Compatible Line Spacing)	<p>Specifies that the line spacing for this text body is decided in a simplistic manner using the font scene. If this attribute is omitted, a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
forceAA (Force Anti-Alias)	<p>Forces the text to be rendered anti-aliased regardless of the font size. Certain fonts can appear grainy around their edges unless they are anti-aliased. Therefore this attribute allows for the specifying of which bodies of text should always be anti-aliased and which ones should not. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fromWordArt (From WordArt)	<p>Specifies that text within this textbox is converted text from a WordArt object. This is more of a backwards compatibility attribute that is useful to the application from a tracking perspective. WordArt was the former way to apply text effects and therefore this attribute is useful in document conversion scenarios. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>[Example: Consider the following DrawingML:</p> <pre> <p:txBody> <a:bodyPr wrap="none" fromWordArt="1" ... /> ... </p:txBody> </pre>

Attributes	Description
	<p><i>end example]</i></p> <p>Because of the presence of the fromWordArt attribute the text within this shape can be mapped back to the corresponding WordArt during document conversion. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>horzOverflow (Text Horizontal Overflow)</p>	<p>Determines whether the text can flow out of the bounding box horizontally. This is used to determine what happens in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied.</p> <p>[<i>Example:</i> Consider the case where we have multiply paragraphs within a shape and the second is greater in length and causes text to flow outside the shape. By applying the clip value of the horzOverflow attribute as a body property this overflowing text now is cut off instead of extending beyond the bounds of the shape.</p> <pre> <p:txBody> <a:bodyPr horzOverflow="clip" ... /> ... <a:p> ... (Some text) </a:p> <a:p> ... (Some more text) </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§20.1.10.68).</p>
<p>lIns (Left Inset)</p>	<p>Specifies the left inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.</p> <p>[<i>Example:</i> Consider the following DrawingML:</p> <pre> <p:txBody> <a:bodyPr lIns="91440" tIns="91440" rIns="91440" bIns="91440" ... /> ... </p:txBody> </pre>

Attributes	Description
	<p>The text box having the above body properties has inset margins of 91440 or 0.1 inches on all four sides. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
numCol (Number of Columns)	<p>Specifies the number of columns of text in the bounding rectangle. When applied to a text run this property takes the width of the bounding box for the text and divides it by the number of columns specified. These columns are then treated as overflow containers in that when the previous column has been filled with text the next column acts as the repository for additional text. When all columns have been filled and text still remains then the overflow properties set for this text body are used and the text is reflowed to make room for additional text. If this attribute is omitted, then a value of 1 is implied.</p> <p>[<i>Example</i>: Consider the case where a text area would need to be split up into four separate columns. Then simply specifying one paragraph with one run of text is enough to describe four columns of text here.</p> <pre> <p:txBody> <a:bodyPr numCol="4" ... /> <a:p> <a:r> ... (Some text) </a:r> </a:p> </p:txBody> </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextColumnCount simple type (§20.1.10.64).</p>
rIns (Right Inset)	<p>Specifies the right inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.</p> <p>[<i>Example</i>: Consider the following DrawingML:</p> <pre> <p:txBody> <a:bodyPr lIns="91440" tIns="91440" rIns="91440" bIns="91440" ... /> ... </p:txBody> </pre> <p>The text box having the above body properties has inset margins of 91440 or 0.1 inches</p>

Attributes	Description
	<p>on all four sides. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
rot (Rotation)	<p>Specifies the rotation that is being applied to the text within the bounding box. If it not specified, the rotation of the accompanying shape is used. If it is specified, then this is applied independently from the shape. That is the shape can have a rotation applied in addition to the text itself having a rotation applied to it. If this attribute is omitted, then a value of 0, is implied.</p> <p>[<i>Example</i>: Consider the case where a shape has a rotation of 5400000, or 90 degrees clockwise applied to it. In addition to this, the text body itself has a rotation of -5400000, or 90 degrees counter-clockwise applied to it. Then the resulting shape would appear to be rotated but the text within it would appear as though it had not been rotated at all. The DrawingML specifying this would look like the following:</p> <pre> <p:sp> <p:spPr> <a:xfrm rot="5400000"> ... </a:xfrm> </p:spPr> ... <p:txBody> <a:bodyPr rot="-5400000" ... /> ... (Some text) ... </p:txBody> </p:sp> </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p>
rtlCol (Columns Right-To-Left)	<p>Specifies whether columns are used in a right-to-left or left-to-right order. The usage of this attribute only sets the column order that is used to determine which column overflow text should go to next. If this attribute is omitted, then a value of 0 or false is implied in which case text starts in the leftmost column and flow to the right.</p> <p>[<i>Note</i>: This attribute in no way determines the direction of text but merely the direction in which multiple columns are used. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
spcCol (Space	Specifies the space between text columns in the text area. This should only apply when

Attributes	Description
Between Columns)	<p>there is more than 1 column present. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42).</p>
spcFirstLastPara (Paragraph Spacing)	<p>Specifies whether the before and after paragraph spacing defined by the user is to be respected. While the spacing between paragraphs is helpful, it is additionally useful to be able to set a flag as to whether this spacing is to be followed at the edges of the text body, in other words the first and last paragraphs in the text body. More precisely since this is a text body level property it should only effect the before paragraph spacing of the first paragraph and the after paragraph spacing of the last paragraph for a given text body. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>[Example: Consider the case where spacing has been defined between multiple paragraphs within a text body using the spcBef and spcAft paragraph spacing attributes. For this text body however the user would like to not have this followed for the edge paragraphs and thus we have the following DrawingML.</p> <pre> <p:txBody> <a:bodyPr spcFirstLastPara="0" ... /> ... <a:p> <a:pPr> <a:spcBef> <a:spcPts val="1800"/> </a:spcBef> <a:spcAft> <a:spcPts val="600"/> </a:spcAft> </a:pPr> ... (Some text) </a:p> <a:p> <a:pPr> <a:spcBef> <a:spcPts val="1800"/> </a:spcBef> <a:spcAft> <a:spcPts val="600"/> </a:spcAft> </a:pPr> ... (Some text) </a:p> </pre>

Attributes	Description
	<p>... </p:txBody> <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tIns (Top Inset)	<p>Specifies the top inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 45720 or 0.05 inches is implied.</p> <p>[<i>Example:</i> Consider the following DrawingML:</p> <pre><p:txBody> <a:bodyPr lIns="91440" tIns="91440" rIns="91440" bIns="91440" ... /> ... </p:txBody></pre> <p>The text box having the above body properties has inset margins of 91440 or 0.1 inches on all four sides. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
upright (Text Upright)	<p>Specifies whether text should remain upright, regardless of the transform applied to it and the accompanying shape transform. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>[<i>Example:</i> Consider text that has been rotated within the text body but has the upright flag set.</p> <pre><p:txBody> <a:bodyPr upright="1" rot="5400000" .../> ... (Some text) ... </p:txBody></pre> <p>This text appears as though no transform has been applied to it. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
vert (Vertical Text)	<p>Determines if the text within the given text body should be displayed vertically. If this attribute is omitted, then a value of horz, or no vertical text is implied.</p> <p>[<i>Example:</i> Consider the case where the user needs to display text that appears vertical and has a right to left flow with respect to its columns.</p>

Attributes	Description
	<pre> <p:txBody> <a:bodyPr vert="wordArtVertRtl" ... /> ... <a:p> ... <a:t>This is</a:t> ... </a:p> <a:p> ... <a:t>some text.</a:t> ... </a:p> </p:txBody> </pre> <p>In the above sample DrawingML there are two paragraphs denoting a separation between the text otherwise which are known as either a line or paragraph break. Because wordArtVertRtl is used here this text is not only displayed in a stacked manner flowing from top to bottom but also have the first paragraph be displayed to the right of the second. This is because it is both vertical text and right to left. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TextVerticalType simple type (§20.1.10.82).</p>
vertOverflow (Text Vertical Overflow)	<p>Determines whether the text can flow out of the bounding box vertically. This is used to determine what happens in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied.</p> <p>[<i>Example:</i> Consider the case where we have multiply paragraphs within a shape and the second causes text to flow outside the shape. By applying the clip value of the vertOverflow attribute as a body property this overflowing text is now cut off instead of extending beyond the bounds of the shape.</p> <pre> <p:txBody> <a:bodyPr vertOverflow="clip" ... /> ... <a:p> ... (Some text) ... </a:p> <a:p> ... (Some longer text) ... </a:p> </pre>

Attributes	Description
	<p data-bbox="456 247 630 279"></p:txBody></p> <p data-bbox="415 317 574 348"><i>end example]</i></p> <p data-bbox="415 390 1409 457">The possible values for this attribute are defined by the ST_TextVertOverflowType simple type (§20.1.10.83).</p>
wrap (Text Wrapping Type)	<p data-bbox="415 472 1446 539">Specifies the wrapping options to be used for this text body. If this attribute is omitted, then a value of square is implied which wraps the text using the bounding text box.</p> <p data-bbox="415 581 1446 648">The possible values for this attribute are defined by the ST_TextWrappingType simple type (§20.1.10.84).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextBodyProperties](#)) is located in §A.4.1. *end note*]

21.1.2.1.2 noAutofit (No AutoFit)

This element specifies that text within the text body should not be auto-fit to the bounding box. Auto-fitting is when text within a text box is scaled in order to remain inside the text box. If this element is omitted, then noAutofit or auto-fit off is implied.

[Example: Consider a text box where the user wishes to have the text extend outside the bounding box. The following DrawingML would describe this.

```

<p:txBody>
  <a:bodyPr wrap="none" rtlCol="0">
    <a:noAutofit/>
  </a:bodyPr>
  <a:p>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>

```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_TextNoAutofit](#)) is located in §A.4.1. *end note*]

21.1.2.1.3 normAutofit (Normal AutoFit)

This element specifies that text within the text body should be normally auto-fit to the bounding box. Auto-fitting is when text within a text box is scaled in order to remain inside the text box. If this element is omitted, then noAutofit or auto-fit off is implied.

[Example: Consider the situation where a user is building a diagram and needs to have the text for each shape that they are using stay within the bounds of the shape. An easy way this might be done is by using normAutofit. The following DrawingML illustrates how this might be accomplished.

```
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:normAutofit fontScale="92.000%" lnSpcReduction="20.000%"/>
    </a:bodyPr>
    ...
    <a:p>
      ...
      <a:t>Diagram Object 1</a:t>
      ...
    </a:p>
  </p:txBody>
</p:sp>
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:normAutofit fontScale="92.000%" lnSpcReduction="20.000%"/>
    </a:bodyPr>
    ...
    <a:p>
      ...
      <a:t>Diagram Object 2</a:t>
      ...
    </a:p>
  </p:txBody>
</p:sp>
```

In the above example there are two shapes that have normAutofit turned on so that when the user types more text within the shape that the text actually resizes to accommodate the new data. For the application to know how and to what degree the text should be resized two attributes are set for the auto-fit resize logic. *end example]*

Attributes	Description
fontScale (Font	Specifies the percentage of the original font size to which each run in the text body is

Attributes	Description
Scale)	<p>scaled. In order to auto-fit text within a bounding box it is sometimes necessary to decrease the font size by a certain percentage. Using this attribute the font within a text box can be scaled based on the value provided. A value of 100% scales the text to 100%, while a value of 1% scales the text to 1%. If this attribute is omitted, then a value of 100% is implied.</p> <p>The possible values for this attribute are defined by the ST_TextFontScalePercentOrPercentString simple type (§20.1.10.66).</p>
InSpcReduction (Line Space Reduction)	<p>Specifies the percentage amount by which the line spacing of each paragraph in the text body is reduced. The reduction is applied by subtracting it from the original line spacing value. Using this attribute the vertical spacing between the lines of text can be scaled by a percent amount. A value of 100% reduces the line spacing by 100%, while a value of 1% reduces the line spacing by one percent. If this attribute is omitted, then a value of 0% is implied.</p> <p>[<i>Note</i>: This attribute applies only to paragraphs with percentage line spacing. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextSpacingPercentOrPercentString simple type (§20.1.10.76).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TextNormalAutofit](#)) is located in §A.4.1. *end note*]

21.1.2.1.4 spAutoFit (Shape AutoFit)

This element specifies that a shape should be auto-fit to fully contain the text described within it. Auto-fitting is when text within a shape is scaled in order to contain all the text inside. If this element is omitted, then noAutofit or auto-fit off is implied.

[*Example*: Consider the situation where a user is building a diagram and needs to have the text for each shape that they are using stay within the bounds of the shape. An easy way this might be done is by using spAutofit. The following DrawingML illustrates how this might be accomplished.

```

<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:spAutoFit/>
    </a:bodyPr>
    ...
    <a:p>
      ...
      <a:t>Diagram Object 1</a:t>
      ...
    </a:p>
  </p:txBody>
</p:sp>
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:spAutoFit/>
    </a:bodyPr>
    ...
    <a:p>
      ...
      <a:t>Diagram Object 2</a:t>
      ...
    </a:p>
  </p:txBody>
</p:sp>

```

In the above example there are two shapes that have `spAutoFit` turned on so that when the user types more text within the shape that the shape actually resizes to accommodate the new data. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextShapeAutofit](#)) is located in §A.4.1. *end note*]

21.1.2.2 Paragraph Formatting

This level of formatting allows for more granular control of text within a shape. Properties here apply to all text residing within the corresponding paragraph. This intermediate property level allows freedom to assign what would seem like lower level properties to a larger group of text. Along with this the paragraph property level also allows what would seem like larger group properties to a more granular set of text. This makes for a property level that is quite versatile in its ability to define formatting on text within a shape.

[*Example:* For instance consider the case where a paragraph of text would need to have bullets applied to it. At first one might think that this formatting must be done at the text run level as it can seem run specific. Much to the contrary this is a paragraph level property and is applied to multiple runs of text. As an example we have once again our three paragraphs with the second having bullets applied to it.

```

<a:p>
...
</a:p>
<a:p>
  <a:pPr>
    <a:buFont typeface="Wingdings"/>
    <a:buChar typeface="ü"/>
  <a:pPr>
  <a:r>
    <a:rPr lang="en-US" dirty="0" smtClean="0"/>
    <a:t>This Paragraph of Text Will Have a Bullet.</a:t>
  </a:r>
</a:p>
<a:p>
...
</a:p>

```

Here we see that the paragraph is formatted to have character bullets for each new line of text that is encountered. In particular this paragraph has the "ü" character applied which in the "Wingdings" font is the checkmark character. The other paragraphs are not effected by this paragraph's bullet formatting and should have their text remain unformatted.

end example]

21.1.2.2.1 br (Text Line Break)

This element specifies the existence of a vertical line break between two runs of text within a paragraph. In addition to specifying a vertical space between two runs of text, this element can also have run properties specified via the rPr child element. This sets the formatting of text for the line break so that if text is later inserted there that a new run can be generated with the correct formatting.

[*Example:* Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:r>
    ...
    <a:t>Text Run 1.</a:t>
    ...
  </a:r>

```

```
<a:br/>
<a:r>
...
<a:t>Text Run 2.</a:t>
...
</a:r>
</a:p>
</p:txBody>
```

This paragraph has two runs of text laid out in a vertical fashion with a line break in between them. This line break acts much like a carriage return would within a normal run of text. *end example*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TextLineBreak](#)) is located in §A.4.1. *end note*]

21.1.2.2.2 defPPr (Default Paragraph Style)

This element specifies the paragraph properties that are to be applied when no other paragraph properties have been specified. If this attribute is omitted, then it is left to the application to decide the set of default paragraph properties that should be applied.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:lstStyle>
  <a:defPPr>
    <a:buNone/>
  </a:defPPr>
</a:lstStyle>
<a:p>
...
  <a:t>Sample Text</a:t>
...
</a:p>
</p:txBody>
```

The above paragraph follows the properties described in defPPr if no overriding properties are specified within the pPr element. *end example*

Attributes	Description
align (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.

Attributes	Description																								
	<div data-bbox="451 285 977 667"> <table> <tr><td>Sample text</td><td>Sample text</td></tr> <tr><td>text Sample</td><td>text Sample</td></tr> <tr><td>Sample text</td><td>Sample text</td></tr> <tr><td>text Sample</td><td>text Sample</td></tr> <tr><td>Sample text</td><td>Sample text</td></tr> <tr><td>text Sample</td><td>text Sample</td></tr> <tr><td>Sample text</td><td>Sample text</td></tr> <tr><td>text Sample</td><td>text Sample</td></tr> <tr><td>Sample text</td><td>Sample text</td></tr> <tr><td>text Sample</td><td>text Sample</td></tr> <tr><td>Sample text</td><td>Sample text</td></tr> <tr><td>text Sample</td><td>text Sample</td></tr> </table> </div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre> <p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</p>	Sample text	Sample text	text Sample	text Sample	Sample text	Sample text	text Sample	text Sample	Sample text	Sample text	text Sample	text Sample	Sample text	Sample text	text Sample	text Sample	Sample text	Sample text	text Sample	text Sample	Sample text	Sample text	text Sample	text Sample

Sample text	Sample text																								
text Sample	text Sample																								
Sample text	Sample text																								
text Sample	text Sample																								
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[<i>Example:</i> Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... </pre>																								

Attributes	Description
	<pre><a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre><p:txBody> ... <a:p> <a:pPr eaLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody></pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> H^2O <p>fontAlgn="t"</p> </div> <div style="text-align: center;"> H^2O <p>fontAlgn="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> H_2O <p>fontAlgn="base"</p> </div> <div style="text-align: center;"> H_2O <p>fontAlgn="b"</p> </div> </div> <pre> <a:txtBody> ... <a:pPr fontAlgn="b" .../> ... <a:r> <a:rPr .../> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" .../> <a:t>2</a:t> </a:r> <a:r> <a:rPr .../> <a:t>O</a:t> </a:r> ... </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§20.1.10.65).</p>

Attributes	Description
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value allows for hanging punctuation forcing the punctuation to not be carried over and a value of false allows the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that is applied to the first line of text in the paragraph. An indentation of 0 is considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div><div>Here is some text</div><div>Sample text</div></div> <p>[Example: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" indent="571500" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Here is some...</a:t> ... </a:p> </p:txBody></pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_TextIndent simple type (§20.1.10.69).</p>
<p>latinLnBrk (Latin Line Break)</p>	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. It is not present within the existence of normal breakable Latin words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> <p:txBody> ... <a:p> <a:pPr latinLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody> </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>lvl (Level)</p>	<p>Specifies the particular level text properties that this paragraph follows. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag has an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p>

Attributes	Description
	<pre> <p:txBody> ... <a:p> <a:pPr lvl="1" .../> ... <a:t>Sample text</a:t> ... </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§20.1.10.70).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example:</i> Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the rtl attribute set to true whereas the first line does not set the rtl attribute.</p>

Attributes	Description
	<p>  </p> <pre> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> <a:t>تجربة</a:t> </a:r> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> <a:r> <a:t>تجربة </a:t> </a:r> </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.2.3 endParaRPr (End Paragraph Run Properties)

This element specifies the text run properties that are to be used if another run is inserted after the last run specified. This effectively saves the run property state so that it can be applied when the user enters additional text. If this element is omitted, then the application can determine which default properties to apply. It is

recommended that this element be specified at the end of the list of text runs within the paragraph so that an orderly list is maintained.

