If this element is omitted, then no write protection shall be applied to the current document.

[*Example:* Consider a WordprocessingML document that can be opened but only in a write protected state unless a password is provided, in which case the file would be opened in an editable state. This requirement would be specified using the following WordprocessingML in the document settings:

```
<w:writeProtection w:hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

If the attributes specified in the password attribute group AG_Password are present, then the application shall require a password to exit write protection. If the hash value derived from supplied password does not match the hash value in the attribute hashValue, then write protection shall be enabled. *end example*

Attributes	Description																		
algorithmName (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value.</p> <p>The following values are reserved:</p> <table> <tr> <th>Value</th><th>Algorithm</th></tr> <tr> <td>MD2</td><td> <p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>MD4</td><td> <p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>MD5</td><td> <p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>RIPEMD-128</td><td> <p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>RIPEMD-160</td><td> <p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td>SHA-1</td><td> <p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td>SHA-256</td><td> <p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td>SHA-384</td><td> <p>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> </table>	Value	Algorithm	MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	RIPEMD-128	<p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	RIPEMD-160	<p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-1	<p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-256	<p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-384	<p>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>
Value	Algorithm																		
MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>																		
MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>																		
MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>																		
RIPEMD-128	<p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>																		
RIPEMD-160	<p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																		
SHA-1	<p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																		
SHA-256	<p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																		
SHA-384	<p>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																		

Attributes	Description	
	SHA-512	Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	WHIRLPOOL	Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	<p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre>< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>	
	<p>hashValue (Password Hash Value)</p> <p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... AlgorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>	
	<p>recommended (Recommend Write Protection in User Interface)</p> <p>Specifies that applications should provide user interface recommending that the user open this document in write protected state. If the user chooses to do so, the document shall be write protected, otherwise, it shall be opened fully editable.</p> <p>If this attribute is omitted, then user interface recommending that the user open this document in write protected state should not be provided. If the password attribute is</p>	

Attributes	Description
	<p>also specified, then this setting shall be ignored.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which specifies that applications must recommend write protection to this document. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre><w:writeProtection w:recommended="true" /></pre> <p>The recommended attribute has a value of <code>true</code> specifying that the applications must hash any password provided, and if it matches this hash value, can only then halt enforcement of write protection. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§22.9.2.7).</p>
saltValue (Salt Value for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the <code>hashValue</code> attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The <code>saltValue</code> attribute value of <code>ZUdHa+D8F/OAKP3I7ssUnQ==</code> specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>base64Binary</code> datatype.</p>
spinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the <code>hashValue</code> attribute.</p> <p>[<i>Rationale:</i> Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p>

Attributes	Description
	<p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_WriteProtection](#)) is located in §A.1. *end note*]

17.15.1.94 zoom (Magnification Setting)

This element specifies the magnification level which should be applied to a document when it is displayed by an application. The zoom level is specified with the use of two attributes stored on this element:

- val, which stores the type of zoom applied to the document
- percent, which stores the zoom percentage to be used when rendering the document

If both attributes are present, then the percent attribute shall be treated as a 'cached' value and only used when the value none is specified for the val attribute.

If this element is omitted, then applications can display the document in any desired magnification setting.

[*Example:* Consider a WordprocessingML document that is to have its zoom level at seventy one percent when it is displayed. This requirement would be specified using the following WordprocessingML fragment in the document settings:

```
<w:zoom w:percent="71%" />
```

The zoom element's percent attribute has a value of 71%, specifying that the given document must have its zoom level set to seventy one percent when it is displayed. *end example*]

Attributes	Description
percent (Zoom Percentage)	<p>Specifies the zoom percentage that should be applied when a given WordprocessingML document is rendered by conforming hosting applications. This value is the zoom percentage specified as an integer with a trailing percent sign (U+0025).</p> <p>If this attribute is omitted, then applications can use any desired default percentage for</p>

Attributes	Description
	<p>the magnification.</p> <p>If the <code>val</code> attribute is instantiated in addition to the <code>percent</code> attribute, then the <code>percent</code> attribute shall be treated as a cached value and only used when the value <code>none</code> is specified for the <code>val</code> attribute. If the value specified exceeds the maximum zoom level available in a conforming hosting application, the conforming hosting application shall display the document using its maximum zoom level. Correspondingly, if the value specified is less than the minimum zoom level available in the conforming hosting application, the conforming hosting application shall display the document using its minimum zoom level.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that is to have its zoom level at fifty percent when rendered by conforming hosting applications. This requirement would be specified using the following WordprocessingML:</p> <pre><w:zoom w:percent="50%" /></pre> <p>The <code>percent</code> attribute has a value of 50%, specifying that the given WordprocessingML document must to have its zoom level set to fifty percent when it is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_DecimalNumberOrPercent</code> simple type (§17.18.11).</p>
val (Zoom Type)	<p>Specifies the type of zoom which shall be applied to a given document on open.</p> <p>If this attribute is not present, then the document shall be displayed as though the value had been set to <code>none</code>, and should rely on the value of the <code>percent</code> attribute for the actual zoom percentage.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that should be visible without any horizontal scrolling when it is displayed. This requirement would be specified using the following WordprocessingML:</p> <pre><w:zoom w:val="bestFit" w:percent="90%" /></pre> <p>The <code>val</code> attribute is equal to the value <code>bestFit</code> specifying that an application must dynamically calculate the magnification needed such that the given document must be visible on the horizontal plane of the document with no horizontal scrolling required to see any part of the WordprocessingML document's pages.</p> <p>Since both attributes are present, the <code>percent</code> attribute must be treated as a 'cached' value and ignored. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_Zoom</code> simple type (§17.18.105).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_Zoom](#)) is located in §A.1. end note*]

17.15.2 Web Page Settings

The next group of settings stored in WordprocessingML is web page settings. These settings specify two categories of settings:

- Settings which are related to HTML documents (i.e. frameset definitions) that can be used in WordprocessingML documents as well
- All settings which affect how this document shall be handled when it is saved as HTML. Actually saving a document as HTML is outside of the scope of ECMA-376, but in order to ensure the maximum interoperability between a WordprocessingML document and an HTML document, settings not explicitly stored elsewhere are stored in these settings.

[*Example: Consider the following WordprocessingML fragment for the web page settings in a WordprocessingML document:*

```
<w:webSettings>
  <w:frameset>
    ...
  </w:frameset>
  <w:doNotUseLongFileNames w:val="true" />
</w:webSettings>
```

The webSettings element contains all of the web page settings for this document. In this case, the web page settings specified for this document are: a frameset defined using the frameset element (§17.15.2.19); and a setting specifying that when this file is saved as a web page, all resulting files must not exceed 8 octets with 3 octet extension using the doNotUseLongFileNames element (§17.15.2.13). *end example*]

17.15.2.1 allowPNG (Allow PNG as Graphic Format)

This element specifies that applications shall allow use of the PNG file format when the contents of this WordprocessingML document are saved as a web page. This includes all supporting images used as part of this HTML web page.

If this element is omitted from the document, then the PNG file format shall not be allowed when this document is saved as a web page, and that another suitable file format (such as the JPEG file format) should be utilized in its place.

[*Note: This setting is intended for applications to save web pages which can be supported by legacy web browsers which do not support the reading of PNG images. However, although PNG utilizes a lossless compression algorithm, JPEG uses 'lossy' compression and can in some cases result in lower fidelity images. end note*]

[*Example: Consider a WordprocessingML document which contains the following content within the web settings part:*

```
<w:webSettings>
  <w:allowPNG w:val="true" />
</w:webSettings>
```

The allowPNG element has a val attribute value of true, which specifies that applications can use the PNG graphic format as needed when saving this WordprocessingML document as a web page. *end example*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.2 blockQuote (Data for HTML blockquote Element)

This element specifies that the current div element does not represent an HTML div element, but rather represents an HTML blockquote element. This element shall specify that this container shall be written out using the blockquote element if this document is subsequently saved as HTML.

If this element is omitted, then the current div element does not represent an HTML blockquote element. If both this element and the bodyDiv element (§17.15.2.3) are specified, then this element shall take precedence in all cases.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border: 5px solid #00FFFF">
      <p>Paragraph in a blockquote.</p>
    </blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

When this document is saved in the WordprocessingML format, the information stored on the div, blockquote, and body elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1626542603">
    ...
    <w:divsChild>
      <w:div w:id="313534916">
        <w:blockQuote w:val="true" />
        ...
      </w:div>
    </w:divsChild>
  </w:div>
</w:divs>
```

The `blockquote` element has a `val` attribute value of `true`, which specifies that the nested `div` element actually represents a nested HTML `blockquote` when this document is resaved as HTML. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.3 `bodyDiv` (Data for HTML body Element)

This element specifies that the current `div` element does not represent an HTML `div` element, but rather represents formatting properties on the HTML body element. This element shall specify that the properties specified by this container shall be written out onto the body element if this document is subsequently saved as HTML.

If this element is omitted, then the current `div` element does not represent an HTML body element. If both this element and the `blockquote` element (§17.15.2.2) are specified, then this element shall be ignored. If this element is specified on any `div` which is not the main `div` element for the document, then this element shall be ignored.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border: 5px solid #00FFFF">
      <p>Paragraph in a blockquote.</p>
    </blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

When this document is saved in the WordprocessingML format, the information stored on the `div`, `blockquote`, and `body` elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1626542603">
    <w:bodyDiv w:val="true" />
    ...
  <w:divsChild>
    ...
  </w:divsChild>
</w:div>
</w:divs>
```

The `bodyDiv` element has a `val` attribute value of `true`, which specifies that the `div` element actually represents properties on the HTML body when this document is resaved as HTML. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.4 bottom (Bottom Border for HTML div)

This element specifies the border which shall be displayed at the bottom of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a bottom border.

[Example: Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
      <p>paragraph of text</p>
    </div>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the div elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1785730240">
    ...
    <w:divBdr>
      <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
      <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
      <w:bottom w:val="outset" w:sz="18" w:color="auto" />
      <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
    </w:divBdr>
  </w:div>
</w:divs>
```

The bottom element specifies border information about the bottom border for the single HTML div structure in the document; in this case, a 2.25 point bottom border of type outset. The initial 3 pixel border was converted to 2.25 points using the following logic:

$$3\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{576 \text{ eighth points}}{1 \text{ inch}} = 18 \text{ eighth points (2.25 points)}$$

end example]

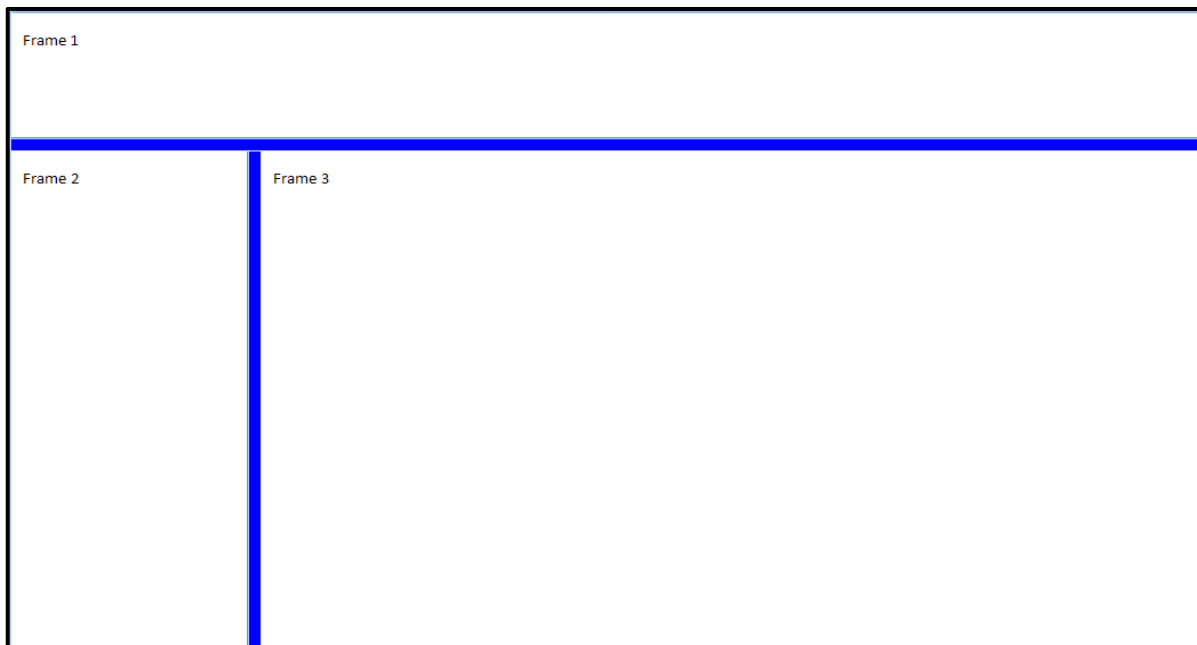

This element's content model is defined by the common border properties definition in §17.3.4.

17.15.2.5 color (Frameset Splitter Color)

This element specifies the color of the splitters within the frameset in this WordprocessingML document. This element shall only be honored on the root frameset for this document, and can be ignored for all nested framesets in this document.

If this element is omitted, then the default color of the splitter can be automatically determined by the application displaying this WordprocessingML document (equivalent to a val attribute value of auto).

[*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
<w:frameset>
  <w:framesetSplitbar>
    <w:w w:val="200" />
    <w:color w:val="0000FF" />
  </w:framesetSplitbar>
  ...
</w:frameset>
```

The color element's val attribute specifies that the splitters must be displayed in the RGB color 0000FF (blue) when the contents of this document are displayed. *end example*]

Attributes	Description
themeColor (Run Content Theme Color)	<p>Specifies a theme color which should be applied to the current run.</p> <p>The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows for color information to be set centrally in the document.</p> <p>If the themeColor attribute is specified, then the val attribute is ignored for this run.</p> <p>[<i>Example</i>: Consider a run of text which should be displayed using the accent3 theme color from the document's Theme part. This requirement would be specified as follows in the resulting WordprocessingML:</p> <pre><w:rPr> <w:color w:themeColor="accent3" /> </w:rPr></pre> <p>The color attribute specifies that the run must use the accent3 theme color. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ThemeColor simple type (§17.18.97).</p>
themeShade (Run Content Theme Color Shade)	<p>Specifies the shade value applied to the supplied theme color (if any) for this run's contents.</p> <p>If the themeShade is supplied, then it is applied to the RGB value of the theme color to determine the final color applied to this run.</p> <p>The themeShade value is stored as a hex encoding of the shade value (from 0 to 255) applied to the current border.</p> <p>[<i>Example</i>: Consider a shade of 40% applied to a run in a document. This shade is calculated as follows:</p> $ \begin{aligned} S_{xml} &= 0.4 * 255 \\ &= 102 \\ &= 66(hex) \end{aligned} $ <p>The resulting themeShade value in the file format would be 66. <i>end example</i>]</p> <p>Given a input red, green, or blue color value C (from 0-255), an output color value of C' (from 0-255), and a shade value S (from 0-100), the shade is applied as follows:</p>

Attributes	Description
	$C' = \left(1 - \frac{S}{100}\right)C$ <p>[<i>Example</i>: Consider a document with a run using the <code>accent6</code> theme color, whose RGB value (in RRGGBB hex format) is <code>F79646</code>.</p> <p>The hex value for the green component is <code>96</code> - 150 in decimal. Applying the shade formula with shade of 50%, the output decimal value of the green component is 75, or a hex value of <code>4B</code>. This transformed value can be seen in the resulting run color WordprocessingML's <code>val</code> attribute:</p> <pre><w:color w:val="7B4B23" w:themeColor="accent6" w:themeShade="80" /></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_UcharHexNumber</code> simple type (§17.18.98).</p>
themeTint (Run Content Theme Color Tint)	<p>Specifies the tint value applied to the supplied theme color (if any) for this run's contents.</p> <p>If the <code>themeTint</code> is supplied, then it is applied to the RGB value of the theme color to determine the final color applied to this run.</p> <p>The <code>themeTint</code> value is stored as a hex encoding of the tint value (from 0 to 255) applied to the current border.</p> <p>[<i>Example</i>: Consider a tint of 60% applied to a run in a document. This tint is calculated as follows:</p> $\begin{aligned} T_{xml} &= 0.6 * 255 \\ &= 153 \\ &= 99(hex) \end{aligned}$ <p>The resulting <code>themeTint</code> value in the file format would be <code>99</code>. <i>end example</i>]</p> <p>Given a input red, green, or blue color value C (from 0-255), an output color value of C' (from 0-255), and a tint value T (from 0-100), the tint is applied as follows:</p> $C' = \left(1 - \frac{T}{100}\right)(255 - C) + C$ <p>[<i>Example</i>: Consider a document with a run using the <code>accent1</code> theme color, whose RGB value (in RRGGBB hex format) is <code>C0504D</code>.</p> <p>The hex value for the green component is <code>50</code> - 80 in decimal. Applying the tint formula with tint of 60%, the output decimal value of the green component is 150, or a hex value</p>

Attributes	Description
	<p>of 96. This transformed value can be seen in the resulting run color's WordprocessingML val attribute:</p> <pre><w:color w:val="D99694" w:themeColor="accent1" w:themeTint="99" /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§17.18.98).</p>
val (Run Content Color)	<p>Specifies the color for this run.</p> <p>This color can either be presented as a hex value (in RRGGBB format), or auto to allow a consumer to automatically determine the run color as appropriate.</p> <p>If the run specifies the use of a theme color via the themeColor attribute, then this value is superseded by the theme color value.</p> <p>[<i>Example:</i> Consider a run color with value auto, as follows:</p> <pre><w:rPr> <w:color ... w:val="auto" /> </w:rPr></pre> <p>This color therefore can be automatically be modified by a consumer as appropriate, for example, in order to ensure that the run contents can be distinguished against the page's background color. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HexColor simple type (§17.18.38).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.1. *end note]*

17.15.2.6 div (Information About Single HTML div Element)

This element specifies information about a single HTML `div`, `body`, or `blockquote` element which was included in this document, so that that information (which is stored on a logical structure with no direct analog in WordprocessingML) can be maintained when an HTML document is stored in the WordprocessingML format.

The `div` element stores the following information about these structures:

- The child HTML `div`, and `blockquote` elements
- The borders for the element
- The margins for the element

When the resulting WordprocessingML document is displayed by an application, the settings specified by this information shall be reflected in the formatting of the resulting paragraphs (i.e. this information shall not only be used when the document is resaved in the HTML format).

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style="border-left-style: solid; border-left-width: 1px; border-right-
style: solid; border-right-width: 1px; padding-left: 4px; padding-right: 4px;
padding-top: 1px; padding-bottom: 1px; margin-left: 50px">
      <p>Paragraph one.</p>
      <p>Paragraph two.</p>
    </div>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div`, `blockquote`, and `body` elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1785730240">
    <w:marLeft w:val="750" />
    ...
    <w:divBdr>
      <w:left w:val="single" w:sz="6" w:color="auto" />
      <w:right w:val="single" w:sz="6" w:color="auto" />
    </w:divBdr>
  </w:div>
</w:divs>
```

The `div` element specifies all margin and border information about the single HTML `div` structures in the document; in this case, the left indentation and the left and right borders. *end example*]

Attributes	Description
id (div Data ID)	<p>Specifies a unique decimal number which shall be used to associate one or more structures in the WordprocessingML content with this HTML div information.</p> <p>When a WordprocessingML structure (a paragraph or a table row) is associated with div information, it shall be associated with the set of information which most immediately contains the current object.</p> <p>[Example: If a paragraph is wrapped within two HTML div elements, like this:</p> <pre data-bbox="451 569 776 737"><div> <div> <p>Paragraph</p> </div> </div></pre> <p>The resulting WordprocessingML paragraph must reference the div Data ID associated with the inner HTML div element - the fact that it is also contained within the outer HTML div must be implied by the nesting of the corresponding WordprocessingML div elements in the web settings part. <i>end example</i>]</p> <p>The ID specified by this attribute is then referenced by the divId element for all structures which are immediately contained within the specified HTML div.</p> <p>[Example: Consider a simple HTML document defined as follows:</p> <pre data-bbox="451 1136 1003 1398"><html> <body style=" margin-top:50px"> <p>Paragraph one.</p> <div style="margin-left:50px"> <p>Paragraph two.</p> </div> </body> </html></pre> <p>If the outer and inner body and div elements were assigned id attributes as follows:</p> <pre data-bbox="451 1514 938 1883"><w:div> <w:div w:id="1626542603"> <w:bodyDiv w:val="1" /> ... <w:divsChild> <w:div w:id="313534916"> ... </w:div> </w:divsChild> </w:div> </w:div></pre>

Attributes	Description
	<p>Then the first paragraph would reference the div ID of the outer div (since it is contained by the HTML body element) and the second paragraph would reference the div ID of the inner div (since it is contained within the child HTML div element), as follows:</p> <pre> <w:p> <w:pPr> <w:divId w:val="1626542603" /> </w:pPr> <w:r> <w:t>Paragraph one.</w:t> </w:r> </w:p> <w:p> <w:pPr> <w:divId w:val="313534916" /> </w:pPr> <w:r> <w:t>Paragraph one.</w:t> </w:r> </w:p> </pre> <p>The id attributes on the div elements link each paragraph with the corresponding container div element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Div](#)) is located in §A.1. *end note*]

17.15.2.7 [divBdr](#) (Set of Borders for HTML div)

This element specifies the set of borders for the boundaries of the current HTML div, body, or blockquote element, using the four border types defined by its child elements.

If this element is omitted, then there shall be no borders associated with the current HTML v, body, or blockquote element.

[Example: Consider a simple HTML document defined as follows:

```

<html>
  <body>
    <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:3px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
      <p>paragraph of text</p>

```

```

    </div>
  </body>
</html>

```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```

<w:divs>
  <w:div w:id="1785730240">
    ...
    <w:divBdr>
      <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
      <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
      <w:bottom w:val="outset" w:sz="18" w:color="auto" />
      <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
    </w:divBdr>
  </w:div>
</w:divs>

```

The `divBdr` element specifies border information about the single HTML `div` structure in the document. *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DivBdr](#)) is located in §A.1. *end note]*

17.15.2.8 `divs` (Information about HTML `div` Elements)

This element specifies all information about the set of HTML `div` elements (as well as the `body` and `blockquote` elements) which were included in this document, so that that information (which is stored on a logical structure with no direct analog in WordprocessingML) can be maintained when an HTML document is stored in the WordprocessingML format.

The `divs` element stores the following information about these structures:

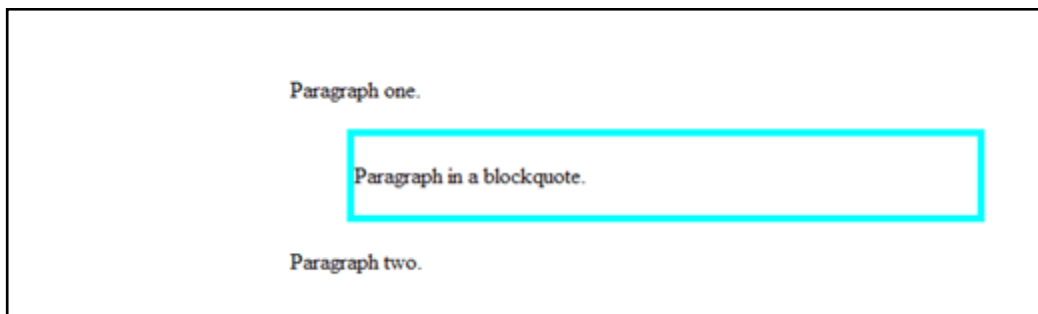

- The parent/child structure of HTML `div`, `blockquote`, and `body` elements
- The borders for each of these elements
- The margins for each of these elements

When the resulting WordprocessingML document is displayed by an application, the settings specified by this information shall be reflected in the formatting of the resulting paragraphs (i.e. this information shall not only be used when the document is resaved in the HTML format).

[Example: Consider a simple HTML document defined as follows:

```
<html>
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border: 5px solid #00FFFF">
      <p>Paragraph in a blockquote.</p>
    </blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div`, `blockquote`, and `body` elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1626542603">
    <w:bodyDiv w:val="1" />
    <w:marLeft w:val="3000" />
    <w:marTop w:val="750" />
```

```

...   <w:divsChild>
      <w:div w:id="313534916">
        <w:blockQuote w:val="1" />
        <w:marLeft w:val="720" />
        <w:marRight w:val="720" />
        <w:marTop w:val="100" />
        <w:marBottom w:val="100" />
        <w:divBdr>
          <w:top w:val="single" w:sz="36" w:color="00FFFF" />
          <w:left w:val="single" w:sz="36" w:color="00FFFF" />
          <w:right w:val="single" w:sz="36" w:color="00FFFF" />
          <w:bottom w:val="single" w:sz="36" w:color="00FFFF" />
        </w:divBdr>
      </w:div>
    </w:divsChild>
  </w:div>
</w:divs>

```

The `divs` element specifies all of the margin and border information about the necessary HTML structures in the document; in this case, the `body` element and the nested `blockquote`. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Divs](#)) is located in §A.1. *end note*]

17.15.2.9 `divsChild` (Child `div` Elements Contained within Current `div`)

This element specifies the set of HTML `div` or `blockquote` elements which are contained within the current HTML `div`, `body`, or `blockquote` element, establishing the parent/child hierarchy of the original set of these elements.

When an HTML document containing these objects is saved in the WordprocessingML format, WordprocessingML objects store a reference to their most immediate parent `div`, `body`, or `blockquote` element using the `divId` element.

However, since only a single reference is stored, this information is often insufficient to determine the appropriate parent/child hierarchy for the original HTML `div` data, so it can be applied appropriately. This element allows that hierarchy to be stored, as child HTML `div` elements are stored within the `childDivs` element.

[*Example:* Consider a simple HTML document defined as follows:

```

<html>
  <body>
    <div style=" margin-top:50px">
      <p>Paragraph one.</p>
      <div style="margin-left:50px">
        <p>Paragraph two.</p>
      </div>
    </div>
  </body>
</html>

```

If the outer and inner body and div elements were assigned id attributes of 1626542603 and 313534916 respectively, then the first paragraph would reference the div ID of the outer div (since it is contained within that HTML div element) and the second paragraph would reference the div ID of the inner div (since it is contained within the child HTML div element), as follows:

```

<w:p>
  <w:pPr>
    <w:divId w:val="1626542603" />
  </w:pPr>
  <w:r>
    <w:t>Paragraph one.</w:t>
  </w:r>
</w:p>
<w:p>
  <w:pPr>
    <w:divId w:val="313534916" />
  </w:pPr>
  <w:r>
    <w:t>Paragraph one.</w:t>
  </w:r>
</w:p>

```

However, this information alone is insufficient - it is unclear if the second div is contained within, or simply adjacent to, the first one.

In order to preserve this information, the correct hierarchy is stored within the web settings part:

```

<w:divs>
  <w:div w:id="1626542603">
    ...
    <w:divsChild>
      <w:div w:id="313534916">
        ...
      </w:div>
    </w:divsChild>
  </w:div>
</w:divs>

```

The divsChild element contains the second div as a child of the first div, specifying that the first div covers both paragraphs. *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Divs](#)) is located in §A.1. *end note*]

17.15.2.10 doNotOrganizeInFolder (Do Not Place Supporting Files in Subdirectory)

This element specifies that applications shall not automatically place all supporting files (images which are part of this HTML web page, etc.) in a subdirectory when the contents of this WordprocessingML document are saved as a web page. Typically, applications which save a document as a web page consisting of multiple files save all supporting files in a subdirectory next to the main HTML file (in order to keep those files organized). This element specifies the files shall be placed in the same directory as the actual web page.

If this element is omitted from the document, then all supporting files should be saved into a subdirectory beneath the main web page file when this document is saved as a web page.

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```

<w:webSettings>
  <w:doNotOrganizeInFolder w:val="true" />
</w:webSettings>

```

The doNotOrganizeInFolder element has a val attribute value of true, which specifies that applications should save all supplementary files in the same directory as the main web page HTML document when saving this WordprocessingML document as a web page. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.11 doNotRelyOnCSS (Do Not Rely on CSS for Font Face Formatting)

This element specifies whether applications can rely on the CSS properties for font face (the font-family property) when saving this WordprocessingML document as a web page. If this element is utilized, then the HTML font element should be used either in place of or in concert with these CSS properties in order to specify the font face formatting for the resulting web page.

If this element is omitted, then applications can choose to rely on the CSS properties for font face as desired.

[*Note:* This setting is intended for applications to save web pages which can be supported by legacy web browsers which do not support the reading of these CSS properties when attempting to read and display the resulting web page, in order to maximize the fidelity of the resulting output. *end note*]

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:doNotRelyOnCSS w:val="true" />
</w:webSettings>
```

The doNotRelyOnCSS element has a val attribute value of true, which specifies that applications should include the HTML font element when saving this WordprocessingML document as a web page. For example, this output:

```
<span style='font-family:"Courier New"'>text</span>
```

This output would instead be saved as follows:

```
<font face="Courier New"><span style='font-family:"Courier
New"'>text</span></font>
```

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.12 doNotSaveAsSingleFile (Recommend Web Page Format over Single File Web Page Format)

This element specifies that applications should recommend that new web page files generated using this WordprocessingML document use a multi-file web page format (HTML), rather than a single-file web page format (MHTML) when this document is saved as an HTML web page. This setting shall not prevent the use of the MHTML format; it shall only cause applications to recommend (via a default) a non single-file format when saving as a web page.

[*Note:* This setting is primarily intended for applications which explicitly support a "Save as Web Page..." action, in order to determine the default setting for the resulting web page. *end note*]

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:doNotSaveAsSingleFile w:val="true" />
</w:webSettings>
```

The `doNotSaveAsSingleFile` element specifies that applications should recommend a multi-file web page format when this document is subsequently saved as a web page. *end example*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.13 `doNotUseLongFileNames` (Do Not Use File Names Longer than 8.3 Characters)

This element specifies that applications shall ensure that the file names for all files generated when saving this document as a web page do not exceed eight octets with a three octet extension. This includes all supporting files (images which are part of this HTML web page, etc.). The file names generated are not case-sensitive.

[*Note:* This setting is intended for applications to save web pages which can be supported by legacy web browsers which do not support the reading of long file names when attempting to read and display the resulting web page. *end note*]

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:doNotUseLongFileNames w:val="true" />
</w:webSettings>
```

The `doNotUseLongFileNames` element specifies that applications should ensure that all file names generated when this document is subsequently saved as a web page do not exceed the 8.3 octet file name limitation. *end example*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.14 `encoding` (Output Encoding When Saving as Web Page)

This element specifies the encoding which shall be used for the contents of this WordprocessingML document when it is saved as an HTML web page. The set of encodings supported by this element shall be derived from the standard set of character set definitions provided at <http://www.iana.org/assignments/character-sets>.

If this element is omitted, then the default encoding for the current system shall be used when this document is saved as a web page. If the value of the `val` attribute is unknown or supported by an application, then the default encoding for the current system shall be used when this document is saved as a web page.

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:encoding w:val="utf-8" />
</w:webSettings>
```

The encoding element's val attribute has a value of utf-8, which specifies that this document must be encoded in the UTF-8 format when it is saved as a web page. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_String](#)) is located in §A.1. *end note*]

17.15.2.15 flatBorders (Frameset Splitter Border Style)

This element specifies the 3D style of the splitters within the frameset in this WordprocessingML document. This element shall only be honored on the root frameset for this document, and can be ignored for all nested framesets in this document. When this property is turned on, the borders for this frameset shall be flat (not 3D), otherwise they can be presented as 3D splitter when they are displayed.

If this element is omitted, then the default style of the splitter should be a 3D splitter.

[*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
<w:frameset>
  <w:framesetSplitbar>
    <w:w w:val="200" />
    <w:color w:val="0000FF" />
    <w:flatBorders w:val="true" />
  </w:framesetSplitbar>
  ...
</w:frameset>
```

The flatBorders element's val attribute has a value of true, which specifies that the style of the splitters must be flat (the splitter might not be 3D when displayed). *end example*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.16 frame (Single Frame Properties)

This element specifies the properties for a single frame within a frameset document. When a document defines a frameset using the frameset element; that frameset is composed of a set of frames, each of which is specified by a single frame element.

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
  <w:sz w:val="20%" />
  <w:name w:val="Frame 1" />
  <w:sourceFileName r:id="rId1" />
</w:frame>
<w:frameset>
...
</w:frameset>
</w:frameset>
```

The frame element specifies the set of properties for a single frame in the document. In this case, these properties (for the frame marked with Frame 1 in the diagram above) specify that the frame must have the following properties:

- A height of 20% of the height of the document
- A name of Frame 1
- The contents of the frame must be pulled from the document that is the target of the relationship with ID rId1

end example]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Frame](#)) is located in §A.1. *end note]*

17.15.2.17 `frameLayout` (Frameset Layout)

This element specifies the order in which the frames (and nested framesets) in a frameset shall be displayed. When a frameset is created, it can only contain frames which are stacked in one direction:

- Vertically (one on top of another)
- Horizontally (one next to another)

This element specifies how the frames in this frameset are stacked, which shall also be used to interpret the sizes defined by the `sz` element (§17.15.2.39) for each frame. In order to determine the ordering of the constituent frames within this frameset, the ordering of the child frame and frameset elements shall be used.

If this element is omitted, then the frames in this frameset shall be stacked vertically on top of one another (a row frameset).

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frameLayout w:val="rows" />
<w:frame>
...
</w:frame>
<w:frameset>
  <w:frameLayout w:val="cols" />
  <w:frame>
```

```
...
</w:frame>
<w:frame>
...
</w:frame>
</w:frameset>
</w:frameset>
```

The `frameLayout` element specifies that the outer frameset is a consists of the single frame and the child frameset stacked vertically, and an inner nested frameset consisting of two frames stacked horizontally. *end example]*

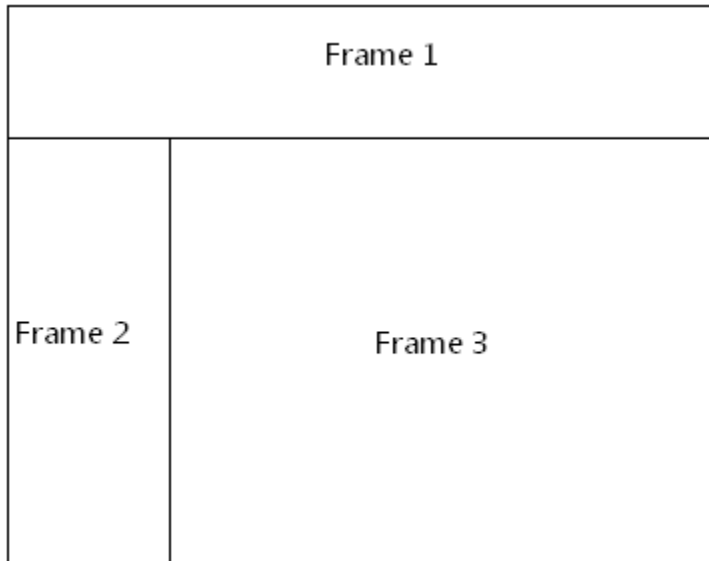

Attributes	Description
val (Frameset Layout Value)	<p>Specifies the type of layout which shall be used to display the contents of the frames and nested framesets within this frameset, as defined by the simple type referenced below.</p> <p>[<i>Example:</i> Consider a frameset definition within a WordprocessingML document which defines the following frameset layout setting:</p> <pre><w:frameset> <w:frameLayout w:val="cols" /> ... </w:frameset></pre> <p>The <code>val</code> attribute value of <code>cols</code> specifies that the contents of this frameset must be stacked horizontally (in columns). <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_FrameLayout</code> simple type (§17.18.31).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_FrameLayout](#)) is located in §A.1. *end note]*

17.15.2.18 frameset (Nested Frameset Definition)

This element specifies a frameset which has been nested within another frameset within a WordprocessingML document. This WordprocessingML element is analogous to the `frameset` element in HTML (when that frameset is the child of another `frameset` element).

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
  <w:frameLayout w:val="rows" />
  <w:frame>
    ...
  </w:frame>
  <w:frameset>
    <w:frameLayout w:val="cols" />
    <w:frame>
      ...
    </w:frame>
    <w:frame>
      ...
    </w:frame>
  </w:frameset>
</w:frameset>
```

The child frameset element specifies the frameset definition for the inner frameset; that frameset consists of two frames (Frame 2 and Frame 3 in the image above) which have been laid out horizontally as columns. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_Frameset](#)) is located in §A.1. *end note*]

17.15.2.19 frameset (Root Frameset Definition)

This element specifies that this document is the container for a frameset. This WordprocessingML element is analogous to the frameset element in HTML.

When the frameset element is present within a document, that document shall serve as a frameset definition only; all of its normal document content shall therefore not be displayed as long as it contains at least one child frame or frameset element.

If this element is omitted, then the currently document shall not be treated as a frameset definition; its regular document content shall be displayed.

[Example: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
  <w:frameLayout w:val="rows" />
  <w:frame>
    ...
  </w:frame>
</w:frameset>
<w:frameset>
  <w:frameLayout w:val="cols" />
  <w:frame>
    ...
  </w:frame>
  <w:frame>
    ...
  </w:frame>
</w:frameset>
```

```

    </w:frame>
  </w:frameset>
</w:frameset>

```

The parent frameset element specifies that the current document is a frameset definition; that frameset consists of a single frame and another nested frameset stacked vertically. *end example*

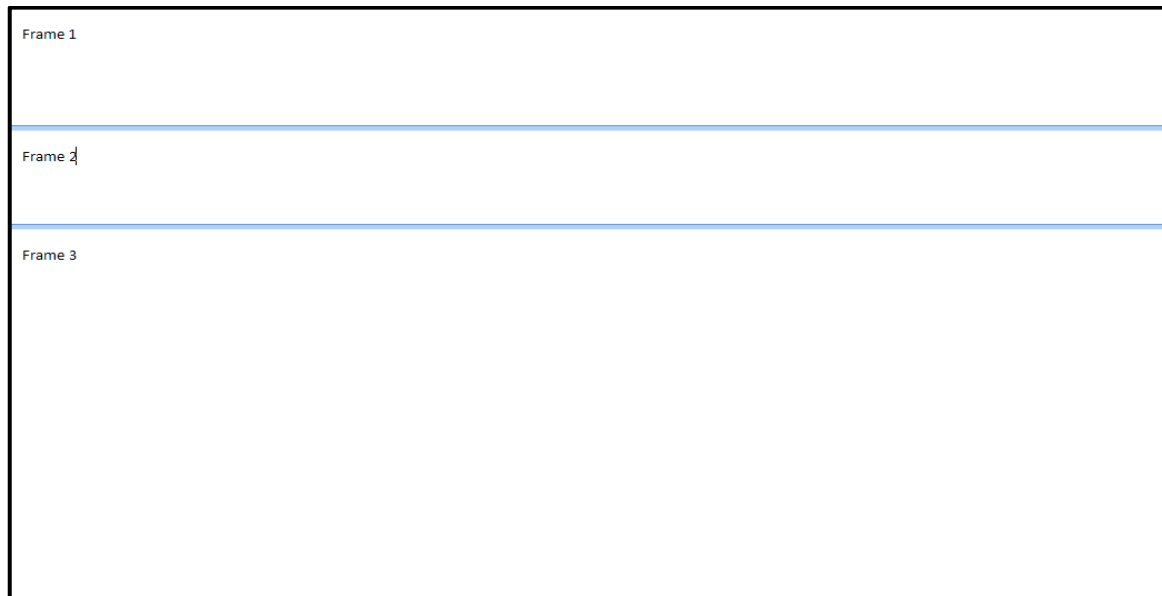

[*Note:* The W3C XML Schema definition of this element's content model ([CT Frameset](#)) is located in §A.1. *end note*]

17.15.2.20 framesetSplitbar (Frameset Splitter Properties)

This element specifies the properties for the splitters associated with this frameset. A *splitter* is a horizontal or vertical line which visually separates the contents of one frame from another within a frameset.

If this element is omitted, then the default parameters for each of the child frameset properties shall be used for all splitters in this frameset.

[*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```

<w:frameset>
  <w:framesetSplitbar>
    <w:w w:val="90" />
    <w:color w:val="auto" />
  </w:framesetSplitbar>
  ...
</w:frameset>

```

The `framesetSplitbar` element specifies the properties for all splitters in this frameset; in this case, those properties are that the splitter must be 4.5 points (90 twentieths of a point) wide, and that the color of the splitter must be automatically determined via the attribute value of `auto`. *end example*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FramesetSplitbar](#)) is located in §A.1. *end note*]

17.15.2.21 `left` (Left Border for HTML `div`)

This element specifies the border which shall be displayed at the left of the boundaries of the current HTML `div` object.

If this element is omitted, then this HTML `div` object shall not have a left border.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
      <p>paragraph of text</p>
    </div>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```

<w:divs>
  <w:div w:id="1785730240">
    ...
    <w:divBdr>
      <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
      <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
      <w:bottom w:val="outset" w:sz="18" w:color="auto" />
      <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
    </w:divBdr>
  </w:div>
</w:divs>

```

The left element specifies border information about the left border for the single HTML `div` structure in the document; in this case, a 3 point bottom border of type `single`. The initial 4 pixel border was converted to 3 points using the following logic:

$$4\text{px} * \frac{1\text{ inch}}{96\text{ px}} * \frac{576\text{ eighth points}}{1\text{ inch}} = 24\text{ eighth points (3 points)}$$

end example]

This element's content model is defined by the common border properties definition in §17.3.4.

17.15.2.22 [linkedToFile \(Maintain Link to Existing File\)](#)

This element specifies that the file referenced by the `sourceFileName` element (§17.15.2.38) as the basis for the current frame shall not be changed, even when the file defined by the parent frameset is moved - i.e. the link shall remain exactly as specified.

[*Guidance:* Typically, when a document is incorporated into a frameset, a copy of that document is made such that all files encompassing the frameset are stored in a single subdirectory (so they can be moved as a single unit). However, if the link to the current file is absolute and must not be changed even when the location of the main frameset document, then this element must be set to indicate that setting. *end guidance*]

If this element is omitted, then a new file can be created as necessary when the parent frameset document is resaved to another location.

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
  <w:sz w:val="20%" />
  <w:name w:val="Frame 1" />
  <w:sourceFileName r:id="rId1" />
  <w:linkedToFile w:val="true" />
</w:frame>
<w:frameset>
...
</w:frameset>
</w:frameset>
```

The `linkedToFile` element specifies that the frame source location specified by the `sourceFileName` element (§17.15.2.38) must not be modified, even if the parent frameset document is resaved to another location. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.23 `longDesc` (Frame Long Description)

This element specifies an explicit relationship whose target is the long description of the frame. This description should supplement the short description provided by the title element. This property is analogous to the `longdesc` attribute on the frame element in HTML.

If this element is omitted, then no long description shall be associated with the given frame.

[Example: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
  <w:name w:val="Frame 1" />
  <w:title w:val="Menu bar" />
  <w:longDesc r:id="rIdMenuBar" />
</w:frame>
<w:frameset>
  <w:title w:val="Navigation and document collection" />
  ...
  <w:frame>
    <w:name w:val="Frame 2" />
    <w:title w:val="Navigation bar" />
    <w:longDesc r:id="rIdNavBar" />
  </w:frame>
  <w:frame>
    <w:name w:val="Frame 3" />
    <w:title w:val="Documents" />
    <w:longDesc r:id="rIdDocs" />
  </w:frame>
</w:frameset>
</w:frameset>
```

The longDesc element specifies that the part targeted by the relationship with an id of rIdMenuBar must be used for supplementary information for Frame 1. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships ... >
...
  <Relationship Id="rIdMenuBar" TargetMode="External"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/hyperlink"
Target="myexample-desc.html#menubar" />
...
</Relationships>
```

The corresponding relationship part item shows that the long description supplementary information for Frame 1 is located at myexample-desc.html#menubar, where myexample-desc.html describes #menubar as “This frame provides links to the major sections of the site: Home, Resources, Links, Help.” *end example*]

Attributes	Description
id (Relationship to Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the relationship ID to a specified part.</p> <p>The specified relationship shall match the relationship type required by the parent element:</p> <ul style="list-style-type: none">• http://purl.oclc.org/ooxml/officeDocument/relationships/customXml for the contentPart element• http://purl.oclc.org/ooxml/officeDocument/relationships/footer for the footerReference element• http://purl.oclc.org/ooxml/officeDocument/relationships/header for the headerReference element• http://purl.oclc.org/ooxml/officeDocument/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements• http://purl.oclc.org/ooxml/officeDocument/relationships/printerSettings for the printerSettings element• http://purl.oclc.org/ooxml/officeDocument/relationships/hyperlink for the longDesc or hyperlink element <p>[Example: Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId10" /></pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Rel](#)) is located in §A.1. *end note*]

17.15.2.24 `marBottom` (Bottom Margin for HTML div)

This element specifies the margin which shall be displayed at the bottom of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a bottom margin.

[Example: Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
bottom:100px">
      <p>paragraph of text</p>
    </div>
    <p>another paragraph of text</p>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the div elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1785730240">
    <w:marLeft w:val="3000" />
    <w:marRight w:val="750" />
    <w:marTop w:val="1500" />
    <w:marBottom w:val="1500" />
  </w:div>
</w:divs>
```

The `marBottom` element specifies margin information about the bottom margin for the single HTML `div` structure in the document; in this case, a 75 point bottom margin. The initial 100 pixel margin was converted to 75 points using the following logic:

$$100\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 1500 \text{ twentieth points (75 points)}$$

end example]

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of -720 whose type is <code>ST_SignedTwipsMeasure</code>. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_SignedTwipsMeasure</code> simple type (§17.18.81).</p>

[*Note:* The W3C XML Schema definition of this element’s content model (`CT_SignedTwipsMeasure`) is located in §A.1. *end note]*

17.15.2.25 `marH` (Top and Bottom Margin for Frame)

This element specifies the top and bottom margin height for a single frame in a frameset document, as follows:

This height is expressed in pixels.

If this element is omitted, then no top or bottom margin shall be used for this frame.

[*Example:* Consider a document that has a frame, where the margin height has been specified and is represented as the following WordprocessingML:

```
<w:frame>
  <w:marH w:val="594"/>
</w:frame>
```

The marH element has a val attribute value of 594, which specifies that this frame has a top and bottom margin value of 594 pixels, resulting in 594 pixels of space between the content and the top and bottom margins of the frame. *end example*]

Attributes	Description
val (Measurement in Pixels)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive measurement in pixels.</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of 960 whose simple type is ST_PixelsMeasure. This attribute value specifies a value of 960 pixels. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PixelsMeasure simple type (§17.18.67).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PixelsMeasure](#)) is located in §A.1.
end note]

17.15.2.26 `marLeft` (Left Margin for HTML `div`)

This element specifies the margin which shall be displayed at the left of the boundaries of the current HTML `div` object.

If this element is omitted, then this HTML `div` object shall not have a left margin.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
bottom:100px">
      <p>paragraph of text</p>
    </div>
    <p>another paragraph of text</p>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```

<w:divs>
  <w:div w:id="1785730240">
    <w:marLeft w:val="3000" />
    <w:marRight w:val="750" />
    <w:marTop w:val="1500" />
    <w:marBottom w:val="1500" />
  </w:div>
</w:divs>

```

The marLeft element specifies margin information about the left margin for the single HTML div structure in the document; in this case, a 150 point left margin. The initial 200 pixel margin was converted to 150 points using the following logic:

$$200\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 3000 \text{ twentieth points (150 points)}$$

end example]

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of -720 whose type is ST_SignedTwipsMeasure. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (§17.18.81).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SignedTwipsMeasure](#)) is located in §A.1. *end note]*

17.15.2.27 marRight (Right Margin for HTML div)

This element specifies the margin which shall be displayed at the right of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a right margin.

[*Example:* Consider a simple HTML document defined as follows:

```

<html>
  <body>
    <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
bottom:100px">
      <p>paragraph of text</p>
    </div>
    <p>another paragraph of text</p>
  </body>
</html>

```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```

<w:divs>
  <w:div w:id="1785730240">
    <w:marLeft w:val="3000" />
    <w:marRight w:val="750" />
    <w:marTop w:val="1500" />
    <w:marBottom w:val="1500" />
  </w:div>
</w:divs>

```

The `marRight` element specifies margin information about the right margin for the single HTML `div` structure in the document; in this case, a 37.5 point right margin. The initial 50 pixel margin was converted to 37.5 points using the following logic:

$$50\text{px} * \frac{1\text{ inch}}{96\text{ px}} * \frac{1440\text{ twentieth points}}{1\text{ inch}} = 750\text{ twentieth points (37.5 points)}$$

end example]

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of -720 whose type is ST_SignedTwipsMeasure. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (§17.18.81).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SignedTwipsMeasure](#)) is located in §A.1. *end note]*

17.15.2.28 marTop (Top Margin for HTML div)

This element specifies the margin which shall be displayed at the top of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a top margin.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
bottom:100px">
      <p>paragraph of text</p>
    </div>
    <p>another paragraph of text</p>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1785730240">
    <w:marLeft w:val="3000" />
    <w:marRight w:val="750" />
    <w:marTop w:val="1500" />
    <w:marBottom w:val="1500" />
  </w:div>
</w:divs>
```

The `marTop` element specifies margin information about the top margin for the single HTML `div` structure in the document; in this case, a 75 point top margin. The initial 100 pixel margin was converted to 75 points using the following logic:

$$100\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 1500 \text{ twentieth points (75 points)}$$

end example]

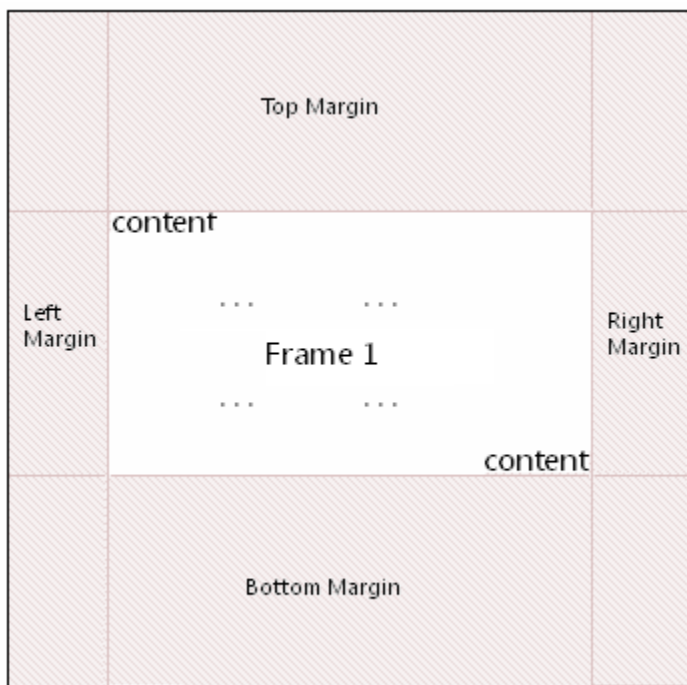

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of -720 whose type is ST_SignedTwipsMeasure. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the <code>ST_SignedTwipsMeasure</code> simple type (§17.18.81).

[Note: The W3C XML Schema definition of this element's content model ([CT_SignedTwipsMeasure](#)) is located in §A.1. *end note*]

17.15.2.29 `marW` (Left and Right Margin for Frame)

This element specifies the left and right margin height for a single frame in a frameset document, as follows:

This height is expressed in pixels.

If this element is omitted, then no left or right margin shall be used for this frame.

[Example: Consider a document that has a frame, where the frame's margins have been specified and is represented as the following WordprocessingML:

```
<w:frame>
  <w:marW w:val="294"/>
</w:frame>
```

The `marW` element has a `val` attribute value of 294, which specifies that this frame has a left and right margin value of 294 pixels, resulting in 294 pixels of space between the content and the left and right margins of the frame. *end example*]

Attributes	Description
val (Measurement in Pixels)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive measurement in pixels.</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example</i>: Consider an attribute value of 960 whose simple type is ST_PixelsMeasure. This attribute value specifies a value of 960 pixels. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PixelsMeasure simple type (§17.18.67).</p>

[*Note*: The W3C XML Schema definition of this element’s content model (CT_PixelsMeasure) is located in §A.1. *end note*]

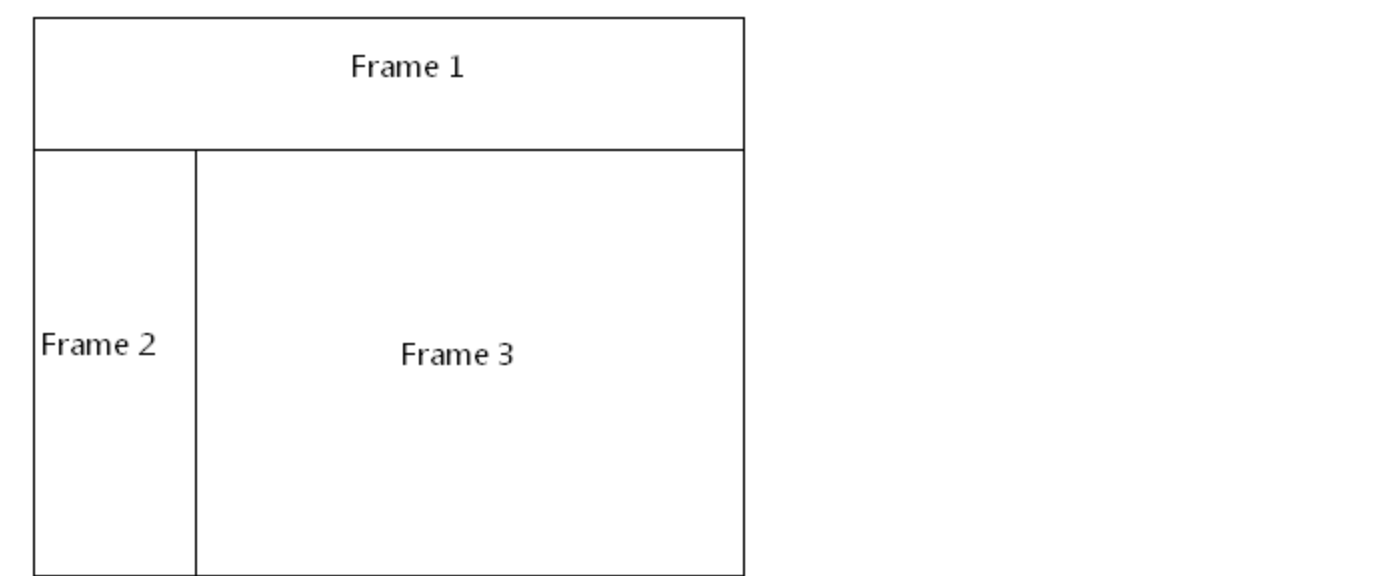

17.15.2.30 name (Frame Name)

This element specifies the name of a single frame within a frameset document. This property is analogous to the name attribute on the frame element in HTML.

[*Note*: The name of a frame can be used in web pages that reference a frame via targeted links, etc. *end note*]

If this element is omitted, then the current frame shall have no name associated with it.

[*Example*: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
  <w:name w:val="Frame 1" />
</w:frame>
<w:frameset>
...
<w:frame>
  <w:name w:val="Frame 2" />
</w:frame>
<w:frame>
  <w:name w:val="Frame 3" />
</w:frame>
</w:frameset>
</w:frameset>
```

The name element specifies the name for each frame within this frameset; in this case, the frames have names of Frame 1, Frame 2, and Frame 3 respectively. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).

[Note: The W3C XML Schema definition of this element’s content model (CT_String) is located in §A.1. *end note*]

17.15.2.31 noBorder (Do Not Display Frameset Splitters)

This element specifies whether the splitters shall be displayed for the contents of the frameset in this WordprocessingML document. This element shall only be honored on the root frameset for this document, and can be ignored for all nested framesets in this document. If this element is present, then no splitters shall be displayed, and all other frameset splitter properties can be ignored.

If this element is omitted, then the splitters in this document shall be displayed as defined by the w and color elements.

[Example: Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```

<w:frameset>
  <w:framesetSplitbar>
    <w:w w:val="200" />
    <w:color w:val="0000FF" />
  </w:framesetSplitbar>
  ...
</w:frameset>

```

If the noBorder element is also specified:

```

<w:frameset>
  <w:framesetSplitbar>
    <w:w w:val="200" />
    <w:color w:val="0000FF" />
    <w:noBorder w:val="true" />
  </w:framesetSplitbar>
  ...
</w:frameset>

```

Then all frameset splitters are suppressed:

The noBorder element's val attribute has a value of true, which specifies that the splitters for this document must not be displayed. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.32 noResizeAllowed (Frame Cannot Be Resized)

This element specifies whether or not the size of the current frame shall be modifiable (i.e. whether the frame can be resized) when the contents of this document are saved as HTML and displayed in a web browser. When this element is set, the size of the frame shall be set to its current values. This property is analogous to the `noresize` attribute on the `frame` element in HTML.

If this element is omitted, the size of the frame shall be modifiable (the frame can be resized when it is displayed).

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frameset>
...
<w:frame>
  <w:name w:val="Frame 2" />
  <w:noResizeAllowed w:val="true" />
</w:frame>
...
</w:frameset>
</w:frameset>
```

The noResizeAllowed element has a val attribute of true, which specifies that the size of the frame specified by Frame 2 must not be modifiable (the two borders which intersect that frame cannot be resized). *end example*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.33 optimizeForBrowser (Disable Features Not Supported by Target Web Profile)

This element specifies whether applications should attempt to customize the output for any web page produced from this document, as well as the HTML output to which it should be customized. [*Example*: This might involve blocking any output which is not supported by that target output profile. *end example*] The target output profile is identified by the contents of the target attribute.

[*Example*: Consider a document whose web settings part contains the following WordprocessingML:

```
<w:webSettings>
...
  <w:optimizeForBrowser w:target="W3C XHTML+CSS1" />
  <w:allowPNG w:val="on"/>
</w:webSettings>
```

The optimizeForBrowser element specifies that the output should be optimized for a specific output target. Since the value of the target attribute specifies a target of W3C XHTML 1.0 output using CSS 1, any HTML generated should fall within that profile. *end example*

Attributes	Description										
target (Target Output Profile)	<p>Specifies the version of HTML output targeted by the output of any web page produced by this document. This attribute shall only contain a string that represents an output profile defined by published standards and W3C recommendations. Product names shall not be used to define a profile.</p> <p>The following reserved values and their targets are listed below:</p> <table> <tr> <th>Value</th><th>Target</th></tr> <tr> <td>W3C XHTML+CSS1</td><td>W3C XHTML 1.0 + CSS 1</td></tr> <tr> <td>W3C HTML4+CSS1</td><td>W3C HTML 4.01 + CSS 1</td></tr> <tr> <td>W3C XHTML+CSS2</td><td>W3C XHTML 1.0 + CSS 2</td></tr> <tr> <td>W3C HTML4+CSS2</td><td>W3C HTML 4.01 + CSS 2</td></tr> </table> <p>[<i>Example</i>: For example, consider the following web publishing settings:</p> <pre><w:optimizeForBrowser w:target="W3C XHTML+CSS2"/></pre> <p>The target attribute explicitly declares that any web page generated from this document should target W3C XHTML 1.0 + CSS 2. <i>end example</i>]</p>	Value	Target	W3C XHTML+CSS1	W3C XHTML 1.0 + CSS 1	W3C HTML4+CSS1	W3C HTML 4.01 + CSS 1	W3C XHTML+CSS2	W3C XHTML 1.0 + CSS 2	W3C HTML4+CSS2	W3C HTML 4.01 + CSS 2
Value	Target										
W3C XHTML+CSS1	W3C XHTML 1.0 + CSS 1										
W3C HTML4+CSS1	W3C HTML 4.01 + CSS 1										
W3C XHTML+CSS2	W3C XHTML 1.0 + CSS 2										
W3C HTML4+CSS2	W3C HTML 4.01 + CSS 2										

Attributes	Description
	The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre data-bbox="451 722 743 751"><... w:val="false"/></pre> <p>The val attribute explicitly declares that the property is false. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OptimizeForBrowser](#)) is located in §A.1. *end note*]

17.15.2.34 pixelsPerInch (Pixels per Inch for Graphics/Images)

This element specifies the number of pixels per inch (or density) that is used for the display of pictures or table cells when a WordprocessingML document is saved as a web page. The size that is specified by this element affects the size of the pictures or table cells relative to the size of text in the document. The pixels per inch (ppi) measurement is relative to the screen resolution, and the resulting physical dimensions of the resulting image or cell in pixels (which are used in web pages, but not for printed documents) are the result of the original dimensions (in inches) multiplied by the number of pixels per inch.

The range of values for this element is typically from 19 to 480 pixels per inch. The common settings for popular screen sizes are 72, 96, and 120 pixels per inch.

If this element is omitted, then a default size of 96 pixels per inch shall be used when determining the number of pixels for images and/or table cells within this document.

[*Note:* This setting is typically only specified if the target screen resolution for the web page is known, as defined by the targetScreenSz element (§17.15.2.41) to set the optimum screen size for the web page. *end note*]

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:pixelsPerInch w:val="200" />
</w:webSettings>
```

The pixelsPerInch element's val attribute has a value of 200, which specifies that all inches to pixels conversions done when saving this web page must be done assuming a transformation of 200 pixels per inch. *end example]*

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute contains a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of simple type ST_DecimalNumber:</p> <pre><... w:val="1512645511" /></pre> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DecimalNumber](#)) is located in §A.1. *end note]*

17.15.2.35 right (Right Border for HTML div)

This element specifies the border which shall be displayed at the right of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a right border.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
      <p>paragraph of text</p>
    </div>
  </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```
<w:divs>
  <w:div w:id="1785730240">
    ...
    <w:divBdr>
      <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
      <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
      <w:bottom w:val="outset" w:sz="18" w:color="auto" />
      <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
    </w:divBdr>
  </w:div>
</w:divs>
```

The `right` element specifies border information about the right border for the single HTML `div` structure in the document; in this case, a 0.75 point bottom border of type `threeDEngrave`. The initial 1 pixel border was converted to 0.75 points using the following logic:

$$1\text{px} * \frac{1\text{ inch}}{96\text{ px}} * \frac{576\text{ eighth points}}{1\text{ inch}} = 6\text{ eighth points (0.75 points)}$$

end example]

This element's content model is defined by the common border properties definition in §17.3.4.

17.15.2.36 `saveSmartTagsAsXml` (Save Smart Tag Data in XML Property Bag)

This element specifies that the information pertaining to all smart tags (`<smart>`) in the current document shall be saved into a separate XML-based property bag at the head of the web page when this WordprocessingML document is saved as a web page.

[*Rationale*: This setting is typically used when saving documents known to contain smart tags as web pages, in order to allow the smart tag data within the web page to be processed as a separate XML document by a separate parser, even though the actual HTML content of the resulting web page cannot be parsed by an XML-based parser. *end rationale*]

If this element is omitted, then the smart tag data of this document shall not be saved into a separate XML-compliant property bag within the HTML output when this document is saved as a web page.

[*Example:* Consider a WordprocessingML document which contains the following content:

Stock symbol: MSFT

Date: 7/4/2006

This document might typically write out the following HTML content:

```
<p>Stock symbol: <st1:stockticker>MSFT</st1:stockticker></p>
<p>Date: <st1:date ls="trans" Month="7" Day="4"
Year="2006">7/4/2006</st1:date></p>
```

However, if the WordprocessingML document also contains the following content within the web settings part:

```
<w:webSettings>
  <w:saveSmartTagsAsXml w:val="true" />
</w:webSettings>
```

The saveSmartTagsAsXml element specifies that all smart tags in the document must also be saved into an XML property bag at the header of the file, for example:

```
<head>
...
<xml>
  <o:DocumentSmartTags>
    <st1:stockticker>MSFT</st1:stockticker>
    <st1:date ls="trans" Month="7" Day="4" Year="2006">7/4/2006</st1:date>
  </o:DocumentSmartTags>
</xml>
...
</head>
```

This header information is in addition to the normal HTML output. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.2.37 scrollbar (Scrollbar Display Option)

This element specifies when a scrollbar shall be visible for the contents of the current frame. When this element is set, the val attribute determines exactly when the scrollbar shall be visible. This property is analogous to the scrolling attribute on the frame element in HTML.

If this element is omitted, the scrollbar shall only be displayed when the contents of the frame exceed the visible space for the frame (i.e. when the scrollbar is needed to display all of the content).

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frameset>
...
  <w:frame>
    <w:name w:val="Frame 2" />
    <w:scrollbar w:val="auto" />
  </w:frame>
...
</w:frameset>
</w:frameset>
```

The scrollbar element has a val attribute of auto, which specifies that the frame must only display a scrollbar when it is needed to display all of its content. *end example]*

Attributes	Description
val (Scrollbar Display Option Value)	Specifies the criteria under which a scrollbar shall be displayed along with the contents of this frameset, as defined by the simple type referenced below. [<i>Example:</i> Consider a frameset definition within a WordprocessingML document which

Attributes	Description
	<p>defines the following scrollbar visibility setting:</p> <pre data-bbox="451 321 902 453"><w:frame> <w:scrollbar w:val="on" /> ... </w:frame></pre> <p>The val attribute value of on specifies that the scrollbar must always be displayed, even when it is not needed (i.e. when it would be displayed disabled). <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_FrameScrollbar simple type (§17.18.32).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FrameScrollbar](#)) is located in §A.1. *end note*]

17.15.2.38 [sourceFileName](#) (Source File for Frame)

This element specifies the ID for the relationship which specifies the source file for a single frame within a frameset document.

The relationship referenced by this element's id attribute shall exist in the relationship part item for the Web Settings part, or this document shall be considered non-conformant. Also, the type of the relationship referenced by this element's id attribute shall be <http://purl.oclc.org/ooxml/officeDocument/relationships/frame>, or this document shall be considered non-conformant.

If this element is omitted, then no source file is present for the current frame, and one can be created dynamically as needed to display content within the frame.

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frameset>
...
  <w:frame>
    <w:name w:val="Frame 2" />
    <w:sourceFileName r:id="rId5" />
  </w:frame>
...
</w:frameset>
</w:frameset>
```

The sourceFileName element specifies that the contents of this frame must be the contents of the file targeted by the relationship with ID rId5 in the web settings part's relationship part item. *end example*]

Attributes	Description
id (Relationship to Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the relationship ID to a specified part. The specified relationship shall match the relationship type required by the parent element: <ul style="list-style-type: none">• http://purl.oclc.org/ooxml/officeDocument/relationships/customXml for the contentPart element• http://purl.oclc.org/ooxml/officeDocument/relationships/footer for the footerReference element• http://purl.oclc.org/ooxml/officeDocument/relationships/header for the headerReference element

Attributes	Description
	<ul style="list-style-type: none"> • http://purl.oclc.org/ooxml/officeDocument/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements • http://purl.oclc.org/ooxml/officeDocument/relationships/prINTERSettings for the printerSettings element • http://purl.oclc.org/ooxml/officeDocument/relationships/hyperlink for the longDesc or hyperlink element <p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId10" /></pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Rel](#)) is located in §A.1. *end note*]

17.15.2.39 sz (Frame Size)

This element specifies the size for a single frame within a frameset.

This size shall be interpreted based on the contents of the frameLayout element (§17.15.2.17) for the parent frameset, as follows:

- If the val attribute on that element is cols, then this element specifies the width of the frame
- If the val attribute on that element is rows, then this element specifies the height of the frame

Once the axis of this measurement has been established using the criteria above, the actual value of the measurement shall be determined by the following:

- If the val attribute ends in an asterisk (*), then this measurement is a relative measurement (relative to all other frames in this frameset).
- If the val attribute ends in a percentage symbol (%), then this measurement is a percentage of the height and/or width of the parent window, respectively.
- Otherwise, the value of the val attribute specifies the size of the frame in pixels. This measurement shall be interpreted in the context of the pixelsPerInch element (§17.15.2.34) to determine the width of the resulting measurement in inches.

If this element is omitted, then no information shall be implied about the size of the current frame.

[*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the top frame within this frameset:

```
<w:frameset>
...
<w:frame>
  <w:sz w:val="300" />
  <w:name w:val="Frame 1" />
</w:frame>
...
<w:pixelsPerInch w:val="150" />
</w:frameset>
```

The sz element's val attribute specifies that the size of this frame is 300 - which translates to a height of exactly 300 pixels tall. In addition, this document specifies that the intended number of pixels per inch for this measurement is 150, resulting in a 2" tall frame height. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre>

Attributes	Description
	<p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_String](#)) is located in §A.1. *end note*]

17.15.2.40 sz (Nested Frameset Size)

This element specifies the size for a frameset that has been nested within another frameset. If this size appears on a root frameset, then it can be ignored and the main frameset shall encompass the entire window.

This size shall be interpreted based on the contents of the frameLayout element (§17.15.2.17) for the parent frameset (not the current nested frameset), as follows:

- If the val attribute on that element is cols, then this element specifies the width of the frameset
- If the val attribute on that element is rows, then this element specifies the height of the frameset

Once the axis of this measurement has been established using the criteria above, the actual value of the measurement shall be determined by the following:

- If the val attribute ends in an asterisk (*), then this measurement is a relative measurement (relative to all other frames in this frameset).
- If the val attribute ends in a percentage symbol (%), then this measurement is a percentage of the height and/or width of the parent frameset, respectively.
- Otherwise, the value of the val attribute specifies the size of the frameset in pixels. This measurement shall be interpreted in the context of the pixelsPerInch element (§17.15.2.34) to determine the width of the resulting measurement in inches.

If this element is omitted, then no information shall be implied about the size of the current frameset.

[Example: Consider a nested frameset defined as follows:

```

<w:frameset>
...
  <w:frameset>
    <w:sz w:val="50%" />
    ...
  </w:frameset>
  ...
  <w:pixelsPerInch w:val="150" />
</w:frameset>

```

The sz element's val attribute specifies that the size of this nested frameset is 50% - which translates to a width of fifty percent of the width of the parent frameset's height. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre> <w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr> </pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre> <w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr> </pre> <p>In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_String](#)) is located in §A.1. *end note*]

17.15.2.41 targetScreenSz (Target Screen Size for Web Page)

This element specifies the ideal minimum target screen size (width by height, specified in pixels) on which web pages generated when saving this document is displayed. This setting can be used to optimize the output of web pages produced from this document.

If this element is omitted, then the target screen size for web pages produced from this document shall be assumed to be 800x600.

[*Example*: Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:targetScreenSz w:val="1600x1200" />
</w:webSettings>
```

The targetScreenSz element's val attribute has a value of 1600x1200, which specifies that a target screen size of 1600 by 1200 pixels must be assumed when saving this document as a web page. *end example*]

Attributes	Description
val (Target Screen Size Value)	<p>Specifies the target screen size for web pages produced by this document, as defined by the simple type referenced below.</p> <p>[<i>Example</i>: Consider a WordprocessingML document which contains the following content within the web settings part:</p> <pre><w:webSettings> <w:targetScreenSz w:val="1024x768" /> </w:webSettings></pre> <p>The val attribute has a value of 1024x768, which specifies that a target screen size of 1024 by 768 pixels must be assumed when saving this document as a web page. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TargetScreenSz simple type (§17.18.86).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TargetScreenSz](#)) is located in §A.1. *end note*]

17.15.2.42 title (Frame or Frameset Title)

This element specifies advisory information about a single frame or frameset. The title information shall be stored in this element's val attribute. This property is analogous to the title attribute on the frame or frameset element in HTML.

If this element is omitted, then no title shall be associated with the given frame or frameset.

[*Example:* Consider a WordprocessingML document that serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```

<w:frameset>
  <w:title w:val="Our library of documents" />
  <w:frame>
    <w:name w:val="Frame 1" />
    <w:title w:val="Menu bar" />
  </w:frame>
  <w:frameset>
    <w:title w:val="Navigation and document collection" />
    ...
    <w:frame>
      <w:name w:val="Frame 2" />
      <w:title w:val="Navigation bar" />
    </w:frame>
    <w:frame>
      <w:name w:val="Frame 3" />
      <w:title w:val="Documents" />
    </w:frame>
  </w:frameset>
</w:frameset>

```

The title element specifies supplementary information for each frame and frameset. In this case, the frames have titles of “Menu bar”, “Navigation bar”, and “Documents”, respectively, while the framesets have titles of “Our library of documents”, and “Navigation and document collection”, respectively. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre data-bbox="451 499 954 604"><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre data-bbox="451 781 1084 919"><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_String](#)) is located in §A.1. *end note*]

17.15.2.43 top (Top Border for HTML div)

This element specifies the border which shall be displayed at the top of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a top border.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
  <body>
    <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
      <p>paragraph of text</p>
```

```

    </div>
  </body>
</html>

```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```

<w:divs>
  <w:div w:id="1785730240">
    ...
    <w:divBdr>
      <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
      <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
      <w:bottom w:val="outset" w:sz="18" w:color="auto" />
      <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
    </w:divBdr>
  </w:div>
</w:divs>

```

The top element specifies border information about the top border for the single HTML `div` structure in the document; in this case, a 2.25 point bottom border of type dashed. The initial 3 pixel border was converted to 2.25 points using the following logic:

$$3\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{576 \text{ eighth points}}{1 \text{ inch}} = 18 \text{ eighth points (2.25 points)}$$

end example]

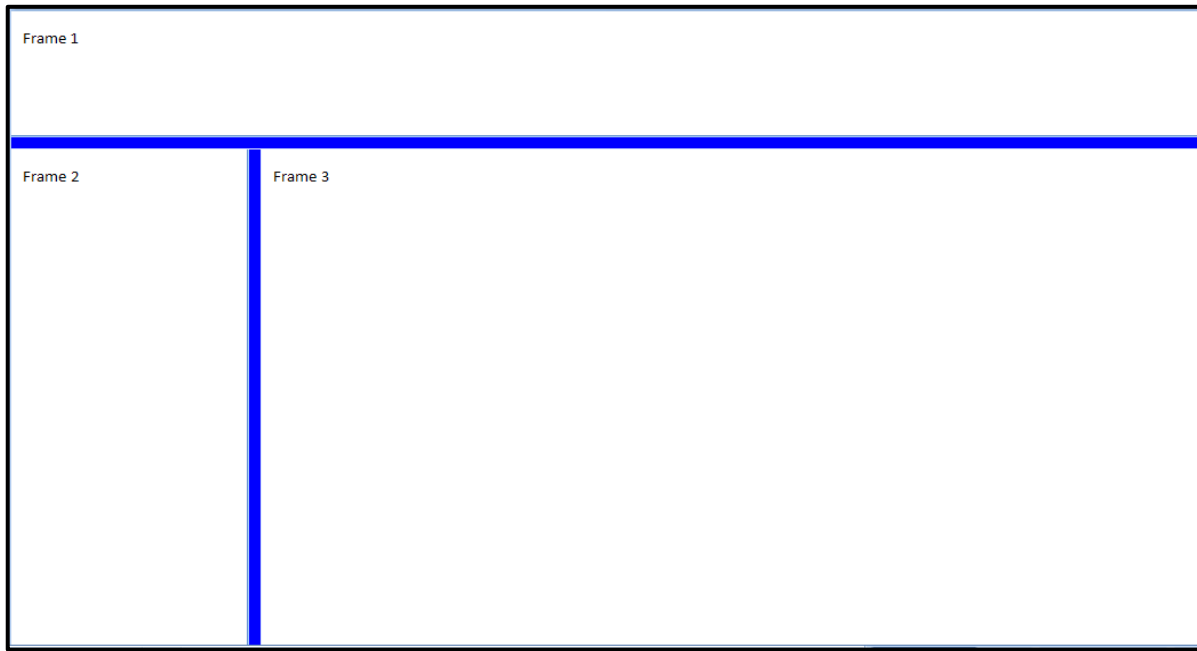

This element's content model is defined by the common border properties definition in §17.3.4.

17.15.2.44 `w` (Frameset Splitter Width)

This element specifies the width of the splitters within the frameset in this WordprocessingML document. This element shall only be honored on the root frameset for this document, and can be ignored for all nested framesets in this document.

If this element is omitted, then the default width of the splitters in this document shall be 4.5 points (90 twentieths of a point) wide. If the noBorder element (§17.15.2.31) is also specified, then this element shall be ignored and no splitters shall be displayed.

[*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
<w:frameset>
  <w:framesetSplitbar>
    <w:w w:val="200" />
    <w:color w:val="0000FF" />
  </w:framesetSplitbar>
  ...
</w:frameset>
```

The w element's val attribute specifies that the splitter must be 10 points (200 twentieths of a point) wide when the contents of this document are displayed. *end example*]

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a val attribute containing a positive measurement in twentieths of a point:</p> <pre><... w:val="720" /></pre>

Attributes	Description
	<p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§22.9.2.14).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TwipsMeasure](#)) is located in §A.1. *end note*]

17.15.2.45 webSettings (Web Page Settings)

This element specifies the set of web page settings that have been specified for a single WordprocessingML document. This element is the root element for the Web Settings part within a WordprocessingML document.