Attributes	Description
altLang (Alternative Language)	<p>Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute is used here.</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).</p>
b (Bold)	<p>Specifies whether a run of text is formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="454 619 803 850"><a:p> ... <a:rPr b="1"/> ... <a:t>Some Text</a:t> ... </a:p></pre> <p>The above run of text is formatted as bold text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
baseline (Baseline)	<p>Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1% is equal to 1 percent of the font size and 100% is equal to 100 percent font of the font size.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
bmK (Bookmark Link Target)	<p>Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
cap (Capitalization)	<p>Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed.</p> <p>The possible values for this attribute are defined by the ST_TextCapsType simple type (§20.1.10.63).</p>
dirty (Dirty)	<p>Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that is to be checked again by the generating application for mistakes such as spelling, grammar, etc.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
err (Spelling Error)	<p>Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
i (Italics)	<p>Specifies whether a run of text is formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[<i>Example</i>: Consider the DrawingML shown below.</p> <pre data-bbox="456 737 808 968"><a:p> ... <a:rPr i="1"/> ... <a:t>Some Text</a:t> ... </a:p></pre> <p>The above run of text is formatted as italic text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
kern (Kerning)	<p>Specifies the minimum font size at which character kerning occurs for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning occurs for all font sizes down to a 0 point font.</p> <p>The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§20.1.10.72).</p>
kumimoji (Kumimoji)	<p>Specifies whether the numbers contained within vertical text continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lang (Language ID)	<p>Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application can select a language of its choice.</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).</p>

Attributes	Description
noProof (No Proofing)	<p>Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
normalizeH (Normalize Heights)	<p>Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
smtClean (SmartTag Clean)	<p>Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
smtId (SmartTag ID)	<p>Specifies a smart tag identifier for a run of text. This ID is unique throughout the presentation and is used to reference corresponding auxiliary information about the smart tag. [Note: For a complete definition of smart tags, which are semantically identical throughout Office Open XML, see §17.5.1. <i>end note</i>]</p> <p>[Example: Consider the following DrawingML:</p> <pre> <p:txBody> <a:bodyPr/> <a:lstStyle/> <a:p> <a:r> <a:rPr lang="en-US" dirty="0" smtId="1"/> <a:t>CNTS</a:t> </a:r> <a:endParaRPr lang="en-US" dirty="0"/> </a:p> </p:txBody> </pre> <p>The text run has a smtId attribute value of 1, which denotes that the text should be inspected for smart tag information, which in this case maps to a stock ticker symbol. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.
spc (Spacing)	<p>Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed.</p> <p>The possible values for this attribute are defined by the ST_TextPoint simple type (§20.1.10.73).</p>
strike (Strikethrough)	<p>Specifies whether a run of text is formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 808 922 1039"><a:p> ... <a:rPr strike="sngStrike"/> ... <a:t>Some Text</a:t> ... </a:p></pre> <p>The above run of text is formatted as single strikethrough text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextStrikeType simple type (§20.1.10.78).</p>
sz (Font Size)	<p>Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 1480 808 1711"><a:p> ... <a:rPr sz="1200"/> ... <a:t>Some Text</a:t> ... </a:p></pre> <p>The above run of text is formatted with a 12 point text size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§20.1.10.67).</p>

Attributes	Description
u (Underline)	<p>Specifies whether a run of text is formatted as underlined text. If this attribute is omitted, than no underline is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre><a:p> ... <a:rPr u="sng"/> ... <a:t>Some Text</a:t> ... </a:p></pre> <p>The above run of text is formatted as single underline text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§20.1.10.81).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TextCharacterProperties](#)) is located in §A.4.1. *end note*]

21.1.2.2.4 fld (Text Field)

This element specifies a text field which contains generated text that the application should update periodically. Each piece of text when it is generated is given a unique identification number that is used to refer to a specific field. At the time of creation the text field indicates the kind of text that should be used to update this field. This update type is used so that all applications that did not create this text field can still know what kind of text it should be updated with. Thus the new application can then attach an update type to the text field id for continual updating.

[*Example:* Consider a slide within a presentation that needs to have the slide number placed on the slide. The following DrawingML can be used to describe such a situation.

```
<p:txBody>
  <a:bodyPr/>
  <a:lstStyle/>
  <a:p>
    <a:fld id="{424CEEAC-8F67-4238-9622-1B74DC6E8318}" type="slidenum">
      <a:rPr lang="en-US" smtClean="0"/>
      <a:pPr/>
      <a:t>3</a:t>
    </a:fld>
```

```

    <a:endParaRPr lang="en-US"/>
  </a:p>
</p:txBody>

```

end example]

Attributes	Description																										
id (Field ID)	<p>Specifies the unique to this document, host specified token that is used to identify the field. This token is generated when the text field is created and persists in the file as the same token until the text field is removed. Any application should check the document for conflicting tokens before assigning a new token to a text field.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>																										
type (Field Type)	<p>Specifies the type of text that should be used to update this text field. This is used to inform the rendering application what text it should use to update this text field. There are no specific syntax restrictions placed on this attribute. The generating application can use it to represent any text that should be updated before rendering the presentation.</p> <p>Reserved Values:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>slidenum</td><td>presentation slide number</td></tr> <tr> <td>datetime</td><td>default date time format for the rendering application</td></tr> <tr> <td>datetime1</td><td>MM/DD/YYYY date time format [<i>Example: 10/12/2007 end example</i>]</td></tr> <tr> <td>datetime2</td><td>Day, Month DD, YYYY date time format [<i>Example: Friday, October 12, 2007 end example</i>]</td></tr> <tr> <td>datetime3</td><td>DD Month YYYY date time format [<i>Example: 12 October 2007 end example</i>]</td></tr> <tr> <td>datetime4</td><td>Month DD, YYYY date time format [<i>Example: October 12, 2007 end example</i>]</td></tr> <tr> <td>datetime5</td><td>DD-Mon-YY date time format [<i>Example: 12-Oct-07 end example</i>]</td></tr> <tr> <td>datetime6</td><td>Month YY date time format [<i>Example: October 07 end example</i>]</td></tr> <tr> <td>datetime7</td><td>Mon-YY date time format [<i>Example: Oct-07 end example</i>]</td></tr> <tr> <td>datetime8</td><td>MM/DD/YYYY hh:mm AM/PM date time format [<i>Example: 10/12/2007 4:28 PM end example</i>]</td></tr> <tr> <td>datetime9</td><td>MM/DD/YYYY hh:mm:ss AM/PM date time format [<i>Example: 10/12/2007 4:28:34 PM end example</i>]</td></tr> <tr> <td>datetime10</td><td>hh:mm date time format [<i>Example: 16:28 end example</i>]</td></tr> </table>	Value	Description	slidenum	presentation slide number	datetime	default date time format for the rendering application	datetime1	MM/DD/YYYY date time format [<i>Example: 10/12/2007 end example</i>]	datetime2	Day, Month DD, YYYY date time format [<i>Example: Friday, October 12, 2007 end example</i>]	datetime3	DD Month YYYY date time format [<i>Example: 12 October 2007 end example</i>]	datetime4	Month DD, YYYY date time format [<i>Example: October 12, 2007 end example</i>]	datetime5	DD-Mon-YY date time format [<i>Example: 12-Oct-07 end example</i>]	datetime6	Month YY date time format [<i>Example: October 07 end example</i>]	datetime7	Mon-YY date time format [<i>Example: Oct-07 end example</i>]	datetime8	MM/DD/YYYY hh:mm AM/PM date time format [<i>Example: 10/12/2007 4:28 PM end example</i>]	datetime9	MM/DD/YYYY hh:mm:ss AM/PM date time format [<i>Example: 10/12/2007 4:28:34 PM end example</i>]	datetime10	hh:mm date time format [<i>Example: 16:28 end example</i>]
Value	Description																										
slidenum	presentation slide number																										
datetime	default date time format for the rendering application																										
datetime1	MM/DD/YYYY date time format [<i>Example: 10/12/2007 end example</i>]																										
datetime2	Day, Month DD, YYYY date time format [<i>Example: Friday, October 12, 2007 end example</i>]																										
datetime3	DD Month YYYY date time format [<i>Example: 12 October 2007 end example</i>]																										
datetime4	Month DD, YYYY date time format [<i>Example: October 12, 2007 end example</i>]																										
datetime5	DD-Mon-YY date time format [<i>Example: 12-Oct-07 end example</i>]																										
datetime6	Month YY date time format [<i>Example: October 07 end example</i>]																										
datetime7	Mon-YY date time format [<i>Example: Oct-07 end example</i>]																										
datetime8	MM/DD/YYYY hh:mm AM/PM date time format [<i>Example: 10/12/2007 4:28 PM end example</i>]																										
datetime9	MM/DD/YYYY hh:mm:ss AM/PM date time format [<i>Example: 10/12/2007 4:28:34 PM end example</i>]																										
datetime10	hh:mm date time format [<i>Example: 16:28 end example</i>]																										

Attributes	Description	
	datetime11	hh:mm:ss date time format [<i>Example: 16:28:34 end example</i>]
	datetime12	hh:mm AM/PM date time format [<i>Example: 4:28 PM end example</i>]
	datetime13	hh:mm:ss: AM/PM date time format [<i>Example: 4:28:34 PM end example</i>]
	The possible values for this attribute are defined by the W3C XML Schema string datatype.	

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TextField](#)) is located in §A.4.1. *end note*]

21.1.2.2.5 **lnSpc (Line Spacing)**

This element specifies the vertical line spacing that is to be used within a paragraph. This can be specified in two different ways, percentage spacing and font point spacing. If this element is omitted then the spacing between two lines of text should be determined by the point size of the largest piece of text within a line.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
  <a:p>
    <a:pPr>
      <a:lnSpc>
        <a:spcPct val="200%"/>
      </a:lnSpc>
    </a:pPr>
    <a:r>
      <a:rPr lang="en-US" dirty="0" smtClean="0"/>
      <a:t>Some</a:t>
    </a:r>
    <a:br>
      <a:rPr lang="en-US" smtClean="0"/>
    </a:br>
    <a:r>
      <a:rPr lang="en-US" dirty="0" smtClean="0"/>
      <a:t>Text</a:t>
    </a:r>
  </a:p>
</p:txBody>
```

This paragraph has two lines of text that have percentage based vertical spacing. This kind of spacing should change based on the size of the text involved as its size is calculated as a percentage of this. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextSpacing](#)) is located in §A.4.1. *end note*]

21.1.2.2.6 p (Text Paragraphs)

This element specifies the presence of a paragraph of text within the containing text body. The paragraph is the highest level text separation mechanism within a text body. A paragraph can contain text paragraph properties associated with the paragraph. If no properties are listed then properties specified in the defPPr element are used.

[*Example:* Consider the case where the user would like to describe a text body that contains two paragraphs. The requirement for these paragraphs is that one be right aligned and the other left aligned. The following DrawingML would specify a text body such as this.

```
<p:txBody>
  ...
  <a:p>
    <a:pPr align="r">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
  <a:p>
    <a:pPr align="l">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>
```

end example

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextParagraph](#)) is located in §A.4.1. *end note*]

21.1.2.2.7 pPr (Text Paragraph Properties)

This element contains all paragraph level text properties for the containing paragraph. These paragraph properties should override any and all conflicting properties that are associated with the paragraph in question.

[*Example:* Consider the DrawingML shown below.

```
<a:p>
  <a:pPr marL="0" align="ctr">
    <a:buNone/>
  </a:pPr>
  ...
  <a:t>Some Text</a:t>
  ...
</a:p>
```

The paragraph described above is formatting with a left margin of 0 and has all of text runs contained within it centered about the horizontal median of the bounding box for the text body. *end example*]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p></pre>

Attributes	Description
	<pre> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[<i>Example:</i> Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... <a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken</p>

Attributes	Description
	<p>for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> <p:txBody> ... <a:p> <a:pPr eaLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody> </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p><i>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</i></p>

Attributes	Description
	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> H^2O <p>fontAlign="t"</p> </div> <div style="text-align: center;"> H^2O <p>fontAlign="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> H_2O <p>fontAlign="base"</p> </div> <div style="text-align: center;"> H_2O <p>fontAlign="b"</p> </div> </div> <pre> <a:txtBody> ... <a:pPr fontAlign="b" .../> ... <a:r> <a:rPr .../> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" .../> <a:t>2</a:t> </a:r> <a:r> <a:rPr .../> <a:t>O</a:t> </a:r> ... </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§20.1.10.65).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value allows for hanging punctuation forcing the punctuation to not be carried over and a value of false allows the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that is applied to the first line of text in the paragraph. An indentation of 0 is considered to be at the same location as marL attribute. If this</p>

Attributes	Description
	<p>attribute is omitted, then a value of -342900 is implied.</p> <p>Here is some text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text</p> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> <p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" indent="571500" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Here is some...</a:t> ... </a:p> </p:txBody> </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§20.1.10.69).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. It is not present within the existence of normal breakable Latin words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not</p>

Attributes	Description
	<p>be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre><p:txBody> ... <a:p> <a:pPr latinLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody></pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph follows. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag has an effective range of 0-8 = 9 available values.</p> <p>[Example: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre><p:txBody> ... <a:p> <a:pPr lvl="1" .../> ... <a:t>Sample text</a:t> ... </a:p> </p:txBody></pre> <p><i>end example]</i></p>

Attributes	Description
	<p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§20.1.10.70).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example:</i> Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the rtl attribute set to true whereas the first line does not set the rtl attribute.</p> <div style="text-align: right; margin-top: 10px;"> <p>Test تجربة ← rtl = 0</p> <p>تجربةTest ← rtl = 1</p> </div> <pre style="margin-top: 20px;"> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> </a:r> </a:p> </pre>

Attributes	Description
	<pre> <a:t>تجربة_</a:t> </a:r> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> </a:p> <a:p> <a:t>تجربة</a:t> </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.2.8 rtl (Right to Left Run)

This element specifies whether the contents of this run shall have right-to-left characteristics. Specifically, the following behaviors are applied when this element's val attribute is true (or an equivalent):

- **Formatting** – When the contents of this run are displayed, all characters shall be treated as complex script characters. This means that the values of the cs element (§21.1.2.3.1) shall be used to determine the font face.
- **Character Directionality Override** – When the contents of this run are displayed, this property acts as a right-to-left override for characters which are classified as follows (using the Unicode Character Database):
 - Weak types except European Number, European Number Terminator, Common Number Separator, Arabic Number and (for Hebrew text) European Number Separator when constituting part of a number
 - Neutral types
- *[Rationale:* This override allows applications to store and utilize higher-level information beyond that implicitly derived from the Unicode Bidirectional algorithm. For example, if the string “first second” appears in a right-to-left paragraph inside a document, the Unicode algorithm would always result in

“first second” at display time (since the neutral character is surrounded by strongly classified characters). However, if the whitespace was entered using a right-to-left input method (e.g. a Hebrew keyboard), then that character could be classified as RTL using this property, allowing the display of “second first” in a right-to-left paragraph, since the user explicitly asked for the space in a right-to-left context. *end rationale*]

This element provides information used to resolve the (Unicode) classifications of individual characters as either L, R, AN or EN. Once this is determined, the line should be displayed subject to the recommendation of the Unicode Bidirectional Algorithm in reordering resolved levels.

This property shall not be used with strong left-to-right text. Any behavior under that condition is unspecified. This property, when off, should not be used with strong right-to-left text. Any behavior under that condition is unspecified.

If this element is not present, the default value is to leave the formatting applied at previous level in the *style hierarchy*. If this element is never applied in the style hierarchy, then right to left characteristics shall not be applied to the contents of this run.

[*Example:* Consider the following DrawingML visual content: “first second, أولى ثاني”. This content might appear as follows within its parent paragraph:

```
<a:p>
  <a:r>
    <a:t>first second, </w:t>
  </a:r>
  <a:r>
    <a:rPr>
      <a:rtl/>
    </a:rPr>
    <a:t>أولى</a:t>
  </a:r>
  <a:r>
    <a:rPr>
      <a:rtl/>
    </a:rPr>
    <a:t> </a:t>
  </a:r>
  <a:r>
    <a:rPr>
      <a:rtl/>
    </a:rPr>
    <a:t>ثاني</a:t>
  </a:r>
</a:p>
```

The presence of the rtl element on the second, third, and fourth runs specifies that:

- The formatting on those runs is specified using the complex-script property variants.
- The whitespace character is treated as right-to-left.

Note that the second, third and fourth runs could be joined as one run with the rtl element specified.

end example]

Attributes	Description
val (On/Off Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of 0 or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre><... val="false"/></pre> <p>The val attribute explicitly declares that the property is false. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.4.1. *end note]*

21.1.2.2.9 spcAft (Space After)

This element specifies the amount of vertical white space that is present after a paragraph. This space is specified in either percentage or points via the child elements spcPct and spcPts.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:spcBef>
      <a:spcPts val="1800"/>
    </a:spcBef>
    <a:spcAft>
      <a:spcPts val="600"/>
    </a:spcAft>
  </a:pPr>
```

```

...
<a:t>Sample Text</a:t>
...
</a:p>
...
</p:txBody>

```

The above paragraph of text is formatted to have a spacing both before and after the paragraph text. The spacing before is a size of 18 points, or value=1800 and the spacing after is a size of 6 points, or value=600. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_TextSpacing](#)) is located in §A.4.1. *end note*]

21.1.2.2.10 spcBef (Space Before)

This element specifies the amount of vertical white space that is present before a paragraph. This space is specified in either percentage or points via the child elements spcPct and spcPts.

[Example: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:spcBef>
      <a:spcPts val="1800"/>
    </a:spcBef>
    <a:spcAft>
      <a:spcPts val="600"/>
    </a:spcAft>
  </a:pPr>
  ...
  <a:t>Sample Text</a:t>
  ...
</a:p>
...
</p:txBody>

```

The above paragraph of text is formatted to have a spacing both before and after the paragraph text. The spacing before is a size of 18 points, or value=1800 and the spacing after is a size of 6 points, or value=600. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_TextSpacing](#)) is located in §A.4.1. *end note*]

21.1.2.2.11 spcPct (Spacing Percent)

This element specifies the amount of white space that is to be used between lines and paragraphs in the form of a percentage of the text size. The text size that is used to calculate the spacing here is the text for each run, with the largest text size having precedence. That is if there is a run of text with 10 point font and within the same paragraph on the same line there is a run of text with a 12 point font size then the 12 point should be used to calculate the spacing to be used.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:spcBef>
      <a:spcPct val="200%"/>
    </a:spcBef>
  </a:pPr>
  ...
  <a:t>Sample Text</a:t>
  ...
</a:p>
...
</p:txBody>
```

The above paragraph of text is formatted to have a spacing before the paragraph text. This spacing is 200% of the size of the largest text on each line. *end example*]

Attributes	Description
val (Value)	Specifies the percentage of the size that the white space should be. The possible values for this attribute are defined by the ST_TextSpacingPercentOrPercentString simple type (§20.1.10.76).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextSpacingPercent](#)) is located in §A.4.1. *end note*]

21.1.2.2.12 spcPts (Spacing Points)

This element specifies the amount of white space that is to be used between lines and paragraphs in the form of a text point size. The size is specified using points where 100 is equal to 1 point font and 1200 is equal to 12 point.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:spcBef>
      <a:spcPts val="1400"/>
    </a:spcBef>
  </a:pPr>
  ...
  <a:t>Sample Text</a:t>
  ...
</a:p>
...
</p:txBody>
```

The above paragraph of text is formatted to have a spacing before the paragraph text. This spacing is a size of 14 points due to val="1400". *end example*]

Attributes	Description
val (Value)	<p>Specifies the size of the white space in point size. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250.</p> <p>The possible values for this attribute are defined by the ST_TextSpacingPoint simple type (§20.1.10.77).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TextSpacingPoint](#)) is located in §A.4.1. *end note*]

21.1.2.2.13 **tab (Tab Stop)**

This element specifies a single tab stop to be used on a line of text when there are one or more tab characters present within the text. When there is more than one present than they should be utilized in increasing position order which is specified via the pos attribute.

[*Example*: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:tabLst>
      <a:tab pos="2292350" algn="1"/>
      <a:tab pos="2627313" algn="1"/>
      <a:tab pos="2743200" algn="1"/>
      <a:tab pos="2974975" algn="1"/>
    </a:tabLst>
  </a:pPr>
  ...
  <a:t>Sample Text</a:t>
  ...
</a:p>
...
</p:txBody>

```

The paragraph within which this <a:tab> information resides has a total of 4 unique tab stops that should be listed in order of increasing position. Along with specifying the tab position each tab allows for the specifying of an alignment. *end example*]

Attributes	Description
algn (Tab Alignment)	<p>Specifies the alignment that is to be applied to text using this tab stop. If this attribute is omitted then the application default for the generating application.</p> <p>The possible values for this attribute are defined by the ST_TextTabAlignType simple type (§20.1.10.79).</p>
pos (Tab Position)	<p>Specifies the position of the tab stop relative to the left margin. If this attribute is omitted then the application default for tab stops is used.</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TextTabStop](#)) is located in §A.4.1. *end note*]

21.1.2.2.14 tabLst (Tab List)

This element specifies the list of all tab stops that are to be used within a paragraph. These tabs should be used when describing any custom tab stops within the document. If these are not specified then the default tab stops of the generating application should be used.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextTabStopList](#)) is located in §A.4.1. *end note*]

21.1.2.3 Run Formatting

Run level formatting is the most granular property level and allows for the specifying of all low level text properties. The text run is what all paragraphs are derived from and thus specifying various properties per run allows for a diversely formatted text paragraph.

[*Example:* Consider the case where have multiple runs within a paragraph and you wish to apply bold to only one of them without having to split up the text into higher level XML groups. To do this we would simply apply the bold run property to the text run that we wish to format as shown below.

```
<a:r>
...
</a:r>
<a:r>
  <a:rPr lang="en-US" b="1" dirty="0" smtClean="0"/>
  <a:t>This text will be bold</a:t>
</a:r>
<a:r>
...
</a:r>
```

end example]

21.1.2.3.1 cs (Complex Script Font)

This element specifies that a complex script font be used for a specific run of text. This font is specified with a typeface attribute much like the others but is specifically classified as a complex script font.

[*Example:* Consider the DrawingML shown below.

```
<a:r>
  <a:rPr ...>
    <a:cs typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>
```

The above run of text is rendered using the complex script font "Sample Font". *end example*]

If the specified font is not available on a system being used for rendering, then the attributes of this element can be utilized to select an alternative font.

Attributes	Description
charset (Similar	Specifies the character set which is supported by the parent font. This information can be

Attributes	Description																																										
Character Set)	<p>used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available.</p> <p>The value of this attribute shall be interpreted as follows:</p> <table data-bbox="415 459 1484 1688"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x00</td><td>Specifies the ANSI character set. 0x51	FIXED PITCH + DECORATIVE FONT FAMILY																																						
0x52	VARIABLE PITCH + DECORATIVE FONT FAMILY																																						
<p>typeface (Text Typeface)</p>	<p>Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic</p>																																						

Attributes	Description
	<p>should be utilized in order to select an alternate font.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextFont](#)) is located in §A.4.1. *end note*]

21.1.2.3.2 defRPr (Default Text Run Properties)

This element contains all default run level text properties for the text runs within a containing paragraph. These properties are to be used when overriding properties have not been defined within the rPr element.

[Example: Consider the DrawingML shown below.

```
<a:p>
...
<a:rPr u="sng"/>
...
<a:t>Some Text</a:t>
...
</a:p>
```

The run of text described above is formatting with a single underline of text matching color. *end example*]

Attributes	Description
altLang (Alternative Language)	<p>Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute is used here.</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).</p>
b (Bold)	<p>Specifies whether a run of text is formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre><a:p> ... <a:rPr b="1"/> ... <a:t>Some Text</a:t> ... </a:p></pre> <p>The above run of text is formatted as bold text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
baseline (Baseline)	<p>Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1% is equal to 1 percent of the font size and 100% is equal to 100 percent font of the font size.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p>
bmk (Bookmark Link Target)	<p>Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
cap (Capitalization)	<p>Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed.</p> <p>The possible values for this attribute are defined by the ST_TextCapsType simple type (§20.1.10.63).</p>
dirty (Dirty)	<p>Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that is to be checked again by the generating application for mistakes such as spelling, grammar, etc.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
err (Spelling Error)	<p>Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
i (Italics)	<p>Specifies whether a run of text is formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 1591 808 1833"> <a:p> ... <a:rPr i="1"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted as italic text. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
kern (Kerning)	<p>Specifies the minimum font size at which character kerning occurs for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning occurs for all font sizes down to a 0 point font.</p> <p>The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§20.1.10.72).</p>
kumimoji (Kumimoji)	<p>Specifies whether the numbers contained within vertical text continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lang (Language ID)	<p>Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application can select a language of its choice.</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).</p>
noProof (No Proofing)	<p>Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
normalizeH (Normalize Heights)	<p>Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
smtClean (SmartTag Clean)	<p>Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
smtId (SmartTag ID)	<p>Specifies a smart tag identifier for a run of text. This ID is unique throughout the presentation and is used to reference corresponding auxiliary information about the smart tag. [Note: For a complete definition of smart tags, which are semantically identical throughout Office Open XML, see §17.5.1. <i>end note</i>]</p> <p>[Example: Consider the following DrawingML:</p> <pre> <p:txBody> <a:bodyPr/> <a:lstStyle/> <a:p> <a:r> <a:rPr lang="en-US" dirty="0" smtId="1"/> <a:t>CNTS</a:t> </a:r> <a:endParaRPr lang="en-US" dirty="0"/> </a:p> </p:txBody> </pre> <p>The text run has a smtId attribute value of 1, which denotes that the text should be inspected for smart tag information, which in this case maps to a stock ticker symbol. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
spc (Spacing)	<p>Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed.</p> <p>The possible values for this attribute are defined by the ST_TextPoint simple type (§20.1.10.73).</p>
strike (Strikethrough)	<p>Specifies whether a run of text is formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre> <a:p> ... <a:rPr strike="sngStrike"/> ... <a:t>Some Text</a:t> ... </a:p> </pre>

Attributes	Description
	<p>The above run of text is formatted as single strikethrough text. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TextStrikeType simple type (§20.1.10.78).</p>
sz (Font Size)	<p>Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 688 808 924"> <a:p> ... <a:rPr sz="1200"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted with a 12 point text size. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§20.1.10.67).</p>
u (Underline)	<p>Specifies whether a run of text is formatted as underlined text. If this attribute is omitted, than no underline is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 1297 808 1533"> <a:p> ... <a:rPr u="sng"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted as single underline text. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§20.1.10.81).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextCharacterProperties](#)) is located in §A.4.1. *end note*]

21.1.2.3.3 ea (East Asian Font)

This element specifies that an East Asian font be used for a specific run of text. This font is specified with a typeface attribute much like the others but is specifically classified as an East Asian font.

[*Example:* Consider the DrawingML shown below.

```
<a:r>
  <a:rPr ...>
    <a:ea typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>
```

The above run of text is rendered using the East Asian font "Sample Font". *end example*

If the specified font is not available on a system being used for rendering, then the attributes of this element can be utilized to select an alternative font.

Attributes	Description																								
charset (Similar Character Set)	<p>Specifies the character set which is supported by the parent font. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available.</p> <p>The value of this attribute shall be interpreted as follows:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x00</td><td>Specifies the ANSI character set. 0x22	VARIABLE PITCH + SWISS FONT FAMILY																												
0x30	DEFAULT PITCH + MODERN FONT FAMILY																												
0x31	FIXED PITCH + MODERN FONT FAMILY																												
0x32	VARIABLE PITCH + MODERN FONT FAMILY																												
0x40	DEFAULT PITCH + SCRIPT FONT FAMILY																												

Attributes	Description	
	0x41	FIXED PITCH + SCRIPT FONT FAMILY
	0x42	VARIABLE PITCH + SCRIPT FONT FAMILY
	0x50	DEFAULT PITCH + DECORATIVE FONT FAMILY
	0x51	FIXED PITCH + DECORATIVE FONT FAMILY
	0x52	VARIABLE PITCH + DECORATIVE FONT FAMILY
	This information is determined by querying the font when present and shall not be modified when the font is not available. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available.	
	The possible values for this attribute are defined by the W3C XML Schema byte datatype.	
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font.	
	The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).	

[Note: The W3C XML Schema definition of this element’s content model ([CT_TextFont](#)) is located in §A.4.1. *end note*]

21.1.2.3.4 highlight (Highlight Color)

This element specifies the highlight color that is present for a run of text.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:highlight>
        <a:srgbClr val="FFFF00"/>
      </a:highlight>
    </a:rPr>
```

```

...
<a:t>Sample Text</a:t>
...
</a:r>
</a:p>
...
</p:txBody>

```

The above run of text has a yellow highlight color as specified by the `srgbClr` child element. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

21.1.2.3.5 `hlinkClick` (Click Hyperlink)

Specifies the on-click hyperlink information to be applied to a run of text. When the hyperlink text is clicked the link is fetched.

[Example: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:hlinkClick r:id="rId2" tooltip="Some Sample Text"/>
    </a:rPr>
    ...
    <a:t>Sample Text</a:t>
    ...
  </a:r>
</a:p>
...
</p:txBody>

```

The above run of text is a hyperlink that points to the resource pointed at by `rId2` within this slides relationship file. Additionally this text should display a tooltip when the mouse is hovered over the run of text. *end example*

Attributes	Description
action (Action Setting)	Specifies an action that is to be taken when this hyperlink is activated. This can be used to specify a slide to be navigated to or a script of code to be run. The possible values for this attribute are defined by the W3C XML Schema string datatype.
endSnd (End Sounds)	Specifies if the URL in question should stop all sounds that are playing when it is clicked.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
highlightClick (Highlight Click)	<p>Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application can determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
history (Add Hyperlink to Page History)	<p>Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1 or true is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Drawing Object Hyperlink Target) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
invalidUrl (Invalid URL)	<p>Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application can still store the URL but it is known that this URL is not correct.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
tgtFrame (Target Frame)	<p>Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute is used to determine if a new window is launched for viewing or if an existing one can be used. If this attribute is omitted, then a new window is opened.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
tooltip (Hyperlink Tooltip)	<p>Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, then the hyperlink text itself can be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Hyperlink](#)) is located in §A.4.1. *end note*]

21.1.2.3.6 hlinkMouseOver (Mouse-Over Hyperlink)

Specifies the mouse-over hyperlink information to be applied to a run of text. When the mouse is hovered over this hyperlink text the link is fetched.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:hlinkMouseOver r:id="rId2" tooltip="Some Sample Text"/>
    </a:rPr>
    ...
    <a:t>Sample Text</a:t>
    ...
  </a:r>
</a:p>
...
</p:txBody>
```

The above run of text is a hyperlink that points to the resource pointed at by rId2 within this slides relationship file. Additionally this text should display a tooltip when the mouse is hovered over the run of text. *end example*]

Attributes	Description
action (Action Setting)	<p>Specifies an action that is to be taken when this hyperlink is activated. This can be used to specify a slide to be navigated to or a script of code to be run.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
endSnd (End Sounds)	<p>Specifies if the URL in question should stop all sounds that are playing when it is clicked.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
highlightClick (Highlight Click)	<p>Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application can determine the color of this text. [Note: The W3C XML Schema definition of this element's content model ([CT_Hyperlink](#)) is located in §A.4.1. *end note*]

21.1.2.3.7 latin (Latin Font)

This element specifies that a Latin font be used for a specific run of text. This font is specified with a typeface attribute much like the others but is specifically classified as a Latin font.

[Example: Consider the DrawingML shown below.

```

<a:r>
  <a:rPr ...>
    <a:latin typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>

```

The above run of text is rendered using the Latin font "Sample Font". *end example*

Attributes	Description																																						
charset (Similar Character Set)	<p>Specifies the character set which is supported by the parent font. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available.</p> <p>The value of this attribute shall be interpreted as follows:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x00</td><td>Specifies the ANSI character set. Attributes	Description
	<p>modified when the font is not available. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available.</p> <p><u>[Note: Although the attribute name is pitchFamily, the integer value of this attribute specifies the font family with higher 4 bits and the font pitch with lower 4 bits. end note]</u></p> <p>The possible values for this attribute are defined by the W3C XML Schema byte datatype.</p>
typeface (Text Typeface)	<p>Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).</p>

[Note: The W3C XML Schema definition of this element's content model (CT_TextFont) is located in §A.4.1. end note]

21.1.2.3.8 r (Text Run)

This element specifies the presence of a run of text within the containing text body. The run element is the lowest level text separation mechanism within a text body. A text run can contain text run properties associated with the run. If no properties are listed then properties specified in the defRPr element are used.

[Example: Consider the case where the user would like to describe a text body that contains two runs of text and would like one to be bold and the other not. The following DrawingML would specify such a text body.

```
<p:txBody>
...
<a:r>
  <a:rPr b="1">
  </a:rPr>
  <a:t>Some text</a:t>
</a:r>
...
<a:r>
  <a:rPr/>
  <a:t>Some text</a:t>
</a:r>
</p:txBody>
```

The above text body has the first run be formatted bold and the second normally. end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RegularTextRun](#)) is located in §A.4.1. *end note*]

21.1.2.3.9 rPr (Text Run Properties)

This element contains all run level text properties for the text runs within a containing paragraph.

[*Example:* Consider the DrawingML shown below.

```
<a:p>
...
<a:rPr u="sng"/>
...
<a:t>Some Text</a:t>
...
</a:p>
```

The run of text described above is formatting with a single underline of text matching color. *end example*]

Attributes	Description
altLang (Alternative Language)	Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute is used here. The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).
b (Bold)	Specifies whether a run of text is formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed. [<i>Example:</i> Consider the DrawingML shown below. <pre><a:p> ... <a:rPr b="1"/> ... <a:t>Some Text</a:t> ... </a:p></pre> The above run of text is formatted as bold text. <i>end example</i>] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
baseline (Baseline)	Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1% is equal to 1 percent of the font size and 100% is equal to 100 percent font of the font size. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).
bmk (Bookmark Link Target)	Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.
cap (Capitalization)	<p>Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed.</p> <p>The possible values for this attribute are defined by the ST_TextCapsType simple type (§20.1.10.63).</p>
dirty (Dirty)	<p>Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that is to be checked again by the generating application for mistakes such as spelling, grammar, etc.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
err (Spelling Error)	<p>Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
i (Italics)	<p>Specifies whether a run of text is formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 1262 808 1493"> <a:p> ... <a:rPr i="1"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted as italic text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
kern (Kerning)	<p>Specifies the minimum font size at which character kerning occurs for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning occurs for all font sizes down to a 0 point font.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§20.1.10.72).
kumimoji (Kumimoji)	<p>Specifies whether the numbers contained within vertical text continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lang (Language ID)	<p>Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application can select a language of its choice.</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).</p>
noProof (No Proofing)	<p>Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
normalizeH (Normalize Heights)	<p>Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
smtClean (SmartTag Clean)	<p>Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
smtId (SmartTag ID)	<p>Specifies a smart tag identifier for a run of text. This ID is unique throughout the presentation and is used to reference corresponding auxiliary information about the smart tag. [Note: For a complete definition of smart tags, which are semantically identical throughout Office Open XML, see §17.5.1. <i>end note</i>]</p> <p>[Example: Consider the following DrawingML:</p> <pre><p:txBody> <a:bodyPr/></pre>

Attributes	Description
	<pre> <a:lstStyle/> <a:p> <a:r> <a:rPr lang="en-US" dirty="0" smtId="1"/> <a:t>CNTS</a:t> </a:r> <a:endParaRPr lang="en-US" dirty="0"/> </a:p> </p:txBody> </pre> <p>The text run has a smtId attribute value of 1, which denotes that the text should be inspected for smart tag information, which in this case maps to a stock ticker symbol. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
spc (Spacing)	<p>Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed.</p> <p>The possible values for this attribute are defined by the ST_TextPoint simple type (§20.1.10.73).</p>
strike (Strikethrough)	<p>Specifies whether a run of text is formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre> <a:p> ... <a:rPr strike="sngStrike"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted as single strikethrough text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextStrikeType simple type (§20.1.10.78).</p>
sz (Font Size)	<p>Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre> <a:p> ... <a:rPr sz="1200"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted with a 12 point text size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§20.1.10.67).</p>
u (Underline)	<p>Specifies whether a run of text is formatted as underlined text. If this attribute is omitted, than no underline is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre> <a:p> ... <a:rPr u="sng"/> ... <a:t>Some Text</a:t> ... </a:p> </pre> <p>The above run of text is formatted as single underline text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§20.1.10.81).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextCharacterProperties](#)) is located in §A.4.1. *end note*]

21.1.2.3.10 sym (Symbol Font)

This element specifies that a symbol font be used for a specific run of text. This font is specified with a typeface attribute much like the others but is specifically classified as a symbol font.

[*Example:* Consider the DrawingML shown below.

```

<a:r>
  <a:rPr ...>
    <a:sym typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>

```

The above run of text is rendered using the symbol font "Sample Font". *end example*]

Attributes	Description																																						
charset (Similar Character Set)	<p>Specifies the character set which is supported by the parent font. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available.</p> <p>The value of this attribute shall be interpreted as follows:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x00</td><td>Specifies the ANSI character set. (IANA name iso-8859-1)</td></tr> <tr> <td>0x01</td><td>Specifies the default character set.</td></tr> <tr> <td>0x02</td><td>Specifies the Symbol character set. This value specifies that the characters in the Unicode private use area (U+FF00 to U+FFFF) of the font should be used to display characters in the range U+0000 to U+00FF.</td></tr> <tr> <td>0x4D</td><td>Specifies a Macintosh (Standard Roman) character set. (IANA name macintosh)</td></tr> <tr> <td>0x80</td><td>Specifies the JIS character set. (IANA name shift_jis)</td></tr> <tr> <td>0x81</td><td>Specifies the Hangul character set. (IANA name ks_c_5601-1987)</td></tr> <tr> <td>0x82</td><td>Specifies a Johab character set. (IANA name KS C-5601-1992)</td></tr> <tr> <td>0x86</td><td>Specifies the GB-2312 character set. (IANA name GBK)</td></tr> <tr> <td>0x88</td><td>Specifies the Chinese Big Five character set. (IANA name Big5)</td></tr> <tr> <td>0xA1</td><td>Specifies a Greek character set. (IANA name windows-1253)</td></tr> <tr> <td>0xA2</td><td>Specifies a Turkish character set. (IANA name iso-8859-9)</td></tr> <tr> <td>0xA3</td><td>Specifies a Vietnamese character set. (IANA name windows-1258)</td></tr> <tr> <td>0xB1</td><td>Specifies a Hebrew character set. (IANA name windows-1255)</td></tr> <tr> <td>0xB2</td><td>Specifies an Arabic character set. (IANA name windows-1256)</td></tr> <tr> <td>0xBA</td><td>Specifies a Baltic character set. (IANA name windows-1257)</td></tr> <tr> <td>0xCC</td><td>Specifies a Russian character set. (IANA name windows-1251)</td></tr> <tr> <td>0xDE</td><td>Specifies a Thai character set. (IANA name windows-874)</td></tr> <tr> <td>0xEE</td><td>Specifies an Eastern European character set. (IANA name windows-</td></tr> </table>	Value	Description	0x00	Specifies the ANSI character set. (IANA name iso-8859-1)	0x01	Specifies the default character set.	0x02	Specifies the Symbol character set. This value specifies that the characters in the Unicode private use area (U+FF00 to U+FFFF) of the font should be used to display characters in the range U+0000 to U+00FF.	0x4D	Specifies a Macintosh (Standard Roman) character set. (IANA name macintosh)	0x80	Specifies the JIS character set. (IANA name shift_jis)	0x81	Specifies the Hangul character set. (IANA name ks_c_5601-1987)	0x82	Specifies a Johab character set. 0xB1	Specifies a Hebrew character set. (IANA name windows-1255)																																						
0xB2	Specifies an Arabic character set. (IANA name windows-1256)																																						
0xBA	Specifies a Baltic character set. (IANA name windows-1257)																																						
0xCC	Specifies a Russian character set. (IANA name windows-1251)																																						
0xDE	Specifies a Thai character set. (IANA name windows-874)																																						
0xEE	Specifies an Eastern European character set. (IANA name windows-																																						

Attributes	Description																																						
		1250)																																					
	0xFF	Specifies an OEM character set not defined by ECMA-376.																																					
	Any other value	Application-defined, can be ignored.																																					
	The possible values for this attribute are defined by the W3C XML Schema byte datatype.																																						
panose (Panose Setting)	Specifies the Panose-1 classification number for the current font using the mechanism defined in §5.2.7.17 of ISO/IEC 14496-22. The possible values for this attribute are defined by the ST_Panose simple type (§22.9.2.8).																																						
pitchFamily (Similar Font Family)	Specifies the font pitch as well as the font family for the corresponding font. Because the value of this attribute is determined by an octet value this value shall be interpreted as follows:																																						
	<table><tr><th>Value</th><th>Description</th></tr><tr><td>0x00</td><td>DEFAULT PITCH + UNKNOWN FONT FAMILY</td></tr><tr><td>0x01</td><td>FIXED PITCH + UNKNOWN FONT FAMILY</td></tr><tr><td>0x02</td><td>VARIABLE PITCH + UNKNOWN FONT FAMILY</td></tr><tr><td>0x10</td><td>DEFAULT PITCH + ROMAN FONT FAMILY</td></tr><tr><td>0x11</td><td>FIXED PITCH + ROMAN FONT FAMILY</td></tr><tr><td>0x12</td><td>VARIABLE PITCH + ROMAN FONT FAMILY</td></tr><tr><td>0x20</td><td>DEFAULT PITCH + SWISS FONT FAMILY</td></tr><tr><td>0x21</td><td>FIXED PITCH + SWISS FONT FAMILY</td></tr><tr><td>0x22</td><td>VARIABLE PITCH + SWISS FONT FAMILY</td></tr><tr><td>0x30</td><td>DEFAULT PITCH + MODERN FONT FAMILY</td></tr><tr><td>0x31</td><td>FIXED PITCH + MODERN FONT FAMILY</td></tr><tr><td>0x32</td><td>VARIABLE PITCH + MODERN FONT FAMILY</td></tr><tr><td>0x40</td><td>DEFAULT PITCH + SCRIPT FONT FAMILY</td></tr><tr><td>0x41</td><td>FIXED PITCH + SCRIPT FONT FAMILY</td></tr><tr><td>0x42</td><td>VARIABLE PITCH + SCRIPT FONT FAMILY</td></tr><tr><td>0x50</td><td>DEFAULT PITCH + DECORATIVE FONT FAMILY</td></tr><tr><td>0x51</td><td>FIXED PITCH + DECORATIVE FONT FAMILY</td></tr><tr><td>0x52</td><td>VARIABLE PITCH + DECORATIVE FONT FAMILY</td></tr></table> This information is determined by querying the font when present and shall not be		Value	Description	0x00	DEFAULT PITCH + UNKNOWN FONT FAMILY	0x01	FIXED PITCH + UNKNOWN FONT FAMILY	0x02	VARIABLE PITCH + UNKNOWN FONT FAMILY	0x10	DEFAULT PITCH + ROMAN FONT FAMILY	0x11	FIXED PITCH + ROMAN FONT FAMILY	0x12	VARIABLE PITCH + ROMAN FONT FAMILY	0x20	DEFAULT PITCH + SWISS FONT FAMILY	0x21	FIXED PITCH + SWISS FONT FAMILY	0x22	VARIABLE PITCH + SWISS FONT FAMILY	0x30	DEFAULT PITCH + MODERN FONT FAMILY	0x31	FIXED PITCH + MODERN FONT FAMILY	0x32	VARIABLE PITCH + MODERN FONT FAMILY	0x40	DEFAULT PITCH + SCRIPT FONT FAMILY	0x41	FIXED PITCH + SCRIPT FONT FAMILY	0x42	VARIABLE PITCH + SCRIPT FONT FAMILY	0x50	DEFAULT PITCH + DECORATIVE FONT FAMILY	0x51	FIXED PITCH + DECORATIVE FONT FAMILY	0x52
Value	Description																																						
0x00	DEFAULT PITCH + UNKNOWN FONT FAMILY																																						
0x01	FIXED PITCH + UNKNOWN FONT FAMILY																																						
0x02	VARIABLE PITCH + UNKNOWN FONT FAMILY																																						
0x10	DEFAULT PITCH + ROMAN FONT FAMILY																																						
0x11	FIXED PITCH + ROMAN FONT FAMILY																																						
0x12	VARIABLE PITCH + ROMAN FONT FAMILY																																						
0x20	DEFAULT PITCH + SWISS FONT FAMILY																																						
0x21	FIXED PITCH + SWISS FONT FAMILY																																						
0x22	VARIABLE PITCH + SWISS FONT FAMILY																																						
0x30	DEFAULT PITCH + MODERN FONT FAMILY																																						
0x31	FIXED PITCH + MODERN FONT FAMILY																																						
0x32	VARIABLE PITCH + MODERN FONT FAMILY																																						
0x40	DEFAULT PITCH + SCRIPT FONT FAMILY																																						
0x41	FIXED PITCH + SCRIPT FONT FAMILY																																						
0x42	VARIABLE PITCH + SCRIPT FONT FAMILY																																						
0x50	DEFAULT PITCH + DECORATIVE FONT FAMILY																																						
0x51	FIXED PITCH + DECORATIVE FONT FAMILY																																						
0x52	VARIABLE PITCH + DECORATIVE FONT FAMILY																																						

Attributes	Description
	<p>modified when the font is not available. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available.</p> <p><u>[Note: Although the attribute name is pitchFamily, the integer value of this attribute specifies the font family with higher 4 bits and the font pitch with lower 4 bits. end note]</u></p> <p>The possible values for this attribute are defined by the W3C XML Schema byte datatype.</p>
typeface (Text Typeface)	<p>Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).</p>

[Note: The W3C XML Schema definition of this element's content model (CT_TextFont) is located in §A.4.1. end note]

21.1.2.3.11 t (Text String)

This element specifies the actual text for this text run. This is the text that is formatted using all specified body, paragraph and run properties. This element shall be present within a run of text.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
...
<a:r>
...
<a:t>Sample Text</a:t>
...
</a:r>
...
</a:p>
...
</p:txBody>
```