[*Example:* Consider the following WordprocessingML fragment for the web page settings in a WordprocessingML document:

```
<w:webSettings>
  ...
  <w:frameset>
    ...
  </w:frameset>
  <w:doNotUseLongFileNames w:val="true" />
  ...
</w:webSettings>
```

The webSettings element contains all of the web page settings for this document. In this case, the web page settings specified for this document are: a frameset defined using the frameset element (§17.15.2.19); and a setting specifying that when this file is saved as a web page, all resulting files must not exceed 8 octets with 3 octet extension using the doNotUseLongFileNames element (§17.15.2.13). *end example*

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_WebSettings](#)) is located in §A.1. *end note*]

17.15.3 Language Compatibility Settings

The last group of settings in WordprocessingML are language compatibility settings. *Language compatibility settings* are optional settings used to specify changes appropriate to a subset of languages, but not usually appropriate in others. [*Example:* The doNotLeaveBackslashAlone setting changes the visual appearance of a specific character to match user expectation based on a historical use of that character in some code pages – users who have used those code pages would expect one value; those who have not would expect another. *end example*]. The behavior of each setting is fully defined in this subclause.

If language compatibility settings are needed, they are stored in the Document Settings part.

[*Note:* Although these settings can be applied in any WordprocessingML document, they are often applied when the document is created in one of the following contexts.

In the case of ja-JP, ko-KR, zh-CN, zh-SG, zh-TW, zh-HK, zh-MO, ii-CN:

- doNotLeaveBackslashAlone
- doNotExpandShiftReturn
- balanceSingleByteDoubleByteWidth
- adjustLineHeightInTable
- ulTrailSpace
- spaceForUL

In the case of th-TH, lo-LA, km-KH, bo-CN, hy-AM:

- applyBreakingRules

end note]

17.15.3.1 `adjustLineHeightInTable` (Add Document Grid Line Pitch To Lines in Table Cells)

This element specifies whether a document grid defined using the `docGrid` element (§17.6.5) that specifies a line grid (manually adding additional pitch to each line in the section) shall also be applied to lines within table cells in this section.

Typically, when additional line pitch is added to all lines in a section via the document grid, it is not applied to text in tables. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that additional line pitch shall be added to lines in table cells.

[*Example:* Consider a WordprocessingML document with a single section, whose document grid is defined such that 25.9 points of additional line pitch are added to each line in the section, as follows:

```
<w:docGrid w:type="lines" w:linePitch="518"/>
```

If text was entered into this section, the default behavior would have line pitch only added to lines which are not in a table cell:

This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.

<p>This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.</p>

This section has a character grid. This section has a character grid. This section has a character grid.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:adjustLineHeightInTable />
</w:compat>
```

Then all lines in this document would have the line pitch from the document grid added to them, resulting in the following output:

This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.

<p>This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.</p>

This section has a character grid. This section has a character grid. This section has a character grid.

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.3.2 [applyBreakingRules \(Use Legacy Ethiopic and Amharic Line Breaking Rules\)](#)

This element specifies whether applications shall use a legacy set of line breaking rules when determining line breaks for text consisting of Ethiopic and/or Amharic characters.

Typically, when line breaking this text, applications should allow line breaks to occur after a character between the UTF-16 (hexadecimal) values 0x1361 and 0x1368 when those characters appear in the document's content. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that when a line break would occur after a character between the UTF-16 hexadecimal values 0x1361 and 0x1368, the line break shall occur before all instances of these characters (i.e. no break opportunity shall be afforded after a character in this range).

[*Example:* Consider a WordprocessingML document with a series of Ethiopic characters in this range. The default presentation would have any line breaks pushed before or after these characters, ensuring that the characters remain together on a single line.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:applyBreakingRules />
</w:compat>
```

Then a line break opportunity must be afforded at any point in a range of these characters, as needed. *end example]*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.3.3 `balanceSingleByteDoubleByteWidth` (Balance Single Byte and Double Byte Characters)

This element specifies whether applications shall balance the width of Single Byte Character Set characters and Double Byte Character Set characters when rendering WordprocessingML documents. Specifically, this element specifies to adjust the fixed pitch fonts' half-width space character and full-width space character to attain a 1 to 2 ratio.

[*Note:* This element is used with East Asian content. Layout and line breaking for East Asian text is dependent on the character width. Half width characters (or Hankaku characters) are one half of an em wide, and full width characters (or Zenkaku characters) are one em wide. Legacy encoding often used a single byte to encode half-width characters and two bytes to encode full width characters. *end note]*

Typically, no adjustment is done on any character when it is displayed as part of a WordprocessingML document. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that character sizes shall be adjusted as needed to meet the 1:2 ratio described above.

[*Example:* Consider a WordprocessingML document with both SBCS and DBCS characters. The default presentation would have the text displayed as follows:

言葉が example 生ま

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:balanceSingleByteDoubleByteWidth />
</w:compat>
```

Then this character-level adjustment must be performed, resulting in the following output:

言葉が example 生ま

This adjustment is usually very minute in nature, therefore the result is better illustrated by showing how the characters after the English text were pushed out due to the width balancing of that text:

言葉が example 生ま

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.3.4 compatSetting (Custom Compatibility Setting)

This element specifies a custom compatibility setting. The semantics for this element are implementation-defined. [*Note: This element can be used to store the transitional compatibility settings specified in Part 4 of ECMA-376. end note*]

[*Example:* Consider the following markup:

```
<w:compatSetting w:name="cooper" w:uri="http://www.example.com/exampleSetting"
w:val="1"/>
```

This custom compatibility setting specifies that:

- It is defined under the `http://www.example.com/exampleSetting` namespace.
- Its name is `cooper`.
- Its value is 1.

Beyond this, the properties of this setting are implementation-defined by the creator of the <http://www.example.com/exampleSetting> namespace. *end example*]

Attributes	Description
name (Name of Setting)	<p>Specifies the name of a custom compatibility setting.</p> <p>[<i>Example:</i> Consider the following markup:</p> <pre><w:compatSetting w:name="cooper" w:uri="http://www.example.com/exampleSetting" w:val="1"/></pre> <p>The name of this custom compatibility setting is cooper. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>
uri (Namespace of Setting)	<p>Specifies the namespace under which the compatibility setting is defined.</p> <p>[<i>Example:</i> Consider the following markup:</p> <pre><w:compatSetting w:name="cooper" w:uri="http://www.example.com/exampleSetting" w:val="1"/></pre> <p>The namespace of this custom compatibility setting is http://www.example.com/exampleSetting. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>
val (Value of Setting)	<p>Specifies the value of a custom compatibility setting.</p> <p>[<i>Example:</i> Consider the following markup:</p> <pre><w:compatSetting w:name="cooper" w:uri="http://www.example.com/exampleSetting" w:val="1"/></pre> <p>The value of this custom compatibility setting is 1. This value is interpreted using the implementation-defined behavior published by the creator of this property. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CompatSetting](#)) is located in §A.1. *end note*]

17.15.3.5 doNotExpandShiftReturn (Don't Justify Lines Ending in Soft Line Break)

This element specifies whether applications should fully justify the contents of incomplete lines which end in a soft line break when the parent paragraph is fully justified using the jc element (§17.3.1.13).

Typically, applications shall fully justify all lines in a paragraph when that setting is specified using the jc element except for the last line in the paragraph (the line ending with the paragraph mark). This element, when present with a val attribute value of true (or equivalent), specifies that any line which ends in a soft line break shall also not be fully justified when the paragraph specifies that setting.

[*Example:* Consider a WordprocessingML document with a paragraph whose first single line consists of East Asian characters followed by a soft paragraph mark. The default presentation would have the contents of that line fully justified:

ホルン^{金管楽器}もそうであるように、チェンバロ^(16～18世紀ごろ用いられた鍵盤楽器。後に発達してピアノになった。)

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotExpandShiftReturn />
</w:compat>
```

Then this line is not fully justified, as it ends with a soft line break, resulting in the following output:

ホルン^{金管楽器}もそうであるように、チェンバロ^(16～18世紀ごろ用いられた鍵盤楽器。後に発達してピアノになった。)

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.3.6 doNotLeaveBackslashAlone (Display Backslash As Yen Sign)

This element specifies whether applications should autodisplay the backslash character using the yen character when displaying the contents of this document.

Typically, no automatic display-only conversion of one character to another is performed. This element, when present with a val attribute value of true (or equivalent), specifies that all occurrences of the backslash character (\, U+005C) shall automatically be displayed using the yen symbol (¥, U+00A5) when the contents of the document are displayed. This setting does not change the Unicode value of the character stored in the underlying WordprocessingML document.

[*Rationale:* In Japanese code page 932, 0x5C is the yen sign (whereas, in most other code pages, it is the reverse solidus—also known as the backslash). In order to accommodate the user expectation that this code point appear as the yen sign, this setting dictates that the character be remapped, for display only, to the Unicode character ¥, such that the expected appearance is maintained. *end rationale]*

[*Example:* Consider a WordprocessingML document containing the following:

Hello \ world.

The default presentation would have exactly that:

Hello \ world.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:doNotLeaveBackslashAlone />
</w:compat>
```

Then the backslash would be displayed as ¥, resulting in the following output:

Hello ¥ world.

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.3.7 spaceForUL (Add Additional Space Below Baseline For Underlined East Asian Text)

This element specifies whether East Asian content in a WordprocessingML document which has been underlined using the `u` element shall have additional descent added to the properties of the font in order to ensure that there is adequate spacing between the characters in the font and the underlining applied to the text.

Typically, no adjustments are made to the contents of text runs containing East Asian text which have been underlined. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that whenever the following conditions are met:

- The text run contains East Asian characters
- The text run is not using baseline font alignment as defined by the `textAlignment` property

That the larger of the following two values is added to the descent property of that font in order to provide additional padding between the text characters and the underline:

- 3 percent of the font size
- 40 twentieths of a point (31 twentieths of a point for Japanese text)

[*Example:* Consider a WordprocessingML document consisting of a single run of underlined Japanese text, as follows:

```

<w:p>
  <w:r>
    <w:rPr>
      <w:u w:val="double" />
    </w:rPr>
    <w:t>クリスタ/w:t>
  </w:r>
</w:p>

```

If this document is displayed, then the text is laid out along with the underline, as follows:

However, if this compatibility setting is turned on:

```

<w:compat>
  <w:spaceForUL />
</w:compat>

```

Then the additional descent specified using the logic above is added to the text, resulting in the following output:

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.15.3.8 `ulTrailSpace` (Underline All Trailing Spaces)

This element specifies whether applications shall display underlining beneath all trailing spaces in the contents of a line when those contents are underlined. *Trailing spaces* are all space characters which are not followed by non-space characters on the same line.

Typically, applications do not display underlining on all trailing spaces which have the underline property applied to them. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that all characters with underline applied, including trailing spaces, shall display underlining if it is applied to that content.

[*Example:* Consider a WordprocessingML document with the following line of Latin alphabetical character and punctuation, trailed by a series of spaces:

```
<w:r>
  <w:rPr>
    <w:u w:val="single"/>
  </w:rPr>
  <w:t>Example text. Example text. Example text. Example text. Example text.
</w:t>
</w:r>
```

The default presentation would have no underlining on those trailing spaces:

Example text. Example text. Example text. Example text. Example text.

However, if this compatibility setting is turned on:

```
<w:compat>
  <w:ulTrailSpace />
</w:compat>
```

Then all trailing spaces would be underlined, resulting in the following output:

Example text. Example text. Example text. Example text. Example text.

end example]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.16 Fields and Hyperlinks

Most text in a word processing document is static; that is, unless it is directly changed as the result of editing, its contents remain the same, no matter how the rest of the document might change. However, certain useful pieces of information can change value over the life of a document. Consider the case of a reference to a page number, as in "For more information on this topic, see page 56." Clearly, hard coding the page number as 56 means that that number needs to be manually replaced as the document's size or layout is changed. Even a simple change to any margin, line spacing, or font size can invalidate such references.

Fields provide a mechanism for placeholders, such as page reference numbers, that can be added to a document such that those placeholders are replaced by their corresponding values when the document is rendered for display or print. Other applications for fields include, but are not limited to, automatic numbering of tables and figures, document creation and current date and time, document author information, and the computation of totals for a table column.

A *field* is a set of codes that instructs a WordprocessingML consumer to insert text, graphics, page numbers, and other material into a document automatically. [*Example:* The DATE field causes the current date to be inserted.

end example] The text or graphics inserted into a document when a consumer carries out a field's codes is referred to as the *field result* (or *field value*) for that field. The default value for a field result is an empty string. The act of carrying out a field's codes is referred to as a *field update*. A field update shall be carried out such that the content contained within the field result correctly reflects the intended semantics of the field codes (as defined in the subclauses of §17.16.5). For a simple field defined via the fldSimple element (§17.16.19), this means replacing its child elements with the appropriate WordprocessingML content; for a complex field represented by use of properly matched fldChar elements (§17.16.18), this means replacing any content between the fldChar element with an fldCharType attribute value of separate and an fldCharType attribute value of end. As to when any field is updated is outside the scope of ECMA-376.

17.16.1 Syntax

The syntax rules in this subclause follow the system shown in ISO/IEC 14977: literal text is surrounded by double-quotes (or by apostrophes); the left-square-bracket and right-square-bracket designate the start and end of an option; the left-curly-bracket and right-curly-bracket designate the start and end of a sequence of one-or-more items; the vertical-line indicates an alternative; and each rule ends with a semicolon. Whenever hyphen is used as the exception-symbol (as per ISO/IEC 14977), it is surrounded by white space, and further clarified by a comment.

The syntax rules below were derived from the field-specific rules in the detailed definitions shown in §17.16.5.*.

[*Note*: In order to produce an automated verifier, field-specific rules in subclauses 17.16.5.* must also be considered. *end note*]

When used in narrative, production names are set in an italic style, as in *comparison*, *field-argument*, and *switches*.

The syntax of a field is as follows:

```
field=
    field-type, [switches] ;
field-type=
    date-and-time |
    document-automation |
    document-information |
    document-property |
    equations-and-formulas |
    index-and-tables |
    links-and-references |
    mail-merge |
    numbering |
    user-information |
    form-field | user-defined-field ;
user-defined-field=
    letter, {letter} ;
```

```

date-and-time=
    "CREATEDATE" | "DATE" | "EDITTIME" | "PRINTDATE" |
    "SAVEDATE" | "TIME" ;

```

Formulas (also called expressions) are discussed in §17.16.3, constants are discussed in §17.16.3.1, bookmarks are discussed in §17.16.3.2, operators are discussed in §17.16.3.3, functions are discussed in §17.16.3.4, table cell references are discussed in §17.16.3.5, and formatting switches are discussed in §17.16.4.

The semantics of a field having a *user-defined-field type* are unspecified.

If the *text* in a *field-argument* or *switch-argument* contains white space, the delimiting double-quote characters shall be present; otherwise, they are optional. To include a double-quote character in *text*, it shall be preceded with a backslash (\). [Example: The field argument "\"name\"" results in the argument's actually being "name". end example] To include a backslash character in *text*, it shall be preceded with another backslash (\). [Example: File system pathnames on some systems use a backslash as a directory separator, as in the field

```
INCLUDETEXT "E:\\ReadMe.txt"
```

in which case, each such separator needs to be preceded with a backslash, as shown above. end example]

Arbitrary amount of white space can occur before the first token, after the last token, and between successive tokens, including no white space at all, except that in a *field-specific-switch*, no white space is permitted between the initial "\" token and the *character* that follows it.

[Example: Here are examples of some fields:

```

DATE
DATE \@ "dddd, MMMM dd, yyyy"
DATE \@ "dddd, MMMM dd, yyyy" \h

```

The field result of all three is today's date: The first field uses some implementation-defined format and the Gregorian calendar; the second field uses the specified format and the Gregorian calendar; and the third field uses the specified format and the Hijri lunar calendar. When rendered in a US-English context on December 31, 2005, the results of these fields were as follows:

12/31/2005
 Saturday, December 31, 2005
 AsSabt, Thoul Ki'dah 30, 1426

end example]

The names of fields are alphabetic tokens [*Example*: Some field-type names are ASK, COMMENTS, NEXT, and SET. *end example*]. These tokens are called *field-type names*. Field-type names are case-insensitive. [*Example*: The field-type names DATE, Date, dAtE, and date are equivalent. *end example*]

The *characters* immediately following the “\” in *field-specific-switch* are case-insensitive. [*Example*: \b and \B are equivalent. *end example*]

There is no ordering of *field-specific-switch* entries in *switches*.

17.16.2 XML representation

Fields shall be implemented in XML using either of two approaches:

- As a *simple field implementation*, using the fldSimple element, or
- As a *complex field implementation*, using a set of runs involving the fldChar and instrText elements.

For a simple field implementation, only one element, fldSimple, shall be used, in which case, its instr attribute shall contain a *field*, and the body of the element shall contain the most recently updated field result. [*Example*: Here is the corresponding XML for a simple field implementation of DATE:

```
<w:fldSimple w:instr="DATE">
  <w:r>
    <w:t>12/31/2005</w:t>
  </w:r>
</w:fldSimple>
```

end example]

For a complex field implementation, a set of runs shall be used with each run containing, in sequence, the following elements:

- fldChar with attribute fldCharType value begin,
- One or more instrText elements, which, collectively, contain a complete *field*,
- Optionally,
 - fldChar with attribute fldCharType value separate, which separates the field from its field result,
 - Any number of runs and paragraphs that contains the most recently updated field result, and
- fldChar with attribute fldCharType value end.

[*Note*: Fields that are for display purposes only have no need to, and do not, store a field result. *end note*][*Example*: Here is the corresponding XML for a complex field implementation of DATE:

```
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText xml:space="preserve"> DATE </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>12/31/2005</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

end example]

[*Note*: Every simple field implementation for a given field has a corresponding complex field implementation. However, not every complex field implementation has a corresponding simple field implementation. If some characters in a *field* have different run properties than others, that field must be implemented using multiple runs, and that requires that complex field implementation be used. For an example, see §17.16.4.3, where the first letter of a DATE field is made bold, underlined, and red, while the other letters have none of these properties. *end note*]

As shown in §17.16.1, the *instruction* of one *field* can be another *field*, allowing fields to nest. In such cases, the XML run sequence for the inner field is defined at the point of reference for that inner field, inside the outer field's XML run sequence. [*Example*: Consider the following sentence:

It's IF DATE \@ "M-d" <> "1-1" "not " new year's day.

The IF field contains the nested field DATE \@ "M-d". When updated, on January 1 of any year, the result sentence is "It's new year's day." On all other days of the year, the resulting sentence is "It's not new year's day."

Here is one way of writing the corresponding XML:

```
<w:r>
  <w:t xml:space="preserve">It's </w:t>
</w:r>
<w:r ...>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
```

```

<w:r>
  <w:instrText xml:space="preserve">IF </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText xml:space="preserve"> DATE \@ "M-d" </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
  <w:instrText>1-4</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
<w:r>
  <w:instrText>&lt;&gt;"1-1" "not "</w:instrText>
</w:r>
<w:r ...>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
  <w:t xml:space="preserve">not </w:t>
</w:r>
<w:r ...>
  <w:fldChar w:fldCharType="end"/>
</w:r>
<w:r>
  <w:t>new year's day!</w:t>
</w:r>

```

end example]

17.16.3 Formulas and expressions

A field instruction can involve a calculation via a *formula*, which is simply an *expression* that is an arbitrary complex arithmetic expression involving constants (§17.16.3.1), bookmarks that refer to *expressions* (§17.16.3.2), arithmetic and logical operators (§17.16.3.3), functions (§17.16.3.4), values of cells in a table (§17.16.3.5), and *fields* that result in a single value. *expression* can contain grouping parentheses to document the default precedence or to override it.

All arithmetic terms in an *expression* are real numbers. Infinities and NaN (Not-a-Number) are not supported. [Example: In the expression 1/3, although the operands appear to be integers, they are, in fact real numbers, and the result is 0.33. end example]

17.16.3.1 Constants

A constant is a number. Exponents are not supported.

[Example: Here are some constants: 1234, 1234.560, 1234., and .1234. end example]

17.16.3.2 Bookmarks

Any arbitrary piece of text and/or graphics in a WordprocessingML document can be assigned a name, called a *bookmark*. If a bookmark references text that represents an *expression*, that bookmark's name can be used as an operand in another *expression*. If a whole field is bookmarked, its bookmark name can also be used as an operand in an *expression*. [Example: Given that X is a bookmark for the text 4, Y is a bookmark for the text 2, and Result is a bookmark for the following field:

=X + Y

the field

=Result * 10

has the result 60. end example]

17.16.3.3 Operators

The *operators* permitted in *expression* are:

Operators		
Operator	Description	Precedence
-	Unary minus	highest
^	Powers and roots	
*	Multiplication	
/	Division	
%	Percentage	
+	Addition	
-	Subtraction	
=	Equal to	
<>	Not equal to	
<	Less than	lowest
<=	Less than or equal to	
>	Greater than	

Operators		
>=	Greater than or equal to	

Operators in *expression* having the same precedence associate left-to-right.

[*Example:* Given that X is a bookmark for the text 4, and Y is a bookmark for the text 2, the field

$$=((-1 + X^2) * 3 - Y)/2$$

produces the result 21.5. *end example*]

The equality, inequality, and relational operators yield 1 for true and 0 for false. An expression with value 0 tests logically false while one with any non-zero value tests true.

17.16.3.4 Functions

A *function* is a predefined procedure that computes and returns a result. Functions defined below with a parameter list of *list* accept two or more arguments separated by commas (,) or semicolons (;). As to which separator is permitted, is defined by the document's listSeparator (§17.15.1.56) element. Arguments to functions can be constants, formulas, or bookmark names that refer to constants or formulas. The functions AVERAGE, COUNT, MAX, MIN, PRODUCT, and SUM can also accept references to table cells as arguments. In the context of a table cell, functions taking a *list* also accept a single argument that designates a named-list of contiguous cells (§17.16.3.5). Function names are not case-sensitive, and white space can occur between a function's name and its argument list, if any.

The functions supported are as follows:

Functions	
Function	Description
ABS(<i>x</i>)	Returns the absolute value of <i>x</i> .
AND(<i>x</i> , <i>y</i>)	Returns 1 if the logical expressions <i>x</i> and <i>y</i> are both true; otherwise, it returns 0.
AVERAGE(<i>list</i>)	Returns the average value of the items in <i>list</i> .
COUNT(<i>list</i>)	Returns the number of items in <i>list</i> .
DEFINED(<i>x</i>)	Returns 1 if the expression <i>x</i> is well formed; otherwise, it returns 0.
FALSE	Returns 0.
INT(<i>x</i>)	Returns the value of the integer part of <i>x</i> .
MAX(<i>list</i>)	Returns the largest value in <i>list</i> .
MIN(<i>list</i>)	Returns the smallest value in <i>list</i> .
MOD(<i>x</i> , <i>y</i>)	Returns the value $x - ny$, for some integer n such that, if y is nonzero, the result has the same sign as x and magnitude less than the

Functions	
	<p>magnitude of y. If y is zero, a diagnostic shall be issued. (y need not be a whole number.) [Example: MOD(21, 5) results in 1 MOD(21, -5) results in 1 MOD(-21, 5) results in -1 MOD(-21, -5) results in -1 <i>end example</i>]</p>
NOT(x)	Returns 0 if the logical expression x is true, or 1 if the expression is false.
OR(x, y)	Returns 1 if either or both logical expressions x and y are true; otherwise, it returns 0.
PRODUCT($list$)	Returns the result of multiplying together all members in $list$.
ROUND(x, y)	Returns the value of x rounded to the specified number of decimal places indicated by floor(y), where floor has the mathematical meaning. If y is negative, any fractional part is discarded and the integer part of the value is rounded to the corresponding power of 10.
SIGN(x)	Returns 1 if x is positive; returns 0 if x is zero; and returns -1 if x is negative.
SUM($list$)	Returns the sum of the items in $list$.
TRUE	Returns 1.

17.16.3.5 Table cell references

Items in a WordprocessingML table are organized into rows and columns with the box formed by the intersection of a row and column being called a *cell*. Cells have names such as A1, A2, B1, B2, and so on, with the letter representing a column and the number representing a row. The cell at the top-left corner of each table is named A1. Column letters are not case-sensitive.

A *cell reference* shall be one of the following:

- The name of a cell.
- A comma-separated set of cell names.
- A cell range where a colon (:) is used to separate the first and last cells in a designated range of cells that has a contiguous rectangular shape. Specifying a row or column's name only as the first and last cell in a range, selects that whole row or column, regardless of the number of rows and columns the table has now or might have in the future.

An *expression* inside a table's cell can have operands that are references to other cells in that table.

[Example: Consider a table with three rows (1, 2, and 3) and two columns (A and B):

A1 + B1	Returns the sum of the contents of cells A1 and B1.
SUM(A1,B2,A3)	Returns the sum of the contents of the list of cells.
SUM(B1:B3)	Returns the sum of the contents of all cells between B1 and B3, inclusive.
SUM(B:B)	Returns the sum of the contents of all cells in column B (even if new rows are added later).
SUM(A1:B2)	Returns the sum of the contents of all (four) cells in the rectangular grid delimited by A1 and B2, inclusive.
SUM(1:1,2:2)	Returns the sum of the contents of all cells in rows 1 and 2.

end example]

When used in a table cell, the functions taking a *list* argument can have a single argument of ABOVE, BELOW, LEFT, or RIGHT, spelled in any case combination. Such lists designate, respectively, all the cells above, below, to the left of, or to the right of that cell. However, the designated range terminates if a cell with blank or non-numeric contents is reached, except that if the first cell is blank, it is treated as containing 0. [Example: Given the following table:

12	=COUNT(BELOW)	
	10	
2	20	=SUM(LEFT)
3	xxx	
=AVERAGE(ABOVE)	40	

AVERAGE(ABOVE) results in 2.5, the average of cells A4 and A3; COUNT(BELOW) results in 2, B2 and B3; and SUM(LEFT) results in 22, the sum of B3 and A3. *end example]*

An *expression* used outside a table or in a cell of one table can refer to cells in a second table by making a bookmark to that second table and qualifying cell names in that table by their table name using the form

(tableBookmarkName cellReference)

[Example: Given that Table1 is a bookmark for a 3x2 table, =SUM(Table1 A1:A3) book results in the sum of column A's cells. *end example]*

17.16.4 Field formatting

The result of a field has a *format*, either by default or because that field contains a *formatting-switch*. There are three kinds of field formatting: date and time (§17.16.4.1), numeric (§17.16.4.2), and general (§17.16.4.3).

17.16.4.1 Date and time formatting

date-and-time-formatting-switch=
 \@ *switch-argument* ;

A *date-and-time-formatting-switch* specifies the format of a date or time result. [Note: This switch is sometimes called a *picture* switch because it allows the use of symbols to represent the format of the field result. *end note*] If the result of a field is not a date or time, this switch has no effect.

If no *date-and-time-formatting-switch* is present, a date or time result is formatted in an implementation-defined manner.

A date and time *switch-argument* is made up of a series of *picture items*.

Date Formatting Picture Items	
Picture Item	Description
aaa	<p>Formats the day of the week or month in an abbreviated form according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP or ko-KR, display in the corresponding language. • For all other lang element values, display picture item as text. <p>Multiple instances of the picture item create repeated content.</p>
A	<p>Formats the day of the month as a number without a leading zero for single-digit days in Japanese numerals.</p> <p>Multiple instances of the picture item create repeated content.</p>
bb	<p>Formats the year as a 2-digit number according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO, use the Gregorian year [ISO 8601] . • For all other lang element values, use Thai Buddhist Era year <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content unless the pattern contains the “bbbb” picture item. Those portions are formatted following the description outlined for the “bbbb” picture item.</p>
bbbb	<p>Formats the year as a 4-digit number according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ZH-TW, zh-CN, zh-HK, zh-SG, or zh-MO, use the Gregorian year [ISO 8601] • For all other lang element values, use Thai Buddhist Era year <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content.</p>
BB	<p>Formats the year as a 2-digit number.</p>

Date Formatting Picture Items	
	<p>Defaults to the Gregorian [ISO 8601] calendar, but also responds to the \s and \h switches.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> Working from the text direction of the run, create as many groups as possible that contain “BBBB” in each group. Format each group using the description outlined for the “BBBB” picture item. Repeat step 1 for groups of “BB” using the description for that picture item.
BBBB	<p>Formats the year as a 4-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also responds to the \s and \h switches.</p> <p>Multiple instances of the picture item create repeated content as specified by the “BB” picture item description.</p>
d	<p>Formats the day of the week or day of the month as a number without a leading zero for single-digit days.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> Working from the text direction of the run, create as many groups as possible that contain “dddd” in each group. Format each group using the description outlined for the “dddd” picture item. Repeat step 1 for groups of “ddd”, “dd”, and “d” using the respective description for each picture item group.
dd	<p>Formats the day of the week or day of the month as a number with a leading zero0 for single-digit days.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “d” picture item description.</p>
ddd	<p>Formats the day of the week or month in its abbreviated form according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence</p>

Date Formatting Picture Items	
	<p>of the \s and \h switches, and the bb, bbbb, ๑๑๑๑, ๑๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, and ๑ picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “d” picture item description.</p>
dddd	<p>Formats the day of the week as its full name according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, ๑๑๑๑, ๑๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, and ๑ picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “d” picture item description.</p>
D	<p>Formats the day of the week or day of the month as a number without a leading zero for single-digit days.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “DDDD” in each group. Format each group using the description outlined for the “DDDD” picture item. 2. Repeat step 1 for groups of “DDD”, “DD”, and “D” using the respective description for each picture item group.
DD	<p>Formats the day of the month as a two-digit number (with a leading zero for single-digit days).</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “D” picture item description.</p>
DDD	<p>Formats the day of the week in an abbreviated form according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb, ๑๑๑๑, ๑๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, and ๑ picture item (to the Thai Buddhist Era calendar).</p>

Date Formatting Picture Items	
	Multiple instances of the picture item create repeated content as specified by the “D” picture item description.
DDDD	<p>Formats the day of the week as its full name according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, ๒๒๒๒, ๒๒๒, ๒๒๒, ๒๒, ๒, ๒๒๒, ๒๒, ๒, and ๒ picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “D” picture item description.</p>
e	<p>Formats the Japanese Emperor Era era with no leading zero for single-digit years.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “ee” in each group. Format each group using the description outlined for the “ee” picture item. 2. Repeat step 1 for groups of “e” using the description for that picture item.
ee	<p>Formats the Japanese Emperor Era era with a leading zero for single-digit years.</p> <p>Multiple instances of the picture item create repeated content as specified by the “e” picture item description.</p>
E	<p>Formats the era according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP, display the Japanese Emperor Era era with no leading zero for single-digit years in the corresponding language. • If the lang element is zh-TW, display the Taiwanese year in the corresponding language. • For all other values, display the Gregorian year [ISO 8601] as a four-digit number using ja-JP. <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “EE” in each group. Format each group using the description outlined for the “EE” picture item. 2. Repeat step 1 for groups of “E” using the description for that picture item.
EE	Formats the Gregorian year [ISO 8601] as a four-digit number, according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.

Date Formatting Picture Items	
	<ul style="list-style-type: none"> • If the lang element is ja-JP, zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO display in the corresponding language. • For all other lang element values, display in ja-JP. <p>Multiple instances of the picture item create repeated content as specified by the “E” picture item description.</p>
g	<p>Formats the era according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <p>If the lang element is ko-KR or zh-TW, display nothing. For all other lang element values, display Japanese Emperor Era era as its abbreviated form in en-US.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “ggg” in each group. Format each group using the description outlined for the “ggg” picture item. 2. From the remaining values, repeat step 1 for groups of “gg” using the description for that picture item. 3. From the remaining values, repeat step 1 for groups of “g” using the description for that picture item.
gg	<p>Formats the era according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP, display the Japanese Emperor Era era as its abbreviated form in the corresponding language. • If the lang element is ko-KR, display the Korean Tangun era as its full name in the corresponding language. • If the lang element is zh-TW, display the Taiwanese era as its full name in the corresponding language. • For all other lang element values, display the Japanese Emperor Era era as its abbreviated form in ja-JP. <p>Multiple instances of the picture item create repeated content as specified by the “g” picture item description.</p>
ggg	<p>Formats the era according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP, display the Japanese Emperor Era era as its full name in the corresponding language. • If the lang element is ko-KR, display the Korean Tangun era as its full name in the corresponding language. • If the lang element is zh-TW, display the Taiwanese era as its full name in the corresponding language. • For all other lang element values, display the Japanese Emperor Era era as its full name in ja-JP.

Date Formatting Picture Items	
	Multiple instances of the picture item create repeated content as specified by the “g” picture item description.
G	<p>Formats the era according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <ul style="list-style-type: none"> • If the lang element is ko-KR or zh-TW, display nothing. • For all other lang element values, display the Japanese Emperor Era era as its abbreviated form in ja-JP. <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “GG” in each group. Format each group using the description outlined for the “GG” picture item. 2. Repeat step 1 for groups of “G” using the description for that picture item.
GG	<p>Formats the era according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <ul style="list-style-type: none"> • If the lang element is ko-KR, display the Korean Tangun era as its full name in the corresponding language. • If the lang element is zh-TW, display the Taiwanese era as its full name in the corresponding language. • For all other lang element values, display the Japanese Emperor Era era as its full name in ja-JP. <p>Multiple instances of the picture item create repeated content as specified by the “G” picture item description.</p>
M	<p>Formats the month as a number without a leading zero for single-digit months. Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “MMMM” in each group. Format each group using the description outlined for the “MMMM” picture item. 2. Repeat step 1 for groups of “MMM”, “MM”, and “M” using the respective description for each picture item group.
MM	<p>Formats the month as a number with a leading zero for single-digit months.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb or bbbb picture item (to the Thai Buddhist Era calendar).</p>

Date Formatting Picture Items	
	Multiple instances of the picture item create repeated content as specified by the “M” picture item description.
MMM	<p>Formats the month in its abbreviated form according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, ๑๑๑๑, ๑๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, ๑๑๑๑, ๑๑๑, ๑๑, and ๑ picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “M” picture item description.</p>
MMMM	<p>Formats the month as its full name according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, ๑๑๑๑, ๑๑, ๑๑๑๑, ๑๑๑, ๑๑, ๑, ๑๑๑๑, ๑๑๑, ๑๑, and ๑ picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “M” picture item description.</p>
n	<p>Formats the Japanese Emperor Era era with no leading zero for single-digit years.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “nn” in each group. Format each group using the description outlined for the “nn” picture item. 2. Repeat step 1 for groups of “n” using the description for that picture item.
nn	<p>Formats the Japanese Emperor Era era with leading zero for single-digit years.</p> <p>Multiple instances of the picture item create repeated content as specified by the “n” picture item description.</p>
O	<p>Formats the month as a number without a leading zero for single-digit months in Japanese numerals.</p> <p>Multiple instances of the picture item create repeated content.</p>
w	<p>Formats the day of the week in an abbreviated form according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP or ko-KR, display in the corresponding language. • For all other lang element values, display picture item as literal text.

Date Formatting Picture Items	
	Multiple instances of the picture item create repeated content.
W	<p>Formats the day of the week in an abbreviated form according to the language specified by the lang element (§17.3.2.20) on the run containing the field instructions:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP, ko-KR, zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO, display in the corresponding language. • For all other lang element values, display the picture item as literal text. <p>Multiple instances of the picture item create repeated content.</p>
y	<p>Formats the year as a 2-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “yyyy” in each group. Format each group using the description outlined for the “yyyy” picture item. 2. Repeat step 1 for groups of “yy” and “y” using the respective description for each picture item group.
yy	<p>Formats the year as a 2-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches.</p> <p>Multiple instances of the picture item create repeated content as specified by the “y” picture item description.</p>
yyyy	<p>Formats the year as a 4-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches.</p> <p>Multiple instances of the picture item create repeated content as specified by the “y” picture item description.</p>
Y	<p>Formats the year as a 2-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, ๒๕๒๕, and ๒๕๒๕ picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p>

Date Formatting Picture Items	
	<ol style="list-style-type: none"> Working from the text direction of the run, create as many groups as possible that contain “YYYY” in each group. Format each group using the description outlined for the “YYYY” picture item. Repeat step 1 for groups of “YY” and “Y” using the respective description for each picture item group.
YY	<p>Formats the year as a 2-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, לולול, and לולול picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “Y” picture item description.</p>
YYYY	<p>Formats the year as a 4-digit number.</p> <p>Defaults to the Gregorian calendar [ISO 8601], but also changes in the presence of the \s and \h switches, and the bb, bbbb, לולול, and לולול picture item (to the Thai Buddhist Era calendar).</p> <p>Multiple instances of the picture item create repeated content as specified by the “Y” picture item description.</p>
ג	<p>Formats the day of the month as a number without a leading zero for single-digit days in Thai numerals.</p> <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> Working from the text direction of the run, create as many groups as possible that contain “גגגג” in each group. Format each group using the description outlined for the “גגגג” picture item. Repeat step 1 for groups of “גגג”, “גג” and “ג” using the respective description for each picture item group.
גג	<p>Formats the day of the month as a two-digit number (with a leading zero for single-digit days) in Thai numerals.</p> <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content as specified by the “ג” picture item description.</p>
גגג	<p>Formats the Thai Buddhist Era day of the week in its abbreviated form in Thai.</p> <p>This picture item can modify the behaviour of other picture items.</p>

Date Formatting Picture Items

ดดดด	<p>Formats the Thai Buddhist Era month as its full name.</p> <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content as specified by the “ด” picture item description.</p>
ปป	<p>Formats the Gregorian year as a 2-digit number using Thai numerals.</p> <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content as specified by</p>

Date Formatting Picture Items	
	<p>the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “๑๑๑๑” in each group. Format each group using the description outlined for the “๑๑๑๑” picture item. 2. Repeat step 1 for groups of “๑๑” using the description for that picture item.
๑๑๑๑	<p>Formats the Gregorian year [ISO 8601] as a 4-digit number using Thai numerals.</p> <p>This picture item can modify the behaviour of other picture items.</p> <p>Multiple instances of the picture item create repeated content as specified by the “๑๑” picture item description.</p>

Time Formatting Picture Items	
Picture Item	Description
C	<p>Formats the seconds as a number using Japanese numerals without a leading zero for single-digit seconds.</p> <p>Multiple instances of the picture item create repeated content.</p>
hor H	<p>Formats the hour on a 12-hr clock without a leading zero for single-digit hours.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “hh” in each group. Format each group using the description outlined for the “hh” picture item. 2. Repeat step 1 for groups of “h” using the description for that picture item. <p>Formats the hour without a leading 0 for single-digit hours.</p>
hh	<p>Formats the hour on a 12-hr clock with a leading zero for single-digit hours.</p> <p>Multiple instances of the picture item create repeated content as specified by the “h” picture item description.</p>
hh or HH	<p>Formats the hour with a leading 0 for single-digit hours.</p>
H	<p>Formats the hour on a 24-hr clock without a leading zero for single-digit hours.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “HH” in each group. Format each group using the description outlined for the “HH” picture item. 2. Repeat step 1 for groups of “H” using the description for that picture

Time Formatting Picture Items	
	item.
HH	<p>Formats the hour on a 24-hr clock with a leading zero for single-digit hours.</p> <p>Multiple instances of the picture item create repeated content as specified by the “H” picture item description.</p>
l	<p>Formats the minutes without a leading zero for single-digit days in Japanese numerals.</p> <p>Multiple instances of the picture item create repeated content.</p>
m	<p>Formats the minutes without a leading zero for single-digit minutes.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “mm” in each group. Format each group using the description outlined for the “mm” picture item. 2. Repeat step 1 for groups of “m” using the description for that picture item.
mm	<p>Formats the minutes with a leading zero for single-digit minutes.</p> <p>Multiple instances of the picture item create repeated content as specified by the “m” picture item description.</p>
r	<p>Formats the hour on a 12-hr clock, without a leading zero for single-digit hours, according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions, as follows:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP, ko-KR, zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO, display in the corresponding language. • For all other lang element values, display in zh-TW. <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “rr” in each group. Format each group using the description outlined for the “rr” picture item. 2. Repeat step 1 for groups of “r” using the description for that picture item.
rr	<p>Formats the hour on a 12-hr clock, without a leading zero for single-digit hours along with 12-hour clock indicators, according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions, as follows:</p> <ul style="list-style-type: none"> • If the lang element is ja-JP, ko-KR, zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO, display in the corresponding language.

Time Formatting Picture Items	
	<ul style="list-style-type: none"> For all other lang element values, display in zh-TW. <p>Multiple instances of the picture item create repeated content as specified by the “r” picture item description.</p>
R	<p>Formats the hour on a 24-hr clock, without a leading zero for single-digit hours, according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions, as follows:</p> <ul style="list-style-type: none"> If the lang element is ja-JP, ko-KR, zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO, display in the corresponding language. For all other lang element values, display in zh-TW. <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> Working from the text direction of the run, create as many groups as possible that contain “RR” in each group. Format each group using the description outlined for the “RR” picture item. Repeat step 1 for groups of “R” using the description for that picture item.
RR	<p>Formats the hour on a 12-hr clock as Arabic numerals, without a leading zero for single-digit hours and 12-hour clock indicators, according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions, as follows:</p> <ul style="list-style-type: none"> If the lang element is ja-JP, ko-KR, zh-TW, zh-CN, zh-HK, zh-SG, or zh-MO, display in the corresponding language. For all other lang element values, display in zh-TW. <p>Multiple instances of the picture item create repeated content as specified by the “R” picture item description.</p>
s	<p>Formats the seconds without a leading zero for single-digit seconds.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> Working from the text direction of the run, create as many groups as possible that contain “ss” in each group. Format each group using the description outlined for the “ss” picture item. Repeat step 1 for groups of “s” using the description for that picture item.
ss	<p>Formats the seconds as a two-digit number (with a leading zero for single-digit seconds).</p> <p>Multiple instances of the picture item create repeated content as specified by the “s” picture item description.</p>

Time Formatting Picture Items	
S	<p>Formats the seconds without a leading zero for single-digit seconds.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “SS” in each group. Format each group using the description outlined for the “SS” picture item. 2. Repeat step 1 for groups of “S” using the description for that picture item.
SS	<p>Formats the seconds as a two-digit number (with a leading zero for single-digit seconds).</p> <p>Multiple instances of the picture item create repeated content as specified by the “S” picture item description.</p>
am/pm or AM/PM	<p>Formats the uppercase 12-hour clock indicators according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.</p> <p>Multiple instances of the picture item creates repeated content. Formats using an am/AM or pm/PM suffix.</p>
AMPM or PMAM or JAM/JPM or JPM/JAM	<p>Formats the uppercase or lowercase 12-hour clock indicators according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.</p> <p>Multiple instances of the picture item create repeated content.</p>
am/pm or pm/am or A/P or P/A or a/p or p/a	<p>Formats the uppercase or lowercase 12-hour clock indicators according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.</p> <p>Multiple instances of the picture item create repeated content.</p>
h	<p>Formats the hour on a 24-hr clock without a leading zero for single-digit hours.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “hh” in each group. Format each group using the description outlined for the “hh” picture item. 2. Repeat step 1 for groups of “h” using the description for that picture item.
hh	<p>Formats the hour on a 24-hr clock as a two-digit number (with a leading zero for single-digit hours).</p> <p>Multiple instances of the picture item create repeated content as specified by the “h” picture item description.</p>

Time Formatting Picture Items	
nn	<p>Formats the minutes with a leading zero for single-digit minutes.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “nn” in each group. Format each group using the description outlined for the “nn” picture item. 2. Repeat step 1 for groups of “n” using the description for that picture item.
n	<p>Formats the minutes without a leading zero for single-digit minutes.</p> <p>Multiple instances of the picture item create repeated content as specified by the “nn” picture item description..</p>
tt	<p>Formats the seconds with a leading zero for single-digit seconds.</p> <p>Multiple instances of the picture item create repeated content as specified by the following:</p> <ol style="list-style-type: none"> 1. Working from the text direction of the run, create as many groups as possible that contain “tt” in each group. Format each group using the description outlined for the “tt” picture item. 2. Repeat step 1 for groups of “t” using the description for that picture item.
t	<p>Formats the seconds without a leading zero for single-digit seconds.</p> <p>Multiple instances of the picture item create repeated content as specified by the “tt” picture item description.</p>

Miscellaneous Formatting Picture Items	
Picture Item	Description
Other character	Includes the specified character in the result at that position. [<i>Note</i> : Commonly used characters are colon (:), hyphen (-), asterisk (*), slash (/), and space. <i>end note</i>]
'text'	Includes <i>text</i> in the result.
`numbered-item`	Includes, in Arabic numerals, the number of the preceding item numbered as a caption or resulting from a SEQ field (§17.16.5.56). <i>numbered-item</i> shall be the same name as <i>identifier</i> in that SEQ field.

[*Example*: When updated in a US-English context on the date and time shown below, the following fields produced these results:

DATE \@ "M/d/yyyy"	1/3/2006
DATE \@ "dddd, MMMM dd, yyyy"	Tuesday, January 03, 2006
DATE \@ "MMMM d, yyyy"	January 3, 2006
DATE \@ "M/d/yy"	1/3/06
DATE \@ "yyyy-MM-dd"	2006-01-03
DATE \@ "d-MMM-yy"	3-Jan-06
DATE \@ "M.d.yyyy"	1.3.2006
DATE \@ "MMM. d, yy"	Jan. 3, 06
DATE \@ "d MMMM yyyy"	3 January 2006
DATE \@ "MMMM yy"	January 06
DATE \@ "MMM-yy"	Jan-06
DATE \@ "M/d/yyyy h:mm am/pm"	1/3/2006 5:28 PM
DATE \@ "M/d/yyyy h:mm:ss am/pm"	1/3/2006 5:28:34 PM
DATE \@ "h:mm am/pm"	5:28 PM
DATE \@ "h:mm:ss am/pm"	5:28:34 PM
DATE \@ "HH:mm"	17:28
DATE \@ "'Today is 'HH:mm:ss"	Today is 17:28:34

end example]

17.16.4.2 Numeric formatting

numeric-formatting-switch=
\# *switch-argument* ;

A *numeric-formatting-switch* specifies the format of a numeric result. If the result of a field is not a number, this switch has no effect.

If no *numeric-formatting-switch* is present, a numeric result is formatted without leading spaces or trailing fractional zeros. If the result is negative, a leading minus sign is present. If the result is a whole number, no radix point is present.

A numeric *switch-argument* is made up of a series of *picture items*.

Numeric Formatting Picture Items	
Picture Item	Description
0	Specifies the requisite numeric positions to display in the result. If the result does not include a digit in that position, 0 is displayed. [Example: In a US-English context, =4+5 \# 00.00 displays "09.00". end example]
#	Specifies the requisite numeric positions to display in the result. If the result does not include a digit in that position, a space is displayed. Extra fractional digits are rounded off. [Example: =9+6 \# \$\$\$\$ displays "\$ 15". end example]
x	Drops digits to the left of the x placeholder. If the placeholder is to the right of the decimal point, the result is rounded to that place. [Example: In a US-English context, =111053+111439 \# x## displays "492", =1/8 \# 0.00x displays "0.125", and =3/4 \# .x displays ".8". end example]
.	Indicates the radix-point position. [Example: In a US-English context, =95.4 \# \$\$\$\$.00 displays "\$ 95.40". end example] The radix-point character displayed is locale-specific.
,	Separates groups of three digits. [Example: In a US-English context, =2456800 \# \$#,###,### displays "2,456,800". end example] The separator character displayed is locale-specific.
-	Prepends a minus sign to a negative result, or prepends a space if the result is positive or 0. [Example: =80-90 \# -## displays "-10", while =90-80 \# -## displays " 80". end example]
+	Prepends a plus sign to a positive result, a minus sign to a negative result, or a space if the result is 0. [Example: =90-80 \# +## displays "+10", and =80-90 \# +## displays "-10". end example]
Other character	Includes the specified character in the result at that position. [Example: =33 \# ##% displays "33%". end example]
'text'	Includes text in the result. [Example: In a US-English context, if Price is a bookmark for 26.5, =Price*15% \# "##0.00 'is the sales tax'" displays "\$ 3.98 is the sales tax". end example]
`numbered-item`	Includes, in Arabic numerals, the number of the preceding item numbered as a caption or resulting from a SEQ field (§17.16.5.56). <i>numbered-item</i> shall be the same name as <i>identifier</i> in that SEQ field. [Example: =SUM(A1:D4) \# "##0.00 'is the total of Table' `table`" displays "456.34 is the total of Table 2". end example]
<i>positive-result ; negative-result</i>	Specifies different sets of picture items for positive and negative results. A zero value uses the positive picture. [Example: =Sales95 \# \$#,##0.00; - \$#,##0.00 displays that bookmark's positive values using \$#,##0.00, and it's negative values using - \$#,##0.00. end example]
<i>positive-result ; negative-result ; zero-result</i>	Specifies different sets of picture items for positive, negative, and zero results. [Example: =Sales95 \# \$#,##0.00; - \$#,##0.00; \$0 displays that bookmark's positive values using \$#,##0.00, it's negative values using - \$#,##0.00, and its zero values using \$0. end example]

17.16.4.3 General formatting

general-formatting-switch=
`* switch-argument ;`

A *general-formatting-switch* specifies a variety of formats for a numeric or text result. If the result type of a field does not correspond to the format specified, this switch has no effect.

A *switch-argument* is made up of a series of *picture items*.

17.16.4.3.1 General formatting - Numeric Values

The following *switch-arguments* apply to fields whose field result is a numeric value. If the result type of the field is not numeric, then these switches have no effect. If the field result varies based on the language of the field instructions, those variations are noted inline:

General Formatting Switch Arguments	
Switch Argument	Description
AIUEO	Formats a numeric result using hiragana characters in the traditional a-i-u-e-o order. [Example: 1 * AIUEO results in ア. end example] Corresponds to an ST_NumberFormat enumeration value of aiueoFullWidth.
ALPHABETIC	Formats a numeric result as one or more occurrences of an uppercase alphabetic Latin character. Value 1 results in the letter A, value 2 results in the letter B, and so on up to value 26, which results in the letter Z. For values greater than 26, 26 is repeatedly subtracted from the value until the result is 26 or less. The result value determines which letter to use, and the same letter is repeated for each time 26 was subtracted from the original value. [Example: =54 * ALPHABETIC results in "BBB" as subtracting 26 from 54 two times, produces the value 2, which is represented by the letter B. end example] Corresponds to an ST_NumberFormat value of upperLetter.
alphabetic	Formats a numeric result as one or more occurrences of an lowercase alphabetic Latin character. Value 1 results in the letter a, value 2 results in the letter b, and so on up to value 26, which results in the letter z. For values greater than 26, 26 is repeatedly subtracted from the value until the result is 26 or less. The result value determines which letter to use, and the same letter is repeated for each time 26 was subtracted from the original value. [Example: =52 * alphabetic results in "zz" as subtracting 26 from 52 one time, produces the value 26, which is represented by the letter z. end example] Corresponds to an ST_NumberFormat enumeration value of lowerLetter.
Arabic	Formats a numeric result using Arabic cardinal numerals. [Example: For page 123, PAGE * Arabic results in "123". end example] Corresponds to an ST_NumberFormat enumeration value of decimal.
ARABICABJAD	Formats a numeric result using ascending Abjad numerals. [Example: 12 * ARABICABJAD results in ١٢. end example] Corresponds to an ST_NumberFormat enumeration value of arabicAbjad.
ARABICALPHA	Formats a numeric result using characters in the Arabic alphabet. [Example:

General Formatting Switch Arguments	
	<p>12 * ARABICABJAD results in ١٢. <i>end example</i></p> <p>Corresponds to an ST_NumberFormat enumeration value of arabicAlpha.</p>
ArabicDash	<p>Formats a numeric result using Arabic cardinal numerals, with a prefix of "- " and a suffix of "- ". [Example: For page 123, PAGE * ArabicDash results in "- 123 -". <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of numberInDash.</p>
BAHTTEXT	<p>Formats a numeric result in the following form:</p> <ul style="list-style-type: none"> • If the value is an integer, it is displayed using the . Thai counting system, with บาทถ้วน appended to the result. • If the value includes a fractional value, the fractional part is rounded to two decimal places, and the resulting value is displayed in the form integer-part-in-Thai-counting format บาท fractional-part-in-Thai-counting format สตางค์. <p>[Example: 1 * BAHTTEXT results in หนึ่งบาทถ้วน. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of bahtText.</p>
CardText	<p>Formats a numeric result as lowercase cardinal text. [Example: For page 123, PAGE * CardText results in "one hundred twenty-three". <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of cardinalText.</p>
CHINESENUM1	<p>Formats a numeric result using ascending numbers from the appropriate counting system. [Example: 10 * CHINESENUM1 results in 十. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chineseCounting (zh-CN) or taiwaneseCounting (zn-TW).</p>
CHINESENUM2	<p>Formats a numeric result using sequential numbers from the appropriate legal format. [Example: 123 * CHINESENUM2 results in 壹佰貳拾參. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chineseLegalSimplified (zh-CN) or ideographLegalTraditional (zh-TW).</p>
CHINESENUM3	<p>Formats a numeric result using sequential numbers from the appropriate counting thousand system. [Example: 10 * CHINESENUM3 results in 一百二十三. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chineseCountingThousand (zh-CN) or taiwaneseCountingThousand (zh-TW).</p>
CHOSUNG	<p>Formats a numeric result using sequential numbers from the Korean Chosung format. [Example: 1 * CHOSUNG results in ㄱ. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chosung.</p>
CIRCLENUM	<p>Formats a numeric result using decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character for numbers in the range 1–20. For non-negative numbers outside this range, formats them as with ARABIC. [Example: 12 * CIRCLENUM results in ⑫. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedCircle.</p>
DBCHAR	<p>Formats a numeric result using double-byte Arabic numbering. [Example: 123 * DBCHAR results in ١٢٣. <i>end example</i>]</p>

General Formatting Switch Arguments	
	Corresponds to an ST_NumberFormat enumeration value of decimalFullWidth.
DBNUM1	Formats a numeric result using sequential digital ideographs, using the appropriate character. [Example: 12 * DBNUM1 results in 一二. end example] Corresponds to an ST_NumberFormat enumeration value of ideographDigital (ja-JP) or koreanDigital (ko-KR).
DBNUM2	Formats a numeric result using sequential numbers from the appropriate counting system. [Example: 12 * DBNUM2 results in 十二. end example] Corresponds to an ST_NumberFormat enumeration value of japaneseCounting (ja-JP) or koreanCounting (ko-KR).
DBNUM3	Formats a numeric result using sequential numbers from the appropriate legal counting system. [Example: 12 * DBNUM3 results in 壹拾貳. end example] Corresponds to an ST_NumberFormat enumeration value of japaneseLegal (ja-JP) or koreanLegal (ko-KR).
DBNUM4	Formats a numeric result using sequential numbers from the appropriate digital counting system. [Example: 12 * DBNUM4 results in 一二. end example] Corresponds to an ST_NumberFormat enumeration value of japaneseDigitalTenThousand (ja-JP) or koreanDigital2 (ko-KR) or taiwaneseDigital (zh-TW).
DollarText	Formats a numeric result in the following form: <i>integer-part-as-cardinal-text</i> and <i>nn/100</i> The fractional part is rounded to two decimal places, <i>nn</i> , and is formatted using Arabic cardinal numerals. [Example: =1234.567 * DollarText results in "one thousand two hundred thirty-four and 57/100". end example] Corresponds to an ST_NumberFormat enumeration value of dollarText.
GANADA	Formats a numeric result using sequential numbers from the Korean Ganada format. [Example: 12 * GANADA results in E1. end example] Corresponds to an ST_NumberFormat enumeration value of ganada.
GB1	Formats a numeric result using decimal numbering followed by a period, using the enclosed alphanumeric glyph character. [Example: 12 * GB1 results in 12.. end example] Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedFullstop.
GB2	Formats a numeric result using decimal numbering enclosed in parenthesis, using the enclosed alphanumeric glyph character. [Example: 12 * GB2 results in (12). end example] Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedParen.
GB3	Formats a numeric result using decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 11, the numbers can be replaced with non-enclosed equivalents. [Example:

General Formatting Switch Arguments	
	12 * GB3 results in 12. <i>end example</i> Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedCircleChinese.
GB4	Formats a numeric result using decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 11, the numbers can be replaced with non-enclosed equivalents. [Example: 12 * GB4 results in 12. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of ideographEnclosedCircle.
HEBREW1	Formats a numeric result using Hebrew numerals. [Example: 123 * HEBREW1 results in קכ"ג. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hebrew1.
HEBREW2	Formats a numeric result using the Hebrew alphabet. [Example: 123 * HEBREW2 results in תתתתתת. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hebrew2.
Hex	Formats the numeric result using uppercase hexadecimal digits. [Example: For page 355, PAGE * Hex results in "FF". <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hex.
HINDIARABIC	Formats a numeric result using Hindi numbers. [Example: 123 * HINDIARABIC results in १२३. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hindiNumbers.
HINDICARDTEXT	Formats a numeric result using sequential numbers from the Hindi counting system. [Example: 123 * HINDICARDTEXT results in एक सौ तेईस. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hindiCounting.
HINDILETTER1	Formats a numeric result using Hindi vowels. [Example: 123 * HINDILETTER1 results in ठठठठ. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hindiVowels.
HINDILETTER2	Formats a numeric result using Hindi consonants. [Example: 123 * HINDILETTER2 results in ओओओओओओओ. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of hindiConsonants.
IROHA	Formats a numeric result using the Japanese iroha. [Example: 12 * IROHA results in 才. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of irohaFullWidth.
KANJINUM1	Formats a numeric result using a Japanese style using the appropriate counting system. [Example: 12 * KANJINUM1 results in 一二. <i>end example</i>] Corresponds to an ST_NumberFormat enumeration value of koreanDigital (ko-KR), ideographDigital (ja-JP), chineseCounting (zh-CN), or taiwaneseCounting (zh-TW).
KANJINUM2	Formats a numeric result using the appropriate counting system. [Example:

General Formatting Switch Arguments	
	<p>12 * KANJINUM2 results in 十二. <i>end example</i></p> <p>Corresponds to an ST_NumberFormat enumeration value of koreanCounting (ko-KR), chineseCountingThousand (ja-JP), chineseLegalSimplified (zh-CN), or ideographLegalTraditional (zh-TW).</p>
KANJINUM3	<p>Formats a numeric result using the appropriate counting system. [Example: 12 * KANJINUM3 results in 壹拾貳. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of koreanLegal (ko-KR) or japaneseLegal (ja-JP) or chineseCountingThousand (zh-CN) or taiwaneseCountingThousand (zh-TW).</p>
Ordinal	<p>Formats a numeric result using lowercase ordinal Arabic numerals. [Example: =32 * Ordinal results in "32nd". <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of ordinal.</p>
OrdText	<p>Formats a numeric result as lowercase ordinal text. Apart from being used to round off the whole number part, the fractional part is not used. [Example: =1234.567 * OrdText results in "one thousand two hundred thirty-fifth". <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of ordinalText.</p>
Roman	<p>Formats a numeric result using uppercase Roman numerals. [Example: For page 123, PAGE * Roman results in "CXXIII". <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of upperRoman.</p>
roman	<p>Formats a numeric result using lowercase Roman numerals. [Example: For page 123, PAGE * roman results in "cxxiii". <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of lowerRoman.</p>
SBCHAR	<p>Formats a numeric result using single-byte Arabic numbering. [Example: 123 * SBCHAR results in 123. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of decimalHalfWidth.</p>
THAIARABIC	<p>Formats a numeric result using Thai numbers. [Example: 123 * THAIARABIC results in ๑๒๓. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of thaiNumbers.</p>
THAICARDTEXT	<p>Formats a numeric result using sequential numbers from the Thai counting system. [Example: 123 * THAICARDTEXT results in หนึ่งร้อยยี่สิบสาม. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of thaiCounting.</p>
THAILETTER	<p>Formats a numeric result using Thai letters. [Example: 30 * THAILETTER results in ๓๐. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of thaiLetters.</p>
VIETCARDTEXT	<p>Formats a numeric result using Vietnamese numerals. [Example: 12 * VIETCARDTEXT results in mười hai. <i>end example</i>]</p> <p>Corresponds to an ST_NumberFormat enumeration value of vietnameseCounting.</p>
ZODIAC1	<p>Formats a numeric result using sequential numerical traditional ideographs.</p>

General Formatting Switch Arguments	
	[<i>Example: 1 * ZODIAC1 results in 甲. end example</i>] Corresponds to an ST_NumberFormat enumeration value of ideographTraditional.
ZODIAC2	Formats a numeric result using sequential zodiac ideographs. [<i>Example: 1 * ZODIAC2 results in 子. end example</i>] Corresponds to an ST_NumberFormat enumeration value of ideographZodiac.
ZODIAC3	Formats a numeric result using sequential traditional zodiac ideographs. [<i>Example: 1 * ZODIAC3 results in 甲子. end example</i>] Corresponds to an ST_NumberFormat enumeration value of ideographZodiacTraditional.

17.16.4.3.2 General formatting - String Values

The following *switch-arguments* apply to fields whose field result is a string value:

General Formatting Switch Arguments	
Switch Argument	Description
Caps	Capitalizes the first letter of each word. [<i>Example: USERNAME "mary smith" * Caps results in "Mary Smith", whereas USERNAME "marysmith" * Caps results in "Marysmith". end example</i>]
FirstCap	Capitalizes the first letter of the first word. [<i>Example: USERNAME "mary smith" * FirstCap results in "Mary smith". end example</i>]
Lower	All letters are lowercase. [<i>Example: USERNAME "Mary Smith" * Lower results in "mary smith". end example</i>]
Upper	All letters are uppercase. [<i>Example: USERNAME "Mary Smith" * Upper results in "MARY SMITH". end example</i>]

17.16.4.3.3 General formatting - Field Result Formatting

The following *switch-arguments* apply to any field result, and provide directions to applications regarding the formatting which should be applied to a field result after a field update has been performed. As discussed in §17.16, as to when a field update is performed is outside the scope of ECMA-376.

The general formatting switch argument CHARFORMAT is an instruction that specifies formatting intended for application to the field result after a field update. If this switch is present, the formatting of the run containing the first instrText element after the fldChar element with a fldCharType attribute value of begin is applied to all runs in the field result whenever a new field result is generated. [*Example: In a US-English context, on January 4, 2006, the field DATE * CHARFORMAT results in "1/4/2006". However, if the first run within the field instructions (containing the D in DATE) is bold, the field DATE * CHARFORMAT results in "**1/4/2006**". If that D is italic, the field DATE * CHARFORMAT results in "*1/4/2006*". If that D is bold, underlined, and red, the field **DATE** * CHARFORMAT results in "**1/4/2006**".*

The XML for the bold, underlined, red case is as follows:

```
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText xml:space="preserve"> </w:instrText>
</w:r>
<w:r ...>
  <w:rPr>
    <w:b/>
    <w:color w:val="ED1C24"/>
    <w:u w:val="single"/>
  </w:rPr>
  <w:instrText>D</w:instrText>
</w:r>
<w:r>
  <w:instrText xml:space="preserve">ATE </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
  <w:t>1/4/2006</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

Then use of the CHARFORMAT switch would cause the new field result to reuse the formatting on the first run in the field instructions, like this:

```
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText xml:space="preserve"> </w:instrText>
</w:r>
```

```

<w:r ...>
  <w:rPr>
    <w:b/>
    <w:color w:val="ED1C24"/>
    <w:u w:val="single"/>
  </w:rPr>
  <w:instrText>D</w:instrText>
</w:r>
<w:r>
  <w:instrText xml:space="preserve">ATE /* CHARFORMAT</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
  <w:rPr>
    <w:b/>
    <w:color w:val="ED1C24"/>
    <w:u w:val="single"/>
  </w:rPr>
  <w:t>1/4/2006</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

end example]

If a format specified directly in the first run of a field's *field-type* name conflicts with a general formatting switch, the general formatting switch is ignored. [*Example*: If the first run is set in small caps and the switch * Lower is also used, that switch is ignored. *end example]*

The general formatting switch argument MERGEFORMAT is used to specify an instruction regarding the formatting which is applied to the field result after a field update. If this switch is present, it specifies that applications that perform field updates should preserve the formatting of the existing field result when a new field result is generated, by applying the following logic:

- Delete all text from the current field result (leaving the paragraph and run structure intact).
- Insert the new field result text into the existing run/paragraph structure.
 - If the new text does not fill the existing structure, delete the superfluous runs/paragraphs.
 - If the new text overflows the existing structure, add additional runs/paragraphs as needed.

[*Example*: Consider the following field:

TIME \@ "HH:mm:ss" * MERGEFORMAT

When it is updated, the result might be 12:22:27, for example. If the seconds part of the displayed field result was underlined by the use of direct formatting within the original WordprocessingML, as in 12:22:27, when that field is next updated, the seconds underlining is preserved.

If the original XML generated for this field is:

```
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText xml:space="preserve"> TIME \@ "HH:mm:ss" \* MERGEFORMAT
</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
  <w:t>17:02:</w:t>
</w:r>
<w:r ...>
  <w:rPr>
    <w:u w:val="single"/>
  </w:rPr>
  <w:t>32</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

then use of the MERGEFORMAT switch would cause the new field result to reuse that structure, like this:

```
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText>TIME \@ "HH:mm:ss" \* MERGEFORMAT</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
  <w:t>12:22:</w:t>
</w:r>
```

```
<w:r ...>
  <w:rPr>
    <w:u w:val="single"/>
  </w:rPr>
  <w:t>27</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

and omitting it would direct an application that it could replace it with a single new run, like this:

```
<w:r>
  <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
  <w:instrText>TIME \@ "HH:mm:ss"</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>12:22:27</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

end example]

17.16.5 Field definitions

Each of the subclauses below this subclause describes a separate field, and each description contains a section marked **Syntax**. That section contains pieces of the field grammar as they pertain to that specific field. These pieces are presented in a slightly simpler form to aid in the understanding of the description. In those sections, the left-square-bracket and right-square-bracket designate the start and end of an option, as used in ISO/IEC 14977. However, the field-name, the open-parenthesis and the close-parenthesis designate actual literal text, as does each comma. [*Note*: Therefore, in a strict presentation according to ISO/IEC 14977, each field-name, open-parenthesis and close-parenthesis would appear with double-quotes surrounding each instance. *end note*]

The set of fields is divided into the following functional categories:

Category	Description	Fields
Date and Time	Inserts the current date and/or time, or date and/or	CREATEDATE (§17.16.5.11), DATE (§17.16.5.13), EDITTIME (§17.16.5.16),

Category	Description	Fields
	time of some kind of event.	PRINTDATE (§17.16.5.47), SAVEDATE (§17.16.5.53), TIME (§17.16.5.65)
Document Automation	Provides functionality for automated document processing.	COMPARE (§17.16.5.10), DOCVARIABLE (§17.16.5.15), GOTOBUTTON (§17.16.5.23), IF (§17.16.5.26), MACROBUTTON (§17.16.5.34), PRINT (§17.16.5.46)
Document Information	Inserts or stores information about the document.	AUTHOR (§17.16.5.4), COMMENTS (§17.16.5.9), DOCPROPERTY (§17.16.5.14), FILENAME (§17.16.5.17), FILESIZE (§17.16.5.18), KEYWORDS (§17.16.5.30), LASTSAVEDBY (§17.16.5.31), NUMCHARS (§17.16.5.41), NUMPAGES (§17.16.5.42), NUMWORDS (§17.16.5.43), SUBJECT (§17.16.5.60), TEMPLATE (§17.16.5.64), TITLE (§17.16.5.66)
Equations and Formulas	Defines formulas and calculates results; inserts symbols.	= <i>formula</i> (§17.16.3), ADVANCE (§17.16.5.2), SYMBOL (§17.16.5.61)
Form Fields	Defines fields that support insertion of data through form controls.	FORMCHECKBOX (§17.16.5.20), FORMDROPDOWN (§17.16.5.21), FORMTEXT (§17.16.5.22)
Index and Tables	Defines entries for, and builds, a table of contents, table of figures, or table of authorities.	INDEX (§17.16.5.29), RD (§17.16.5.50), TA (§17.16.5.62), TC (§17.16.5.63), TOA (§17.16.5.67), TOC (§17.16.5.68), XE (§17.16.5.72)
Links and References	Inserts information from another place in the same document or from a different document or file.	AUTOTEXT (§17.16.5.5), AUTOTEXTLIST (§17.16.5.6), BIBLIOGRAPHY (§17.16.5.7), CITATION (§17.16.5.8) HYPERLINK (§17.16.5.25), INCLUDEPICTURE (§17.16.5.27), INCLUDETTEXT (§17.16.5.28), LINK (§17.16.5.32), NOTEREF (§17.16.5.40), PAGEREF (§17.16.5.45), QUOTE (§17.16.5.49), REF (§17.16.5.51), STYLEREF (§17.16.5.59)
Mail Merge	Defines information that is to be used in a mail merge. A <i>mail merge</i> is a process by which a data set (e.g., of names and addresses) is combined with a WordprocessingML document to produce a customized document for	ADDRESSBLOCK (§17.16.5.1), ASK (§17.16.5.3), COMPARE (§17.16.5.10), DATABASE (§17.16.5.12), FILLIN (§17.16.5.19), GREETINGLINE (§17.16.5.24), IF (§17.16.5.26), MERGEFIELD (§17.16.5.35), MERGEREC (§17.16.5.36), MERGESEQ (§17.16.5.37), NEXT (§17.16.5.38), NEXTIF (§17.16.5.39), SET (§17.16.5.57), SKIPIF (§17.16.5.58)

Category	Description	Fields
	each record in said data set. In other words, a <i>mail merge</i> is an operation by which an application replaces certain fields with the data in each record from a corresponding data source (see §17.14 for additional information).	
Numbering	Specifies numbering for document items such as sections and pages; also bar codes.	LISTNUM (§17.16.5.33), PAGE (§17.16.5.44), REVNUM (§17.16.5.52), SECTION (§17.16.5.54), SECTIONPAGES (§17.16.5.55), SEQ (§17.16.5.56)
User Information	Referencethe name, initials, or address of a user account under which the document is manipulated. [<i>Note</i> : These fields can be used in documents to allow applications to perform implementation-defined updates under a particular user's context (if such a context exists); for example, to add the address of the current user to a generic form letter. <i>end note</i>]	USERADDRESS (§17.16.5.69), USERINITIALS (§17.16.5.70), USERNAME (§17.16.5.71)

17.16.5.1 ADDRESSBLOCK

Syntax:

ADDRESSBLOCK [*switches*]

Description: Represents an address block. An *address block* is a block of text specifying information appropriate for a postal mailing address, in the order required by the destination country. [*Example*: An address block for the Canadian postal system might consist of:

```
<<RECIPIENT NAME>>
<<POSTAL ADDRESS>>
<<CITY>>, <<PROVINCE>>, Canada
<<POSTAL CODE>>
```

end example]

Field Value: The address block.

Switches: Zero or more of the following *field-specific-switches*.

<code>\c field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> specifies whether to include the name of the country/region: a value of 0 causes the country/region to be omitted; a value of 1 causes it to be included (regardless of any value given for <code>\e</code>), and a value of 2 causes country/region to be included, but only if it is different from any and all specified values for <code>\e</code> .																								
<code>\d</code>	Specifies that the address is to be formatted according to the country/region of the recipient as defined by POST*CODE (Universal Postal Union 2006). If this switch is not used, then addresses are formatted according to the ordering defined by the <code>\f</code> switch. If that switch is also omitted, addresses are formatted according to some implementation-specific preference.																								
<code>\e field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> specifies a country/region to exclude from the address block. [Note: This is useful when your mailing contains a mix of domestic and international recipients. <i>end note</i>] To exclude more than one country or region, use a <code>\e</code> switch for each one, as multiple <code>\e</code> switches are permitted.																								
<code>\f field-argument</code>	<p><i>text</i> in this switch's <i>field-argument</i> specifies the name and address format by providing a template of merge-field placeholders in the following format: "<<_ + MAPPED NAME + "_>>" (< = U+003C; > = U+003E; _ = U+005F), where MAPPED NAME corresponds to a value specified by the mappedName element (§17.14.23).</p> <p>The following possible values of MAPPED NAME and corresponding mapped merge field names are reserved:</p> <table border="1"> <thead> <tr> <th>MAPPED NAME</th><th>Merge Field Name</th></tr> </thead> <tbody> <tr> <td>TITLE0</td><td>Title</td></tr> <tr> <td>FIRST0</td><td>First Name</td></tr> <tr> <td>LAST0</td><td>Last Name</td></tr> <tr> <td>SUFFIX0</td><td>Suffix</td></tr> <tr> <td>COMPANY</td><td>Company</td></tr> <tr> <td>STREET1</td><td>Address 1</td></tr> <tr> <td>STREET2</td><td>Address 2</td></tr> <tr> <td>CITY</td><td>City</td></tr> <tr> <td>STATE</td><td>State</td></tr> <tr> <td>POSTAL</td><td>Postal Code</td></tr> <tr> <td>COUNTRY</td><td>Country or Region</td></tr> </tbody> </table> <p>[Example: Using these values, a U.S. postal address might be specified as follows:</p> <pre>\f "<<_TITLE0_ >><<_FIRST0_>><< _LAST0_>><< _SUFFIX0_>> <<_COMPANY_>></pre>	MAPPED NAME	Merge Field Name	TITLE0	Title	FIRST0	First Name	LAST0	Last Name	SUFFIX0	Suffix	COMPANY	Company	STREET1	Address 1	STREET2	Address 2	CITY	City	STATE	State	POSTAL	Postal Code	COUNTRY	Country or Region
MAPPED NAME	Merge Field Name																								
TITLE0	Title																								
FIRST0	First Name																								
LAST0	Last Name																								
SUFFIX0	Suffix																								
COMPANY	Company																								
STREET1	Address 1																								
STREET2	Address 2																								
CITY	City																								
STATE	State																								
POSTAL	Postal Code																								
COUNTRY	Country or Region																								

	<<_STREET1_>> <<_STREET2_>> <<_CITY_>><<, _STATE_>><< _POSTAL_>><<_COUNTRY_>>" <i>end example]</i>
\l <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the language ID used to format the address. The default is to use the language ID of the first character of the document. This language ID is specified in the format defined by ST_Lang (§22.9.2.6)

17.16.5.2 ADVANCE

Syntax:

ADVANCE [*switches*]

Description: When text within a document is rendered, typically, each character is displayed immediately following the previous piece of content (another character, an image, and so on), according to the lexical order of the underlying WordprocessingML. The presence of this field moves the starting point at which the text that lexically follows the field is displayed to the right or left, up or down, or to a specific horizontal or vertical position. It does not affect the display of other run content (e.g., images). The switches used by this field can cause text to overlap when it is displayed. If the text is displayed within the constraints of a fixed page, repositioned text is not display if it is moved beyond the print margins of the current page (even if the target location would logically appear on a previous/following page).

Field Value: None.

Switches: Zero or more of the following *field-specific-switches*.

\d <i>field-argument</i>	Moves the text that follows the field down by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
\l <i>field-argument</i>	Moves the text that follows the field left by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
\r <i>field-argument</i>	Moves the text that follows the field right by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
\u <i>field-argument</i>	Moves the text that follows the field up by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
\x <i>field-argument</i>	Moves the text that follows the field the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> from the left edge of the column, frame, or text box.
\y <i>field-argument</i>	Moves the text that follows the field the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . This shift is the vertical position relative to the page. The entire line of text that contains the field is moved. This switch is ignored if it specifies a location outside the page margins or if the switch is used inside any of the following: table, text box, footnote, endnote, annotation, header, or footer.

[Example: When the following WordprocessingML is displayed:

```
<w:r>
  <w:t>XX</w:t>
</w:r>
<w:fldSimple w:instrText="ADVANCE \u 6"/>
<w:r>
  <w:t>XX</w:t>
</w:r>
<w:fldSimple w:instrText="ADVANCE \d 12"/>
<w:r>
  <w:t>XX</w:t>
</w:r>
<w:fldSimple w:instrText="ADVANCE \l 20"/>
<w:r>
  <w:t>+</w:t>
</w:r>
<w:fldSimple w:instrText="ADVANCE \x 150"/>
<w:r>
  <w:t>ZZ</w:t>
</w:r>
```

The results are:

```
XXXX
  XX      ZZ
```

end example]

17.16.5.3 ASK

Syntax:

ASK *field-argument-1* *field-argument-2* [*switches*]

field-argument-1:
field-argument

field-argument-2:
field-argument

Description: Prompts the user to enter information and assigns the bookmark designated by *field-argument-1* to represent the user's response. *text* in *field-argument-2* specifies the prompt text, which is displayed in a dialog box. The prompt is displayed each time the ASK field is updated. A response remains assigned to the bookmark until a new response is entered. Represents information needed to elicit and store a response (where a response is any string of characters, including the empty string). When a field update is performed, the text specified by

field-argument-2 is intended for use when requesting the response, and the resulting response is stored within the bookmark (§17.18.29) whose name attribute matches the value specified by *field-argument-1*.

Field Value: None.

Switches: Zero or more of the following *field-specific-switches*.

<code>\d <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies a default response if one is not entered. If no default response is specified, the <i>field</i> result remains unchanged. To specify a blank entry as the default, <i>field-argument</i> shall be "".
<code>\o</code>	When used in a mail merge main document, this causes the display of the prompt once instead of each time a new data record is merged. The same response is inserted in each resulting merged document.

[Example: When the following fields are updated and "John" is entered as the response,

```
ASK AskResponse "What is your first name?"
Hello REF AskResponse.
```

the result is

```
Hello John.
```

end example]

17.16.5.4 AUTHOR

Syntax:

```
AUTHOR [ field-argument ] [ switches ]
```

Description: Retrieves, and optionally sets, the document author's name, as recorded in the Creator element of the Core File Properties part or, if *field-argument* is present, the name specified by *text* in *field-argument*. Specifying a *field-argument* shall change Creator to *text*.

Field Value: The document author's name.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[Example: Consider the case in which the Creator element is as follows:

```
<Creator>William Jones</Creator>
```

and the following field is updated:

AUTHOR

The result is:

William Jones

Updating the following field:

AUTHOR "Tony Caruso"

causes the Creator element to take on the specified value. *end example*]

17.16.5.5 AUTOTEXT

Syntax:

AUTOTEXT *field-argument*

Description: References the AutoText entry (§17.12.5) that meets the following conditions:

- The val attribute of the gallery element (§17.12.9) has a value of autoTxt.
- The val attribute of the name element (§17.12.13) has the value specified by *text* in *field-argument*.

When a field update is performed, the field result is the WordprocessingML contents of the AutoText entry.

Field Value: The WordprocessingML content of the specified AutoText entry.

Switches: None.

[*Example:* Assuming the following entries are defined with values of current page number, salutation, and a notice:

```
AUTOTEXT "- PAGE -"
AUTOTEXT "Yours truly,"
AUTOTEXT Confidential
```

when evaluated, they might produce the following results.