The above DrawingML specifies a text body containing a single paragraph, containing a single run which contains the actual text specified with the <a:t> element.

The possible values for this element are defined by the W3C XML Schema string datatype.

21.1.2.3.12 uFill (Underline Fill)

This element specifies the fill color of an underline for a run of text.

[*Example:* Consider the DrawingML shown below.]

```
<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:uFill>
        <a:solidFill>
          <a:srgbClr val="FFFF00"/>
        </a:solidFill>
      </a:uFill>
    </a:rPr>
    ...
    <a:t>Sample Text</a:t>
  </a:r>
</a:p>
...
</p:txBody>
```

The underline color of the above text is yellow specified by the srgbClr child element. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextUnderlineFillGroupWrapper](#)) is located in §A.4.1. *end note*]

21.1.2.3.13 uFillTx (Underline Fill Properties Follow Text)

This element specifies that the fill color of an underline for a run of text should be of the same color as the text run within which it is contained.

[*Example:* Consider the DrawingML shown below.]

```
<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:uFillTx>
    </a:rPr>
  </a:r>
...
</a:p>
```

```

    <a:t>Sample Text</a:t>
    ...
  </a:r>
</a:p>
...
</p:txBody>

```

The underline color of the above text follows the color of the text run within which it resides. *end example*]

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TextUnderlineFillFollowText](#)) is located in §A.4.1. *end note*]

21.1.2.3.14 uLn (Underline Stroke)

This element specifies the properties for the stroke of the underline that is present within a run of text.

[*Example*: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:uLn align="r">
    </a:rPr>
    ...
    <a:t>Sample Text</a:t>
    ...
  </a:r>
</a:p>
...
</p:txBody>

```

The underline alignment of the above text is right aligned. *end example*]

Attributes	Description
align (Stroke Alignment)	<p>Specifies the alignment to be used for the underline stroke.</p> <p>The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).</p>
cap (Line Ending Cap Type)	<p>Specifies the ending caps that should be used for this line. [<i>Note</i>: Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, than a value of square is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).</p>

Attributes	Description
cmpd (Compound Line Type)	<p>Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.</p> <p>The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).</p>
w (Line Width)	<p>Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.2.3.15 uLnTx (Underline Follows Text)

This element specifies that the stroke style of an underline for a run of text should be of the same as the text run within which it is contained.

[*Example*: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:r>
    <a:rPr ...>
      <a:uLnTx>
    </a:rPr>
    ...
    <a:t>Sample Text</a:t>
    ...
  </a:r>
</a:p>
...
</p:txBody>

```

The underline stroke of the above text follows the stroke of the run text within which it resides. *end example*]

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TextUnderlineLineFollowText](#)) is located in §A.4.1. *end note*]

21.1.2.4 Bullets and Numbering

In addition to the above body, paragraph and text run properties there can also be a structure of bullets and numbering that can be defined by utilizing a few of these layers. Since Bullet and Numbering does span multiple formatting levels it is described on it's own in the following section.

21.1.2.4.1 buAutoNum (Auto-Numbered Bullet)

This element specifies that automatic numbered bullet points should be applied to a paragraph. These are not just numbers used as bullet points but instead automatically assigned numbers that are based on both buAutoNum attributes and paragraph level.

[Example: Consider the DrawingML content shown below.

1. Bullet 1
 1. Bullet 2
2. Bullet 3

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buAutoNum type="arabicPeriod"/>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
<a:p>
  <a:pPr lvl="1"...>
    <a:buAutoNum type="arabicPeriod"/>
  </a:pPr>
  ...
  <a:t>Bullet 2</a:t>
  ...
</a:p>
```

```
<a:p>
  <a:pPr ...>
    <a:buAutoNum type="arabicPeriod"/>
  </a:pPr>
  ...
  <a:t>Bullet 3</a:t>
  ...
</a:p>
...
</p:txBody>
```

For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Due to this breakdown of levels, the numbering sequence that should be automatically applied is 1, 1, 2 as is shown in the picture above. *end example*]

Attributes	Description
startAt (Start Numbering At)	<p>Specifies the number that starts a given sequence of automatically numbered bullets. When the numbering is alphabetical, the number should map to the appropriate letter. For instance 1 maps to 'a', 2 to 'b' and so on. If the numbers are larger than 26, then multiple letters should be used. For instance 27 should be represented as 'aa' and similarly 53 should be 'aaa'.</p> <p>The possible values for this attribute are defined by the ST_TextBulletStartAtNum simple type (§20.1.10.62).</p>
type (Bullet Autonumbering Type)	<p>Specifies the numbering scheme that is to be used. This allows for the describing of formats other than strictly numbers. For instance, a set of bullets can be represented by a series of Roman numerals instead of the standard 1,2,3,etc. number set.</p> <p>The possible values for this attribute are defined by the ST_TextAutonumberScheme simple type (§20.1.10.60).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TextAutonumberBullet](#)) is located in §A.4.1. *end note*]

21.1.2.4.2 buBlip (Picture Bullet)

This element specifies that a picture be applied to a set of bullets. This element allows for any standard picture format graphic to be used instead of the typical bullet characters. This opens up the possibility for bullets to be anything the generating application would seek to apply.

[*Example:* Consider the DrawingML shown below.

 Bullet 1

 Bullet 2

 Bullet 3

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buBlip>
      <a:blip r:embed="rId2"/>
    </a:buBlip>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
<a:p>
  <a:pPr lvl="1" ...>
    <a:buBlip>
      <a:blip r:embed="rId2"/>
    </a:buBlip>
  </a:pPr>
  ...
  <a:t>Bullet 2</a:t>
  ...
</a:p>
<a:p>
  <a:pPr ...>
    <a:buBlip>
      <a:blip r:embed="rId2"/>
    </a:buBlip>
  </a:pPr>
  ...
  <a:t>Bullet 3</a:t>
  ...
</a:p>
...
</p:txBody>
```

For the above text there are a total of three bullet points. Two of which are at `lvl="0"` and one at `lvl="1"`. Because the same picture is specified for each bullet the levels do not stand out here. The only difference is the indentation as shown in the picture above. *end example*

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TextBlipBullet](#)) is located in §A.4.1. *end note*]

21.1.2.4.3 buChar (Character Bullet)

This element specifies that a character be applied to a set of bullets. These bullets are allowed to be any character in any font that the system is able to support. If no bullet font is specified along with this element then the paragraph font is used.

[*Example*: Consider the DrawingML shown below.

```
g  Bullet 1
  g  Bullet 2
g  Bullet 3
```

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buFont typeface="Calibri"/>
    <a:buChar char="g"/>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
<a:p>
  <a:pPr lvl="1" ...>
    <a:buFont typeface="Calibri"/>
    <a:buChar char="g"/>
  </a:pPr>
  ...
  <a:t>Bullet 2</a:t>
  ...
</a:p>
```

```

<a:p>
  <a:pPr ...>
    <a:buFont typeface="Calibri"/>
    <a:buChar char="g"/>
  </a:pPr>
  ...
  <a:t>Bullet 3</a:t>
  ...
</a:p>
...
</p:txBody>

```

For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Because the same character is specified for each bullet the levels do not stand out here. The only difference is the indentation as shown in the picture above. *end example]*

Attributes	Description
char (Bullet Character)	<p>Specifies the character to be used in place of the standard bullet point. This character can be any character for the specified font that is supported by the system upon which this document is being viewed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextCharBullet](#)) is located in §A.4.1. *end note]*

21.1.2.4.4 buClr (Color Specified)

This element specifies the color to be used on bullet characters within a given paragraph. The color is specified using the numerical RGB color format.

[*Example:* Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buClr>
      <a:srgbClr val="FFFF00"/>
    </a:buClr>
  </a:pPr>
...
  <a:t>Bullet 1</a:t>
...
</a:p>
...
</p:txBody>

```

The color of the above bullet does not follow the text color but instead has a yellow color specified by `val="FFFF00"`. This color should only apply to the actual bullet character and not to the text within the bullet. *end example*

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

21.1.2.4.5 buClrTx (Follow Text)

This element specifies that the color of the bullets for a paragraph should be of the same color as the text run within which each bullet is contained.

[*Example*: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buClrTx>
  </a:pPr>
...
  <a:t>Bullet 1</a:t>
...
</a:p>
...
</p:txBody>

```

The color of the above bullet follows the default text color of the text for the run of text shown above since no specific text color was specified. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextBulletColorFollowText](#)) is located in §A.4.1. *end note*]

21.1.2.4.6 buFont (Specified)

This element specifies the font to be used on bullet characters within a given paragraph. The font is specified using the typeface that it is registered as within the generating application.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buFont typeface="Arial"/>
    <a:buChar char="g"/>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
...
</p:txBody>
```

The font of the above bullet does not follow the text font but instead has Arial font specified by typeface="Arial". This font should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Attributes	Description										
charset (Similar Character Set)	<p>Specifies the character set which is supported by the parent font. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. This information is determined by querying the font when present and shall not be modified when the font is not available.</p> <p>The value of this attribute shall be interpreted as follows:</p> <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0x00</td><td>Specifies the ANSI character set. (IANA name <code>iso-8859-1</code>)</td></tr> <tr> <td>0x01</td><td>Specifies the default character set.</td></tr> <tr> <td>0x02</td><td>Specifies the Symbol character set. 0x52	VARIABLE PITCH + DECORATIVE FONT FAMILY																										
typeface (Text Typeface)	<p>Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80).</p>																										

[*Note*: The W3C XML Schema definition of this element's content model (CT_TextFont) is located in §A.4.1. *end note*]

21.1.2.4.7 buFontTx (Follow text)

This element specifies that the font of the bullets for a paragraph should be of the same font as the text run within which each bullet is contained.

[*Example*: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buFontTx>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
...
</p:txBody>

```

The font of the above bullet follows the default text font of the text for the run of text shown above since no specific text font was specified. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextBulletTypefaceFollowText](#)) is located in §A.4.1. *end note*]

21.1.2.4.8 buNone (No Bullet)

This element specifies that the paragraph within which it is applied is to have no bullet formatting applied to it. That is to say that there should be no bulleting found within the paragraph where this element is specified.

[*Example:* Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buNone/>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
...
</p:txBody>

```

The above paragraph is formatted with no bullets. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextNoBullet](#)) is located in §A.4.1. *end note*]

21.1.2.4.9 buSzPct (Bullet Size Percentage)

This element specifies the size in percentage of the surrounding text to be used on bullet characters within a given paragraph.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buSzPct val="111%"/>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
...
</p:txBody>
```

The size of the above bullet follows the text size in that it is always rendered at 111% the size of the text within the given text run. This is specified by `val="111%"`, with a restriction on the values not being less than 25% or more than 400%. This percentage size should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Attributes	Description
val (Value)	<p>Specifies the percentage of the text size that this bullet should be. This attribute should not be lower than 25% and not be higher than 400%.</p> <p>The possible values for this attribute are defined by the <code>ST_TextBulletSizePercent</code> simple type (§20.1.10.61).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextBulletSizePercent](#)) is located in §A.4.1. *end note*]

21.1.2.4.10 buSzPts (Bullet Size Points)

This element specifies the size in points to be used on bullet characters within a given paragraph. The size is specified using the points where 100 is equal to 1 point font and 1200 is equal to 12 point font.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buSzPts val="1400"/>
  </a:pPr>
  ...
  <a:t>Bullet 1</a:t>
  ...
</a:p>
...
</p:txBody>
```

The size of the above bullet does not follow the text size of the text within the given text run. The bullets size is specified by val="1400", which corresponds to a point size of 14. This bullet size should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Attributes	Description
val (Value)	<p>Specifies the size of the bullets in point size. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250.</p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§20.1.10.67).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_TextBulletSizePoint](#)) is located in §A.4.1. *end note*]

21.1.2.4.11 buSzTx (Bullet Size Follows Text)

This element specifies that the size of the bullets for a paragraph should be of the same point size as the text run within which each bullet is contained.

[Example: Consider the DrawingML shown below.

```

<p:txBody>
...
<a:p>
  <a:pPr ...>
    <a:buSzTx>
  </a:pPr>
...
  <a:t>Bullet 1</a:t>
...
</a:p>
...
</p:txBody>

```

The size of the above bullet follows the default text size of the text for the run of text shown above since no specific text size was specified. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextBulletSizeFollowText](#)) is located in §A.4.1. *end note*]

21.1.2.4.12 [lstStyle](#) (Text List Styles)

This element specifies the list of styles associated with this body of text.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. *end note*]

21.1.2.4.13 [lvl1pPr](#) (List Level 1 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="0"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example:* Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl1pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
...
<a:lstStyle>
  <a:lv1pPr align="r">
    <a:buNone/>
  </a:lv1pPr>
</a:lstStyle>
<a:p>
  <a:pPr lvl="0">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>
```

end example]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lv1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p>

Attributes	Description
	<pre> <p:txBody> <a:bodyPr numCol="2" spcCol="914400" .../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] </pre> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</p>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[<i>Example:</i> Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... <a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] </pre> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces</p>

Attributes	Description
	<p>without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre><p:txBody> ... <a:p> <a:pPr eaLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody></pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[<i>Example:</i> Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p>

Attributes	Description
	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> H^2O <p>fontAlign="t"</p> </div> <div style="text-align: center;"> H^2O <p>fontAlign="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> H_2O <p>fontAlign="base"</p> </div> <div style="text-align: center;"> H_2O <p>fontAlign="b"</p> </div> </div> <pre> <a:txtBody> ... <a:pPr fontAlign="b" .../> ... <a:r> <a:rPr .../> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" .../> <a:t>2</a:t> </a:r> <a:r> <a:rPr .../> <a:t>O</a:t> </a:r> ... </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§20.1.10.65).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value allows for hanging punctuation forcing the punctuation to not be carried over and a value of false allows the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that is applied to the first line of text in the paragraph. An indentation of 0 is considered to be at the same location as marL attribute. If this</p>

Attributes	Description
	<p>attribute is omitted, then a value of -342900 is implied.</p> <p>Here is some text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text text Sample text text Sample text Sample text Sample text Sample text</p> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" indent="571500" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Here is some...</a:t> ... </a:p> </p:txBody></pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§20.1.10.69).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. It is not present within the existence of normal breakable Latin words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not</p>

Attributes	Description
	<p>be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre><p:txBody> ... <a:p> <a:pPr latinLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody></pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph follows. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag has an effective range of 0-8 = 9 available values.</p> <p>[Example: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre><p:txBody> ... <a:p> <a:pPr lvl="1" .../> ... <a:t>Sample text</a:t> ... </a:p> </p:txBody></pre> <p><i>end example]</i></p>

Attributes	Description
	<p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§20.1.10.70).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example:</i> Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the rtl attribute set to true whereas the first line does not set the rtl attribute.</p> <div style="text-align: center; margin: 10px 0;">  </div> <pre> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> </pre>

Attributes	Description
	<pre> <a:t>تجربة</a:t> </a:r> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> <a:r> <a:t>تجربة</a:t> </a:r> </a:p> </p:txBody> end example] The possible values for this attribute are defined by the W3C XML Schema boolean datatype. </pre>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.4.14 lvl2pPr (List Level 2 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="1"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl2pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```

<p:txBody>
...
<a:lstStyle>
  <a:lvl2pPr algn="r">
    <a:buNone/>
  </a:lvl2pPr>
</a:lstStyle>

```

```
<a:p>
  <a:pPr lvl="1">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>
```

end example]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" align="just"></pre>

Attributes	Description
	<pre> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[Example: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... <a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[Example: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the</p>

21.1.2.4.15 lvl3pPr (List Level 3 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="2"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl3pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```

<p:txBody>
...
<a:lstStyle>
  <a:lvl3pPr algn="r">
    <a:buNone/>
  </a:lvl3pPr>
</a:lstStyle>

```

```
<a:p>
  <a:pPr lvl="2">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>
```

end example]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
	<p>properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§20.1.10.70).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[Example: Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the rtl attribute set to true whereas the first line does not set the rtl attribute.</p> <div style="text-align: center; margin: 10px 0;">  </div> <pre> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> <a:t>تجربة</a:t> </a:r> </a:p> </pre>

Attributes	Description
	<pre> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> <a:r> <a:t>تجربة</a:t> </a:r> </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.4.16 lvl4pPr (List Level 4 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="3"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl4pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```

<p:txBody>
...
<a:lstStyle>
  <a:lvl4pPr algn="r">
    <a:buNone/>
  </a:lvl4pPr>
</a:lstStyle>