```
- 13 -
Yours truly,
CONFIDENTIAL
```

end example]

17.16.5.6 AUTOTEXTLIST

Syntax:

AUTOTEXTLIST *field-argument* [*switches*]

Description: Creates a shortcut menu based on AutoText entries in the active template. The list can vary based on the styles applied to the AutoText entries. *text* in *field-argument* is inserted into the document.

A complex field XML implementation shall be used, and the *field-argument* text shall be placed in one or more runs between the separate and end parts of the fldChar element.

Field Value: *text* in *field-argument*.

Switches: Zero or more of the following *field-specific-switches*.

<code>\s <i>field-argument</i></code>	Specifies that the list is to contain entries based on the style specified by <i>text</i> in this switch's <i>field-argument</i> . Without this switch, entries of the current paragraph style appear. If there are no entries for the current style, all entries appear. The style can be a paragraph style or a character style.
<code>\t <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the text to show in the ScreenTip.

[Example: The field:

```
{ AUTOTEXTLIST "List of salutations" \s Salutation \t "Choose a salutation" }
```

causes the following to be displayed: In the document, the Salutation list; in the ScreenTip, Choose a salutation, and on the shortcut menu, the list of entries whose style is Salutation.

end example]

17.16.5.7 BIBLIOGRAPHY

Syntax:

BIBLIOGRAPHY [*switches*]

Description: Retrieves and displays the contents of the document's Bibliography part in the bibliographic style specified within the SelectedStyle attribute of the Sources (§22.6.2.60) element of the Bibliography part.

Field Value: The formatted bibliographic data for all sources in the current document.

Switches: Zero or more of the following *field-specific-switches*.

<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the language ID that shall be used in to format the bibliographic sources in the document that do not specify a locale using the LCID (§22.6.2.39) element. This language ID is specified in the format defined by ST_Lang (§22.9.2.6)
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the language ID that shall be used to filter the bibliographic data to only the sources in the document that use that language. This language ID is specified in the format defined by ST_Lang (§22.9.2.6)

<code>\m <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies that only the source with a Tag (§22.6.2.65) element value matching <i>field-argument</i> shall be displayed in the bibliography.
---------------------------------------	--

[Example: Consider a document with bibliographic data for ECMA-376:

Author: Ecma International

Title: Office Open XML Document Interchange Specification

Year: 2006

Month: October

the following field is updated:

BIBLIOGRAPHY /l 1033

The result for MLA is:

Ecma International. Office Open XML Document Interchange Specification. October 2006.

And for APA:

Ecma International. (2006, October). Office Open XML Document Interchange Specification.

end example]

17.16.5.8 CITATION

Syntax:

CITATION *field-argument* [*switches*]

Description: Displays the contents of the Source (§22.6.2.59) element with a Tag (§22.6.2.65) element value matching *field-argument* using the bibliographic style specified within the SelectedStyle attribute of the Sources (§22.6.2.60) element of the Bibliography part.

Field Value: The comments relating to the current document.

Switches: Zero or more of the following *field-specific-switches*.

<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the language ID which shall be used in conjunction with the specified bibliographic style to format the citation in the document. This language ID is specified in the format defined by ST_Lang (§22.9.2.6)
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the prefix which shall be prepended to the citation.

<code>\s field-argument</code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the suffix which shall be appended to the citation.
<code>\p field-argument</code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the page number associated with the citation.
<code>\v field-argument</code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the volume number associated with the citation.
<code>\n</code>	Specifies that the author information shall be suppressed from the citation.
<code>\t</code>	Specifies that the title information shall be suppressed from the citation.
<code>\y</code>	Specifies that the year information shall be suppressed from the citation.
<code>\m field-argument</code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the Tag (§22.6.2.65) element value for another source to be included in this citation's field result.

[Example: Consider a case with bibliographic data for ECMA-376:

Tag: Ecma01

Author: Ecma International

Title: Office Open XML Document Interchange Specification

Year: 2006

Month: October

the following field is updated:

CITATION Ecma01 /1 1033

The result for MLA is:

(Ecma International)

And for APA:

(Ecma International, 2006)

end example]

17.16.5.9 COMMENTS

Syntax:

COMMENTS [*field-argument*] [*switches*]

Description: Retrieves, and optionally sets, the comments relating to the current document, as recorded in the Description element of the Core File Properties part or, if *field-argument* is present, the comments specified by *text* in *field-argument*. Specifying a field-argument shall change Description to *text*.

Field Value: The comments relating to the current document.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example*: Consider the case in which the Description element is as follows:

<Description>Once upon a time, in a land far, far away ...</Description>

and the following field is updated:

COMMENTS

The result is:

Once upon a time, in a land far, far away ...

Updating the following field:

COMMENTS "I came, I saw, I was not impressed."

causes the Description element to take on the specified value. *end example*]

17.16.5.10 COMPARE

Syntax:

COMPARE *comparison* [*switches*]

Description: Compares the values designated by the two *expressions* in *comparison* using the operator designated by *comparison-operator*. [*Note*: This field can be used to create compound logical comparisons with AND and OR functions in a formula, and then by using the result of the formula in an IF field. *end note*]

[*Note*: *comparison-operator* can be any one of the six relational and equality operators specified for *operator* (§17.16.3.3). *end note*]

If *comparison-operator* is = or <>, the left-hand *expression* operand can contain a question mark (?) to represent any single character, or an asterisk (*) to represent any string of characters. The expression shall be enclosed in quotation marks so that it is compared as a character string.

Field Value: 1 if the comparison is true, or 0 if the comparison is false.

Switches: None.

[*Example*: Consider the case in which the IF field in the following example is inserted into a mail merge main document. The COMPARE fields examine the data fields CustomerNumber and CustomerRating as each data record is merged. The OR function of the formula returns the value 1 if at least one of the data fields indicates poor credit, in which case the first text in quotation marks is printed:

```
{ IF { = OR ( { COMPARE { MERGEFIELD CustomerNumber } >= 4 },  
  { COMPARE { MERGEFIELD CustomerRating } <= 9 } ) } = 1  
  "Credit not acceptable" "Credit acceptable" }
```

The following COMPARE field results in the value 1 if any value in the PostalCode data field is the range 98500–98599:

```
{ COMPARE "{ MERGEFIELD PostalCode }" = "985*" }
```

end example]

17.16.5.11 **CREATEDATE**

Syntax:

```
CREATEDATE [ switches ]
```

Description: Retrieves the date and time at which the document was created, as recorded in the DateCreated element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined.

Field Value: The date and time at which the document was created.

Switches: Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

\h	Use the Hijri Lunar or Hebrew Lunar calendar, depending on the language specified by the lang element (§17.3.2.20).
\s	Use the Saka Era calendar.

[Example: Consider the case in which the DateCreated element is as follows:

```
<DateCreated>2006-01-05T03:31:00Z</DateCreated>
```

and the following fields are updated in a US-English context that is UTC -5:

```
CREATEDATE  
CREATEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"  
CREATEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \h  
CREATEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \s
```

the results are:

```
1/4/2006 10:31:00 PM  
Wednesday, January 04, 2006 22:31:00  
AlArbia'a, Thoul Hijjah 04, 1426 22:31:00  
Budhavara, Pausa 14, 1927 22:31:00
```

end example]

17.16.5.12 DATABASE

Syntax:

DATABASE [*switches*]

DATABASE [*switches*]

Description: Inserts the results of a database query into a WordprocessingML table. If the number of columns is 62 or more, the field inserts the results of a query in columns separated by tabs. The DATABASE field contains all the information needed to connect to a database and perform an SQL query. Each time the field is updated, the database is queried again.

Field Value: The results of a database query as a WordprocessingML table.

Switches: Zero or more of the following *field-specific-switches*.

<code>\b <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies which attributes of the format set by the \l switch are to be applied to the table. If the \l switch is blank, the \b switch value shall be 16 (AutoFit). <i>text</i> can have a value that is the bitwise-or of any combination of the following: 0, None 1, Borders 2, Shading 4, Font 8, Color 16, AutoFit 32, Heading Rows 64, Last Row 128, First Column 256, Last Column
<code>\c <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies a connection to the data.
<code>\d <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the complete path and file name of the database. Used for all database queries except a query to an SQL database table using ODBC.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the integral record number of the first data record to insert
<code>\h</code>	Inserts the field names from the database as column headings in the resulting table.
<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the format that is to be applied to the result of the database query. If this switch is used and the \b switch doesn't specify the table attributes, an unformatted table is inserted.
<code>\o <i>field-argument</i></code>	Inserts data at the beginning of a merge. By adding the \o switch to

	the database field, it only gets the data for the database field at the beginning of a merge instead of once for each record merged. This is a performance optimization and should only be used when the database field doesn't rely on record specific information to gather.
<code>\s <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies a set of SQL instructions. Each quotation mark in the instructions shall be preceded by a backslash (\).
<code>\t <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the integral record number of the last data record to insert.

[Example: The following field results from a query to a database through ODBC:

```
{ DATABASE \d "C:\\Data\\Sales93.mdb" \c "DSN=MS Access Database;
  DBQ=C:\\Data\\Sales93.mdb; FIL=RedISAM"
  \s "select * from \"Customer List\"\" \f "2445" \t "2486" \l "2"
```

end example]

17.16.5.13 DATE

Syntax:

DATE [*switches*]

DATE [*switches*]

Description: The current date and time. If no calendar is specified via a *field-specific-switch* or *date-and-time-formatting-switch*, the Gregorian calendar [ISO 8601, §3.2.1] is used. As specified in §17.16.4.1, if no *date-and-time-formatting-switch* is present, a date or time result is formatted in an implementation-defined manner.

Field Value: The current date and time.

Switches: Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

<code>\h</code>	Use the Hijri Lunar or Hebrew Lunar calendar, depending on the language specified by the lang element (§17.3.2.20).
<code>\l</code>	When a field update is performed, if no <i>date-and-time-formatting-switch</i> is used, this switch is an instruction specifying that the field shall use the <i>date-and-time-formatting-switch</i> last used by the hosting application when inserting a new DATE field. If there is no last-used date format available, then the <i>date-and-time-formatting-switch</i> used is implementation-defined.
<code>\s</code>	Use the Saka Era calendar.

[*Example*: Consider the case in which the following fields are updated in a US-English context by an application with a default *date-and-time-formatting-switch* of M/d/yyyy on 2006-01-05T19:09:01:

DATE

DATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"

DATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \h

DATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \s

the results are:

1/5/2006

Thursday, January 05, 2006 19:09:01

AlKhamis, Thoul Hijjah 05, 1426 19:09:01

Bruhaspathivara, Pausa 15, 1927 19:09:01

end example]

[*Note*: For some *date-and-time-formatting-switches*, the DATE and TIME (§17.16.5.65) fields can produce the same result. *end note*]

17.16.5.14 DOCPROPERTY

Syntax:

DOCPROPERTY *docprop-category* [*switches*]

Description: Retrieves the indicated document information. For some combinations of DOCPROPERTY and *docprop-category*, there is an equivalent field, in which case, the description for the combination can be obtained from that field. For those combinations not having an equivalent field, the description is shown directly. When used directly, some of the equivalent fields allow the value of the designated property to be changed. However, when the corresponding DOCPROPERTY field is used, such values shall not be changed. This is indicated in the following table by "Read-only operation."

docprop-category	Corresponding Field	Description
AUTHOR	AUTHOR (§17.16.5.4)	Read-only operation.
BYTES	FILESIZE (§17.16.5.18)	
CATEGORY	No equivalent	The contents of the Category element of the Core File Properties part.
CHARACTERS	NUMCHARS (§17.16.5.41)	
CHARACTERSWITHSPACES	No equivalent	Like NUMCHARS, but includes all white space characters as well.
COMMENTS	COMMENTS (§17.16.5.7)	Read-only operation.

docprop-category	Corresponding Field	Description
COMPANY	No equivalent	The contents of the Company element of the Application-Defined File Properties part.
CREATETIME	CREATEDATE (§17.16.5.11)	
HYPERLINKBASE	No equivalent	The contents of the HyperlinkBase element of the Application-Defined File Properties part.
KEYWORDS	No equivalent	The contents of the Keywords element of the Core File Properties part.
LASTPRINTED	PRINTDATE (§17.16.5.47)	
LASTSAVEDBY	LASTSAVEDBY (§17.16.5.31)	
LASTSAVEDTIME	SAVEDATE (§17.16.5.53)	
LINES	No equivalent	The contents of the Lines element of the Application-Defined File Properties part.
MANAGER	No equivalent	The contents of the Manager element of the Application-Defined File Properties part.
NAMEOFAPPLICATION	No equivalent	The contents of the Application element of the Application-Defined File Properties part.
ODMADOCID		
PAGES	NUMPAGES (§17.16.5.42)	
PARAGRAPHS	No equivalent	The contents of the Paragraphs element of the Application-Defined File Properties part.
REVISIONNUMBER	REVNUM (§17.16.5.52)	
SECURITY	No equivalent	The contents of the DocSecurity element of

docprop-category	Corresponding Field	Description
		the Application-Defined File Properties part.
SUBJECT	SUBJECT (§17.16.5.60)	Read-only operation.
TEMPLATE	TEMPLATE (§17.16.5.64)	
TITLE	TITLE (§17.16.5.66)	Read-only operation.
TOTALEDITINGTIME	EDITTIME (§17.16.5.16)	
WORDS	No equivalent	The contents of the Words element of the Application-Defined File Properties part.

Field Value: The indicated document information.

17.16.5.15 DOCVARIABLE

Syntax:

DOCVARIABLE *field-argument*

DOCVARIABLE field-argument

Description: Inserts the string assigned to the document variable designated by *text* in *field-argument*. Each WordprocessingML document has a collection of variables. This field is used to access and display the contents of docVar (§17.15.1.31) elements in the Document Settings part.

Field Value: The value of the specified document variable.

Switches: None.

17.16.5.16 EDITTIME

Syntax:

EDITTIME [*switches*]

Description: Retrieves the total editing time, in minutes, since the document was created, as recorded in the TotalTime element of the Application-Defined File Properties part. By default, the *numeric-formatting-switch* or *general-formatting-switch* used is implementation-defined.

Field Value: The total editing time, in minutes.

Switches: Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[*Example:* Consider the case in which the TotalTime element is as follows:

<TotalTime>930</TotalTime>

and the following fields are updated in a US-English context:

```
EDITTIME
EDITTIME \* OrdText
EDITTIME \# "#,##0"
```

the results are:

```
930
nine hundred thirtieth
930
```

end example]

17.16.5.17 FILENAME

Syntax:

FILENAME [*switches*]

Description: Retrieves the name of the current document from its storage location.

Field Value: The name of the current document.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper, and zero or one of the following *field-specific-switches*.

\p	Include the full file path name.
----	----------------------------------

[*Example:* Consider the case in which the following fields are updated:

```
FILENAME \* Upper
FILENAME \p
```

the results might be:

```
FIELD DEMO SUITE.DOCX
E:\Std\OOXML\Fields\Field Demo Suite.docx
http://example.com/files/myFile.docx
```

end example]

17.16.5.18 FILESIZE

Syntax:

FILESIZE [*switches*]

Description: The size of the WordprocessingML package in bytes, or the empty string if the size of the package cannot be determined when a field update is performed. [*Example:* If the package is being streamed, and its size

is not yet known by the application reading that stream. *end example*] [*Note*: This information is not stored inside the document's XML. *end note*]

Field Value: The size of the current document in bytes.

Switches: Zero or one *numeric-formatting-switch* or *general-formatting-switch* and zero or one of the following *field-specific-switches*.

\k	Round to the nearest thousand bytes.
\m	Round to the nearest million bytes.

[*Example*: Consider the case in the document's size is 4,660,736 bytes and the following fields are updated:

FILESIZE \# #,##0

FILESIZE \k

FILESIZE \m

the results are:

4,660,736

4661

5

end example]

17.16.5.19 FILLIN

Syntax:

FILLIN [*field-argument*] [*switch*]

Description: Prompts the user to enter text. *text* in *field-argument* contains the prompt. The prompt is displayed each time the field is updated. When a new document is created based on a template containing FILLIN fields, those fields are updated automatically.

Field Value: The user's response.

Switches: Zero or more of the following *field-specific-switches*.

\d <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a default response if one is not entered. If no default response is specified, the most recent response is used. To specify a blank entry as the default, <i>field-argument</i> shall be "".
\o	When used in a mail merge main document, this causes the display of the prompt once instead of each time a new data record is merged. The same response is inserted in each resulting merged document.

[*Example:* The following FILLIN field helps the user fill in the correct information by displaying the patient name from the current data record:

FILLIN "Please enter the appointment time for MERGEFIELD PatientName :"

end example]

17.16.5.20 FORMCHECKBOX

Syntax:

FORMCHECKBOX

Description: Inserts a check box style form field which, when the editing of form fields is enabled using the documentProtection element (§17.15.1.29), can be checked and unchecked. An instance of this field shall be accompanied by a use of the ffData element (§17.16.17) which contains the form field's properties.

Field Value: A check box based on the properties of the ffData element (§17.16.17).

Switches: None.

[*Example:* Consider the following fields:

FORMCHECKBOX

Assuming the appropriate properties are used in the child XML elements of the field, a check box is displayed.

end example]

17.16.5.21 FORMDROPDOWN

Syntax:

FORMDROPDOWN

Description: Inserts a drop-down list style form field which, when the editing of form fields is enabled using the documentProtection element (§17.15.1.29), can be used to select an entry in the list. An instance of this field shall be accompanied by a use of the ffData element (§17.16.17) which contains the form field's properties.

Field Value: A drop-down list based on the properties of the ffData element (§17.16.17).

Switches: None.

[*Example:* Consider the following fields:

FORMDROPDOWN

Assuming the appropriate properties are used in the child XML elements of the field, a drop-down list is displayed.

end example]

17.16.5.22 FORMTEXT

Syntax:

FORMTEXT

Description: Inserts a text box style form field which, when the editing of form fields is enabled using the documentProtection element (§17.15.1.29), can be typed into. An instance of this field shall be accompanied by a use of the ffData element (§17.16.17) which contains the form field's properties.

Field Value: A text box based on the properties of the ffData element (§17.16.17).

Switches: None.

[*Example:* Consider the following fields:

FORMTEXT

Assuming the appropriate properties are used in the child XML elements of the field, a text box is displayed.

end example]

17.16.5.23 GOTOBUTTON

Syntax:

GOTOBUTTON *field-argument-1* *field-argument-2*

field-argument-1:
expression

field-argument-2:
expression

Description: Inserts a jump command, such that when it is activated, the insertion point of the document is moved to the location specified by *text* in *field-argument-1*. *text* can be a bookmark, a page number, or some other item (as described below). The page number can be a reference resulting from a REF field. The other items than can be locations are:

a <i>n</i>	annotation
f <i>n</i>	footnote
l <i>n</i>	line
p <i>n</i>	page
s <i>n</i>	section

where *n* is an integer that designates the *n*th occurrence of the corresponding item (which is not necessarily the item numbered *n*).

text in *field-argument-2* is the text or graphic "button" that appears in the document, such that it can be selected to activate the jump. [Note: The BOOKMARK and INCLUDEPICTURE fields make for some interesting button possibilities. *end note*] The text or graphic shall appear on one line in the field result; otherwise, an error occurs.

Field Value: None.

Switches: None.

[Example: Consider the following fields:

```
GOTOBUTTON MyBookmark Dest
GOTOBUTTON p3 Page
GOTOBUTTON "f 2" Footnote
```

When the Dest "button" is activated, the insertion point becomes the location marked by MyBookmark. When Page is activated, the insertion point becomes the beginning of the third page. When Footnote is activated, the insertion point becomes the marker of the second footnote, at the place it is used in the document, not in any footnote list.

end example]

17.16.5.24 GREETINGLINE

Syntax:

GREETINGLINE [*switches*]

Description: Inserts a mail merge greeting line.

Field Value: The greeting line.

Switches: Zero or more of the following *field-specific-switches*.

<code>\c <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the text to include in the merge field if the name field in the data source is blank.
<code>\c <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the format of the name included in the field.
<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the language ID used to format the name. it defaults to the language ID of the first character of the document. This language ID is specified in the format defined by ST_Lang (§22.9.2.6)

17.16.5.25 HYPERLINK

Syntax:

HYPERLINK *field-argument* [*switches*]

Description: When selected, causes control to jump to the location specified by *text* in *field-argument*. That location can be a bookmark or a URL.

Field Value: None.

Switches: Zero or more of the following *field-specific-switches*.

<code>\l <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies a location in the file, such as a bookmark, where this hyperlink jumps.
<code>\m</code>	Appends coordinates to a hyperlink for a server-side image map.
<code>\n</code>	Causes the destination site to be opened in a new web browser window.
<code>\o <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the ScreenTip text for the hyperlink.
<code>\t <i>field-argument</i></code>	<p><i>text</i> in this switch's <i>field-argument</i> specifies the target to which the link should be redirected. Use this switch to link from a frames page to a page that you want to appear outside of the frames page. The permitted values for <i>text</i> are:</p> <ul style="list-style-type: none"> • <code>_top</code>, whole page (the default) • <code>_self</code>, same frame • <code>_blank</code>, new web browser window • <code>_parent</code>, parent frame

[Example:

```
HYPERLINK http://www.example.com/
HYPERLINK "E:\\ReadMe.txt"
```

end example]

17.16.5.26 IF

Syntax:

`IF comparison field-argument-1 field-argument-2`

field-argument-1:
expression

field-argument-2:
expression

Description: Compares the values designated by the *expressions* in *comparison* using the operator designated by *comparison-operator*.

[Note: *comparison-operator* can be any one of the six relational and equality operators specified for operator (§17.16.3.3). end note]

If *comparison-operator* is = or <>, the left-hand *expression* operand can contain a question mark (?) to represent any single character, or an asterisk (*) to represent any string of characters.

Field Value: *field-argument-1* if the comparison is true; otherwise, *field-argument-2*.

Switches: None.

[*Example:* The following example specifies that if the customer order is greater than or equal to 100 units, the result is "Thanks"; but if the customer order is fewer than 100 units, the result is "The minimum order is 100 units":

```
{IF order >= 100 "Thanks" "The minimum order is 100 units" }
```

For other examples, see §17.16.2, and the COMPARE field (§17.16.5.10) and the QUOTE field (§17.16.5.48). *end example*]

17.16.5.27 INCLUDEPICTURE

Syntax:

INCLUDEPICTURE *field-argument* [*switches*]

Description: Retrieves the picture named by *field-argument* and displays it as the field result. *Field-argument* specifies the location of the picture using an IRI.

[*Note:* A list of possible image formats is provided in §15.2.14. *end note*]

Field Value: The specified picture.

Switches: Zero or more of the following *field-specific-switches*.

\c <i>field-argument</i>	If <i>text</i> in this switch's <i>field-argument</i> identifies the graphics filter to be used.
\d	Reduce the file size by not storing graphics data with the document.

[*Example:*

```
INCLUDEPICTURE "file:///g:/photos/Ellen%20in%20slo.jpg"
```

end example]

17.16.5.28 INCLUDETTEXT

Syntax:

INCLUDETTEXT *field-argument-1* [*field-argument-2*] [*switches*]

field-argument-1:
field-argument

field-argument-2:
field-argument

Description: Inserts all or part of the text and graphics contained in the document named by *field-argument-1*. *field-argument-1* specifies the location of the document using an IRI (Duerst and Suignard 2005). If the document is a WordprocessingML document, the portion marked by the optional bookmark *field-argument-2* is inserted. If no such bookmark is specified here, the whole document is inserted. If the document is an XML file, the fragment referred to by an XPath expression in the \x switch is inserted. If no such switch is specified, the whole XML file is inserted.

If *field-argument-1* contains white space, it shall be enclosed in double quotes.

[Note: A list of possible text formats is provided in §11.3.1. *end note*]

Field Value: The specified text and graphics.

Switches: Zero or more of the following *field-specific-switches*.

\!	Prevents this field from being updated unless all fields in the inserted text are first updated in their original document.
\c <i>field-argument</i>	Specifies that the file specified by <i>field-argument-2</i> shall be processed by a document filter whose name matches the corresponding <i>field-argument</i> value. Possible <i>field-argument</i> values are implementation-defined.
\e	Specifies the encoding applied to the data within the file referenced by <i>field-argument-1</i> . If this argument is omitted, applications should attempt to determine the encoding by reading the file's contents if possible.
\m	Specifies the MIME type of the file referenced by <i>field-argument-1</i> , as defined by http://www.iana.org/assignments/media-types/ . If this argument is omitted, applications should attempt to determine the file type from its contents if possible.
\n <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a namespace mapping for XPath queries. This switch is required if the \x switch refers to an element by name in an XML file that declares a namespace.
\t <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies an XSLT for formatting XML data.
\x <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies the XPath for returning a fragment of data in an XML file.

[Example: The following field inserts the portion of the WordprocessingML document referred to by the bookmark Summary:

```
INCLUDETEXT "file:///C:/Winword/Port Development RFP" Summary
```

The following field inserts the Name element of the XML document Resume.xml and applies the XSLT Display.xsl to it:

```
INCLUDETEXT "file:///C:/Resume.xml" \n xmlns:a=\"resume-schema\"
\t "file:///C:/display.xsl" \x a:Resume/a:Name
```

end example]

17.16.5.29 INDEX

Syntax:

```
INDEX [ switches ]
```

Description: Builds an index using the index entries specified by XE fields (§17.16.5.72), and inserts that index at this place in the document. Each index entry and subentry is a separate paragraph unless the \r switch is used, in which case, an index entry and all its subentries together make up a paragraph.

Field Value: The index.

Switches: Zero or more of the following *field-specific-switches*.

\b <i>field-argument</i>	Builds an index for the portion of the document marked by the bookmark indicated by <i>text</i> in this switch's <i>field-argument</i> .
\c <i>field-argument</i>	Builds an index having the number of columns per page specified by <i>text</i> in this switch's <i>field-argument</i> . That number can be 1–4. Without this switch, the number of columns is 1.
\d <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate sequence numbers and page numbers when the \s switch is used. By default, a hyphen (-) is used.
\e <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate an index entry and its first page number. By default, a comma (,) and space sequence is used. If <i>text</i> contains a horizontal tab character, the page number list is right justified in the column.
\f <i>field-argument</i>	Builds an index using only those entries having the entry type (§17.16.5.72) specified by <i>text</i> in this switch's <i>field-argument</i> . Without this switch, all entries included.
\g <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate the start and end of a page range. By default, an en dash is used.
\h <i>field-argument</i>	Builds an index such that the <i>text</i> in this switch's <i>field-argument</i> occurs as a heading—formatted with the Index Heading style—at the start of each set of entries for any given letter. If the first letter in <i>text</i> is A or a, that letter is replaced with the corresponding letter for each letter set. To replace the default heading with a blank line, use a space as <i>text</i> . [Example:

	<p>INDEX \h "a Entries Follow" \c "1" \z "1033"</p> <p>F Entries Follow fox, 1</p> <p>Q Entries Follow quick brown fox. See Fox</p> <p><i>end example]</i></p>
\k <i>field-argument</i>	<p>The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate an index entry and its cross reference (as produced by an XE entry (§17.16.5.72) having a \t switch). By default, a period (.) and space sequence is used. [Example: The quick brown fox{ XE "fox" } jumps over the lazy dog. The quick brown fox jumps over the lazy dog. The quick brown fox jumps over the lazy dog. The quick brown fox{ XE "quick brown fox" \t "See Fox" } jumps over the lazy dog. The quick brown fox jumps over the lazy dog.</p> <p>INDEX \k <test> \c "1" \z "1033"</p> <p>fox, 1 quick brown fox <test>See Fox</p> <p><i>end example]</i></p>
\l <i>field-argument</i>	<p>The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate two page numbers in a page number list. By default, a comma (,) and space sequence is used.</p>
\p <i>field-argument</i>	<p>Builds an index using only those entries whose first letter is in the range of letters specified by <i>text</i> in this switch's <i>field-argument</i>. The letter range has the form <i>startLetter-endLetter</i>. If <i>startLetter</i> is !, entries whose first character is not a letter, are also included, as are the letters starting from A. The letters in the range can be either upper- or lowercase.</p>
\r	<p>Runs subentries into the same line as the main entry. Colons (:) separate main entries from subentries; semicolons (;) separate subentries.</p>
\s <i>field-argument</i>	<p>The <i>text</i> in this switch's <i>field-argument</i> is used as a sequence name, and the sequence number is included along with the page number, these numbers being separated by a hyphen (-), by default. Use the \d switch to specify a separator character other than the default.</p>
\y	<p>Enables the use of yomi text for index entries.</p>
\z <i>field-argument</i>	<p>The <i>text</i> in this switch's <i>field-argument</i> specifies the language ID used to generate the index. This language ID is specified in the format defined by ST_Lang (§22.9.2.6)</p>

[Example: The index produced using the corresponding set of index entries and the field INDEX \c "1" \e "tab" \g " to " \h "A" \z "1033" is:

B

end example]

17.16.5.30 **KEYWORDS**

Syntax:

KEYWORDS [*field-argument*] [*switches*]

Description: Retrieves, and optionally sets, the document's keywords, as recorded in the Keywords element of the Core File Properties part or, if *field-argument* is present, the subject specified by *text* in *field-argument*. Specifying a *field-argument* shall change Keywords to *text*. The Keywords element contains a string of text whose format and semantics is unspecified by ECMA-376.

Field Value: The document's keywords

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Consider the case in which the Keywords element is as follows:

<Keywords>switch, field, syntax</Keywords>

and the following field is updated:

KEYWORDS

The result is:

switch, field, syntax

Updating the following field:

KEYWORDS "field, formatting, switch, syntax"

causes the Subject element to take on the given value. *end example*]

17.16.5.31 LASTSAVEDBY

Syntax:

LASTSAVEDBY [*switches*]

Description: Retrieves the name of the user who last modified and saved the current document, as recorded in the LastModifiedBy element of the Core File Properties part.

Field Value: The name of the user who last modified and saved the current document.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Consider the case in which the LastModifiedBy element is as follows:

```
<LastModifiedBy>Elizabeth Martin</LastModifiedBy>
```

and the following field is updated:

```
LASTSAVEDBY \* Upper
```

the result might be:

```
ELIZABETH MARTIN
```

end example]

17.16.5.32 LINK

Syntax:

LINK *field-argument-1* *field-argument-2* [*field-argument-3*] [*switches*]

field-argument-1:
field-argument

field-argument-2:
field-argument

field-argument-3:
field-argument

Description: For information copied from another application, this field links that information to its original source file. The application type of the link information is specified by *field-argument-1*. The name and location of the source file is specified by *field-argument-2*. *field-argument-3* specifies the portion of the source file that's being linked. [*Example:* If the source file is a SpreadsheetML document, the reference might be to a cell reference or a named range. For a WordprocessingML document, it might be a bookmark. *end example*]

Field Value: None.

Switches: Zero or more of the following *field-specific-switches*.

\a	Causes this field to be updated automatically.
\b	Inserts the linked object as a bitmap.
\d	Don't store the graphic data with the document, thus reducing the file size.
\f <i>field-argument</i>	Causes the linked object to update its formatting in a particular way, according to the integral value of <i>text</i> in this switch's <i>field-argument</i> . The possible values are: <ul style="list-style-type: none"> • 0 Maintain the formatting of the source file • 1 Not supported • 2 Match the formatting of the destination document • 3 Not supported • 4 Maintain the formatting of the source file, if the source file is a SpreadsheetML workbook • 5 Match the formatting of the destination document, if the source file is a SpreadsheetML workbook
\h	Inserts the linked object as HTML format text.
\p	Inserts the linked object as a picture.
\r	Inserts the linked object in rich-text format (RTF).
\t	Inserts the linked object in text-only format.
\u	Inserts the linked object as Unicode text.

[*Example:* The following example inserts a range of cells from a SpreadsheetML worksheet. The \a switch ensures that the information is updated in the WordprocessingML document whenever the worksheet is changed:

```
{ LINK Excel.Sheet.8 "C:\\My Documents\\Profits.xls"
  "Sheet1!R1C1:R4C4" \a \p }
```

end example]

17.16.5.33 LISTNUM

Syntax:

LISTNUM [*field-argument*] [*switches*]

Description: Computes the next value from a specific level of a numbering definition, or a specific value from a specific level of a numbering definition.

The terms numbering definition and level are used as defined in §17.9. Within the context of this field, determining the numbering definition is equivalent to reading the value of the numId element (§17.9.18), and determining the level is equivalent to reading to value of the ilvl element (§17.9.3). [*Rationale:* This field is

distinct from the numbering defined by the syntax in §17.9. This syntax stores the numbering as run content, rather than a paragraph property. This allows multiple numbered items to occur in a single paragraph; at locations other than the start of the paragraph, etc. *end rationale*]

For LISTNUM fields, the associated numbering definition is calculated using the first of the following conditions met:

- If *field-argument* is NumberValue, OutlineDefault, or LegalDefault, all items with each value are part of a single numbering definition.
- If the current paragraph has numbering applied, all items within that paragraph are part of its numbering definition.
- If field-argument is present, the field belongs to the numbering definition used by level one of the abstract numbering definition (§17.9.1) whose name element (§17.9.13) matches *field-argument*. If no such list exists, then the field shall behave as though field-argument was omitted.
- If *field-argument* has been omitted, the field belongs to the same numbering definition as the last instance of a LISTNUM field or numbered paragraph present in the document.

Once the numbering definition has been determined, the level is calculated as follows:

- If the \l switch is present, the value of that switch overrides all subsequent rules.
- If *field-argument* is NumberValue, OutlineDefault, or LegalDefault:
 - The first instance of the field is level one.
 - Each instance of the field which occurs at the start of the paragraph preceded only by other LISTNUM fields (or nothing) increments the level by one. [*Example: A LISTNUM field with no field-argument inserted as the first item in a paragraph using level one of a numbering definition is at level two. end example*]
 - The first instance of the field which occurs after other paragraph content increments the level by one, and all subsequent LISTNUM fields belong to the same level. [*Example: Consider the following paragraph content: {LISTNUM} {LISTNUM} test {LISTNUM} test2 {LISTNUM} {LISTNUM}. Within this paragraph, the first two instances of the field are levels one and two, and the third through fifth instances of the field are part of level three. end example*]
- If *field-argument* has any other value:
 - If the current paragraph has numbering applied, that paragraph numbering resets the level to one.
 - Each LISTNUM field which occurs at the start of the paragraph preceded only by other LISTNUM fields (or nothing) increments the level by one. [*Example: A LISTNUM field with no field-argument inserted as the first item in a paragraph using level one of a numbering definition is at level two. end example*]
 - The first LISTNUM field which occurs after other paragraph content increments the level by one, and all subsequent LISTNUM fields belong to the same level. [*Example: Consider the following paragraph content: {LISTNUM} {LISTNUM} test {LISTNUM} test2 {LISTNUM}*

{LISTNUM}. Within this paragraph, the first two instances of the field are levels one and two, and the third through fifth instances of the field are part of level three. *end example*]

- Fields in paragraphs with no numbering applied start at the same level as the last instance of a LISTNUM field or numbered paragraph present in the document.

The XML generated for a complex field implementation shall not have the optional field value stored.

Although the value of a LISTNUM field is calculated as a consecutive-valued non-negative integer, once a value is computed, the corresponding integer is rendered in the appropriate format, as described below. In all possible display methods, the list entry value is considered to be a number, and the list to be a numbered list. There are nine levels of list, and the result style used for each is determined based on the *field-argument* as follows:

- If the *field-argument* is NumberValue, OutlineDefault, or LegalDefault, the formatting is based on the table below.
- For any other value, the formatting is based on the abstract numbering definition (§17.9.1) whose name element (§17.9.13) matches *field-argument*. If no such list exists, then the field shall behave as though *field-argument* was omitted.
- If *field-argument* has been omitted:
 - If the current paragraph has numbering applied, the field shall take on the format of the next level of the corresponding numbering definition. [*Example*: A LISTNUM field inserted into a paragraph using level one of a numbering definition is displayed in the format defined by level two of that numbering definition. *end example*]
 - If not, the field takes on the numbering format of the last instance of a LISTNUM field or numbered paragraph present in the document.

The following tables describe the predefined sequences NumberValue, OutlineDefault, and LegalDefault. The formats described are used as defined by ST_NumberFormat (§17.18.59).

Level	NumberValue Value Content and Format
1	The decimal format followed immediately by ")". [<i>Example</i> : "3)", "9)", and "15)". <i>end example</i>].
2	The lowerLetter format followed immediately by ")". [<i>Example</i> : "c)", "i)", and "o)". <i>end example</i>].
3	The lowerRoman format followed immediately by ")". [<i>Example</i> : "iii)", "ix)", and "xv)". <i>end example</i>].
4	The decimal format surrounded by "(" and ")", without any intervening white space. [<i>Example</i> : "(3)", "(9)", and "(15)". <i>end example</i>].
5	The lowerLetter format surrounded by "(" and ")", without any intervening white space. [<i>Example</i> : "(c)", "(i)", and "(o)". <i>end example</i>].
6	The lowerRoman format surrounded by "(" and ")", without any intervening white space. [<i>Example</i> : "(iii)", "(ix)", and "(xv)". <i>end example</i>].
7	The decimal format followed immediately by ".". [<i>Example</i> : "3.", "9.", and "15.". <i>end example</i>].

Level	NumberValue Value Content and Format
8	The lowerLetter format followed immediately by ".". [Example: "c.", "i.", and "o.". end example].
9	The lowerRoman format followed immediately by ".". [Example: "iii.", "ix.", and "xv.". end example].

Level	OutlineDefault Value Content and Format
1	The upperRoman format followed immediately by ".". [Example: "III.", "IX.", and "XV.". end example].
2	The upperLetter format followed immediately by ".". [Example: "C.", "I.", and "O.". end example].
3	The decimal format followed immediately by ".". [Example: "3.", "9.", and "15.". end example].
4	The lowerLetter format followed immediately by ")". [Example: "(c)", "(i)", and "(o)". end example].
5	The decimal format surrounded by "(" and ")", without any intervening white space. [Example: "(3)", "(9)", and "(15)". end example].
6	The lowerLetter format surrounded by "(" and ")", without any intervening white space. [Example: "(c)", "(i)", and "(o)". end example].
7	The lowerLetter format defined by ST_NumberFormat surrounded by "(" and ")", without any intervening white space. [Example: "(iii)", "(ix)", and "(xv)". end example].
8	The lowerLetter format surrounded by "(" and ")", without any intervening white space. [Example: "(c)", "(i)", and "(o)". end example].
9	The lowerRoman format surrounded by "(" and ")", without any intervening white space. [Example: "(iii)", "(ix)", and "(xv)". end example].

Level	LegalDefault Value Content and Format
1	The decimal format followed immediately by ".". [Example: "3.", "9.", and "15.". end example].
2–9	A sequence consisting of the last number from each previous level (delimited by "." followed immediately by the next value at this level and "." (all in the decimal format). [Example: "1.3.", "2.4.9.", and "1.3.7.2.15.". end example].

Field Value: The next value, or a specific value, from the numbering definition which this instance of the LISTNUM field belongs to (as described above).

Switches: Zero or more of the following *field-specific-switches*.

<code>\l field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> is an integer that specifies the level in the list, overriding the default behavior of the field. If <code>\l</code> is omitted, for a new series, the default value is 3; otherwise, the current level is continued.
<code>\s field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> is an integer that specifies the starting value for this field. If <code>\s</code> is omitted, for a new series, the default value is 1; otherwise, the current series numbering is continued.

[*Example:* When the following fields are updated:

We need to perform the following functions: LISTNUM NumberDefault \l 3 \s 1 Get approval for the project. LISTNUM Arrange for funding. LISTNUM Hire staff.

The results are:

We need to perform the following functions: i) Get approval for the project. ii) Arrange for funding. iii) Hire staff.

When the following fields are updated:

```
LISTNUM NumberDefault \l 3 \s 1
LISTNUM
LISTNUM NumberDefault
LISTNUM NumberDefault \s 3
LISTNUM
LISTNUM NumberDefault \l 1
LISTNUM
LISTNUM NumberDefault \l 1 \s 1
LISTNUM LegalDefault \l 1 \s 1
LISTNUM LegalDefault
LISTNUM LegalDefault \l 1
LISTNUM LegalDefault \s 4
LISTNUM LegalDefault
```

The results are:

```
i)
ii)
iii)
iii)
iv)
2)
3)
1)
1.1.1.
1.1.2.
2.
2.1.4.
2.1.5.
```

end example]

17.16.5.34 MACROBUTTON

Syntax:

MACROBUTTON *field-argument-1 field-argument-2*

field-argument-1:
field-argument

field-argument-2:
field-argument

Description: Allows the macro or command designated by *text* in *field-argument-1* to be run. *text* in *field-argument-2* designates the text or graphic to appear as the "button" that is selected to run the macro or command. The mechanism by which the command specified by *text* in *field-argument-1* is located and/or executed by an application is implementation-defined.

Field Value: *field-argument-2*.

Switches: None.

17.16.5.35 MERGEFIELD

Syntax:

MERGEFIELD *field-argument* [*switches*]

Description: Retrieves the name of a data field designated by *text* in *field-argument* within the merge characters in a mail merge main document. When the main document is merged with the selected data source, information from the specified data field is inserted in place of the merge field.

The name designated by *text* shall match exactly the field name in the header record.

Field Value: The name of a data field designated by *text* in *field-argument*.

Switches: Zero or more of the following *field-specific-switches*.

<code>\b <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the text to be inserted before the MERGEFIELD field if the field is not blank.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the text to be inserted after the MERGEFIELD field if the field is not blank.
<code>\m</code>	Specifies that the MERGEFIELD field is a mapped field.
<code>\v</code>	Enables character conversion for vertical formatting.

[*Example:* Placing the following three MERGEFIELD fields together and using the \f switch ensures that the three fields have spaces between them, but only if the designated field information is present in the data source.

```
MERGEFIELD CourtesyTitle \f " " MERGEFIELD FirstName \f " "
MERGEFIELD LastName
```

end example]

17.16.5.36 MERGEREC

Syntax:

MERGEREC

Description: When an application uses the contents of this document to perform a mail merge, this field is an instruction that the *field result* display the number of the corresponding data record in the merged document. The number reflects the sequential order of the data records that were selected and possibly sorted for merging with the active main document. It does not indicate the actual order of the records as they occur in the physical data source. [Note: A personnel database might contain thousands of records. However, to send a form letter to employees who've reached their five-year anniversary with your company, you'd select as your data source only the records of those five-year employees, a much smaller set of records. To print a physical record number, you must include a record number field in the data source and insert the corresponding merge field in the main document. *end note*]

Field Value: The literal text «MERGEREC» unless a mail merge is being performed, in which case, the number of the data record being merged.

Switches: None.

[Example: The following example uses a MERGEREC field inside a formula to create unique invoice numbers. When the main document is merged with the data source, the number resulting from the MERGEREC field is added to the numbers representing the date and time the invoices are printed.

Invoice Number: = { PRINTDATE \@ "MMddyyyyHHmm" + MERGEREC }

The result might be:

Invoice Number for record 12, printed on Feb. 13, 2003 at 9:46:
02132003094612

end example]

17.16.5.37 MERGESEQ

Syntax:

MERGESEQ

Description: Counts the number of data records that were successfully merged with the main document. Merged records are numbered starting from 1 each time documents are merged. [Note: The number might be different from the value inserted by the MERGEREC field. *end note*]

Field Value: The number of data records that were successfully merged with the main document.

Switches: None.

[*Example:* Consider the case in which only records 10–25 are merged. The MERGESEQ number corresponding to the first data record merged is 1, even though the MERGEREC number for that data record is 10. *end example*]

17.16.5.38 NEXT

Syntax:

NEXT

Description: Merges the next data record into the current resulting merged document, rather than starting a new merged document. [*Note:* This field is used when setting up a mailing label and envelope main document during a mail merge. *end note*]

Field Value: None.

Switches: None.

[*Example:* The following fields print three sets of names and phone numbers in each resulting merged document:

```
MERGEFIELD Name MERGEFIELD Phone
NEXT MERGEFIELD Name MERGEFIELD Phone
NEXT MERGEFIELD Name MERGEFIELD Phone
```

end example]

17.16.5.39 NEXTIF

Syntax:

NEXTIF *comparison*

Description: Compares the values designated by the *expressions* in *comparison* using the operator designated by *comparison-operator*. If the comparison is true, the next data record is merged into the current merge document. (Merge fields that follow the NEXTIF in the main document are replaced by values from the next data record rather than the current data record.) If the comparison is false, the next data record is merged into a new merge document.

[*Note:* *comparison-operator* can be any one of the six relational and equality operators specified for *operator* (§17.16.3.3). *end note*]

A NEXTIF fields shall not be used in a footnote, an endnote, annotation, a header, a footer, or a data source. A NEXTIF field shall not be nested within any field.

If *comparison-operator* is = or <>, the right-hand *expression* operand can contain a question mark (?) to represent any single character, or an asterisk (*) to represent any string of characters. The expression shall be enclosed in quotation marks so that it is compared as a character string.

Field Value: None.

Switches: None.

17.16.5.40 NOTEREF

Syntax:

NOTEREF *field-argument* [*switches*]

Description: Inserts the mark of the footnote or endnote that is marked by the bookmark specified by *text* in *field-argument*.

Field Value: The mark of the footnote or endnote.

Switches: Zero or more of the following *field-specific-switches*.

\f	For a footnote, inserts the reference mark with the same character formatting as the Footnote Reference style. For an endnote, inserts the reference mark with the same character formatting as the Endnote Reference style.
\h	Inserts a hyperlink to the bookmarked endnote or footnote.
\p	Inserts the relative position of the footnote or endnote. If the NOTEREF field occurs before the bookmark, the result is "below". If the NOTEREF field occurs after the bookmark, the result is "above".

[Example: Consider the case in which a bookmark called F10 marks the footnote of interest. When the field

... (see note { NOTEREF F10 }).

is updated, the result might be:

... (see note 5).

end example]

17.16.5.41 NUMCHARS

Syntax:

NUMCHARS [*switches*]

Description: Retrieves the number of characters in the current document, as recorded in the Characters element of the Application-Defined File Properties part.

Field Value: The number of characters in the current document.

Switches: Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[Example: Consider the case in the document has 6,183 words and the following fields are updated:

NUMCHARS

NUMCHARS \# #,##0

the results are:

6183

6,183

end example]

17.16.5.42 Numpages

Syntax:

Numpages [*switches*]

Description: Retrieves the number of pages in the current document, as recorded in the Pages element of the Application-Defined File Properties part.

Field Value: The number of pages in the current document.

Switches: Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[*Example:* Consider the case in the document has 19 pages and the following fields are updated:

Numpages \# #,##0

Numpages * OrdText

the results are:

19

nineteenth

end example]

17.16.5.43 Numwords

Syntax:

Numwords [*switches*]

Description: Retrieves the number of words in the current document, as recorded in the Words element of the Application-Defined File Properties part.

Field Value: The number of words in the current document.

Switches: Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[*Example:* Consider the case in the document has 1,243 words and the following fields are updated:

NUMWORDS
NUMWORDS \# #,##0

the results are:

1243
1,243

end example]

17.16.5.44 PAGE

Syntax:

PAGE [*switches*]

Description: Retrieves the number of the current page.

Field Value: The number of the current page.

Switches: Zero or more *general-formatting-switches*.

[*Example:* When the current page number is 19 and the following fields are updated:

PAGE
PAGE * ArabicDash
PAGE * ALPHABETIC
PAGE * roman

the results are:

19
- 19 -
S
xix

end example]

17.16.5.45 PAGeref

Syntax:

PAGeref *field-argument* [*switches*]

Description: Inserts the number of the page containing the bookmark specified by *text* in *field-argument* for a cross-reference.

Field Value: The number of the page containing the bookmark.

Switches: Zero or one of the *general-formatting-switches*, zero or one of the *numeric-formatting-switches*, and zero or more of the following *field-specific-switches*.

<code>\h</code>	Creates a hyperlink to the bookmarked paragraph.
<code>\p</code>	Causes the field to display its position relative to the source bookmark. If the PAGEREF field is on the same page as the bookmark, it omits "on page #" and returns "above" or "below" only. If the PAGEREF field is not on the same page as the bookmark, the string "on page #" is used.

[*Example:* Consider the case in which a bookmark called `Worldpop1990` marks the table containing figures for 1990. When the field

The world population in 1991 was 5 billion; for 1990 figures,
see the table { PAGEREF Worldpop1990 \p }.

is updated, the position of the table is inserted in place of the field. The result is one of the following::

... see the table above.
... see the table below.
... see the table on page 27.

end example]

17.16.5.46 PRINT

Syntax:

PRINT *field-argument* [*switches*]

Description: An instruction to send the printer-specific control code characters specified by *text* in *field-argument* to the selected printer when the document is printed.

Field Value: None.

Switches: Zero or more of the following *field-specific-switches*.

<code>\p <i>field-argument-1</i> <i>field-argument-2</i></code>	<p>Allows PostScript strings to be sent to the printer as native PostScript codes. PostScript commands embedded in the document are carried out in the order in which they are inserted.</p> <p>The y-coordinate space used for PostScript commands is as follows: The graphics origin (0,0) is in the lower-left corner of the page, and the positive directions are up and to the right. PostScript drawing instructions take place within a drawing rectangle. The graphics origin is translated to the lower-left corner of the drawing rectangle.</p> <p><i>text</i> in this switch's <i>field-argument-1</i> defines the drawing rectangle on which the subsequent PostScript instructions operate.</p> <p><i>text</i> in this switch's <i>field-argument-2</i> contains the PostScript instructions.</p>
---	---

17.16.5.47 PRINTDATE

Syntax:

PRINTDATE [*switches*]

Description: Retrieves the date and time on which the document was last printed, as recorded in the LastPrinted element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined. For a document that has never been printed, the date and time corresponds to 0000-00-00T00:00:00 local time and each text component is XXX.

Field Value: The date and time on which the document was last printed.

Switches: Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

\h	Use the Hijri Lunar or Hebrew Lunar calendar, depending on the language specified by the lang element (§17.3.2.20).
\s	Use the Saka Era calendar.

[Example: Consider the case in which the LastPrinted element is as follows:

<LastPrinted>2006-01-06T19:58:00Z</LastPrinted>

and the following fields are updated in a US-English context that is UTC -5:

PRINTDATE
PRINTDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"

the results are:

1/6/2006 2:58:00 PM
Friday, January 06, 2006 14:58:00

For a document that has never been printed, the result is:

0/0/0000 0:00:00 AM
XXX, XXX 00, 0000 00:00:00

end example]

17.16.5.48 PRIVATE

Syntax:

PRIVATE

Description: Provides a private storage area. This field is used to store data for documents converted from other file formats. The field contains data needed for converting a document back to its original file format.

A PRIVATE field is formatted as hidden text.

Field Value: None.

Switches: None.

17.16.5.49 QUOTE

Syntax:

QUOTE *field-argument*

Description: Retrieves the text specified by *text* in *field-argument*. This text can include any other fields except SYMBOL.

Field Value: The specified text.

Switches: One or more of the *date-and-time-formatting-switch*, *general-formatting-switch*, or *date-and-time-formatting-switches*, depending on the type of *field-argument*.

[*Example:* When the current month is January and the following field is updated:

```
Last month was QUOTE IF DATE \@ "M" = 1 "12" "=" DATE \@ "M" - 1"/1/2000 \@
"MMMM".
```

the result is:

```
Last month was December.
```

end example]

17.16.5.50 RD

Syntax:

RD *field-argument* [*switches*]

Description: *field-argument* identifies a file to include when creating a table of contents, a table of authorities, or an index using a TOC (§17.16.5.68), TOA (§17.16.5.67), or INDEX field (§17.16.5.29). RD fields that reference a series of files shall be in the same order as the files in the final document. If the location includes a long file name containing spaces, *field-argument* shall contain delimiting quotes. A single backslash in the file path shall be preceded directly by a backslash.

For a complex field implementation in XML the optional field-value storage is not needed.

Field Value: None.

Switches: One of the following *field-specific-switches*:

\p	Indicates that the path is relative to the current document.
----	--

[*Example:* The following fields inserted into one document create a table of contents that includes entries from the three referenced documents:

```
{ TOC }
{ RD C:\\Manual\\Chapters\\Chapter1.doc }
{ RD C:\\Manual\\Chapters\\Chapter2.doc }
{ RD C:\\Manual\\Chapters\\Chapter3.doc }
```

end example]

17.16.5.51 REF

Syntax:

[REF] *field-argument* [*switches*]

Description: Inserts the text or graphics represented by the bookmark specified by *text* in *field-argument*. The bookmark shall be defined in the current document. Provided the bookmark name is not exactly the same as a field name, the REF prefix can be omitted. If the text marked by the bookmark contains a paragraph mark, the text preceding the REF field assumes the formatting of the paragraph in the bookmark.

Field Value: The specified text or graphics.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper, and zero or one of the following *field-specific-switches*.

\d <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that is used to separate sequence numbers and page numbers.
\f	Increments footnote, endnote, and annotation numbers that are marked by the bookmark, and inserts the corresponding footnote, endnote, and comment text.
\h	Creates a hyperlink to the bookmarked paragraph.
\n	For a referenced paragraph, causes the field result to have the entire paragraph number without trailing periods. No information about prior levels is displayed unless it is included as part of the current level.
\p	Causes the field result to contain the position relative to the source bookmark using the word "above" or "below." If the REF field appears in the document before the bookmark, it evaluates to "below". If the REF field appears after the bookmark, it evaluates to "above". If the REF field appears within the bookmark, an error is returned. This switch can also be used in conjunction with the \n, \r, and \w switches, in which case, "above" or "below" is appended to the end of the field result.
\r	Inserts the entire paragraph number of the bookmarked paragraph in relative context—or relative to its position in the numbering scheme —without trailing periods.
\t	Causes the REF field to suppress non-delimiter or non-numerical text when used in conjunction with the \n, \r, or \w switch.

<code>\w</code>	Inserts the paragraph number of the bookmarked paragraph in full context from anywhere in the document.
-----------------	---

[*Example:* The following field

```
REF _Ref116788778 \r \h
```

makes a hyperlink reference. This kind of field is commonly used, to indicate forward references within a document. *end example*]

17.16.5.52 REVNUM

Syntax:

```
REVNUM
```

Description: Retrieves the document's revision number (which indicates the number of times the document has been saved), as recorded in the Revision element of the Core File Properties part.

Field Value: The document's revision number.

Switches: None.

[*Example:* Consider the case in which the Revision element is as follows:

```
<Revision>11</Revision>
```

and the following field is updated:

```
REVNUM
```

The result is:

```
11
```

end example]

17.16.5.53 SAVEDATE

Syntax:

```
SAVEDATE [ switches ]
```

Description: Retrieves the date and time on which the document was last saved, as recorded in the DateModified element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined. For a document that has never been saved, the date and time corresponds to 0000-00-00T00:00:00 local time and each text component is XXX.

Field Value: The date and time on which the document was last saved.

Switches: Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

\h	Use the Hijri Lunar or Hebrew Lunar calendar, depending on the language specified by the lang element (§17.3.2.20).
\s	Use the Saka Era calendar.

[Example: Consider the case in which the DateModified element is as follows:

```
<DateModified>2006-01-06T20:15:00Z</DateModified>
```

and the following fields are updated in a US-English context that is UTC -5:

```
SAVEDATE
SAVEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"
```

the results are:

```
1/6/2006 3:15:00 PM
Friday, January 06, 2006 15:15:00
```

For a document that has never been saved, the result is:

```
0/0/0000 0:00:00 AM
XXX, XXX 00, 0000 00:00:00
```

end example]

17.16.5.54 SECTION

Syntax:

```
SECTION [ switches ]
```

Description: Retrieves the number of the current section.

Field Value: The number of the current section.

Switches: Zero or more *general-formatting-switches*.

[Example: When the current section number is 19 and the following fields are updated:

```
SECTION
SECTION \* ArabicDash
SECTION \* ALPHABETIC
SECTION \* roman
```

the results are:

19
 - 19 -
 S
 xix

end example]

17.16.5.55 SECTIONPAGES

Syntax:

SECTIONPAGES [*switches*]

Description: Retrieves the number of the current page within the current section.

Field Value: The number of the current page within the current section.

Switches: Zero or more *general-formatting-switches*.

[*Example:* When the current page number within the current section is 19 and the following fields are updated:

```
SECTIONPAGES
SECTIONPAGES \* ArabicDash
SECTIONPAGES \* ALPHABETIC
SECTIONPAGES \* roman
```

the results are:

19
 - 19 -
 S
 xix

end example]

17.16.5.56 SEQ

Syntax:

SEQ *identifier* [*field-argument*] [*switches*]

Description: Sequentially numbers chapters, tables, figures, and other user-defined lists of items in a document. If an item and its SEQ field are added, deleted, or moved, updating the remaining SEQ fields in the document reflects the new sequence. A SEQ field in a header, footer, annotation, or footnote shall not affect the sequence numbering that results from SEQ fields in the document text.

[*Note:* The LISTNUM field also produces automatic numbering and can be a better alternative when creating a complex numbered list. *end note]*

identifier is the name assigned to the series of items that are to be numbered. [Example: *identifier* might be Equation, Figure, Table, or Thing, as the user deems appropriate for a caption. end example] *identifier* shall start with a Latin letter and shall consist of no more than 40 Latin letters, Arabic digits, and underscores. (See the TOC field (§17.16.5.68) switches \c and \s for uses of *identifier*.)

text in *field-argument* specifies a bookmark name that refers to an item elsewhere in the document rather than in the current location.

Field Value: The next number in the sequence.

Switches: Zero or one of the *numeric-formatting-switches*, or zero or more of the following *field-specific-switches*. If no *numeric-formatting-switch* is present, * Arabic is used.

\c	Repeats the closest preceding sequence number. [Note: This is useful for inserting chapter numbers in headers or footers. end note]
\h	Hides the field result unless a <i>general-formatting-switch</i> is also present.[Note: This switch can be used to refer to a SEQ field in a cross-reference without printing the number. end note]
\n	Inserts the next sequence number for the specified item. This is the default.
\r <i>field-argument</i>	Resets the sequence number to the integer number specified by <i>text</i> in this switch's <i>field-argument</i> .
\s <i>field-argument</i>	Resets the sequence number to the built-in (integer) heading level specified by <i>text</i> in this switch's <i>field-argument</i> .

[Example: When the following fields are updated:

```
SEQ Figure
SEQ Figure \* roman
SEQ Figure \n
SEQ Figure \c : ...
SEQ Figure \h : ...
SEQ Figure
SEQ Figure \r 1
SEQ Figure
```

the results are:

Figure 1
 Figure ii
 Figure 3
 Figure 3: ...
 Figure : ...
 Figure 5
 Figure 10
 Figure 11

end example]

17.16.5.57 SET

Syntax:

SET *field-argument-1* *field-argument-2*

field-argument-1:
field-argument

field-argument-2:
field-argument

Description: Defines the bookmark name specified by *field-argument-1* to represent the information specified by *field-argument-2*.

Field Value: None.

Switches: None.

[*Example:* Consider the following:

```
SET EnteredBy "Paul Smith"
SET UnitCost 25.00
SET Quantity FILLIN "Enter number of items ordered:"
SET SalesTax 10%
SET TotalCost = (UnitCost * Quantity) + ((UnitCost * Quantity) * SalesTax)
Total cost: TotalCost \# "$#0.00"
Thank you for your order,
EnteredBy
```

end example]

17.16.5.58 SKIPIF

Syntax:

SKIPIF *comparison*

Description: Compares the values designated by the *expressions* in *comparison* using the operator designated by *comparison-operator*. If the comparison is true, SKIPIF cancels the current merge document, moves to the

next data record in the data source, and starts a new merge document. If the comparison is false, the current merge document is continued.

[*Note: comparison-operator* can be any one of the six relational and equality operators specified for *operator* (§17.16.3.3). *end note*]

If *comparison-operator* is = or <>, the right-hand *expression* operand can contain a question mark (?) to represent any single character, or an asterisk (*) to represent any string of characters. The expression shall be enclosed in quotation marks so that it is compared as a character string.

Field Value: None.

Switches: None.

[*Example:* Inserted into a mail merge main document, the following field examines the contents of the Order field for the current data record. If the field contains a number less than 100, no merged document is produced for that data record.

```
SKIPIF MERGEFIELD Order < 100
```

end example]

17.16.5.59 STYLeref

Syntax:

```
STYLeref field-argument [ switches ]
```

Description: Inserts the nearest piece of text prior to this field that is formatted by the style whose name is specified by *text* in *field-argument*. The style can be a paragraph style or a character style.

When this field is used in a header or footer, it results in the first or the last text formatted with the specified style on the current page, allowing for dictionary-style headers or footers.

The location at which a STYLeref field is inserted determines the direction searched for the style, as follows:

- In document text, by default, the search goes backward from the STYLeref field. If the style isn't found, the search goes forward from the STYLeref field.
- In footnotes, annotations, and endnotes, the search goes backward from the footnote, annotation, or endnote reference mark. If the style isn't found, the search goes forward from the reference mark.
- In headers and footers in a printed document, the search is applied to the current page, by default, from top to bottom, for the specified style. If the style isn't found, the search goes from the top of the page to the beginning of the document, and then from the bottom of the page to the end of the document. If the \l switch is used, the search goes from the bottom of the page to the beginning and then to the end of the document.

- In headers and footers in an electronic document, the search goes on in the section that contains the `STYLEREF` field, from the beginning, for the specified style. If the style isn't found, the search goes from the end of the section to the end of the document.

Field Value: The nearest piece of text prior to this field that is formatted by the style whose name is specified by *text* in *field-argument*.

Switches: Zero or more of the following *field-specific-switches*.

<code>\l</code>	Inserts the nearest text following the field.
<code>\n</code>	Inserts the paragraph number of the referenced paragraph exactly as it appears in the document.
<code>\p</code>	Inserts the relative position of the referenced paragraph as being "above" or "below".
<code>\r</code>	Inserts the paragraph number of the referenced paragraph exactly in relative context.
<code>\t</code>	When used with the <code>\n</code> , <code>\r</code> , or <code>\w</code> switch, causes non-delimiter and non-numerical text to be suppressed.
<code>\w</code>	Inserts the paragraph number of the referenced paragraph in full context, from anywhere in the document.

[*Example:* When the following field is inserted in a header, it displays the contents of the first paragraph formatted with the style "Heading 3" on the current page:

On this page: { `STYLEREF "Heading 3"` }

To print the first and last names that appear on each page in a membership directory, for example, apply a character style called `Last Name` to each member's last name. Then insert the following fields in the header:

{ `STYLEREF "Last Name"` } — { `STYLEREF "Last Name" \l` }

end example]

17.16.5.60 SUBJECT

Syntax:

`SUBJECT [field-argument] [switches]`

Description: Retrieves, and optionally sets, the document's subject, as recorded in the Subject element of the Core File Properties part or, if *field-argument* is present, the subject specified by *text* in *field-argument*. Specifying a *field-argument* shall change Subject to *text*.

Field Value: The document's subject.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Consider the case in which the Title element is as follows:

<Subject>A specification for fields</Subject>

and the following field is updated:

SUBJECT

The result is:

A specification for fields

Updating the following field:

SUBJECT "A specification for WordprocessingML Fields"

causes the Subject element to take on the given value. *end example*]

17.16.5.61 SYMBOL

Syntax:

SYMBOL *field-argument* [*switches*]

Description: Retrieves the character whose code point value is specified in decimal or hexadecimal (by using a leading 0x or 0X) by *text* in *field-argument*. The formatting switches over ride any formatting applied directly to the result.

The XML generated for a complex field implementation shall not have the optional field value stored.

Field Value: The specified character.

Switches: Zero or more of the following *field-specific-switches*.

\a	Interprets <i>text</i> in <i>field-argument</i> as the value of an ANSI character.
\f <i>field-argument</i>	Interprets <i>text</i> in the switch's <i>field-argument</i> as the name of the font from which the character whose value is specified by <i>text</i> in the field's <i>field-argument</i> . By default, the font used is that for the current text run.
\h	Inserts the symbol without affecting the line spacing of the paragraph. If large symbols are inserted with this switch, text above the symbol might be overwritten.
\j	Interprets <i>text</i> in <i>field-argument</i> as the value of a Windows-31J character.
\s <i>field-argument</i>	Interprets <i>text</i> in the switch's <i>field-argument</i> as the integral font size in points.
\u	Interprets <i>text</i> in <i>field-argument</i> as the value of a Unicode character.

[*Example:* Consider the case in which the following fields are updated:

```
SYMBOL 65
SYMBOL 66 \a
SYMBOL 67 \u
SYMBOL 0x20ac \u
SYMBOL 68
SYMBOL 68 \f Symbol
SYMBOL 40 \f Wingdings \s 24
```

the results are:

A
B
C
€
D
△
☎

end example]

17.16.5.62 TA

Syntax:

TA [*switches*]

Description: Defines the text and page number for a table of authorities entry, which is used by a TOA field (§17.16.5.67).

Field Value: None.

Switches: Zero or one of the following *field-specific-switches*.

\b	Applies bold formatting to the page number for the entry. If the table of authorities style for the entry already has bold formatting, \b removes it.
\c <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the integral entry category, which is a number that corresponds to the order of categories. The number determines how citations are grouped in tables of authorities. If \c is omitted, category 1 is the default.
\i	Applies italic formatting to the page number for the entry. If the table of authorities' style for the entry already has italic formatting, \i removes it.

<code>\l <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> defines the long citation for the entry.
<code>\r <i>field-argument</i></code>	Inserts as the entry's page number the range of pages marked by the bookmark specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\s <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> defines the short citation for the entry.

[*Example*: Given the following fields occurring on page 2:

```
TA \l "Hotels v. Leisure Time" \c 2
TA \l "Baldwin v. Alberti, 58 Wn. 2d 243 (1961)"
   \s "Baldwin v. Alberti" \c 1 \b
```

the table of authorities produced by INDEX \e "tab" \c "1" \z "1033" is:

Cases

Baldwin v. Alberti, 58 Wn. 2d 243 (1961)..... 2

Statutes

Hotels v. Leisure Time..... 2

end example]

17.16.5.63 TC

Syntax:

TC *field-argument* [*switches*]

Description: Defines the text and page number for a table of contents (including a table of figures) entry, which is used by a TOC field (§17.16.5.68). The text of the entry is *text* in *field-argument*.

Field Value: None.

Switches: Zero or one of the following *field-specific-switches*.

<code>\f <i>field-argument</i></code>	The type of items collected in a particular contents list. Use a unique list type identifier (typically a letter from A-Z) for each type of list. For example, to build a list of illustrations, mark each illustration with a field such as TC "Illustration 1" \f i , where i indicates only illustration entries. If no list type is specified, the entry is listed in a table of contents.
<code>\l <i>field-argument</i></code>	The level of the TC entry. [<i>Example</i> : The field TC "Entering Data" \l 4 marks a level-4 entry, and applies the built-in style

	TOC 4 to that entry in the table of contents. <i>end example</i>
	If no level is specified, level 1 is assumed.
\n	Omits the page number for the entry.

17.16.5.64 TEMPLATE

Syntax:

TEMPLATE [*switches*]

Description: The file name of the template used by the current document.

Field Value: The file name of the template used by the current document, as specified by the target of the relationship specified by the id attribute of the attachedTemplate element (§17.15.1.6), or the empty string if no such element exists.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper, and zero or one of the following *field-specific-switches*.

\p	Include the full file path name.
----	----------------------------------

[*Example:* Consider the case in which the following fields are updated:

TEMPLATE * Upper

TEMPLATE \p

the results might be:

NORMAL.DOTM

C:\Templates\Normal.dotm

end example]

17.16.5.65 TIME

Syntax:

TIME [*switches*]

Description: The current date and time. As specified in Date and Time Formatting (§17.16.4.1), if no *date-and-time-formatting-switch* is present, a date or time result is formatted in an implementation-defined manner.

Field Value: The current date and time.

Switches: Zero or one *date-and-time-formatting-switch*.

[*Example:* Consider the case in which the following fields are updated on the given date and time:

TIME

TIME \@ "dddd, MMMM dd, yyyy HH:mm:ss"

the results are:

```
1:59 PM
Friday, January 06, 2006 13:59:42
```

end example]

[*Note:* For some *date-and-time-formatting-switches*, the DATE (§17.16.5.13) and TIME fields can produce the same result. *end note]*

17.16.5.66 TITLE

Syntax:

```
TITLE [ field-argument ] [ switches ]
```

Description: Retrieves, and optionally sets, the document's title, as recorded in the Title element of the Core File Properties part or, if *field-argument* is present, the name specified by *text* in *field-argument*. Specifying a *field-argument* shall change Title to *text*.

Field Value: The document's title.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Consider the case in which the Title element is as follows:

```
<Title>My Life's Story</Title>
```

and the following field is updated:

```
TITLE
```

The result is:

```
My Life's Story
```

Updating the following field:

```
TITLE "My Life, the Fantasy" \* Upper
```

causes the Title element to take on the value My Life, the Fantasy while the result is:

```
MY LIFE THE FANTASY
```

end example]

17.16.5.67 TOA

Syntax:

TOA [*switches*]

Description: Builds a table of authorities (that is, a list of the references in a legal document, such as references to cases, statutes, and rules, along with the numbers of the pages on which the references appear) using the entries specified by TA fields (§17.16.5.62).

Field Value: The table of authorities.

Switches: Zero or more of the following *field-specific-switches*.

<code>\b field-argument</code>	Includes entries only from the portion of the document marked by the bookmark specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\c field-argument</code>	<i>Includes the entries whose integral category is that specified by text in this switch's field-argument.</i>
<code>\d field-argument</code>	Used in conjunction with \s to specify the character sequence that separates the sequence numbers and page numbers. If \d is omitted, a hyphen (-) is used.
<code>\e field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that separates a table of authorities entry and its page number. If \e is not specified, a tab stop with leader dots is used.
<code>\f</code>	Removes the formatting of the entry text in the document from the entry in the table of authorities.
<code>\g field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that separates the pages in a page range. If \g is omitted, an en dash (–) is used.
<code>\h</code>	Includes the category heading for the entries in a table of authorities.
<code>\l field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that separates multiple page references. If \l is omitted, a comma (,) and space are used.
<code>\p</code>	Replaces five or more different page references to the same authority with "passim", which is used to indicate that a word or passage occurs frequently in the work cited.
<code>\s field-argument</code>	Includes a case or section number before the page number. The entry shall be numbered with a SEQ field (§17.16.5.56), and <i>text</i> in this switch's <i>field-argument</i> shall match the identifier in the SEQ field.

[Example: See TA (§17.16.5.62). end example]

17.16.5.68 TOC

Syntax:

TOC [*switches*]

Description: Builds a table of contents (which can also be a table of figures) using the entries specified by TC fields (§17.16.5.63), their heading levels, and specified styles, and inserts that table at this place in the document. Each table entry is a separate paragraph.

Field Value: The table of contents.

Switches: Zero or more of the following *field-specific-switches*.

<code>\a <i>field-argument</i></code>	Includes captioned items, but omits caption labels and numbers. The identifier designated by <i>text</i> in this switch's <i>field-argument</i> corresponds to the caption label. Use <code>\c</code> to build a table of captions with labels and numbers.
<code>\b <i>field-argument</i></code>	Includes entries only from the portion of the document marked by the bookmark named by <i>text</i> in this switch's <i>field-argument</i> .
<code>\c <i>field-argument</i></code>	Includes figures, tables, charts, and other items that are numbered by a SEQ field (§17.16.5.56). The sequence identifier designated by <i>text</i> in this switch's <i>field-argument</i> , which corresponds to the caption label, shall match the identifier in the corresponding SEQ field.
<code>\d <i>field-argument</i></code>	When used with <code>\s</code> , the <i>text</i> in this switch's <i>field-argument</i> defines the separator between sequence and page numbers. The default separator is a hyphen (-).
<code>\f <i>field-argument</i></code>	Includes only those TC fields whose identifier exactly matches the <i>text</i> in this switch's <i>field-argument</i> (which is typically a letter).
<code>\h</code>	Makes the table of contents entries hyperlinks.
<code>\l <i>field-argument</i></code>	Includes TC fields that assign entries to one of the levels specified by <i>text</i> in this switch's <i>field-argument</i> as a range having the form <i>startLevel-endLevel</i> , where <i>startLevel</i> and <i>endLevel</i> are integers, and <i>startLevel</i> has a value equal-to or less-than <i>endLevel</i> . TC fields that assign entries to lower levels are skipped.
<code>\n <i>field-argument</i></code>	Without <i>field-argument</i> , omits page numbers from the table of contents. Page numbers are omitted from all levels unless a range of entry levels is specified by <i>text</i> in this switch's <i>field-argument</i> . A range is specified as for <code>\l</code> .
<code>\o <i>field-argument</i></code>	Uses paragraphs formatted with all or the specified range of built-in heading styles. Headings in a style range are specified by <i>text</i> in this switch's <i>field-argument</i> using the notation specified as for <code>\l</code> , where each integer corresponds to the style with a style ID of HeadingX (e.g. 1 corresponds to Heading1). If no heading range is specified, all heading levels used in the document are listed.
<code>\p <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that separate an entry and its page number. The default is a tab with leader dots.
<code>\s <i>field-argument</i></code>	For entries numbered with a SEQ field (§17.16.5.56), adds a prefix

	to the page number. The prefix depends on the type of entry. <i>text</i> in this switch's <i>field-argument</i> shall match the identifier in the SEQ field.
\t <i>field-argument</i>	Uses paragraphs formatted with styles other than the built-in heading styles. <i>text</i> in this switch's <i>field-argument</i> specifies those styles as a set of comma-separated doublets, with each doublet being a comma-separated set of style name and table of content level. \t can be combined with \o.
\u	Uses the applied paragraph outline level.
\w	Preserves tab entries within table entries.
\x	Preserves newline characters within table entries.
\z	Hides tab leader and page numbers in Web layout view.

[*Example*: The index produced using the corresponding set of index entries and the field TOC \o "3-3" \h \z \t "Heading 1,1,Heading 2,2,Appendix 1,1,Appendix 2,2,Unnumbered Heading,1" is:

1. Introduction	1

3. XML representation.....	4
4. Formulas and expressions.....	6
4.1 Constants.....	6
4.2 Bookmarks.....	6
4.3 Operators.....	6
4.4 Functions.....	7
4.5 Table cell references.....	8
...	
Annex A. Index.....	12

end example]

17.16.5.69 USERADDRESS

Syntax:

USERADDRESS [*field-argument*] [*switches*]

Description: Retrieves the current user's postal address or, if *field-argument* is present, the address specified by *text* in *field-argument*. Specifying a field-argument shall not change the address of the current user.

Field Value: If a particular user's context exists, the current user's postal address; otherwise, an empty string.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Given the current user's address, the following fields:

```
USERADDRESS
```

```
USERADDRESS "10 Top Secret Lane, Chiswick" \* Upper
```

produce results of:

```
114 Rue du Rhône
CH-1204 Geneva
Switzerland
```

```
10 TOP SECRET LANE, CHISWICK
```

end example]

17.16.5.70 USERINITIALS

Syntax:

```
USERINITIALS [ field-argument ] [ switches ]
```

Description: Retrieves the current user's initials or, if *field-argument* is present, the initials specified by *text* in *field-argument*. Specifying a field-argument shall not change the initials of the current user.

Field Value: If a particular user's context exists, the current user's initials; otherwise, an empty string.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Given a current user with initials "DW", the following fields:

```
USERINITIALS \* Lower
```

```
USERINITIALS "JaJ"
```

```
USERINITIALS "jaJ" \* Upper
```

produce results of:

```
dw
JaJ
JAJ
```

end example]

17.16.5.71 USERNAME

Syntax:

USERNAME [*field-argument*] [*switches*]

Description: Retrieves the current user's name or, if *field-argument* is present, the name specified by *text* in *field-argument*. Specifying a field-argument shall not change the name of the current user.

Field Value: If a particular user's context exists, the current user's name; otherwise, an empty string.

Switches: One of the following *general-formatting-switches*: * Caps, * FirstCap, * Lower, or * Upper.

[*Example:* Given a current user of "David Williams", the following fields:

```
USERNAME \* Lower
USERNAME "John Jones"
USERNAME "Mary Smith" \* Upper
```

produce results of:

```
david williams
John Jones
MARY SMITH
```

end example]

17.16.5.72 XE

Syntax:

XE *field-argument* [*switches*]

Description: Defines the text and page number for an index entry, which is used by an INDEX field (§17.16.5.29). The text of the entry is *text* in *field-argument*. To indicate a subentry, the main entry text and the subentry text shall be separated by a colon (:). Subentries beyond one level are permitted.

Field Value: None.

Switches: Zero or one of the following *field-specific-switches*.

\b	Applies bold formatting to the entry's page number. However, if the index style for that entry is already bold, this switch removes that formatting for that entry.
\f <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> defines an index entry type. If an INDEX field has the same \f switch and <i>field-argument</i> , this entry is included in the resulting index; otherwise, it is excluded.

<code>\i</code>	Applies italic formatting to the entry's page number. However, if the index style for that entry is already italic, this switch removes that formatting for that entry.
<code>\r <i>field-argument</i></code>	Instead of the entry's page number, uses the range of pages marked by the bookmark specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\t <i>field-argument</i></code>	Uses <i>text</i> from <i>field-argument</i> in place of a page number. [Note: Useful for "See ..." or "See also ..." entries. <i>end note</i>]
<code>\y <i>field-argument</i></code>	Specifies that the <i>text</i> from <i>field-argument</i> defines the yomi (first phonetic character for sorting indexes) for the index entry.

[Example: Given the following fields spread over a series of pages, and a multi-page bookmark called OOXMLPageRange:

```
XE "Office Open XML" \b
XE "syntax" \f "Introduction"
XE "behavior:implementation-defined" \b
XE "Office Open XML" \i
XE "behavior:implementation-defined:documenting" \b
XE "grammar" \f "Introduction" \b
XE "Office Open XML"
XE "item: package-relationship" \t "See package-relationship item"
XE "XML" \r OOXMLPageRange
XE "grammar" \f "Introduction"
XE "production" \f "Introduction"
```

the index produced by INDEX \e "tab" \c "1" \z "1033" is:

behavior

implementation-defined	2
documenting	3

item

package-relationship	See package-relationship item
Office Open XML	2, 3, 4
XML	1–4

and that produced by INDEX \f "Introduction" \e "tab" \c "1" \z "1033" is:

grammar	3, 5
---------------	------

production 5

syntax 2

end example]

17.16.6 calcOnExit (Recalculate Fields When Current Field Is Modified)

This element specifies that the current contents of all fields within the current WordprocessingML document shall be recalculated from their field codes when the contents of the parent form field are modified. [*Note:* It is at the discretion of an application to determine the scope of a single modification, for example, when the user moves the insertion point in a user interface, or after each keystroke, etc. *end note*]

If this element is omitted, then modification of the contents of the current field shall not result in all fields in the current document being recalculated.

[*Example:* Consider the following WordprocessingML fragment for the contents of two fields in a document:

```
<w:bookmarkStart w:name="Text1" ... />
<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:calcOnExit/>
      ...
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMTEXT </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>1</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
<w:bookmarkEnd ... />
<w:fldSimple w:instr="=Text1+10">
  <w:r>
    <w:t>11</w:t>
  </w:r>
</w:fldSimple>
```

The first field above (the text form field) has a current value of 1, but also has the calcOnExit element present (therefore inheriting its default attribute value of true). This means that if the value of this form field is changed to 10, that all fields in the document must automatically be updated, resulting in the second field's value being automatically changed to 20. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.16.7 checkBox (Checkbox Form Field Properties)

This element specifies a set of properties which shall be associated with the parent FORMCHECKBOX checkbox form field (§17.16.5.20) within the document.

If the parent form field is not a checkbox (i.e. its field code does not have a value of FORMCHECKBOX), then these properties can be ignored.

[*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
  <w:checkBox>
    <w:size w:val="20" />
    <w:checked w:val="true" />
  </w:checkBox>
</w:ffData>
```

The checkBox element specifies that it contains a set of properties for the parent checkbox form field. In this case, these properties specify that the size of the checkbox must be exactly 10 points via the size element (§17.16.29), and that the current state of the checkbox must be checked via the checked element (§17.16.8). *end example*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FFCheckBox](#)) is located in §A.1. *end note*]

17.16.8 checked (Checkbox Form Field State)

This element specifies the current state for a checkbox form field. This value shall be used to specify the current value for a checkbox as explicitly chosen for that checkbox, as opposed its default value, which is specified using the default element (§17.16.12).

If this element is omitted, then the parent form field checkbox has no state, and its state shall be determined based on the value of the default element in the checkbox form field properties.

[*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```

<w:ffData>
  <w:checkBox>
    ...
    <w:checked w:val="true" />
  </w:checkBox>
</w:ffData>

```

The checked element specifies that the current state of the checkbox is checked (via an attribute value of true). *end example]*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.16.9 ddList (Drop-Down List Form Field Properties)

This element specifies a set of properties which shall be associated with the parent FORMDROPDOWN drop-down list form field (§17.16.5.21) within the document.

If the parent form field is not a drop-down list (i.e. its field code does not have a value of FORMDROPDOWN), then these properties can be ignored.

[*Example:* Consider the following WordprocessingML fragment for the properties of a drop-down list form field:

```

<w:ffData>
  <w:ddList>
    <w:listEntry w:val="One" />
    <w:listEntry w:val="Two" />
    <w:listEntry w:val="Three" />
  </w:ddList>
</w:ffData>

```

The ddList element specifies that it contains a set of properties for the parent drop-down list form field. In this case, these properties specify that the drop-down list must contain three entries of One, Two, and Three via the listEntry elements (§17.16.25). *end example]*

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FFDDLlist](#)) is located in §A.1. *end note]*

17.16.10 default (Default Text Box Form Field String)

This element specifies the default string for the parent text box form field. This string is the content which shall be displayed in the document story within this form field if its current run contents are empty (i.e. there is not actual content within the text box). If the type (§17.16.34) of the current form field is calculation, then this string shall hold the calculation to be performed.

If this element is omitted, then the current text box form field shall not have a default value.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldChar w:fldCharType="begin">
  <w:ffData>
    <w:textInput>
      <w:default w:val="No content."/>
    </w:textInput>
  </w:ffData>
</w:fldChar>
```

The default element specifies the default value of the text box form field to be `No content`. Since the form field does not contain any value, this is the content which must be displayed when the contents of the form field are displayed by an application. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre> <p>The value of the <code>val</code> attribute is the ID of the associated paragraph style's <code>styleId</code>.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the <code>val</code> attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (§22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element’s content model (`CT_String`) is located in §A.1. *end note*]

17.16.11 default (Default Drop-Down List Item Index)

This element specifies the zero-based index of the default entry for the parent drop-down list form field. This index value is the value within the drop-down list which shall be displayed in the document story within this form field if no element is selected (i.e. the result element (§17.16.28) is omitted).

If this element is omitted, then the current drop-down list form field shall have a default value of 0 (its first entry). If the attribute value references an index value which does not exist (i.e. a negative number or a number that exceeds the number of items in the drop-down list), then this value can be ignored and the current drop-down list form field shall have a default value of 0 (its first entry).

[*Example:* Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldChar w:fldCharType="begin">
  <w:ffData>
    <w:ddList>
      <w:default w:val="1" />
      <w:listEntry w:val="One" />
      <w:listEntry w:val="Two" />
      <w:listEntry w:val="Three" />
    </w:ddList>
  </w:ffData>
</w:fldChar>
```

The default element specifies the index of the default value of the drop-down list form field to be 1. Since the form field does not contain a result element, this is the index of the content which must be displayed when the contents of the form field are displayed by an application. In this case, the resulting default value text is Two. *end example*]

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute contains a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of simple type ST_DecimalNumber:</p> <pre><... w:val="1512645511" /></pre> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DecimalNumber](#)) is located in §A.1.
end note]

17.16.12 default (Default Checkbox Form Field State)

This element specifies the default checkbox state for the parent checkbox form field. This value determines the checkbox state when its current run contents are empty (i.e. there is not actual content within the drop-down list).

If this element is omitted, then the current checkbox form field shall have a default value of 0 (unchecked).

[*Example:* Consider the following WordprocessingML fragment for a checkbox list form field:

```
<w:fldChar w:fldCharType="begin">
  <w:ffData>
    <w:checkBox>
      <w:default w:val="true" />
    </w:checkBox>
  </w:ffData>
</w:fldChar>
```

The default element specifies the default state of the checkbox form field to be true. Since the form field does not contain any run content, this is the state which must be displayed when the contents of the form field are displayed by an application. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.16.13 delInstrText (Deleted Field Code)

This element specifies that this run contains deleted field codes (§17.16.5) within a complex field in the document. The delInstrText element shall be used for all runs containing field codes which are part of a region of text that is contained in a deleted region using the del element (§17.13.5.14).

If this element is not contained within a del element, then the document is non-conformant. If this element is contained within a run which is not part of a complex field's field codes, then it should be handled as regular deleted text.

[*Example:* Consider a complex field within a WordprocessingML document which was changed from a text box form field to a checkbox form field with revision tracking enabled. This field would therefore be represented as follows:

```

<w:fldChar w:fldCharType="begin" />
<w:ins>
  <w:r>
    <w:instrText>FORMCHECKBOX</w:instrText>
  </w:r>
</w:ins>
<w:del>
  <w:r>
    <w:delInstrText>FORMFIELDTEXT</w:delInstrText>
  </w:r>
</w:del>
<w:fldChar w:fldCharType="separate" />
...
<w:fldChar w:fldCharType="end" />

```

The deleted field code is contained in a delInstrText node, while the inserted (and current) field code is contained in an instrText node. *end example*]

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>[<i>Example:</i> Consider the following run contained within a WordprocessingML document:</p> <pre> <w:r> <w:t> significant whitespace </w:t> </w:r> </pre> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is subject to the space preservation rules currently specified in that run's scope. <i>end example</i>]</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Text](#)) is located in §A.1. *end note*]

17.16.14 enabled (Form Field Enabled)

This element specifies whether the parent form field shall behave as though it is enabled or disabled when it is displayed in the document. This setting shall have no effect on the behavior of this form field unless the document's Settings part specifies that the documentProtection element for the current document is in a state allowing the filling in of form fields.

If this element is omitted, then the parent form field shall be in its enabled state when the document settings specify that the document allows the filling-in of form fields.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```
<w:r>
  <w:fldChar w:fldCharType="begin" >
    <w:ffData>
      <w:enabled w:val="false"/>
      <w:textInput>
        ...
      </w:textInput>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMTEXT </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>1</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

The enabled element specifies that the state of the current text box form field is disabled; therefore this text box must not be editable within the current document even when the state of the documentProtection element specifically allows the editing of form fields. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.16.15 entryMacro (Script Function to Execute on Form Field Entry)

This element specifies a subroutine in a scripting language which should be executed when the when the run contents of the parent form field are entered. The language and location of this subroutine can be determined using any method desired by an application. [*Note:* It is at the discretion of an application to determine the scope and timing of "entering" a form field, for example, when the user moves the insertion point in a user interface or upon each operation by an application without a user interface, etc. *end note*]

If this element is omitted, then no subroutine shall be associated with entering the run contents of the parent form field. If this element specifies a macro which cannot be located or is not supported by an application, then its value can be ignored, but shall not be lost upon resaving the file.

[*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```

<w:ffData>
  <w:entryMacro w:val="TestEntryFunction" />
  <w:checkBox>
    ...
  </w:checkBox>
</w:ffData>

```

The entryMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called TestEntryFunction when the contents of the checkbox are entered. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*

Attributes	Description
val (Name of Script Function)	<p>Specifies the name of a single scripting subroutine which shall be associated with the parent element. Its use is specifies based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for the properties of a form field:</p> <pre> <w:ffData> <w:exitMacro w:val="HelloWorld" /> </w:ffData> </pre> <p>The val attribute specifies that a script function called HelloWorld must be used in the context of the parent element; in this case, to execute when the field is exited. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_MacroName simple type (§17.18.51).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_MacroName](#)) is located in §A.1. *end note*]

17.16.16 exitMacro (Script Function to Execute on Form Field Exit)

This element specifies a subroutine in a scripting language which should be executed when the when the run contents of the parent form field are exited. The language and location of this subroutine can be determined using any method desired by an application. [*Note:* It is at the discretion of an application to determine the scope and timing of "exiting" a form field, for example, when the user moves the insertion point in a user interface or upon each operation by an application without a user interface, etc. *end note*]

If this element is omitted, then no subroutine shall be associated with exiting the run contents of the parent form field. If this element specifies a macro which cannot be located or is not supported by an application, then its value can be ignored, but shall not be lost upon resaving the file.

[*Example:* Consider the following WordprocessingML fragment for the properties of a form field:

```
<w:ffData>
  <w:exitMacro w:val="TestExitFunction" />
</w:ffData>
```

The exitMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called TestExitFunction when the contents of the form field are exited. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*]

Attributes	Description
val (Name of Script Function)	<p>Specifies the name of a single scripting subroutine which shall be associated with the parent element. Its use is specifies based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for the properties of a form field:</p> <pre><w:ffData> <w:exitMacro w:val="HelloWorld" /> </w:ffData></pre> <p>The val attribute specifies that a script function called HelloWorld must be used in the context of the parent element; in this case, to execute when the field is exited. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_MacroName simple type (§17.18.51).</p>

[*Note:* The W3C XML Schema definition of this element’s content model (CT_MacroName) is located in §A.1. *end note*]

17.16.17 ffData (Form Field Properties)

This element specifies a set of properties which shall be associated with the parent form field within the document. This form field can be of any of the following types (with the associated field codes in parentheses):

- Checkbox (FORMCHECKBOX)
- Drop-down List (FORMDROPDOWN)
- Text box (FORMTEXT)

If this element is present and the field codes for the document do not specify a form field of one of these types, then the document shall be considered non-conformant.

If this element is omitted, then the properties associated with the parent form field shall be determined based on their default values.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```

<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:name w:val="TextTextBox" />
      <w:enabled w:val="false"/>
      <w:textInput>
        <w:maxLength w:val="10" />
      </w:textInput>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMTEXT </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>1</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

The `ffData` element specifies the set of properties for this text box form field; in this example, a form field name of `TestTextBox` via the `name` element (§17.16.27), a disabled state via the `enabled` element (§17.16.14), and a maximum character length of 10 Unicode scalar values via the `maxLength` element (§17.16.26). *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_FFDData](#)) is located in §A.1. *end note*]

17.16.18 fldChar (Complex Field Character)

This element specifies the presence of a complex field character at the current location in the parent run. A *complex field character* is a special character which delimits the start and end of a complex field or separates its field codes from its current field result.

A complex field is defined via the use of the two required complex field characters: a *start character*, which specifies the beginning of a complex field within the document content; and an *end character*, which specifies the end of a complex field. This syntax allows multiple fields to be embedded (or "nested") within each other in a document.

As well, because a complex field can specify both its field codes and its current result within the document, these two items are separated by the optional *separator character*, which defines the end of the field codes and

the beginning of the field contents. The omission of this character shall be used to specify that the contents of the field are entirely field codes (i.e. the field has no result).

[*Example:* Consider the following complex field definition within a WordprocessingML document:

```
<w:r>
  <w:fldChar w:fldCharType="begin" />
</w:r>
<w:r>
  <w:instrText>AUTHOR</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate" />
</w:r>
<w:r>
  <w:t>Rex Jaeschke</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end" />
</w:r>
```

The three fldChar elements specify:

- The beginning of the field, using the type attribute value of start
- The separator between the field codes and the current field results, using the type attribute value of separate
- The end of the field, using the type attribute value of end

end example]

If a complex field is not closed before the end of a document story, then no field shall be generated and each individual run shall be processed as if the field characters did not exist (i.e. the contents of all field code run content shall not be displayed, and the field results shall be displayed as literal text).

[*Example:* Consider the following WordprocessingML document:

```

<w:body>
  <w:p>
    <w:r>
      <w:fldChar w:fldCharType="begin" />
    </w:r>
    <w:r>
      <w:instrText>AUTHOR</w:instrText>
    </w:r>
    <w:r>
      <w:fldChar w:fldCharType="separate" />
    </w:r>
    <w:r>
      <w:t>Rex Jaeschke</w:t>
    </w:r>
  </w:p>
</w:body>

```

The complex field is technically incorrect since no end character exists in the main document story. The resulting content must be interpreted as though no field characters exist, resulting in only the literal text Rex Jaeschke being displayed in the document. *end example]*

Attributes	Description
dirty (Field Result Invalidated)	<p>Specifies that this field has been flagged by an application to indicate that its current results are no longer correct (stale) due to other modifications made to the document, and these contents should be updated before they are displayed if this functionality is supported by the next processing application.</p> <p><i>[Rationale:</i> This functionality allows applications with limited subsets of the full functionality of ECMA-376 to process Word Open XML documents without needing to understand and update all fields based on the semantics for their field codes.</p> <p>For example, an application can add a new paragraph and flag the table of contents as dirty, without needing to understand anything about how to recalculate that field's content. <i>end rationale]</i></p> <p>If this attribute is omitted, then its value shall be assumed to be false. If the type of the current field character is not start, then his setting can be ignored.</p> <p><i>[Example:</i> Consider the following WordprocessingML for a complex field:</p> <pre> ... <w:r> <w:fldChar w:fldCharType="begin" w:dirty="true"/> </w:r> <w:r> <w:instrText>TOC /l 1-3</w:instrText> </pre>

Attributes	Description
	<pre> </w:r> <w:r> <w:fldChar w:fldCharType="separate"/> </w:r> ... </pre> <p>The dirty attribute value of true specifies that the contents of this field are no longer current based on the contents of the document, and should be recalculated whenever an application with this functionality reads the document. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>
fldCharType (Field Character Type)	<p>Specifies the type of the current complex field character in the document.</p> <p>[<i>Example:</i> Consider the following WordprocessingML for a complex field character:</p> <pre> ... <w:fldChar w:fldCharType="separate" /> ... </pre> <p>The type attribute value of separate specifies that this is a complex field separator character; therefore it is being used to separate the field codes from the field contents in a complex field. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_FldCharType simple type (§17.18.29).</p>
fldLock (Field Should Not Be Recalculated)	<p>Specifies that the parent complex field shall not have its field result recalculated, even if an application attempts to recalculate the results of all fields in the document or a recalculation is explicitly requested.</p> <p>If this attribute is omitted, then its value shall be assumed to be false. If the type of the current field character is not start, then this setting can be ignored.</p> <p>[<i>Example:</i> Consider the following WordprocessingML for a complex field:</p> <pre> <w:r> <w:fldChar w:fldCharType="begin" w:fldLock="true"/> </w:r> ... <w:r> <w:fldChar w:fldCharType="separate"/> </w:r> <w:r> <w:t>field result</w:t> </w:r> <w:r> <w:fldChar w:fldCharType="end" /> </pre>

Attributes	Description
	<p><code></w:r></code></p> <p>The <code>fldLock</code> attribute value of <code>true</code> specifies that the contents of this field must remain <code>field result</code> regardless of the actual result of the current field codes. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§22.9.2.7).</p>

[Note: The W3C XML Schema definition of this element's content model (`CT_FldChar`) is located in §A.1. *end note*]

17.16.19 fldSimple (Simple Field)

This element specifies the presence of a simple field at the current location in the document. The semantics of this field are defined via its field codes (§17.16.5).

[Example: Consider the following WordprocessingML fragment for a simple field:

```
<w:fldSimple w:instr="FILENAME">
  <w:r>
    <w:t>Example Document.docx</w:t>
  </w:r>
</w:fldSimple>
```

The `fldSimple` element defines a `FILENAME` field (§17.16.5.17) using the simple field syntax. The current field result for the field is `Example Document.docx`. *end example*

Attributes	Description
dirty (Field Result Invalidated)	<p>Specifies that this field has been flagged by an application to indicate that its current results are no longer correct (stale) due to other modifications made to the document, and these contents should be updated before they are displayed if this functionality is supported by the next processing application.</p> <p>[<i>Rationale</i>: This functionality allows applications with limited subsets of the full functionality of ECMA-376 to process Word Open XML documents without needing to understand and update all fields based on the semantics for their field codes.</p> <p>For example, an application can add a new paragraph and flag the table of contents as dirty, without needing to understand anything about how to recalculate that field's content. <i>end rationale</i>]</p> <p>If this attribute is omitted, then its value shall be assumed to be <code>false</code>.</p> <p>[Example: Consider the following WordprocessingML for a simple field:</p> <pre><w:fldSimple w:instr="AUTHOR" w:dirty="true"/></pre>

Attributes	Description
	<p>The dirty attribute value of true specifies that the contents of this field are no longer current based on the contents of the document, and should be recalculated whenever an application with this functionality reads the document. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>
fldLock (Field Should Not Be Recalculated)	<p>Specifies that the parent field shall not have its field result recalculated, even if an application attempts to recalculate the results of all fields in the document or a recalculation is explicitly requested.</p> <p>If this attribute is omitted, then its value shall be assumed to be false.</p> <p>[<i>Example:</i> Consider the following WordprocessingML for a simple field:</p> <pre data-bbox="451 751 1209 926"><w:fldSimple w:instr="AUTHOR" w:fldLock="true"> <w:r> <w:t>Rex Jaeschke</w:t> </w:r> </w:fldSimple></pre> <p>The fldLock attribute value of true specifies that the contents of this field must remain Rex Jaeschke regardless of the actual result of the current field codes. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>
instr (Field Codes)	<p>Specifies the field codes for the simple field. The possible field codes are defined in §17.16.5.</p> <p>[<i>Example:</i> Consider the following WordprocessingML for a simple field:</p> <pre data-bbox="451 1297 1209 1472"><w:fldSimple w:instr="AUTHOR" w:fldLock="true"> <w:r> <w:t>Rex Jaeschke</w:t> </w:r> </w:fldSimple></pre> <p>The instr attribute specifies the field codes for this simple field to be AUTHOR. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SimpleField](#)) is located in §A.1. *end note*]

17.16.20 format (Text Box Form Field Formatting)

This element specifies the field formatting which shall be applied to the contents of the parent form field whenever those contents are modified. The type of formatting which is applied to the field depends on the value of its type element (§17.16.34), as follows:

- When the type is equal to `currentDate`, `currentTime`, or `date`, a date formatting string using the syntax defined in §17.16.4.1
- When the type is equal to `calculated` or `number`, a number formatting string using the syntax defined in §17.16.4.2
- When the type is equal to `regular`, a text formatting string defined as follows:

Argument	Description
Uppercase	All letters are uppercase. [<i>Example: Mary Smith results in MARY SMITH. end example</i>]
Lowercase	All letters are lowercase. [<i>Example: Mary Smith results in mary smith. end example</i>]
First capital	Capitalizes the first letter of the first word. [<i>Example: Mary Smith results in Mary smith. end example</i>]
Title case	Capitalizes the first letter of each word. [<i>Example: Mary Smith results in Mary Smith. end example</i>]

[*Example: Consider the following WordprocessingML fragment for the properties of a text box form field:*

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The `format` element specifies the field formatting which is applied to the input to the field (in this case, a grouping of number formatting picture items as the type element specifies a value of `number`). If a value of 8 was entered into this field, the formatted result would be *8.00. end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example: Consider the following WordprocessingML fragment:</i></p>

Attributes	Description
	<pre data-bbox="451 283 954 388"><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre> <p data-bbox="414 420 1409 457">The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p data-bbox="414 493 925 529">However, consider the following fragment:</p> <pre data-bbox="451 567 1079 703"><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p data-bbox="414 735 1477 844">In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p data-bbox="414 877 1339 949">The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_String](#)) is located in §A.1. *end note*]

17.16.21 helpText (Associated Help Text)

This element specifies optional help text which shall be associated with the parent form field. The method or user interface by which this help text can be surfaced is not defined by ECMA-376.

If this element is omitted, then no help text shall be associated with the current form field.

[Example: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:helpText w:type="text" w:val="Example help text."/>
      <w:ddlList>
        ...
      </w:ddlList>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMDROPDOWN </w:instrText>
</w:r>
```

```

<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

The `helpText` element specifies the help text for the parent form field - in this case, literal help text consisting of the string `Example help text`. *end example*

Attributes	Description
type (Help Text Type)	<p>Specifies the type of help text which is specified by this element, defined by the simple type below.</p> <p>If this attribute is omitted, then its value shall be assumed to be <code>text</code>.</p> <p>[<i>Example</i>: Consider the following WordprocessingML fragment for a form field:</p> <pre> <w:ffData> <w:helpText w:type="text" w:val="Example help text." /> </w:ffData> </pre> <p>The <code>type</code> attribute has a value of <code>text</code>, which specifies that the text in the <code>val</code> attribute is the literal help text for this form field. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_InfoTextType</code> simple type (§17.18.43).</p>
val (Help Text Value)	<p>Specifies the help text for the current form field. Based on the value of the <code>type</code> attribute, the contents of this field shall be interpreted as follows:</p> <ul style="list-style-type: none"> When the <code>type</code> attribute value is <code>text</code>, contains the literal help text for the form field. When the <code>type</code> attribute value is <code>autoText</code>, contains the name of a glossary document entry which contains the help text for the form field. <p>[<i>Example</i>: Consider the following WordprocessingML fragment for a form field:</p> <pre> <w:ffData> <w:helpText w:type="autoText" w:val="HelpText" /> </w:ffData> </pre> <p>The text in the <code>val</code> attribute is the name of a glossary document entry containing the help text for this form field, since the <code>type</code> attribute has a value of <code>autoText</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_FFHelpTextVal</code> simple type (§17.18.25).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_FFHelpText](#)) is located in §A.1. *end note*]

17.16.22 hyperlink (Hyperlink)

This element specifies the presence of a hyperlink at the current location in the document.

[*Example:* Consider the following WordprocessingML fragment for a hyperlink:

```
<w:hyperlink r:id="rId10">
  <w:r>
    <w:t>Click here</w:t>
  </w:r>
</w:hyperlink>
```

The hyperlink element defines a hyperlink whose display text is `Click here`, and whose target is specified by the relationship with an `Id` attribute value of `rId10`. *end example*]

Attributes	Description
<p>anchor (Hyperlink Anchor)</p>	<p>Specifies the name of a bookmark in the current document which shall be the target of this hyperlink.</p> <p>If this attribute is omitted, then the default behavior shall be to navigate to the start of the document. If a hyperlink target is also specified using the <code>r:id</code> attribute, then this attribute shall be ignored. If no bookmark exists in the current document with the given bookmark name, then the default behavior shall be to navigate to the start of the document.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p> <pre><w:hyperlink w:anchor="chapter3"> <w:r> <w:t>Go to Chapter Three</w:t> </w:r> </w:hyperlink></pre> <p>The anchor attribute specifies that the target of the current hyperlink must be the text contained within the bookmark <code>chapter3</code> within the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (§22.9.2.13).</p>
<p>docLocation (Location in Target Document)</p>	<p>Specifies a location in the target of the hyperlink that has no bookmarks. The method by which the contents of this attribute are linked to document text is outside the scope of ECMA-376.</p> <p>If this attribute is omitted, then no location shall be associated with the parent hyperlink. If the anchor attribute is also specified, then this attribute can be ignored when the hyperlink is invoked.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p>

Attributes	Description
	<pre><w:hyperlink r:id="rId9" w:docLocation="table"> <w:r> <w:t>Click Here</w:t> </w:r> </w:hyperlink></pre> <p>The docLocation attribute specifies that the target of the current hyperlink must be a region targeted by the string table within the target document. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>
history (Add To Viewed Hyperlinks)	<p>Specifies whether the target of the parent hyperlink (as specified via the r:id attribute) shall be added to a list of viewed hyperlinks when it is invoked.</p> <p>If this attribute is omitted, then its value shall be assumed to be false.</p> <p>[Example: Consider the following WordprocessingML fragment for a hyperlink:</p> <pre><w:hyperlink r:id="rId9" w:history="true"> <w:r> <w:t>http://www.example.com</w:t> </w:r> </w:hyperlink></pre> <p>The history attribute value of true specifies that the target of the current hyperlink must be added to a list of visited hyperlinks when invoked within the document. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>
id (Hyperlink Target) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the ID of the relationship whose target shall be used as the target for this hyperlink.</p> <p>If this attribute is omitted, then there shall be no external hyperlink target for the current hyperlink - a location in the current document can still be target via the anchor attribute. If this attribute exists, it shall supersede the value in the anchor attribute.</p> <p>[Example: Consider the following WordprocessingML fragment for a hyperlink:</p> <pre><w:hyperlink r:id="rId9"> <w:r> <w:t>http://www.example.com</w:t> </w:r> </w:hyperlink></pre> <p>The id attribute value of rId9 specifies that relationship in the associated relationship part item with a corresponding Id attribute value must be navigated to when this</p>

Attributes	Description												
	<p>hyperlink is invoked. For example, if the following XML is present in the associated relationship part item:</p> <pre><Relationships xmlns="..."> <Relationship Id="rId9" Mode="External" Target=http://www.example.com /> </Relationships></pre> <p>The target of this hyperlink would therefore be the target of relationship rId9 - in this case, <code>http://www.example.com</code>. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>												
tgtFrame (Hyperlink Target Frame)	<p>Specifies a frame within the parent HTML frameset for the target of the parent hyperlink when one exists. All values specified by this element shall be handled as follows:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>_top</td><td>Open hyperlink target in the full region of the current window.</td></tr><tr><td>_self</td><td>Open hyperlink target in the same frame as the hyperlink appears.</td></tr><tr><td>_parent</td><td>Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.</td></tr><tr><td>_blank</td><td>Open hyperlink target in a new web browser window.</td></tr><tr><td>all other values</td><td>Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame. If this string does not begin with an alphabetic character, it shall be ignored.</td></tr></table> <p>If this attribute is omitted, then no target frame information shall be associated with the parent hyperlink. If the current document is not part of a frameset, then this information can be ignored.</p> <p>[Example: Consider the following WordprocessingML fragment for a hyperlink:</p>	Value	Description	_top	Open hyperlink target in the full region of the current window.	_self	Open hyperlink target in the same frame as the hyperlink appears.	_parent	Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.	_blank	Open hyperlink target in a new web browser window.	all other values	Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame. If this string does not begin with an alphabetic character, it shall be ignored.
Value	Description												
_top	Open hyperlink target in the full region of the current window.												
_self	Open hyperlink target in the same frame as the hyperlink appears.												
_parent	Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.												
_blank	Open hyperlink target in a new web browser window.												
all other values	Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame. If this string does not begin with an alphabetic character, it shall be ignored.												

Attributes	Description
	<pre data-bbox="456 285 1143 453"><w:hyperlink r:id="rId9" w:tgtFrame="_top"> <w:r> <w:t>http://example.com</w:t> </w:r> </w:hyperlink></pre> <p data-bbox="415 491 1451 558">The <code>tgtFrame</code> attribute value of <code>_top</code> specifies that the target of this hyperlink must be displayed in the full extents of the current window. <i>end example</i></p> <p data-bbox="415 596 1341 663">The possible values for this attribute are defined by the <code>ST_String</code> simple type (§22.9.2.13).</p>
tooltip (Associated String)	<p data-bbox="415 680 1463 785">Specifies a string which can be surfaced in a user interface as associated with the parent hyperlink. The method by which this string is surfaced by an application is outside the scope of ECMA-376.</p> <p data-bbox="415 823 1373 890">If this attribute is omitted, then no associated string shall be linked to the parent hyperlink in the document.</p> <p data-bbox="415 928 1349 961">[Example: Consider the following WordprocessingML fragment for a hyperlink:</p> <pre data-bbox="456 999 1240 1167"><w:hyperlink r:id="rId9" w:tooltip="Click here!"> <w:r> <w:t>http://example.com</w:t> </w:r> </w:hyperlink></pre> <p data-bbox="415 1205 1479 1272">The <code>tooltip</code> attribute value specifies that the parent hyperlink has the associated string of <code>Click here!</code>, which can be used as desired. <i>end example</i></p> <p data-bbox="415 1310 1341 1377">The possible values for this attribute are defined by the <code>ST_String</code> simple type (§22.9.2.13).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Hyperlink](#)) is located in §A.1. *end note*]

17.16.23 `instrText` (Field Code)

This element specifies that this run contains field codes (§17.16.5) within a complex field in the document.

If this element is contained within a run which is not part of a complex field's field codes, then it and its contents should be treated as regular text. If this element is contained within a `del` element, then the document is non-conformant.

[*Example:* Consider a complex checkbox field within a WordprocessingML. This field would be represented as follows:

```
<w:r>
  <w:fldChar w:fldCharType="begin" />
</w:r>
<w:r>
  <w:instrText>FORMCHECKBOX</w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate" />
</w:r>
...
<w:r>
  <w:fldChar w:fldCharType="end" />
</w:r>
```

The field code is contained in an `instrText` node which occurs within the field codes portion of the complex field (i.e. before the separator character). *end example*

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>[<i>Example:</i> Consider the following run contained within a WordprocessingML document:</p> <pre><w:r> <w:t> significant whitespace </w:t> </w:r></pre> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is subject to the space preservation rules currently specified in that run's scope. <i>end example</i>]</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Text](#)) is located in §A.1. *end note*]

17.16.24 label (Form Field Label)

This element specifies the label identifier associated with the current form field. The identifier representing the label shall be stored on this element’s `val` attribute and is used to reference the unique identifier value of a structured document tag. The contents of the structured document tag resolved by a specific unique identifier shall be used as the label content for the form field that references that specific unique identifier of the structured document tag. If multiple instances of the label element are present, the labels referenced are

ordered from most general to most specific. [Example: A form element for specifying country name might reference the label for these three items (in order): “Sender”, “Home Address”, and “Country”. *end example*]

If this element is omitted or the value of the label identifier cannot be resolved, then no label shall be associated with the given form field.

[Example: Consider the following text box form field, which references a structured document tag as a label:

```
<w:sdt>
  <w:sdtPr>
    <w:id w:val="5" />
  </w:sdtPr>
  <w:sdtContent>
    <w:p>
      <w:r>
        <w:t>Name</w:t>
      </w:r>
    </w:p>
  </w:sdtContent>
</w:sdt>
...
<w:ffData>
  <w:name w:val="TextTextBox" />
  <w:enabled />
  <w:textInput />
  <w:label w:val="5" />
</w:ffData>
```

The label element specifies that the text box form field uses the contents of the structured document tag with an identifier value of 5 as a label source. In this example, the label contents is “Name”. *end example*]

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute contains a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following numeric WordprocessingML property of simple type ST_DecimalNumber:</p> <pre><... w:val="1512645511" /></pre> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).

[Note: The W3C XML Schema definition of this element’s content model ([CT_DecimalNumber](#)) is located in §A.1. *end note*]

17.16.25 listEntry (Drop-Down List Entry)

This element specifies the presence of a single drop-down list entry within the parent drop-down list form field in the document. The order of appearance of the series of listEntry elements in the WordprocessingML markup shall dictate the order of the entries in the drop-down list when it is displayed.

[Example: Consider the following WordprocessingML fragment for the properties of a drop-down list form field:

```
<w:ffData>
  <w:ddList>
    <w:listEntry w:val="One" />
    <w:listEntry w:val="Two" />
    <w:listEntry w:val="Three" />
  </w:ddList>
</w:ffData>
```

The three listEntry elements each specify one drop-down list entry for the parent drop-down list form field. In this case, these properties specify that the drop-down list must contain three entries of One, Two, and Three in that order when displayed. *end example*]

Attributes	Description
val (String Value)	<p>Specifies that its contents contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="Heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /></pre>

Attributes	Description
	<p>...</p> <p></w:sdtPr></p> <p>In this case, the decimal number in the val attribute is the caption of the nearest ancestor structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§22.9.2.13).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_String](#)) is located in §A.1. *end note*]

17.16.26 maxLength (Text Box Form Field Maximum Length)

This element specifies the maximum length of text which should be allowed within the parent text box form field before any formatting specified by the format element (§17.16.20). If the current contents of this field exceed the specified value when the document is loaded, that violation shall not result in an error, but the application shall prevent the addition of any additional characters until the contents are brought below that limit.

If this element is omitted, then there shall be no limit on the number of characters in the parent text box form field.

[Example: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The maxLength element specifies that the contents of this form field should not be allowed to exceed four characters when edited by an application. *end example*

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute contains a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following numeric WordprocessingML property of simple type ST_DecimalNumber:</p>

Attributes	Description
	<p><... w:val="1512645511" /></p> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_DecimalNumber](#)) is located in §A.1. *end note*]

17.16.27 name (Form Field Name)

This element specifies the name of the current form field.

[Example: Consider the following WordprocessingML fragment for a text box form field:

```
<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:name w:val="FirstName" />
      <w:textInput>
        ...
      </w:textInput>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMTEXT </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>1</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

The name element specifies that the name of the current form field is `FirstName`. *end example*]

Attributes	Description
val (Form Field Name Value)	<p>Specifies the name of the form field.</p> <p>If this attribute is omitted, then the parent form field shall have no name.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a form field:</p> <pre><w:ffData> <w:name w:val="ExampleFieldName"/> </w:ffData></pre> <p>The val attribute specifies that the name of the current form field is ExampleFieldName. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FFName simple type (§17.18.26).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FFName](#)) is located in §A.1. *end note]*

17.16.28 result (Drop-Down List Selection)

This element specifies the zero-based index of the currently selected entry for the parent drop-down list form field.

If this element is omitted, then the current drop-down list form field shall have the selection specified by the value of the default element (§17.16.11). If the attribute value references an index value which does not exist (i.e. a negative number or a number that exceeds the number of items in the drop-down list), then this value can be ignored and the current drop-down list form field shall have the selection specified by the value of the default element.

[*Example:* Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:ddList>
        <w:default w:val="1" />
        <w:result w:val="2" />
        <w:listEntry w:val="One" />
        <w:listEntry w:val="Two" />
        <w:listEntry w:val="Three" />
      </w:ddList>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMDROPDOWN </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>
```

The result element specifies the index of the currently selected value of the drop-down list form field to be 2. In this case, the resulting default value text is Three. *end example*]

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute contains a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following numeric WordprocessingML property of simple type ST_DecimalNumber:</p> <div><... w:val="1512645511" /></div> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§17.18.10).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_DecimalNumber](#)) is located in §A.1. *end note*]

17.16.29 size (Checkbox Form Field Size)

This element specifies the exact size for the parent checkbox form field. The resulting field shall be displayed in this point size regardless of the size specified by the formatting of its corresponding content in the document via the style hierarchy.

[*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
  <w:checkBox>
    <w:size w:val="20" />
    <w:checked w:val="true" />
  </w:checkBox>
</w:ffData>
```

The size element specifies that the checkbox must be displayed in a ten point font size, regardless of the formatting which would normally be applied to this text via the style hierarchy. *end example*]

Attributes	Description
val (Half Point Measurement)	<p>Specifies a positive measurement specified in half-points (1/144 of an inch).</p> <p>The contents of this attribute value are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><... w:val="30" /></pre> <p>The value in the val attribute is 30, which is equivalent to 15 points (30 half-points).</p> <p>This value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_HpsMeasure simple type (§17.18.42).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_HpsMeasure](#)) is located in §A.1. *end note*]

17.16.30 sizeAuto (Automatically Size Form Field)

This element specifies that the parent checkbox form field shall be formatted using the point size which is applied to its field characters via the style hierarchy.

[*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```

<w:r>
  <w:rPr>
    <w:sz w:val="40"/>
  </w:rPr>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:checkBox>
        <w:sizeAuto />
        <w:checked w:val="true" />
      </w:checkBox>
    </w:ffData>
  </w:fldChar>
</w:r>

```

The sizeAuto element specifies that the checkbox must be displayed in the point size of the formatting which would normally be applied to this text via the style hierarchy. In this case, this size is the twenty points specified via the direct formatting on the parent run. *end example*]

This element's content model is defined by the common boolean property definition in §17.17.4.

17.16.31 statusText (Associated Status Text)

This element specifies optional status text which shall be associated with the parent form field. The method or user interface by which this status text can be surfaced is not defined by ECMA-376.

If this element is omitted, then no status text shall be associated with the current form field.

[*Example:* Consider the following WordprocessingML fragment for a drop-down list form field:

```

<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:statusText w:type="text" w:val="Example status text."/>
      <w:ddList>
        ...
      </w:ddList>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMDROPDOWN </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

The `statusText` element specifies the status text for the parent form field - in this case, literal text consisting of the string `Example status text.` *end example*]

Attributes	Description
type (Status Text Type)	<p>Specifies the type of status text which is specified by this element, defined by the simple type below.</p> <p>If this attribute is omitted, then its value shall be assumed to be <code>text</code>.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a form field:</p> <pre><w:ffData> <w:statusText w:type="text" w:val="Example status text." /> </w:ffData></pre> <p>The <code>type</code> attribute has a value of <code>text</code>, which specifies that the text in the <code>val</code> attribute is the literal status text for this form field. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_InfoTextType</code> simple type (§17.18.43).</p>
val (Status Text Value)	<p>Specifies the status text for the current form field. Based on the value of the <code>type</code> attribute, the contents of this field shall be interpreted as follows:</p> <ul style="list-style-type: none"> • When the <code>type</code> attribute value is <code>text</code>, contains the literal status text for the form field. • When the <code>type</code> attribute value is <code>autoText</code>, contains the name of a glossary document entry which contains the status text for the form field. <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a form field:</p> <pre><w:ffData> <w:statusText w:type="autoText" w:val="MyStatusText" /> </w:ffData></pre> <p>The text in the <code>val</code> attribute is the name of a glossary document entry containing the status text for this form field, since the <code>type</code> attribute has a value of <code>autoText</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_FFStatusTextVal</code> simple type (§17.18.27).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FFStatusText](#)) is located in §A.1. *end note*]

17.16.32 `tabIndex` (Form Field Navigation Order Index)

This element specifies the position of the current form field in the navigation (tab) order used in the document. The tabbing index shall be stored on this element's `val` attribute and is analogous to the `tabIndex` attribute in HTML.

Objects that support tab index shall be navigated by consumers in the following order:

- Objects for which the XML specifies a non-zero `tabIndex` value are navigated first. Navigation proceeds with the element with the lowest resolved value of `tabIndex` to the element with the highest resolved value of `tabIndex`.
- Objects that specify identical resolved values of `tabIndex` is navigated in the lexical order in which the elements appear in the underlying WordprocessingML.
- Objects for which the XML does not specify an index or objects for which the XML specifies a resolved `tabIndex` value of 0 are navigated last. These objects are navigated in the lexical order in which they appear in the underlying WordprocessingML.

[*Example:* Consider the following two text box form fields where form field specifies a tab index:

```
<w:ffData>
  <w:name w:val="FirstName" />
  <w:enabled />
  <w:textInput />
  <w:tabIndex w:val="1" />
</w:ffData>
...
<w:ffData>
  <w:name w:val="LastName" />
  <w:enabled />
  <w:textInput />
  <w:tabIndex w:val="2" />
</w:ffData>
```

The `tabIndex` element specifies that the `FirstName` form field must be the first content to be reached via tabbing, whereas the `LastName` form field must be the second content to be reached via tabbing. *end example*]

Attributes	Description
<code>val</code> (Positive Decimal Number Value)	<p>Specifies that the contents of this attribute contains a positive decimal number.</p> <p>The contents of this positive decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of type <code>ST_UnsignedDecimalNumber</code>:</p>

Attributes	Description
	<p data-bbox="456 285 711 315"><... w:val="15" /></p> <p data-bbox="415 354 1438 422">The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i></p> <p data-bbox="415 462 1443 529">The possible values for this attribute are defined by the ST_UnsignedDecimalNumber simple type (§22.9.2.16).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UnsignedDecimalNumber](#)) is located in §A.1. *end note*]

17.16.33 textInput (Text Box Form Field Properties)

This element specifies a set of properties which shall be associated with the parent FORMTEXT text box form field (§17.16.5.22) within the document.

If the parent form field is not a text box (i.e. its field code does not have a value of FORMTEXT), then these properties can be ignored.

[Example: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:maxLength w:val="4" />
    ...
    <w:type w:val="number" />
  </w:textInput>
</w:ffData>
```

The textInput element specifies that it contains a set of properties for the parent text box form field. In this case, these properties specify that the drop-down list must contain no more than four characters via the maxLength element (§17.16.26), and that its contents must contain a number via the type element (§17.16.34). *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_FFTextInput](#)) is located in §A.1. *end note*]

17.16.34 type (Text Box Form Field Type)

This element specifies the type of the contents of the current text box form field. This element shall not be used to prevent the successful loading of any contents in the field, but shall be used to parse the formatting specified in the format element (§17.16.20) and should be used to prevent the addition of illegal content when its contents are edited by an application.

If this element is omitted, then its default value shall be assumed to be regular.

[*Example:* Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The type element specifies that the contents of this form field should be handled as a number by an application.
end example]

Attributes	Description
val (Text Box Form Field Type Values)	<p>Specifies the type of the text box form field, as defined by the simple type referenced below.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for the properties of a text box form field:</p> <pre><w:ffData> <w:textInput> <w:type w:val="currentDate" /> </w:textInput> </w:ffData></pre> <p>The val attribute value of currentDate specifies that the contents of this form field should be the current date when the field is updated. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FFTextType simple type (§17.18.28).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_FFTextType](#)) is located in §A.1. *end note]*

17.17 Miscellaneous Topics

This section covers topics not covered elsewhere within the WordprocessingML documentation.

17.17.1 Subdocuments

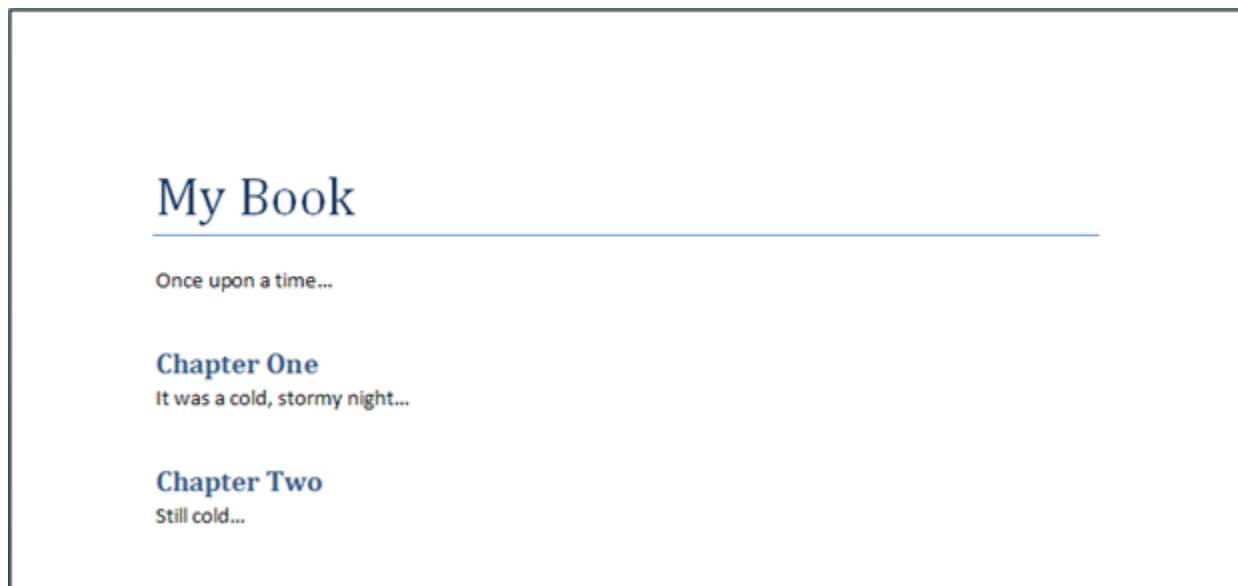

Within a WordprocessingML document, it is sometimes necessary to break a large document into two or more separate WordprocessingML document files, allowing each of these files to be distributed, edited, and handled independently.

[*Example*: A book might consist of five chapters, each edited by a separate author. The editor for the book would therefore desire to create six WordprocessingML documents - one for each author to work on their chapter, and a main document which collates the content of the five chapters appropriately. *end example*]

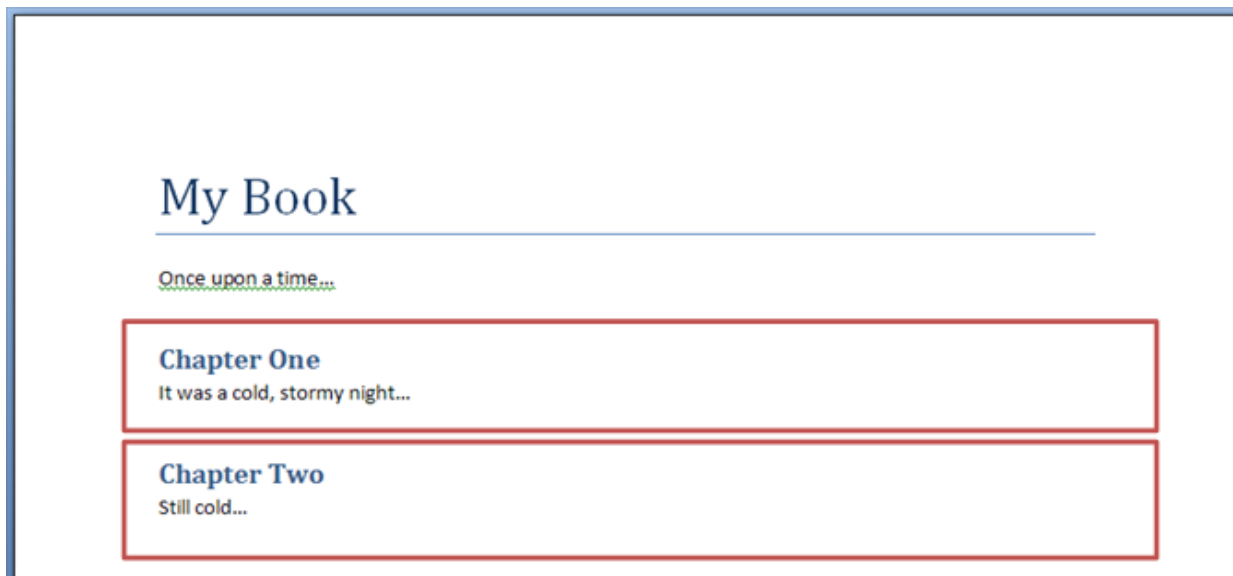

When a WordprocessingML document is comprised of other WordprocessingML documents in this way, the resulting documents are called a master document and its subdocuments.

- A *subdocument* is a WordprocessingML document - there is no specific information in a document which classifies it as such, other than that it is incorporated into another document.
- A *master document* is a document which incorporates one or more subdocuments (as well as optional WordprocessingML content) to create a larger document

[*Example*: Consider a WordprocessingML document which is being used to write a book:

To allow this document to be written by multiple authors, each chapter in the book is placed in a separate file (the sections highlighted in red below):

The result is three WordprocessingML documents:

- A master document (containing the title of the book, the first paragraph, and references to the subdocuments for each chapter)
- Two subdocuments (one for each chapter)

end example]

17.17.1.1 subDoc (Anchor for Subdocument Location)

This element specifies a location within a master document for the insertion of the contents of a specified subdocument. The specified subdocument's contents should appear at the specified location within the master document as needed, but shall remain part of the separate file specified by the subdocument location. The location of the subdocument shall be specified by the relationship whose Id attribute matches the id attribute on this element.

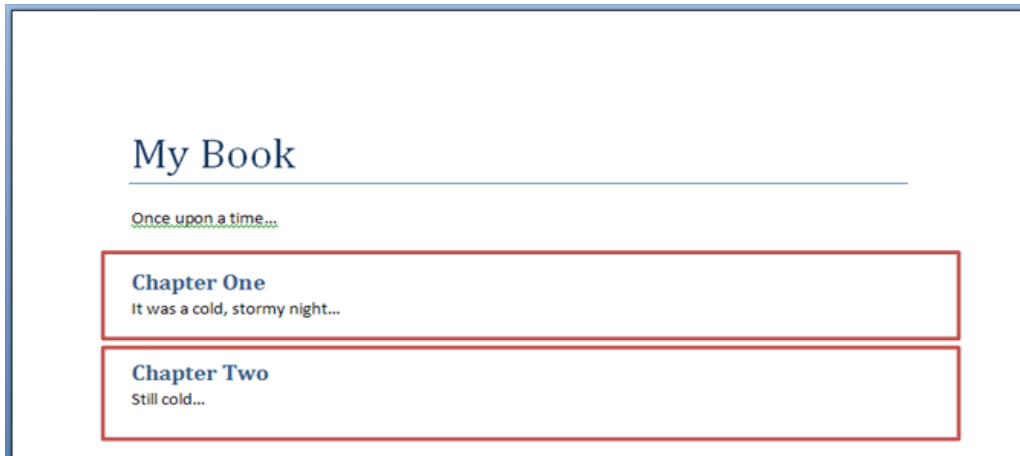

If the relationship type of the relationship specified by this element is not <http://purl.oclc.org/ooxml/officeDocument/relationships/subDocument>, is not present, or does not have a TargetMode attribute value of External, then the document shall be considered non-conformant.

When a subdocument is displayed at the specified location within the master document, the following logic determines how the styles and formatting of the subdocument and associated master document shall be handled:

- All direct formatting in the subdocument is retained.
- For each style in each subdocument:
 - If a style with the same styleId attribute value exists in the master document, display the contents of the subdocument using the style in the master document.

- Otherwise, import the style into the master document and display the content using the original style.
- If a subsequent subdocument also contains a style with the same styleId attribute value, the latter's style is ignored and the content is displayed using the version of the style imported into the master document.

[Example: Consider a book consisting of three chapters, two of which have been divided into subdocuments as follows (the red rectangle indicates the bounds of each subdocument's contents):

The resulting master document would consist of its own WordprocessingML content as well as subdocument anchors in the appropriate locations:

```
<w:body>
  <w:p>
    ...
    <w:r>
      <w:t>My Book</w:t>
    </w:r>
  </w:p>
  <w:p>
    <w:r>
      <w:t>Once upon a time...</w:t>
    </w:r>
  </w:p>
  <w:p>
    <w:subDoc r:id="subDocRel1" />
  </w:p>
```

```
<w:p>
  <w:subDoc r:id="subDocRel2" />
</w:p>
<w:sectPr>
  ...
</w:sectPr>
</w:body>
```

The two subDoc elements specify that the subdocuments targeted by the relationships with an ID of subDocRel1 and subDocRel2 must be imported in that order after the content of the first two paragraphs of content. Examining the contents of the corresponding relationship part item, we can see the targets for those relationships:

```
<Relationships ... >
...
<Relationship Id="subDocRel1" TargetMode="External"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/subDocument"
Target="Chapter1.docx" />
<Relationship Id="subDocRel2" TargetMode="External"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/subDocument"
Target="Chapter2.docx" />
...
</Relationships>
```

The corresponding relationship part item shows that the two files to be imported are located in the same location as the current file and name Chapter1.docx and Chapter2.docx respectively. *end example*]

Attributes	Description
<p>id (Relationship to Part)</p> <p>Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships</p>	<p>Specifies the relationship ID to a specified part.</p> <p>The specified relationship shall match the relationship type required by the parent element:</p> <ul style="list-style-type: none"> • http://purl.oclc.org/ooxml/officeDocument/relationships/customXml for the contentPart element • http://purl.oclc.org/ooxml/officeDocument/relationships/footer for the footerReference element • http://purl.oclc.org/ooxml/officeDocument/relationships/header for the headerReference element • http://purl.oclc.org/ooxml/officeDocument/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements • http://purl.oclc.org/ooxml/officeDocument/relationships/printerSettings for the printerSettings element • http://purl.oclc.org/ooxml/officeDocument/relationships/hyperlink for the longDesc or hyperlink element

Attributes	Description
	<p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre data-bbox="451 321 743 352"><... r:id="rId10" /></pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Rel](#)) is located in §A.1. *end note*]

17.17.2 Alternative Format Import

When generating WordprocessingML documents, it is sometimes necessary to include existing document content (henceforth called *external content*) within the document. External content in a document is typically included because it was stored in a format other than the WordprocessingML format defined by ECMA-376.

As described in §11.3.1, conforming producers shall not create WordprocessingML packages which utilize this mechanism.

In order to facilitate the inclusion of such content without requiring its conversion as a prerequisite to its inclusion in a document, WordprocessingML includes the facility for applications to implement the import of external content in any format as part of a WordprocessingML document. This functionality, called external content import, allows the inclusion of content of an arbitrary content type within the WordprocessingML package, which shall then be opened and merged into the main document when the package is consumed by applications which understand that content type.

[*Example:* Consider a WordprocessingML document which is being created based on the following existing HTML content:

```
<html ... >
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border:5px solid #00FFFF">Paragraph in a
blockquote.</blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

This content could be converted to its WordprocessingML equivalents using the XML syntax defined by ECMA-376, or a more basic tool can use the external content import to include the HTML document within a WordprocessingML package, allowing a subsequent consumer of that content to import the resulting HTML. When the resulting WordprocessingML package is opened, the HTML document must be read (if it is an

alternate format understood by the consuming application) and migrated into the appropriate location in the main WordprocessingML document. *end example]*

17.17.2.1 altChunk (Anchor for Imported External Content)

This element specifies a location within a document for the insertion of the contents of a specified file containing external content to be imported into the main WordprocessingML document. The specified file's contents should appear at the specified location within the document, and can henceforth be emitted as regular WordprocessingML without distinction to its origin. The location of the external content to be imported shall be specified by the relationship whose Id attribute matches the id attribute on this element.

If the relationship type of the relationship specified by this element is not `http://purl.oclc.org/ooxml/officeDocument/relationships/aFChunk`, is not present, or does not have a TargetMode attribute value of `Internal`, then the document shall be considered non-conformant. If an application cannot process external content of the content type specified by the targeted part, then it should ignore the specified alternate content but continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[*Example:* Consider a WordprocessingML document consisting of contents which must be imported from the following HTML document:

```
<html ... >
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border:5px solid #00FFFF">Paragraph in a
blockquote.</blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

The resulting WordprocessingML host document would consist of its own WordprocessingML content as well as an external content import anchor in the appropriate location:

```
<w:body>
  <w:altChunk r:id="altChunk1" />
  <w:p/>
  <w:sectPr>
    ...
  </w:sectPr>
</w:body>
```

The altChunk element specifies that the external content targeted by the relationship with an ID of altChunk1 must be imported at the beginning of the document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```

<Relationships ... >
  ...
  <Relationship Id="altChunk1" TargetMode="Internal"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/aFChunk" Target="import.htm"
/>
  ...
</Relationships>

```

The corresponding relationship part item shows that the file to be imported is located next to the main document and is named `import.htm`. *end example*]

Attributes	Description
id (Relationship to Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the relationship ID to a specified part containing alternate content for import.</p> <p>If the specified relationship does not match the relationship type required by the parent element, then this document shall be considered to be non-conformant.</p> <p>[<i>Example</i>: Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId10" /></pre> <p>The markup specifies the associated relationship part with relationship ID <code>rId1</code> contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_RelationshipId</code> simple type (§22.8.2.1).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_AltChunk](#)) is located in §A.1. *end note*]

17.17.2.2 altChunkPr (External Content Import Properties)

This element specifies the set of properties which shall be applied to the import of the external content specified by the parent `altChunk` element. Within ECMA-376, only one property is specified.

[*Example*: Consider a WordprocessingML document consisting of contents which contains an external content import anchor in the appropriate location:

```

<w:body>
  <w:altChunk r:id="altChunk1">
    <w:altChunkPr>
      <w:matchSrc w:val="false" />
    </w:altChunkPr>
  </w:altChunk>
</w:p>

```

```

    <w:sectPr>
    ...
  </w:sectPr>
</w:body>

```

The altChunkPr element specifies the set of properties applied to the external content import when importing the specified content. *end example*

[Note: The W3C XML Schema definition of this element's content model ([CT_AltChunkPr](#)) is located in §A.1. *end note*]

17.17.2.3 matchSrc (Keep Source Formatting on Import)

This element specifies if any style definitions present in the imported content shall be overridden by identical styles present in the host WordprocessingML document. If this element's val attribute is true, then any style exists in both the imported content and main document shall be maintained on the imported content by redefining the style name and/or ID as needed. Conversely, if this element's val attribute is false, any style which exists in both the imported content and main document shall apply the style form the main document in place of the style in the imported content.

If this element is omitted, then styles from the main document shall override identical styles from the imported content.

[Example: Consider a WordprocessingML document consisting of contents which contains an external content import anchor in the appropriate location:

```

<w:body>
  <w:altChunk r:id="altChunk1">
    <w:altChunkPr>
      <w:matchSrc w:val="true" />
    </w:altChunkPr>
  </w:altChunk>
  <w:p/>
  <w:sectPr>
  ...
</w:sectPr>
</w:body>

```

The matchSrc element has a val attribute value of true, which specifies that conflicting styles must be maintained when importing the specified content. For example, if the Heading 1 style was defined in both places, then applications must ensure that the resulting document does not lose either instance of its formatting as appropriate. *end example*

This element's content model is defined by the common boolean property definition in §17.17.4.

17.17.3 Roundtripping Alternate Content

Office Open XML defines a mechanism for the storage of content which is not defined by ECMA-376, for example extensions developed by future software applications which leverage the Office Open XML formats. This mechanism allows for the storage of a series of alternative representations of content, of which the consuming application should use the first alternative whose requirements are met.

[*Example:* Consider an application which creates a new paragraph property intended to make the colors of its text change colors randomly when it is displayed. This functionality is not defined in ECMA-376, and so the application might choose to create an alternative representation setting a different manual color on each character for clients which do not understand this extension using an AlternateContent block as follows:

```
<ve:AlternateContent xmlns:ve="...">
  <ve:Choice Requires="colors" xmlns:colors="urn:randomTextColors">
    <w:p>
      <w:pPr>
        <colors:random colors:val="true" />
      </w:pPr>
      <w:r>
        <w:t>Random colors!</w:t>
      </w:r>
    </w:p>
  </ve:Choice>
  <ve:Fallback>
    <w:p>
      <w:r>
        <w:rPr>
          <w:color w:val="FF0000" />
        </w:rPr>
        <w:t>R</w:t>
      </w:r>
      <w:r>
        <w:rPr>
          <w:color w:val="00FF00" />
        </w:rPr>
        <w:t>a</w:t>
      </w:r>
      ...
    </w:p>
  </ve:Fallback>
</ve:AlternateContent>
```

The Choice element that requires the new color extensions uses the random element in its namespace, and the Fallback element allows clients that do not support this namespace to see an appropriate alternative representation. *end example*]

These alternate content blocks can occur at any location within a WordprocessingML document, and applications shall handle and process them appropriately (taking the appropriate choice).

However, WordprocessingML does not explicitly define a set of locations where applications shall attempt to store and roundtrip all non-taken choices whenever possible. This behavior is therefore application-defined.

[*Example:* If an application does not understand the colors extension, the resulting file (if alternate choices are to be preserved would appear as follows:

```
<ve:AlternateContent xmlns:ve="...">
  <ve:Choice Requires="colors" xmlns:colors="urn:randomTextColors">
    ...
  </ve:Choice>
  <ve:Fallback>
    ...
  </ve:Fallback>
</ve:AlternateContent>
```

The file would then appear as follows after the choice is processed:

```
<w:p>
  <w:r>
    <w:rPr>
      <w:color w:val="FF0000" />
    </w:rPr>
    <w:t>R</w:t>
  </w:r>
  <w:r>
    <w:rPr>
      <w:color w:val="00FF00" />
    </w:rPr>
    <w:t>a</w:t>
  </w:r>
  ...
</w:p>
```

The state of the alternate choices (preserved or not) is dependent on the application hosting the file. Preserving the content involves storing each non-taken choice while the file is being edited, and writing out the file with an AlternateContent block when it is resaved. *end example*]

17.17.4 Boolean Property (CT_OnOff)

This common complex type specifies a boolean attribute used throughout WordprocessingML.

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of 1 or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of 0 or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre><... w:val="false"/></pre> <p>The val attribute explicitly declares that the property is false. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§22.9.2.7).</p>

[*Note:* The W3C XML Schema definition of this complex type's content model ([CT_OnOff](#)) is located in §A.1. *end note*]

17.18 Simple Types

This is the complete list of simple types dedicated to WordprocessingML.

17.18.1 ST_AnnotationVMerge (Table Cell Vertical Merge Revision Type)

This simple type specifies the possible values for the vertical merge setting which applied to a table cell by a cell merge (or split) revision.

[*Example:* Consider a two row by two column table in which the cells in the second column are merged, and this change is tracked as a revision. The annotation on the last cell in the table would appear as follows:

```
<w:tc>
  <w:tcPr>
    <w:cellMerge ... w:vMerge="cont" />
  </w:tcPr>
  ...
</w:tc>
```

The vmerge attribute value of cont specifies that the revision on the table cell resulted in it being merged with the previous set of vertically merged cells above it (whether that was one cell or many). *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cont (Vertically Merged Cell)	Specifies that the revision resulted in this cell being vertically merged with the cell above it.
rest (Vertically Split Cell)	Specifies that the revision resulted in this cell being vertically split from the one above it.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_AnnotationVMerge](#)) is located in §A.1. *end note*]

17.18.2 ST_Border (Border Styles)

This simple type specifies the kinds of borders which can be specified for WordprocessingML objects which have a border.

Borders can be separated into two types:

- *Line borders*, which specify a pattern to be used when drawing a line around the specified object.
- *Art borders*, which specify a repeated image to be used when drawing a border around the specified object.

Line borders can be specified on any object which allows a border, however, art borders can only be used as a border at the page level - the borders under the pgBorders element (§17.6.10).

For art borders, each border definition is specified by the combination of eight images, as follows:

For the edge borders (top, bottom, left, and right), the border image is repeated as necessary to span the distance between the two intersecting corners. Electronic normative definitions of each piece of border art are included in Annex F.

[*Example:* Consider a left border resulting in the following WordprocessingML:

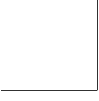