```

```
<a:p>
  <a:pPr lvl="3">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>
```

end example]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" align="just"></pre>

Attributes	Description
	<pre> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[Example: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... <a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[Example: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the</p>

Attributes	Description
	<p>long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre><p:txBody> ... <a:p> <a:pPr eaLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody></pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div><div>H^2O<p>fontAlgn="t"</p></div><div>H^2O<p>fontAlgn="ctr"</p></div><div>H_2O<p>fontAlgn="base"</p></div><div>H_2O<p>fontAlgn="b"</p></div></div>

Attributes	Description
	<pre> <a:txtBody> ... <a:pPr fontAlign="b" .../> ... <a:r> <a:rPr .../> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" .../> <a:t>2</a:t> </a:r> <a:r> <a:rPr .../> <a:t>0</a:t> </a:r> ... </p:txBody> end example] </pre> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§20.1.10.65).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value allows for hanging punctuation forcing the punctuation to not be carried over and a value of false allows the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that is applied to the first line of text in the paragraph. An indentation of 0 is considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p>

Attributes	Description
	<p>properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§20.1.10.70).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[Example: Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the rtl attribute set to true whereas the first line does not set the rtl attribute.</p> <div style="text-align: center; margin: 10px 0;">  </div> <pre> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> <a:t>تجربة</a:t> </a:r> </pre>

Attributes	Description
	<pre> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> <a:r> <a:t>تجربة</a:t> </a:r> </a:p> </p:txBody> end example] The possible values for this attribute are defined by the W3C XML Schema boolean datatype. </pre>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.4.18 lvl6pPr (List Level 6 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="5"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl6pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```

<p:txBody>
...
<a:lstStyle>
  <a:lvl6pPr algn="r">
    <a:buNone/>
  </a:lvl6pPr>
</a:lstStyle>

```

```
<a:p>
  <a:pPr lvl="5">
    </a:pPr>
    ...
    <a:t>Some text</a:t>
    ...
  </a:p>
</p:txBody>
```

end example]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" align="just"></pre>

Attributes	Description
	<pre> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[Example: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... <a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[Example: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the</p>

Attributes	Description
	<p>long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> <p:txBody> ... <a:p> <a:pPr eaLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody> </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> H^2O <p>fontAlgn="t"</p> </div> <div style="text-align: center;"> H^2O <p>fontAlgn="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> H_2O <p>fontAlgn="base"</p> </div> <div style="text-align: center;"> H_2O <p>fontAlgn="b"</p> </div> </div>

Attributes	Description
	<pre> <a:txtBody> ... <a:pPr fontAlign="b" .../> ... <a:r> <a:rPr .../> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" .../> <a:t>2</a:t> </a:r> <a:r> <a:rPr .../> <a:t>0</a:t> </a:r> ... </p:txBody> end example] </pre> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§20.1.10.65).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value allows for hanging punctuation forcing the punctuation to not be carried over and a value of false allows the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that is applied to the first line of text in the paragraph. An indentation of 0 is considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p>

Attributes	Description
	<p>Here is some text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</p> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400".../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" indent="571500" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Here is some...</a:t> ... </a:p> </p:txBody></pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§20.1.10.69).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. It is not present within the existence of normal breakable Latin words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. 	<p>properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§20.1.10.70).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§20.1.10.71).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[Example: Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the rtl attribute set to true whereas the first line does not set the rtl attribute.</p> <div style="text-align: center;"> <p>Test تجربة ← rtl = 0</p> <p>تجربةTest ← rtl = 1</p> </div> <pre> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> <a:t>تجربة</a:t> </a:r> </pre>

Attributes	Description
	<pre> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> <a:r> <a:t>تجربة</a:t> </a:r> </a:p> </p:txBody> end example] The possible values for this attribute are defined by the W3C XML Schema boolean datatype. </pre>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.4.20 `lvl8pPr` (List Level 8 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="7"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl8pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```

<p:txBody>
...
<a:lstStyle>
  <a:lvl8pPr algn="r">
    <a:buNone/>
  </a:lvl8pPr>
</a:lstStyle>
<a:p>
  <a:pPr lvl="7">
    </a:pPr>
  ...

```

```
<a:t>Some text</a:t>
...
</a:p>
</p:txBody>
```

end example]

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre><p:txBody> <a:bodyPr numCol="2" spcCol="914400"../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" align="just"> <a:buNone/> </a:pPr> ... <a:t>Sample Text ...</a:t></pre>

Attributes	Description
	<pre> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_TextAlignType simple type (§20.1.10.58).</pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[<i>Example:</i> Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> <p:txBody> ... <a:p> <a:pPr defTabSz="376300" .../> ... <a:t>Sample Text ...</a:t> ... </a:p> </p:txBody> end example] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it is not present within the existence of normal breakable East Asian words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> <p:txBody> ...</pre>

Attributes	Description
	<pre> <a:p> <a:pPr eaLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody> </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div style="display: flex; justify-content: space-around; align-items: flex-end;"> <div style="text-align: center;"> H^2O <p>fontAlgn="t"</p> </div> <div style="text-align: center;"> H^2O <p>fontAlgn="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-end; margin-top: 20px;"> <div style="text-align: center;"> H_2O <p>fontAlgn="base"</p> </div> <div style="text-align: center;"> H_2O <p>fontAlgn="b"</p> </div> </div> <pre> <a:txtBody> ... <a:pPr fontAlgn="b" .../> </pre>

Attributes	Description
	<pre> ... <a:r> <a:rPr .../> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" .../> <a:t>2</a:t> </a:r> <a:r> <a:rPr .../> <a:t>0</a:t> </a:r> ... </p:txBody> end example] </pre> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§20.1.10.65).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value allows for hanging punctuation forcing the punctuation to not be carried over and a value of false allows the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that is applied to the first line of text in the paragraph. An indentation of 0 is considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div style="display: flex; justify-content: space-between; margin-top: 20px;"> <div style="width: 45%;"> <p>Here is some</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text Sample</p> </div> <div style="width: 45%;"> <p>text Sample text</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text Sample</p> <p>text Sample text</p> <p>Sample text</p> </div> </div>

Attributes	Description
	<p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> <p:txBody> <a:bodyPr numCol="2" spcCol="914400" .../> <a:normAutofit/> </a:bodyPr> ... <a:p> <a:pPr marL="0" indent="571500" algn="just"> <a:buNone/> </a:pPr> ... <a:t>Here is some...</a:t> ... </a:p> </p:txBody> </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§20.1.10.69).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. It is not present within the existence of normal breakable Latin words but is when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1 or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it can fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> <p:txBody> ... <a:p> <a:pPr latinLnBrk="0" .../> ... <a:t>Sample text (Long word)</a:t> ... </a:p> </p:txBody> </pre>

Attributes	Description

rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this</p>

Attributes	Description
	<p>attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[Example: Consider the following example of a text body with two lines of text. In this example, both lines contain English and Arabic text, however, the second line has the <code>rtl</code> attribute set to true whereas the first line does not set the <code>rtl</code> attribute.</p> <p>  </p> <pre> <p:txBody> ... <a:p> <a:r> <a:t>Test </a:t> </a:r> <a:r> <a:rPr> <a:rtl w:val="1"/> </a:rPr> <a:t>تجربة</a:t> </a:r> </a:p> <a:p> <a:pPr rtl="1"/> <a:r> <a:rPr> <a:rtl w:val="0"/> </a:rPr> <a:t>Test </a:t> </a:r> <a:r> <a:t>تجربة</a:t> </a:r> </a:p> </p:txBody> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextParagraphProperties](#)) is located in §A.4.1. *end note*]

21.1.2.5 Font Substitution

If any DrawingML element references a font and an appropriate format of the font is not stored within the document, the process of finding a suitable alternative font is known as *font substitution*.

The following elements specify font information: buFont@panose (§21.1.2.4.6); cs@panose (§21.1.2.3.1); ea@panose (§21.1.2.3.3); font@panose (§19.2.1.13); latin@panose (§21.1.2.3.7); sym@panose (§21.1.2.3.10).

The exact algorithm which is used for font substitution is highly dependent on the characteristics which are most desirable when performing the substitution: similar appearance of each glyph (to maximize visual familiarity), similar physical characteristics (to minimize changes in line height and breaking), etc. ECMA-376 recommends that applications look for the closest match to the following attribute values (in descending priority) in order to determine a suitable alternative font: panose, charset, pitchFamily, and typeface; however, applications are free to apply higher-order logic in its place.

21.1.3 Tables

This section contains information regarding the definition of a table within DrawingML. The following image is an example table within DrawingML.

text	text	text	text	text
text	text	text	text	text
text	text	text	text	text
text	text	text	text	text
text	text	text	text	text

21.1.3.1 cell3D (Cell 3-D)

This element specifies a set of properties which dictate the 3-D appearance of a given cell in a table.

Collectively, these properties are referred to as a cell 3-D. The application of these properties occurs on a per-cell basis in the table.

Attributes	Description
prstMaterial (Preset Material)	Specifies a material type which is used to define the material characteristics of the cell. The material properties, combined with the lighting characteristics of the scene in define the final look and feel of the 3-D appearance of the cell. The possible values for this attribute are defined by the ST_PresetMaterialType simple

Attributes	Description
	type (§20.1.10.49).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Cell3D](#)) is located in §A.4.1. *end note*]

21.1.3.2 [gridCol \(Table Grid Column\)](#)

This element specifies the width of a given column within a table. For each column in a table, there is an associated table grid column defining the width of the column.

[*Example*: Consider the following example of a table grid containing widths defined for three table grid columns:

```
<a:tblGrid>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
</a:tblGrid>
```

end example]

Attributes	Description
w (Width)	The width of the column in EMUs. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TableCol](#)) is located in §A.4.1. *end note*]

21.1.3.3 [header \(Header Cell Reference\)](#)

This element specifies a reference, using a unique identifier, to a table header cell that is associated with the current table cell. The identifier representing the reference shall be stored on this element’s val attribute and is used to reference the unique identifier value of a table header cell. The contents of the table header cell designated by a specific unique identifier shall be used as the table header information associated with the table cell that references that specific unique identifier.

If this element is omitted or the value of the header cell identifier cannot be resolved, no header cell shall be associated with the current table cell.

[*Example*: Consider the following 3 x 3 table with four header cells with values A, B, C, and D and four data cells with values x1, x2, y1, and y2:

	A	B
C	x1	x2
D	y1	y2

Each of the data cells is associated with two header cells and can be represented in DrawingML as follows:

```

<a:tbl>
...
<a:tr>
...
<a:tc >
...
</a:tc>
<a:tc id="HeaderA">
...
<a:p>
  <a:r>
    <a:t>A</a:t>
  </a:r>
</a:p>
</a:tc>
...
</a:tr>
<a:tr>
...
<a:tc id="HeaderC">
...
<a:p>
  <a:r>
    <a:t>C</a:t>
  </a:r>
</a:p>
</a:tc>
<a:tc>

  <a:p>
    <a:r>
      <a:t>x1</a:t>
    </a:r>
  </a:p>
  <a:tcPr>

...
  <a:headers>
    <a:header val="HeaderA" />

```

```
        <a:header val="HeaderC" />
      </a:headers>
      ...
    </a:tcPr>
  </a:tc>
  ...
</a:tr>
</a:tbl>
```

The headers element specifies the list of header cells associated with the table cell that has a value of x1. In this example the table cell with the content value of x1 is associated with headers that have an id of HeaderA and HeaderC. *end example*]

The possible values for this element are defined by the W3C XML Schema string datatype.

21.1.3.4 headers (Header Cells Associated With Table Cell)

This element specifies the list of header cells, as specified by children header elements, that provide header information associated with the current table cell. Each header cell shall specify a unique identifier, as specified by the use of the attribute id on the header cell tc element. This element is typically used to gather header information about data and sub header cells.

If this element is omitted or there exists no children header element, no header cell shall be associated with the given table cell.

[*Example:* Consider the following 3 x 3 table with four header cells with values A, B, C, and D and four data cells with values x1, x2, y1, and y2:

	A	B
C	x1	x2
D	y1	y2

Each of the data cells is associated with two header cells and can be represented in DrawingML as follows:

```
<a:tbl>
...
<a:tr>
...
  <a:tc >
    ...
  </a:tc>
  <a:tc id="HeaderA">
    ...
    <a:p>
      <a:r>
        <a:t>A</a:t>
```

```

        </a:r>
      </a:p>
    </a:tc>
    ...
  </a:tr>
  <a:tr>
    ...
    <a:tc id="HeaderC">
      ...
      <a:p>
        <a:r>
          <a:t>C</a:t>
        </a:r>
      </a:p>
    </a:tc>
    <a:tc>
      <a:p>
        <a:r>
          <a:t>x1</a:t>
        </a:r>
      </a:p>
    <a:tcPr>
      ...
      <a:headers>
        <a:header val="HeaderA" />
        <a:header val="HeaderC" />
      </a:headers>
      ...
    </a:tcPr>
  </a:tc>
  ...
</a:tr>
</a:tbl>

```

The headers element specifies the list of header cells associated with the table cell that has a value of x1. In this example x1 is associated with headers that have an id of HeaderA and HeaderC. *end example*]

[Note: The W3C XML Schema definition of this element's content model ([CT_Headers](#)) is located in §A.4.1. *end note*]

21.1.3.5 lnB (Bottom Border Line Properties)

This element defines the line properties associated with the bottom border of a given cell.

[Example: Consider the following example of a bottom border line properties element within DrawingML:

```
<a:lnB w="38100" cap="flat" compd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnB>
```

In this example, one can see that the bottom border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. [<i>Note</i> : Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).
compd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.3.6 lnBlToTr (Bottom-Left to Top-Right Border Line Properties)

This element defines the line properties associated with the diagonal line from the bottom left corner of the cell to the top right corner.

[*Example*: Consider the following example of a lnBlToTr within DrawingML:

```

<a:lnBlToTr w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnBlToTr >

```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. [<i>Note</i> : Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, then a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.3.7 InL (Left Border Line Properties)

This element defines the line properties associated with the left border of a cell

[*Example*: Consider the following example of a InL within DrawingML:

```
<a:lnL w="38100" cap="flat" compd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnL >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. [<i>Note</i> : Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).
compd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.3.8 lnR (Right Border Line Properties)

This element defines the line properties associated with right border of a cell.

[*Example*: Consider the following example of a lnR within DrawingML:

```

<a:lnR w="38100" cap="flat" compd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnR >

```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. [<i>Note</i> : Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, then a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).
compd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.3.9 InT (Top Border Line Properties)

This element defines the line properties associated with the top border of a cell.

[*Example*: Consider the following example of a InT within DrawingML:

```
<a:lnT w="38100" cap="flat" compd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnT >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. [<i>Note</i> : Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).
compd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.3.10 lnTlToBr (Top-Left to Bottom-Right Border Line Properties)

This element defines the line properties associated with the diagonal line from the top left corner of the cell to the bottom right corner.

[*Example*: Consider the following example of a lnTlToBr within DrawingML:

```

<a:lnTlToBr w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnTlToBr>

```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. [<i>Note</i> : Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, then a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

21.1.3.11 tableStyle (Table Style)

This element specifies a particular table style. Fourteen elements make up the styling information of a given table style. These fourteen elements work together to provide visual formatting options for on/off states of the following toggles:

- First row on/off - Associated element: firstRow

- Last row on/off - Associated element: lastRow
- First column on/off - Associated element: firstCol
- Last column on/off - Associated element: lastCol
- Row banding on/off - Associated elements: band1H, band2H
- Column banding on/off - Associated elements: band1V, band2V

The formatting associated with the wholeTbl element defines the table formatting when all options are off. When an option is turned on, the formatting for that particular option is applied to the table. The four cell specific formatting options are enabled when overlapping options are toggled on. For example, when the first row, and first column formatting options are enabled, any formatting within the northwest cell is also be applied since that is the overlapping table cell when both first column and first row formatting options are on.

[Example: Consider the following partial example of a tblStyle within DrawingML:

```
<a:tblStyle styleId="{5940675A-B579-460E-94D1-54222C63F5DA}"
  styleName="No Style, Table Grid">
  <a:wholeTbl>
    <a:tcTxStyle>
      <a:fontRef idx="minor">
        <a:scrgbClr r="0" g="0" b="0"/>
      </a:fontRef>
      <a:schemeClr val="tx1"/>
    </a:tcTxStyle>
    <a:tcStyle>
      <a:tcBdr>
        <a:left>
          <a:ln w="12700" cmpd="sng">
            <a:solidFill>
              <a:schemeClr val="tx1"/>
            </a:solidFill>
          </a:ln>
        </a:left>
```

...right, top, bottom, insideH, insideV border information is defined just as the 'left' tag...

```
      </a:tcBdr>
      <a:fill>
        <a:noFill/>
      </a:fill>
    </a:tcStyle>
  </a:wholeTbl>
```

```

<a:band1H>
  <a:tcStyle>
    <a:tcBdr/>
  </a:tcStyle>
</a:band1H>

```

...band2H, band1V, band2V, firstCol, firstRow, lastCol, lastRow, neCell, nwCell, seCell, swCell tags are all defined just as the 'band1H' tag

```

</a:tblStyle>

```

In this example, one can get an idea for the definition of a table style in its entirety. The above defined table style creates a style with only 1pt line formatting applied to all of the cells in a table. Notice that the on/off toggle formatting (band1H, band2H, firstCol, etc) do not define any formatting and therefore have no effect to the table when toggled. *end example]*

Attributes	Description
styleId (Style ID)	Specifies a GUID identifying the table style in a unique manner. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).
styleName (Name)	Specifies the name of the table style which can show up in the user interface identifying the style to a user. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyle](#)) is located in §A.4.1. *end note]*

21.1.3.12 tableStyleId (Table Style ID)

This element defines the table style which is currently applied to the table by referencing the styleId attribute of the tableStyle element.

[Example: Consider the following example of a tableStyleId within DrawingML:

```

<a:tblPr firstRow="1" bandRow="1">
  <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId>
</a:tblPr>

```

In this example, we see a reference to a table style being specified in the tableStyleId element. *end example]*

The possible values for this element are defined by the ST_Guid simple type (§22.9.2.4).

[Note: The W3C XML Schema definition of this element's content model ([ST_Guid](#)) is located in §A.6.9. *end note]*

21.1.3.13 `tbl` (Table)

This element is the root element for a table. Within this element is contained everything that one would need to define a table within DrawingML.

[*Example:* Consider the following example of a `tbl` within DrawingML:

```
<a:tbl>
  <a:tblPr firstRow="1" bandRow="1">
    ...
  <a:tblPr>
    <a:tblGrid>
      ...
    </a:tblGrid>
    <a:tr h="419100">
      ...
    </a:tr>
  </a:tbl>
```

In this example, we see can see the definition of a table within DrawingML. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Table](#)) is located in §A.4.1. *end note]*

21.1.3.14 `tblGrid` (Table Grid)

This element defines a list of table column (§21.1.3.2) elements. There should be a table column (§21.1.3.2) element for every column held within the table.

[*Example:* Consider the following example of a `tblGrid` within DrawingML:

```
<a:tblGrid>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
</a:tblGrid>
```

In this example, we have a `tblGrid` defined that holds three columns, therefore the table has three columns. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableGrid](#)) is located in §A.4.1. *end note]*

21.1.3.15 `tblPr` (Table Properties)

This element defines the properties of a table on the whole. Within this element are many visual modifications that can be applied to the table.

[*Example:* Consider the following example of a `tblPr` within DrawingML:

```
<a:tblPr firstRow="1" bandRow="1">
  <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId>
</a:tblPr>
```

In this example, we see that there is a link to a table style id (§21.1.3.12) which is defined elsewhere and that the first column formatting and banded row formatting has been enabled. The table style defines the formatting applied with the two formatting options enabled. *end example*]

Attributes	Description
bandCol (Banded Columns)	<p>Enables or disables the banded column formatting for a table style. A value of 1 or true enables the banded column formatting defined in the table style. The attribute defaults to off if it is not specified.</p> <p>[<i>Example:</i> Consider the following run:</p> <pre><a:tblPr bandCol="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see the banded column formatting is enabled for the table. When applied, the linked table style defines the formatting for banded columns. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bandRow (Banded Rows)	<p>Enables or disables the banded row formatting for a table style. A value of 1 or true enables the banded row formatting defined in the table style. The attribute defaults to false if it is not specified.</p> <p>[<i>Example:</i> Consider the following run:</p> <pre><a:tblPr bandRow="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see the banded row formatting is enabled for the table. When applied, the linked table style defines the formatting for banded rows. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
firstCol (First	Enables or disables the first column formatting for a table style. A value of 1 or true

Attributes	Description
Column)	<p>enables the first column formatting defined in the table style. The attribute defaults to false if it is not specified.</p> <p>[<i>Example:</i> Consider the following run:</p> <pre><a:tblPr firstCol="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see the first column formatting is enabled for the table. When applied, the linked table style defines the formatting for the first column. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
firstRow (First Row)	<p>Enables or disables the first row formatting for a table style. A value of 1 or true enables the first row formatting defined in the table style. The attribute defaults to false if it is not specified.</p> <p>[<i>Example:</i> Consider the following run:</p> <pre><a:tblPr firstRow="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see the first row formatting is enabled for the table. When applied, the linked table style defines the formatting for the first row. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lastCol (Last Column)	<p>Enables or disables the last column formatting for a table style. A value of 1 or true enables the last column formatting defined in the table style. The attribute defaults to false if it is not specified.</p> <p>[<i>Example:</i> Consider the following run:</p> <pre><a:tblPr lastCol="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see the last column formatting is enabled for the table. When applied, the linked table style defines the formatting for the last column. <i>end example</i>]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>lastRow (Last Row)</p>	<p>Enables or disables the last row formatting for a table style. A value of 1 or true enables the last row formatting defined in the table style. The attribute defaults to false if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre><a:tblPr lastRow="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see the last row formatting is enabled for the table. When applied, the linked table style defines the formatting for the last row. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>rtl (Right-to-Left)</p>	<p>Defines enables the right-to-left settings of a table. If the value of rtl is 1 or true , then the table is laid out from the right-to-left rather than the default left-to-right.</p> <p>[Example: Consider the following run:</p> <pre><a:tblPr rtl="1"> <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId> </a:tblPr></pre> <p>In this example, we can see that the table is to be created in a right-to-left direction. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT TableProperties](#)) is located in §A.4.1. *end note*]

21.1.3.16 tc (Table Cell)

This element defines a cell within the table. The table cell holds a text body that actually contains the data held within the cell along with the properties of the table cell which hold formatting options associated with the cell.

[Example: Consider the following example of a tc within DrawingML:

```
<a:tc>
  <a:txBody>
    <a:bodyPr/>
    <a:lstStyle/>
    <a:p>
      <a:pPr marL="0" algn="ctr" rtl="0"/>
      <a:r>
        <a:rPr lang="en-US" dirty="0" smtClean="0"/>
        <a:t>data</a:t>
      </a:r>
    <a:endParaRPr lang="en-US" dirty="0"/>
  </a:p>
</a:txBody>
<a:tcPr/>
</a:tc>
```

In this example, we see a single cell in a table being defined with the default cell properties and a text body which contains the word "data". The text "data" is the only text in the cell. *end example*]

Attributes	Description
gridSpan (Grid Span)	<p>Specifies the number of columns that a merged cell spans. This is used in combination with the hMerge attribute on other cells in order to specify the beginning cell of a horizontal merge.</p> <p>[Example: Consider the following example:</p> <pre><a:tc gridSpan="3"> ... /a:tc> <a:tc hMerge="1"> ... /a:tc> <a:tc hMerge="1"> ... /a:tc></pre> <p>In this example, we can define what looks like a single cell in the table as a group of three cells merged together. The merged cell spans three columns of the table. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
hMerge (Horizontal Merge)	<p>When this attribute is set to 1 or true , then this table cell is to be merged with the previous horizontal table cell when the table is created.</p> <p>[Example: Consider the following example:</p>

Attributes	Description
	<pre><a:tc hMerge="1"> ... </a:tc></pre> <p>In this example, we see the hMerge attribute set to on which signifies that this cell is to be merged with the previous horizontal cell in the table. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Table Cell Identifier)	<p>Specifies a unique identifier for the current table cell. This identifier shall be unique within the table, and is used to identify this table cell as a header cell for other cells within the table, using the headers child element.</p> <p>If this element is omitted, this table cell has no unique identifier.</p> <p>[<i>Example:</i> Consider a table cell defined as follows:</p> <pre><a:tc id="januarytwentynine"> ... </a:tc></pre> <p>The value in the id specifies a unique identifier of januarytwentynine. Other cells in the table are then able to reference this cell as a row or column header by referencing this ID. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
rowSpan (Row Span)	<p>Specifies the number of rows that a merged cell spans. This is used in combination with the vMerge attribute on other cells in order to specify the beginning cell of a horizontal merge.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre><a:tc rowspan="3"> ... </a:tc> <a:tc vMerge="1"> ... </a:tc> <a:tc vMerge="1"> ... </a:tc></pre> <p>In this example, we can define what looks like a single cell in the table as a group of three</p>

Attributes	Description
	<p>cells merged together. The merged cell spans three rows of the table. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
vMerge (Vertical Merge)	<p>When this attribute is set to 1 or true , then this table cell is to be merged with the previous vertical table cell when the table is created.</p> <p>[Example: Consider the following example:</p> <pre data-bbox="451 548 727 646"><a:tc vMerge="1"> ... /a:tc></pre> <p>In this example, we see the vMerge attribute set to on which signifies that this cell is to be merged with the previous vertical cell in the table. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TableCell](#)) is located in §A.4.1. *end note*]

21.1.3.17 tcPr (Table Cell Properties)

This element defines the formatting properties associated with a cell. The formatting options which are available to be adjusted range from the line types used for the borders to the cell fill to the margins associated with the layout of the text in the cell.

[Example: Consider the following example of a tcPr within DrawingML:

```
<a:tcPr marL="45720" marR="45720">
  <a:lnL w="38100" cap="flat" cmpd="sng" algn="ctr">
    <a:solidFill>
      <a:schemeClr val="accent2"/>
    </a:solidFill>
    <a:prstDash val="solid"/>
    <a:round/>
    <a:headEnd type="none" w="med" len="med"/>
    <a:tailEnd type="none" w="med" len="med"/>
  </a:lnL>
</a:tcPr>
```

In this example, we have a solid line defined as the left border of the cell along with left and right margin adjustments being made from the default margins. *end example*]

Attributes	Description
anchor (Anchor)	<p>Defines the alignment of the text vertically within the cell.</p> <p>[<i>Example</i>: Consider the following example:</p> <pre><a:tcPr marL="45720" anchor="ctr"/></pre> <p>In this example, the text in the cell is anchored to the center of the cell vertically. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§20.1.10.59).</p>
anchorCtr (Anchor Center)	<p>When this attribute is 1 or true , it modifies the anchor attribute. This attribute center-aligns the text box itself which allows for text to be left aligned along the center of the cell for example.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
horzOverflow (Horizontal Overflow)	<p>Specifies the clipping behavior of the cell. The two options here allow for the text to be clipped and out of view when outside of the bounds of the cell, or for the text to remain visible and overflow outside of the cell.</p> <p>[<i>Example</i>: Consider the following example:</p> <pre><a:tcPr horzOverflow="overflow"> ... </a:tcPr></pre> <p>In this example, the text in the cell freely overflows outside of the cell boundaries and always remains visible. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§20.1.10.68).</p>
marB (Bottom Margin)	<p>Specifies the bottom margin of the cell. The value specified in this attribute is the distance to offset from the bottom of the cell.</p> <p>[<i>Example</i>: Consider the following example:</p> <pre><a:tcPr marB="45720" anchor="ctr"> ... </a:tcPr></pre> <p>In this example, we have specified a value for the margin on the bottom of the cell. <i>end</i></p>

Attributes	Description
	<p><i>example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
marL (Left Margin)	<p>This attribute specifies the left margin of the cell. The value specified in this attribute is the distance to offset from the left of the cell in EMU's.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre><a:tcPr marL="45720" anchor="ctr"> ... </a:tcPr></pre> <p>In this example, we have specified a value for the margin on the left of the cell. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
marR (Right Margin)	<p>This attribute specifies the right margin of the cell. The value specified in this attribute is the distance to offset from the right of the cell in EMU's.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre><a:tcPr marR="45720" anchor="ctr"> ... </a:tcPr></pre> <p>In this example, we have specified a value for the margin on the right of the cell. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
marT (Top Margin)	<p>This attribute specifies the top margin of the cell. The value specified in this attribute is the distance to offset from the top of the cell in EMU's.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre><a:tcPr marT="45720" anchor="ctr"> ... </a:tcPr></pre> <p>In this example, we have specified a value for the margin on the top of the cell. <i>end example]</i></p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17).</p>
vert (Text Direction)	<p>Defines the text direction within the cell.</p> <p>[<i>Example:</i> Consider the following example: <code><a:tcPr vert="vert270"></code> ... <code></a:tcPr></code></p> <p>In this example, we have rotated the layout of the text 270 degrees so that it starts at the bottom of the cell and goes upward toward the top of the cell. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextVerticalType simple type (§20.1.10.82).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableCellProperties](#)) is located in §A.4.1. *end note*]

21.1.3.18 tr (Table Row)

This element defines a row in a table. A row as defined in a table is simply a listing of table cells (§21.1.3.16). There is a table row element defined for every row in the table.

[*Example:* Consider the following example of a tr within DrawingML:

```
<a:tr h="774700">
  <a:tc>
    <a:txBody>
      <a:bodyPr/>
      <a:lstStyle/>
      <a:p>
        <a:endParaRPr lang="en-US" dirty="0"/>
      </a:p>
    </a:txBody>
  </a:tcPr/>
</a:tc>
...
</a:tr>
```

In this example, we see a table row defined with an example table cell (§21.1.3.16) defined within it. The height of the row has been specified and in real use, there is a table cell defined in this row for each grid column (§21.1.3.2) defined in the table. *end example*]

Attributes	Description
h (Height)	Defines the height of the row in the table. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).

[Note: The W3C XML Schema definition of this element’s content model ([CT_TableRow](#)) is located in §A.4.1. *end note*]

21.2 DrawingML - Charts

The chart namespace in DrawingML is for representing visualizations of numeric data with column charts, pie charts, scatter charts, or other types of charts.

21.2.1 Table of Contents

This subclause is informative.

21.2.2 Elements 3358

21.2.2.1 applyToEnd (Apply to End) 3359

21.2.2.2 applyToFront (Apply To Front) 3359

21.2.2.3 applyToSides (Apply To Sides) 3359

21.2.2.4 area3DChart (3D Area Charts) 3360

21.2.2.5 areaChart (Area Charts)..... 3360

21.2.2.6 auto (Automatic Category Axis)..... 3360

21.2.2.7 autoTitleDeleted (Auto Title Is Deleted)..... 3360

21.2.2.8 autoUpdate (Update Automatically) 3361

21.2.2.9 axId (Axis ID) 3361

21.2.2.10 axPos (Axis Position) 3362

21.2.2.11 backWall (Back Wall) 3362

21.2.2.12 backward (Backward) 3362

21.2.2.13 bandFmt (Band Format) 3362

21.2.2.14 bandFmts (Band Formats) 3363

21.2.2.15 bar3DChart (3D Bar Charts)..... 3363

21.2.2.16 barChart (Bar Charts)..... 3363

21.2.2.17 barDir (Bar Direction) 3363

21.2.2.18 baseTimeUnit (Base Time Unit) 3363

21.2.2.19 bubble3D (3D Bubble) 3364

21.2.2.20 bubbleChart (Bubble Charts) 3364

21.2.2.21 bubbleScale (Bubble Scale)..... 3364

21.2.2.22 bubbleSize (Bubble Size)..... 3364

21.2.2.23 builtInUnit (Built in Display Unit Value)..... 3365

21.2.2.24	cat (Category Axis Data)	3365
21.2.2.25	catAx (Category Axis Data)	3365
21.2.2.26	chart (Reference to Chart Part)	3365
21.2.2.27	chart (Chart)	3366
21.2.2.28	chartObject (Chart Object)	3366
21.2.2.29	chartSpace (Chart Space).....	3366
21.2.2.30	clrMapOvr (Color Map Override)	3366
21.2.2.31	crossAx (Crossing Axis ID)	3368
21.2.2.32	crossBetween (Cross Between)	3369
21.2.2.33	crosses (Crosses).....	3369
21.2.2.34	crossesAt (Crossing Value).....	3369
21.2.2.35	custSplit (Custom Split).....	3370
21.2.2.36	custUnit (Custom Display Unit)	3370
21.2.2.37	data (Data Cannot Be Changed)	3370
21.2.2.38	date1904 (1904 Date System)	3371
21.2.2.39	dateAx (Date Axis)	3371
21.2.2.40	delete (Delete).....	3371
21.2.2.41	depthPercent (Depth Percent)	3372
21.2.2.42	dispBlanksAs (Display Blanks As).....	3372
21.2.2.43	dispEq (Display Equation)	3372
21.2.2.44	dispRSqr (Display R Squared Value).....	3373
21.2.2.45	dispUnits (Display Units).....	3373
21.2.2.46	dispUnitsLbl (Display Units Label)	3373
21.2.2.47	dLbl (Data Label).....	3374
21.2.2.48	dLblPos (Data Label Position)	3374
21.2.2.49	dLbls (Data Labels).....	3374
21.2.2.50	doughnutChart (Doughnut Charts).....	3374
21.2.2.51	downBars (Down Bars)	3374
21.2.2.52	dPt (Data Point)	3374
21.2.2.53	dropLines (Drop Lines).....	3375
21.2.2.54	dTable (Data Table)	3375
21.2.2.55	errBars (Error Bars).....	3375
21.2.2.56	errBarType (Error Bar Type)	3375
21.2.2.57	errDir (Error Bar Direction).....	3375
21.2.2.58	errValType (Error Bar Value Type).....	3376
21.2.2.59	evenFooter (Even Footer).....	3376
21.2.2.60	evenHeader (Even Header)	3376

21.2.3.60	ST_ThicknessPercent (Thickness Percentage)	3460

End of informative text.

21.2.2 Elements

In DrawingML, charts define a visualization of numeric data. The definition includes where the data shall come from, a cache of the data, and how the data shall be represented graphically. Other DrawingML elements are reused to define aspects of the formatting of the visualization.

See the informative material in Annex L for a description and overview of the basic chart types and chart components.

21.2.2.1 `applyToEnd` (Apply to End)

This element specifies the picture shall be applied to the end of the point or series.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.2 `applyToFront` (Apply To Front)

This element specifies the picture shall be applied to the front of the point or series.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or <code>true</code> specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or <code>false</code> specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.3 `applyToSides` (Apply To Sides)

This element specifies the picture shall be applied to the sides of the point or series.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or <code>true</code> specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or <code>false</code> specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.4 [area3DChart \(3D Area Charts\)](#)

This element specifies the 3-D area series on this chart.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Area3DChart](#)) is located in §A.5.1. *end note*]

21.2.2.5 [areaChart \(Area Charts\)](#)

This element specifies the 2-D area series on this chart.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_AreaChart](#)) is located in §A.5.1. *end note*]

21.2.2.6 [auto \(Automatic Category Axis\)](#)

This element specifies that this axis is a date or text axis based on the data that is used for the axis labels, not a specific choice.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.7 [autoTitleDeleted \(Auto Title Is Deleted\)](#)

This element specifies the title shall not be shown for this chart.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.8 [autoUpdate \(Update Automatically\)](#)

This element specifies the external data is updated automatically when the document containing the chart is opened.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.9 [axId \(Axis ID\)](#)

When specified as a child element of valAx, dateAx, catAx, or serAx, this element specifies the identifier for the axis. When specified as a child element of a chart, this element specifies the identifier of an axis that defines the coordinate space of the chart.

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. end note*]

21.2.2.10 [axPos \(Axis Position\)](#)

This element specifies the position of the axis on the chart.

Attributes	Description
val (Axis Position Value)	<p>Specifies the position of the axis on the chart.</p> <p>The possible values for this attribute are defined by the ST_AxPos simple type (§21.2.3.2).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_AxPos](#)) is located in §A.5.1. end note*]

21.2.2.11 [backWall \(Back Wall\)](#)

This element specifies the back wall of the chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_Surface](#)) is located in §A.5.1. end note*]

21.2.2.12 [backward \(Backward\)](#)

This element specifies the number of categories (or units on a scatter chart) that the trend line extends before the data for the series that is being trended. On scatter and non-scatter charts, the value shall be any non-negative value.

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. end note*]

21.2.2.13 [bandFmt \(Band Format\)](#)

This element specifies the formatting band of a surface chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_BandFmt](#)) is located in §A.5.1. end note*]

21.2.2.14 [bandFmts \(Band Formats\)](#)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

[*Note: The W3C XML Schema definition of this element's content model ([CT_BandFmts](#)) is located in §A.5.1. end note*]

21.2.2.15 [bar3DChart \(3D Bar Charts\)](#)

This element contains the 3-D bar or column series on this chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_Bar3DChart](#)) is located in §A.5.1. end note*]

21.2.2.16 [barChart \(Bar Charts\)](#)

This element contains the 2-D bar or column series on this chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_BarChart](#)) is located in §A.5.1. end note*]

21.2.2.17 [barDir \(Bar Direction\)](#)

This element specifies whether the series form a bar (horizontal) chart or a column (vertical) chart

Attributes	Description
val (Bar Direction Value)	Specifies the direction of the series. The possible values for this attribute are defined by the ST_BarDir simple type (§21.2.3.3).

[*Note: The W3C XML Schema definition of this element's content model ([CT_BarDir](#)) is located in §A.5.1. end note*]

21.2.2.18 [baseTimeUnit \(Base Time Unit\)](#)

This element specifies the smallest time unit that is represented on the date axis.

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§21.2.3.49).

[*Note: The W3C XML Schema definition of this element's content model ([CT_TimeUnit](#)) is located in §A.5.1. end note*]

21.2.2.19 [bubble3D \(3D Bubble\)](#)

This element specifies that the bubbles have a 3-D effect applied to them.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. end note*]

21.2.2.20 [bubbleChart \(Bubble Charts\)](#)

This element contains the bubble series on this chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_BubbleChart](#)) is located in §A.5.1. end note*]

21.2.2.21 [bubbleScale \(Bubble Scale\)](#)

This element specifies the scale factor for the bubble chart. This element can be a percentage value from 0 to 300, corresponding to a percentage of the default size.

Attributes	Description
val (Bubble Scale Value)	<p>Specifies how to scale bubbles on a bubble chart.</p> <p>The possible values for this attribute are defined by the ST_BubbleScale simple type (§21.2.3.5).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_BubbleScale](#)) is located in §A.5.1. end note*]

21.2.2.22 [bubbleSize \(Bubble Size\)](#)

This element specifies the data for the sizes of the bubbles on the bubble chart.

[Note: The W3C XML Schema definition of this element's content model ([CT_NumDataSource](#)) is located in §A.5.1. *end note*]

21.2.2.23 [builtInUnit \(Built in Display Unit Value\)](#)

This element specifies the display unit is one of the built in values.

Attributes	Description
val (Built In Unit Value)	Specifies the display unit scaling applied to the axis. The possible values for this attribute are defined by the ST_BuiltInUnit simple type (§21.2.3.6).

[Note: The W3C XML Schema definition of this element's content model ([CT_BuiltInUnit](#)) is located in §A.5.1. *end note*]

21.2.2.24 [cat \(Category Axis Data\)](#)

This element specifies the data used for the category axis.

[Note: The W3C XML Schema definition of this element's content model ([CT_AxDataSource](#)) is located in §A.5.1. *end note*]

21.2.2.25 [catAx \(Category Axis Data\)](#)

This element specifies the category axis of the chart.

[Note: The W3C XML Schema definition of this element's content model ([CT_CatAx](#)) is located in §A.5.1. *end note*]

21.2.2.26 [chart \(Reference to Chart Part\)](#)

This element specifies the chart.

Attributes	Description
id (Relationship Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the relationship for this Chart or Chart Drawing part. The type of relationship needed is specified by the parent element. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_RelId](#)) is located in §A.5.1. *end note*]

21.2.2.27 [chart \(Chart\)](#)

This element specifies the chart.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Chart](#)) is located in §A.5.1. *end note*]

21.2.2.28 [chartObject \(Chart Object\)](#)

This element specifies that the chart cannot be edited by the user

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.29 [chartSpace \(Chart Space\)](#)

This element specifies overall settings for a single chart, and is the root node for the chart part.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ChartSpace](#)) is located in §A.5.1. *end note*]

21.2.2.30 [clrMapOvr \(Color Map Override\)](#)

This element represents color mapping information. It is used to override the applications color mapping if the user has selected keep source formatting after a copy-paste.