```
<w:left w:val="single" .../>
```

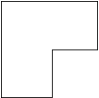

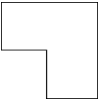

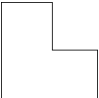

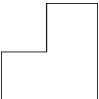

This border's val is single, indicating that the border style is a single line border. *end example*]

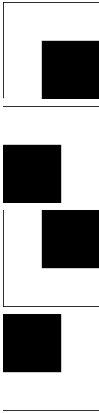

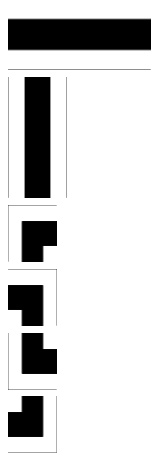

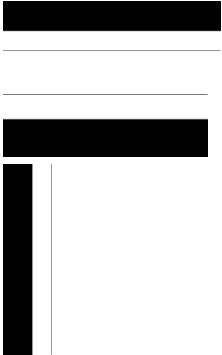

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
apples (Apples Art Border)	Specifies an art border using the following images: All Sides: 
archedScallops (Arched Scallops Art Border)	Specifies an art border using the following images: All Sides: 
babyPacifier (Baby Pacifier Art Border)	Specifies an art border using the following images: All Sides: 
babyRattle (Baby Rattle Art Border)	Specifies an art border using the following images: All Sides: 
balloons3Colors (Three Color Balloons Art Border)	Specifies an art border using the following images: All Sides: 
balloonsHotAir (Hot Air Balloons Art Border)	Specifies an art border using the following images: All Sides: 
basicBlackDashes (Black Dash Art Border)	Specifies an art border using the following images: Top and Bottom:  Left and Right: 

Enumeration Value	Description
	<p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
basicBlackDots (Black Dot Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
basicBlackSquares (Black Square Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
basicThinLines (Thin Line Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom: </p> <p>Left and Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
basicWhiteDashes (White Dash Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom: </p>

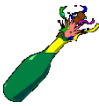

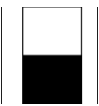

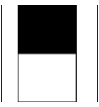

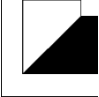

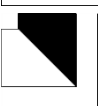

Enumeration Value	Description
	<div>Left and Right:</div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div>
basicWhiteDots (White Dot Art Border)	<div>Specifies an art border using the following images:</div> <div>All Sides:</div>
basicWhiteSquares (White Square Art Border)	<div>Specifies an art border using the following images:</div> <div>All Sides:</div>
basicWideInline (Wide Inline Art Border)	<div>Specifies an art border using the following images:</div> <div>Top:</div> <div>Bottom:</div> <div>Left:</div> <div>Right:</div>

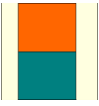

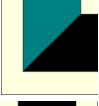

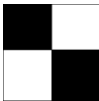

Enumeration Value	Description
	<div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div> </div> 
basicWideMidline (Wide Midline Art Border)	<p>Specifies an art border using the following images:</p> <div> <div>Top and Bottom:</div> <div>Left and Right:</div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div> </div> 
basicWideOutline (Wide Outline Art Border)	<p>Specifies an art border using the following images:</p> <div> <div>Top:</div> <div>Bottom:</div> <div>Left:</div> </div> 

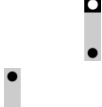

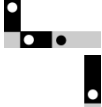

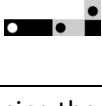

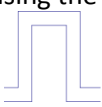

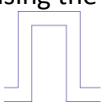

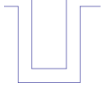

Enumeration Value	Description
	<div>  </div> <p>Right:</p> <div>  </div> <p>Top Left:</p> <div>  </div> <p>Top Right:</p> <div>  </div> <p>Bottom Left:</p> <div>  </div> <p>Bottom Right:</p>
bats (Bats Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> <div>  </div>
birds (Birds Art Border)	<p>Specifies an art border using the following images:</p> <p>Top, Bottom, Top Left, Top Right, Bottom Left and</p> <div>  </div> <p>Bottom Right:</p> <p>Left and Right:</p> <p>[Note: Second image is blank. end note]</p>
birdsFlight (Birds Flying Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> <div>  </div>
cabins (Cabin Art Border)	<p>Specifies an art border using the following images:</p>

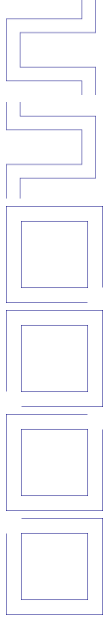

Enumeration Value	Description
	<p>All Sides:</p> 
cakeSlice (Cake Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
candyCorn (Candy Corn Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p>  <p>Bottom:</p>  <p>Left:</p>  <p>Right:</p>  <p>Top Left:</p>  <p>Top Right:</p>  <p>Bottom Left:</p>  <p>Bottom Right:</p> 
celticKnotwork (Knot Work Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p>  <p>Bottom:</p> 

Enumeration Value	Description
	<div>Left:</div> <div>Right:</div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div> 
certificateBanner (Certificate Banner Art Border)	<div>Specifies an art border using the following images:</div> <div>Top:</div> <div>Bottom:</div>  <div>Left:</div> <div>[Note: Image is blank. end note]</div> <div>Right:</div> <div>[Note: Image is blank. end note]</div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div> 

Enumeration Value	Description
chainLink (Chain Link Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
champagneBottle (Champagne Bottle Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
checkedBarBlack (Black and White Bar Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
checkedBarColor (Color Checked Bar Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p>

Enumeration Value	Description
	<div data-bbox="1117 247 1214 323"></div> <p data-bbox="824 317 927 344">Bottom:</p> <div data-bbox="1117 344 1214 449"></div> <p data-bbox="824 422 883 449">Left:</p> <div data-bbox="1117 449 1214 554"></div> <p data-bbox="824 527 899 554">Right:</p> <div data-bbox="1117 554 1214 659"></div> <p data-bbox="824 632 932 659">Top Left:</p> <div data-bbox="1117 659 1214 764"></div> <p data-bbox="824 737 948 764">Top Right:</p> <div data-bbox="1117 764 1214 869"></div> <p data-bbox="824 842 980 869">Bottom Left:</p> <div data-bbox="1117 869 1214 974"></div> <p data-bbox="824 947 997 974">Bottom Right:</p>
checkered (Checkerboard Art Border)	<p data-bbox="824 1058 1425 1085">Specifies an art border using the following images:</p> <div data-bbox="1019 1085 1117 1184"></div> <p data-bbox="824 1163 932 1190">All Sides:</p>
christmasTree (Christmas Tree Art Border)	<p data-bbox="824 1281 1425 1308">Specifies an art border using the following images:</p> <div data-bbox="1019 1308 1117 1407"></div> <p data-bbox="824 1386 932 1413">All Sides:</p>
circlesLines (Circles And Lines Art Border)	<p data-bbox="824 1503 1433 1530">Specifies an art border using the following images:</p> <div data-bbox="1117 1556 1214 1598"></div> <p data-bbox="824 1608 883 1635">Top:</p> <div data-bbox="1117 1677 1214 1719"></div> <p data-bbox="824 1709 932 1736">Bottom:</p> <div data-bbox="1117 1740 1175 1839"></div> <p data-bbox="824 1814 883 1841">Left:</p>

	<p>Right:</p>  <p>Top Left:</p>  <p>Top Right:</p>  <p>Bottom Left:</p>  <p>Bottom Right:</p> 
circlesRectangles (Circles and Rectangles Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p>  <p>Bottom:</p>  <p>Left:</p>  <p>Right:</p>  <p>Top Left:</p>  <p>Top Right:</p>  <p>Bottom Left:</p>  <p>Bottom Right:</p> 
classicalWave (Wave Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p>  <p>Bottom:</p> 

Enumeration Value	Description
	<p>Left:</p> <p>Right:</p> <p>Top Left:</p> <p>Top Right:</p> <p>Bottom Left:</p> <p>Bottom Right:</p> 
clocks (Clocks Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
compass (Compass Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom:</p>  <p>Left and Right:</p>  <p>Top Left, Top Right, Bottom Left, and Bottom Right:</p> 
confetti (Confetti Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p> <p>Bottom:</p> <p>Left:</p> 

Enumeration Value	Description
	<p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
confettiGrays (Confetti Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
confettiOutline (Confetti Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
confettiStreamers (Confetti Streamers Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
confettiWhite (Confetti Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
cornerTriangles (Corner Triangle Art Border)	<p>Specifies an art border using the following images:</p> <p>Top, Bottom, Left, and Right: </p> <p>Top Left: </p>

Enumeration Value	Description
	<div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div>
couponCutoutDashes (Dashed Line Art Border)	<div>Specifies an art border using the following images:</div> <div>Top, Bottom, Left, and Right:</div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div> <div></div>
couponCutoutDots (Dotted Line Art Border)	<div>Specifies an art border using the following images:</div> <div>Top:</div> <div>Bottom:</div> <div>Left:</div> <div>Right:</div> <div>Top Left:</div>

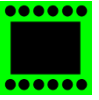

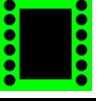

Enumeration Value	Description
	<p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
crazyMaze (Maze Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom: </p> <p>Left and Right: </p> <p>Top Left, Top Right, Bottom Left and Bottom Right: </p>
creaturesButterfly (Butterfly Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
creaturesFish (Fish Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
creaturesInsects (Insects Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left and Right: </p> <p>Top Left and Top Right: </p>

Enumeration Value	Description
	Bottom Left and Bottom Right: 
creaturesLadyBug (Ladybug Art Border)	Specifies an art border using the following images: All Sides: 
crossStitch (Cross-stitch Art Border)	Specifies an art border using the following images: All Sides: 
cup (Cupid Art Border)	Specifies an art border using the following images: All Sides: 
custom (Custom Defined Art Border)	Specifies a custom art border using the parent element's attributes to reference one or more customer art border images.
dashDotStroked (Dash Dot Stroked Line Border)	Specifies a line border consisting of a line with a series of alternating thin and thick strokes around the parent object. <i>[Example:</i>  <i>end example]</i>
dashed (Dashed Line Border)	Specifies a line border consisting of a dashed line around the parent object. <i>[Example:</i>  <i>end example]</i>
dashSmallGap (Dashed Line Border)	Specifies a line border consisting of a dashed line with small gaps around the parent object. <i>[Example:</i> 

Enumeration Value	Description
	<i>end example]</i>
decoArch (Archway Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom: </p> <p>Left and Right: </p> <p>Top Left and Top Right: </p> <p>Bottom Left and Bottom Right: </p>
decoArchColor (Color Archway Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom: </p> <p>Left and Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left and Bottom Right: </p>
decoBlocks (Blocks Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p>

Enumeration Value	Description
	<p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
diamondsGray (Gray Diamond Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
dotDash (Dot Dash Line Border)	<p>Specifies a line border consisting of a alternating dotted and dashed line around the parent object.</p> <p>[Example:</p> <p>-----</p> <p>end example]</p>
dotDotDash (Dot Dot Dash Line Border)	<p>Specifies a line border consisting of a alternating dotted, dotted, dashed line around the parent object.</p> <p>[Example:</p> <p>-----</p> <p>end example]</p>
dotted (Dotted Line Border)	<p>Specifies a line border consisting of a dotted line around the parent object.</p> <p>[Example:</p> <p>.....</p> <p>end example]</p>
double (Double Line Border)	<p>Specifies a line border consisting of a double line around the parent object.</p>

Enumeration Value	Description
	<p>[Example:</p>  <p>end example]</p>
doubleD (Double D Art Border)	<p>Specifies an art border using the following images:</p> <div> <div>Top:</div> <div>Bottom:</div> <div>Left:</div> <div>Right:</div> <div>Top Left:</div> <div>Top Right:</div> <div>Bottom Left:</div> <div>Bottom Right:</div> </div> 
doubleDiamonds (Diamond Art Border)	<p>Specifies an art border using the following images:</p> <div> <div>All Sides:</div> </div>  <div>  </div>
doubleWave (Double Wave Line Border)	<p>Specifies a line border consisting of a double wavy line around the parent object.</p> <p>[Example:</p>  <p>end example]</p>

Enumeration Value	Description
earth1 (Earth Art Border)	Specifies an art border using the following images: All Sides: 
earth2 (Earth Art Border)	Specifies an art border using the following images: All Sides: 
earth3 (Earth Art Border)	Specifies an art border using the following images: All sides: 
eclipsingSquares1 (Shadowed Square Art Border)	Specifies an art border using the following images: All Sides: 
eclipsingSquares2 (Shadowed Square Art Border)	Specifies an art border using the following images: All Sides: 
eggsBlack (Painted Egg Art Border)	Specifies an art border using the following images: All Sides: 
fans (Fans Art Border)	Specifies an art border using the following images: All Sides: 
film (Film Reel Art Border)	Specifies an art border using the following images: Top and Bottom:  Left and Right:  Top Left and Bottom Left: 

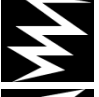

Enumeration Value	Description
	<p>Top Right and Bottom Right:</p> 
firecrackers (Firecracker Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
flowersBlockPrint (Flowers Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
flowersDaisies (Daisy Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
flowersModern1 (Flowers Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
flowersModern2 (Flowers Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom:</p>  <p>Left and Right:</p>  <p>Top Left:</p>  <p>Top Right:</p>  <p>Bottom Left:</p>  <p>Bottom Right:</p> 

Enumeration Value	Description
flowersPansy (Pansy Art Border)	Specifies an art border using the following images: All Sides: 
flowersRedRose (Red Rose Art Border)	Specifies an art border using the following images: All Sides: 
flowersRoses (Roses Art Border)	Specifies an art border using the following images: All Sides: 
flowersTeacup (Flowers in a Teacup Art Border)	Specifies an art border using the following images: All Sides: 
flowersTiny (Small Flower Art Border)	Specifies an art border using the following images: Top:  Bottom:  Left:  Right:  Top Left:  Top Right:  Bottom Left:  Bottom Right: 

Enumeration Value	Description
gems (Gems Art Border)	<p>Specifies an art border using the following images:</p> <p>Top, Bottom, Left and Right</p> <p>Top Left:</p> <p>Top Right:</p> <p>Bottom Left:</p> <p>Bottom Right:</p> 
gingerbreadMan (Gingerbread Man Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
gradient (Triangle Gradient Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
handmade1 (Handmade Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p> <p>Bottom:</p> <p>Left:</p> <p>Right:</p> <p>Top Left:</p> 

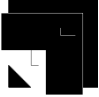

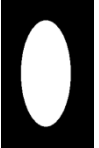

Enumeration Value	Description
	<p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
handmade2 (Handmade Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
heartBalloon (Heart-Shaped Balloon Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
heartGray (Gray Heart Art Border)	Specifies an art border using the following images:

Enumeration Value	Description
	<p>All Sides: </p>
hearts (Hearts Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
heebieJeebies (Pattern Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
holly (Holly Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
houseFunky (House Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
hypnotic (Circular Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p>

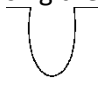

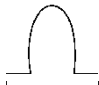

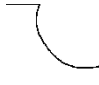

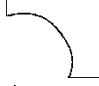

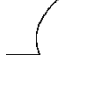

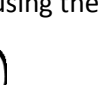

Enumeration Value	Description
	<p>Bottom Left: </p> <p>Bottom Right: </p>
iceCreamCones (Ice Cream Cone Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
inset (Inset Line Border)	<p>Specifies a line border consisting of an inset set of lines around the parent object.</p> <p>[Example:</p> <p></p> <p>end example]</p>
lightBulb (Light Bulb Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
lightning1 (Lightning Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
lightning2 (Lightning Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left and Top Left: </p> <p>Right and Top Right: </p>

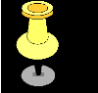

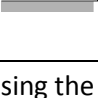

Enumeration Value	Description
	<p>Bottom Left:</p>  <p>Bottom Right:</p> 
mapleLeaf (Maple Leaf Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
mapleMuffins (Muffin Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
mapPins (Map Pins Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
marquee (Marquee Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom:</p>  <p>Left and Right:</p>  <p>Top Left, Top Right, Bottom Left, and Bottom Right:</p> 
marqueeToothed (Marquee Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p>  <p>Bottom:</p>  <p>Left:</p>  <p>Right:</p>  <p>Top Left:</p>  <p>Top Right:</p>  <p>Bottom Left:</p> 

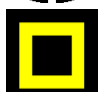

Enumeration Value	Description
	Bottom Right: 
moons (Moon Art Border)	Specifies an art border using the following images: Top:  Bottom:  Left:  Right:  Top Left:  Top Right:  Bottom Left:  Bottom Right: 
mosaic (Mosaic Art Border)	Specifies an art border using the following images: All Sides: 
musicNotes (Musical Note Art Border)	Specifies an art border using the following images: All Sides: 
nil (No Border)	Specifies that no border shall be applied to the current item.
none (No Border)	Specifies that no border shall be applied to the current item.
northwest (Patterned Art Border)	Specifies an art border using the following images: Top:  Bottom:  Left:  Right: 

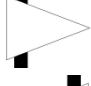

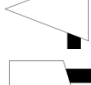

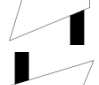

Enumeration Value	Description
	<p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
outset (Outset Line Border)	<p>Specifies a line border consisting of an outset set of lines around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
ovals (Oval Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom: </p> <p>Right and Left: </p> <p>Top Left, Top Right, Bottom Left and Bottom Right: </p>
packages (Package Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
palmsBlack (Black Palm Tree Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>

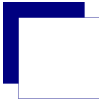

Enumeration Value	Description
palmsColor (Color Palm Tree Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
paperClips (Paper Clip Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
papyrus (Papyrus Art Border)	<p>Specifies an art using the following images:</p> <p>Top and Bottom: </p> <p>Right and Left: </p> <p>Top Left and Top Right: </p> <p>Bottom Left and Bottom Right: </p>
partyFavor (Party Favor Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
partyGlass (Party Glass Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
pencils (Pencils Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
people (Character Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
peopleHats (Character With Hat Art Border)	<p>Specifies an art border using the following images:</p>

Enumeration Value	Description
	<p>All Sides: </p>
peopleWaving (Waving Character Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
poinsettias (Poinsettia Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
postageStamp (Postage Stamp Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
pumpkin1 (Pumpkin Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>

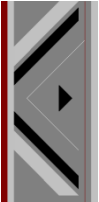

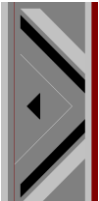

Enumeration Value	Description
pushPinNote1 (Push Pin Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p> <p>Bottom: </p> <p>Left:</p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
pushPinNote2 (Push Pin Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p>

Enumeration Value	Description
	<p>Bottom Right:</p> 
pyramids (Pyramid Art Border)	<p>Specifies an art border using the following images:</p> <p>Top:</p>  <p>Bottom:</p>  <p>Left:</p>  <p>Right:</p>  <p>Top Left, Top Right, Bottom Left, and Bottom Right:</p> 
pyramidsAbove (Pyramid Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
quadrants (Quadrants Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom:</p>  <p>Left and Right:</p>  <p>Top Left:</p>  <p>Top Right:</p>  <p>Bottom Left:</p>  <p>Bottom Right:</p> 
rings (Rings Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
safari (Safari Art Border)	<p>Specifies an art border using the following images:</p>

Enumeration Value	Description
	All Sides: 
sawtooth (Saw tooth Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p> <p>Bottom Left: </p> <p>Bottom Right: </p>
sawtoothGray (Gray Saw tooth Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left: </p> <p>Top Right: </p>

Enumeration Value	Description
	<p>Bottom Left:</p>  <p>Bottom Right:</p> 
scaredCat (Scared Cat Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
seattle (Umbrella Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
shadowedSquares (Shadowed Squares Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides:</p> 
shapes1 (Black and White Shapes Art Border)	<p>Specifies an art border using the following images:</p> <p>Top and Bottom:</p>  <p>Right and Left:</p>  <p>Top Left, Top Right, Bottom Left and Bottom Right:</p> 
shapes2 (Black and White Art Border Two)	<p>Specifies an art border using the following images:</p> <p>Top, Bottom, Left and Right:</p>  <p>Top Left, Top Right, Bottom Left and Bottom Right:</p> 
sharksTeeth (Shark Tooth Art Border)	<p>Specifies an art border using the following images:</p>

Enumeration Value	Description
	 <p>All Sides:</p>
shorebirdTracks (Bird Tracks Art Border)	<p>Specifies an art border using the following images:</p> <p>Top: </p> <p>Bottom: </p> <p>Left: </p> <p>Right: </p> <p>Top Left, Top Right, Bottom Left and Bottom Right: </p>
single (Single Line Border)	<p>Specifies a line border consisting of a single line around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
skyrocket (Rocket Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
snowflakeFancy (Snowflake Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
snowflakes (Snowflake Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>
sombrero (Sombrero Art Border)	<p>Specifies an art border using the following images:</p> <p>All Sides: </p>

zigZagStitch (Zigzag stitch)	<div>Specifies an art border using the following images:</div> <div>Top:</div> <div>Bottom:</div> <div>Left:</div> <div>Right:</div>

Enumeration Value	Description
	

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Border](#)) is located in §A.1. *end note*]

17.18.3 ST_BrClear (Line Break Text Wrapping Restart Location)

This simple type specifies the set of possible restart locations which can be used as to determine the next available line when a break's type attribute has a value of `textWrapping`. This property only affects the restart location when the current run is being displayed on a line which does not span the full text extents due to the presence of a floating object (see enumeration values for details).

[*Example:* Consider a text wrapping break character which should force the restart location to the next line which spans the full width of the text extents of the page (there are no floating objects which interrupt the line).

This line break is of style `textWrapping`, since it must only advance to the next line, but the clear value must specify that this restart location must ignore all lines which are not of the full line width by specifying a value of `all`, as follows:

```
<w:br w:type="textWrapping" w:clear="all" />
```

This break must therefore not use the next available line, but rather the next available line ignoring all lines which do not span the full text width. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
all (Restart On Next Full Line)	Specifies that the text wrapping break shall advance the text to the next line in the WordprocessingML document which spans the full width of the line (i.e. the next line which is not interrupted by any floating

Enumeration Value	Description
	<p>objects when those objects are positioned on the page at display time.</p> <p>[<i>Note</i>: This setting is typically used to place a single line of text next to a floating object for use as a caption. <i>end note</i>]</p>
left (Restart In Next Text Region Unblocked on the Left)	<p>Specifies that the text wrapping break shall behave as follows when this line intersects a floating object:</p> <p>If the parent paragraph is left-to-right:</p> <ul style="list-style-type: none"> • If this is the leftmost region of text flow currently on this line, • If a floating object occurs to the left of the break, advance the text to the next available line that does not have a floating object on the left. • Otherwise, advance the text to the next position on the line where text can be displayed • Otherwise, treat this as a text wrapping break of type none. <p>If the parent paragraph is right to left:</p> <p>If the object occurs to the left of the break, advance the text to the next available line that does not have a floating object on the left.</p> <ul style="list-style-type: none"> • Otherwise, treat this as a text wrapping break of type none. <p>In either case, if this line does not intersect a floating object, then treat this break as a text wrapping break of type none.</p>
none (Restart On Next Line)	<p>Specifies that the text wrapping break shall advance the text to the next line in the WordprocessingML document, regardless of its position left to right or the presence of any floating objects which intersect with the line,</p> <p>This is the setting for a typical line break in a document.</p>
right (Restart In Next Text Region Unblocked on the Right)	<p>Specifies that the text wrapping break shall behave as follows when this line intersects a floating object:</p>

Enumeration Value	Description
	<p>If the parent paragraph is left-to-right:</p> <ul style="list-style-type: none"> • If the object occurs to the right of the break, advance the text to the next available line that does not have a floating object on the right. • Otherwise, treat this as a text wrapping break of type none. <p>If the parent paragraph is right to left:</p> <ul style="list-style-type: none"> • If this is the rightmost region of text flow currently on this line, <ul style="list-style-type: none"> • If a floating object occurs to the right of the break, advance the text to the next available line that does not have a floating object on the right. • Otherwise, advance the text to the next position on the line where text can be displayed • Otherwise, treat this as a text wrapping break of type none. <p>In either case, if this line does not intersect a floating object, then treat this break as a text wrapping break of type none.</p>

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_BrClear](#)) is located in §A.1. *end note*]

17.18.4 ST_BrType (Break Types)

This simple type specifies the possible kinds of break characters in a WordprocessingML document. The break type determines the next location where text shall be placed after this manual break is applied to the text contents (see enumeration values for details).

[*Example*: Consider a manual break which must advance the text to the next text column in the document, rather than just the next available line. This break would therefore be specified as follows:

```
<w:br w:type="column"/>
```

The type attribute specifies a value of `column`, which means that the break must force the next character in the document to be restarted on the next line in a new text column in the document. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
column (Column Break)	<p>Specifies that the current break shall restart itself on the next column available on the current page when the document is displayed in page view.</p> <p>If the current section is not divided into columns, or the column break occurs in the last column on the current page when displayed, then the restart location for text shall be the next page in the document.</p>
page (Page Break)	<p>Specifies that the current break shall restart itself on the next page of the document when the document is displayed in page view.</p> <p>Page breaks shall be ignored when present in frames unless the showBreaksInFrames element (Part 4, §9.7.3.36) is present in the document's compatibility settings.</p>
textWrapping (Line Break)	<p>Specifies that the current break shall restart itself on the next line in the document when the document is displayed in page view.</p> <p>The determine of the next line shall be done subject to the value of the clear attribute on the specified break character.</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_BrType](#)) is located in §A.1. *end note*]

17.18.5 ST_CaptionPos (Automatic Caption Positioning Values)

This simple type specifies the possible values can be used for the position of an automatically inserted caption on an object within this document. These values specify the position a given caption shall be take relative to the object it is used to label.

[Example: Consider a WordprocessingML document which should have all automatically inserted captions placed below the objects they are captioning, for example:

This requirement is specified using the following WordprocessingML in the document settings:

```
<w:captions>
  <w:caption w:name="Table" w:pos="below" w:numFmt="decimal" />
</w:captions>
```

The pos attribute has a value of below, specifying that the caption must be placed below the newly inserted objects. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
above (Position Caption Above Object)	Specifies that an automatically inserted caption shall be positioned above the object that it is used to label.
below (Position Caption Below Object)	Specifies that an automatically inserted caption shall be positioned below the object that it is used to label.
left (Position Caption Left Of Object)	Specifies that an automatically inserted caption shall be positioned to the left of the object that it is used to label (the position where text typed immediately before the object would appear).
right (Position Caption Right Of Object)	Specifies that an automatically inserted caption shall be positioned to the right of the object that it is used to label (the position where text typed immediately after the object would appear).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CaptionPos](#)) is located in §A.1. *end note*]

17.18.6 ST_ChapterSep (Chapter Separator Types)

This simple type specifies the character which shall be used to separate the chapter number from the page number for page numbers in a given section, when chapter numbers are being displayed.

[*Example:* Consider a section in a document in which the chapter must be separated from the page number using a colon character. This constraint would be specified using the following WordprocessingML:

```
<w:pgNumType w:chapSep="colon" w:chapStyle="1" />
```

The chapSep attribute declares that the chapter and page number must be separated by a colon (e.g. 1:1 for chapter one, page one). *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
colon (Colon Chapter Separator)	Specifies that a colon character shall be used to separate the chapter number from the page number when page numbers are displayed. [<i>Example:</i> 1:1 for page one, section one. <i>end example</i>]
emDash (Em Dash Chapter Separator)	Specifies that an em dash character shall be used to separate the chapter number from the page number when page numbers are displayed. [<i>Example:</i> 1—1 for page one, section one. <i>end example</i>]
enDash (En Dash Chapter Separator)	Specifies that an en dash character shall be used to separate the chapter number from the page number when page numbers are displayed. [<i>Example:</i> 1–1 for page one, section one. <i>end example</i>]
hyphen (Hyphen Chapter Separator)	Specifies that a non-breaking hyphen character shall be used to separate the chapter number from the page number when page numbers are displayed. [<i>Example:</i> 1-1 for page one, section one. <i>end example</i>]
period (Period Chapter Separator)	Specifies that a period character shall be used to separate the chapter number from the page number when page numbers are displayed. [<i>Example:</i> 1.1 for page one, section one. <i>end example</i>]

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_ChapterSep](#)) is located in §A.1. *end note*]

17.18.7 ST_CharacterSpacing (Character-Level Whitespace Compression Settings)

This simple type specifies the possible ways in which full-width characters in the current WordprocessingML document can be compressed to remove additional whitespace when the contents of this document are displayed, specifically by specifying the set(s) of characters which can be compressed to remove additional whitespace.

[*Example:* Consider the WordprocessingML below:

```
<w:characterSpacingControl w:val="doNotCompress" />
```

The characterSpacingControl element has a val attribute value of doNotCompress, which specifies that no character compression shall be applied to any character when the document is displayed. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
compressPunctuation (Compress Whitespace From Punctuation Characters)	Specifies that only whitespace characters shall have whitespace compression applied to them.
compressPunctuationAndJapaneseKana (Compress Whitespace From Both Japanese Kana And Punctuation Characters)	Specifies that whitespace and Japanese kana characters shall have whitespace compression applied to them.
doNotCompress (Do Not Compress Whitespace)	Specifies that characters shall not have whitespace compression applied to them.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_CharacterSpacing](#)) is located in §A.1. *end note*]

17.18.8 ST_CombineBrackets (Two Lines in One Enclosing Character Type)

This simple type specifies the kind of bracket character which shall be used to enclose the two lines in one text within the current run when displayed

[*Example:* Consider a paragraph with the text `two lines in one`, which must be displayed within a single logical line in the document and enclosed in curly brackets. This constraint would be specified as follows in the WordprocessingML:

```
<w:r>
  <w:rPr>
    <w:eastAsianLayout w:id="1" w:combine="on" w:combineBrackets="curly"/>
  </w:rPr>
```

```
<w:t>two lines in one</w:t>
</w:r>
```

The resulting text would be displayed on two sub lines within the other text on this line and enclosed within curly brackets when displayed. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
angle (Angle Brackets)	Specifies that angle bracket characters shall be used to enclose the contents of the current run's two lines in one text. <i>[Example: <...> end example]</i>
curly (Curly Brackets)	Specifies that curly bracket characters shall be used to enclose the contents of the current run's two lines in one text. <i>[Example: {...} end example]</i>
none (No Enclosing Brackets)	Specifies that no characters shall be used to enclose the contents of the current run's two lines in one text.
round (Round Brackets)	Specifies that round bracket characters shall be used to enclose the contents of the current run's two lines in one text. <i>[Example: (...) end example]</i>
square (Square Brackets)	Specifies that square bracket characters shall be used to enclose the contents of the current run's two lines in one text. <i>[Example: [...] end example]</i>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CombineBrackets](#)) is located in §A.1. *end note*]

17.18.9 ST_DateTime (Standard Date and Time Storage Format)

This simple type specifies that its contents contain a date in the standard XML Schema xsd:dateTime format, whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following WordprocessingML fragment:

```
<w:date w:fullDate="01-01-2006T12:00:00Z">
```

```
...
</w:date>
```

In this case, the date in the `realDate` attribute is the full date associated with the parent date picker structured document. In every case, the value of this simple type is interpreted in the context of the parent element or attribute. *end example*

This simple type's contents are a restriction of the W3C XML Schema `dateTime` datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DateTime](#)) is located in §A.1. *end note*]

17.18.10 ST_DecimalNumber (Decimal Number Value)

This simple type specifies that its contents contain a whole decimal number (positive or negative), whose contents are interpreted based on the context of the parent XML element.

[*Example:* Consider the following WordprocessingML fragment:

```
<w:pPr>
  <w:divId w:val="1512645511" />
</w:pPr>
```

The value of the `val` attribute is the ID of the associated HTML `div`.

However, consider the following fragment:

```
<w:ilvl w:val="1">
  ...
</w:ilvl>
```

In this case, the decimal number in the `val` attribute is the ID of the associated numbering level. In each case, the value is interpreted in the context of the parent element. *end example*

This simple type's contents are a restriction of the W3C XML Schema `integer` datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DecimalNumber](#)) is located in §A.1. *end note*]

17.18.11 ST_DecimalNumberOrPercent (Percentage Measurement)

This simple type specifies that its contents will contain a percentage-based value. See the union's member types for details.

This simple type is a union of the following types:

- The `ST_Percentage` simple type (§22.9.2.9).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DecimalNumberOrPercent](#)) is located in §A.1. *end note*]

17.18.12 ST_Direction (Bidirectional Direction Types)

This simple type specifies the possible values for bidirectional settings within a WordprocessingML document.

[Example: Consider the following bidirectional setting; in this case, a bidirectional override:

```
<w:bdo w:val="rtl">
...
</w:bdo>
```

The val attribute explicitly declares that the override is applied right to left via the val attribute value of rtl. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

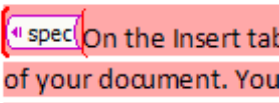

Enumeration Value	Description
ltr (Left to Right)	Specifies a left-to-right direction for the property defined by the parent XML element.
rtl (Right to Left)	Specifies a right-to-left direction for the property defined by the parent XML element.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Direction](#)) is located in §A.1. *end note*]

17.18.13 ST_DisplacedByCustomXml (Location of Custom XML Markup Displacing an Annotation)

This simple type specifies the possible values for the location of a single custom XML element's start and/or end tag relative to the location of an annotation tag in document order. This enumeration shall be used to specify that the parent annotation's placement shall be directly linked with the location of the physical presentation of a custom XML element in the document.

[Example: Consider a paragraph with block level custom XML markup and two comment anchor annotations (one before and one after the custom XML element's physical representation), as follows:

Since all three of these items are around the entire paragraph, they are stored outside of the paragraph. However, in order to ensure that their relative positions are stored correctly, any annotation which must be

displaced by the physical custom XML element specifies this information, resulting in the following WordprocessingML:

```
...
<w:commentRangeStart w:id="0" />
<w:commentRangeStart w:id="1" w:displaced byCustomXml="next" />
<w:customXml w:element="spec" ... >
  <w:p>
    ...
  </w:p>
</w:customXml>
...
```

The `displacedByCustomXml` attribute specifies that even though all three of these items are around the paragraph and is moved inside the paragraph to be represented physically, the comment with ID 0 must be inside the custom XML, but the comment with ID 1 must be displaced to stay outside of the relative location of the next custom XML element (the `spec` element). *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
next (Displaced by Next Custom XML Markup Tag)	<p>Specifies that this annotation anchor shall be displaced by the physical representation of the next element of custom XML markup in the document.</p> <p>If no custom XML markup exists in the same paragraph and after this anchor, then this setting shall be ignored.</p>
prev (Displaced by Previous Custom XML Markup Tag)	<p>Specifies that this annotation anchor shall be displaced by the physical representation of the previous element of custom XML markup in the document.</p> <p>If no custom XML markup exists in the same paragraph and directly before this anchor, then this setting shall be ignored.</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DisplacedByCustomXml](#)) is located in §A.1. *end note*]

17.18.14 ST_DocGrid (Document Grid Types)

Specifies the kind of the current document grid, which defines the grid behavior.

The grid can define a grid which snaps all East Asian characters to grid positions, but leaves Latin text with its default spacing; a grid which adds the specified character pitch to all characters on each row; or a grid which affects only the line pitch for the current section.

[*Example:* Consider the document discussed above with the document grid defined to allow 20 characters per line, and 20 lines per page by snapping characters to the grid as follows:

This document has a type attribute of type ST_DocGrid and value snapToChars, which specifies that the grid must force East Asian characters to fit 20 to a line. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
default (No Document Grid)	Specifies that no document grid shall be applied to the contents of the current section in the document.
lines (Line Grid Only)	Specifies that the parent section shall have additional line pitch added to each line within it (as specified on the docGrid element (§17.6.5)) in order to maintain the specified number of lines per page.
linesAndChars (Line and Character Grid)	Specifies that the parent section shall have both the additional line pitch and character pitch added to each line and character within it (as specified on the docGrid element (§17.6.5)) in order to maintain a specific number of lines per page and characters per line.

Enumeration Value	Description
	When this value is set, the input specified via the user interface can be allowed in exact number of line/character pitch units.
snapToChars (Character Grid Only)	<p>Specifies that the parent section shall have both the additional line pitch and character pitch added to each line and character within it (as specified on the docGrid element (§17.6.5)) in order to maintain a specific number of lines per page and characters per line.</p> <p>When this value is set, the input specified via the user interface can be restricted to the number of lines per page and characters per line, with the consumer or producer translating this information based on the current font data to get the resulting line and character pitch values</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DocGrid](#)) is located in §A.1. *end note*]

17.18.15 ST_DocPartBehavior (Insertion Behavior Types)

This simple type specifies the possible sets of behaviors which can be applied to the contents of a single glossary document entry (§17.12.5) when it is added to the main document story of a WordprocessingML document.

[Example: Consider the WordprocessingML fragment for a glossary document entry containing a single run, defined as follows:

```

<w:docPart>
  <w:docPartPr>
    <w:behaviors>
      <w:behavior w:val="p"/>
    </w:behaviors>
    ...
  </w:docPartPr>
  <w:docPartBody>
    <w:p>
      <w:r>
        <w:t>Sample entry.</w:t>
      </w:r>
    </w:p>
  </w:docPartBody>
</w:docPart>

```

The behavior element of type `ST_DocPartBehavior` has a value of `p`, which specifies that the contents of the parent glossary document entry must be inserted in their own paragraph when they are added to the contents of a document. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
content (Insert Content At Specified Location)	<p>Specifies that when the glossary document entry is inserted into the main document contents of the document, it shall be inserted normally as defined above.</p> <p>This includes ensuring that the final paragraph which is included in the part is not inserted, and its run content is added to the paragraph into which the current part is being inserted.</p>
p (Ensure Entry Is In New Paragraph)	<p>Specifies that the glossary document entry shall be added into its own unique paragraph, by failing to remove the last paragraph from the entry's contents when they are added to the document.</p>
pg (Ensure Entry Is On New Page)	<p>Specifies that the glossary document entry shall be added into its own new page, by preceding the entry with a blank paragraph whose only content is a page break character.</p>

[*Note*: The W3C XML Schema definition of this simple type's content model (`ST_DocPartBehavior`) is located in §A.1. *end note*]

17.18.16 ST_DocPartGallery (Entry Gallery Types)

This simple type specifies possible settings for the predefined gallery into which a glossary document part shall be classified. This classification, although its enumeration values can be interpreted to imply semantics around the contents of the parent glossary document entry, shall only be used to classify and sort this entry (via an application or a user interface).

[*Example*: Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```

<w:docPartPr>
  <w:category>
    <w:name w:val="Internal Memo Covers" />
    <w:gallery w:val="coverPg" />
  </w:category>
  ...
</w:docPartPr>

```

The gallery element with a value of coverPg specifies that the gallery categorization applied to the current entry, for the purposes of classification or user interface sorting, puts this entry into the Cover Pages classification. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
any (All Galleries)	Specifies that this glossary document entry shall be associated with all possible gallery classification values.
autoTxt (AutoText Gallery)	Specifies that this glossary document entry shall be associated with the AutoText gallery classification.
bib (Bibliography Gallery)	Specifies that this glossary document entry shall be associated with the Bibliography gallery classification.
coverPg (Cover Page Gallery)	Specifies that this glossary document entry shall be associated with the Cover Page gallery classification.
custAutoTxt (Custom AutoText Gallery)	Specifies that this glossary document entry shall be associated with the Custom AutoText gallery classification.
custBib (Custom Bibliography Gallery)	Specifies that this glossary document entry shall be associated with the Custom Bibliography gallery classification.
custCoverPg (Custom Cover Page Gallery)	Specifies that this glossary document entry shall be associated with the Custom Cover Page gallery classification.
custEq (Custom Equation Gallery)	Specifies that this glossary document entry shall be associated with the Custom Equation gallery classification.
custFtrs (Custom Footer Gallery)	Specifies that this glossary document entry shall be associated with the Custom Footer gallery classification.
custHdrs (Custom Header Gallery)	Specifies that this glossary document entry shall be associated with the Custom Header gallery classification.

Enumeration Value	Description
custom1 (Custom 1 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 1 gallery classification.
custom2 (Custom 2 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 2 gallery classification.
custom3 (Custom 3 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 3 gallery classification.
custom4 (Custom 4 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 4 gallery classification.
custom5 (Custom 5 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 5 gallery classification.
custPgNum (Custom Page Number Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number gallery classification.
custPgNumB (Custom Page Number At Bottom Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Bottom gallery classification.
custPgNumMargins (Custom Page Number At Margins Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Margins gallery classification.
custPgNumT (Custom Page Number At Top Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Top gallery classification.
custQuickParts (Custom Quick Parts Gallery)	Specifies that this glossary document entry shall be associated with the Custom Quick Parts gallery classification.
custTblOfContents (Custom Table of Contents Gallery)	Specifies that this glossary document entry shall be associated with the Custom Table of Contents gallery classification.
custTbls (Custom Table Gallery)	Specifies that this glossary document entry shall be associated with the Custom Tables gallery classification.
custTextBox (Custom Text Box Gallery)	Specifies that this glossary document entry shall be associated with the Custom Text Box gallery classification.
custWatermarks (Custom Watermark Gallery)	Specifies that this glossary document entry shall be associated with the Custom Watermark gallery classification.
default (No Gallery Classification)	Specifies that this glossary document entry shall not have a gallery classification.
docParts (Document Parts Gallery)	Specifies that this glossary document entry shall be associated with the Document Parts gallery

Enumeration Value	Description
	classification.
eq (Equations Gallery)	Specifies that this glossary document entry shall be associated with the Equations gallery classification.
fters (Footers Gallery)	Specifies that this glossary document entry shall be associated with the Footers gallery classification.
hdrs (Headers Gallery)	Specifies that this glossary document entry shall be associated with the Headers gallery classification.
pgNum (Page Numbers Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers gallery classification.
pgNumB (Page Numbers At Bottom Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Bottom gallery classification.
pgNumMargins (Page Numbers At Margins Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Margins gallery classification.
pgNumT (Page Numbers At Top Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Top gallery classification.
placeholder (Structured Document Tag Placeholder Text Gallery)	Specifies that this glossary document entry shall be associated with the Structured Document Tag Placeholder Text gallery classification.
tblOfContents (Table of Contents Gallery)	Specifies that this glossary document entry shall be associated with the Table of Contents gallery classification.
tbls (Table Gallery)	Specifies that this glossary document entry shall be associated with the Tables gallery classification.
txtBox (Text Box Gallery)	Specifies that this glossary document entry shall be associated with the Text Box gallery classification.
watermarks (Watermark Gallery)	Specifies that this glossary document entry shall be associated with the Watermark gallery classification.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DocPartGallery](#)) is located in §A.1. *end note*]

17.18.17 ST_DocPartType (Entry Types)

This simple type specifies the possible entry types which can be applied to the properties of a single glossary document entry (§17.12.5). Each of these entry types can, based on their values, influence the visibility and behavior of the parent glossary document entry.

[*Example:* Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
  <w:types>
    <w:type w:val="bbPlcHdr" />
  </w:types>
  ...
</w:docPartPr>
```

The type element with a value of bbPlcHdr specifies that the parent glossary document entry must be treated as if it was the placeholder text for one or more structured document tags in the document. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
autoExp (Automatically Replace Name With Content)	Specifies that the type of the current glossary document entry shall allow the entry to be automatically inserted into the document whenever its name is entered into an application.
bbPlcHdr (Structured Document Tag Placeholder Text)	Specifies that the type of the current glossary document entry shall be structured document tag placeholder text.
formFld (Form Field Help Text)	Specifies that the type of the current glossary document entry shall be form field help text.
none (No Type)	Specifies no type information for the current glossary document entry.
normal (Normal)	Specifies that the type of the current glossary document entry shall be normal (i.e. a regular glossary document entry).
speller (AutoCorrect Entry)	Specifies that the type of the current glossary document entry shall be associated with the spelling and grammar tools.
toolbar (AutoText User Interface Entry)	Specifies that the type of the current glossary document entry shall be associated with a special grouping of entries associated with a single piece of user interface.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DocPartType](#)) is located in §A.1. *end note*]

17.18.18 ST_DocProtect (Document Protection Types)

This simple type specifies the possible set of editing restrictions which can be enforced on a given WordprocessingML document.

[*Example:* Consider a WordprocessingML document that contains the following WordprocessingML specifying that hosting applications must enforce read-only protection for a given document:

```
<w:documentProtection w:edit="readOnly" w:enforcement="1" />
```

The edit attribute has a value of readOnly and an enforcement attribute with a value of 1, specifying that read-only document protection must be enforced on the given document. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
comments (Allow Editing of Comments)	Specifies that the edits made to this document shall be restricted to: <ul style="list-style-type: none"> The insertion and deletion of comments within the document The editing of regions delimited by range permissions which match the editing rights of the user account which is performing the editing.
forms (Allow Editing of Form Fields)	Specifies that the edits made to this document shall be restricted to: <ul style="list-style-type: none"> The editing of form fields in sections where the formProt element (§17.6.6) has a value of true. No restrictions in sections where the formProt element has a value of false.
none (No Editing Restrictions)	Specifies that no editing restrictions have been applied to the document.
readOnly (Allow No Editing)	Specifies that the edits made to this document shall be restricted to: <ul style="list-style-type: none"> The editing of regions delimited by range permissions which match the editing rights of the user account which is performing the editing.
trackedChanges (Allow Editing With Revision Tracking)	Specifies that the edits made to this document shall be tracked as revisions. This value shall imply the presence of the trackRevisions element (§17.15.1.89), and applications shall not allow that element's state to be changed to false.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DocProtect](#)) is located in §A.1. *end note*]

17.18.19 ST_DocType (Document Classification Values)

This simple type specifies the possible classifications that can be used for a WordprocessingML document.

The following possible values for this type are reserved:

Value	Description
eMail (E-Mail Message)	Specifies that this document shall be classified as an e-mail message.
letter (Letter)	Specifies that this document shall be classified as a letter.
notSpecified (Default Document)	Specifies that this document shall be classified as a default document.

[*Example:* Consider a set of WordprocessingML documents which should be classified as 'letters'. This classification would be specified using the following WordprocessingML in the document settings of these documents:

```
<w:documentType w:val="letter" />
```

The documentType element's val attribute is equal to letter, specifying that the hosting application must apply the behaviors it has specified for letters to the given WordprocessingML document. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DocType](#)) is located in §A.1. *end note*]

17.18.20 ST_DropCap (Text Frame Drop Cap Location)

This simple type specifies the location which shall be used to position a drop cap text frame when the contents of that text frame are displayed in the anchor paragraph at display time.

[*Note:* Although a drop cap is simply a text frame, the values of this simple type are used to determine how the cap should be positioned relative to the following non-frame paragraph in relative terms (see enumeration values), rather than relying on absolute sizing. *end note*]

[*Example:* Consider the following paragraph containing a text frame which should be positioned as a drop cap:

```
<w:p>
  <w:pPr>
    <w:framePr w:dropCap="margin" w:lines="3" w:hSpace="432" w:wrap="around"
    w:vAnchor="text" w:hAnchor="page" />
  </w:pPr>
</w:p>
```

```

</w:pPr>
<w:r>
  <w:t>A</w:t>
</w:r>
</w:p>

```

The dropCap attribute specifies a value of margin, so this drop cap is placed outside of the text margin before the start of the current text. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
drop (Drop Cap Inside Margin)	Specifies that the drop cap text frame shall be positioned inside the text margin on the anchor paragraph when this text frame is displayed in the document.
margin (Drop Cap Outside Margin)	Specifies that the drop cap text frame shall be positioned outside of the text margin on the anchor paragraph when this text frame is displayed in the document.
none (Not Drop Cap)	Specifies that this text frame is not a drop cap text frame.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DropCap](#)) is located in §A.1. *end note*]

17.18.21 ST_EdGrp (Range Permission Editing Group)

This simple type specifies the set of possible aliases (or editing groups) which can be used as aliases to determine if the current user shall be allowed to edit a single range defined by a range permission within a document. This mechanism simply provides a set of predefined editing groups which can be associated with user accounts by applications in any desired manner.

[Example: Consider a range permission defined as follows:

```

<w:permStart w:id="0" w:edGrp="editors" ... />
...
<w:permEnd w:id="0" />

```

The edGrp attribute value of editors specifies that only user(s) who the current application associates with the editors group must be allowed to edit the contents between the start and end markers when document protection is being enforced. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
administrators (Administrator Group)	Specifies that users associated with the Administrators group shall be allowed to edit range permissions using this editing group when document protection is enabled.
contributors (Contributors Group)	Specifies that users associated with the Contributors group shall be allowed to edit range permissions using this editing group when document protection is enabled.
current (Current Group)	Specifies that users associated with the Current group shall be allowed to edit range permissions using this editing group when document protection is enabled.
editors (Editors Group)	Specifies that users associated with the Editors group shall be allowed to edit range permissions using this editing group when document protection is enabled.
everyone (All Users Have Editing Permissions)	Specifies that all users that open the document shall be allowed to edit range permissions using this editing group when document protection is enabled.
none (No Users Have Editing Permissions)	Specifies that none of the users that open the document shall be allowed to edit range permissions using this editing group when document protection is enabled.
owners (Owners Group)	Specifies that users associated with the Owners group shall be allowed to edit range permissions using this editing group when document protection is enabled.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_EdGrp](#)) is located in §A.1. *end note*]

17.18.22 ST_EdnPos (Endnote Positioning Location)

This simple type specifies the possible positions of endnotes in a document.

[Example: Consider a document in which endnotes must be positioned at the end of the section. The section properties for this section must be declared as follows:

```
<w:settings>
  <w:endnotePr>
    <w:pos w:val="sectEnd" />
  </w:endnotePr>
  ...
</w:settings>
```

The val attribute is sectEnd, therefore the position of endnotes is specified to be at the end of the section. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
docEnd (Endnotes Positioned at End of Document)	Specifies that all endnotes shall be placed at the end of the current document, regardless of which section they are referenced within.
sectEnd (Endnotes Positioned at End of Section)	Specifies that endnotes shall be placed at the end of the section in which they are referenced. An endnote which is never referenced is never displayed.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_EdnPos](#)) is located in §A.1. *end note]*

17.18.23 ST_EighthPointMeasure (Measurement in Eighths of a Point)

This simple type specifies that its contents contain a positive whole number, whose contents consist of a measurement in eighths of a point (equivalent to 1/576th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[Example: Consider an attribute value of 24 whose simple type is ST_EighthPointMeasure. This attribute value specifies a size in eighths of a point (24 eighths of a point = 3 points). *end example]*

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber datatype (§22.9.2.16).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_EighthPointMeasure](#)) is located in §A.1. *end note]*

17.18.24 ST_Em (Emphasis Mark Type)

This simple type specifies possible types of emphasis marks which can be displayed for each non-space character in a run. This character is rendered above or below the character glyph as specified by enumeration values.

[Example: Consider a run of text which must have a dot underneath each character as an emphasis mark. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:em w:val="dot"/>
</w:rPr>
```

This run explicitly declares that the emphasis mark type is dot, so the contents of this run has a dot emphasis mark above each character. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
circle (Circle Emphasis Mark Above Characters)	Specifies that the emphasis mark is a circle character which shall be rendered above each character in this run using Unicode character 0x02DA when the language of the text is not Traditional Chinese. For that language Unicode character 0x3002 shall be used instead, positioned beneath the characters.
comma (Comma Emphasis Mark Above Characters)	Specifies that the emphasis mark is a comma character which shall be rendered above each character in this run, using Unicode character 0x3001.
dot (Dot Emphasis Mark Above Characters)	Specifies that the emphasis mark is a dot character which shall be rendered above each character in this run using Unicode character 0x02D9 whenever the language of the text is not Japanese, Simplified Chinese, or Traditional Chinese. For those three languages, the emphasis mark shall be rendered as follows: <ul style="list-style-type: none"> • Japanese = Unicode character 0xFF0E (dot beneath characters) • Simplified Chinese = Unicode character 0xFF0E (dot beneath characters) • Traditional Chinese = Unicode character 0x2027
none (No Emphasis Mark)	Specifies that there shall be no emphasis mark for any character in this run.
underDot (Dot Emphasis Mark Below Characters)	Specifies that the emphasis mark is a dot character which shall be rendered below each character in this run using Unicode character 0xFF0E.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Em](#)) is located in §A.1. *end note*]

17.18.25 ST_FFHelpTextVal (Help Text Value)

This simple type specifies the format of optional help text which can be associated with the parent form field.

[*Example:* Consider the following WordprocessingML fragment for a drop-down list form field:

```

<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:helpText w:type="text" w:val="Example help text."/>
      <w:ddList>
        ...
      </w:ddList>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMDROPDOWN </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

The `helpText` element specifies the help text for the parent form field - in this case, literal help text consisting of the string `Example help text.` *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 256 Unicode scalar values.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FFHelpTextVal](#)) is located in §A.1. *end note*]

17.18.26 ST_FFName (Form Field Name Value)

This simple type specifies the format of the name which can be associated with the parent form field.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```

<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:name w:val="FirstName" />
      <w:textInput>
        ...
      </w:textInput>
    </w:ffData>
  </w:fldChar>
</w:r>

```

```

<w:r>
  <w:instrText> FORMTEXT </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r>
  <w:t>1</w:t>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

The name element specifies that the name of the current form field is `FirstName`. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 65 Unicode scalar values.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_FFName](#)) is located in §A.1. *end note*]

17.18.27 ST_FFStatusTextVal (Status Text Value)

This simple type specifies the format of optional status text which can be associated with the parent form field.

[Example: Consider the following WordprocessingML fragment for a drop-down list form field:

```

<w:r>
  <w:fldChar w:fldCharType="begin">
    <w:ffData>
      <w:statusText w:type="text" w:val="Example status text."/>
      <w:ddlList>
        ...
      </w:ddlList>
    </w:ffData>
  </w:fldChar>
</w:r>
<w:r>
  <w:instrText> FORMDROPDOWN </w:instrText>
</w:r>
<w:r>
  <w:fldChar w:fldCharType="end"/>
</w:r>

```

The `statusText` element specifies the status text for the parent form field - in this case, literal text consisting of the string `Example status text`. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 140 characters.

[*Note:* The W3C XML Schema definition of this simple type's content model (`ST_FFStatusTextVal`) is located in §A.1. *end note*]

17.18.28 ST_FFTextType (Text Box Form Field Type Values)

This simple type specifies the possible types of the contents of a text box form field.

[*Example:* Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The type element specifies that the contents of this form field should be handled as a number by an application. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
calculated (Field Calculation)	Specifies that the contents of this text box form field shall be the result of the field calculation specified by the corresponding default element (§17.16.10). This field should not be directly editable when the editing of form fields is enabled.
currentDate (Current Date Display)	Specifies that the contents of this text box form field shall be the current date when the field is updated.
currentTime (Current Time Display)	Specifies that the contents of this text box form field shall be the current time when the field is updated.
date (Date)	Specifies that the contents of this text box form field shall be treated as a date.
number (Number)	Specifies that the contents of this text box form field

Enumeration Value	Description
	shall be treated as a number value.
regular (Text Box)	Specifies that this text form field is a plain text field (no additional content restrictions).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FFTextType](#)) is located in §A.1. *end note*]

17.18.29 ST_FldCharType (Complex Field Character Type)

This simple type specifies the possible values for the type of a single complex field character in the document.

[*Example*: Consider the following WordprocessingML for a complex field character:

```
...
<w:fldChar w:fldCharType="separate" />
...
```

The type attribute value of `separate` specifies that this is a complex field separator character; therefore it is being used to separate the field codes from the field contents in a complex field. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
begin (Start Character)	Specifies that the character is a start character, which defines the start of a complex field.
end (End Character)	Specifies that the character is an end character, which defines the end of a complex field.
separate (Separator Character)	Specifies that the character is a separator character, which defines the end of the field codes and the start of the field result for a complex field.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FldCharType](#)) is located in §A.1. *end note*]

17.18.30 ST_FontFamily (Font Family Value)

This simple type specifies possible values for the font family of a font.

[*Example*: Consider the following information stored for a single font:

```
<w:font w:name="Calibri">
  <w:family w:val="swiss" />
  ...
</w:font>
```

The family element specifies via its val attribute value of *swiss* that this font is part of the Swiss family. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (No Font Family)	Specifies that information about a font's font family does not exist.
decorative (Novelty Font)	Specifies the Novelty font family.
modern (Monospace Font)	Specifies a monospace font with or without serifs (monospace fonts are usually modern).
roman (Proportional Font With Serifs)	Specifies a proportional font with serifs.
script (Script Font)	Specifies a script font designed to mimic the appearance of handwriting.
swiss (Proportional Font Without Serifs)	Specifies a proportional font without serifs.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FontFamily](#)) is located in §A.1. *end note*]

17.18.31 ST_FrameLayout (Frameset Layout Order)

This simple type specifies the possible order in which the frames (and nested framesets) in a frameset can be displayed. When a frameset is created, it can only contain frames which are stacked in one direction:

- Vertically (one on top of another)
- Horizontally (one next to another)

[*Example*: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
  <w:frameLayout w:val="rows" />
  <w:frame>
    ...
  </w:frame>
  <w:frameset>
    <w:frameLayout w:val="cols" />
    <w:frame>
      ...
    </w:frame>
    <w:frame>
      ...
    </w:frame>
  </w:frameset>
</w:frameset>
```

The frameLayout element specifies that the outer frameset is consists of the single frame and the child frameset stacked vertically, and an inner nested frameset consisting of two frames stacked horizontally. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cols (Stack Frames Horizontally)	Specifies that the frames in the frameset shall be

Enumeration Value	Description
	stacked horizontally next to each other in left to right order.
none (Do Not Stack Frames)	Specifies that no frames shall be shown in the frameset.
rows (Stack Frames Vertically)	Specifies that the frames in the frameset shall be stacked vertically next to each other in top to bottom order.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FrameLayout](#)) is located in §A.1.
end note]

17.18.32 ST_FrameScrollbar (Frame Scrollbar Visibility)

This simple type specifies the possible settings for when a scrollbar shall be visible for the contents of the current frame.

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```

<w:frameset>
...
</w:frameset>

```

```
...
<w:frame>
  <w:name w:val="Frame 2" />
  <w:scrollbar w:val="auto" />
</w:frame>
...
</w:frameset>
</w:frameset>
```

The scrollbar element has a val attribute of auto, which specifies that the frame must only display a scrollbar when it is needed to display all of its content. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatically Show Scrollbar As Needed)	Specifies that the scrollbar for a frame shall automatically be hidden and/or displayed as needed based on the length of the contents.
off (Never Show Scrollbar)	Specifies that the scrollbar for a frame shall always be hidden.
on (Always Show Scrollbar)	Specifies that the scrollbar for a frame shall always be displayed (even when not needed).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FrameScrollbar](#)) is located in §A.1. *end note*]

17.18.33 ST_FtnEdn (Footnote or Endnote Type)

This simple type specifies the possible types of footnotes and endnotes which can be specified in a WordprocessingML document.

[*Example*: Consider a document with a single footnote at the bottom of the first page. This footnote must be separated from the text by the separator footnote (the footnote explicitly used to separate text from the footnote list (circled in red below):

This footnote type would be declared as follows in the WordprocessingML:

```
<w:footnote w:type="separator" w:id="0">
...
</w:footnote>
```

In this example, the footnote has an attribute value of `separator`, specifies when this footnote must be used. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
continuationNotice (Continuation Notice Separator)	<p>Specifies that this footnote or endnote is a continuation notice footnote or endnote.</p> <p><i>Continuation notice footnotes and endnotes</i> are used when the footnotes or endnotes exceed the length allowed on a single page. When this happens, this footnote or endnote shall be placed on the bottom of each page where the note shall continue to indicate that fact to the reader.</p>
continuationSeparator (Continuation Separator)	<p>Specifies that this footnote or endnote is a continuation separator footnote or endnote.</p> <p><i>Continuation separator footnotes and endnotes</i> are used when the footnotes or endnotes exceed the length allowed on a single page. When this happens, this footnote or endnote shall be placed between the main text contents and the continued footnotes/endnotes on all subsequent pages of the</p>

Enumeration Value	Description
	document.
normal (Normal Footnote/Endnote)	Specifies that this footnote or endnote is a normal footnote or endnote, and can be referenced by main document content.
separator (Separator)	<p>Specifies that this footnote or endnote is a separator footnote or endnote.</p> <p><i>Separator footnotes and endnotes</i> are used to indicate the separation between the main document's content and the footnotes or endnotes to indicate that fact to the reader.</p>

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FtnEdn](#)) is located in §A.1. *end note*]

17.18.34 ST_FtnPos (Footnote Positioning Location)

This simple type specifies the position of footnotes in the document.

[*Example:* Consider a document in which footnotes must be positioned beneath their text. The footnote properties for this document must be declared as follows:

```
<w:sectPr>
  <w:footnotePr>
    <w:pos w:val="beneathText" />
  </w:footnotePr>
  ...
</w:sectPr>
```

The val attribute is beneathText, therefore the position of footnotes is specified to be beneath the page's text. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
beneathText (Footnotes Positioned Beneath Text)	Specifies that footnotes shall be displayed immediately after the last line of text on the page on which the note reference mark appears.
docEnd (Footnotes Positioned At End of Document)	Specifies that all footnotes shall be placed at the end of the current document, regardless of which section they are referenced within.
pageBottom (Footnotes Positioned at Page Bottom)	Specifies that footnotes shall be displayed at the

Enumeration Value	Description
	bottom margin of the page on which the note reference mark appears.
sectEnd (Footnotes Positioned At End of Section)	<p>Specifies that all footnotes shall be placed at the end of the section in which they are referenced.</p> <p>A footnote which is never referenced is never displayed.</p>

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_FtnPos](#)) is located in §A.1. *end note*]

17.18.35 ST_HAnchor (Horizontal Anchor Location)

This simple type specifies the horizontal position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final horizontal position of the object in the document.

[*Example:* Consider a text frame which should be positioned one inch to the right of its column in a left-to-right document. This text frame would be specified using the following WordprocessingML:

```
<w:pPr>
  <w:framePr ... w:x="1440" w:hAnchor="margin" />
</w:pPr>
```

These frame horizontal anchor properties specify that they are relative to the anchor paragraph's margin (the text margin excluding any indents). *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
margin (Relative To Margin)	<p>Specifies that the parent object shall be horizontally anchored to the text margins.</p> <p>This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the text margin.</p>
page (Relative to Page)	<p>Specifies that the parent object shall be horizontally anchored to the page edge.</p> <p>This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the page.</p>

Enumeration Value	Description
text (Relative to Text Extents)	<p>Specifies that the parent object shall be horizontally anchored to the text extents.</p> <p>This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the text in the anchor paragraph (including text indentations on that paragraph within the text margins).</p>

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_HAnchor](#)) is located in §A.1. *end note*]

17.18.36 ST_HdrFtr (Header or Footer Type)

This simple type specifies the possible types of headers and footers which can be specified for a given header or footer reference in a document. This value determines the page(s) on which the current header or footer shall be displayed.

[*Example:* Consider a WordprocessingML section which specifies the following header reference:

```
<w:headerReference r:id="rId10" w:type="first" />
```

The resulting section must use the specified header part for the first page. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
default (Default Header or Footer)	<p>Specifies that this header or footer shall appear on every page in this section which is not overridden with a specific even or first page header/footer.</p> <p>In a section with all three types specified, this header/footer type shall be used on all odd numbered pages (counting from the first page in the section, not the section numbering).</p>
even (Even Numbered Pages Only)	<p>Specifies that this header or footer shall appear on all even numbered pages in this section (counting from the first page in the section, not the section numbering).</p> <p>The appearance of this header or footer is contingent on the setting of the evenAndOddHeaders element (§17.10.1).</p>

Enumeration Value	Description
first (First Page Only)	Specifies that this header or footer shall appear on the first page in this section. The appearance of this header or footer is contingent on the setting of the titlePg element (§17.10.6).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_HdrFtr](#)) is located in §A.1. *end note*]

17.18.37 ST_HeightRule (Height Rule)

This simple type specifies the logic which shall be used to calculate the height of the parent object when it is displayed in the document.

[Example: Consider the following table row:

```
<w:trPr>
  <w:trHeight w:hRule="atLeast" w:val="2189" />
</w:trPr>
```

The val attribute specifies a value of 2189 twentieths of a point, so this table row is a minimum of 2189 twentieths of a point high regardless of its contents, since its hRule value is set to atLeast. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
atLeast (Minimum Height)	Specifies that the height of the parent object shall be at least the value specified, but can be expanded to fit its content as needed.
auto (Determine Height Based On Contents)	Specifies that the height of the parent object shall be automatically determined by the size of its contents, with no predetermined minimum or maximum size.
exact (Exact Height)	Specifies that the height of the parent object shall be exactly the value specified, regardless of the size of the contents of the object. If the contents are too large for the specified height, then they shall be clipped.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_HeightRule](#)) is located in §A.1. *end note*]

17.18.38 ST_HexColor (Color Value)

This simple type specifies that its contents contain one of the following:

- A color values in RRGGBB format (ST_HexColorRGB)
- The enumeration value auto (ST_HexColorAuto)

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider a border color with value auto, as follows:

```
<w:bottom ... w:color="auto"/>
```

This color therefore can be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. *end example*]

This simple type is a union of the following types:

- The ST_HexColorRGB simple type (§22.9.2.5).
- The ST_HexColorAuto simple type (§17.18.39).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_HexColor](#)) is located in §A.1. *end note*]

17.18.39 ST_HexColorAuto ('Automatic' Color Value)

This simple type specifies that its contents contain the enumeration value auto. This value shall be used to specify an automatically determined color value, the meaning of which is interpreted based on the context of the parent XML element.

[*Example*: Consider a border color with value auto, as follows:

```
<w:bottom ... w:color="auto"/>
```

This color therefore can be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatically Determined Color)	Specifies that the color value can automatically be defined when this document is processed, based on the display context.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_HexColorAuto](#)) is located in §A.1. *end note*]

17.18.40 ST_HighlightColor (Text Highlight Colors)

This simple type specifies the possible values for highlighting colors which can be applied as a background behind the contents of a text run.

[*Example:* Consider a run within a paragraph which has yellow text highlighting using the highlight element. This formatting is specified using the following WordprocessingML:

```
<w:rPr>
  <w:highlight w:val="yellow" />
</w:rPr>
```

The resulting run would have yellow highlighting visible over its contents. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
black (Black Highlighting Color)	Specifies that the text highlighting color for this run shall be black. The hexadecimal RGB value for this setting shall be 000000.
blue (Blue Highlighting Color)	Specifies that the text highlighting color for this run shall be blue. The hexadecimal RGB value for this setting shall be 0000FF.
cyan (Cyan Highlighting Color)	Specifies that the text highlighting color for this run shall be cyan. The hexadecimal RGB value for this setting shall be 00FFFF.
darkBlue (Dark Blue Highlighting Color)	Specifies that the text highlighting color for this run shall be dark blue. The hexadecimal RGB value for this setting shall be 00008B.
darkCyan (Dark Cyan Highlighting Color)	Specifies that the text highlighting color for this run shall be dark cyan. The hexadecimal RGB value for this setting shall be 008B8B.
darkGray (Dark Gray Highlighting Color)	Specifies that the text highlighting color for this run shall be dark gray.

Enumeration Value	Description
	The hexadecimal RGB value for this setting shall be A9A9A9.
darkGreen (Dark Green Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark green.</p> <p>The hexadecimal RGB value for this setting shall be 006400.</p>
darkMagenta (Dark Magenta Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark magenta.</p> <p>The hexadecimal RGB value for this setting shall be 800080.</p>
darkRed (Dark Red Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark red.</p> <p>The hexadecimal RGB value for this setting shall be 8B0000.</p>
darkYellow (Dark Yellow Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark cyan.</p> <p>The hexadecimal RGB value for this setting shall be 808000.</p>
green (Green Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be green.</p> <p>The hexadecimal RGB value for this setting shall be 00FF00.</p>
lightGray (Light Gray Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be light gray.</p> <p>The hexadecimal RGB value for this setting shall be D3D3D3.</p>
magenta (Magenta Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be magenta.</p> <p>The hexadecimal RGB value for this setting shall be FF00FF.</p>
none (No Text Highlighting)	Specifies that this text run shall have no text highlighting applied to its contents.
red (Red Highlighting Color)	Specifies that the text highlighting color for this run shall be red.

Enumeration Value	Description
	The hexadecimal RGB value for this setting shall be FF0000.
white (White Highlighting Color)	Specifies that the text highlighting color for this run shall be white. The hexadecimal RGB value for this setting shall be FFFFFFFF.
yellow (Yellow Highlighting Color)	Specifies that the text highlighting color for this run shall be yellow. The hexadecimal RGB value for this setting shall be FFFF00.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_HighlightColor](#)) is located in §A.1. *end note*]

17.18.41 ST_Hint (Font Type Hint)

Specifies the font type which shall be used to format any ambiguous characters in the current run.

There are certain characters which are not explicitly stored in the document, and can be mapped into multiple categories of the four mentioned above. This attribute shall be used to arbitrate that conflict, and determine how ambiguities in this run shall be handled. [*Note*: This is primarily used to handle the formatting on the paragraph mark glyph, and other characters that are not stored as text in the WordprocessingML document. *end note*]

[*Example*: Consider the run representing the paragraph mark glyph, which is not stored as a physical character. Since this could therefore be formatted with any of the fonts specified for the run, this ambiguity is resolved using the following WordprocessingML:

```
<w:pPr>
  <w:rPr>
    <w:rFonts w:hint="eastAsia" />
  </w:rPr>
</w:pPr>
```

The hint attribute specifies that the run must use the eastAsia font (theme or not, whichever is in use for East Asian text) as applied for this run. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
cs (Complex Script Font)	Specifies that the font hint for this text run shall be to use the Complex Script font defined on the run via the style hierarchy.
default (High ANSI Font)	Specifies that the font hint for this text run shall be to use the High ANSI font defined on the run via the style hierarchy.
eastAsia (East Asian Font)	Specifies that the font hint for this text run shall be to use the East Asian font defined on the run via the style hierarchy.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Hint](#)) is located in §A.1. *end note*]

17.18.42 ST_HpsMeasure (Measurement in Half-Points)

This simple type specifies that its contents contain either:

- A positive whole number, whose contents consist of a measurement in half-points (equivalent to 1/144th of an inch), or
- A positive decimal number immediately followed by a unit identifier.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of 72 whose simple type is ST_HpsMeasure. This attribute value specifies a size of one-half of an inch or 36 points (72 halves of a point = 36 points = 0.5 inches). *end example*]

[*Example:* Consider an attribute value of 12.7mm whose type is ST_HpsMeasure. This attribute value specifies a size of 0.0127 meter or one-half of an inch or 36 points. *end example*]

This simple type is a union of the following types:

- The ST_PositiveUniversalMeasure simple type (§22.9.2.12).
- The ST_UnsignedDecimalNumber simple type (§22.9.2.16).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_HpsMeasure](#)) is located in §A.1. *end note*]

17.18.43 ST_InfoTextType (Help or Status Text Type)

This simple type specifies the possible values for the type of help or status text which can be associated with a form field.

[*Example:* Consider the following WordprocessingML fragment for a form field:

```
<w:ffData>
  <w:helpText w:type="text" w:val="Example help text." />
</w:ffData>
```

The type attribute has a value of text, which specifies that the text in the val attribute is the literal help text for this form field. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
autoText (Glossary Document Entry)	Specifies that the value specified by the parent XML element's val attribute shall be interpreted as the name of a glossary document entry whose contents contain the help or status text.
text (Literal Text)	Specifies that the value specified by the parent XML element's val attribute shall be interpreted as the literal text for the help or status text.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_InfoTextType](#)) is located in §A.1. *end note*]

17.18.44 ST_Jc (Horizontal Alignment Type)

This simple type specifies all types of alignment which are available to be applied to objects in a WordprocessingML document.

[*Example:* Consider a paragraph which is aligned to the trailing edge of text flow. This requirement would be specified as follows in the WordprocessingML markup:

```
<w:pPr>
  <w:jc w:val="end" />
</w:pPr>
```

The val attribute's value of end specifies that the content must be right-aligned on the page for a left-to-right paragraph, and left justified for a right-to-left paragraph. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
both (Justified)	Specifies that the text shall be justified between both of the text margins in the document. The lowKashida setting shall also be applied to Arabic

Enumeration Value	Description
	<p>text when this setting is applied.</p> <p>This type of justification shall only affect the inter-word spacing on each line, and not the inter-character spacing between each word when justifying its contents.</p>
center (Align Center)	Specifies that the text shall be centered on the line between both of the text margins in the document.
distribute (Distribute All Characters Equally)	<p>Specifies that the text shall be justified between both of the text margins in the document.</p> <p>This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line.</p>
end (Align to Trailing Edge)	Specifies that the text shall be aligned on the trailing text margin in the document (right for left-to-right paragraphs; left for right-to-left paragraphs).
highKashida (Widest Kashida Length)	<p>Specifies that the kashida length for text in the current paragraph shall be extended to its widest possible length.</p> <p>This setting only affects <i>kashidas</i>, which are special characters used to extend the joiner between two Arabic characters. [Note: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. <i>end note</i>]</p> <p>[Example: The following example illustrates each type of kashida:</p> <p>Low: هَذَا إِمْتِيحَان</p> <p>Medium: هَذَا إِمْتِيحَان</p> <p>High: هَذَا إِمْتِيحَان</p> <p><i>end example</i>]</p>
lowKashida (Low Kashida Length)	Specifies that the kashida length for text in the current paragraph shall be extended to a slightly longer length. This setting shall also be applied to Arabic text when

Enumeration Value	Description
	<p>the both setting is applied.</p> <p>This setting only affects <i>kashidas</i>, which are special characters used to extend the joiner between two Arabic characters. [Note: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. <i>end note</i>]</p> <p>[Example: The following example illustrates each type of kashida:</p> <p>Low: هذا إمتيحيان</p> <p>Medium: هذا إمتيحيان</p> <p>High: هذا إمتيحيان</p> <p><i>end example]</i></p>
mediumKashida (Medium Kashida Length)	<p>Specifies that the kashida length for text in the current paragraph shall be extended to a medium length determined by the consumer.</p> <p>This setting only affects <i>kashidas</i>, which are special characters used to extend the joiner between two Arabic characters. [Note: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. <i>end note</i>]</p> <p>[Example: The following example illustrates each type of kashida:</p> <p>Low: هذا إمتيحيان</p> <p>Medium: هذا إمتيحيان</p> <p>High: هذا إمتيحيان</p> <p><i>end example]</i></p>
numTab (Align to List Tab)	<p>Specifies that the text shall be aligned to the list tab, which is the tab stop after the numbering for the current paragraph.</p> <p>If the current paragraph has no numbering, this setting has no effect.</p>

Enumeration Value	Description
	[<i>Note</i> : This justification style is used for backwards compatibility with earlier word processors, and should be avoided in favor of hanging paragraph indentation. <i>end note</i>]
start (Align To Leading Edge)	Specifies that the text shall be aligned on the leading text margin in the document (left for left-to-right paragraphs; right for right-to-left paragraphs).
thaiDistribute (Thai Language Justification)	<p>Specifies that the text shall be justified with an optimization for Thai.</p> <p>This type of justification shall affect both the inter-word spacing on each line, and the inter-character spacing between each word when justifying its contents, unlike both justification. This difference is created in that the inter-character space is increased slightly in order to ensure that the additional space created by the justification is reduced.</p> <p>[<i>Note</i>: This setting is different from justification in that the reduction in inter-character spacing would be inappropriate in Western languages. <i>end note</i>]</p>

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Jc](#)) is located in §A.1. *end note*]

17.18.45 ST_JcTable (Table Alignment Type)

This simple type specifies all types of alignment that are available to be applied to tables in a WordprocessingML document.

[*Example*: Consider a table row that is right aligned. This requirement would be specified as follows in the WordprocessingML markup:

```
<w:trPr>
  <w:jc w:val="end" />
</w:trPr>
```

The val attribute's value of end specifies that the table is right-aligned on the page (assuming the table is aligned left-to-right. *end example*)

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Align Center)	Specifies that the table shall be centered on the line between both of the text margins in the document.
end (Align to Trailing Edge)	Specifies that the table shall be aligned to the trailing edge of the text flow – the right text margin (for a left-to-right table); or the left text margin (for a right-to-left table) in the document. (See §17.4.1)
start (Align to Starting Edge)	Specifies that the table shall be aligned to the leading edge of the text flow – the left text margin (for a left-to-right table); or the right text margin (for a right-to-left table) in the document. (See §17.4.1)

[Note: The W3C XML Schema definition of this simple type's content model ([ST_JcTable](#)) is located in §A.1. *end note*]

17.18.46 ST_LevelSuffix (Content Between Numbering Symbol and Paragraph Text)

This simple type specifies the types of content which shall be possible between a given numbering level's text and the text of every numbered paragraph which references that numbering level.

[Example: Consider the numbered paragraph below:

1. Test

In this example, a space exists between the numbering symbol 1. and the numbered paragraph text Test. The space would be specified in WordprocessingML as follows:

```
<w:lvl w:ilvl="0">
...
  <w:suff w:val="space" />
...
</w:lvl>
```

The suff element with an attribute value of space specifies that the character between the numbering's level text and the paragraph text must be a space. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
nothing (Nothing Between Numbering and Text)	Specifies that no character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.

Enumeration Value	Description
space (Space Between Numbering and Text)	Specifies that a space character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.
tab (Tab Between Numbering and Text)	<p>Specifies that a tab character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.</p> <p>This tab shall follow normal tab stop rules to determine its length.</p>

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_LevelSuffix](#)) is located in §A.1. *end note*]

17.18.47 ST_LineNumberRestart (Line Numbering Restart Position)

This simple type specifies when the line numbering in the parent section shall be reset to its restart value. The line numbering increments for each line (even if the line number itself is not displayed) until it reaches the restart point specified by this element.

[*Example*: Consider the line numbering used on each page of this document, which specifies that line numbering must restart at the top of each new page. This line numbering setting would be defined using the following WordprocessingML:

```
<w:lnNumType w:restart="newPage" ... />
```

The restart attribute is of type ST_LineNumberRestart, and a value of newPage specifies that the line numbers must restart at the top of each page to the value specified by the start attribute. In this case, newPage is the default, so this value could have been omitted entirely. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
continuous (Continue Line Numbering From Previous Section)	Specifies that line numbering for the parent section shall continue from the line numbering from the end of the previous section, if any.
newPage (Restart Line Numbering on Each Page)	Specifies that line numbering for the parent section shall restart to the starting value whenever a new page is displayed.
newSection (Restart Line Numbering for Each Section)	Specifies that line numbering for the parent section shall restart to the starting value whenever the parent

Enumeration Value	Description
	begins.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_LineNumberRestart](#)) is located in §A.1. *end note*]

17.18.48 ST_LineSpacingRule (Line Spacing Rule)

This simple type specifies the logic which shall be used to calculate the line spacing of the parent object when it is displayed in the document.

[*Example:* Consider the following WordprocessingML paragraph:

```
<w:pPr>
  <w:spacing w:line="276" w:lineRule="auto" />
</w:pPr>
```

This paragraph specifies that the spacing in each line should be automatically calculated using 1.15 times (276 divided by 240) the normal single spacing calculation. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
atLeast (Minimum Line Height)	Specifies that the height of the line shall be at least the value specified, but might be expanded to fit its content as needed.
auto (Automatically Determined Line Height)	Specifies that the line spacing of the parent object shall be automatically determined by the size of its contents, with no predetermined minimum or maximum size.
exact (Exact Line Height)	Specifies that the height of the line shall be exactly the value specified, regardless of the size of the contents of the contents. If the contents are too large for the specified height, then they shall be clipped as necessary.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_LineSpacingRule](#)) is located in §A.1. *end note*]

17.18.49 ST_Lock (Locking Types)

This simple type specifies the possible set of locking behaviors that can be applied to the contents of the nearest ancestor structured document tag when the contents of this document are edited by an application (whether through a user interface or directly).

[*Example:* Consider the following plain text structured document tag:

```
<w:sdt>
  <w:sdtPr>
    <w:lock w:val="sdtLocked"/>
    ...
    <w:text/>
  </w:sdtPr>
  ...
</w:sdt>
```

This plain text structured document tag's properties contain a lock element, specifying locking behaviors for the structured document tag. Since the locking val attribute value is sdtLocked, this locking setting must specify that the contents of the structured document tag can be edited, but the structured document tag itself must not be deleted from the document. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
contentLocked (Contents Cannot Be Edited At Runtime)	Specifies that the editing restriction applied to the nearest ancestor structured document tag shall be as follows: <ul style="list-style-type: none"> This structured document tag's contents shall not be editable This structured document tag can be deleted in its entirety (but only entirely, no sub portion of it can be deleted)
sdtContentLocked (Contents Cannot Be Edited At Runtime And SDT Cannot Be Deleted)	Specifies that the editing restriction applied to the nearest ancestor structured document tag shall be as follows: <ul style="list-style-type: none"> This structured document tag's contents shall not be editable This structured document tag shall not be deleted in its entirety
sdtLocked (SDT Cannot Be Deleted)	Specifies that the editing restriction applied to the nearest ancestor structured document tag shall be as follows: <ul style="list-style-type: none"> This structured document tag's contents shall

Enumeration Value	Description
	be editable <ul style="list-style-type: none"> This structured document tag shall not be deleted in its entirety
unlocked (No Locking)	Specifies that no special locking behaviors shall be applied to the nearest ancestor structured document tag. The default behaviors as specified on the lock element (§17.5.2.23) shall be used.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Lock](#)) is located in §A.1. *end note*]

17.18.50 ST_LongHexNumber (Eight Digit Hexadecimal Value)

This simple type specifies a number value specified as a four octet (eight digit) hexadecimal number, whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following value for a node of simple type ST_LongHexNumber: 00BE2C6C.

This value is permitted, as it contains four hexadecimal octets, each an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 8 hexadecimal digit(s).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LongHexNumber](#)) is located in §A.1. *end note*]

17.18.51 ST_MacroName (Script Subroutine Name Value)

This simple type specifies a subroutine in a scripting language which can be executed based on the context of the parent XML element. The language and location of this subroutine can be determined using any method desired by an application.

[Example: Consider the following WordprocessingML fragment for the properties of a form field:

```
<w:ffData>
  <w:exitMacro w:val="TestExitFunction" />
</w:ffData>
```

The `exitMacro` element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called `TestExitFunction` when the contents of the form field are exited. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 33 Unicode scalar values.

[*Note*: The W3C XML Schema definition of this simple type's content model (`ST_MacroName`) is located in §A.1. *end note*]

17.18.52 `ST_MailMergeDataType` (Mail Merge Data Source Type Values)

This simple type specifies the data source access mechanism used to connect to the data source for a mail merge. This setting is purely a suggestion of the data source access mechanism which shall be used, and can be ignored in favor of an alternative mechanism if one is present.

Although this any access mechanism value can be specified, the following values are reserved:

Value	Description
native (Office Data Source Object Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source via the data stored in the Office Data Source Object (ODSO) interface (§17.14.25).
odbc (Open Database Connectivity Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source via the Open Database Connectivity interface.
query (Query Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source using an external query file.
soap (SOAP Data Source)	Specifies that a given WordprocessingML document has been connected to a data source using SOAP.
spreadsheet (Spreadsheet Data Source)	Specifies that a given WordprocessingML document has been connected to a spreadsheet.
textFile (Text File Data Source)	Specifies that a given WordprocessingML document has been connected to a text file.
xQuery (Text File Data Source)	Specifies that a given WordprocessingML document has been connected to an external data source via XQuery.
xmlFile (XML File Data Source)	Specifies that a given WordprocessingML document has been connected to an XML file.

[*Example*: Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:dataType w:val="odbc" />
```

The dataType element's val attribute is equal to odbc, specifying that the given merged WordprocessingML document has been connected to an external data source via the Open Database Connectivity interface. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_MailMergeDataType](#)) is located in §A.1. *end note*]

17.18.53 ST_MailMergeDest (Merged Document Destination Types)

This simple type specifies the possible results which can be generated when a mail merge is carried out on a given WordprocessingML source document. In other words, this element is used to specify what is to be done with the merged documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.

[*Example*: Consider a WordprocessingML source document containing the following WordprocessingML:

```
<w:mailMerge>
  <w:destination w:val="newDocument" />
  ...
</w:mailMerge>
```

The destination element's val attribute is set to newDocument, specifying that when the mail merge is carried out, the source document must be used to generate a specified number of new documents, which can be handled as appropriate. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
email (Send Merged Documents as E-mail Messages)	Specifies that conforming hosting applications shall generate emails using the documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.
fax (Send Merged Documents as Faxes)	Specifies that conforming hosting applications shall generate faxes using the documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.
newDocument (Send Merged Documents to New)	Specifies that conforming hosting applications shall

Enumeration Value	Description
Documents)	generate new documents by populating the fields within a given merged WordprocessingML document with data from the specified external data source.
printer (Send Merged Documents to Printer)	Specifies that conforming hosting applications shall print the documents that result from populating the fields within a given merged WordprocessingML document with external data from the specified external data source.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MailMergeDest](#)) is located in §A.1. *end note*]

17.18.54 ST_MailMergeDocType (Source Document Types)

This simple types specifies the possible types for a given WordprocessingML source document.

[Example: Consider the WordprocessingML below:

```
<w:mailMerge>
  <w:mainDocumentType w:val="formLetters" />
  ...
</w:mailMerge>
```

In this example, the source document is of the `formLetters` type, as specified by the `mainDocumentType` element's `val` attribute being equal to `formLetters`. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
catalog (Catalog Source Document)	Specifies that the mail merge source document is of the catalog type.
email (E-Mail Source Document)	Specifies that the mail merge source document is of the e-mail message type.
envelopes (Envelope Source Document)	Specifies that the mail merge source document is of the envelope type.
fax (Fax Source Document)	Specifies that the mail merge source document is of the fax type.
formLetters (Form Letter Source Document)	Specifies that the mail merge source document is of the form letter type.
mailingLabels (Mailing Label Source Document)	Specifies that the mail merge source document is of the mailing label type.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_MailMergeDocType](#)) is located in §A.1. *end note*]

17.18.55 ST_MailMergeOdsoFMDFieldType (Merge Field Mapping Types)

This simple types specifies the possible types used to indicate if a given mail merge field has been mapped to a column in the given external data source.