Attributes	Description
accent1 (Accent 1) Namespace: http://purl.oclc.org/ooxml/drawingml/main	<p>Specifies a color defined which is associated as the accent 1 color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).</p>
accent2 (Accent 2)	<p>Specifies a color defined which is associated as the accent 2 color.</p>

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/drawingml/main	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent3 (Accent 3) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent4 (Accent 4) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent5 (Accent 5) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
accent6 (Accent 6) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg1 (Background 1) Namespace: http://purl.oclc.org/ooxml/drawingml/main	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
bg2 (Background 2) Namespace: http://purl.oclc.org/ooxml/drawingml/main	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
folHlink (Followed Hyperlink) Namespace:	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).

Attributes	Description
http://purl.oclc.org/ooxml/drawing/ml/main	
hlink (Hyperlink) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx1 (Text 1) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).
tx2 (Text 2) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14).

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1. end note]

21.2.2.31 crossAx (Crossing Axis ID)

This element specifies the ID of axis that this axis crosses. For instance, a category axis might cross a value axis, and the category axis's crossAx would contain the ID of the value axis.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. end note]

21.2.2.32 `crossBetween` (Cross Between)

This element specifies whether the value axis crosses the category axis between categories.

If not specified, then the application should choose an appropriate behavior.

Attributes	Description
val (Cross Between Value)	Specifies whether the value axis crosses the category axis between categories or on categories. The possible values for this attribute are defined by the ST_CrossBetween simple type (§21.2.3.7).

[Note: The W3C XML Schema definition of this element's content model (`CT_CrossBetween`) is located in §A.5.1. *end note*]

21.2.2.33 `crosses` (Crosses)

This element specifies how this axis crosses the perpendicular axis.

Attributes	Description
val (Crosses Value)	Specifies where the axis crosses its perpendicular axis. The possible values for this attribute are defined by the ST_Crosses simple type (§21.2.3.8).

[Note: The W3C XML Schema definition of this element's content model (`CT_Crosses`) is located in §A.5.1. *end note*]

21.2.2.34 `crossesAt` (Crossing Value)

This element specifies where on the axis the perpendicular axis crosses. The units are dependent on the type of axis.

When specified as a child element of `valAx`, the value is a decimal number on the value axis. When specified as a child element of `dateAx`, the date is defined as a integer number of days relative to the base date of the current date system. When specified as a child element of `catAx`, the value is an integer category number, starting with 1 as the first category.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.35 [custSplit \(Custom Split\)](#)

This element contains the custom split information for a pie-of-pie or bar-of-pie chart with a custom split.

[Note: The W3C XML Schema definition of this element's content model ([CT_CustSplit](#)) is located in §A.5.1. *end note*]

21.2.2.36 [custUnit \(Custom Display Unit\)](#)

This element specifies a custom value for the display unit.

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.37 [data \(Data Cannot Be Changed\)](#)

This element specifies that the user cannot change the choice of data used for the chart

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.38 [date1904 \(1904 Date System\)](#)

This element specifies that the chart uses the 1904 date system. If the 1904 date system is used, then all dates and times shall be specified as a decimal number of days since Dec. 31, 1903. If the 1904 date system is not used, then all dates and times shall be specified as a decimal number of days since Dec. 31, 1899.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.39 [dateAx \(Date Axis\)](#)

This element specifies a date axis for the chart.

[Note: The W3C XML Schema definition of this element's content model ([CT DateAx](#)) is located in §A.5.1. *end note*]

21.2.2.40 [delete \(Delete\)](#)

This element specifies that the chart element specified by its containing element shall be deleted from the chart.

This should be set to true if the application adds these elements by default even after the user has specified that they should be removed from the chart.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p>

Attributes	Description
	<p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.41 depthPercent (Depth Percent)

This element specifies the depth of a 3-D chart as a percentage of the chart width (between 20 and 2000 percent).

Attributes	Description
val (Depth Percent Value)	<p>Specifies a percentage value for the property defined by the parent XML element.</p> <p>The possible values for this attribute are defined by the ST_DepthPercent simple type (§21.2.3.9).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DepthPercent](#)) is located in §A.5.1. *end note*]

21.2.2.42 dispBlanksAs (Display Blanks As)

This element specifies how blank cells shall be plotted on a chart .

Attributes	Description
val (Display Blanks As Value)	<p>Specifies how blank cells are plotted on the chart.</p> <p>The possible values for this attribute are defined by the ST_DispBlanksAs simple type (§21.2.3.10).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DispBlanksAs](#)) is located in §A.5.1. *end note*]

21.2.2.43 dispEq (Display Equation)

This element specifies that the equation for the trendline is displayed on the chart (in the same label as the R-squared value).

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.44 [dispRSqr \(Display R Squared Value\)](#)

This element specifies that the R-squared value of the trendline is displayed on the chart (in the same label as the equation).

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.45 [dispUnits \(Display Units\)](#)

This element specifies the scaling value of the display units for the value axis.

[Note: The W3C XML Schema definition of this element's content model ([CT DispUnits](#)) is located in §A.5.1. *end note*]

21.2.2.46 [dispUnitsLbl \(Display Units Label\)](#)

This element specifies the display unit label for the value axis in the specified chart.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_DispUnitsLbl](#)) is located in §A.5.1. *end note*]

21.2.2.47 [dLbl \(Data Label\)](#)

This element specifies a data label.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_DLbl](#)) is located in §A.5.1. *end note*]

21.2.2.48 [dLblPos \(Data Label Position\)](#)

This element specifies the position of the data label.

Attributes	Description
val (Data Label Position Value)	Specifies how the data label is positioned on the chart. The possible values for this attribute are defined by the ST_DLblPos simple type (§21.2.3.11).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_DLblPos](#)) is located in §A.5.1. *end note*]

21.2.2.49 [dLbls \(Data Labels\)](#)

This element serves as a root element that specifies the settings for the data labels for an entire series or the entire chart. It contains child elements that specify the specific formatting and positioning settings.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_DLbls](#)) is located in §A.5.1. *end note*]

21.2.2.50 [doughnutChart \(Doughnut Charts\)](#)

This element contains the doughnut chart series.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_DoughnutChart](#)) is located in §A.5.1. *end note*]

21.2.2.51 [downBars \(Down Bars\)](#)

This element specifies the down bars.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_UpDownBar](#)) is located in §A.5.1. *end note*]

21.2.2.52 [dPt \(Data Point\)](#)

This element specifies a single data point.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_DPt](#)) is located in §A.5.1. *end note*]

21.2.2.53 `dropLines` (Drop Lines)

This element specifies drop lines.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ChartLines](#)) is located in §A.5.1. *end note*]

21.2.2.54 `dTable` (Data Table)

This element specifies a data table.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DTable](#)) is located in §A.5.1. *end note*]

21.2.2.55 `errBars` (Error Bars)

This element specifies error bars. The `errValType` element controls whether the `minus`, `plus`, or `val` elements are used.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ErrBars](#)) is located in §A.5.1. *end note*]

21.2.2.56 `errBarType` (Error Bar Type)

This element specifies the style of the error bars - positive, negative, or both.

Attributes	Description
<code>val</code> (Error Bar Type Value)	Specifies the style of error bars. The possible values for this attribute are defined by the <code>ST_ErrBarType</code> simple type (§21.2.3.12).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ErrBarType](#)) is located in §A.5.1. *end note*]

21.2.2.57 `errDir` (Error Bar Direction)

This element specifies the direction of the error bars.

Attributes	Description
<code>val</code> (Error Bar Direction Value)	Specifies the direction of the error bars. The possible values for this attribute are defined by the <code>ST_ErrDir</code> simple type (§21.2.3.13).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ErrDir](#)) is located in §A.5.1. *end note*]

21.2.2.58 `errValType` (Error Bar Value Type)

This element specifies the type of values used to determine the length of the error bars.

Attributes	Description
val (Error Bar Type Value)	<p>Specifies the type of values of the error bars.</p> <p>The possible values for this attribute are defined by the ST_ErrValType simple type (§21.2.3.14).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ErrValType](#)) is located in §A.5.1. *end note*]

21.2.2.59 `evenFooter` (Even Footer)

This element specifies the footer to use on even numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.60 `evenHeader` (Even Header)

This element specifies the header to use on even numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.61 explosion (Explosion)

This element specifies the amount the data point shall be moved from the center of the pie.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. *end note*]

21.2.2.62 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that are used for later versions of generating applications.

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the W3C XML Schema token datatype.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Extension](#)) is located in §A.5.1. *end note*]

21.2.2.63 externalData (External Data Relationship)

This element specifies the relationship to the data for this chart.

The data can be linked, pointing to a spreadsheet in another file. Or, the data can be embedded, contained in a separate part within the same xml package containing the chart. In this case, it shall be stored as an embedded Spreadsheet object in Office Open XML format.

This is not used by a spreadsheet application as the spreadsheet application can maintain its own reference to the data in the spreadsheet via the formula <f> element.

Attributes	Description
id (Relationship Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID for the relationship for this chart. The relationship explicitly targeted by this attribute shall either be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/package, or http://schemas.openxmlformats.org/officeDocument/2006/relationships/oleObject. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ExternalData](#)) is located in §A.5.1. *end note*]

21.2.2.64 extLst (Chart Extensibility)

This element contains tags used for future extensibility of the file format.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ExtensionList](#)) is located in §A.5.1. *end note*]

21.2.2.65 f (Formula)

This element specifies a reference to source of the data contained in this chart. This shall be used by the spreadsheet application only. A presentation, or word processing application should use the externalData element.

This reference is in the form of a book, sheet, and cell reference or a book, optional sheet, and defined name reference. This reference does not include the equals sign. [*Example*:

```

<c:cat>
  <c:strRef>
    <c:f>Sheet1!$A$1:$C$1</c:f>
    <c:strCache>
      ...
    </c:strCache>
  </c:strRef>
</c:cat>

```

The above example shows a formula reference used for the string cache. In this case the series names, which are referenced by the formula element, are in cells A1, B1, and C1.

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

21.2.2.66 firstFooter (First Footer)

This element specifies the footer to use on the first page.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.67 firstHeader (First Header)

This element specifies the header to use on the first page.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.68 firstSliceAng (First Slice Angle)

This element specifies the angle of the first pie or doughnut chart slice, in degrees (clockwise from up).

Attributes	Description
val (First Slice Angle Value)	Specifies the angle of the first slice. The possible values for this attribute are defined by the ST_FirstSliceAng simple type (§21.2.3.15).

[Note: The W3C XML Schema definition of this element's content model ([CT_FirstSliceAng](#)) is located in §A.5.1. *end note*]

21.2.2.69 floor (Floor)

This element specifies the floor of a 3D chart.

[Note: The W3C XML Schema definition of this element's content model ([CT_Surface](#)) is located in §A.5.1. *end note*]

21.2.2.70 fmtId (Format ID)

This element represents a pivot format ID. It serves as a link back to the correct pivotTable which in turn specifies a link that then defines which set of chart format rules apply to this chart.

This ID shall match the chartFormat element, chart attribute, described in §18.10.1.12 of the SpreadsheetML reference material. The chartFormat element also contains a format attribute which is used to index into the pivotFmts collection (§21.2.2.143).

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number.

Attributes	Description
	<p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. *end note*]

21.2.2.71 [formatCode \(Format Code\)](#)

This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§18.8.30) formatCode attribute.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.72 [formatting \(Formatting\)](#)

This element specifies that a user cannot change formatting on chart elements.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.73 [forward \(Forward\)](#)

This element specifies the number of categories (or units on a scatter chart) that the trendline extends after the data for the series that is being trended. On scatter and non-scatter charts, the value shall be any non-negative value.

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.74 [gapDepth \(Gap Depth\)](#)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Attributes	Description
val (Gap Size Value)	<p>Specifies that the contents of this attribute contain a gap amount between 0% and 500%.</p> <p>The possible values for this attribute are defined by the ST_GapAmount simple type (§21.2.3.16).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GapAmount](#)) is located in §A.5.1. *end note*]

21.2.2.75 [gapWidth \(Gap Width\)](#)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Attributes	Description
val (Gap Size Value)	<p>Specifies that the contents of this attribute contain a gap amount between 0% and 500%.</p> <p>The possible values for this attribute are defined by the ST_GapAmount simple type (§21.2.3.16).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GapAmount](#)) is located in §A.5.1. *end note*]

21.2.2.76 [grouping \(Grouping\)](#)

This element specifies the kind of grouping for a column, line, or area chart.

Attributes	Description
val (Grouping	Specifies the grouping value.

Attributes	Description
Value)	The possible values for this attribute are defined by the ST_Grouping simple type (§21.2.3.17).

[Note: The W3C XML Schema definition of this element's content model ([CT_Grouping](#)) is located in §A.5.1. *end note*]

21.2.2.77 grouping (Bar Grouping)

This element specifies the kind of grouping for a bar chart.

Attributes	Description
val (Bar Grouping Value)	Specifies the bar grouping value. The possible values for this attribute are defined by the ST_BarGrouping simple type (§21.2.3.4).

[Note: The W3C XML Schema definition of this element's content model ([CT_BarGrouping](#)) is located in §A.5.1. *end note*]

21.2.2.78 h (Height)

This element specifies the height (if Height Mode is Factor) or bottom (if Height Mode is edge) of the chart element as a fraction of the height of the chart.

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.79 headerFooter (Header and Footer)

This element specifies the headers and footers that shall be used when the chart is printed.

Attributes	Description
alignWithMargins	Specifies the header and footer should align with the left and right margins of the chart.

Attributes	Description
(Align With Margins)	<p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
differentFirst (Different First)	<p>Specifies the header and footer are different for the first page.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
differentOddEven (Different Odd Even)	<p>Specifies the header and footer are different on odd-numbered pages and even-numbered pages.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_HeaderFooter](#)) is located in §A.5.1. *end note*]

21.2.2.80 [hiLowLines \(High Low Lines\)](#)

This element specifies the high-low lines for the series.

[Note: The W3C XML Schema definition of this element's content model ([CT_ChartLines](#)) is located in §A.5.1. *end note*]

21.2.2.81 [hMode \(Height Mode\)](#)

This element specifies how to interpret the Height element for this manual layout.

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§21.2.3.20).

[Note: The W3C XML Schema definition of this element's content model ([CT_LayoutMode](#)) is located in §A.5.1. *end note*]

21.2.2.82 holeSize (Hole Size)

This element specifies the size of the hole in a doughnut chart group.

Attributes	Description
val (Hole Size Value)	Specifies that the contents of this attribute contain a hole size between 10% and 90% of the size of the plot area. The possible values for this attribute are defined by the ST_HoleSize simple type (§21.2.3.18).

[Note: The W3C XML Schema definition of this element's content model ([CT_HoleSize](#)) is located in §A.5.1. *end note*]

21.2.2.83 hPercent (Height Percent)

This element specifies the height of a 3-D chart as a percentage of the chart width.

Attributes	Description
val (Height Percent Value)	Specifies that the contents of this attribute contain a height percent between 5% and 500%. The possible values for this attribute are defined by the ST_HPercent simple type (§21.2.3.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_HPercent](#)) is located in §A.5.1. *end note*]

21.2.2.84 idx (Index)

This element specifies the index of the containing element. This index shall determine which of the parent's children collection this element applies to.

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute contain an integer number.

Attributes	Description
	<p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. *end note*]

21.2.2.85 [intercept \(Intercept\)](#)

This element specifies the value where the trendline shall cross the y axis. This property shall be supported only when the trendline type is exp, linear, or poly.

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.86 [invertIfNegative \(Invert if Negative\)](#)

This element specifies the parent element shall invert its colors if the value is negative.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. end note*]

21.2.2.87 [lang \(Editing Language\)](#)

This element specifies the primary editing language which was use when this chart was last modified.

Attributes	Description
val (Language Code)	Specifies a language tag as defined by RFC 3066. See simple type for additional information. The possible values for this attribute are defined by the ST_Lang simple type (§22.9.2.6).

[*Note: The W3C XML Schema definition of this element's content model ([CT_TextLanguageID](#)) is located in §A.5.1. end note*]

21.2.2.88 [layout \(Layout\)](#)

This element specifies how the chart element is placed on the chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_Layout](#)) is located in §A.5.1. end note*]

21.2.2.89 [layoutTarget \(Layout Target\)](#)

This element specifies whether to layout the plot area by its inside (not including axis and axis labels) or outside (including axis and axis labels).

Attributes	Description
val (Layout Target Value)	Specifies the layout target value. The possible values for this attribute are defined by the ST_LayoutTarget simple type (§21.2.3.21).

[*Note: The W3C XML Schema definition of this element's content model ([CT_LayoutTarget](#)) is located in §A.5.1. end note*]

21.2.2.90 [lblAlign \(Label Alignment\)](#)

This element specifies the text alignment for the tick labels on the axis.

Attributes	Description
val (Label Alignment Value)	Specifies the label alignment. The possible values for this attribute are defined by the ST_LblAlign simple type (§21.2.3.22).

[*Note: The W3C XML Schema definition of this element's content model ([CT_LblAlign](#)) is located in §A.5.1. end note*]

21.2.2.91 [lblOffset \(Label Offset\)](#)

This element specifies the distance of labels from the axis.

Attributes	Description
val (Label Offset Value)	Specifies the distance of labels from the axis. Shall contain a percentage between 0% and 1000%. The possible values for this attribute are defined by the ST_LblOffset simple type (§21.2.3.23).

[*Note: The W3C XML Schema definition of this element's content model ([CT_LblOffset](#)) is located in §A.5.1. end note*]

21.2.2.92 [leaderLines \(Leader Lines\)](#)

This element specifies the leader lines for data labels.

[*Note: The W3C XML Schema definition of this element's content model ([CT_ChartLines](#)) is located in §A.5.1. end note*]

21.2.2.93 [legend \(Legend\)](#)

This element specifies the legend.

[*Note: The W3C XML Schema definition of this element's content model ([CT_Legend](#)) is located in §A.5.1. end note*]

21.2.2.94 [legendEntry \(Legend Entry\)](#)

This element specifies a legend entry.

[*Note: The W3C XML Schema definition of this element's content model ([CT_LegendEntry](#)) is located in §A.5.1. end note*]

21.2.2.95 [legendPos \(Legend Position\)](#)

This element specifies the position of the legend.

Attributes	Description
val (Legend Position Value)	Specifies the position of the legend. The possible values for this attribute are defined by the ST_LegendPos simple type

Attributes	Description
	(§21.2.3.24).

[Note: The W3C XML Schema definition of this element's content model ([CT_LegendPos](#)) is located in §A.5.1. *end note*]

21.2.2.96 [line3DChart \(3D Line Charts\)](#)

This element contains the 3-D line chart series.

[Note: The W3C XML Schema definition of this element's content model ([CT_Line3DChart](#)) is located in §A.5.1. *end note*]

21.2.2.97 [lineChart \(Line Charts\)](#)

This element contains the 2-D line chart series.

[Note: The W3C XML Schema definition of this element's content model ([CT_LineChart](#)) is located in §A.5.1. *end note*]

21.2.2.98 [logBase \(Logarithmic Base\)](#)

This element specifies the logarithmic base for a logarithmic axis.

Attributes	Description
val (Logarithmic Base Value)	Specifies the logarithmic base for a logarithmic axis. Shall contain a floating point value greater than or equal to 2. The possible values for this attribute are defined by the ST_LogBase simple type (§21.2.3.25).

[Note: The W3C XML Schema definition of this element's content model ([CT_LogBase](#)) is located in §A.5.1. *end note*]

21.2.2.99 [lvl \(Level\)](#)

This element specifies data for a single level of labels for a category axis.

[Note: The W3C XML Schema definition of this element's content model ([CT_Lvl](#)) is located in §A.5.1. *end note*]

21.2.2.100 [majorGridlines \(Major Gridlines\)](#)

This element specifies major gridlines.

[Note: The W3C XML Schema definition of this element's content model ([CT_ChartLines](#)) is located in §A.5.1. *end note*]

21.2.2.101 `majorTickMark` (Major Tick Mark)

This element specifies the major tick marks.

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position. The possible values for this attribute are defined by the ST_TickMark simple type (§21.2.3.48).

[Note: The W3C XML Schema definition of this element's content model ([CT_TickMark](#)) is located in §A.5.1. *end note*]

21.2.2.102 `majorTimeUnit` (Major Time Unit)

This element specifies the time unit for major tick marks.

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§21.2.3.49).