[*Example:* Consider the WordprocessingML below:

```
<w:odso>
...
<w:fieldMapData>
  <w:type w:val="dbColumn" />
  <w:name w:val="Country" />
  <w:mappedName w:val="Country or Region" />
  <w:column w:val="9" />
...
</w:fieldMapData>
</w:odso>
```

In this example, the country column within the given external data source must be mapped to the mail merge field Country or Region, as specified by the type element's val attribute being equal to dbColumn. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dbColumn (Field Mapping to Data Source Column)	Specifies that the mail merge field has been mapped to a column in the given external data source.
null (Field Not Mapped)	Specifies that the mail merge field has not been mapped to a column in the given external data source.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_MailMergeOdsoFMDFieldType](#)) is located in §A.1. *end note*]

17.18.56 ST_MailMergeSourceType (Mail Merge ODSO Data Source Types)

This simple type specifies the type of external data source to be connected to via as part of the ODSO connection information for this mail merge. This setting is purely a suggestion of the data source type which is being used for this mail merge, and can be ignored in favor of an alternative mechanism if one is present.

[*Example:* Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:type w:val="database" />
```

The type element's val attribute is equal to database, specifying that the given merged WordprocessingML document has been connected to an external data source via the ODSO settings, and that the resulting data source was a database. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
addressBook (Address Book Data Source)	Specifies that a given merged WordprocessingML document has been connected to an address book of contacts.
database (Database Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database.
document1 (Alternate Document Format Data Source)	Specifies that a given merged WordprocessingML document has been connected to another document format supported by the producing application. The format of this document is application-defined and outside the scope of ECMA-376.
document2 (Alternate Document Format Data Source Two)	Specifies that a given merged WordprocessingML document has been connected to another document format supported by the producing application. The format of this document is application-defined and outside the scope of ECMA-376.
email (E-Mail Program Data Source)	Specifies that a given merged WordprocessingML document has been connected to an e-mail application.
legacy (Legacy Document Format Data Source)	Specifies that a given merged WordprocessingML document has been connected to a legacy document format supported by the producing application. The format of this legacy document is application-defined and outside the scope of ECMA-376.
master (Aggregate Data Source)	Specifies that a given merged WordprocessingML document has been connected to a data source which aggregates other data sources.
native (Native Data Source)	Specifies that a given merged WordprocessingML document has been connected to another document format native to the producing application. The format of this document is application-defined and outside the scope of ECMA-376.
text (Text File Data Source)	Specifies that a given merged WordprocessingML

Enumeration Value	Description
	document has been connected to a text file.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_MailMergeSourceType](#)) is located in §A.1. *end note*]

17.18.57 ST_Merge (Merged Cell Type)

This element specifies the way in which a cell shall be included in a merged group of cells (horizontally or vertically) within the parent table.

[*Example:* Consider a table with three rows and two columns with the last column completely vertically merged:

The second cell in the first row starts a vertical merge that is completed in the last cell, resulting in the following WordprocessingML:

```
<w:tbl>
...
<w:tr>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    <w:tcPr>
      <w:vMerge w:val="restart"/>
    </w:tcPr>
    ...
  </w:tc>
</w:tr>
```

```
<w:tr>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    <w:tcPr>
      <w:vMerge w:val="continue"/>
    </w:tcPr>
    ...
  </w:tc>
</w:tr>
<w:tr>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    ...
  </w:tc>
  <w:tc>
    <w:tcPr>
      <w:vMerge w:val="continue"/>
    </w:tcPr>
    ...

```

The val attribute of type ST_Merge on the vMerge element defines the cells that are vertically merged, and how each cell is merged together. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
continue (Continue Merged Region)	<p>Specifies that the current cell continues a previously existing merged group of cells in the parent table.</p> <p>If the previous cell in the document (horizontally or vertically) does not either begin or continue a set of merged cells, then this value shall be ignored (i.e. a group of merged cells shall start with a merge whose</p>

Enumeration Value	Description
	ST_Merge value is restart).
restart (Start/Restart Merged Region)	<p>Specifies that the current cell starts (or restarts) a group of merged cells in the parent table.</p> <p>After this value, all following cells which have a value of continue shall be merged into this merged cell group.</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Merge](#)) is located in §A.1. *end note*]

17.18.58 ST_MultiLevelType (Numbering Definition Type)

This simple type specifies the possible types of numbering which can be defined by a given abstract numbering type. This information shall only be used by a consumer to determine user interface behaviors for this numbering definition, and shall not be used to limit the behavior of the list (i.e. a list with multiple levels marked as `singleLevel` shall not be prevented from using levels 2 through 9).

[Example: Consider the WordprocessingML below:

```
<w:abstractNum w:abstractNumId="8">
...
  <w:multiLevelType w:val="singleLevel" />
...
</w:abstractNum>
```

This abstract numbering definition is specified to be of the `singleLevel` type by the `multiLevelType` element. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
hybridMultilevel (Hybrid Multilevel Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a multiple levels, each of a potentially different kind (bullets vs. level text).
multilevel (Multilevel Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a multiple levels, each of the same kind (bullets vs. level text).
singleLevel (Single Level Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a single level only.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_MultiLevelType](#)) is located in §A.1. *end note*]

17.18.59 ST_NumberFormat (Numbering Format)

This simple type specifies the numbering format which shall be used for a group of automatically numbered objects,

[*Example:* A value of lowerLetter for page numbering indicates that a consumer must use lowercase letters for each page in this section: a,b,c... *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
aiueo (AIUEO Order Half-Width Katakana)	<p>Specifies that the sequence shall consist of one or more occurrences of a single half-width Katakana character from the set listed below, in the traditional a-i-u-e-o order.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–46 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–46 is U+FF71–U+FF9C, U+FF66, and U+FF9D, respectively.</p> <p>For values greater than 46, the sequence begins again, iterating through the same 46 values, repeating this pattern as necessary.</p> <p>[<i>Example:</i> The numbering for these items should be represented by the following pattern: ア, イ, ウ, ..., ヲ, ン, ア, イ, ウ, ... <i>end example</i>]</p>
aiueoFullWidth (AIUEO Order Full-Width Katakana)	<p>Specifies that the sequence shall consist of one or more occurrences of a single full-width katakana character from the set listed below, in the traditional a-i-u-e-o order.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–46 and then repeats those same characters using the logic defined below to construct all other values.</p>

Enumeration Value	Description
	<p>The set of characters used by this numbering format for values 1–46 is U+30A2, U+30A4, U+30A6, U+30A8, U+30AA, U+30AB, U+30AD, U+30AF, U+30B1, U+30B3, U+30B5, U+30B7, U+30B9, U+30BB, U+30BD, U+30BF, U+30C1, U+30C4, U+30C6, U+30C8, U+30CA, U+30CB, U+30CC, U+30CD, U+30CE, U+30CF, U+30D2, U+30D5, U+30D8, U+30DB, U+30DE, U+30DF, U+30E0, U+30E1, U+30E2, U+30E4, U+30E6, U+30E8, U+30E9, U+30EA, U+30EB, U+30EC, U+30ED, U+30EF, U+30F0, U+30F1, U+30F2, and U+30F3, respectively.</p> <p>For values greater than 46, the sequence begins again, iterating through the same 46 values, repeating this pattern as necessary.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: ア, イ, ウ, ..., ヲ, シ, アア, イイ, ウウ, ... <i>end example</i>]</p>
arabicAbjad (Arabic Abjad Numerals)	<p>Specifies that the sequence shall consist of one or more occurrences of a single ascending Abjad numeral from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–28 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–28 is U+0623, U+0628, U+062C, U+062F, U+0647, U+0648, U+0632, U+062D, U+0637, U+064A, U+0643, U+0644, U+0645, U+0646, U+0633, U+0639, U+0641, U+0635, U+0642, U+0631, U+0634, U+062A, U+062B, U+062E, U+0630, U+0636, U+063A, and U+0638, respectively.</p> <p>For values greater than 28, the text displayed shall be constructed as follows:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (28) from the value until the result is equal to or less than the size of the set. 2. The remainder determines which character to use from the set above, and that character is written once and then written once and then

Enumeration Value	Description
	<p>written once and then repeated the number of times the size of the set was subtracted from the original value.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: أ, ب, ج, ..., ظ, غ, أأ, ب ب, ج ج, ..., ظ ظ, غ غ, أأ, ب ب, ج ج, ... <i>end example</i>]</p>
arabicAlpha (Arabic Alphabet)	<p>Specifies that the sequence shall consist of one or more occurrences of a single character in the Arabic alphabet from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–28 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–28 is U+0623, U+0628, U+062A, U+062B, U+062C, U+062D, U+062E, U+062F, U+0630, U+0631, U+0632, U+0633, U+0634, U+0635, U+0636, U+0637, U+0638, U+0639, U+063A, U+0641, U+0642, U+0643, U+0644, U+0645, U+0646, U+0647, U+0648, and U+064A, respectively.</p> <p>For values greater than 28, the text displayed shall be constructed as follows:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (28) from the value until the result is equal to or less than the size of the set. 2. The remainder determines which character to use from the set above, and that character is written once and then written once and then written once and then repeated the number of times the size of the set was subtracted from the original value. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: أ, ب, ت, ..., و, ي, أ, ب, ت, ..., و, ي, أأ, ب ب, ج ج, ..., ت ت, ت ت, ... <i>end example</i>]</p>
bahtText (Thai Baht Text)	<p>Specifies that the sequence shall consist of a numeric value from the Thai counting system, with บาทถ้วน</p>

Enumeration Value	Description
	<p>appended to the result.</p> <p>The portion of the sequence which is prepended to the static text shall be the equivalent value in the thaiCounting format, defined below.</p> <p>[<i>Example</i>: The values for the items should be represented by the following pattern: หนึ่งบาทถ้วน, สองบาทถ้วน, สามบาทถ้วน. <i>end example</i>]</p>
bullet (Bullet)	<p>Specifies that the sequence shall consist of the bullet character defined by the lvlText element (§17.9.11).</p> <p>[<i>Example</i>: • <i>end example</i>]</p>
cardinalText (Cardinal Text)	<p>Specifies that the sequence shall consist of cardinal text of the run language.</p> <p>This sequence is a set of strings each of which is the textual representation, in the language of the lang element (§17.3.2.20), of a different unique position in that sequence.</p> <p>[<i>Example</i>: The numbering for the items in Spanish should be represented by the following pattern: Uno, Dos, Tres, ..., Nueve, Diez, Once, ... Diecinueve, Veinte, Veintiuno, ... <i>end example</i>]</p>
chicago (Chicago Manual of Style)	<p>Specifies that the sequence shall consist of one or more occurrences of a single character from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–4 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–4 is U+002A, U+2020, U+2021, and U+00A7, respectively.</p> <p>For values greater than 4, the text displayed shall be constructed as follows:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (4) from the value until the result is equal to or less than the size of the set. 2. The remainder determines which character to

Enumeration Value	Description
	<p>use from the set above, and that character is written once and then written once and then repeated the number of times the size of the set was subtracted from the original value.</p> <p><i>[Example: The first nine items in this format are: *, †, ‡, §, **, ††, ‡‡, §§, ***. end example]</i></p>
chineseCounting (Chinese Counting System)	<p>Specifies that the sequence shall consist of one or more occurrences of a single ascending number from the Chinese counting system, from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–10 and then repeats those same characters using the logic defined below to construct all other values. ○ represents the number zero.</p> <p>The set of characters used by this numbering format for values 0–10 is U+25CB, U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, U+4E5D, and U+5341, respectively.</p> <p>For values greater than 10, the text displayed shall be constructed as follows:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol that represents the remainder. If the quotient is less than 10, then write 十 to the left of the symbol, which represents the remainder. 2. Divide the quotient of the previous division by 10, and write the symbol, which represents the remainder, to the left of the existing characters. 3. Repeat step 2 until the remaining value is equal to zero. <p><i>[Example: The numbering for the items should be represented by the following pattern: 一, 二, 三, ..., 九, 十, 十一, 十二, ..., 十九, 二十, 二十一, ..., 九十九, 一〇〇, 一〇一, ... end example]</i></p>
chineseCountingThousand (Chinese Counting Thousand System)	<p>Specifies that the sequence shall consist of one or more occurrences of a single sequential number from the Chinese counting thousand system, from the set listed below.</p>

Enumeration Value	Description																				
	<p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–10, 100, 1,000, and 10,000, and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format is U+96F6, U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, U+4E5D, U+5341, U+767E, U+5343, and U+4E07.</p> <p>To construct a value that is beyond the set, but less than one hundred thousand, work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> 1. Create as many groups as possible that contain ten thousand in each group. <ul style="list-style-type: none"> • Write down the symbol representing that value (1–9): <table border="1" data-bbox="964 957 1312 1461"> <thead> <tr> <th>Digit</th><th>Character</th></tr> </thead> <tbody> <tr><td>1</td><td>一 (U+4E00)</td></tr> <tr><td>2</td><td>二 (U+4E8C)</td></tr> <tr><td>3</td><td>三 (U+4E09)</td></tr> <tr><td>4</td><td>四 (U+56DB)</td></tr> <tr><td>5</td><td>五 (U+4E94)</td></tr> <tr><td>6</td><td>六 (U+516D)</td></tr> <tr><td>7</td><td>七 (U+4E03)</td></tr> <tr><td>8</td><td>八 (U+516B)</td></tr> <tr><td>9</td><td>九 (U+4E5D)</td></tr> </tbody> </table> • If no groups are formed, do not write any characters. • If groups were formed, write down the symbol representing ten thousand: 万 2. Repeat step 1 for groups of one thousand (千) using the corresponding symbol to indicate the groups (so five thousand would be 五千). <ul style="list-style-type: none"> • If the original value was between 10,000 and 100,000 and if no groups are formed (and the number is not a multiple of 	Digit	Character	1	一 (U+4E00)	2	二 (U+4E8C)	3	三 (U+4E09)	4	四 (U+56DB)	5	五 (U+4E94)	6	六 (U+516D)	7	七 (U+4E03)	8	八 (U+516B)	9	九 (U+4E5D)
Digit	Character																				
1	一 (U+4E00)																				
2	二 (U+4E8C)																				
3	三 (U+4E09)																				
4	四 (U+56DB)																				
5	五 (U+4E94)																				
6	六 (U+516D)																				
7	七 (U+4E03)																				
8	八 (U+516B)																				
9	九 (U+4E5D)																				

Enumeration Value	Description
	<p>thousand) write the symbol 零 instead (so ten thousand and five would be 一万零五)</p> <ol style="list-style-type: none"> 3. Repeat step 1 for groups of one hundred (百) using the corresponding symbol to indicate the groups (so five hundred would be 五百). <ul style="list-style-type: none"> • If the original value was between 1,000 and 10,000 and if no groups are formed (and the number is not a multiple of hundred) write the symbol 零 instead (so one thousand and five would be 一千零五) 4. Repeat step 1 for groups of ten (十) using the corresponding symbol to indicate the groups (so fifty would be 五十). <ul style="list-style-type: none"> • If the original value was between 100 and 1000 and if no groups are formed (and the number is not a multiple of ten) write the symbol 零 instead (so one hundred and five would be 一百零五) 5. Write down the symbol for the remaining number. <p>If the number is larger than one hundred thousand but less than one hundred million, perform the cycle for the numbers above one thousand, but use two characters to represent each group. So, for example, groups of one hundred thousand are represented as ten ten thousands (一十万). An additional symbol for counting groups is introduced at one hundred million (because 10 million is one thousand ten thousands).</p> <p>[Example: The numbering for the items should be represented by the following pattern: 一, 二, 三, ..., 八, 九, 一十, 一十一, 一十二, ..., 一十九, 二十, 二十一, ..., 九九, 一百, 一百一, ... end example]</p>
chineseLegalSimplified (Chinese Legal Simplified Format)	<p>Specifies that the sequence shall consist of one or more occurrences of a single sequential number from the Chinese simplified legal format, from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those are combined with additional characters to represent the corresponding power of ten.</p>

Enumeration Value	Description																				
	<p>The set of characters used by this numbering format for values 1–10 is U+96F6, U+58F9, U+8D30, U+53C1, U+8086, U+4F0D, U+9646, U+67D2, U+634C, and U+7396, respectively.</p> <p>To construct a number that is less than one hundred thousand, work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> Create as many groups as possible that contain ten thousand in each group. <ul style="list-style-type: none"> Write down the symbol representing that value (1–9): <table data-bbox="964 743 1256 1247"> <tr> <th>Digit</th><th>Character</th></tr> <tr> <td>1</td><td>壹(U+58F9)</td></tr> <tr> <td>2</td><td>貳 (U+8D30)</td></tr> <tr> <td>3</td><td>叁 (U+53C1)</td></tr> <tr> <td>4</td><td>肆(U+8086)</td></tr> <tr> <td>5</td><td>伍 (U+4F0D)</td></tr> <tr> <td>6</td><td>陆 (U+9646)</td></tr> <tr> <td>7</td><td>柒 (U+67D2)</td></tr> <tr> <td>8</td><td>捌 (U+634C)</td></tr> <tr> <td>9</td><td>玖 (U+7396)</td></tr> </table> If no groups are formed, do not write any characters. If groups were formed, write down the symbol representing ten thousand: 万 Repeat step 1 for groups of one thousand (仟) using the corresponding symbol to indicate the groups (so five thousand would be 伍仟). <ul style="list-style-type: none"> If the original value was between 10,000 and 100,000 and If no groups are formed (and the number is not a multiple of thousand) write the symbol 零 instead (so ten thousand and five would be 壹万零伍) Repeat step 1 for groups of one hundred (佰) using the corresponding symbol to indicate the groups (so five hundred would be 伍佰). <ul style="list-style-type: none"> If the original value was between 1,000 and 10,000 and if no groups are formed 	Digit	Character	1	壹(U+58F9)	2	貳 (U+8D30)	3	叁 (U+53C1)	4	肆(U+8086)	5	伍 (U+4F0D)	6	陆 (U+9646)	7	柒 (U+67D2)	8	捌 (U+634C)	9	玖 (U+7396)

Enumeration Value	Description
	<p>(and the number is not a multiple of hundred) write the symbol 零 instead (so one thousand and five would be 壹仟零伍)</p> <ol style="list-style-type: none"> 4. Repeat step 1 for groups of ten (拾) using the corresponding symbol to indicate the groups (so fifty would be 伍拾). <ul style="list-style-type: none"> • If the original value was between 100 and 1000 and If no groups are formed (and the number is not a multiple of ten) write the symbol 零 instead (so one hundred and five would be 壹佰零伍) 5. Write down the symbol for the remaining number. <p>If the number is larger than one hundred thousand but less than one hundred million, perform the cycle for the numbers above one thousand but use two characters to represent each group. So, for example, groups of one million are represented as one hundred ten thousands (佰万). An additional symbol for counting groups is introduced at one hundred million (because 10 million is one thousand ten thousands).</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 壹, 貳叁, ..., 捌, 玖, 壹拾, 壹拾壹, 壹拾貳, ..., 壹拾玖, 貳拾, 貳拾壹, ..., 玖玖, 壹佰, 壹佰零壹, ... <i>end example</i>]</p>
chosung (Korean Chosung Numbering)	<p>Specifies that the sequence shall consist of one or more occurrences of a single sequential number from the Korean Chosung format, from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–14 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–14 is U+3131, U+3134, U+3137, U+3139, U+3141, U+3142, U+3145, U+3147, U+3148, U+314A, U+314B, U+314C, U+314D, and U+314E, respectively.</p> <p>For values greater than 14, the text displayed shall be constructed as follows:</p>

Enumeration Value	Description
	<ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (14) from the value until the result is equal to or less than the size of the set. 2. The remainder determines which character to use from the set above, and that character is written once and then repeated the number of times the size of the set was subtracted from the original value. <p>[<i>Example: The numbering for the items should be represented by the following pattern: ㄱ, ㄴ, ㄷ, ..., ㅈ, ㅊ, ㅋ, ㄴ, ㄷ, ㄷ, ... end example</i>]</p>
custom (Custom Defined Number Format)	Specifies a custom number format using the parent element's attribute to specify a number format using the mechanism defined by the XSLT format attribute.
decimal (Decimal Numbers)	<p>Specifies that the sequence shall consist of decimal numbering.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 0 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+0030–U+0039, respectively.</p> <p>Continue the sequence by using the following steps:</p> <ol style="list-style-type: none"> 1. Increment the rightmost position. 2. Every time the end of the set is reached, for a given position, increment the position to the immediate left (if there is no position to the immediate left, create a new position and start the sequence of the new position at 1) and reset the current position to 0. <p>[<i>Example: The numbering for the items should be represented by the following pattern: 1, 2, 3, ..., 8, 9, 10, 11, 12, ..., 18, 19, 20, 21, ... end example</i>]</p>
decimalEnclosedCircle (Decimal Numbers Enclosed in a Circle)	Specifies that the sequence shall consist of decimal numbering enclosed in a circle, using the enclosed character.

Enumeration Value	Description
	<p>This system uses a set of characters to represent the numbers 1–20.</p> <p>The set of characters used by this numbering format for values 1–20 is U+2460–U+2473, respectively.</p> <p>For values greater than the size of the set, the items fall back to the decimal format.</p> <p><i>[Example: The numbering for the items should be represented by the following pattern: ①, ②, ③, ..., ⑱, ⑳, 21, ... end example]</i></p>
decimalEnclosedCircleChinese (Decimal Numbers Enclosed in a Circle)	Identical to decimalEnclosedCircle.
decimalEnclosedFullstop (Decimal Numbers Followed by a Period)	<p>Specifies that the sequence shall consist of decimal numbering followed by a period, using the appropriate character, as described below.</p> <p>This system uses a set of characters to represent the numbers 1–20.</p> <p>The set of characters used by this numbering format for values 1–20 is U+2488–U+249B, respectively.</p> <p>For values greater than the size of the set, the items fall back to the decimal format.</p> <p><i>[Example: The numbering for the items should be represented by the following pattern: 1., 2., 3., ..., 19., 20., 21, ... end example]</i></p>
decimalEnclosedParen (Decimal Numbers Enclosed in Parenthesis)	<p>Specifies that the sequence shall consist of decimal numbering enclosed in parentheses, using the appropriate character, as described below.</p> <p>This system uses a set of characters to represent the numbers 1–20.</p> <p>The set of characters used by this numbering format for values 1–20 is U+2474–U+2487, respectively.</p> <p>For values greater than the size of the set, the items fall back to the decimal format.</p> <p><i>[Example: The numbering for the items should be represented by the following pattern: (1), (2), (3), ..., (19), (20), 21, 22, ... end example]</i></p>

Enumeration Value	Description
decimalFullWidth (Full Width Arabic Numerals)	<p>Specifies that the sequence shall consist of full-width Arabic numbering.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 0 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+FF10–U+FF19, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p><i>[Example: The numbering for the items should be represented by the following pattern: 1 , 2 , 3 , ..., 8 , 9 , 1 0 , 1 1 , 1 2 , ..., 1 8 , 1 9 , 2 0 , 2 1 , ... end example]</i></p>
decimalHalfWidth (Half Width Arabic Numerals)	<p>Specifies that the sequence shall consist of half-width Arabic numbering.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 0 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+0030–U+0039, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p>

Enumeration Value	Description
	<ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 1, 2, 3, ..., 8, 9, 10, 11, 12, ..., 18, 19, 20, 21, ... <i>end example</i>]</p>
decimalZero (Initial Zero Arabic Numerals)	<p>Specifies that the sequence shall consist of Arabic numbering with a zero added to numbers one through nine.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of paired characters (zero followed by an additional symbol) that represent positions 1–9 and then those same characters are combined with each other to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+0030–U+0039.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 01, 02, 03, ..., 08, 09, 10, 11, 12, ..., 18, 19, 20, 21, 22, ..., 98, 99, 100, 101, ... <i>end example</i>]</p>
dollarText (Dollar Text)	<p>Specifies that the sequence shall consist of a cardinal text value of the run language, with "and 00/100" (also in the run language) appended to the result.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: The latter text is fixed because values in numbering sequences are integer-based. <i>end note</i>]</p> <p>The cardinal text value which is prepended to the static text shall be the equivalent value in the cardinalText format, defined below.</p> <p>[<i>Example</i>: one and 00/100, two and 00/100, three and 00/100. <i>end example</i>]</p>
ganada (Korean Ganada Numbering)	<p>Specifies that the sequence shall consist of one or more occurrences of a single sequential number from the Korean Ganada format, from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–14 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–14 is U+AC00, U+B098, U+B2E4, U+B77C, U+B9C8, U+BC14, U+C0AC, U+C544, U+C790, U+CC28, U+CE74, U+D0C0, U+D30C, and U+D558, respectively.</p> <p>For values greater than 14, the text displayed shall be constructed as follows:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (14) from the value until the result is equal to or less than the size of the set. 2. The remainder determines which character to use from the set above, and that sequence of character is repeated the number of times the size of the set was subtracted from the original value. <p>[<i>Example</i>: The numbering for the items should be represented by the following pattern: 가, 나, 다, ..., 파, 하, 가가, 나나, 다다, ... <i>end example</i>]</p>
hebrew1 (Hebrew Letters)	<p>Specifies that the sequence shall consist of Hebrew letters from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9, each multiple of ten (less than</p>

Enumeration Value	Description																																						
	<p>100), each multiple of 100 (less than 1000), etc. which are then combined with each other to construct the remaining values.</p> <p>The set of characters used by this numbering format is U+05D0–U+05D9, U+05DB, U+05DC, U+05DE, U+05E0–U+05E2, U+05E4, U+05E6–U+05EA, U+05E7–U+05E9, U+05EA, U+05DA, U+05DD, U+05DF, U+05E3, and U+05E5, respectively.</p> <p>To construct the text for any value, convert it from its decimal equivalent following these steps (writing right to left):</p> <ol style="list-style-type: none"> 1. Replace the thousands digit with the appropriate symbol: <table data-bbox="922 814 1224 1327"> <tr> <th>Digit</th><th>Symbol</th></tr> <tr> <td>1</td><td>𐤀 (U+05D0)</td></tr> <tr> <td>2</td><td>𐤁 (U+05D1)</td></tr> <tr> <td>3</td><td>𐤂 (U+05D2)</td></tr> <tr> <td>4</td><td>𐤃 (U+05D3)</td></tr> <tr> <td>5</td><td>𐤄 (U+05D4)</td></tr> <tr> <td>6</td><td>𐤅 (U+05D5)</td></tr> <tr> <td>7</td><td>𐤆 (U+05D6)</td></tr> <tr> <td>8</td><td>𐤇 (U+05D7)</td></tr> <tr> <td>9</td><td>𐤈 (U+05D8)</td></tr> </table> 2. Enumeration Value	Description
	<p>value. If a number spells out a Hebrew word with a negative or positive connotation, the number group can be rearranged.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: א, ב, ג, ... זטז, זי, חי, טי, כ, אכ, ... <i>end example</i>]</p>
hebrew2 (Hebrew Alphabet)	<p>Specifies that the sequence shall consist of the Hebrew alphabet.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–22 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–22 is U+05D0–U+05D9, U+05DB, U+05DC, U+05DE, U+05E0–U+05E2, U+05E4, and U+05E6–U+05EA, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (22) from the value until the result is equal to or less than the size of the set. 2. Write the symbol represented by the result value. 3. Then the ן symbol is repeated (to the right of the first symbol) for each time the size of the set was subtracted from the original value. 4. Reordering a number group does not change its value. If a number spells out a Hebrew word with a negative or positive connotation, the number group can be rearranged. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: א, ב, ג, ..., את, בת, ... <i>end example</i>]</p>
hex (Hexadecimal Numbering)	<p>Specifies that the sequence shall consist of hexadecimal numbering.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that</p>

Enumeration Value	Description
	<p>represent positions 1–15 and then those same characters are combined with each other and 0 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–15 is U+0030–U+0039, and U+0041–U+0046, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 16 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 16 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 1, 2, 3, ..., E, F, 10, 11, 12, ..., 1E, 1F, 20, 21, ... <i>end example</i>]</p>
hindiConsonants (Hindi Consonants)	<p>Specifies that the sequence shall consist of one or more occurrences of a single Hindi consonant from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–18 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–18 is U+0905–U+0914, U+0905 combined with U+0902, and U+0905 combined with U+0903, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (18) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use, and the same character is written once

Enumeration Value	Description
	<p>and then repeated for each time the size of the set was subtracted from the original value.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: अ, आ, इ, ..., अं,अः, अअ, आआ, इइ, ..., अंअं, अःअः, अअअ, आआआ, इइइ, ... <i>end example</i>]</p>
hindiCounting (Hindi Counting System)	<p>Specifies that the sequence shall consist of sequential numbers from the Hindi counting system.</p> <p>This sequence is a set of strings each of which is the full name, in Hindi, of the next value in that sequence.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: एक, दो, तीन, चार, पाँच, छः, सात, आठ, नौ, दस, ... <i>end example</i>]</p>
hindiNumbers (Hindi Numbers)	<p>Specifies that the sequence shall consist of one or more occurrences of a single Hindi number from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and ० (U+0966, which represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 1–9 is U+0967, U+0968, U+0969, U+096A, U+096B, U+096C, U+096D, U+096E, and U+096F, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero.

Enumeration Value	Description
	<p>[<i>Example</i>: The numbering for the items should be represented by the following pattern: १, २, ३, ..., ८, ९, १०, ११, १२, ..., १८, १९, २०, २१, ... <i>end example</i>]</p>
hindiVowels (Hindi Vowels)	<p>Specifies that the sequence shall consist of one or more occurrences of a single Hindi vowel from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–37 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–37 is U+0915–U+0939, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (37) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use, and the same character is written once and then repeated for each time the size of the set was subtracted from the original value. <p>[<i>Example</i>: The numbering for the items should be represented by the following pattern: क, ख, ग, ..., स, ह, कक, खख, गग, ..., सस, हह, ककक, खखख, गगग, ... <i>end example</i>]</p>
ideographDigital (Ideographs)	<p>Specifies that the sequence shall consist of sequential numerical ideographs, using the appropriate character, as described below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 〇 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format</p>

Enumeration Value	Description
	<p>for values 0–9 is U+3007, U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, and U+4E5D, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 一, 二, 三, ..., 八, 九, 一〇, 一一, 一二, ..., 一八, 一九, 二〇, 二一, ... <i>end example</i>]</p>
ideographEnclosedCircle (Ideographs Enclosed in a Circle)	<p>Specifies that the sequence shall consist of sequential numerical ideographs, using the appropriate character, as described below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–10.</p> <p>The set of characters used by this numbering format for values 1–10 is U+3220–U+3229, respectively.</p> <p>For values greater than the size of the set, the items fall back to the decimal format.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: (一), (二), (三), ..., (九), (十), 11,12, ... <i>end example</i>]</p>
ideographLegalTraditional (Traditional Legal Ideograph Format)	<p>Specifies that the sequence shall consist of sequential numerical traditional legal ideographs.</p> <p>This system uses a set of characters to represent the numbers 1–9 and then those are combined with additional characters to represent the corresponding power of ten.</p>

Enumeration Value	Description																				
	<p>The set of characters used by this numbering format is U+58F9, U+8CB3, U+53C3, U+8086, U+4F0D, U+9678, U+67D2, U+634C, U+7396, U+62FE, U+4F70, U+4EDF, and U+842C, respectively.</p> <p>To construct a number that is less than hundred thousand, you work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> 1. Create as many groups as possible that contain ten thousand in each group. <ul style="list-style-type: none"> • Write down the symbol representing that value (1–9): <table border="1" data-bbox="976 709 1274 1213"> <thead> <tr> <th>Digit</th><th>Character</th></tr> </thead> <tbody> <tr><td>1</td><td>壹 (U+58F9)</td></tr> <tr><td>2</td><td>貳 (U+8CB3)</td></tr> <tr><td>3</td><td>參 (U+53C3)</td></tr> <tr><td>4</td><td>肆 (U+8086)</td></tr> <tr><td>5</td><td>伍 (U+4F0D)</td></tr> <tr><td>6</td><td>陸 (U+9678)</td></tr> <tr><td>7</td><td>柒 (U+67D2)</td></tr> <tr><td>8</td><td>捌 (U+634C)</td></tr> <tr><td>9</td><td>玖 (U+7396)</td></tr> </tbody> </table> <ul style="list-style-type: none"> • If no groups are formed, do not write any characters. • If groups were formed, write down the symbol representing ten thousand (the power of ten represented by that position): 萬 2. Repeat this for groups of one thousand (仟), one hundred (佰) and ten (拾) using the corresponding symbol to indicate the groups (so five hundred would be 伍佰 and fifty would be 伍拾). 3. Write down the symbol for the remaining number. <p>If the number is larger than hundred thousand but less than one hundred million, you perform the cycle for the numbers above one thousand but use two characters to represent each group. So, for example,</p>	Digit	Character	1	壹 (U+58F9)	2	貳 (U+8CB3)	3	參 (U+53C3)	4	肆 (U+8086)	5	伍 (U+4F0D)	6	陸 (U+9678)	7	柒 (U+67D2)	8	捌 (U+634C)	9	玖 (U+7396)
Digit	Character																				
1	壹 (U+58F9)																				
2	貳 (U+8CB3)																				
3	參 (U+53C3)																				
4	肆 (U+8086)																				
5	伍 (U+4F0D)																				
6	陸 (U+9678)																				
7	柒 (U+67D2)																				
8	捌 (U+634C)																				
9	玖 (U+7396)																				

Enumeration Value	Description
	<p>groups of one million are represented as one hundred ten thousands (拾萬). An additional symbol for counting groups is introduced at one hundred million (because 10 million is one thousand ten thousands).</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 壹, 貳, 參, ..., 捌, 玖, 壹拾, 壹拾壹, 壹拾貳, ..., 壹拾玖, 貳拾, 貳拾壹, ... <i>end example</i>]</p>
ideographTraditional (Traditional Ideograph Format)	<p>Specifies that the sequence shall consist of sequential numerical traditional ideographs.</p> <p>This system uses a set of characters (elements in the Chinese Sexagenary cycle) to represent the numbers 1–10. For values greater than the size of the set, the items fall back to the decimal format.</p> <p>The set of characters used by this numbering format for values 1–10 is U+7532, U+4E59, U+4E19, U+4E01, U+620A, U+5DF1, U+5E9A, U+8F9B, U+58EC, and U+7678, respectively.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 甲, 乙, 丙, 丁, ..., 壬, 癸, 11, 12, ... <i>end example</i>]</p>
ideographZodiac (Zodiac Ideograph Format)	<p>Specifies that the sequence shall consist of sequential zodiac ideographs.</p> <p>This system uses a set of characters (animals in the Chinese Sexagenary cycle) to represent the numbers 1–12. For values greater than the size of the set, the items fall back to the decimal format.</p> <p>The set of characters used by this numbering format for values 1–12 is U+5B50, U+4E11, U+5BC5, U+536F, U+8FB0, U+5DF3, U+5348, U+672A, U+7533, U+9149, U+620C, and U+4EA5, respectively.</p> <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 子, 丑, 寅, ..., 戌, 亥, 13, 14, ... <i>end example</i>]</p>
ideographZodiacTraditional (Traditional Zodiac Ideograph Format)	<p>Specifies that the sequence shall consist of sequential traditional zodiac ideographs.</p>

Enumeration Value	Description
	<p>This system uses a set of character pairs (all of the element-animal combinations of the Chinese sexagenary cycle) to represent the numbers 1–60 and then those same character pairs are repeated to construct the remaining values.</p> <p>The set of character pairs used by this numbering format for values 1–60 is U+7532, U+5B50; U+4E59, U+4E11; U+4E19, U+5BC5; U+4E01, U+536F; U+620A, U+8FB0; U+5DF1, U+5DF3; U+5E9A, U+5348; U+8F9B, U+672A; U+58EC, U+7533; U+7678, U+9149; U+7532, U+620D; U+4E59, U+4EA5; U+4E19, U+5B50; U+4E01, U+4E11; U+620A, U+5BC5; U+5DF1, U+536F; U+5E9A, U+8FB0; U+8F9B, U+5DF3; U+58EC, U+5348; U+7678, U+672A; U+7532, U+7533; U+4E59, U+9149; U+4E19, U+620D; U+4E01, U+4EA5; U+620A, U+5B50; U+5DF1, U+4E11; U+5E9A, U+5BC5; U+8F9B, U+536F; U+58EC, U+8FB0; U+7678, U+5DF3; U+7532, U+5348; U+4E59, U+672A; U+4E19, U+7533; U+4E01, U+9149; U+620A, U+620D; U+5DF1, U+4EA5; U+5E9A, U+5B50; U+8F9B, U+4E11; U+58EC, U+5BC5; U+7678, U+536F; U+7532, U+8FB0; U+4E59, U+5DF3; U+4E19, U+5348; U+4E01, U+672A; U+620A, U+7533; U+5DF1, U+9149; U+5E9A, U+620D; U+8F9B, U+4EA5; U+58EC, U+5B50; U+7678, U+4E11; U+7532, U+5BC5; U+4E59, U+536F; U+4E19, U+8FB0; U+4E01, U+5DF3; U+620A, U+5348; U+5DF1, U+672A; U+5E9A, U+7533; U+8F9B, U+9149; U+58EC, U+620D; U+7678, U+4EA5, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (60) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character pair to use. <p><i>[Example: The numbering for the items should be represented by the following pattern: 甲子, 乙丑, 丙寅, ..., 壬戌, 癸亥, 甲子, 乙丑, 丙寅, ... end example]</i></p>
iroha (Iroha Ordered Katakana)	<p>Specifies that the sequence shall consist of the iroha.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–48 and then repeats those same</p>

Enumeration Value	Description
	<p>characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–48 is U+FF72, U+FF9B, U+FF8A, U+FF86, U+FF8E, U+FF8D, U+FF84, U+FF81, U+FF98, U+FF87, U+FF99, U+FF66, U+FF9C, U+FF76, U+FF96, U+FF80, U+FF9A, U+FF7F, U+FF82, U+FF88, U+FF85, U+FF97, U+FF91, U+FF73, U+30F0, U+FF89, U+FF75, U+FF78, U+FF94, U+FF8F, U+FF79, U+FF8C, U+FF7A, U+FF74, U+FF83, U+FF71, U+FF7B, U+FF77, U+FF95, U+FF92, U+FF90, U+FF7C, U+30F1, U+FF8B, U+FF93, U+FF7E, U+FF7D, and U+FF9D, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (48) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: い, ぽ, へ, ..., ん, じ, い, ぽ, へ, ... <i>end example</i>]</p>
irohaFullWidth (Full-Width Iroha Ordered Katakana)	<p>Specifies that the sequence shall consist of the full-width forms of the iroha.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–48 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–48 is U+30A4, U+30ED, U+30CF, U+30CB, U+30DB, U+30D8, U+30C8, U+30C1, U+30EA, U+30CC, U+30EB, U+30F2, U+30EF, U+30AB, U+30E8, U+30BF, U+30EC, U+30BD, U+30C4, U+30CD, U+30CA, U+30E9, U+30E0, U+30A6, U+30F0, U+30CE, U+30AA, U+30AF, U+30E4, U+30DE, U+30B1, U+30D5, U+30B3, U+30A8, U+30C6, U+30A2, U+30B5, U+30AD, U+30E6, U+30E1, U+30DF, U+30B7, U+30F1, U+30D2, U+30E2, U+30BB, U+30B9, and U+30F3, respectively.</p>

Enumeration Value	Description																		
	<p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (48) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use. <p>[<i>Example: The numbering for the items should be represented by the following pattern: イ, □, ハ, ..., ス, シ, イ, □, ハ, ... end example</i>]</p>																		
japaneseCounting (Japanese Counting System)	<p>Specifies that the sequence shall consist of sequential numbers from the Japanese counting system.</p> <p>This system uses a set of characters to represent the numbers 1–9 and then those are combined with additional characters to represent the corresponding power of ten.</p> <p>The set of characters used by this numbering format is U+3007, U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, U+4E5D, U+5341, U+5343, and U+767E, respectively.</p> <p>To construct a number that is less than ten thousand, you work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> 1. Create as many groups as possible that contain one thousand in each group. <ul style="list-style-type: none"> • Write down the symbol representing that value (1–9): <table border="1" data-bbox="964 1438 1268 1892"> <thead> <tr> <th>Digit</th><th>Character</th></tr> </thead> <tbody> <tr><td>1</td><td>一 (U+4E00)</td></tr> <tr><td>2</td><td>二 (U+4E8C)</td></tr> <tr><td>3</td><td>三 (U+4E09)</td></tr> <tr><td>4</td><td>四 (U+56DB)</td></tr> <tr><td>5</td><td>五 (U+4E94)</td></tr> <tr><td>6</td><td>六 (U+516D)</td></tr> <tr><td>7</td><td>七 (U+4E03)</td></tr> <tr><td>8</td><td>八 (U+516B)</td></tr> </tbody> </table> 	Digit	Character	1	一 (U+4E00)	2	二 (U+4E8C)	3	三 (U+4E09)	4	四 (U+56DB)	5	五 (U+4E94)	6	六 (U+516D)	7	七 (U+4E03)	8	八 (U+516B)

[Example: For Norwegian (Nyorsk), the following Unicode characters are used by this numbering format: U+0061–U+007A, U+00E6, U+00F8, U+00E5. <i>end example</i>] • When the language in use is based on any other system, the characters U+0061–U+007A are used. <p data-bbox="824 1843 1479 1873">For values greater than the size of the set, the number</p>																								

Enumeration Value	Description
	<p>is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use and the same character is written once and then repeated for each time the size of the set was subtracted from the original value. <p>[<i>Example</i>: For English, the numbering for the items should be represented by the following pattern: a, b, c, ..., y, z, aa, bb, cc, ..., yy, zz, aaa, bbb, ccc, ... <i>end example</i>]</p>
lowerRoman (Lowercase Roman Numerals)	<p>Specifies that the sequence shall consist of lowercase roman numerals.</p> <p>This system uses a set of characters to represent the numbers 1, 5, 10, 50, 100, 500, and 1000 and then those are combined with each other to construct the remaining values.</p> <p>The set of characters used by this numbering format is U+0069, U+0076, U+0078, U+006C, U+0063, U+0064, U+006D, respectively.</p> <p>To construct a number that is outside the set, you work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> 1. Create as many groups as possible that contain one thousand in each group. <ul style="list-style-type: none"> • The symbol representing one thousand (the power of ten represented by that position): m is repeated for the number of groups formed. If no groups are formed, do not write any symbol. 2. Repeat this for groups of nine hundred (cm), five-hundred (d), four-hundred (cd), one-hundred (c), ninety (xc), fifty (l), forty (xl), ten (x), nine (ix), five (v), four (iv) and finally one (i) using the corresponding symbol to indicate the groups (so four-hundred fifty would be cdl and forty-five would be xlv). <p>[<i>Example</i>: The numbering for the items should be</p>

Enumeration Value	Description
	represented by the following pattern: i, ii, iii, iv, ..., xviii, xix, xx, xxi, ... <i>end example</i>]
none (No Numbering)	Specifies that the sequence shall not display any numbering.
numberInDash (Number With Dashes)	<p>Specifies that the sequence shall consist of the Arabic numbering surrounded by hyphen-minus characters (U+002D).</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 0 (U+0030, which represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format is U+002D (-) and, for values 1–9, U+0031–U+0039, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. 4. Place the final number between two dashes. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: - 1 -, - 2 -, - 3 -, ..., - 8 -, - 9 -, - 10 -, - 11 -, - 12 -, ..., - 18 -, - 19 -, - 20 -, - 21 -, ... <i>end example</i>]</p>
ordinal (Ordinal)	<p>Specifies that the sequence shall consist of ordinals of the run language.</p> <p>This sequence is a set of strings each of which is the textual representation, in the language of the lang element (§17.3.2.20), of a different unique position in that sequence.</p> <p>[<i>Example:</i> The numbering for the items in French</p>

Enumeration Value	Description
	<p>should be represented by the following pattern: 1er, 2e, 3e, ..., 9e, 10e, 11e, ... 19e, 20e, 21e, ... <i>end example</i>]</p>
ordinalText (Ordinal Text)	<p>Specifies that the sequence shall consist of ordinal text of the run language.</p> <p>This sequence is a set of strings each of which is the textual representation, in the language of the lang element (§17.3.2.20), of a different unique position in that sequence.</p> <p>[<i>Example:</i> The numbering for the items in German should be represented by the following pattern: Erste, Zweite, Dritte, ..., Neunte, Zehnte, Elfte, ..., Neunzehnte, Zwanzigste, Einundzwanzigste, ... <i>end example</i>]</p>
russianLower (Lowercase Russian Alphabet)	<p>Specifies that the sequence shall consist of one or more occurrences of a single letter of the Russian alphabet in lower case, from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–29 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–29 is U+0430–U+0438, U+043A–U+043F, U+0440–U+0449, U+044B, U+044D, U+044E, and U+044F, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (29) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use and the same character is written once and then repeated for each time the size of the set was subtracted from the original value. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: а, б, в, ..., ю, я, аа, бб, вв, ..., юю, яя, ааа, ббб, ввв, ... <i>end example</i>]</p>

Enumeration Value	Description
russianUpper (Uppercase Russian Alphabet)	<p>Specifies that the sequence shall consist of one or more occurrences of a single letter of the Russian alphabet in upper case, from the set listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–29 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–29 is U+0410–U+0418, U+041A–U+041F, U+0420–U+0429, U+042B, U+042D, U+042E, and U+042F, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (29) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use and the same character is written once and then repeated for each time the size of the set was subtracted from the original value. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: А, Б, В, ..., Ю, Я, АА, ББ, ВВ, ..., ЮЮ, ЯЯ, ААА, БББ, ВВВ, ... <i>end example</i>]</p>
taiwaneseCounting (Taiwanese Counting System)	<p>Specifies that the sequence shall consist of sequential numbers from the Taiwanese counting system.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 〇 (U+25CB, which represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 1–10 is U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, U+4E5D, and U+5341, respectively.</p> <p>For values greater than the size of the set, the number</p>

Enumeration Value	Description								
	<p>is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. <ul style="list-style-type: none"> • If the quotient is less than 10 then write 一 to the left of the symbol, which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing positions. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: 一, 二, 三, ..., 九, 十, 十一, 十二, ..., 十九, 二十, 二十一, ..., 九十九, 一〇〇, 一〇一, ... <i>end example</i>]</p>								
taiwaneseCountingThousand (Taiwanese Counting Thousand System)	<p>Specifies that the sequence shall consist of sequential numbers from the Taiwanese counting thousand system.</p> <p>This system uses a set of characters to represent the numbers 1–10 and then those are combined with additional characters to construct the remaining characters.</p> <p>The set of characters used by this numbering format is U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, U+4E5D, U+842C, U+5343, U+5341, U+767E, and U+96F6.</p> <p>To construct a number that is beyond the set but less than hundred thousand, you work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> 1. Create as many groups as possible that contain ten thousand in each group. <ul style="list-style-type: none"> • Write down the symbol representing that value (1–9): <table border="1" data-bbox="964 1692 1289 1892"> <thead> <tr> <th>Digit</th><th>Character</th></tr> </thead> <tbody> <tr> <td>1</td><td>一 (U+4E00)</td></tr> <tr> <td>2</td><td>二 (U+4E8C)</td></tr> <tr> <td>3</td><td>三 (U+4E09)</td></tr> </tbody> </table> 	Digit	Character	1	一 (U+4E00)	2	二 (U+4E8C)	3	三 (U+4E09)
Digit	Character								
1	一 (U+4E00)								
2	二 (U+4E8C)								
3	三 (U+4E09)								

Enumeration Value	Description												
	<table border="1" data-bbox="966 241 1291 546"> <tr><td>4</td><td>四 (U+56DB)</td></tr> <tr><td>5</td><td>五 (U+4E94)</td></tr> <tr><td>6</td><td>六 (U+516D)</td></tr> <tr><td>7</td><td>七 (U+4E03)</td></tr> <tr><td>8</td><td>八 (U+516B)</td></tr> <tr><td>9</td><td>九 (U+4E5D)</td></tr> </table> <ul style="list-style-type: none"> If no groups are formed, do not write any characters. If groups were formed, write down the symbol representing ten thousand: 萬 <ol style="list-style-type: none"> Repeat step 1 this for groups of one thousand (千) using the corresponding symbol to indicate the groups (so five thousand would be 五千). If the original value was between 10,000 and 100,000 and If no groups are formed (and the number is not a multiple of ten) write the symbol 零 instead (so ten thousand and five would be 一萬零五) Repeat step 1 this for groups of one hundred (百) using the corresponding symbol to indicate the groups (so five hundred would be 五百). The value 10 uses the symbol 十. For all other groups of ten, use the corresponding symbol to indicate the groups (so fifty would be 五十). If the original value was between 100 and 1000 and If no groups are formed (and the number is not a multiple of ten) write the symbol 零 instead (so one hundred and five would be 一百零五) Write down the symbol for the remaining number. <p>If the number is larger than one hundred thousand but less than one hundred million, you perform the cycle for the numbers above one thousand but use two characters to represent each group. So, for example, groups of one million are represented as one hundred ten thousands (十萬). An additional symbol for counting groups is introduced at one hundred million (because 10 million is one thousand ten thousands).</p> <p>[Example: The numbering for the items should be</p>	4	四 (U+56DB)	5	五 (U+4E94)	6	六 (U+516D)	7	七 (U+4E03)	8	八 (U+516B)	9	九 (U+4E5D)
4	四 (U+56DB)												
5	五 (U+4E94)												
6	六 (U+516D)												
7	七 (U+4E03)												
8	八 (U+516B)												
9	九 (U+4E5D)												

Enumeration Value	Description
	represented by the following pattern: 一, 二, 三, ..., 八, 九, 一十, 十一, 十二, ..., 十九, 二十, 二十一, ..., 九九, 一百, 一百零一, ... <i>end example</i>]
taiwaneseDigital (Taiwanese Digital Counting System)	<p>Specifies that the sequence shall consist of sequential numbers from the Taiwanese digital counting system.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and 〇 (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+25CB, U+4E00, U+4E8C, U+4E09, U+56DB, U+4E94, U+516D, U+4E03, U+516B, and U+4E5D, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol which represents the remainder. 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example</i>: The numbering for the items should be represented by the following pattern: 一, 二, ..., 八, 九, 一〇, 一一, 一二, ..., 一八, 一九, 二〇, 二一, ... <i>end example</i>]</p>
thaiCounting (Thai Counting System)	<p>Specifies that the sequence shall consist of sequential numbers from the Thai counting system.</p> <p>This sequence is a set of strings each of which is the full name, in Thai, of the next value in that sequence.</p> <p>[<i>Example</i>: The numbering for the items should be represented by the following pattern: หนึ่ง, สอง, สาม, สี่, ห้า, หก, เจ็ด, แปด, เก้า, สิบ, ... <i>end example</i>]</p>
thaiLetters (Thai Letters)	Specifies that the sequence shall consist of one or more occurrences of a single Thai letter from the set

Enumeration Value	Description
	<p>listed below.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–41 and then repeats those same characters using the logic defined below to construct all other values.</p> <p>The set of characters used by this numbering format for values 1–41 is U+0E01, U+0E02, U+0E04, U+0E07–U+0E23, U+0E25, and U+0E27–U+0E2E, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set (41) from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use and the same character is written once and then repeated for each time the size of the set was subtracted from the original value. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: ก, ข, ค, ..., ฉ, ษ, กก, ขข, คค, ..., ฉฉ, ษษ, กกก, ขขข, คคค, ... <i>end example</i>]</p>
thaiNumbers (Thai Numerals)	<p>Specifies that the sequence shall consist of Thai numerals.</p> <p>To determine the text that is displayed for any value, this sequence specifies a set of characters that represent positions 1–9 and then those same characters are combined with each other and ๐ (represents the number zero) to construct the remaining values.</p> <p>The set of characters used by this numbering format for values 0–9 is U+0E50, U+0E51, U+0E52, U+0E53, U+0E54, U+0E55, U+0E56, U+0E57, U+0E58, and U+0E59, respectively.</p> <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Divide the value by 10 and write the symbol

Enumeration Value	Description
	<p>which represents the remainder.</p> <ol style="list-style-type: none"> 2. Divide the quotient of the previous division by 10 and write the symbol, which represents the remainder, to the left of the existing position. 3. Repeat step 2 until the remaining value is equal to zero. <p>[<i>Example:</i> The numbering for the items should be represented by the following pattern: ௧, ௨, ௩, ..., ௮, ௯, ௧௦, ௧௧, ௧௨, ..., ௧௮, ௧௯, ௨௦, ௨௧, ௨௨, ..., ௨௮, ௨௯, ... <i>end example</i>]</p>
upperLetter (Uppercase Latin Alphabet)	<p>Specifies that the sequence shall consist of one or more occurrences of a single letter of the Latin alphabet in upper case, from the set listed below.</p> <p>This system uses a set of characters to represent the numbers 1 to the length of the language of the alphabet and then those same characters are combined to construct the remaining values.</p> <p>The characters used by this numbering format is determined by using the language of the lang element (§17.3.2.20). Specifically:</p> <ul style="list-style-type: none"> • When the script in use is derived from the Latin alphabet (A–Z), that alphabet is used. [<i>Example:</i> For Norwegian (Norsk), the following Unicode characters are used by this numbering format: U+0041–U+005A, U+00C6, U+00D8, U+00C5. <i>end example</i>] • When the language in use is based on any other system, the characters U+0041–U+005A are used. <p>For values greater than the size of the set, the number is constructed by following these steps:</p> <ol style="list-style-type: none"> 1. Repeatedly subtract the size of the set from the value until the result is equal to or less than the size of the set. 2. The result value determines which character to use, and the same character is written once and then repeated for each time the size of the set was subtracted from the original value.

Enumeration Value	Description
	<p>[<i>Example</i>: For English, the numbering for the items should be represented by the following pattern: A, B, C, ..., Y, Z, AA, BB, CC, ..., YY, ZZ, AAA, BBB, CCC, ... <i>end example</i>]</p>
upperRoman (Uppercase Roman Numerals)	<p>Specifies that the sequence shall consist of uppercase roman numerals.</p> <p>This system uses a set of characters to represent the numbers 1, 5, 10, 50, 100, 500, and 1000 and then those characters are combined with each other to construct the remaining values.</p> <p>The set of characters used by this numbering format is U+0049, U+0056, U+0058, U+004C, U+0043, U+0044, U+004D, respectively.</p> <p>To construct a number that is outside the set, you work from largest groups to smallest following these steps:</p> <ol style="list-style-type: none"> 1. Create as many groups as possible that contain one thousand in each group. <ul style="list-style-type: none"> • The symbol representing one thousand (the power of ten represented by that position): M is repeated for the number of groups formed. If no groups are formed, do not write any symbol. 2. Repeat this for groups of nine hundred (CM), five-hundred (D), four-hundred (CD), one-hundred (C), ninety (XC), fifty (L), forty (XL), ten (X), nine (IX), five (V), four (IV) and finally one (I) using the corresponding symbol to indicate the groups (so four-hundred fifty would be CDL and forty-five would be XLV). <p>[<i>Example</i>: The numbering for the items should be represented by the following pattern: I, II, III, IV, ..., XVIII, XIX, XX, XXI, ... <i>end example</i>]</p>
vietnameseCounting (Vietnamese Numerals)	<p>Specifies that the sequence shall consist of Vietnamese numerals.</p> <p>This sequence is a set of strings each of which is the full name, in Vietnamese, of the next value in that sequence.</p>

Enumeration Value	Description
	[<i>Example: một, hai, ba, bốn, năm, sáu, bảy, tám, chín, mười. end example</i>]

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_NumberFormat](#)) is located in §A.1. end note*]

17.18.60 ST_ObjectDrawAspect (Embedded Object Representations)

This simple type specifies the ways in which embedded objects are displayed in the application.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
content (Snapshot)	The object's presentation is a picture of the contained document (provided by the object's server application).
icon (Icon)	The object's presentation is an icon.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_ObjectDrawAspect](#)) is located in §A.1. end note*]

17.18.61 ST_ObjectUpdateMode (Embedded Object Update Modes)

This simple type specifies how an embedded object is updated.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
always (Server Application Update)	The object is updated whenever the object's server application indicates there is new data available.
onCall (User Update)	The object is updated when the user chooses to update it.

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_ObjectUpdateMode](#)) is located in §A.1. end note*]

17.18.62 ST_PageBorderDisplay (Page Border Display Options)

This simple type specifies the pages in the parent section on which the page border shall be printed.

[*Example:* Consider a section in a document for which the page border must only be printed on the first page. This setting is specified using the following WordprocessingML:

```
<w:pgBorders w:display="firstPage">
...
</w:pgBorders>
```

The display attribute with a value of firstPage specifies that only the first page must display the page border defined for this section. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allPages (Display Page Border on All Pages)	Specifies that the page border shall be displayed on all pages in the parent section.
firstPage (Display Page Border on First Page)	Specifies that the page border shall be displayed on only the first page in the parent section.
notFirstPage (Display Page Border on All Pages Except First)	Specifies that the page border shall be displayed on only the first page in the parent section.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_PageBorderDisplay](#)) is located in §A.1. *end note*]

17.18.63 ST_PageBorderOffset (Page Border Positioning Base)

This simple type specifies how the relative positioning of the page borders shall be calculated.

If the value of this attribute is text, then the space attribute on each page border shall be interpreted as the distance from the text margins that shall be left before the page border.

[*Example:* Consider the following WordprocessingML fragment:

```
<w:pgBorders w:offsetFrom="page">
  <w:top w:val="dashed" w:space="24" />
  <w:left w:val="dashed" w:space="24" />
  <w:bottom w:val="dashed" w:space="24"/>
  <w:right w:val="dashed" w:space="24"/>
</w:pgBorders>
```

This fragment specifies that the page borders must be indented 24 points from the page extents.

This is distinct from the following fragment with identical space attribute values:

```

<w:pgBorders w:offsetFrom="text">
  <w:top w:val="dashed" w:space="24" />
  <w:left w:val="dashed" w:space="24" />
  <w:bottom w:val="dashed" w:space="24"/>
  <w:right w:val="dashed" w:space="24"/>
</w:pgBorders>

```

In this case, the page borders is offset by 24 points, but in this case, that offset is calculated relative to the text margins. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
page (Page Border Is Positioned Relative to Page Edges)	Specifies that the space attribute on each page border shall be interpreted as the distance from the edge of the page that shall be left before the page border.
text (Page Border Is Positioned Relative to Text Extents)	Specifies that the space attribute on each page border shall be interpreted as the distance from the edge of the text extents (text margins) that shall be left before the page border..

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_PageBorderOffset](#)) is located in §A.1. *end note*]

17.18.64 ST_PageBorderZOrder (Page Border Z-Order)

This simple type specifies whether the page border is positioned above or below intersecting texts and objects in this document.

[*Example:* Consider a document in which the page border must be displayed below any intersecting text as follows:

This setting is specified by setting the value of an attribute with `to back`, which specifies that the page border must be displayed behind all intersecting text and objects. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
back (Page Border Behind Text)	Specifies that the page border shall be rendered beneath any text or object which intersects it - effectively placing it at the lowest z-order on the page.
front (Page Border Ahead of Text)	Specifies that the page border shall be rendered above any text or object which intersects it - effectively placing it at the highest z-order on the page.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PageBorderZOrder](#)) is located in §A.1. *end note*]

17.18.65 ST_PageOrientation (Page Orientation)

This simple type specifies the orientation of all pages in the parent section. This information is used to determine the actual paper size to use when printing the file.

[*Example*: Pages 11" wide by 8.5" long in landscape mode use 8.5"x11" paper, because the width and height are reversed for pages in this landscape section with respect to the printed page. *end example*]

[*Example*: Consider the following WordprocessingML:

```
<w:pgSz w:w="15840" w:h="12240" w:orient="landscape" />
```

Although the page width is 11", and page height is 8.5", according to the w and h attributes, because the orient attribute is set to landscape, pages in this section are printed on 8.5x11" paper in landscape mode. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
landscape (Landscape Mode)	Specifies that pages in this section shall be printed in landscape mode, which prints the page contents with a 90 degree rotation with respect to the normal page orientation.
portrait (Portrait Mode)	Specifies that pages in this section shall be printed in portrait mode.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PageOrientation](#)) is located in §A.1. *end note*]

17.18.66 ST_Pitch (Font Pitch Value)

This simple type specifies the possible values for the font pitch of a font.

[*Example*: Consider the following information stored for a single font:

```
<w:font w:name="Courier New">
  <w:pitch w:val="fixed" />
  ...
</w:font>
```

The pitch element specifies via its val attribute value of `fixed` that this is a fixed width font. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
default (Default)	Specifies that no information is available about the pitch of a font.
fixed (Fixed Width)	Specifies that this is a fixed width font.
variable (Proportional Width)	Specifies that this is a proportional width font.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Pitch](#)) is located in §A.1. *end note*]

17.18.67 ST_PixelsMeasure (Measurement in Pixels)

This simple type specifies that its contents contain a positive whole number, whose contents consist of a measurement in pixels.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of 96 whose simple type is `ST_PixelsMeasure`. This attribute value specifies a size of 96 pixels (one inch on a 96 pixels per inch display). *end example*]

This simple type's contents are a restriction of the `ST_UnsignedDecimalNumber` datatype (§22.9.2.16).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PixelsMeasure](#)) is located in §A.1. *end note*]

17.18.68 ST_PointMeasure (Measurement in Points)

This simple type specifies that its contents contain a positive whole number, whose contents consist of a measurement in points (equivalent to 1/72nd of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of 24 whose simple type is ST_PointMeasure. This attribute value specifies a size in points (24 points = 1/3 of an inch). *end example*]

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber datatype (§22.9.2.16).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PointMeasure](#)) is located in §A.1. *end note*]

17.18.69 ST_Proof (Proofing State Values)

This simple type specifies the values which can be used to indicate the status of a given hosting application's grammar and spell checking when a given WordprocessingML document was last saved.

[*Example*: Consider a WordprocessingML document that is saved by a hosting application whose grammar checking engine had completed checking the grammar in the given WordprocessingML document, but whose spell checking engine had not completed checking the spelling in the given WordprocessingML document . In this instance, the following WordprocessingML must be written in the document settings:

```
<w:proofState w:spelling="dirty" w:grammar="clean" />
```

The proofState element's attributes spelling and grammar have the ST_Proof simple type enumeration values dirty and clean respectively, specifying that the hosting application's spell checking engine had not completed checking the spelling of the document, and that the hosting application's grammar checking engine had completed checking the grammar of the document, when the WordprocessingML document was last saved. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
clean (Check Completed)	Specifies that the given proofing engine completed checking the document when it was last saved.
dirty (Check Not Completed)	Specifies that the given proofing engine did not complete checking the document when it was last saved.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Proof](#)) is located in §A.1. *end note*]

17.18.70 ST_ProofErr (Proofing Error Type)

This simple type specifies the possible values for the types of proofing error markers which can appear in the contents of a WordprocessingML document to indicate the last known state of any spell- and grammar-checking performed on the contents of this document.

[*Example:* Consider the following paragraph consisting of two misspelled words, where the second word has been explicitly flagged as not being a spelling error. This paragraph would consist of the following WordprocessingML markup:

```
<w:p>
  <w:proofErr w:type="spellStart"/>
  <w:r>
    <w:t>erqwt</w:t>
  </w:r>
  <w:proofErr w:type="spellEnd"/>
  <w:r>
    <w:t xml:space="preserve"> werewr</w:t>
  </w:r>
</w:p>
```

The proofErr elements with a val attribute value of spellStart and spellEnd, respectively delimit the start and end the content in this paragraph which is stored as a spelling error. Since the second word is not included in that range, it is not stored as a spelling error. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
gramEnd (End of Region Marked as Grammatical Error)	Specifies that this proofing error marker shall indicate the start of a region to be marked as a grammatical error in the document.
gramStart (Start of Region Marked as Grammatical Error)	Specifies that this proofing error marker shall indicate the end of a region to be marked as a grammatical error in the document.
spellEnd (End of Region Marked as Spelling Error)	Specifies that this proofing error marker shall indicate the end of a region to be marked as a spelling error in the document.
spellStart (Start of Region Marked as Spelling Error)	Specifies that this proofing error marker shall indicate the start of a region to be marked as a spelling error in the document.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_ProofErr](#)) is located in §A.1. *end note]*

17.18.71 ST_PTabAlignment (Absolute Position Tab Alignment)

This simple type specifies the alignment of an absolutely positioned tab character in a document. This alignment value determines the position on the line to which this absolute tab shall advance, as well as the alignment of the text entered after the alignment tab character position.

[*Example*: Consider a positional tab stop in a WordprocessingML document who must move to the left edge of the text margins and whose subsequent text should be left aligned. This positional tab stop would be defined as follows:

```
<w:ptab w:alignment="left" w:relativeTo="margin" ... />
```

The alignment attribute has a value of `left`, which specifies that this custom tab stop must align on the left edge of the line relative to the text margin. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center)	Specifies that the positional tab should be center aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be center aligned.
left (Left)	Specifies that the positional tab should be left aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be left aligned.
right (Right)	Specifies that the positional tab should be right aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be right aligned.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PTabAlignment](#)) is located in §A.1. *end note*]

17.18.72 ST_PTabLeader (Absolute Position Tab Leader Character)

This simple type specifies the characters which can be used to fill in the space created by a positional tab. This character shall be repeated as required to completely fill the tab spacing generated by the positional tab character.

[*Example*: Consider a positional tab stop which should be preceded by a sequence of underscore characters, as follows:

```
_____Text at the positional tab stop
```

This tab stop would have a leader attribute value of `underscore`, indicating that the tab stop must be preceded by underscore characters as needed to fill the tab spacing. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dot (Dot Leader Character)	<p>Specifies that the leader character for this positional tab stop shall be a dot.</p> <p><i>[Example:</i></p> <p>..... Text at absolute tab.</p> <p><i>end example]</i></p>
hyphen (Hyphen Leader Character)	<p>Specifies that the leader character for this positional tab stop shall be a hyphen.</p> <p><i>[Example:</i></p> <p>----- Text at absolute tab.</p> <p><i>end example]</i></p>
middleDot (Centered Dot Leader Character)	<p>Specifies that the leader character for this positional tab stop shall be a centered dot.</p> <p><i>[Example:</i></p> <p>..... Text at absolute tab.</p> <p><i>end example]</i></p>
none (No Leader Character)	<p>Specifies that there shall be no leader character for this positional tab.</p> <p><i>[Example:</i></p> <p>Text at absolute tab.</p> <p><i>end example]</i></p>
underscore (Underscore Leader Character)	<p>Specifies that the leader character for this positional tab stop shall be an underscore.</p> <p><i>[Example:</i></p> <p>_____ Text at absolute tab.</p> <p><i>end example]</i></p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PTabLeader](#)) is located in §A.1. *end note*]

17.18.73 ST_PTabRelativeTo (Absolute Position Tab Positioning Base)

Specifies the possible extents which can be used to calculate the absolute positioning of this positional tab character.

[Example: Consider a positional tab stop in a WordprocessingML document that should have a resulting position that is centered on the text margins, ignoring both any custom tab stops and any text indents on the paragraph. This positional tab stop would be defined as follows:

```
<w:ptab w:relativeTo="margin" ... />
```

The relativeTo attribute specifies that this absolute position tab stop must be relative to the margin. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
indent (Relative To Indents)	Specifies that the absolute positioning of the tab shall be relative to the indents.
margin (Relative To Text Margins)	Specifies that the absolute positioning of the tab shall be relative to the margins.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PTabRelativeTo](#)) is located in §A.1. *end note*]

17.18.74 ST_RestartNumber (Footnote/Endnote Numbering Restart Locations)

This simple type specifies the possible values for when the automatic numbering of footnotes or endnotes shall be restarted.

[Example: Consider a WordprocessingML document where the numbering for its endnotes must be restarted after each section must be restarted after each page. This setting is represented by the following WordprocessingML:

```
<w:footnotePr>
...
  <w:numRestart w:val="eachSect" />
...
</w:footnotePr>
```

The val attribute value of eachSect specifies that numbering must be restarted after each section. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
continuous (Continue Numbering From Previous Section)	Specifies that the numbering of footnotes or endnotes shall continue from the previous section in the document.
eachPage (Restart Numbering On Each Page)	Specifies that the numbering of footnotes or endnotes shall be restarted to its starting value for each unique page in the document.
eachSect (Restart Numbering For Each Section)	Specifies that the numbering of footnotes or endnotes shall be restarted to its starting value for each unique section in the document.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RestartNumber](#)) is located in §A.1. *end note*]

17.18.75 ST_RubyAlign (Phonetic Guide Text Alignment)

This simple type specifies the possible alignment settings which can be used to determine the placement of phonetic guide text with respect to the base text when this phonetic guide is displayed.

[Example: Consider a run of phonetic guide text which must have the ruby text positioned to the far left of the base text. This constraint is specified using the following WordprocessingML:

```
<w:rubyPr>
...
<w:rubyAlign w:val="left"/>
...
</w:rubyPr>
```

The rubyAlign property is left for the phonetic guide, so the ruby text is displayed on the left side of the base text. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
center (Center)	Specifies that the phonetic guide text shall be centered with respect to the base text in this document. [Example: <div style="text-align: center;">guide text this is a test center</div>

Enumeration Value	Description
	<i>end example]</i>
distributeLetter (Distribute All Characters)	<p>Specifies that the phonetic guide text shall be distributed with respect to the base text in this document.</p> <p>This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line.</p> <p>[Example:</p> <pre>g u i d e t e x t a test distribute letter</pre> <p><i>end example]</i></p>
distributeSpace (Distribute all Characters w/ Additional Space On Either Side)	<p>Specifies that the phonetic guide text shall be distributed with respect to the base text in this document, with additional space added to the guide text to ensure it is indented with respect to the base text.</p> <p>This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line. As well, an additional space is added before and after the guide text to ensure it is indented with respect to the base text.</p> <p>[Example:</p> <pre>g u i d e t e x t a test distribute space</pre> <p><i>end example]</i></p>
left (Left Aligned)	<p>Specifies that the phonetic guide text shall be left aligned with respect to the base text in this document.</p> <p>[Example:</p> <pre>guide text this is a test left</pre>

Enumeration Value	Description
	<i>end example]</i>
right (Right Aligned)	<p>Specifies that the phonetic guide text shall be right aligned with respect to the base text in this document.</p> <p>[Example:</p> <p style="text-align: right;">guide text</p> <p>this is a test right</p> <p><i>end example]</i></p>
rightVertical (Vertically Aligned to Right of Base Text)	<p>Specifies that the phonetic guide text shall be right aligned with respect to the base text in this document, and shall always be displayed vertically and to the right of the base text, regardless of the alignment of the base text.</p> <p>[Example:</p> <p style="text-align: right;">this is a test right vertical</p> <p style="text-align: right;">guide text</p> <p><i>end example]</i></p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RubyAlign](#)) is located in §A.1.
end note]

17.18.76 ST_SdtDateMappingType (Date Storage Format Types)

This simple type specifies the possible types of translations which can be performed on the displayed date in a date picker structured document tag when the current contents are saved into the associated custom XML data via the dataBinding element (§17.5.2.6).

[Example: Consider the following date picker structured document tag:

```
<w:sdt>
  <w:sdtPr>
    <w:date w:fullDate="01-01-2006T06:30:00Z">
      <w:storeMappedDateAs w:val="text"/>
      ...
    </w:date>
  </w:sdtPr>
  <w:sdtContent>
    <w:r>
      <w:t>January 1</w:t>
    </w:r>
  </w:sdtContent>
</w:sdt>
```

The value of the storeMappedDateAs element's attribute value is text, therefore the current run contents must be sent to the mapped XML element without any translation (in this case, the value must be January 1). *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
date (XML Schema Date Format)	Specifies that the date specified in the parent date picker structured document tag shall be converted to the xsd:date format when stored in a mapped XML element.
dateTime (XML Schema DateTime Format)	Specifies that the date specified in the parent date picker structured document tag shall be converted to the xsd:dateTime format when stored in a mapped XML element.
text (Same As Display)	Specifies that no translation shall be performed on the displayed date when stored in a mapped XML element - the mapped contents shall be the same as the displayed contents.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SdtDateMappingType](#)) is located in §A.1. *end note]*

17.18.77 ST_SectionMark (Section Type)

Specifies the kind of the current section.

[Example: Consider a section that must start on the next page in the document. The WordprocessingML specifying this would look like:

```

<w:sectPr>
...
  <w:type w:val="nextPage"/>
</w:sectPr>

```

The nextPage value specifies that this section starts on the next page. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
continuous (Continuous Section Break)	Specifies a continuous section break, which begin the new section on the following paragraph. This means that continuous section breaks might not specify certain page-level section properties, since they are inherited from the following section. These breaks, however, can specify other section properties, such as line numbering and footnote/endnote settings. If a footnote reference (§17.11.14) occurs on the same page as a section break of this kind, the new section shall begin on the following page.
evenPage (Even Page Section Break)	Specifies an even page section break, which begins the new section on the next even-numbered page, leaving the next odd page blank if necessary.
nextColumn (Column Section Break)	Specifies a column section break, which begins the new section on the following column on the page.
nextPage (Next Page Section Break)	Specifies a next page section break, which begins the new section on the following page.
oddPage (Odd Page Section Break)	Specifies an odd page section break, which begins the new section on the next odd-numbered page, leaving the next even page blank if necessary.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SectionMark](#)) is located in §A.1. *end note*]

[Note: A continuous section break balances the content of the previous section. *end note*]

[Example: Consider the following sample document:

Column-balancing-sample.....Section Break (Continuous).....

Text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·
text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·text·
text·text·text.....Section Break (Continuous).....

Last section.¶

The second section (“Text text text ...”) has two columns and the third section (“Last section”) has the type “continuous”. As a result, the content of the second section is balanced before the third section is laid out. *end example]*

The process of “balancing” is defined by starting the next section at the minimum section height such that all content constraints are met.

[Example:

Consider the following sample document:

Column-balancing-sample.....Section Break (Continuous).....

A.....D.....Section Break (Continuous)

B.....

C.....

Last section.

The above balancing is incorrect, as the height of the second section can be reduced such that the following minimal balancing is achieved:

Column-balancing-sample.....Section Break (Continuous)

A¶

B¶

Last-section.¶

C¶

D.....Section Break (Continuous)

end example]

[Example:

The document

Column-balancing-sample.....Section Break (Continuous)

A¶

C¶

B¶

D¶

E.....Section Break (Continuous)

Last-section.¶

has

incorrect column balancing, as the content is not laid out with respect to the implied constraints—although the section height is minimal. The correct minimal balancing looks like this:

Column-balancing-sample.....Section Break (Continuous)

A¶

D¶

B¶

E.....Section Break (Continuous)

C¶

Last-section.¶

end example]

[Example:

The following section balancing

Column-balancing-sample.....Section Break (Continuous)

A·long·long·long·long·long·long·long·long·
paragraph-with-Widow/Orphan·control·

turned·on.....Section Break (Continuous)

Last-section.¶

is incorrect, as the “Widow/Orphan” constraints are not met. The correct balancing looks like this:

Column-balancing-sample.....Section Break (Continuous)

A·long·long·long·long·long·long·long·long·
paragraph-with-Widow/Orphan·control·

turned·on.....Section Break (Continuous)

Last-section.¶

end example]

17.18.78 ST_Shd (Shading Patterns)

This simple type specifies the pattern that shall be used to lay the pattern color over the background color for shading.

This pattern consists of a mask that is applied over the background shading color to get the locations where the pattern color should be shown. Each of these possible masks is shown in the enumeration values below. In each example, an 8 pixel by 8 pixel mask is displayed where black has been used as the fill color (the parent element's fill attribute), and white has been used as the pattern color (the parent element's color attribute). When the shading is applied, the mask is tiled as necessary to match the size of the shaded area.

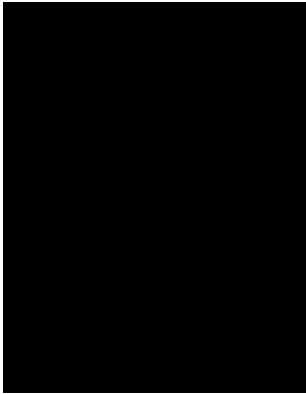

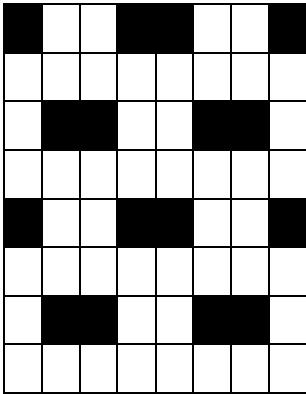

[*Example*: Consider a shaded paragraph which uses a 10 percent foreground fill, resulting in the following WordprocessingML:

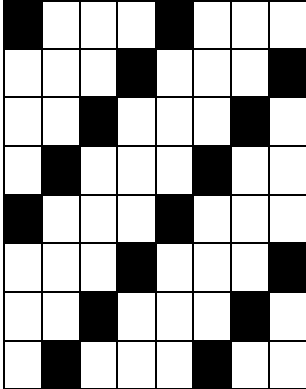

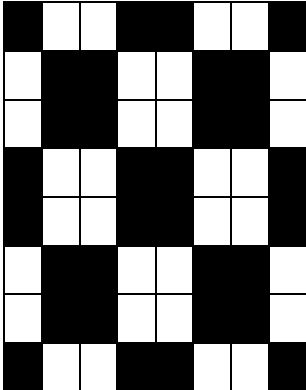

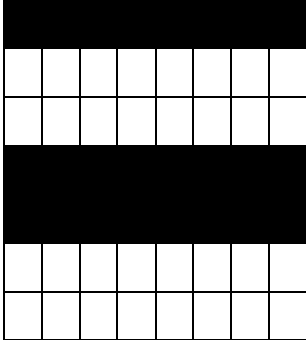

```
<w:shd w:val="pct10" .../>
```

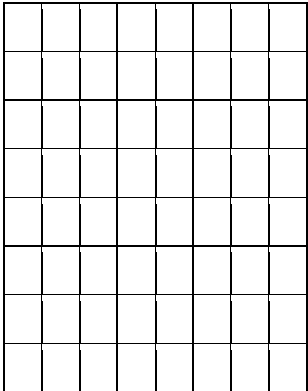

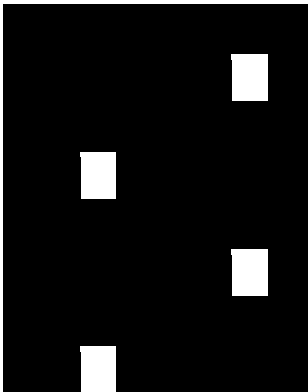

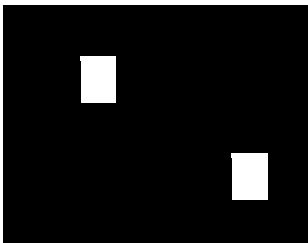

This shading val is pct10, indicating that the border style is a 10 percent foreground fill mask. *end example*]

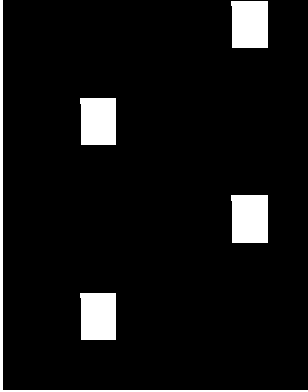

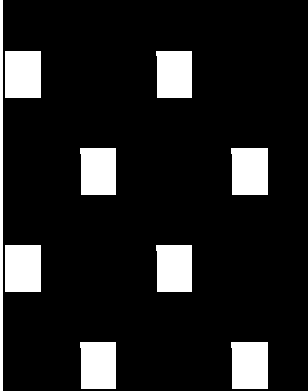

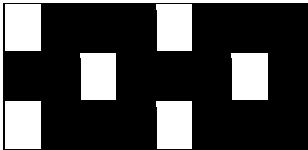

This simple type's contents are a restriction of the W3C XML Schema string datatype.

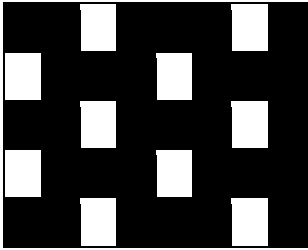

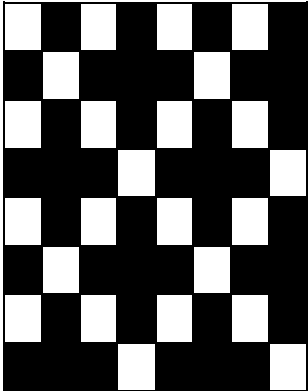

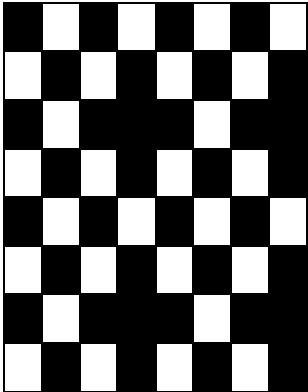

This simple type is restricted to the values listed in the following table:

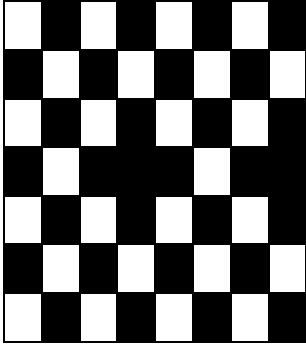

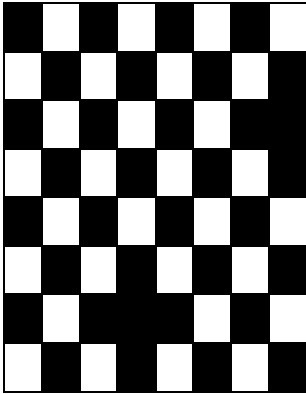

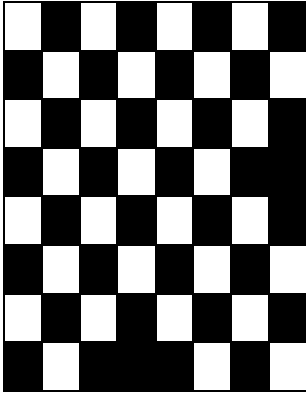

Enumeration Value	Description
clear (No Pattern)	<div>Specifies that the following mask shall be applied as the shading pattern:</div> <div></div>
diagCross (Diagonal Cross Pattern)	<div>Specifies that the following mask shall be applied as the shading pattern:</div> <div></div>

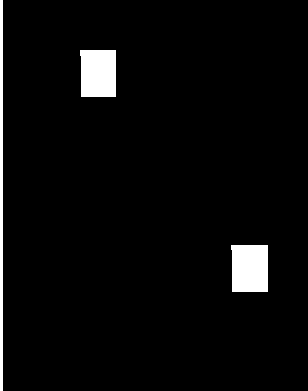

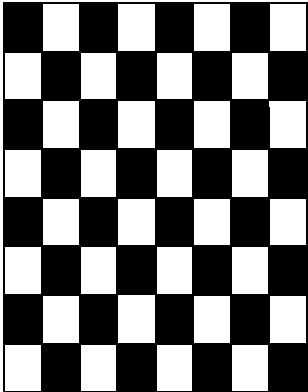

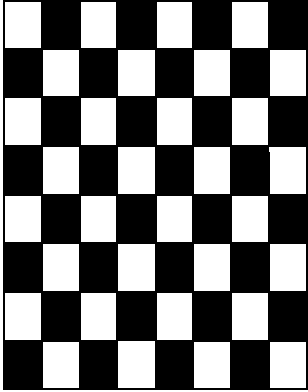

Enumeration Value	Description
diagStripe (Diagonal Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
horzCross (Horizontal Cross Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
horzStripe (Horizontal Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

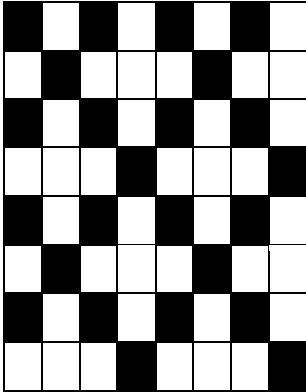

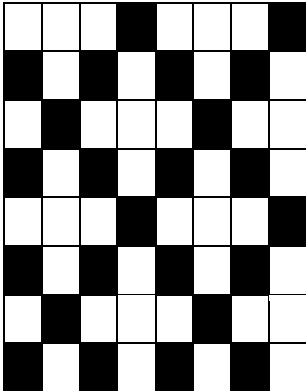

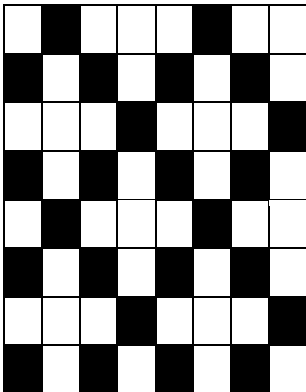

Enumeration Value	Description
	
nil (No Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct10 (10% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct12 (12.5% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

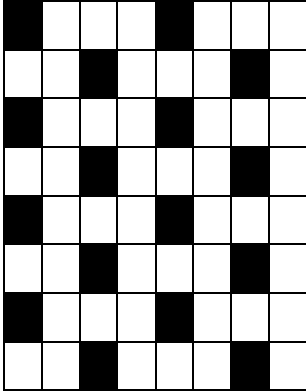

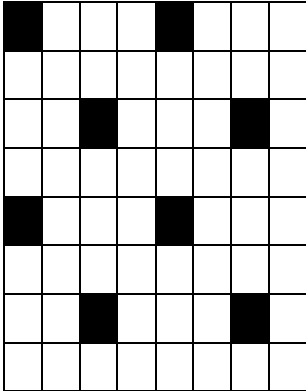

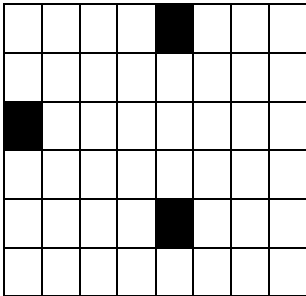

Enumeration Value	Description
	
pct15 (15% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct20 (20% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct25 (25% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

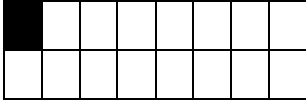

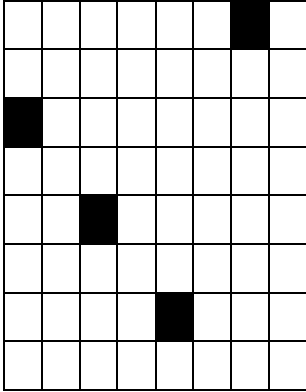

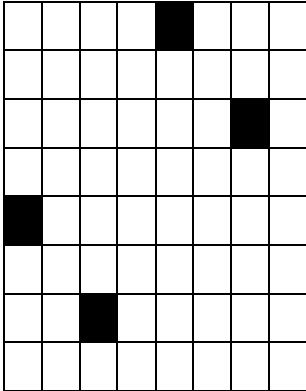

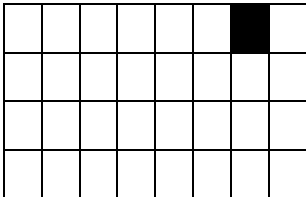

Enumeration Value	Description
	
pct30 (30% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct35 (35% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct37 (37.5% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

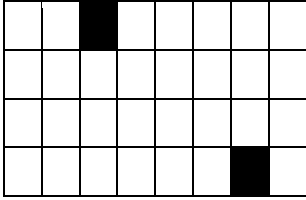

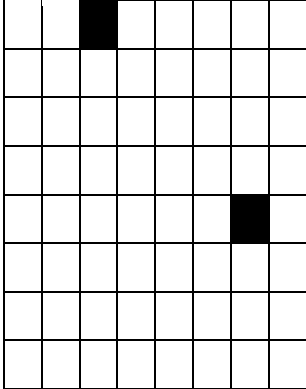

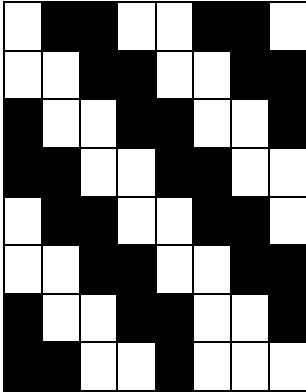

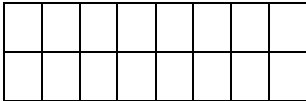

Enumeration Value	Description
	
pct40 (40% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct45 (45% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct5 (5% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p>

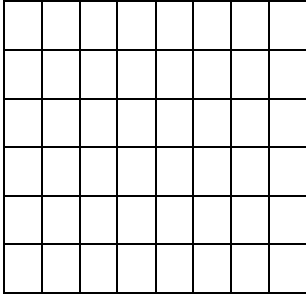

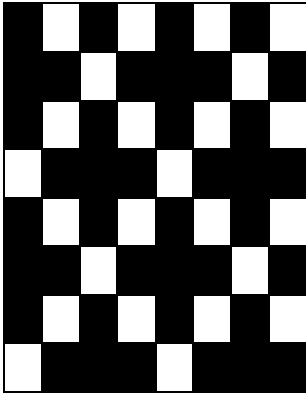

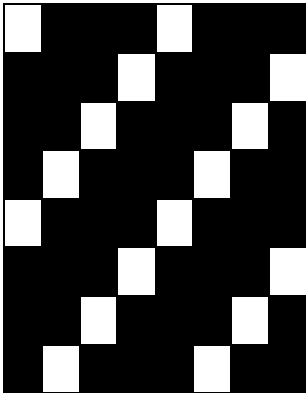

Enumeration Value	Description
	
pct50 (50% Fill Pattern)	<p data-bbox="824 753 1445 825">Specifies that the following mask shall be applied as the shading pattern:</p> 
pct55 (55% Fill Pattern)	<p data-bbox="824 1335 1445 1407">Specifies that the following mask shall be applied as the shading pattern:</p> 

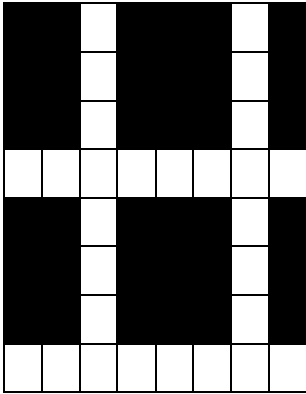

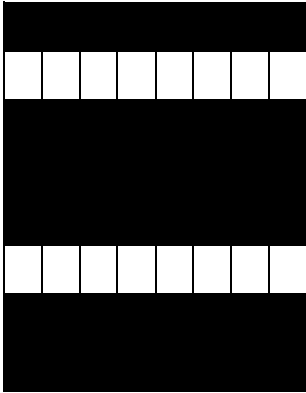

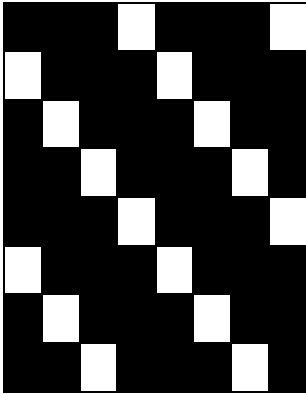

Enumeration Value	Description
pct60 (60% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct62 (62.5% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct65 (65% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

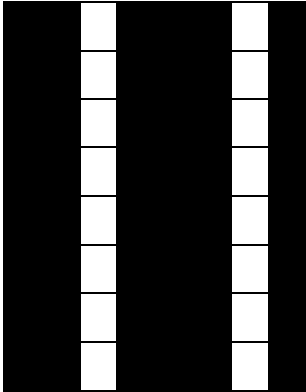

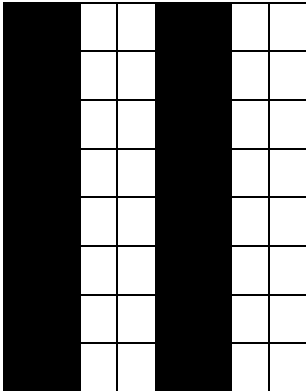

Enumeration Value	Description
pct70 (70% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct75 (75% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct80 (80% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

Enumeration Value	Description
	
pct85 (85% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct87 (87.5% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
pct90 (90% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

Enumeration Value	Description
	
pct95 (95% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
reverseDiagStripe (Reverse Diagonal Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
solid (100% Fill Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

Enumeration Value	Description
	
thinDiagCross (Thin Diagonal Cross Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
thinDiagStripe (Thin Diagonal Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
thinHorzCross (Thin Horizontal Cross Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p>

Enumeration Value	Description
	
thinHorzStripe (Thin Horizontal Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
thinReverseDiagStripe (Thin Reverse Diagonal Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

Enumeration Value	Description
thinVertStripe (Thin Vertical Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 
vertStripe (Vertical Stripe Pattern)	<p>Specifies that the following mask shall be applied as the shading pattern:</p> 

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Shd](#)) is located in §A.1. *end note*]

17.18.79 ST_ShortHexNumber (Four Digit Hexadecimal Value)

This simple type specifies a number value specified as a two octet (four digit) hexadecimal number, whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following value for a node of type ST_ShortHexNumber: 2F6C.

This value is permitted, as it contains two hexadecimal octets, each an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the W3C XML Schema `hexBinary` datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 4 hexadecimal digit(s).

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_ShortHexNumber](#)) is located in §A.1. *end note*]

17.18.80 ST_SignedHpsMeasure (Signed Measurement in Half-Points)

This simple type specifies that its contents contain either:

- A positive or negative whole number, whose contents consist of a measurement in half-points (equivalent to 1/144th of an inch).
- A positive or negative number followed immediately by a unit identifier.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of -72 whose type is `ST_SignedHpsMeasure`. This attribute value specifies a size of negative one-half of an inch or -36 points (-72 halves of a point = -36 points = -0.5 inches). *end example*]

[*Example:* Consider an attribute value of -12.7mm whose type is `ST_SignedHpsMeasure`. This attribute value specifies a size of -0.0127 meter or negative one-half of an inch or -36 points. *end example*]

This simple type is a union of the following types:

- The `ST_UniversalMeasure` simple type (§22.9.2.15).
- The W3C XML Schema integer datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_SignedHpsMeasure](#)) is located in §A.1. *end note*]

17.18.81 ST_SignedTwipsMeasure (Signed Measurement in Twentieths of a Point)

This simple type specifies that its contents contain either:

- A positive or negative whole number, whose contents consist of a measurement in twentieths of a point (equivalent to 1/1440th of an inch), or
- A positive decimal number immediately following by a unit identifier.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of 720 whose simple type is `ST_SignedTwipsMeasure`. This attribute value specifies a size of one-half of an inch or 36 points (720 twentieths of a point = 36 points = 0.5 inches). *end example*]

[*Example:* Consider an attribute value of -12.7mm whose type is ST_SignedTwipsMeasure. This attribute value specifies a size of -0.0127 meter or negative one-half of an inch or -36 points. *end example*]

This simple type is a union of the following types:

- The ST_UniversalMeasure simple type (§22.9.2.15).
- The W3C XML Schema integer datatype.

[*Note:* The W3C XML Schema definition of this simple type's content model (ST_SignedTwipsMeasure) is located in §A.1. *end note*]

17.18.82 ST_StyleSort (Style Sort Settings)

This simple type specifies the ways in which the list of document styles can be ordered when they are displayed in a user interface.

[*Example:* Consider the WordprocessingML below:

```
<w:stylePaneSortMethod w:val="basedOn" />
```

The stylePaneSortMethod element has a val attribute value of basedOn, which specifies that styles are sorted by the value of their basedOn element (§17.7.4.3). *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
basedOn (Sort by Based On Style)	Specifies that styles which are visible should be sorted by the style on which they are based using the basedOn element (§17.7.4.3).
default (Sort by Default Method)	Specifies that styles which are visible should be sorted by the default sorting of the host application.
font (Sort by Font)	Specifies that styles which are visible should be sorted by the font which they apply.
name (Sort by Style Name)	Specifies that styles which are visible should be sorted by their names.
priority (Sort by Style Priority)	Specifies that styles which are visible should be sorted by their UI priority using the uiPriority element (§17.7.4.19).
type (Sort by Style Type)	Specifies that styles which are visible should be sorted by their style types (i.e. character, linked, paragraph).

[*Note:* The W3C XML Schema definition of this simple type's content model (ST_StyleSort) is located in §A.1. *end note*]

17.18.83 ST_StyleType (Style Types)

This simple type specifies the possible values for the types of style definitions defined within a WordprocessingML document. WordprocessingML supports six types of style definitions:

- Paragraph styles
- Character styles
- Table styles
- Numbering styles
- Linked styles (paragraph + character)
- Default paragraph + character properties

Each of the first four style types corresponds to a different value below, and therefore defines the style type of the current style. [Note: The last two style types are unique in that they are not simply a style type: a linked style is a pairing of a character and paragraph style via the link element (§17.7.4.6); and the document default properties are defined via the docDefaults element (§17.7.5.1). *end note*]

[Example: Consider a style defined as follows:

```
<w:style w:type="paragraph" ... >
  <w:name w:val="My Paragraph Style"/>
  <w:rPr>
    <w:b/>
  </w:rPr>
</w:style>
```

The type attribute is of simple type ST_StyleType, and its value of paragraph specifies that this style definition creates a paragraph style. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
character (Character Style)	Specifies that the parent style definition is a character style.
numbering (Numbering Style)	Specifies that the parent style definition is a numbering style.
paragraph (Paragraph Style)	Specifies that the parent style definition is a paragraph style.
table (Table Style)	Specifies that the parent style definition is a table style.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_StyleType](#)) is located in §A.1.
end note]

17.18.84 ST_TabJc (Custom Tab Stop Type)

This simple type specifies the available types of custom tab stop, which determines the behavior of the tab stop and the alignment which shall be applied to text entered at the current custom tab stop.

[*Example*: Consider a custom tab stops at 1.5" in a WordprocessingML document. This tab stop would be contained within a tab element defining the tab stop as follows:

```
<w:tab w:val="start" w:pos="2160" />
```

The val attribute specifies that this custom tab stop must align all text entered at its location to its left. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bar (Bar Tab)	Specifies that the current tab is a bar tab. A <i>bar tab</i> is a tab which does not result in a custom tab stop in the parent paragraph (this tab stop location shall be skipped when positioning custom tab characters), but instead shall be used to draw a vertical line (or bar) at this location in the parent paragraph.
center (Centered Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is centered (i.e. all text runs following this tab stop and preceding the next tab stop shall be centered around the tab stop location).
clear (No Tab Stop)	Specifies that the current tab stop is cleared and shall be removed and ignored when processing the contents of this document.
decimal (Decimal Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is aligned around the first decimal character in the following text runs. All text runs before the first decimal character shall be before the tab stop, all text runs after it shall be after the tab stop location.
end (Trailing Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is aligned to its trailing edge (i.e. all text runs following this tab stop and preceding the next tab stop shall be

Enumeration Value	Description
	aligned against the trailing edge with respect to the tab stop location). [<i>Example</i> : In an RTL paragraph, the trailing edge is the left edge, so text aligns to that edge, extending to the right. <i>end example</i>]
num (List Tab)	Specifies that the current tab is a list tab, which is the tab stop between the numbering and the paragraph contents in a numbered paragraph. [<i>Note</i> : This justification style is used for backwards compatibility with earlier word processors, and should be avoided in favor of hanging paragraph indentation. <i>end note</i>]
start (Leading Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is aligned to its leading edge (i.e. all text runs following this tab stop and preceding the next tab stop shall be aligned against the leading edge with respect to the tab stop location).

[*Note*: The W3C XML Schema definition of this simple type's content model (`ST_TabJc`) is located in §A.1. *end note*]

17.18.85 ST_TabTlc (Custom Tab Stop Leader Character)

This simple type specifies the characters which can be used to fill in the space created by a tab which ends at this custom tab stop. The chosen character shall be repeated as required to completely fill the tab spacing generated by the tab character.

[*Example*: Consider a tab stop which should be preceded by a sequence of underscore characters, as follows:

_____Text at the tab stop

This tab stop would have a leader attribute value of underscore, indicating that the tab stop must be preceded by underscore characters as needed to fill the tab spacing. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dot (Dotted leader line)	Specifies that the leader character for this custom tab stop shall be a dot. [<i>Example</i> :

Enumeration Value	Description
	<p>.....Text at tab stop.</p> <p><i>end example]</i></p>
heavy (Heavy solid leader line)	<p>Specifies that the leader character for this custom tab stop shall be a heavy solid line, or an underscore.</p> <p>[<i>Note:</i> This setting is used for backwards compatibility with earlier word processors, and should be avoided in favor of other leader characters. It can be displayed using underscores if desired. <i>end note]</i></p> <p>[<i>Example:</i></p> <p>_____Text at tab stop.</p> <p><i>end example]</i></p>
hyphen (Dashed tab stop leader line)	<p>Specifies that the leader character for this custom tab stop shall be a hyphen.</p> <p>[<i>Example:</i></p> <p>-----Text at tab stop.</p> <p><i>end example]</i></p>
middleDot (Middle dot leader line)	<p>Specifies that the leader character for this custom tab stop shall be a centered dot.</p> <p>[<i>Example:</i></p> <p>.....Text at tab stop.</p> <p><i>end example]</i></p>
none (No tab stop leader)	<p>Specifies that there shall be no leader character for this custom tab.</p> <p>[<i>Example:</i></p> <p>Text at tab stop.</p> <p><i>end example]</i></p>
underscore (Solid leader line)	<p>Specifies that the leader character for this custom tab stop shall be an underscore.</p> <p>[<i>Example:</i></p>

Enumeration Value	Description
	<p>_____Text at tab stop.</p> <p><i>end example]</i></p>

[Note: The W3C XML Schema definition of this simple type's content model (ST_TabTlc) is located in §A.1. *end note]*

17.18.86 ST_TargetScreenSz (Target Screen Sizes for Generated Web Pages)

This simple type specifies possible ideal minimum target screen sizes (width by height, specified in pixels) for which web pages generated can be optimized when saving this document as a web page.

[Example: Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:targetScreenSz w:val="1600x1200" />
</w:webSettings>
```

The targetScreenSz element's val attribute has a value of 1600x1200, which specifies that a target screen size of 1600 by 1200 pixels must be assumed when saving this document as a web page. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
1024x768 (Optimize for 1024x768)	Specifies that web pages produced from this document should be optimized for a screen size of 1024x768.
1152x882 (Optimize for 1152x882)	Specifies that web pages produced from this document should be optimized for a screen size of 1152x882.
1152x900 (Optimize for 1152x900)	Specifies that web pages produced from this document should be optimized for a screen size of 1152x900.
1280x1024 (Optimize for 1280x1024)	Specifies that web pages produced from this document should be optimized for a screen size of 1280x1024.
1600x1200 (Optimize for 1600x1200)	Specifies that web pages produced from this document should be optimized for a screen size of 1600x1200.
1800x1440 (Optimize for 1800x1440)	Specifies that web pages produced from this

Enumeration Value	Description
	document should be optimized for a screen size of 1800x1440.
1920x1200 (Optimize for 1920x1200)	Specifies that web pages produced from this document should be optimized for a screen size of 1920x1200.
544x376 (Optimize for 544x376)	Specifies that web pages produced from this document should be optimized for a screen size of 544x376.
640x480 (Optimize for 640x480)	Specifies that web pages produced from this document should be optimized for a screen size of 640x480.
720x512 (Optimize for 720x512)	Specifies that web pages produced from this document should be optimized for a screen size of 720x512.
800x600 (Optimize for 800x600)	Specifies that web pages produced from this document should be optimized for a screen size of 800x600.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TargetScreenSz](#)) is located in §A.1. *end note*]

17.18.87 ST_TblLayoutType (Table Layout Type)

This simple type defines the possible types of layout algorithms which can be used to lay out a table within a WordprocessingML document.

These algorithms are defined in the following paragraphs (noting, of course, that implementations are free to implement more efficient versions of each).

Fixed Width Table Layout - This method of table layout uses the preferred widths on the table items to generate the final sizing of the table, but does not change that size regardless of the contents of each table cell, hence the table is fixed width.

[Guidance: Although an application can choose to use a different process, this layout could be performed as follows:

- The table grid is used to create the set of shared columns in the table and their initial widths as defined in the tblGrid element (§17.4.48)
- The table's total width is defined based on the tblW property (§17.4.63) – if it is set to auto or nil, then the width is not yet determined and is specified using the row and cell information.
- The first table row is read and the initial number of grid units before the row starts is skipped. The width of the skipped grid columns is set using the wBefore property (§17.4.86).

- The first cell is placed on the grid, and the width of the specified grid column span set by `gridSpan` (§17.4.17) is set based on the `tcW` property (§17.4.71).
- Each additional cell is placed on the grid.
- If at any stage, the preferred width requested for the cells exceeds the preferred width of the table, then each grid column is proportionally reduced in size to fit the table width.
- If the grid is exceeded (e.g. `tblGrid` specifies three grid columns, but the second cell has a `gridSpan` of three), the grid is dynamically increased with a default width for the new grid column.
- For each subsequent row, cells are placed on the grid, and each grid column is adjusted to be the maximum value of the requested widths (if the widths do not agree) by adding width to the last cell that ends with that grid column. Again, if at any point, the space requested for the cells exceeds the width of the table, then each grid column is proportionally reduced in size to fit the table width.

end guidance]

The resulting table shall be displayed regardless of its contents to the size requested.

AutoFit Table Layout - This method of table layout uses the preferred widths on the table items to generate the final sizing of the table, but then uses the contents of each cell to determine final column widths.

[*Guidance*: This layout can be performed in any manner available to an application, but one algorithm as follows can be used:

- Perform the steps above to lay out the fixed width version of the table.
- Calculate the minimum content width - the width of the cell's contents including all possible line breaking locations (or the cell's width, if the width of the content is smaller), and the maximum content width - the width of the cell's contents (assuming no line breaking not generated by explicit line breaks).
- The minimum and maximum content width of all cells that span a single grid column is the minimum and maximum content width of that column.
- For cells which span multiple grid columns, enlarge all cells which it spans as needed to meet that cell's minimum width.
- If any cell in a grid column has a preferred width, the first such width overrides the maximum width of the column's contents.
- Place the text in the cells in the table, respecting the minimum content width of each cell's content. If a cell's minimum content width exceeds the cell's current width, preferences are overridden as follows:
 - First, override the column widths by making all other grid columns proportionally smaller until each it at its minimum width. This cell can then grow to any width between its own minimum and maximum width.
 - Next, override the preferred table width until the table reaches the page width.
 - Finally, force a line break in each cell's contents as needed

end guidance]

[Example: Consider the following fixed width table, which makes extensive use of resized and merged cells on what is actually just a seven-column grid. (The arrows point to each (invisible) vertical line of the grid and the numbers refer to the grid columns):

Although the table is visually complex, the standard rules apply: the first cell in the table is simply a cell which spans four grid units horizontally, as specified in the `gridSpan` element, and whose preferred width is 2952 twentieths of a point, specified in the `tcW` element:

```
<w:tc>
  <w:tcPr>
    <w:tcW w:w="2952" w:type="dxa"/>
    <w:gridSpan w:val="4"/>
  </w:tcPr>
</w:tc>
```

Similarly, all cells indented from the start and end of the grid specify that indent using the `gridBefore` and `gridAfter` elements. For example, the XML for the second row in the table shows that that row starts three grid units into the table:

```
<w:tr>
  <w:trPr>
    <w:gridBefore w:val="3"/>
    <w:wBefore w:w="2748" w:type="dxa"/>
  </w:trPr>
  ...
</w:tr>
```

If we take this fixed width table and introduce a long string into the single cell in row three, we see that the presence of this text does not affect cell widths:

xtstrin
gwithn
obreak
ingcha
racters

If we now turn on the AutoFit property, we see that the algorithm for this AutoFit table causes grid column two to increase in size, proportionally decreasing the other grid columns’ size to accommodate the long non-breaking string in the last cell:

longtextstringwithnobreakingcharacters		

Each of the other grid columns was reduced, but since all columns are not at their minimum size, the table width is not increased even though the table is not yet at the page width. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
autofit (AutoFit Table Layout)	Specifies that this table shall use an AutoFit table layout algorithm.
fixed (Fixed Width Table Layout)	Specifies that this table shall use the fixed width table layout algorithm described above.

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_TblLayoutType](#)) is located in §A.1. *end note*]

17.18.88 ST_TblOverlap (Table Overlap Setting)

This simple type contains the possible settings for a floating table which shall be used to determine if the table can overlap with other floating tables when displayed in the document.

[*Example*: Consider two floating tables in a WordprocessingML document which overlap when displayed, as follows:

If either of these tables specifies that it must not allow overlapping, using the following WordprocessingML:

```
<w:tblPr>
  <w:tblOverlap w:val="never"/>
</w:tblPr>
```

The resulting tables must not overlap, and shall be adjusted at display time to prevent any overlapping, for example:

The value of *never* specifies that the specified table cannot overlap with other floating tables in the document.
end example]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
never (Floating Table Cannot Overlap)	Specifies that the parent table, if floating, shall never be displayed in a state where it would be overlapping another floating table in the document. If two floating tables intersect and this option is set on either of them, then one or both tables shall be adjusted as needed to ensure that the table whose value is never is not overlapped when displayed.
overlap (Floating Table Can Overlap)	Specifies that the parent table, if floating, can be displayed in a state where it would be overlapping another floating table in the document.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TblOverlap](#)) is located in §A.1. *end note*]

17.18.89 ST_TblStyleOverrideType (Conditional Table Style Formatting Types)

This simple type specifies possible values for the sections of the table to which the current conditional formatting properties shall be applied when this table style is used.

[*Example:* Consider a table style which contains conditional formatting, defined as follows:

```
<w:style w:type="table" ...>
  ...
  <w:tblStylePr w:type="lastRow">
    ...
  </w:tblStylePr>
</w:style>
```

The type attribute value of `lastRow` specifies that this set of conditional formatting properties must be applied to the last row of the table only. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
band1Horz (Banded Row Conditional Formatting)	Specifies that the table formatting applies to odd numbered groupings of rows.
band1Vert (Banded Column Conditional Formatting)	Specifies that the table formatting applies to odd numbered groupings of columns.
band2Horz (Even Row Stripe Conditional Formatting)	Specifies that the table formatting applies to even numbered groupings of rows.

Enumeration Value	Description
band2Vert (Even Column Stripe Conditional Formatting)	Specifies that the table formatting applies to even numbered groupings of columns.
firstCol (First Column Conditional Formatting)	Specifies that the table formatting applies to the first column.
firstRow (First Row Conditional Formatting)	Specifies that the table formatting applies to the first row. Any subsequent row which has the tblHeader element present (§17.4.49) shall also use this conditional format.
lastCol (Last table column formatting)	Specifies that the table formatting applies to the last column.
lastRow (Last table row formatting)	Specifies that the table formatting applies to the last row.
neCell (Top right table cell formatting)	Specifies that the table formatting applies to the top right cell.
nwCell (Top left table cell formatting)	Specifies that the table formatting applies to the top left cell.
seCell (Bottom right table cell formatting)	Specifies that the table formatting applies to the bottom right cell.
swCell (Bottom left table cell formatting)	Specifies that the table formatting applies to the bottom left cell.
wholeTable (Whole table formatting)	Specifies that the conditional formatting applies to the whole table.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TblStyleOverrideType](#)) is located in §A.1. *end note*]

17.18.90 ST_TblWidth (Table Width Units)

This simple type specifies the possible values for the units of the width property being defined by a specific table width property. These properties are used to define various properties of a table, including: cell spacing, preferred width, and table margins.

[Example: Consider a table with a table cell bottom cell spacing with a type of dxa, as follows:

```
<w:bottom ... w:type="dxa" />
```

This type must therefore be used to interpret the width specified in the w attribute as a value in twentieths of a point. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatically Determined Width)	<p>Specifies that the value for the measurement of the current table width property in the parent table shall be automatically determined by the table layout algorithm when the table is displayed (this width can be adjusted as appropriate).</p> <p>If this value is inappropriate for the current measurement (i.e. this measurement is not affected by that algorithm), then this width type and the associated value can be ignored.</p>
dxa (Width in Twentieths of a Point)	<p>Specifies that the value for the measurement of the current table width property in the parent table shall be interpreted as twentieths of a point (1/1440 of an inch).</p>
nil (No Width)	<p>Specifies that the current width is zero, regardless of any width value specified on the parent element.</p>
pct (Width in Percent of Table Width)	<p>Specifies that the value for the measurement of the current table width property in the parent table shall be interpreted as whole percentage point when a percent sign (U+0025) is present.</p> <p>These percentages shall be calculated relative to the extents specified by the parent XML element.</p> <p>If this value is inappropriate for the current measurement (i.e. this measurement is not part of the width of the table), then this width type and the associated value can be ignored.</p>

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_TblWidth](#)) is located in §A.1. *end note*]

17.18.91 ST_TextAlignment (Vertical Text Alignment Types)

This simple type specifies the type of vertical alignment which shall be used to align the characters on each line in the parent object.

[Example: Consider a paragraph of text of different font sizes, as follows:

This is text of various sizes.

If the text on this paragraph must be aligned based on the top point of the maximum character height, that requirement would be specified as follows in the WordprocessingML:

```
<w:pPr>
  <w:textAlignment w:val="top" />
</w:pPr>
```

The resulting text would be top aligned, as follows:

This is text of **various** sizes.

The characters are all aligned to the maximum character extent on the line. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
auto (Automatically Determine Alignment)	Specifies that all text in the parent object shall be aligned automatically when displayed.
baseline (Align Text at Baseline)	Specifies that all text in the parent object shall be aligned to the baseline of each character when displayed.
bottom (Align Text at Bottom)	Specifies that all text in the parent object shall be aligned to the bottom of each character when displayed.
center (Align Text at Center)	Specifies that all text in the parent object shall be aligned to the center of each character when displayed.
top (Align Text at Top)	Specifies that all text in the parent object shall be aligned to the top of each character when displayed.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextAlignment](#)) is located in §A.1. *end note*]

17.18.92 ST_TextboxTightWrap (Lines To Tight Wrap Within Text Box)

This simple type specifies the lines in the parent paragraph which shall allow the text to be tight wrapped to the paragraph (and not the containing text box) extents when displaying the document.

[Example: Consider a paragraph in a text box which meets the criteria specified above which must allow wrapping to the text extents on its first line only. That requirement would be specified using the following WordprocessingML:

```
<w:pPr>
  <w:textboxTightWrap w:val="firstLineOnly" />
</w:pPr>
```

The resulting paragraph would allow text to tightly wrap to the contents of its first line only. All other lines would wrap to the text box's extents. *end example*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
allLines (Tight Wrap All Lines)	Specifies that all lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
firstAndLastLine (Tight Wrap First and Last Lines)	Specifies that only the first and last lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
firstLineOnly (Tight Wrap First Line)	Specifies that only the first line in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
lastLineOnly (Tight Wrap Last Line)	Specifies that only the last line in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
none (Do Not Tight Wrap)	Specifies that no lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TextboxTightWrap](#)) is located in §A.1. *end note*]

17.18.93 ST_TextDirection (Text Flow Direction)

This simple type specifies the direction of the text flow for the parent object.

[*Example:* Consider an object in which text must be oriented vertically, flowing from left to right horizontally on the page. This is achieved by using an `lr` value in an element of type `ST_TextDirection`. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
lr (Lines Flow From Left to Right)	Specifies that text in the parent object shall be oriented vertically, flowing from left to right

Enumeration Value	Description
	<p>horizontally on the page.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p>
lrV (Lines Flow From Left to Right Rotated)	<p>Specifies that text in the parent object shall be oriented vertically, flowing from left to right horizontally on the page.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p> <p>This flow is also rotated clockwise such that text which is not in an East Asian script is rotated 90 degrees when displayed on a page.</p>
rl (Lines Flow From Right to Left)	<p>Specifies that text in the parent object shall be oriented vertically, flowing from right to left horizontally on the page, as if the text were rotated 90 degrees.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p>
rlV (Lines Flow From Right to Left Rotated)	<p>Specifies that text in the parent object shall be oriented vertically, flowing from right to left horizontally on the page.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p> <p>This flow is also rotated such that text which is not in an East Asian script is rotated 90 degrees clockwise when displayed on a page.</p>
tb (Lines Flow From Top to Bottom)	<p>Specifies that text in the parent object shall be oriented horizontally, flowing from top to bottom vertically on the page.</p> <p>The text direction can be set to right-to-left using the <code>bidirectional</code> element (§17.3.1.6) within individual paragraphs.</p> <p>This means that horizontal lines are filled before the text expands vertically.</p>
tbV (Lines Flow From Top to Bottom Rotated)	<p>Specifies that text in the parent object shall be oriented horizontally, flowing from top to bottom vertically on the page.</p>

Enumeration Value	Description
	<p>This means that horizontal lines are filled before the text expands vertically.</p> <p>This flow is also rotated such that any characters from an East Asian script shall be rotated 270 degrees clockwise when displayed on a page.</p>

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextDirection](#)) is located in §A.1. *end note*]

17.18.94 ST_TextEffect (Animated Text Effects)

This simple type specifies the possible types of animated text effect which can be applied to a text run when it is displayed..

[*Example*: Consider a run of text which must have an animated text effect consisting of multiple colored flashing lights. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:effect w:val="lights"/>
</w:rPr>
```

This run explicitly declares a type of text effect, using the val property, of `lights`, so the contents of this run has the animated lights text effect. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
antsBlack (Black Dashed Line Animation)	Specifies that this text shall be surrounded by an animated black dashed line border.
antsRed (Marching Red Ants)	Specifies that this text shall be surrounded by an animated red dashed line border.
blinkBackground (Blinking Background Animation)	Specifies that this text shall be surrounded by a background color which alternates between black and white.
lights (Colored Lights Animation)	Specifies that this text shall be surrounded by a border consisting of a series of colored lights, which constantly change colors in sequence.
none (No Animation)	Specifies that this text shall have no animated text effect.
shimmer (Shimmer Animation)	Specifies that this text shall be animated by alternating between normal and blurry states.

Enumeration Value	Description
sparkle (Sparkling Lights Animation)	Specifies that this text shall have a background consisting of a random pattern of colored lights, which constantly change colors in sequence.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextEffect](#)) is located in §A.1. *end note*]

17.18.95 ST_TextScale (Text Expansion/Compression Percentage)

This simple type specifies that the percentage by which the contents of a run shall be expanded or compressed with respect to its normal (100%) character width, with a minimum width of 1% and maximum width of 600%.

[*Example*: Consider a run of text which must be compressed by half when displaying each character within the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:w w:val="50%" />
</w:rPr>
```

This run explicitly declares that the `w` value is 50%, so the contents of this run appear at 50% of their normal character width by compressing the width of each character. *end example*]

This simple type is a union of the following types:

- The `ST_TextScalePercent` simple type (§A.1).

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TextScale](#)) is located in §A.1. *end note*]

17.18.96 ST_Theme (Theme Font)

This simple type specifies a theme font type which can be referenced as a theme font within the parent run properties. This theme font is a reference to one of the predefined theme fonts, located in the document's Theme part, which allows for font information to be set centrally in the document.

[*Example*: Consider a run of text which must be displayed using the `majorASCII` theme font. This requirement would be specified as follows in the resulting WordprocessingML:

```
<w:rPr>
  <w:rFonts w:asciiTheme="majorAscii" />
</w:rPr>
```

The `ascii` attribute specifies that the run must use the `majorAscii` theme font as defined in the document's themes part for all text in the appropriate range. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
majorAscii (Major ASCII Theme Font)	Specifies that the current font is a reference to the major theme font for the range of characters from U+0000–U+007F.
majorBidi (Major Complex Script Theme Font)	Specifies that the current font is a reference to the major theme font for the Complex Script range.
majorEastAsia (Major East Asian Theme Font)	Specifies that the current font is a reference to the major theme font for the East Asian range.
majorHAnsi (Major High ANSI Theme Font)	Specifies that the current font is a reference to the major theme font for the High ANSI range.
minorAscii (Minor ASCII Theme Font)	Specifies that the current font is a reference to the minor theme font for the range of characters from U+0000–U+007F.
minorBidi (Minor Complex Script Theme Font)	Specifies that the current font is a reference to the minor theme font for the Complex Script range.
minorEastAsia (Minor East Asian Theme Font)	Specifies that the current font is a reference to the minor theme font for the East Asian range.
minorHAnsi (Minor High ANSI Theme Font)	Specifies that the current font is a reference to the minor theme font for the High ANSI range.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Theme](#)) is located in §A.1. *end note*]

17.18.97 ST_ThemeColor (Theme Color)

This simple type specifies a theme color to be applied to the current object. The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows color information to be set centrally in the document.

[Example: Consider a set of borders configured to use the accent2 theme color, resulting in the following WordprocessingML markup:

```
<w:top ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
<w:bottom ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
<w:left ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
<w:right ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
```

The borders have a themeColor attribute of type ST_ThemeColor that when specified, imports the accent2 theme color specified for this document. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accent1 (Accent 1 Theme Color)	Specifies that the color to be used shall be the theme color specified by the accent1 attribute of the clrSchemeMapping element (§17.15.1.20).
accent2 (Accent 2 Theme Color)	Specifies that the color to be used shall be the theme color specified by the accent2 attribute of the clrSchemeMapping element (§17.15.1.20).
accent3 (Accent 3 Theme Color)	Specifies that the color to be used shall be the theme color specified by the accent3 attribute of the clrSchemeMapping element (§17.15.1.20).
accent4 (Accent 4 Theme Color)	Specifies that the color to be used shall be the theme color specified by the accent4 attribute of the clrSchemeMapping element (§17.15.1.20).
accent5 (Accent 5 Theme Color)	Specifies that the color to be used shall be the theme color specified by the accent5 attribute of the clrSchemeMapping element (§17.15.1.20).
accent6 (Accent 6 Theme Color)	Specifies that the color to be used shall be the theme color specified by the accent6 attribute of the clrSchemeMapping element (§17.15.1.20).
background1 (Background 1 Theme Color)	Specifies that the color to be used shall be the theme color specified by the bg1 attribute of the clrSchemeMapping element (§17.15.1.20).
background2 (Background 2 Theme Color)	Specifies that the color to be used shall be the theme color specified by the bg2 attribute of the clrSchemeMapping element (§17.15.1.20).
dark1 (Dark 1 Theme Color)	Specifies that the color to be used shall be the theme color specified by the t1 attribute of the clrSchemeMapping element (§17.15.1.20).
dark2 (Dark 2 Theme Color)	Specifies that the color to be used shall be the theme color specified by the t2 attribute of the clrSchemeMapping element (§17.15.1.20).
followedHyperlink (Followed Hyperlink Theme Color)	Specifies that the color to be used shall be the theme color specified by the followedHyperlink attribute of the clrSchemeMapping element (§17.15.1.20).
hyperlink (Hyperlink Theme Color)	Specifies that the color to be used shall be the theme color specified by the hyperlink attribute of the clrSchemeMapping element (§17.15.1.20).
light1 (Light 1 Theme Color)	Specifies that the color to be used shall be the theme color specified by the bg1 attribute of the clrSchemeMapping element (§17.15.1.20).

Enumeration Value	Description
light2 (Light 2 Theme Color)	Specifies that the color to be used shall be the theme color specified by the bg2 attribute of the clrSchemeMapping element (§17.15.1.20).
none (No Theme Color)	Specifies that no theme color shall be applied to the current object.
text1 (Text 1 Theme Color)	Specifies that the color to be used shall be the theme color specified by the t1 attribute of the clrSchemeMapping element (§17.15.1.20).
text2 (Text 2 Theme Color)	Specifies that the color to be used shall be the theme color specified by the t2 attribute of the clrSchemeMapping element (§17.15.1.20).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ThemeColor](#)) is located in §A.1. *end note*]

17.18.98 ST_UcharHexNumber (Two Digit Hexadecimal Value)

This simple type specifies a number value specified as a one octet (two digit) hexadecimal number, whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following value for a node of type ST_UcharHexNumber: BE.

This value is permitted, as it contains two hexadecimal digits, as an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 2 hexadecimal digit(s).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_UcharHexNumber](#)) is located in §A.1. *end note*]

17.18.99 ST_Underline (Underline Patterns)

This simple type specifies the types of patterns which can be used to create the underline applied beneath the text in a run.

[Example: Consider a run of text which must have a double underline explicitly turned on for the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:u w:val="double"/>
</w:rPr>
```

The val of the underline on this run is double, so the style of the underline on this run must be a double line.
end example]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
dash (Dashed Underline)	Specifies an underline consisting of a dashed line beneath all characters in this run. <i>[Example:</i> <u>Underline text.</u> <i>end example]</i>
dashDotDotHeavy (Thick Dash-Dot-Dot Underline)	Specifies an underline consisting of a series of thick dash, dot, dot characters beneath all characters in this run. <i>[Example:</i> <u>Underline text.</u> <i>end example]</i>
dashDotHeavy (Thick Dash-Dot Underline)	Specifies an underline consisting of a series of thick dash, dot characters beneath all characters in this run. <i>[Example:</i> <u>Underline text.</u> <i>end example]</i>
dashedHeavy (Thick Dashed Underline)	Specifies an underline consisting of a series of thick dashes beneath all characters in this run. <i>[Example:</i> <u>Underline text.</u> <i>end example]</i>
dashLong (Long Dashed Underline)	Specifies an underline consisting of long dashed characters beneath all characters in this run. <i>[Example:</i>

Enumeration Value	Description
	<p><u>Underline text.</u></p> <p><i>end example]</i></p>
dashLongHeavy (Thick Long Dashed Underline)	<p>Specifies an underline consisting of thick long dashed characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dotDash (Dash-Dot Underline)	<p>Specifies an underline consisting of a series of dash, dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dotDotDash (Dash-Dot-Dot Underline)	<p>Specifies an underline consisting of a series of dash, dot, dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dotted (Dotted Underline)	<p>Specifies an underline consisting of a series of dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dottedHeavy (Thick Dotted Underline)	<p>Specifies an underline consisting of a series of thick dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p>

Enumeration Value	Description
	<i>end example]</i>
double (Double Underline)	<p>Specifies an underline consisting of two lines beneath all characters in this run.</p> <p>[Example:</p> <p><u><u>Underline text.</u></u></p> <p><i>end example]</i></p>
none (No Underline)	<p>Specifies no underline beneath this run.</p> <p>[Example:</p> <p>Underline text.</p> <p><i>end example]</i></p>
single (Single Underline)	<p>Specifies an underline consisting of a single line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
thick (Thick Underline)	<p>Specifies an underline consisting of a single thick line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
wave (Wave Underline)	<p>Specifies an underline consisting of a single wavy line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
wavyDouble (Double Wave Underline)	<p>Specifies an underline consisting of a pair of wavy lines beneath all characters in this run.</p>

Enumeration Value	Description
	<p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
wavyHeavy (Heavy Wave Underline)	<p>Specifies an underline consisting of a single thick wavy line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
words (Underline Non-Space Characters Only)	<p>Specifies an underline consisting of a single line beneath all non-space characters in the run. There shall be no underline beneath any space character (breaking or non-breaking).</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>

[Note: The W3C XML Schema definition of this simple type's content model ([ST Underline](#)) is located in §A.1. end note]

17.18.100 ST_VAnchor (Vertical Anchor Location)

This simple type specifies the vertical position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final vertical position of the object in the document.

[Example: Consider a text frame which should be positioned one inch to the right of its column in a left-to-right document. This text frame would be specified using the following WordprocessingML:

```
<w:pPr>
  <w:framePr ... w:y="1440" w:vAnchor="page" />
</w:pPr>
```

These frame vertical anchor properties specify that they are relative to the anchor paragraph's page. end example]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
margin (Relative To Margin)	Specifies that the parent object shall be vertically anchored to the text margins. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the text margin.
page (Relative To Page)	Specifies that the parent object shall be vertically anchored to the page edge. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the edge of the page.
text (Relative To Vertical Text Extents)	Specifies that the parent object shall be vertically anchored to the text extents. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the text in the anchor paragraph.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_VAnchor](#)) is located in §A.1. *end note*]

17.18.101 ST_VerticalJc (Vertical Alignment Type)

This simple type specifies the vertical alignment for text between the top and bottom margins of the parent container (page or table cell).

[*Example*: Consider a region where the text must be vertically centered in the parent element. This would require a val value of center, in order to specify that all justification vertically must be centered relative to the parent. For a section, this setting would be specified as follows:

```
<w:vAlign w:val="center" />
```

The val attribute of center specifies that the content is centered relative to its container . *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
both (Vertical Justification)	Specifies that the text shall be vertically justified

Enumeration Value	Description
	<p>between the top and bottom margins of the parent object, by adding additional line spacing to each paragraph as required.</p> <p>This setting is only applied for the content of the section which is displayed on full pages. If the content does not use the full page (e.g. another section begins on the same page, or the document ends mid-page), then the value shall be ignored when rendering that page (returning to the default value of top)</p> <p>This value is only permitted for page justification settings, and shall be ignored when specified on a table cell (returning to the default value of top).</p>
bottom (Align Bottom)	Specifies that the text shall be vertically aligned to the bottom margin of the parent object, by moving all text to the bottom text extent within the parent object as required.
center (Align Center)	Specifies that the text shall be vertically aligned to the center of the parent object..
top (Align Top)	Specifies that the text shall be vertically aligned to the top margin of the parent object, by moving all text to the top text extent within the parent object as required.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_VerticalJc](#)) is located in §A.1. *end note*]

17.18.102 ST_View (Document View Values)

This simple type defines the possible views which can be used to determine how WordprocessingML documents can be rendered when displayed by an application.

[Example: Consider a WordprocessingML document that must be displayed on the screen in the same form as it is printed. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:view w:val="print" />
```

The view element's val attribute is equal to print specifying that the given WordprocessingML document must be rendered as it is printed. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
masterPages (Master Document View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents. [<i>Note</i> : This setting can be interpreted as functionally equivalent to the <code>outline</code> setting, as it only remains separate to support legacy applications. <i>end note</i>]
none (Default View)	Specifies that a given WordprocessingML document shall be rendered in the default view of the application.
normal (Draft View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.
outline (Outline View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.
print (Print Layout View)	Specifies that this document shall be opened in a view that displays the document as it prints.
web (Web Page View)	Specifies that a given WordprocessingML document shall be rendered in a view mimicking the way this document would be displayed in a web page.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_View](#)) is located in §A.1. *end note*]

17.18.103 ST_WmlColorSchemeIndex (Theme Color Reference)

This simple type specifies the possible set of theme color stored in the document's Theme part which can be referenced by document content. This reference is used to map the use of the theme colors in the `ST_ThemeColor` enumeration to the theme colors in the theme part.

[*Example*: Consider a WordprocessingML document that must have references to the theme color `accent1` mapped to the theme color `lt1` as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:

```
<w:clrSchemeMapping w:accent1="light1" />
```

The `accent1` attribute has a value of `light1`, specifying that uses of the theme color value `accent1` must be mapped to the theme color `lt1`. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
accent1 (Accent 1 Theme Color Reference)	Specifies a reference to the accent1 theme color in the document's Theme part.
accent2 (Accent 2 Theme Color Reference)	Specifies a reference to the accent2 theme color in the document's Theme part.
accent3 (Accent 3 Theme Color Reference)	Specifies a reference to the accent3 theme color in the document's Theme part.
accent4 (Accent4 Theme Color Reference)	Specifies a reference to the accent4 theme color in the document's Theme part.
accent5 (Accent5 Theme Color Reference)	Specifies a reference to the accent5 theme color in the document's Theme part.
accent6 (Accent 6 Theme Color Reference)	Specifies a reference to the accent6 theme color in the document's Theme part.
dark1 (Dark 1 Theme Color Reference)	Specifies a reference to the dk1 theme color in the document's Theme part.
dark2 (Dark 2 Theme Color Reference)	Specifies a reference to the dk2 theme color in the document's Theme part.
followedHyperlink (Followed Hyperlink Theme Color Reference)	Specifies a reference to the folHlink theme color in the document's Theme part.
hyperlink (Hyperlink Theme Color Reference)	Specifies a reference to the hlink theme color in the document's Theme part.
light1 (Light 1 Theme Color Reference)	Specifies a reference to the lt1 theme color in the document's Theme part.
light2 (Light 2 Theme Color Reference)	Specifies a reference to the lt2 theme color in the document's Theme part.

[Note: The W3C XML Schema definition of this simple type's content model ([ST_WmlColorSchemeIndex](#)) is located in §A.1. *end note*]

17.18.104 ST_Wrap (Text Wrapping around Text Frame Type)

This simple type specifies the type of text wrapping which shall be allowed around a text frame within a document.

[Example: Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
  <w:pPr>
    <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="text" w:hAnchor="page" w:x="1643" w:y="73" />
  </w:pPr>
```

```

<w:r>
  <w:t>Text Frame Content.</w:t>
</w:r>
</w:p>

```

This wrap attribute on this text frame specifies that when the frame is rendered on the page, any non-text frame paragraphs which would normally flow onto the same lines must be allowed to wrap around it. *end example]*

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
around (Allow Text Wrapping Around Frame)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document.
auto (Default Text Wrapping Around Frame)	Specifies that text shall have the default application-defined behavior of the application displaying the WordprocessingML document with regard to the text wrapping displayed around the frame.
none (No Text Wrapping Around Frame)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this text frame. Any text content shall therefore be placed on the next line following this text frame which does not intersect with the frame's extents.
notBeside (No Text Wrapping Beside Frame)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this text frame. Any text content shall therefore be placed on the next line following this text frame which does not intersect with the frame's extents.
through (Through Text Wrapping Around Frame)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document.
tight (Tight Text Wrapping Around Frame)	Specifies that text shall be allowed to tightly wrap around the remaining space on each line around this text frame in the document.

[Note: The W3C XML Schema definition of this simple type's content model ([ST Wrap](#)) is located in §A.1. *end note]*

17.18.105 ST_Zoom (Magnification Preset Values)

This simple type specifies the type of magnification settings which can be applied to a given document on open.

[*Example*: Consider a WordprocessingML document that should be visible without any horizontal scrolling when it is displayed. This requirement would be specified using the following WordprocessingML:

```
<w:zoom w:val="bestFit" w:percent="90%" />
```

The val attribute is equal to the value bestFit specifying that an application must dynamically calculate the magnification needed such that the given document must be visible on the horizontal plane of the document with no horizontal scrolling required to see any part of the WordprocessingML document's pages. *end example*]

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

Enumeration Value	Description
bestFit (Display Page Width)	Specifies that the magnification setting shall be adjusted to ensure the width of the current page matches the available window width.
fullPage (Display One Full Page)	Specifies that the magnification setting shall be adjusted to ensure that one full page can be seen at a time.
none (No Preset Magnification)	Specifies that no preset magnification is present, and the last known cached setting shall be used.
textFit (Display Text Width)	Specifies that the magnification setting shall be adjusted to ensure the width of the text extents on the current page matches the available window width.

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Zoom](#)) is located in §A.1. *end note*]

17.18.106 ST_TextScalePercent (Text Expansion/Compression Percentage)

This simple type specifies that the percentage by which the contents of a run shall be expanded or compressed with respect to its normal (100%) character width, with a minimum width of 1% and maximum width of 600%.

[*Example*: Consider a run of text that must be compressed by half when displaying each character within the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>  
  <w:w w:val="50%" />  
</w:rPr>
```

This run explicitly declares that the *w* value is 50%, so the contents of this run appear at 50% of their normal character width by compressing the width of each character. *end example*]

This simple type also specifies the following restrictions:

This simple type's contents shall match the following regular expression pattern:

`0*(600|([0-5]?[0-9]?[0-9]))%`.

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TextScalePercent) is located in §A.1. *end note*]

17.18.107 ST_MeasurementOrPercent (Measurement or Percentage Value)

This simple type specifies the possible values for a table measurement, which can be percentage-based or absolute. See the union's member types for details.

This simple type is a union of the following types:

The ST_DecimalNumberOrPercent simple type (§17.18.11).

The ST_UniversalMeasure simple type (§22.9.2.15).

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_MeasurementOrPercent) is located in §A.1. *end note*]

18. SpreadsheetML Reference Material

[Note: For further information on the mapping of elements and attributes to OPC parts, see the Bibliography entry, “Information on elements, attributes, and OPC parts in ECMA-376 (OOXML)”. *end note*]

The subordinate subclauses specify the semantics for the XML markup comprising a SpreadsheetML document, as defined by §12 of this Part of ECMA-376.

18.1 Table of Contents

This subclause is informative.

18.2	Workbook	1537
18.2.1	bookViews (Workbook Views).....	1538
18.2.2	calcPr (Calculation Properties)	1538

End of informative text.

18.2 Workbook

A workbook is composed of workbook-level properties and a collection of 1 or more sheets. The sheets are the central structure within a workbook, and can contain cells, which, in turn, can contain the text, numbers, dates, formulas, and other constructs of a workbook. The workbook part and corresponding properties comprise data used to set application and workbook-level operational state. The workbook also serves to bind all the sheets and child elements into an organized single file. The workbook XML attributes and elements include information about what application last saved the file, where and how the windows of the workbook were positioned, and an enumeration of the worksheets in the workbook.

It is important for the sake of simplicity to minimize the *required* set of workbook XML attributes and elements that shall be present to compose a valid SpreadsheetML workbook. Therefore this is the XML for the smallest possible (blank) workbook:

```
<workbook>
```

```
<sheets>
  <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
</sheets>
</workbook>
```

Note that this workbook has a single sheet, named Sheet1. An Id for the sheet is required, and a relationship Id pointing to the location of the sheet definition is also required.

18.2.1 bookViews (Workbook Views)

This element specifies the collection of workbook views of the enclosing workbook. Each view can specify a window position, filter options, and other configurations. There is no limit on the number of workbook views that can be defined for a workbook.

[Example:

```
<bookViews>
  <workbookView showHorizontalScroll="0" showVerticalScroll="0"
    showSheetTabs="0" xWindow="120" yWindow="45" windowWidth="15135"
    windowHeight="8130" activeTab="2" autoFilterDateGrouping="0"/>
</bookViews>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT BookViews](#)) is located in §A.2. end note]

18.2.2 calcPr (Calculation Properties)

This element defines the collection of properties the application uses to record calculation status and details. Calculation is the process of computing formulas and then displaying the results as values in the cells that contain the formulas.

[Example:

```
<calcPr calcId="122211" calcMode="auto" refMode="R1C1" iterate="1"
  fullPrecision="0"/>
```

end example]

Attributes	Description
calcCompleted (Calc Completed)	<p>Specifies a boolean value that determines whether workbook data was recalculated before the workbook was saved.</p> <p>A value of 1 or true indicates recalculation was completed before save.</p> <p>A value of 0 or false indicates that recalculation was not completed before save.</p>

Attributes	Description
	<p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
calcId (Calculation Id)	<p>Specifies the version of the calculation engine used to calculate values in the workbook. When you open a workbook created in the current version, the application recalculates only the formulas that depend on cells that have changed. When you open a workbook that was created in an earlier version of the application, all the formulas in the workbook— those that depend on cells that have changed and those that do not— are recalculated. This ensures that the workbook is fully optimized for the current application version.</p> <p>The value for calcID depends on the application. SpreadsheetML defaults form [version][build], where [version] refers to the version of the application, and [build] refers to the build of the application when the calculation engine changed.</p> <p>[Example:</p> <pre data-bbox="451 940 852 970"><calcPr calcId="122211"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
calcMode (Calculation Mode)	<p>Specifies when the application should calculate formulas in the workbook.</p> <p>The default value for this attribute is "auto."</p> <p>The possible values for this attribute are defined by the ST_CalcMode simple type (§18.18.4).</p>
calcOnSave (Calculate On Save)	<p>Specifies a boolean value that indicates whether the application recalculates values when the workbook is saved.</p> <p>A value of 1 or true indicates recalculation is performed when the workbook is saved.</p> <p>A value of 0 or false indicates recalculation is not performed when the workbook is saved.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
concurrentCalc (Concurrent	<p>Specifies a boolean value that indicates whether concurrent calculation processes are enabled for this workbook.</p>

Attributes	Description
Calculations)	<p>A value of on, 1, or true indicates concurrent calculations are enabled in this workbook.</p> <p>A value of 0 or false indicates concurrent calculations are not enabled.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
concurrentManual Count (Concurrent Thread Manual Count)	<p>Specifies the count of concurrent calculation processes manually set by the user. If omitted, the count is set automatically by the application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
forceFullCalc (Force Full Calculation)	<p>Specifies a boolean value that indicates whether the application performs a full recalculation when one was not indicated by other calculation properties. This attribute allows the application to expose mechanisms in the user interface that give users the ability to trigger when full recalculations take place.</p> <p>A value of 1 or true indicates the application performs a full recalculation of the workbook.</p> <p>A value of 0 or false indicates the application does not perform a full recalculation of the workbook.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fullCalcOnLoad (Full Calculation On Load)	<p>Specifies a boolean value that indicates whether the application shall perform a full recalculation when the workbook is opened. After load and successful calculation, the application should set this value to false. The application should set this value to true when cell formulas or values are modified by another process while the application has the workbook opened.</p> <p>A value of 1 or true indicates the application performs a full recalculation of workbook values when the workbook is opened.</p> <p>A value of 0 or false indicates the application does not perform a full recalculation when the workbook is opened.</p> <p>[Note: If manual calcMode is true, then a full recalculation does not performed on load, even when this attribute is set. end note]</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
fullPrecision (Full Precision Calculation)	<p>Specifies a boolean that indicates the precision the application uses when performing calculations in the workbook. Full precision means that the application uses the entire value(s) stored in cells referenced by the formula to perform the calculation.</p> <p><i>[Example: If two cells each contain the value 10.005 and the cells are formatted to display values in currency format, the value \$10.01 is displayed in each cell. If you add the two cells together, the result is \$20.01 because the application adds the stored values 10.005 and 10.005, not the displayed values. You can change the precision of calculations so that the application uses the displayed value instead of the stored value when it recalculates formulas.</i></p> <p>For the above example, if fullPrecision is false, then the result must be \$20.02, because each cell shows \$10.01, so those are the values to be added. Furthermore, when fullPrecision is false, the calculated value as displayed must be saved to file. <i>end example</i></p> <p>A value of 1 or true indicates the application uses the stored values of the referenced cells when performing calculations.</p> <p>A value of 0 or false indicates the application uses the display values of the referenced cells when performing calculations.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
iterate (Calculation Iteration)	<p>Specifies a boolean value that indicates whether the application should attempt to calculate formulas that contain circular references. A circular reference is a formula that refers to the cell— either directly or indirectly— that contains the formula. If a formula refers back to one of its own cells, you shall determine how many times the formula should recalculate.</p> <p>A value of on, 1, or true indicates the application should attempt to calculate circular references. The calculation engine performs iterative iterateCount calculations to before stopping.</p> <p>A value of 0 or false indicates that the application should not attempt to calculate formulas with circular references. The calculation engine stops on the first iteration when it encounters a circular references.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
iterateCount (Iteration Count)	Specifies the number of iterations the calculation engine attempts when calculating a workbook with circular references, when iterate is true.

Attributes	Description
	<p>The default value for this attribute is 100.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
iterateDelta (Iterative Calculation Delta)	<p>Specifies a double that contains the maximum change for iterative calculations. The application stops calculating after iterateCount iterations or after all values in the circular reference change by less than iterateDelta between iterations, whichever comes first.</p> <p>The default value for this attribute is "0.001"</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
refMode (Reference Mode)	<p>Specifies the reference style for this workbook. Instead of using letters for columns and numbers for rows ("A1"), this option enables using numbers for both rows and columns. Cells are then referred to in this format: R1C1.</p> <p>The default value for this attribute is "A1."</p> <p>The possible values for this attribute are defined by the ST_RefMode simple type (§18.18.64).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_CalcPr](#)) is located in §A.2. *end note*]

18.2.3 customWorkbookView (Custom Workbook View)

This element specifies a single custom workbook view. A custom workbook view consists of a set of display and print settings that you can name and apply to a workbook. You can create more than one custom workbook view of the same workbook. Custom Workbook Views are not required in order to construct a valid SpreadsheetML document, and are not necessary if the document is never displayed by a spreadsheet application, or if the spreadsheet application has a fixed display for workbooks. However, if a spreadsheet application chooses to implement configurable display modes, the customWorkbookView element should be used to persist the settings for those display modes. The settings fall into the following categories, and individual settings are detailed in the table following:

Window settings - these include size and positioning of the spreadsheet window as well as which window features should be displayed (scrollbars, sheet tabs, etc.).

Workbook content display and print settings - specifies whether features in the workbook should be included or ignored by a spreadsheet application when a custom workbook view is displayed or printed. *[Example: Whether comments in the workbook should be displayed and how objects such as images should be displayed can be controlled by a Custom Workbook View. end example]*

Persistence settings - these include settings that describe how a spreadsheet application should update persisted SpreadsheetML content if multiple spreadsheet applications are accessing a common instance of the SpreadsheetML document at the same time.

When a Custom Workbook View is present, there should also be corresponding customSheetView (§18.3.1.25) elements for each sheet (§18.2.19) in the workbook. The guid attribute of these customSheetView elements associates the customSheetView with the appropriate customWorkbookView. Attributes on the customWorkbookView element should be used to determine which settings within the Custom Sheet View should be respected by a spreadsheet application if the Custom Workbook View is displayed.

Attributes	Description
activeSheetId (Active Sheet in Book View)	<p>Specifies the sheetId of a sheet in the workbook that identifies to a consuming application the default sheet to display. Corresponds to a sheetId of a sheet in the sheets collection.</p> <p>This attribute is required.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
autoUpdate (Auto Update)	<p>Specifies a boolean value that is an instruction that if the workbook is loaded by a spreadsheet application, that spreadsheet application should automatically update changes at the interval specified by the mergeInterval attribute. This is only applicable for shared workbooks (§18.11).</p> <p>A value of 1 or true is an instruction to the spreadsheet application to update changes at the interval specified in the mergeInterval attribute.</p> <p>A value of 0 or false is an instruction to the spreadsheet application to update changes whenever the spreadsheet application generates SpreadsheetML representing the workbook.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
changesSavedWin (Changes Saved Win)	<p>Specifies a boolean value that instructs a spreadsheet application to overwrite the persisted version of the document with the updated version being persisted. This is only applicable for shared workbooks in automatic update mode.</p> <p>A value of 1 or true instructs a spreadsheet application to overwrite changes in the persisted version of a shared workbook when conflicts in data are found.</p> <p>A value of 0 or false instructs a spreadsheet application to not overwrite changes in the persisted version of a shared workbook when conflicts are found.</p> <p>The default value for this attribute is false.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
guid (Custom View GUID)	<p>Specifies a globally unique identifier (GUID) for this custom view</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
includeHiddenRowCol (Include Hidden Rows & Columns)	<p>Specifies a boolean value that indicates whether to include hidden rows, columns, and filter settings in this custom view.</p> <p>A value of 1 or true indicates that hidden rows, columns, and filter settings are included in this custom view.</p> <p>A value of 0 or false indicates that hidden rows, columns, and filter settings are not included.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
includePrintSettings (Include Print Settings)	<p>Specifies a boolean value that indicates whether to include print settings in this custom view.</p> <p>A value of 1 or true indicates that print settings are included in this custom view.</p> <p>A value of 0 or false indicates print settings are not included in this custom view.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
maximized (Maximized)	<p>Specifies a boolean value that indicates whether the workbook window is maximized.</p> <p>A value of 1 or true indicates the workbook window is maximized.</p> <p>A value of 0 or false indicates the workbook window is not maximized.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
mergeInterval (Merge Interval)	<p>Automatic update interval (in minutes). Only applicable for shared workbooks in automatic update mode.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.
minimized (Minimized)	<p>Specifies a boolean value that indicates whether the workbook window is minimized.</p> <p>A value of 1 or true indicates the workbook window is minimized.</p> <p>A value of 0 or false indicates the workbook window is not minimized.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
name (Custom View Name)	<p>Specifies the name of the custom view.</p> <p>This attribute is required.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
onlySync (Only Synch)	<p>Specifies a boolean value that indicates, during automatic update, the current user's changes are not saved. The workbook is only updated with other users' changes. Only applicable for shared workbooks in automatic update mode.</p> <p>A value of 1 or true indicates the current user's changes is not saved during automatic update.</p> <p>A value of 0 or false indicates the current user's is saved during automatic update.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
personalView (Personal View)	<p>Specifies a boolean value that indicates that this custom view is a personal view for a shared workbook user. Only applicable for shared workbooks. Personal views allow each user of a shared workbook to store their individual print and filter settings.</p> <p>A value of 1 or true indicates this custom view is a personal view for a shared workbook user.</p> <p>A value of 0 or false indicates this view is not a personal view.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showComments	Specifies how comments are displayed in this custom view

Attributes	Description
(Show Comments)	<p>The possible values for this attribute are defined by the ST_Comments simple type (§18.18.14).</p>
<p>showFormulaBar (Show Formula Bar)</p>	<p>Specifies a boolean value that indicates whether to display the formula bar in the application user interface.</p> <p>A value of 1 or true indicates the formula bar is shown in the user interface.</p> <p>A value of 0 or false indicates the formula bar is not shown in the user interface.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showHorizontalScroll (Show Horizontal Scroll)</p>	<p>Specifies a boolean value that indicates whether to display the horizontal scroll bar in the user interface.</p> <p>A value of 1 or true indicates that the horizontal scrollbar is shown.</p> <p>A value of 0 or false indicates that the horizontal scrollbar is not shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showObjects (Show Objects)</p>	<p>Specifies how objects are displayed in this custom view.</p> <p>The default value for this attribute is "all."</p> <p>The possible values for this attribute are defined by the ST_Objects simple type (§18.18.48).</p>
<p>showSheetTabs (Show Sheet Tabs)</p>	<p>Specifies a boolean value that indicates whether to display the sheet tabs in the user interface.</p> <p>A value of 1 or true indicates that sheet tabs shall be shown.</p> <p>A value of 0 or false indicates that sheet tabs shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showStatusbar (Show Status Bar)</p>	<p>Specifies a boolean value that indicates whether to display the status bar in the user interface.</p>

Attributes	Description
	<p>A value of 1 or true indicates that the status bar is shown.</p> <p>A value of 0 or false indicates the status bar is not shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showVerticalScroll (Show Vertical Scroll)	<p>Specifies a boolean value that indicates whether to display the vertical scroll bar.</p> <p>A value of 1 or true indicates the vertical scrollbar shall be shown.</p> <p>A value of 0 or false indicates the vertical scrollbar shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tabRatio (Sheet Tab Ratio)	<p>Specifies the ratio between the workbook tabs bar and the horizontal scroll bar. tabRatio is assumed to be out of 1000 of the horizontal window width.</p> <p>The default value for this attribute is 600.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
windowHeight (Window Height)	<p>Specifies the height of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
windowWidth (Window Width)	<p>Specifies the width of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
xWindow (Top Left Corner (X Coordinate))	<p>Specifies the X coordinate for the upper left corner of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
yWindow (Top Left Corner (Y Coordinate))	<p>Specifies the Y coordinate for the upper left corner of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT CustomWorkbookView](#)) is located in §A.2. *end note*]

18.2.4 customWorkbookViews (Custom Workbook Views)

This element defines the collection of custom workbook views that are defined for this workbook. A customWorkbookView is similar in concept to a workbookView (§18.2.30) in that its attributes contain settings related to the way that the workbook should be displayed on a screen by a spreadsheet application.

[*Note:* Whilst a workbookView is intended to store the way the workbook window should be displayed by a spreadsheet application, customWorkbookView elements are intended to allow the user to switch between a selection of customWorkbookView items defining window and content display options. *end note*]

A customWorkbookView contains a greater number of settings (e.g., the presence of a formula bar; visibility of hidden data; whether or not to show comments) and is named.

[*Example:* A workbook which is used by two different departments might contain two customWorkbookView elements – one where the comments and hidden data are not shown, and one where they are. Users might switch between the customWorkbookView items according to the department in which they work. *end example*]

There is no limit on the number of custom views that can be contained within a SpreadsheetML instance.

[*Example:*

```
<customWorkbookViews>
  <customWorkbookView name="CustomView"
    guid="{CE6681F1-E999-414D-8446-68A031534B57}" maximized="1" xWindow="1"
    yWindow="1" windowWidth="1024" windowHeight="547" activeSheetId="1"/>
</customWorkbookViews>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT CustomWorkbookViews](#)) is located in §A.2. *end note*]

18.2.5 definedName (Defined Name)

This element defines the defined names that are defined within this workbook. Defined names are descriptive text that is used to represents a cell, range of cells, formula, or constant value. Use easy-to-understand names, such as Products, to refer to hard to understand ranges, such as Sales!C20:C30.

A defined name in a formula can make it easier to understand the purpose of the formula. [*Example:* The formula =SUM(FirstQuarterSales) might be easier to identify than =SUM(C20:C30). *end example*]

Names are available to any sheet. *[Example: If the name ProjectedSales refers to the range A20:A30 on the first worksheet in a workbook, you can use the name ProjectedSales on any other sheet in the same workbook to refer to range A20:A30 on the first worksheet. end example]*

Names can also be used to represent formulas or values that do not change (constants). *[Example: The name SalesTax can be used to represent the sales tax amount (such as 6.2 percent) applied to sales transactions. end example]*

You can also link to a defined name in another workbook, or define a name that refers to cells in another workbook. *[Example: The formula =SUM(Sales.xls!ProjectedSales) refers to the named range ProjectedSales in the workbook named Sales. end example]*

A compliant producer or consumer considers a defined name in the range A1-XFD1048576 to be an error.

All other names outside this range can be defined as names and overrides a cell reference if an ambiguity exists.