[Note: The W3C XML Schema definition of this element's content model ([CT_TimeUnit](#)) is located in §A.5.1. *end note*]

21.2.2.103 `majorUnit` (Major Unit)

This element specifies the distance between major ticks.

Attributes	Description
val (Major Unit Value)	Specifies the distance between major ticks. Shall contain a positive floating-point number. The possible values for this attribute are defined by the ST_AxisUnit simple type (§21.2.3.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_AxisUnit](#)) is located in §A.5.1. *end note*]

21.2.2.104 `manualLayout` (Manual Layout)

This element specifies the exact position of a chart element.

[Note: The W3C XML Schema definition of this element's content model ([CT_ManualLayout](#)) is located in §A.5.1. *end note*]

21.2.2.105 [marker \(Show Marker\)](#)

This element is a Boolean that, when `true`, specifies that the marker shall be shown.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of <code>1</code> or <code>true</code> specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of <code>0</code> or <code>false</code> specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.106 [marker \(Marker\)](#)

This element specifies a data marker.

[Note: The W3C XML Schema definition of this element's content model ([CT_Marker](#)) is located in §A.5.1. *end note*]

21.2.2.107 [max \(Maximum\)](#)

This element specifies the maximum value of the axis.

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.108 min (Minimum)

This element specifies the minimum value of the axis.

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Double](#)) is located in §A.5.1. *end note*]

21.2.2.109 minorGridlines (Minor Gridlines)

This element specifies the minor gridlines.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ChartLines](#)) is located in §A.5.1. *end note*]

21.2.2.110 minorTickMark (Minor Tick Mark)

This element specifies the minor tick marks for the axis.

Attributes	Description
val (Tick Mark Value)	<p>Specifies the minor tick mark position.</p> <p>The possible values for this attribute are defined by the ST_TickMark simple type (§21.2.3.48).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TickMark](#)) is located in §A.5.1. *end note*]

21.2.2.111 minorTimeUnit (Minor Time Unit)

This element specifies the time unit for the minor tick marks.

Attributes	Description
val (Time Unit Value)	<p>Specifies the time unit for the tick marks.</p> <p>The possible values for this attribute are defined by the ST_TimeUnit simple type (§21.2.3.49).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TimeUnit](#)) is located in §A.5.1. *end note*]

21.2.2.112 [minorUnit \(Minor Unit\)](#)

This element specifies the distance between minor tick marks.

Attributes	Description
val (Minor Unit Value)	Specifies the distance between minor tick marks. Shall contain a positive floating-point number. The possible values for this attribute are defined by the ST_AxisUnit simple type (§21.2.3.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_AxisUnit](#)) is located in §A.5.1. *end note*]

21.2.2.113 [minus \(Minus\)](#)

This element specifies the error bar value in the negative direction. It shall be used only when the errValType is cust.

[Note: The W3C XML Schema definition of this element's content model ([CT_NumDataSource](#)) is located in §A.5.1. *end note*]

21.2.2.114 [multiLvlStrCache \(Multi Level String Cache\)](#)

This element specifies the last data shown on the chart for a category axis.

[Note: The W3C XML Schema definition of this element's content model ([CT_MultiLvlStrData](#)) is located in §A.5.1. *end note*]

21.2.2.115 [multiLvlStrRef \(Multi Level String Reference\)](#)

This element specifies a reference to data for the category axis with a cache of the last values used.

[Note: The W3C XML Schema definition of this element's content model ([CT_MultiLvlStrRef](#)) is located in §A.5.1. *end note*]

21.2.2.116 [name \(Trendline Name\)](#)

This element specifies the name of the trendline.

The possible values for this element are defined by the W3C XML Schema string datatype.

21.2.2.117 [name \(Pivot Name\)](#)

This element specifies the name of the pivot table to get the data for the chart from.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element’s content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.118 noEndCap (No End Cap)

This element specifies an end cap is not drawn on the error bars.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.119 noMultiLvlLbl (No Multi-level Labels)

This element specifies the labels shall be shown as flat text. If this element is not included or is set to false, then the labels shall be drawn as a hierarchy.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.120 numCache (Number Cache)

This element specifies the last data shown on the chart for a series.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NumData](#)) is located in §A.5.1. *end note*]

21.2.2.121 numFmt (Number Format)

This element specifies number formatting for the parent element.

Attributes	Description
formatCode (Number Format Code)	<p>This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§18.8.30) formatCode attribute.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
sourceLinked (Linked to Source)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NumFmt](#)) is located in §A.5.1. *end note*]

21.2.2.122 numLit (Number Literal)

This element specifies a set of numbers used for the parent element.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NumData](#)) is located in §A.5.1. *end note*]

21.2.2.123 numRef (Number Reference)

This element specifies a reference to numeric data with a cache of the last values used.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NumRef](#)) is located in §A.5.1. *end note*]

21.2.2.124 oddFooter (Odd Footer)

This element specifies the footer to use on odd numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.125 oddHeader (Odd Header)

This element specifies the header to use on odd numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

21.2.2.126 ofPieChart (Pie of Pie or Bar of Pie Charts)

This element contains the pie of pie or bar of pie series on this chart. Only the first series shall be displayed. The splitType element shall determine whether the splitPos and custSplit elements apply.

[Note: The W3C XML Schema definition of this element's content model ([CT_OfPieChart](#)) is located in §A.5.1. *end note*]

21.2.2.127 ofPieType (Pie of Pie or Bar of Pie Type)

This element specifies whether this chart is pie of pie or bar of pie.

Attributes	Description
val (Pie of Pie or Bar of Pie Type Value)	<p>Specifies the type of pie of pie or bar of pie chart.</p> <p>The possible values for this attribute are defined by the ST_OfPieType simple type (§21.2.3.28).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_OfPieType](#)) is located in §A.5.1. *end note*]

21.2.2.128 order (Order)

This element specifies the order of the series in the collection. It is 0 based.

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. *end note*]

21.2.2.129 order (Polynomial Trendline Order)

This element specifies the order of the polynomial trend line. It is ignored for other trend line types.

Attributes	Description
val (Order Value)	<p>Specifies that the contents of this attribute contain an integer between 2 and 6.</p> <p>The possible values for this attribute are defined by the ST_Order simple type (§21.2.3.29).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Order](#)) is located in §A.5.1. *end note*]

21.2.2.130 orientation (Axis Orientation)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

Attributes	Description
val (Orientation Value)	<p>Specifies the orientation of the axis.</p> <p>The possible values for this attribute are defined by the ST_Orientation simple type (§21.2.3.30).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Orientation](#)) is located in §A.5.1. *end note*]

21.2.2.131 [overlap \(Overlap\)](#)

This element specifies how much bars and columns shall overlap on 2-D charts.

Attributes	Description
val (Overlap Value)	<p>Specifies how much bars and columns shall overlap on 2-D charts. Shall contain a percentage between -100% and 100%.</p> <p>The possible values for this attribute are defined by the ST_Overlap simple type (§21.2.3.31).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Overlap](#)) is located in §A.5.1. *end note*]

21.2.2.132 [overlay \(Overlay\)](#)

This element specifies that other chart elements shall be allowed to overlap this chart element.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.133 `pageMargins` (Page Margins)

This element specifies the page margins for a chart.

Attributes	Description
b (Bottom)	Specifies the bottom page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
footer (Footer)	Specifies the footer margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
header (Header)	Specifies the header margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
l (Left)	Specifies the left page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
r (Right)	Specifies the right page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
t (Top)	Specifies the top page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PageMargins](#)) is located in §A.5.1.
end note]

21.2.2.134 `pageSetup` (Page Setup)

This element defines the page setup for the chart.

[*Example*: The following example shows the `pageSetup` element for ISO A0 paper, printed in black and white, with graphics:

```
<pageSetup blackAndWhite="true" draft="false" paperHeight="1189mm"
  paperWidth="841mm"/>
```

end example]

Attributes	Description																																
blackAndWhite (Black and White)	<p>Specifies the page shall print in black and white.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																																
copies (Copies)	<p>Specifies the number of copies that shall be printed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>																																
draft (Draft)	<p>Specifies the page shall be printed in draft mode.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																																
firstPageNumber (First Page Number)	<p>Specifies the page number.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>																																
horizontalDpi (Horizontal DPI)	<p>Specifies the horizontal resolution to print in dots per inch.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>																																
orientation (Orientation)	<p>Specifies the orientation of the paper.</p> <p>The possible values for this attribute are defined by the ST_PageSetupOrientation simple type (§21.2.3.32).</p>																																
paperHeight (Paper Height)	<p>Height of custom paper as a number followed by a unit identifier. <i>[Example: 297mm, 11in end example]</i></p> <p>When paperHeight and paperWidth are specified, paperSize shall be ignored.</p> <p>The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).</p>

<p>When paperHeight and paperWidth are specified, paperSize should be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>				

Attributes	Description
	datatype.
paperWidth (Paper Width)	<p>Width of custom paper as a number followed by a unit identifier. [Example: 21cm, 8.5in end example]</p> <p>When paperHeight and paperWidth are specified, paperSize shall be ignored.</p> <p>The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).</p>
useFirstPageNumber (Use First Page Number)	<p>Specifies to use the first page number instead of automatically generating a page number.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
verticalDpi (Vertical DPI)	<p>Specifies the vertical resolution to print in dots per inch.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PageSetup](#)) is located in §A.5.1. end note]

21.2.2.135 period (Period)

This element specifies the period of the trend line for a moving average trend line. It is ignored for other trend line variants.

Attributes	Description
val (Period Value)	<p>Specifies the period of the trend line for a moving average trend line. Shall contain an integer between 2 and 255.</p> <p>The possible values for this attribute are defined by the ST_Period simple type (§21.2.3.33).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Period](#)) is located in §A.5.1. end note]

21.2.2.136 perspective (Perspective)

This element specifies the field of view angle for the 3-D chart. This element is ignored if Right Angle Axes is true.

Attributes	Description
val (Perspective)	Specifies the field of view angle for the 3-D chart. Shall contain an integer between 0

Attributes	Description
Value)	and 240, whose unit is one-half degrees. The possible values for this attribute are defined by the ST_Perspective simple type (§21.2.3.34).

[Note: The W3C XML Schema definition of this element's content model ([CT_Perspective](#)) is located in §A.5.1. *end note*]

21.2.2.137 [pictureFormat](#) (Picture Format)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

Attributes	Description
val (Picture Format Value)	Specifies the stretching and stacking of the picture. The possible values for this attribute are defined by the ST_PictureFormat simple type (§21.2.3.35).

[Note: The W3C XML Schema definition of this element's content model ([CT_PictureFormat](#)) is located in §A.5.1. *end note*]

21.2.2.138 [pictureOptions](#) (Picture Options)

This element specifies the picture to be used on the data point, series, wall, or floor.

[Note: The W3C XML Schema definition of this element's content model ([CT_PictureOptions](#)) is located in §A.5.1. *end note*]

21.2.2.139 [pictureStackUnit](#) (Picture Stack Unit)

This element specifies the unit for each picture on the chart. This element applies only if the Picture Format is Stack and Scale.

Attributes	Description
val (Picture Stack Unit)	Specifies the unit for each picture on the chart. Shall contain a floating point number. The possible values for this attribute are defined by the ST_PictureStackUnit simple type (§21.2.3.36).

[Note: The W3C XML Schema definition of this element's content model ([CT_PictureStackUnit](#)) is located in §A.5.1. *end note*]

21.2.2.140 pie3DChart (3D Pie Charts)

This element contains the 3-D pie series for this chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Pie3DChart](#)) is located in §A.5.1. *end note*]

21.2.2.141 pieChart (Pie Charts)

This element contains the 2-D pie series for this chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PieChart](#)) is located in §A.5.1. *end note*]

21.2.2.142 pivotFmt (Pivot Format)

This element contains a set of formatting to be applied to the chart that is based on a pivotTable.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PivotFmt](#)) is located in §A.5.1. *end note*]

21.2.2.143 pivotFmts (Pivot Formats)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PivotFmts](#)) is located in §A.5.1. *end note*]

21.2.2.144 pivotSource (Pivot Source)

This element specifies the source pivot table for a pivot chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PivotSource](#)) is located in §A.5.1. *end note*]

21.2.2.145 plotArea (Plot Area)

This element specifies the plot area of the chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PlotArea](#)) is located in §A.5.1. *end note*]

21.2.2.146 plotVisOnly (Plot Visible Only)

This element specifies that only visible cells should be plotted on the chart.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is</p>

Attributes	Description
	<p>omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.147 plus (Plus)

This element specifies the error bar value in the positive direction. It shall be used only when the errValType is cust.

[Note: The W3C XML Schema definition of this element's content model ([CT_NumDataSource](#)) is located in §A.5.1. *end note*]

21.2.2.148 printSettings (Print Settings)

This element specifies the print settings for the chart.

[Note: The W3C XML Schema definition of this element's content model ([CT_PrintSettings](#)) is located in §A.5.1. *end note*]

21.2.2.149 protection (Protection)

This element specifies protection for the chart. If the chart is on a protected worksheet or chart sheet, then these settings shall control how a user is able to interact with the chart.

[Note: The W3C XML Schema definition of this element's content model ([CT_Protection](#)) is located in §A.5.1. *end note*]

21.2.2.150 pt (Numeric Point)

This element specifies data for a particular data point.

Attributes	Description
formatCode (Number Format)	<p>A string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§18.8.30) formatCode attribute.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
idx (Index)	<p>The index of the series in the collection</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_NumVal](#)) is located in §A.5.1. *end note*]

21.2.2.151 `pt` (String Point)

This element specifies string data for a specific data point.

Attributes	Description
idx (Index)	<p>A 0 based index into a set of points. Represents the data point number this data is for.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_StrVal](#)) is located in §A.5.1. *end note*]

21.2.2.152 `ptCount` (Point Count)

This element contains the number of values in the cache.

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. *end note*]

21.2.2.153 `radarChart` (Radar Charts)

This element contains the radar chart series on this chart.

[Note: The W3C XML Schema definition of this element's content model ([CT_RadarChart](#)) is located in §A.5.1. *end note*]

21.2.2.154 `radarStyle` (Radar Style)

This element specifies what type of radar chart shall be drawn.

Attributes	Description
val (Radar Style Value)	<p>Specifies the style of the radar chart.</p> <p>The possible values for this attribute are defined by the ST_RadarStyle simple type (§21.2.3.37).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RadarStyle](#)) is located in §A.5.1. *end note*]

21.2.2.155 [rAngAx \(Right Angle Axes\)](#)

This element specifies that the chart axes are at right angles, rather than drawn in perspective. Applies only to 3-D charts.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.156 [rich \(Rich Text\)](#)

This element contains a string with rich text formatting.

[Note: The W3C XML Schema definition of this element's content model ([CT_TextBody](#)) is located in §A.4.1. *end note*]

21.2.2.157 [rotX \(X Rotation\)](#)

This element specifies the amount a 3-D chart shall be rotated in the X direction.

Attributes	Description
val (X Rotation Value)	<p>Specifies the amount a 3-D chart shall be rotated in the X direction. Shall contain an integer between -90 and 90.</p> <p>The possible values for this attribute are defined by the ST_RotX simple type</p>

Attributes	Description
	(§21.2.3.38).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RotX](#)) is located in §A.5.1. *end note*]

21.2.2.158 [rotY \(Y Rotation\)](#)

This element specifies the amount a 3-D chart shall be rotated in the Y direction.

Attributes	Description
val (Y Rotation Value)	Specifies the amount a 3-D chart shall be rotated in the Y direction. Shall contain an integer between 0 and 360. The possible values for this attribute are defined by the ST_RotY simple type (§21.2.3.39).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RotY](#)) is located in §A.5.1. *end note*]

21.2.2.159 [roundedCorners \(Rounded Corners\)](#)

This element specifies the chart area shall have rounded corners.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of 0 or false specifies that the property is not applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.160 [scaling \(Scaling\)](#)

This element contains additional axis settings.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Scaling](#)) is located in §A.5.1. *end note*]

21.2.2.161 `scatterChart` (Scatter Charts)

This element contains the scatter chart series for this chart.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ScatterChart](#)) is located in §A.5.1. *end note*]

21.2.2.162 `scatterStyle` (Scatter Style)

This element specifies the kind of lines for the scatter chart.

Attributes	Description
val (Scatter Style Value)	<p>Specifies the style of the scatter chart.</p> <p>The possible values for this attribute are defined by the ST_ScatterStyle simple type (§21.2.3.40).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ScatterStyle](#)) is located in §A.5.1. *end note*]

21.2.2.163 `secondPiePt` (Second Pie Point)

This element specifies a data point that shall be drawn in the second pie or bar in a pie of pie or bar of pie chart.

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_UnsignedInt](#)) is located in §A.5.1. *end note*]

21.2.2.164 `secondPieSize` (Second Pie Size)

This element specifies the size of the second pie or bar of a pie of pie chart or a bar of pie chart.

Attributes	Description
val (Second Pie Size Value)	<p>Specifies the second pie or bar of a pie of pie chart or a bar of pie chart, as a percentage of the size of the first pie. Shall contain a percentage between 5% and 200%.</p> <p>The possible values for this attribute are defined by the ST_SecondPieSize simple type (§21.2.3.41).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_SecondPieSize](#)) is located in §A.5.1. end note*]

21.2.2.165 [selection \(Selection\)](#)

This element specifies the chart elements are protected from selection.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. end note*]

21.2.2.166 [separator \(Separator\)](#)

This element specifies text that shall be used to separate the parts of a data label. The default is a comma, except for pie charts showing only category name and percentage, when a line break shall be used instead.

The possible values for this element are defined by the W3C XML Schema string datatype.

21.2.2.167 [ser \(Scatter Chart Series\)](#)

This element specifies a series on a scatter chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_ScatterSer](#)) is located in §A.5.1. end note*]

21.2.2.168 [ser \(Area Chart Series\)](#)

This element specifies a series on an area chart.

[*Note: The W3C XML Schema definition of this element's content model ([CT_AreaSer](#)) is located in §A.5.1. end note*]

21.2.2.169 [ser \(Radar Chart Series\)](#)

This element specifies a series on a radar chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_RadarSer](#)) is located in §A.5.1. *end note*]

21.2.2.170 [ser](#) (Bar Chart Series)

This element specifies a series on a bar chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_BarSer](#)) is located in §A.5.1. *end note*]

21.2.2.171 [ser](#) (Line Chart Series)

This element specifies a series on a line chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_LineSer](#)) is located in §A.5.1. *end note*]

21.2.2.172 [ser](#) (Pie Chart Series)

This element specifies a series on a doughnut or pie chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PieSer](#)) is located in §A.5.1. *end note*]

21.2.2.173 [ser](#) (Surface Chart Series)

This element specifies a series on a surface chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SurfaceSer](#)) is located in §A.5.1. *end note*]

21.2.2.174 [ser](#) (Bubble Chart Series)

This element specifies a series on a bubble chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_BubbleSer](#)) is located in §A.5.1. *end note*]

21.2.2.175 [serAx](#) (Series Axis)

This element specifies a series axis for the chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SerAx](#)) is located in §A.5.1. *end note*]

21.2.2.176 [serLines](#) (Series Lines)

This element specifies series lines for the chart.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ChartLines](#)) is located in §A.5.1. *end note*]

21.2.2.177 `shape` (Shape)

This element specifies the shape of a series or a 3-D bar chart.

Attributes	Description
val (Shape Value)	<p>Specifies the shape of the series.</p> <p>The possible values for this attribute are defined by the ST_Shape simple type (§21.2.3.42).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Shape](#)) is located in §A.5.1. *end note*]

21.2.2.178 `showBubbleSize` (Show Bubble Size)

This element specifies the bubble size shall be shown in a data label.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.179 `showCatName` (Show Category Name)

This element specifies that the category name shall be shown in the data label.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.180 [showDLblsOverMax \(Show Data Labels over Maximum\)](#)

This element specifies data labels over the maximum of the chart shall be shown.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.181 [showHorzBorder \(Show Horizontal Border\)](#)

This element specifies the horizontal borders shall be shown in a data table.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.182 showKeys (Show Legend Keys)

This element specifies the legend keys shall be shown in a data table.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.183 showLeaderLines (Show Leader Lines)

This element specifies leader lines shall be shown for data labels.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.184 showLegendKey (Show Legend Key)

This element specifies legend keys shall be shown in data labels.

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.5.1. *end note*]

21.2.2.185 [showNegBubbles \(Show Negative Bubbles\)](#)

This element specifies negative sized bubbles shall be shown on a bubble chart.

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