[Example: For clarification: LOG10 is always a cell reference, LOG10() is always formula, LOGO1000 can be a defined name that overrides a cell reference. end example]

Attributes	Description
comment (Comment)	Specifies the comment the user provided when the name was created. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
customMenu (Custom Menu Text)	Specifies custom menu text for the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
description (Description)	Specifies description text for the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
function (Function)	Specifies a boolean value that indicates that the defined name refers to a user-defined function. This attribute is used when there is an add-in or other code project associated with the file. A value of 1 or true indicates the name refers to a function. A value of 0 or false indicates the name does not refer to a function. The default value for this attribute is false. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
functionGroupId	Specifies the function group index if the defined name refers to a function. The function

Attributes	Description
(Function Group Id)	<p>group defines the general category for the function. This attribute is used when there is an add-in or other code project associated with the file.</p> <p>The following functionGroupIds are defined in SpreadsheetML for applications that support the association of an add-in or code project for their workbook:</p> <ul style="list-style-type: none"> • 1 Financial • 2 Date and Time • 3 Math and Trig • 4 Statistical • 5 Lookup and Reference • 6 Database • 7 Text • 8 Logical • 9 Information • 10 Commands • 11 Customizing • 12 Macro Control • 13 DDE / External • 14 User Defined • 15 Engineering • 16 Cube <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
help (Help)	<p>Specifies the help topic to display for this defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
hidden (Hidden Name)	<p>Specifies a boolean value that indicates whether the defined name is hidden in the user interface.</p> <p>A value of 1 or true indicates the name is hidden.</p> <p>A value of 0 or false indicates the name is not hidden.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
localSheetId (Local Name Sheet Id)	<p>Specifies the sheet index in this workbook where data from an external reference is displayed.</p> <p>[Example: In the following example, the defined name refers to a range whose data source is an external database called "Northwind_Database":</p> <pre><definedName name="Northwind_Database"</pre>

Attributes	Description
	<p><code>localSheetId="2">Sheet5!\$A\$1:\$T\$47</definedName></code> <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
name (Defined Name)	<p>Specifies the name that appears in the user interface for the defined name. This attribute is required. The following built-in names are defined in this SpreadsheetML specification:</p> <ul style="list-style-type: none"> • • Print <ul style="list-style-type: none"> • <code>_xlnm.Print_Area</code>: this defined name specifies the workbook's print area. • <code>_xlnm.Print_Titles</code>: this defined name specifies the row(s) or column(s) to repeat at the top of each printed page. • • Filter & Advanced Filter <ul style="list-style-type: none"> • <code>_xlnm.Criteria</code>: this defined name refers to a range containing the criteria values to be used in applying an advanced filter to a range of data. • <code>_xlnm.FilterDatabase</code>: can be one of the following <ul style="list-style-type: none"> a. this defined name refers to a range to which an advanced filter has been applied. This represents the source data range, unfiltered. b. This defined name refers to a range to which an AutoFilter has been applied. • <code>_xlnm.Extract</code>: this defined name refers to the range containing the filtered output values resulting from applying an advanced filter criteria to a source range. • • Miscellaneous <ul style="list-style-type: none"> • <code>_xlnm.Consolidate_Area</code>: the defined name refers to a consolidation area. • <code>_xlnm.Database</code>: the range specified in the defined name is from a database data source. • <code>_xlnm.Sheet_Title</code>: the defined name refers to a sheet title. • <p>Built-in names reserved by SpreadsheetML begin with "<code>_xlnm.</code>". End users shall not use this string for custom names in the user interface.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
publishToServer (Publish To Server)	<p>Specifies a boolean value that indicates whether the defined name is included in the version of the workbook that is published to or rendered on a Web or application server.</p> <p>A value of 1 or true indicates the name shall be published.</p> <p>A value of 0 or false indicates the name shall not be published.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
shortcutKey (Shortcut Key)	<p>Specifies the keyboard shortcut for the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
statusBar (Status Bar)	<p>Specifies text that is displayed on the application status bar when the user places focus on the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
vbProcedure (Procedure)	<p>Specifies a boolean value that indicates whether the defined name is related to an external function, command, or other executable code.</p> <p>A value of 1 or true indicates the name is related to an external function, command, or other executable code, and the loading application can optionally decide whether to load and/or execute the commands.</p> <p>A value of 0 or false indicates the name does not refer to an external function, command, or other executable code.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
workbookParameter (Workbook Parameter (Server))	<p>Specifies a boolean value that indicates that the name is used as a workbook parameter on a version of the workbook that is published to or rendered on a Web or application server.</p> <p>A value of 1 or true indicates the name is used as a workbook parameter on the application server.</p> <p>A value of 0 or false indicates the name is not used as a workbook parameter on the application server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
xlm (External Function)	<p>Specifies a boolean value that indicates whether the defined name is related to an external function, command, or other executable code.</p> <p>A value of 1 or true indicates the name is related to an external function, command, or other executable code, and the loading application can optionally decide whether to load and/or execute the commands.</p> <p>A value of 0 or false indicates the name does not refer to an external function,</p>

Attributes	Description
	<p>command, or other executable code.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>Xml:space (Content Contains Significant Whitespace)</p> <p>Namespace: http://www.w3.org/XML/1998/namespace</p>	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DefinedName](#)) is located in §A.2. end note]

18.2.6 definedNames (Defined Names)

This element defines the collection of defined names for this workbook. Defined names are descriptive names to represent cells, ranges of cells, formulas, or constant values. Defined names can be used to represent a range on any worksheet.

[Example:

```
<definedNames>
  <definedName name="NamedFormula"
    comment="Comment text for defined name.">SUM(Sheet3!$B$2:$B$9)</definedName>
  <definedName name="NamedRange">Sheet3!$A$1:$C$12</definedName>
  <definedName name="NamedRangeFromExternalReference" localSheetId="2"
    hidden="1">Sheet5!$A$1:$T$47</definedName>
</definedNames>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_DefinedNames](#)) is located in §A.2. end note]

18.2.7 ext (Extension)

Each extension within an extension list shall be contained within an ext element. Extensions shall be versioned by namespace, using the uri attribute, and shall be allowed to appear in any order within the extension list. Any number of extensions shall be allowed within an extension list.

When extension lists are processed, a consumer might understand some extensions, and might not understand other extensions. The preservation model for extensions is that unprocessed extensions shall always be preserved (when consuming) and written out (when producing) in whole, as long as the underlying schema extended by the extension list remains. *[Example: If a spreadsheetML sheet contains several extensions within an extension list, and through runtime processing that sheet is removed from the workbook, then the extensions associated with that sheet must not be written out when producing the resulting markup document. end example].*

Markup namespaces within extensions shall not be required to be listed in the Ignorable Compatibility-Rule attribute, nor shall these namespaces be required to be listed in the PreserveElements and PreserveAttributes Compatibility-Rule attributes. *[Note: See Part 3 for additional discussion on Application-Defined Extension Elements and processing rules. end note]*

[Example:

In this example, there are two extensions written. The first extension describes a new structure that might have been defined by a fictitious second version of ECMA-376. The second extension describes a structure that might be introduced by a private party, developed independently from ECMA-376.

```
<extLst>
  <ext uri='http://purl.oclc.org/ooxml/spreadsheetml/versionTwoExtension'>
    <v2:newContent
      xmlns:v2='http://purl.oclc.org/ooxml/spreadsheetml/versionTwoExtension'>
      ...
    </v2:newContent>
  </ext>
  <ext uri='http://www.extension.com/versionOneExtension'>
    <v2:moreContent xmlns:v2='http://www.extension.com/versionOneExtension'>
      ...
    </v2:moreContent>
  </ext>
</extLst>
```

end example]

Each extension has an uri attribute, which serves as an identifier to indicate information about the extension. *[Note: For example, the uri might state the version of a markup specification to which the content conforms, or it might state the version of a producing application that wrote the content. end note]* Upon encountering extensions, a processing consumer shall determine whether it knows how to process extensions using the value of the uri. If the consumer knows how to process such an extension, the markup contained within that extension is processed. Otherwise, the extension content shall be preserved so long as the underlying structure being extended by the extLst has not been removed.

Attributes	Description
uri (URI)	<p>A token to identify version and application information for this particular extension.</p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Extension](#)) is located in §A.2. *end note*]

18.2.8 externalReference (External Reference)

This element defines an external reference that stores data for workbook elements.

Attributes	Description
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies a unique identifier that is used to identify a relationship to another part in the file. Relationship identifiers link the element definition with the part where data for the element is stored.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalReference](#)) is located in §A.2. *end note*]

18.2.9 externalReferences (External References)

This element defines the collection of external references for this workbook.

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalReferences](#)) is located in §A.2. *end note*]

18.2.10 extLst (Future Feature Data Storage Area)

This element provides a convention for extending spreadsheetML in defined locations within the markup specification. The locations shall be denoted with the extLst element, and are called extension lists. Extension list locations within the markup document are specified in the markup specification and can be used to store extensions to the markup specification, whether those are future version extensions of the markup specification or are private extensions implemented independently from the markup specification. Markup within an extension might not be understood by a markup consumer.

extLst elements contain ext elements, called *extensions*. See §18.2.7 for more discussion of extensions.

[*Note:* Allowing markup specification extensions and private markup extensions within an extension list does not violate interoperability because the rules articulated within §18.2.7 and Part 3, §12 describe how markup producers and consumers must generate and consume markup documents containing application defined extension elements, including how to avoid and when to generate error conditions. *end note*]

[*Note:* This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExtensionList](#)) is located in §A.2. *end note*]

18.2.11 fileRecoveryPr (File Recovery Properties)

This element defines properties that track the state of the workbook file, such as whether the file was saved during a crash, or whether it should be opened in auto-recover mode.

Attributes	Description
autoRecover (Auto Recover)	<p>Specifies a boolean value that indicates whether the file is mark for auto-recovery. Applications typically mark files for auto-recover following a crash.</p> <p>A value of 1 or true indicates the file is marked for auto-recover.</p> <p>A value of 0 or false indicates the file is not marked for auto-recover.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
crashSave (Crash Save)	<p>Specifies a boolean value that indicates whether the application last saved the workbook file after a crash.</p> <p>A value of 1 or true indicates the workbook was last saved after a crash.</p> <p>A value of 0 or false indicates was not last saved as part of a crash.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dataExtractLoad (Data Extract Load)	<p>Specifies a boolean value that indicates whether the application last opened the workbook for data recovery.</p> <p>A value of 1 or true indicates the workbook was last opened for data recovery.</p> <p>A value of 0 or false indicates was not last opened for data recovery.</p>

Attributes	Description
	<p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
repairLoad (Repair Load)	<p>Specifies a boolean value that indicates whether the application last opened the workbook in safe or repair mode.</p> <p>A value of 1 or true indicates the workbook was last opened in safe or repair mode.</p> <p>A value of 0 or false indicates the workbook was last opened without problems.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FileRecoveryPr](#)) is located in §A.2. *end note*]

18.2.12 fileSharing (File Sharing)

This element tracks file sharing settings for the workbook. When a password is to be hashed and stored in this element, it shall be hashed starting from a UTF-16LE encoded string value. If there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation.

Attributes	Description						
algorithmName (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value.</p> <p>The following values are reserved:</p> <table> <tr> <th>Value</th><th>Algorithm</th></tr> <tr> <td>MD2</td><td> <p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>MD4</td><td> <p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> </table>	Value	Algorithm	MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>
Value	Algorithm						
MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>						
MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>						

Attributes	Description																
	<table border="1"> <tr> <td data-bbox="412 247 667 472">MD5</td><td data-bbox="667 247 1484 472"> <p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td data-bbox="412 472 667 697">RIPEMD-128</td><td data-bbox="667 472 1484 697"> <p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td data-bbox="412 697 667 779">RIPEMD-160</td><td data-bbox="667 697 1484 779"> <p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td data-bbox="412 779 667 861">SHA-1</td><td data-bbox="667 779 1484 861"> <p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td data-bbox="412 861 667 942">SHA-256</td><td data-bbox="667 861 1484 942"> <p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td data-bbox="412 942 667 1024">SHA-384</td><td data-bbox="667 942 1484 1024"> <p>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td data-bbox="412 1024 667 1106">SHA-512</td><td data-bbox="667 1024 1484 1106"> <p>Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td data-bbox="412 1106 667 1197">WHIRLPOOL</td><td data-bbox="667 1106 1484 1197"> <p>Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> </table> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre>< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>	MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	RIPEMD-128	<p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	RIPEMD-160	<p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-1	<p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-256	<p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-384	<p>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-512	<p>Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	WHIRLPOOL	<p>Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>
MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>																
RIPEMD-128	<p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>																
RIPEMD-160	<p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																
SHA-1	<p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																
SHA-256	<p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																
SHA-384	<p>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																
SHA-512	<p>Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																
WHIRLPOOL	<p>Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																
hashValue (Password Hash Value)	<p>Specifies the hash value for the password required for editing this workbook. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then the reservationPassword attribute shall contain the</p>																

Attributes	Description
	<p>password hash for the workbook.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
readOnlyRecommended (Read Only Recommended)	<p>Specifies a boolean value that indicates on open, whether the application alerts the user that the file be marked as read-only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saltValue (Salt Value for Password Verifier)	<p>Specifies the salt that was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and that shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The saltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
spinCount	Specifies the number of times the hashing function shall be iteratively run (runs using

Attributes	Description
(Iterations to Run Hashing Algorithm)	<p>each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute.</p> <p>[<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
userName (User Name)	<p>Specifies the username of the person with write reservation for this workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_FileSharing](#)) is located in §A.2. *end note*]

18.2.13 fileVersion (File Version)

This element defines properties that track which version of the application accessed the data and source code contained in the file.

Attributes	Description
appName (Application Name)	<p>Specifies the application name. When saving, applications can write their appName value and optionally write lastEdited and lowestEdited attributes to track the version of the application that performed those actions. When opening the workbook, applications can examine the value of appName and decide how to interpret the lastEdited, lowestEdited, and rupBuild attributes.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
codeName (Code	Specifies the GUID that identifies the code project that is associated with the workbook.

Attributes	Description
Name)	<p>[<i>Note</i>: the primary use of this attribute is to track the version of the compiled code.]</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
lastEdited (Last Edited Version)	<p>Specifies the version of the application that last saved the workbook. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
lowestEdited (Lowest Edited Version)	<p>Specifies the earliest version of the application that saved the workbook. This value is reset any time an application that can read all data in the file saves the file. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
rupBuild (Build Version)	<p>Specifies the incremental public release of the application. [<i>Example</i>: Betas, service packs, and versions. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_FileVersion](#)) is located in §A.2. *end note*]

18.2.14 functionGroup (Function Group)

This element represents a single function group.

Attributes	Description
name (Name)	<p>Specifies the name of the function group.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_FunctionGroup](#)) is located in §A.2. *end note*]

18.2.15 functionGroups (Function Groups)

This element defines the collection of function groups for the workbook.

Attributes	Description
builtInGroupCount	Specifies the count of built-in function groups that the application provides in this

Attributes	Description
(Built-in Function Group Count)	<p>workbook.</p> <p>The default value for this attribute is 16.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FunctionGroups](#)) is located in §A.2. *end note*]

18.2.16 oleSize (Embedded Object Size)

This element defines the embedded object server for this workbook.

Attributes	Description
ref (Reference)	<p>Specifies the reference for the embedded object.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_OleSize](#)) is located in §A.2. *end note*]

18.2.17 pivotCache (PivotCache)

This element represents a cache of data for pivot tables and formulas in the workbook.

Attributes	Description
cacheId (PivotCache Id)	<p>Specifies the unique identifier for the pivot cache for this workbook in the pivot cache part.</p> <p>This attribute is required.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Specifies the identifier to a pivot cache definition part where cached data is stored.</p> <p>This attribute is required.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotCache](#)) is located in §A.2. *end note*]

18.2.18 pivotCaches (PivotCaches)

This element enumerates pivot cache definition parts used by pivot tables and formulas in this workbook.

[Example:

```
<pivotCaches>
  <pivotCache cacheId="4" r:id="rId8"/>
</pivotCaches>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotCaches](#)) is located in §A.2. *end note*]

18.2.19 sheet (Sheet Information)

This element defines a sheet in this workbook. Sheet data is stored in a separate part.

Attributes	Description
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identifier of the sheet part where the definition for this sheet is stored. This attribute is required. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Sheet Name)	Specifies the name of the sheet. This name shall be unique. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
sheetId (Sheet Tab Id)	Specifies the internal identifier for the sheet. This identifier shall be unique. This attribute is required. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
state (Visible State)	Specifies the visible state of this sheet. The default value for this attribute is "visible."

Attributes	Description
	The possible values for this attribute are defined by the ST_SheetState simple type (§18.18.68).

[Note: The W3C XML Schema definition of this element’s content model ([CT_Sheet](#)) is located in §A.2. *end note*]

18.2.20 sheets (Sheets)

This element represents the collection of sheets in the workbook. There are different types of sheets you can create in SpreadsheetML. The most common sheet type is a worksheet; also called a spreadsheet. A worksheet is the primary document that you use in SpreadsheetML to store and work with data. A worksheet consists of cells that are organized into columns and rows.

Some workbooks might have a modular design where there is one sheet for data and another worksheet for each specific analysis performed on that data. In a complex modular system, you might have dozens of sheets, each dedicated to a specific task.

[Example:

```
<sheets>
  <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
  <sheet name="Sheet2" sheetId="2" r:id="rId2"/>
  <sheet name="Sheet5" sheetId="3" r:id="rId3"/>
  <sheet name="Chart1" sheetId="4" r:id="rId4"/>
</sheets>
```

end example]

[Note: The W3C XML Schema definition of this element’s content model ([CT_Sheets](#)) is located in §A.2. *end note*]

18.2.21 smartTagPr (Smart Tag Properties)

This element defines a collection of smart tag properties that determine smart tag behavior in the workbook.

[Example:

```
<smartTagPr embed="1" show="noIndicator"/>
```

end example]

Attributes	Description
embed (Embed SmartTags)	Specifies a boolean value that indicates whether the application saves smart tags with the workbook. Smart tag information is saved both in the workbook part and the sheet parts. A value of 1 or true indicates the application saves smart tags with the workbook.

Attributes	Description
	<p>A value of 0 or false indicates the application does not save smart tags with the workbook.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
show (Show Smart Tags)	<p>Specifies how the application displays smart tags in the user interface.</p> <p>The default value for this attribute is "all."</p> <p>The possible values for this attribute are defined by the ST_SmartTagShow simple type (§18.18.71).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_SmartTagPr](#)) is located in §A.2. *end note*]

18.2.22 smartTagType (Smart Tag Type)

This element represents a smart tag in the workbook.

Attributes	Description
name (Name)	<p>Specifies the element name used for a smart tag that is used by the application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
namespaceUri (SmartTag Namespace URI)	<p>Specifies the namespace Uniform Resource Identifier (URI) for a smart tag used by the application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
url (Smart Tag URL)	<p>Specifies the URL for a smart tag provided by the smart tag provider in the application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_SmartTagType](#)) is located in §A.2. *end note*]

18.2.23 smartTagTypes (Smart Tag Types)

This element defines the collection of smart tag types in the workbook. Smart tags represent data that is recognized and labeled as a particular type.

[Example: For example, a person's name or a date can be recognized and labeled with a smart tag.

```
<smartTagTypes>
  <smartTagType namespaceUri="urn:schemas-openxmlformats-org:office:smartrags"
    name="date"/>
</smartTagTypes>
```

end example]

[Note: The W3C XML Schema definition of this element’s content model (CT SmartTagTypes) is located in §A.2.
end note]

18.2.24 webPublishing (Web Publishing Properties)

This element defines properties that relate to publishing this workbook to the Web.

Attributes	Description
allowPng (Allow PNG)	<p>Specifies a boolean value that indicates whether the application saves images in the PNG (Portable Network Graphics) graphic format.</p> <p>A value of 1 or true indicates the application supports PNG .</p> <p>A value of 0 or false indicates the application does not support PNG.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
characterSet (Character Set)	<p>Name of the character set the application uses when a Web page is saved. The values alllowed within this attribute are names and aliases listed in the IANA CHARACTER SETS listing found at http://www.iana.org/assignments/character-sets.</p> <p>If this attribute is not present then the codePage attribute can be used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
css (Use CSS)	<p>Specifies a boolean value that indicates whether the application uses Cascading Style Sheet (CSS) for font formatting on Web pages.</p> <p>A value of 1 or true indicates the application uses CSS for font formats in Web pages.</p> <p>A value of 0 or false indicates the application does not use CSS for font formats.</p>

Attributes	Description
	<p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dpi (DPI)	<p>Specifies the DPI (defined as the number of pixels per inch) that are used to display images in Web pages. The specified DPI affects the size of graphics relative to the size of text on the screen.</p> <p>The default value for this attribute is 96.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
longFileNames (Enable Long File Names)	<p>Specifies a boolean value that indicates whether the application allows file names longer than 8 octets with a three octet extension for Web pages. File names are not case-sensitive.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
targetScreenSize (Target Screen Size)	<p>Specifies the screen size on which Web pages are displayed. The specified screen size might affect the size and layout of images on web pages.</p> <p>The default value of this attribute is "800x600."</p> <p>The possible values for this attribute are defined by the ST_TargetScreenSize simple type (§18.18.79).</p>
thicket (Thicket)	<p>Specifies a boolean value that indicates that the application stores supporting files such as bullets, background textures, and graphics in a separate folder from the Web page</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
vml (VML in Browsers)	<p>Specifies a boolean value that indicates whether the application uses VML (Vector Markup Language) to display graphics in Web browsers</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_WebPublishing](#)) is located in §A.2.
end note]

18.2.25 webPublishObject (Web Publishing Object)

This element defines a single Web publishing object for the workbook. This element tracks basic information about an object in the workbook, such as a named range, that is published to the Web.

Attributes	Description
autoRepublish (Auto Republish)	<p>Specifies a boolean value that indicates whether the object specified in sourceObject is automatically published every time the workbook is saved.</p> <p>A value of 1 or true indicates the application will publish the sourceObject when the workbook is saved.</p> <p>A value of 0 or false indicates the application will not publish the sourceObject when the workbook is saved.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
destinationFile (Destination File)	<p>Specifies the destination file name to which the sourceObject is published.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
divId (Div Id)	<p>Specifies the destination bookmark (div id) for the published object.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
id (Id)	<p>Specifies the number, in "nnnnn" format, used in generated div id, in style id's, token filenames, and other variables.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sourceObject (Source Object)	<p>Specifies the named range to be published. If omitted, the entire workbook is published.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
title (Title)	<p>Specifies the title of the published item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT WebPublishObject](#)) is located in §A.2. end note]

18.2.26 webPublishObjects (Web Publish Objects)

This element defines the collection of Web publishing objects in the workbook.

Attributes	Description
count (Count)	Specifies the number of items in the collection.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WebPublishObjects](#)) is located in §A.2. *end note*]

18.2.27 workbook (Workbook)

The workbook element is the top level element. It contains elements and attributes that encompass the data content of the workbook. The workbook's child elements each have their own subclause references, and these are shown in the child elements table below. A partial list of the workbook's structures that these elements represent are:

- **Sheets:** represents the collection of worksheets in the workbook. The sheets are the central structure within a workbook, and contain the text, numbers, dates, formulas, and other elements of a workbook.
- **Views:** SpreadsheetML defines a collection of Workbook views that define basic window dimensions and position of the workbook if it is ever displayed by a spreadsheet application. It also defines a collection of Custom Workbook Views that allows SpreadsheetML to describe one or more views of the data within a workbook.
- **Properties:** the workbook has several property collection that store basic workbook settings, such as the date system to use, file protection settings, calculation settings, and smart tag behaviors.
- **Names:** words or strings of characters that represent cells, ranges of cells, formulas, or constant values.

[*Example:*

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<workbook xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main"
  xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships">
  <fileVersion lastEdited="4" lowestEdited="4" rupBuild="4017"/>
  <workbookPr vbName="ThisWorkbook" defaultThemeVersion="123820"/>
  <bookViews>
    <workbookView xWindow="120" yWindow="45" windowWidth="15135"
      windowHeight="7650" activeTab="4"/>
  </bookViews>
  <sheets>
    <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
    <sheet name="Sheet2" sheetId="2" r:id="rId2"/>
    <sheet name="Sheet5" sheetId="3" r:id="rId3"/>
    <sheet name="Chart1" sheetId="4" r:id="rId4"/>
  </sheets>
```

```
<definedNames>
  <definedName name="MyDefinedName">Sheet3!$A$1:$C$12</definedName>
</definedNames>
<calcPr calcId="122211" calcMode="autoNoTable" refMode="R1C1" iterate="1"
  fullPrecision="0"/>
<customWorkbookViews>
  <customWorkbookView name="CustomView1"
    guid="{CE6681F1-E999-414D-8446-68A031534B57}" maximized="1" xWindow="1"
    yWindow="1" windowWidth="1024" windowHeight="547" activeSheetId="1"/>
</customWorkbookViews>
<pivotCaches>
  <pivotCache cacheId="0" r:id="rId8"/>
</pivotCaches>
<smartTagPr embed="1" show="noIndicator"/>
<smartTagTypes>
  <smartTagType namespaceUri="urn:schemas-openxmlformats-org:office:smartrags"
    name="date"/>
</smartTagTypes>
<webPublishing codePage="1252"/>
</workbook>
```

end example]

Attributes	Description
conformance (Document Conformance Class)	<p>Specifies the conformance class (§2.1) to which the SpreadsheetML document conforms.</p> <p>If this attribute is omitted, its default value is <code>transitional</code>.</p> <p>[<i>Example:</i> Consider the following SpreadsheetML Workbook part markup:</p> <pre><workbook conformance="strict"> ... </workbook></pre> <p>This document has a conformance attribute value of <code>strict</code>, therefore it conforms to the SML Strict conformance class. <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_ConformanceClass</code> simple type (§22.9.2.2).</p>

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Workbook](#)) is located in §A.2. *end note]*

18.2.28 workbookPr (Workbook Properties)

This element defines a collection of workbook properties.

[Example:

```
<workbookPr showObjects="none" saveExternalLinkValues="0"
  defaultThemeVersion="123820"/>
```

end example]

Attributes	Description
allowRefreshQuery (Allow Refresh Query)	<p>Specifies a boolean value that indicates whether the application will refresh query tables in this workbook.</p> <p>A value of 1 or true indicates the application will refresh query tables when the workbook is loaded.</p> <p>A value of 0 or false indicates the application will not refresh query tables.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoCompressPictures (Auto Compress Pictures)	<p>Specifies a boolean value that indicates the application automatically compressed pictures in the workbook.</p> <p>A value of 1 or true indicates the application automatically compresses pictures of the workbook. When a picture is compressed, the application:</p> <ul style="list-style-type: none"> • Reduces resolution (to 96 dots per inch (dpi) for Web and 200 dpi for print), and unnecessary information is discarded. • Discards extra information. [Example: When a picture has been cropped or resized, the "hidden" parts of the picture are stored in the file. end example] • Compress the picture, if possible. <p>A value of 0 or false indicates the application does not compress pictures in this workbook.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
backupFile (Create Backup File)	<p>Specifies a boolean value that indicates whether the application creates a backup of the workbook on save.</p> <p>A value of 1 or true indicates the application creates a backup of the workbook on save.</p>

Attributes	Description
	<p>A value of 0 or false indicates the application does not create a backup.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
checkCompatibility (Check Compatibility On Save)	<p>Specifies a boolean value that indicates whether the application checks for compatibility when saving this workbook to older file formats.</p> <p>A value of 1 or true indicates the application performs a compatibility check when saving to legacy binary formats.</p> <p>A value of 0 or false indicates the application does not perform a compatibility check when saving to legacy binary formats.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
codeName (Code Name)	<p>Specifies the codename of the application that created this workbook. Use this attribute to track file content in incremental releases of the application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
date1904 (Date 1904)	<p>Value that indicates whether to use a 1900 or 1904 date system when converting serial date-times in the workbook to dates.</p> <p>A value of 1 or true indicates the workbook uses the 1904 date system.</p> <p>A value of 0 or false indicates the workbook uses the 1900 date system.</p> <p>(See §18.17.4.1 for the definition of the date systems.)</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
defaultThemeVersion (Default Theme Version)	<p>Specifies the default version of themes to apply in the workbook.</p> <p>The value for defaultThemeVersion depends on the application. SpreadsheetML defaults to the form [version][build], where [version] refers to the version of the application, and [build] refers to the build of the application when the themes in the user interface changed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.
filterPrivacy (Filter Privacy)	<p>Specifies a boolean value that indicates whether the application has inspected the workbook for personally identifying information (PII). If this flag is set, the application warns the user any time the user performs an action that will insert PII into the document. <i>[Example: Inserting a comment might insert the user's name. end example]</i></p> <p>A value of 1 or true indicates the application will warn the user when they insert PII into the workbook.</p> <p>A value of 0 or false indicates the application will not warn the user when they insert PII into the workbook; the workbook has not been inspected for PII.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hidePivotFieldList (Hide Pivot Field List)	<p>Specifies a boolean value that indicates whether a list of fields is shown for pivot tables in the application user interface.</p> <p>A value of 1 or true indicates a list of fields is show for pivot tables.</p> <p>A value of 0 or false indicates a list of fields is not shown for pivot tables.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
promptedSolutions (Prompted Solutions)	<p>Specifies a boolean value that indicates whether the user has received an alert to load Smart Document components.</p> <p>A value of 1 or true indicates the user received an alert to load SmartDoc.</p> <p>A value of 0 or false indicates the user did not receive an alert.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
publishItems (Publish Items)	<p>Specifies a boolean value that indicates whether the publish the workbook or workbook items to the application server.</p> <p>A value of 1 or true indicates that workbook items are published.</p> <p>A value of 0 or false indicates that the workbook is published.</p>

Attributes	Description
	<p>The default value for this attribute is <code>false</code>.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
refreshAllConnections (Refresh all Connections on Open)	<p>Specifies a boolean value that indicates whether the workbook shall refresh all the connections to data sources during load.</p> <p>The default value for this attribute is <code>false</code>.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saveExternalLinkValues (Save External Link Values)	<p>Specifies a boolean value that indicates whether the application will cache values retrieved from other workbooks via an externally linking formula. Data is cached at save.</p> <p>A value of <code>1</code> or <code>true</code> indicates data from externally linked formulas is cached. A supporting part is written out containing a cached cell table from the external workbook.</p> <p>A value of <code>0</code> or <code>false</code> indicates data from externally linked formulas is not cached.</p> <p>The default value for this attribute is <code>true</code>.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showBorderUnselectedTables (Show Border Unselected Table)	<p>Specifies a boolean value that indicates whether a border is drawn around unselected tables in the workbook.</p> <p>A value of <code>1</code> or <code>true</code> indicates borders are drawn around unselected tables.</p> <p>A value of <code>0</code> or <code>false</code> indicates borders are not drawn around unselected tables.</p> <p>The default value for this attribute is <code>true</code>.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showInkAnnotation (Show Ink Annotations)	<p>Specifies a boolean value that indicates whether the book shows ink annotations.</p> <p>A value of <code>1</code> or <code>true</code> indicates that ink annotations are shown in the workbook.</p> <p>A value of <code>0</code> or <code>false</code> indicates that ink annotations are not shown in the workbook.</p> <p>The default value for this attribute is <code>true</code>.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
showObjects (Show Objects)	<p>Specifies how the application shows embedded objects in the workbook.</p> <p>This attribute is optional.</p> <p>The default value for this attribute is "all."</p> <p>The possible values for this attribute are defined by the ST_Objects simple type (§18.18.48).</p>
showPivotChartFilter (Show Pivot Chart Filter)	<p>Specifies a boolean value that indicates whether filtering options are shown for pivot charts in the workbook.</p> <p>A value of 1 or true indicates filtering options shall be shown for pivot charts.</p> <p>A value of 0 or false indicates filtering options shall not be shown.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
updateLinks (Update Links Behavior)	<p>Specifies how the application updates external links when the workbook is opened.</p> <p>The default value for this attribute is userSet.</p> <p>The possible values for this attribute are defined by the ST_UpdateLinks simple type (§18.18.87).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_WorkbookPr](#)) is located in §A.2. end note]

18.2.29 workbookProtection (Workbook Protection)

This element specifies options for protecting data in the workbook. Applications might use workbook protection to prevent anyone from accidentally changing, moving, or deleting important data. This protection can be ignored by applications which choose not to support this optional protection mechanism.

When a password is to be hashed and stored in this element, it shall be hashed as defined below, starting from a UTF-16LE encoded string value. If there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation.

[Note: Worksheet or workbook element protection should not be confused with file security. It is not meant to make your workbook safe from unintentional modification, and cannot protect it from malicious modification. end note]

Attributes	Description						
lockRevision (Lock Revisions)	<p>Specifies a boolean value that indicates whether the workbook is locked for revisions.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>						
lockStructure (Lock Structure)	<p>Specifies a boolean value that indicates whether structure of workbook is locked.</p> <p>A value of 1 or true indicates the structure of the workbook is locked. Worksheets in the workbook can't be moved, deleted, hidden, unhidden, or renamed, and new worksheets can't be inserted.</p> <p>A value of 0 or false indicates the structure of the workbook is not locked.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>						
lockWindows (Lock Windows)	<p>Specifies a boolean value that indicates whether the windows that comprise the workbook are locked.</p> <p>A value of 1 or true indicates the workbook windows are locked. Windows are the same size and position each time the workbook is opened.</p> <p>A value of 0 or false indicates the workbook windows are not locked.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>						
revisionsAlgorithm Name (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value for the revisionsHashValue attribute.</p> <p>The following values are reserved:</p> <table data-bbox="415 1457 1484 1887"> <tr> <th data-bbox="415 1457 669 1505">Value</th><th data-bbox="669 1457 1484 1505">Algorithm</th></tr> <tr> <td data-bbox="415 1505 669 1734">MD2</td><td data-bbox="669 1505 1484 1734"> <p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</p> </td></tr> <tr> <td data-bbox="415 1734 669 1887">MD4</td><td data-bbox="669 1734 1484 1887"> <p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[Note: It is recommended that applications should avoid using</p> </td></tr> </table>	Value	Algorithm	MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</p>	MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[Note: It is recommended that applications should avoid using</p>
Value	Algorithm						
MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</p>						
MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[Note: It is recommended that applications should avoid using</p>						

Attributes	Description
	this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]
	MD5 Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>
	RIPEMD-128 Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>
	RIPEMD-160 Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-1 Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-256 Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-384 Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-512 Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	WHIRLPOOL Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	<p><i>[Example: Consider an Office Open XML document with the following information stored in one of its protection elements:</i></p> <pre>< ... revisionsAlgorithmName="SHA-1" revisionsHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The revisionsAlgorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm shall be used to generate a hash from the user-defined password. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
revisionsHashValue (Password Hash Value)	Specifies the hash value for the password stored for unlocking revisions in this workbook. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent

Attributes	Description
	<p>XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p>[<i>Example:</i> Consider a SpreadsheetML document with the following information stored in one of its protection elements:</p> <pre><... revisionsAlgorithmName="SHA-1" revisionsHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The revisionsHashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the revisionsAlgorithmName attribute value of SHA-1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
revisionsSaltValue (Salt Value for Password Verifier)	<p>Specifies the salt that was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the revisionsHashValue attribute, and that shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... revisionsSaltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" revisionsHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The revisionsSaltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
revisionsSpinCount (Iterations to Run)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number</p>

Attributes	Description								
Hashing Algorithm)	<p>of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the revisionsHashValue attribute.</p> <p>[<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... revisionsSpinCount="100000" revisionHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The revisionsSpinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the revisionsHashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>								
workbookAlgorithmName (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value for the workbookHashValue attribute.</p> <p>The following values are reserved:</p> <table border="1" data-bbox="415 1144 1479 1873"> <thead> <tr> <th data-bbox="415 1144 667 1192">Value</th><th data-bbox="667 1144 1479 1192">Algorithm</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1192 667 1423">MD2</td><td data-bbox="667 1192 1479 1423"> <p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td data-bbox="415 1423 667 1654">MD4</td><td data-bbox="667 1423 1479 1654"> <p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td data-bbox="415 1654 667 1873">MD5</td><td data-bbox="667 1654 1479 1873"> <p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> </tbody> </table>	Value	Algorithm	MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>
Value	Algorithm								
MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>								
MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>								
MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>

workbookHashValue (Password Hash Value)	<p data-bbox="415 1453 1477 1596">Specifies the hash value for the password stored for unlocking this workbook. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p data-bbox="415 1633 1477 1701">If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p data-bbox="415 1738 1477 1806"><i>[Example: Consider a SpreadsheetML document with the following information stored in one of its protection elements:</i></p> <pre data-bbox="456 1843 967 1875"><... workbookAlgorithmName="SHA-1"</pre>														

Attributes	Description
	<p><code>workbookHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></code></p> <p>The <code>workbookHashValue</code> attribute value of <code>9oN7nWkCAyEZib1RomSJTjmPpCY=</code> specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the <code>workbookAlgorithmName</code> attribute value of SHA-1) and that the resulting has value must be <code>9oN7nWkCAyEZib1RomSJTjmPpCY=</code> for the protection to be disabled. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>base64Binary</code> datatype.</p>
<p><code>workbookSaltValue</code> (Salt Value for Password Verifier)</p>	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the <code>workbookHashValue</code> attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... workbookSaltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" workbookHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The <code>workbookSaltValue</code> attribute value of <code>ZUdHa+D8F/OAKP3I7ssUnQ==</code> specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>base64Binary</code> datatype.</p>
<p><code>workbookSpinCount</code> (Iterations to Run Hashing Algorithm)</p>	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the <code>workbookHashValue</code> attribute.</p> <p>[<i>Rationale:</i> Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p>

Attributes	Description
	<p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... workbookSpinCount="100000" revisionHashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The workbookSpinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the workbookHashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WorkbookProtection](#)) is located in §A.2. *end note*]

18.2.30 workbookView (Workbook View)

This element specifies a single Workbook view.

Units for window widths and other dimensions are expressed in twips. Twip measurements are portable between different display resolutions. The formula is (screen pixels) * (20 * 72) / (logical device dpi), where the logical device dpi can be different for x and y coordinates.

Attributes	Description
activeTab (Active Sheet Index)	<p>Specifies an unsignedInt that contains the index to the active sheet in this book view.</p> <p>The default value for this attribute is 0.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
autoFilterDateGrouping (AutoFilter Date Grouping)	<p>Specifies a boolean value that indicates whether to group dates when presenting the user with filtering options in the user interface.</p> <p>A value of 1 or true indicates that dates are grouped.</p> <p>A value of 0 or false indicates that dates are not grouped.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
firstSheet (First Sheet)	<p>Specifies the index to the first sheet in this book view.</p>

Attributes	Description
	<p>The default value for this attribute is 0.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
minimized (Minimized)	<p>Specifies a boolean value that indicates whether the workbook window is minimized.</p> <p>A value of 1 or true indicates the workbook window is minimized.</p> <p>A value of 0 or false indicates the workbook window is not minimized.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showHorizontalScroll (Show Horizontal Scroll)	<p>Specifies a boolean value that indicates whether to display the horizontal scroll bar in the user interface.</p> <p>A value of 1 or true indicates that the horizontal scrollbar shall be shown.</p> <p>A value of 0 or false indicates that the horizontal scrollbar shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showSheetTabs (Show Sheet Tabs)	<p>Specifies a boolean value that indicates whether to display the sheet tabs in the user interface.</p> <p>A value of 1 or true indicates that sheet tabs shall be shown.</p> <p>A value of 0 or false indicates that sheet tabs shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showVerticalScroll (Show Vertical Scroll)	<p>Specifies a boolean value that indicates whether to display the vertical scroll bar.</p> <p>A value of 1 or true indicates the vertical scrollbar shall be shown.</p> <p>A value of 0 or false indicates the vertical scrollbar shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
tabRatio (Sheet Tab Ratio)	<p>Specifies ratio between the workbook tabs bar and the horizontal scroll bar.</p> <p>The default value for this attribute is 600.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
visibility (Visibility)	<p>Specifies visible state of the workbook window.</p> <p>The default value for this attribute is "visible."</p> <p>The possible values for this attribute are defined by the ST_Visibility simple type (§18.18.89).</p>
windowHeight (Window Height)	<p>Specifies the height of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
windowWidth (Window Width)	<p>Specifies the width of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
xWindow (Upper Left Corner (X Coordinate))	<p>Specifies the X coordinate for the upper left corner of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
yWindow (Upper Left Corner (Y Coordinate))	<p>Specifies the Y coordinate for the upper left corner of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_BookView](#)) is located in §A.2. *end note*]

18.3 Worksheets

Sheets are the central structures within a workbook, and are where the user does most of their spreadsheet work. The most common type of sheet is the worksheet, which is represented as a grid of cells. Worksheet cells can contain text, numbers, dates, and formulas. Cells can be formatted as well. Workbooks usually contain more than one sheet. To aid in the analysis of data and making informed decisions, spreadsheet applications often implement features and objects which help calculate, sort, filter, organize, and graphically display information.

Since these features are often connected very tightly with the spreadsheet grid, these are also included in the sheet definition on disk.

Other types of sheets include chart sheets and dialog sheets.

Note that sheet information is organized into three main sections:

- Top-level sheet properties (everything before sheetData)
- The cell table (sheetData)
- Supporting sheet features (everything after sheetData)

18.3.1 Worksheets

The following elements define a sheet and its contents:

18.3.1.1 [anchor \(Object Cell Anchor\)](#)

This element specifies the position of an embedded object or embedded control.

[*Example:* The following example demonstrates an embedded object whose top-left corner is at the top-left point of the cell in the first column and first row and whose bottom-right corner is offset horizontally into the cell at the fifth column and eleventh row.

```
<oleObject ... >
  <objectPr ... >
    <anchor sizeWithCells="true">
      <from>
        <col>0</col>
        <colOff>0</colOff>
        <row>0</row>
        <rowOff>0</rowOff>
      </from>
      <to>
        <col>4</col>
        <colOff>182880</colOff>
        <row>10</row>
        <rowOff>0</rowOff>
      </to>
    </anchor>
  </objectPr>
</oleObject>
```

end example]

Attributes	Description
moveWithCells	Specifies that the object moves with its underlying cells.

Attributes	Description
(Move With Cells)	<p>[Example:</p> <pre data-bbox="451 352 967 384"><anchor moveWithCells="true" ... ></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sizeWithCells (Size With Cells)	<p>Specifies that the object resizes with its underlying cells.</p> <p>[Example:</p> <pre data-bbox="451 720 967 751"><anchor sizeWithCells="true" ... ></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
z-order (Z-Order)	<p>Specifies the Z-order index of the object. Higher numbers indicate higher Z-order. Objects with higher Z-order are rendered on top of objects with lower Z-order when they intersect or overlap.</p> <p>[Example:</p> <pre data-bbox="451 1161 854 1192"><anchor z-order="10 " ... ></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT ObjectAnchor](#)) is located in §A.2.
end note]

18.3.1.2 autoFilter (AutoFilter Settings)

AutoFilter temporarily hides rows based on a filter criteria, which is applied column by column to a table of data in the worksheet. This collection expresses AutoFilter settings.

[Example: This example expresses a filter indicating to 'show only values greater than 0.5'. The filter is being applied to the range B3:E8, and the criteria is being applied to values in the column whose colId is 1 (zero based column numbering, from left to right). Therefore any rows must be hidden if the value in that particular column is less than or equal to 0.5.

```

<autoFilter ref="B3:E8">
  <filterColumn colId="1">
    <customFilters>
      <customFilter operator="greaterThan" val="0.5"/>
    </customFilters>
  </filterColumn>
</autoFilter>

```

end example]

Attributes	Description
ref (Cell or Range Reference)	Reference to the cell range to which the AutoFilter is applied. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).

[Note: The W3C XML Schema definition of this element's content model ([CT_AutoFilter](#)) is located in §A.2. *end note*]

18.3.1.3 brk (Break)

Individual row or column breaks

Attributes	Description
id (Id)	Zero-based row or column Id of the page break. Breaks occur above the specified row and left of the specified column. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
man (Manual Page Break)	Manual Break flag. 1 means the break is a manually inserted break. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
max (Maximum)	Zero-based index of end row or column of the break. For row breaks, specifies column index; for column breaks, specifies row index. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
min (Minimum)	Zero-based index of start row or column of the break. For row breaks, specifies column index; for column breaks, specifies row index. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

Attributes	Description
pt (Pivot-Created Page Break)	Flag indicating that a PivotTable created this break. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Break](#)) is located in §A.2. *end note*]

18.3.1.4 c (Cell)

This collection represents a cell in the worksheet. Information about the cell's location (reference), value, data type, formatting, and formula is expressed here.

[Example: This example shows the information stored for a cell whose address in the grid is C6, whose style index is '6', and whose value metadata index is '15'. The cell contains a formula as well as a calculated result of that formula.

```
<c r="C6" s="1" vm="15">
  <f>CUBEVALUE("xlext.dat9 Adventure Works",C$5,$A6)</f>
  <v>2838512.355</v>
</c>
```

end example

While a cell can have a formula element *f* and a value element *v*, when the cell's type *t* is *inlineStr* then only the element *is* is allowed as a child element.

[Example:

Here is an example of expressing a string in the cell rather than using the shared string table.

```
<row r="1" spans="1:1">
  <c r="A1" t="inlineStr">
    <is><t>This is inline string example</t></is>
  </c>
</row>
```

end example

Attributes	Description
cm (Cell Metadata Index)	The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference. The possible values for this attribute are defined by the W3C XML Schema unsignedInt

Attributes	Description
	datatype.
ph (Show Phonetic)	<p>A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
r (Reference)	<p>An A1 style reference to the location of this cell</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
s (Style Index)	<p>The index of this cell's style. Style records are stored in the Styles Part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
t (Cell Data Type)	<p>An enumeration representing the cell's data type.</p> <p>The possible values for this attribute are defined by the ST_CellType simple type (§18.18.11).</p>
vm (Value Metadata Index)	<p>The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Cell](#)) is located in §A.2. *end note*]

18.3.1.5 cellSmartTag (Cell Smart Tag)

Single smart tag associated with a cell. There can be more than one cellSmartTag for a cell.

Attributes	Description
deleted (Deleted)	<p>Boolean flag indicating that the application shouldn't display a particular smart tag in the cell. [Example: When the user has chosen to explicitly remove the Smart Tag by interacting with the application's user interface. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
type (Smart Tag Type Index)	Book-level zero-based index of the smart tag type. This index references a <smartTagType> element in the <smartTagTypes> collection in the workbook start

Attributes	Description
	<p>part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
xmlBased (XML Based)	<p>Boolean flag indicating the Smart Tag recognition is triggered because the cell is associated with an XML map (schema-based semantic recognition), as contrasted with the more usual cell-content-based recognition of smart tags.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CellSmartTag](#)) is located in §A.2.
end note]

18.3.1.6 [cellSmartTagPr \(Smart Tag Properties\)](#)

Represents a single property of a smart tag in a cell; contains a key-value pair.

Attributes	Description
key (Key Name)	<p>Key name of a single property of a smart tag in a cell.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
val (Value)	<p>String value of a single property of a smart tag in a cell.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CellSmartTagPr](#)) is located in §A.2.
end note]

18.3.1.7 [cellSmartTags \(Cell Smart Tags\)](#)

The element is used to label the cell with a smart tag. A cell can be determined to have semantic meaning and the cell containing this data can be labeled with a smart tag. The actions which can be taken depend on the semantic meaning of the data and the actions that the application decides to associate with that type of smart tag.

[*Example:* If you recently sent mail to "Chad Rothschiller", and you type the name into a cell on the worksheet, the name is recognized and given a smart tag with actions you can take including Send Mail, Schedule a Meeting, Open Contact, or Add to Contacts.

end example]

An application can decide that the smart tag indicators appear in the cell in the worksheet.

This collection represents a collection of smart tags on a cell.

[*Example:* This example expresses a smart tag associated with cell A1. The @type is used to associate this smart tag with a workbook-level smart tag type defined in the workbook start part.

```
<cellSmartTags r="A1">
  <cellSmartTag type="0"/>
</cellSmartTags>
```

end example]

Attributes	Description
r (Reference)	Reference to the cell that contains this set of smart tags. The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CellSmartTags](#)) is located in §A.2. *end note]*

18.3.1.8 cellWatch (Cell Watch Item)

The watch window is a single UI location where the application user can keep track of certain cell formulas & values which they have chosen to be in the set of watched cells. This element expresses the cell address of a cell being watched. It is always a reference to a single cell.

Attributes	Description
r (Reference)	Cell reference of the cell being watched. The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CellWatch](#)) is located in §A.2. *end note]*

18.3.1.9 cellWatches (Cell Watch Items)

Collection of cells on this worksheet being watched in the 'watch window'.

[*Example:* In this example, cells B3 and B4 are being watched.

```
<cellWatches>
  <cellWatch r="B3"/>
  <cellWatch r="B4"/>
</cellWatches>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_CellWatches](#)) is located in §A.2. *end note*]

18.3.1.10 cfRule (Conditional Formatting Rule)

This collection represents a description of a conditional formatting rule.

[Example:

This example shows a conditional formatting rule highlighting cells whose values are greater than 0.5. Note that in this case the content of <formula> is a static value, but can also be a formula expression.

```
<conditionalFormatting sqref="E3:E9">
  <cfRule type="cellIs" dxflId="0" priority="1" operator="greaterThan">
    <formula>0.5</formula>
  </cfRule>
</conditionalFormatting>
```

end example]

Only rules with a type attribute value of expression support formula syntax.

Attributes	Description
aboveAverage (Above Or Below Average)	Indicates whether the rule is an "above average" rule. 1 indicates 'above average'. This attribute is ignored if type is not equal to aboveAverage. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bottom (Bottom N)	Indicates whether a "top/bottom n" rule is a "bottom n" rule. 1 indicates 'bottom'. This attribute is ignored if type is not equal to top10. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dxflId (Differential Formatting Id)	This is an index to a dxf element in the Styles Part indicating which cell formatting to apply when the conditional formatting rule criteria is met. The possible values for this attribute are defined by the ST_DxflId simple type (§18.18.25).

Attributes	Description
equalAverage (Equal Average)	<p>Flag indicating whether the 'aboveAverage' and 'belowAverage' criteria is inclusive of the average itself, or exclusive of that value. 1 indicates to include the average value in the criteria. This attribute is ignored if type is not equal to aboveAverage.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
operator (Operator)	<p>The operator in a "cell value is" conditional formatting rule. This attribute is ignored if type is not equal to cellIs</p> <p>The possible values for this attribute are defined by the ST_ConditionalFormattingOperator simple type (§18.18.15).</p>
percent (Top 10 Percent)	<p>Indicates whether a "top/bottom n" rule is a "top/bottom n percent" rule. This attribute is ignored if type is not equal to top10.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
priority (Priority)	<p>The priority of this conditional formatting rule. This value is used to determine which format should be evaluated and rendered. Lower numeric values are higher priority than higher numeric values, where 1 is the highest priority.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
rank (Rank)	<p>The value of "n" in a "top/bottom n" conditional formatting rule. This attribute is ignored if type is not equal to top10.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
stdDev (StdDev)	<p>The number of standard deviations to include above or below the average in the conditional formatting rule. This attribute is ignored if type is not equal to aboveAverage. If a value is present for stdDev and the rule type = aboveAverage, then this rule is automatically an "above or below N standard deviations" rule.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
stopIfTrue (Stop If True)	<p>If this flag is 1, no rules with lower priority shall be applied over this rule, when this rule evaluates to true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
text (Text)	<p>The text value in a "text contains" conditional formatting rule. This attribute is ignored if type is not equal to containsText.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

Attributes	Description
timePeriod (Time Period)	<p>The applicable time period in a "date occurring..." conditional formatting rule. This attribute is ignored if type is not equal to timePeriod.</p> <p>The possible values for this attribute are defined by the ST_TimePeriod simple type (§18.18.82).</p>
type (Type)	<p>Type of conditional formatting rule.</p> <p>The possible values for this attribute are defined by the ST_CfType simple type (§18.18.12).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_CfRule](#)) is located in §A.2. *end note*]

18.3.1.11 cfvo (Conditional Format Value Object)

Describes the values of the interpolation points in a gradient scale.

[Example: This example demonstrates a color scale conditional formatting rule, which defines a color for the minimum value in the range of cell values, a color for the midpoint value, and a color for the maximum value in the in the range of cell values. Information is given about how to define the midpoint. In this case, it is the 50 percent mark.

```
<colorScale>
  <cfvo type="min" val="0"/>
  <cfvo type="percent" val="50"/>
  <cfvo type="max" val="0"/>
  <color rgb="FFFF0000"/>
  <color rgb="FFFFFF00"/>
  <color rgb="FF00B050"/>
</colorScale>
```

The first <cfvo> element corresponds with the first <color> definition, and so on.

end example]

Attributes	Description
gte (Greater Than Or Equal)	<p>For icon sets, determines whether this threshold value uses the greater than or equal to operator. 0 indicates 'greater than' is used instead of 'greater than or equal to'.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
type (Type)	<p>The type of this conditional formatting value object. [Example: 'min' and 'max' would be used (in conjunction with @val) to express the lower and upper values to be used in a gradient. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_CfvoType simple type (§18.18.13).
val (Value)	The value of this conditional formatting value object. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_Cfvo](#)) is located in §A.2. *end note*]

18.3.1.12 [chartsheet \(Chart Sheet\)](#)

This is the root element of Chartsheet Parts in a SpreadsheetML document.

[Note: The W3C XML Schema definition of this element's content model ([CT_Chartsheet](#)) is located in §A.2. *end note*]

18.3.1.13 [col \(Column Width & Formatting\)](#)

Defines column width and column formatting for one or more columns of the worksheet.

[Example: This example shows that column 5 (E) has width and style information applied.

```
<col min="5" max="5" width="9.140625" style="3"/>
```

end example]

Attributes	Description
bestFit (Best Fit Column Width)	Flag indicating if the specified column(s) is set to 'best fit'. 'Best fit' is set to true under these conditions: <ul style="list-style-type: none"> • The column width has never been manually set by the user, AND • The column width is not the default width • • 'Best fit' means that when numbers are typed into a cell contained in a 'best fit' column, the column width should automatically resize to display the number. <p>[Note: In best fit cases, column width must not be made smaller, only larger. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
collapsed (Collapsed)	Flag indicating if the outlining of the affected column(s) is in the collapsed state. See description of row collapsed and outlinePr element's summaryBelow and summaryRight attributes for detailed information. <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
customWidth (Custom Width)	<p>Flag indicating that the column width for the affected column(s) is different from the default or has been manually set.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hidden (Hidden Columns)	<p>Flag indicating if the affected column(s) are hidden on this worksheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
max (Maximum Column)	<p>Last column affected by this 'column info' record.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
min (Minimum Column)	<p>First column affected by this 'column info' record.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
outlineLevel (Outline Level)	<p>Outline level of affected column(s). Range is 0 to 7. See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
phonetic (Show Phonetic Information)	<p>Flag indicating if the phonetic information should be displayed by default for the affected column(s) of the worksheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
style (Style)	<p>Default style for the affected column(s). Affects cells not yet allocated in the column(s). In other words, this style applies to new columns.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
width (Column Width)	<p>Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. There are 4 pixels of margin padding (two on each side), plus 1 pixel padding for the gridlines.</p> $\text{width} = \text{Truncate}([\{\text{Number of Characters}\} * \{\text{Maximum Digit Width}\} + \{5 \text{ pixel padding}\}] / \{\text{Maximum Digit Width}\} * 256) / 256$ <p><i>[Example: Using the Calibri font as an example, the maximum digit width of 11 point font size is 7 pixels (at 96 dpi). In fact, each digit is the same width for this font. Therefore, if the cell width is 8 characters wide, the value of this attribute must be $\text{Truncate}([8*7+5]/7*256)/256 = 8.7109375$. end example]</i></p>

Attributes	Description
	<p>To translate the value of width in the file into the column width value at runtime (expressed in terms of pixels), use this calculation:</p> $= \text{Truncate}(((256 * \{\text{width}\} + \text{Truncate}(128/\{\text{Maximum Digit Width}\}))/256) * \{\text{Maximum Digit Width}\})$ <p>[<i>Example:</i> Using the same example as above, the calculation would be $\text{Truncate}(((256 * 8.7109375 + \text{Truncate}(128/7))/256) * 7) = 61$ pixels. <i>end example</i>]</p> <p>To translate from pixels to character width, use this calculation:</p> $= \text{Truncate}((\{\text{pixels}\} - 5) / \{\text{Maximum Digit Width}\} * 100 + 0.5) / 100$ <p>[<i>Example:</i> Using the example above, the calculation would be $\text{Truncate}((61 - 5) / 7 * 100 + 0.5) / 100 = 8$ characters. <i>end example</i>]</p> <p>[<i>Note:</i> when wide borders are applied, part of the left/right border must overlap with the 2 pixel padding on each side. Wide borders do not affect the width calculation of the column. <i>end note</i>]</p> <p>[<i>Note:</i> When the sheet is in the mode to view formulas instead of values, the pixel width of the column is doubled. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Col](#)) is located in §A.2. *end note*]

18.3.1.14 colBreaks (Vertical Page Breaks)

Vertical page break information used for print layout view, page layout view, drawing print breaks in normal view, and for printing the worksheet.

[*Example:*

In this example, a page break has been inserted at C3 (the break occurs left and above C3).

```
<colBreaks count="1" manualBreakCount="1">
  <brk id="2" max="1048575" man="1"/>
</colBreaks>
```

end example]

Attributes	Description
count (Page Break Count)	Number of breaks in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
manualBreakCount (Manual Break Count)	Number of manual breaks in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT PageBreak](#)) is located in §A.2. *end note*]

18.3.1.15 color (Data Bar Color)

One of the colors associated with the data bar or color scale.

The auto attribute shall not be used in the context of data bars.

Attributes	Description
auto (Automatic)	A boolean value indicating the color is automatic and system color dependent. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
indexed (Index)	Indexed color value. Only used for backwards compatibility. References a color in indexedColors. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rgb (Alpha Red Green Blue Color Value)	Standard Alpha Red Green Blue color value (ARGB). The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).
theme (Theme Color)	A zero-based index into the <clrScheme> collection (§20.1.6.2), referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
tint (Tint)	Specifies the tint value applied to the color. If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied. The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and

Attributes	Description
	<p>1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p>[Example:</p> <p>Here are some examples of how to apply tint to color:</p> <p>If (tint < 0) $\text{Lum}' = \text{Lum} * (1.0 + \text{tint})$ <p>For example: Lum = 200; tint = -0.5; Darken 50% $\text{Lum}' = 200 * (0.5) \Rightarrow 100$ <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black) $\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0$ <p>If (tint > 0) $\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))$ <p>For example: Lum = 100; tint = 0.75; Lighten 75% $\begin{aligned} \text{Lum}' &= 100 * (1 - .75) + (\text{HLSMAX} - \text{HLSMAX} * (1 - .75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white) $\begin{aligned} \text{Lum}' &= 100 * (1 - 1) + (\text{HLSMAX} - \text{HLSMAX} * (1 - 1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> </p></p></p></p></p></p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.2. *end note*]

18.3.1.16 colorScale (Color Scale)

Describes a gradated color scale in this conditional formatting rule.

[Example:

```
<colorScale>
  <cfvo type="min" val="0"/>
  <cfvo type="max" val="0"/>
  <color theme="5"/>
  <color rgb="FFFFFFF9C"/>
</colorScale>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorScale](#)) is located in §A.2. *end note*]

18.3.1.17 cols (Column Information)

Information about whole columns of the worksheet.

[*Example:*

This example shows that column 4 (D) has 'best fit' applied to it, which is also a custom width. Also, column 5 (E) is listed as having a custom width and a style applied at the column level (as opposed to the cell level).

```
<cols>
  <col min="4" max="4" width="12" bestFit="1" customWidth="1"/>
  <col min="5" max="5" width="9.140625" style="3"/>
</cols>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Cols](#)) is located in §A.2. *end note*]

18.3.1.18 conditionalFormatting (Conditional Formatting)

A Conditional Format is a format, such as cell shading or font color, that a spreadsheet application can automatically apply to cells if a specified condition is true. This collection expresses conditional formatting rules applied to a particular cell or range.

[*Example:* This example applies a 'top10' rule to the cells C3:C8. The @dxfId references the formatting (defined in the styles part) to be applied to cells that match the criteria.

```
<conditionalFormatting sqref="C3:C8">
  <cfRule type="top10" dxfId="1" priority="3" rank="2"/>
</conditionalFormatting>
```

end example]

Attributes	Description
pivot (PivotTable Conditional	Flag indicating if this is conditional formatting associated with a PivotTable.

Attributes	Description
Formatting)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sqref (Sequence of References)	Range over which these conditional formatting rules apply. The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).

[Note: The W3C XML Schema definition of this element's content model ([CT_ConditionalFormatting](#)) is located in §A.2. *end note*]

18.3.1.19 control (Embedded Control)

A single embedded control.

Attributes	Description
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	This relationship ID references an Embedded Control Data part which contains control-specific properties and state information about this particular embedded control. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Control Name)	The code name of the control. The possible values for this attribute are defined by the W3C XML Schema string datatype.
shapeId (Shape Id)	ID of the drawing shape in the DrawingML part with which this control is associated. The drawing is used to draw the control in the sheet. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Control](#)) is located in §A.2. *end note*]

18.3.1.20 controlPr (Embedded Control Properties)

This element specifies the visual, positional and cell linkage properties of an embedded control.

[Example: The following example demonstrates an non-printing embedded control linked to cell A4 that is represented as an image:

```
<controls>
  <control ... >
```

```

    <controlPr print="false" autoLine="false" linkedCell="$A$4" cf="pict"
r:id="rId5">
    <anchor sizeWithCells="true">
        <from> ... </from>
        <to> ... </to>
    </anchor>
</controlPr>
</control>
</controls>

```

end example]

Attributes	Description
altText (Alternative Text)	<p>Specifies alternative text for the object, for use by assistive technologies or applications.</p> <p>[Example:</p> <pre><controlPr altText="Alternate text" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
autoFill (Automatic Fill Flag)	<p>Specifies whether the object's fill formatting is provided automatically by the application.</p> <p>[Example:</p> <pre><controlPr autoFill="false" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoLine (Automatic Line Flag)	<p>Specifies whether the object's line formatting is provided automatically by the application.</p> <p>[Example:</p> <pre><controlPr autoLine="false" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoPict (Automatic	<p>Specifies whether the object's size is formatted automatically by the application.</p>

Attributes	Description
Size Flag)	<p>[Example:</p> <pre><controlPr autoPict="false" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
cf (Image Format)	<p>Specifies the image format used to render the object.</p> <p>[Example:</p> <pre><controlPr cf="pict" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
defaultSize (Default Size Flag)	<p>Specifies whether the object is at its default size.</p> <p>[Example:</p> <pre><controlPr defaultSize="false" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
disabled (Disabled Flag)	<p>Specifies whether the object is allowed to run an attached macro.</p> <p>[Example:</p> <pre><controlPr disabled="true" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Relationship ID for Embedded Control Properties) Namespace: http://purl.oclc.or	<p>Specifies the relationship ID for the relationship which contains the properties for this embedded control. This property bag is contained in a separate part within the package.</p> <p>The relationship explicitly targeted by this attribute shall be of relationship type http://purl.oclc.org/ooxml/officeDocument/relationships/control or the document shall be considered non-conformant.</p>

Attributes	Description
g/ooxml/officeDocument/relationships	<p>If this attribute is omitted, then the embedded control shall be given no property bag when instantiated.</p> <p>[<i>Example:</i> Consider the following WordprocessingML markup for an embedded control in a document:</p> <pre><w:control r:id="rId5" w:id="CheckBox1" w:name="CheckBox1" w:shapeid="_x0000_s1027" w:class="shape" w:w="145" w:h="28" w:align="left" /></pre> <p>The id attribute in the relationship reference namespace specifies that the relationship with relationship ID rId5 must contain the property data for this embedded control. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
linkedCell (Linked Formula)	<p>Specifies the cell the control is linked to, using standard cell A1-style reference syntax as described in §18.17.2.3.1. The value in the linked cell and the index of the selected item in the object are linked together. This link is ignored if the control allows multiple selections.</p> <p>[<i>Example:</i></p> <pre><controlPr linkedCell="\$A\$4" ... /></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Formula simple type (§18.18.35).</p>
listFillRange (List Items Source Range)	<p>Specifies the range of source data cells used to populate the list box, using standard A1-style cell reference syntax as described in §18.17.2.3.1.</p> <p>[<i>Example:</i></p> <pre><controlPr listFillRange="\$A\$1:\$A\$15" ... /></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Formula simple type (§18.18.35).</p>
locked (Locked Flag)	<p>Specifies that the object is locked when the sheet is protected.</p> <p>[<i>Example:</i></p>

Attributes	Description
	<p><code><controlPr locked="false" ... /></code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
macro (Custom Function)	<p>Specifies the custom function associated with the object. [<i>Example:</i> A macro script, add-in function, and so on. <i>end example]</i></p> <p>[<i>Example:</i></p> <p><code><controlPr macro="Button1_Click()" ... /></code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Formula simple type (§18.18.35).</p>
print (Print Flag)	<p>Specifies whether the object is printed when the document is printed.</p> <p>[<i>Example:</i></p> <p><code><controlPr print="false" ... /></code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
recalcAlways (Recalculation Flag)	<p>Specifies whether the object is always included in recalculation. This is used by controls that reference cells in the spreadsheet to update themselves when the spreadsheet changes.</p> <p>[<i>Example:</i></p> <p><code><controlPr recalcAlways="true" ... /></code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
uiObject (UI Object Flag)	<p>Specifies whether the object is a UI-only object. Applications should prevent UI-only objects from being selected and edited in their user interface.</p> <p>[<i>Example:</i></p> <p><code><objectPr uiObject="true" ... /></code></p>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model (CT_ControlPr) is located in §A.2. *end note]*

18.3.1.21 controls (Embedded Controls)

Worksheets can have embedded controls embedded in them. This collection is a listing of embedded controls in this worksheet. This collection is used to reference individual Embedded Control Data part definitions, enumerate the code name of each control, and reference drawing information used to draw the control.

[*Note:* The W3C XML Schema definition of this element's content model (CT_Controls) is located in §A.2. *end note]*

18.3.1.22 customPr (Custom Property)

The custom property element provides a mechanism to store name/value pairs of arbitrary user-defined data. The name is stored in the attribute name, the arbitrary data is stored in the binary part referenced by the relationshipId.

[*Note:* There is nothing in the binary part except the arbitrary data itself.

Custom XML Data Properties provide a preferred mechanism for storing arbitrary data. The customPr supports legacy third-party document components, as well as those situations that have a stringent need for binary parts. *end note]*

Attributes	Description
id (Relationship Id)	This relationship references the binary part containing the specified custom properties.
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Custom Property Name)	<p>Name of the custom property</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_CustomProperty](#)) is located in §A.2. *end note*]

18.3.1.23 [customProperties \(Custom Properties\)](#)

This collection is used to reference binary parts containing arbitrary user-defined data.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_CustomProperties](#)) is located in §A.2. *end note*]

18.3.1.24 [customSheetView \(Custom Chart Sheet View\)](#)

This element defines custom view properties for chart sheets. [*Note*: See [customSheetView](#) (§18.3.1.25) for an example. *end note*]

Attributes	Description
guid (GUID)	<p>Unique identifier of this custom view</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
scale (Print Scale)	<p>Print scaling, representing percent values. The values of this attribute shall be restricted to the range from 10 to 400. Horizontal & Vertical scale together.</p> <p>[<i>Example</i>:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
state (Visible State)	<p>Visibility state of the sheet.</p> <p>The possible values for this attribute are defined by the ST_SheetState simple type (§18.18.68).</p>
zoomToFit (Zoom To Fit)	<p>Flag indicating whether chart sheet is zoom to fit window.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_CustomChartsheetView](#)) is located in §A.2. *end note*]

18.3.1.25 customSheetView (Custom Sheet View)

This collection stores information pertaining to one custom sheet view definition. A custom view is a collection of settings defining a particular view of the sheet. These views can be selected by the user for quick access to predefined views of the sheet.

[Example: This example indicates that there is both a horizontal and vertical split in the sheet view, and that the top left cell of the bottom right pane is F7. Page margin, print options, page setup, and header / footer information is also stored with this view.

```
<customSheetView guid="{F3A061A9-D5FD-4F9C-A7CD-483AD476BA25}"
  sizeWithWindow="0">
  <pane xSplit="5" ySplit="6" topLeftCell="F7"/>
  <selection/>
  <pageMargins left="0.7" right="0.7" top="0.75" bottom="0.75" header="0.3"
    footer="0.3"/>
  <printOptions gridLinesSet="0"/>
  <pageSetup paperSize="0" scale="0" orientation="portrait" printDriver="0"
    horizontalDpi="0" verticalDpi="0" copies="0"/>
  <headerFooter/>
</customSheetView>
```

end example]

Attributes	Description
colorId (Color Id)	Index to the color value for the text in row/column headings and gridlines for this custom view. This is an 'index color value' (ICV) rather than rgb value. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
filter (Filtered List)	Flag indicating whether the view contains a filtered range. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
filterUnique (Filter)	Indicates whether an advanced filter has been applied, and the option to filter out duplicate records from the data list has been selected, in this custom view. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
fitToPage (Fit To Page)	Flag indicating whether this view should be fit to page when printing this custom view. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
guid (GUID)	Unique identifier of this custom view. This is used to ensure uniqueness. It is generated when the view is created. Shall correspond to a customWorkbookView guid value in the

Attributes	Description
	<p>workbook Start Part.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
hiddenColumns (Hidden Columns)	<p>Flag indicating that there is one or more hidden column(s) in this custom view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hiddenRows (Hidden Rows)	<p>Flag indicating that there is one or more hidden row(s) in this custom view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
outlineSymbols (Show Outline Symbols)	<p>Flag indicating whether outline symbols are displayed in this custom view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
printArea (Print Area Defined)	<p>Flag indicating whether a print area is defined as part of this custom view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
scale (Print Scale)	<p>Print scaling for this custom view. The values of this attribute shall be restricted to the range from 10 to 400.</p> <p><i>[Example:</i> 10 - 10% 20 - 20% ... 100 - 100% ... 400 - 400% <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
showAutoFilter (Show AutoFilter Drop Down Controls)	<p>Flag indicating whether the autofilter dropdown buttons are visible in this custom view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showFormulas (Show Formulas)	<p>Flag indicating whether formulas are shown in this custom view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showGridLines	<p>Flag indicating whether gridlines are shown in this custom view.</p>

Attributes	Description
(Show Grid Lines)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showPageBreaks (Show Page Breaks)	Flag indicating whether page breaks are shown in this custom view. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showRowCol (Show Headers)	Flag indicating whether row and column headers are shown in this custom view. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showRuler (Show Ruler)	Flag indicating whether to show the ruler in this custom view. Only applicable if this Custom View is in Page Layout View. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
state (Visible State)	Visibility state for this custom view. The possible values for this attribute are defined by the ST_SheetState simple type (§18.18.68).
topLeftCell (Top Left Visible Cell)	Location of the top left visible cell in the bottom right pane in this custom view (when in Left-to-Right mode). The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).
view (View Type)	Indicates the view type for this Custom View The possible values for this attribute are defined by the ST_SheetViewType simple type (§18.18.69).
zeroValues (Show Zero Values)	Flag indicating whether the window should display 0 (zero) values in this custom view. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomSheetView](#)) is located in §A.2. end note]

18.3.1.26 customSheetViews (Custom Chart Sheet Views)

Collection of custom Chart Sheet View information.

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomChartsheetViews](#)) is located in §A.2. end note]

18.3.1.27 `customSheetViews` (Custom Sheet Views)

This is a collection of custom sheet views.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomSheetViews](#)) is located in §A.2. *end note*]

18.3.1.28 `dataBar` (Data Bar)

Describes a data bar conditional formatting rule.

[*Example:*

In this example a data bar conditional format is expressed, which spreads across all cell values in the cell range, and whose color is blue.

```
<dataBar>
  <cfvo type="min" val="0"/>
  <cfvo type="max" val="0"/>
  <color rgb="FF638EC6"/>
</dataBar>
```

end example]

The length of the data bar for any cell can be calculated as follows:

Data bar length = minLength + (cell value - minimum value in the range) / (maximum value in the range - minimum value in the range) * (maxLength - minLength),

where min and max length are a fixed percentage of the column width (by default, 10% and 90% respectively.)

The minimum difference in length (or increment amount) is 1 pixel.

Attributes	Description
maxLength (Maximum Length)	The maximum length of the data bar, as a percentage of the cell width. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
minLength (Minimum Length)	The minimum length of the data bar, as a percentage of the cell width. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
showValue (Show Values)	Indicates whether to show the values of the cells on which this data bar is applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_DataBar](#)) is located in §A.2. *end note*]

18.3.1.29 dataConsolidate (Data Consolidate)

Data consolidation settings. The dataRefs are the set of source ranges containing data to consolidate. The function indicates the function that shall be used to consolidate the data.

[Example:

This example demonstrates consolidating the ranges A1:C1 and A3:C3 by using the 'count' function.

```
<dataConsolidate function="count">
  <dataRefs count="2">
    <dataRef ref="A1:C1" sheet="Sheet1"/>
    <dataRef ref="A3:C3" sheet="Sheet1"/>
  </dataRefs>
</dataConsolidate>
```

end example]

Attributes	Description
function (Function Index)	Indicates which function to use when consolidating the ranges. The possible values for this attribute are defined by the ST_DataConsolidateFunction simple type (§18.18.17).
link (Link)	Create links to source data. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
startLabels (Use Starting Column Labels)	Use labels in first column. Both startLabels and topLabels can be true at the same time. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
topLabels (Labels In Top Row)	Use labels in top row. Both leftLabels and topLabels can be true at the same time. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([CT_DataConsolidate](#)) is located in §A.2. *end note*]

18.3.1.30 dataRef (Data Consolidation Reference)

A single data consolidate reference. One dataRef shall use either name or sheet & ref, but not both on the same dataRef.

Attributes	Description
id (relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Used only when the source range is external to this workbook. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Named Range)	Named range, either in this workbook or the external workbook referenced by r:Id. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ref (Reference)	Cell range. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sheet (Sheet Name)	Sheet name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_DataRef](#)) is located in §A.2. *end note*]

18.3.1.31 dataRefs (Data Consolidation References)

Data consolidate reference collection.

Attributes	Description
count (Data Consolidation Reference Count)	Count of data consolidate references. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DataRefs](#)) is located in §A.2. *end note*]

18.3.1.32 dataValidation (Data Validation)

A single item of data validation defined on a range of the worksheet.

Attributes	Description
allowBlank (Allow Blank)	<p>A boolean value indicating whether the data validation allows the use of empty or blank entries. 1 means empty entries are OK and do not violate the validation constraints.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
error (Error Message)	<p>Message text of error alert.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
errorStyle (Data Validation Error Style)	<p>The style of error alert used for this data validation.</p> <p>The possible values for this attribute are defined by the ST_DataValidationErrorStyle simple type (§18.18.18).</p>
errorTitle (Error Alert Text)	<p>Title bar text of error alert.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
imeMode (IME Mode Enforced)	<p>The IME (input method editor) mode enforced by this data validation. Only applies for these languages:</p> <ul style="list-style-type: none"> • Chinese Simplified • Chinese Traditional • Japanese • Korean • • When imeMode is set, the input for the cell can be restricted to specific sets of characters, as specified by the value of imeMode. See the simple type referenced below for additional details. • <p>When imeMode is set but the application's language is not one of the languages listed above, then the default value is noControl.</p> <p>The possible values for this attribute are defined by the ST_DataValidationImeMode simple type (§18.18.19).</p>
operator (Operator)	<p>The relational operator used with this data validation.</p> <p>The possible values for this attribute are defined by the ST_DataValidationOperator simple type (§18.18.20).</p>

Attributes	Description
prompt (Input Prompt)	<p>Message text of input prompt.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
promptTitle (Prompt Title)	<p>Title bar text of input prompt.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
showDropDown (Show Drop Down)	<p>A boolean value indicating whether to display a dropdown combo box for a list type data validation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showErrorMessage (Show Error Message)	<p>A boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showInputMessage (Show Input Message)	<p>A boolean value indicating whether to display the input prompt message.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sqref (Sequence of References)	<p>Range over which data validation is applied.</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).</p>
type (Data Validation Type)	<p>The type of data validation.</p> <p>The possible values for this attribute are defined by the ST_DataValidationType simple type (§18.18.21).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DataValidation](#)) is located in §A.2. end note]

18.3.1.33 dataValidations (Data Validations)

This collection expresses all data validation information for cells in a sheet which have data validation features applied.

Data validation is used to specify constraints on the data that can be entered into a cell. Additional UI can be provided to help the user select values (e.g., a dropdown control on the cell or hover text when the cell is active), and to help the user understand why a particular entry was disallowed (e.g., alerts and messages).

Various data types can be selected, and logical operators (e.g., greater than, less than, equal to, etc) can be used. Additionally, instead of specifying an explicit set of values that are permitted, a cell or range reference can be used.

An input message can be specified to help the user know what kind of value is expected, and a warning message (and warning type) can be specified to alert the user when they've entered data which is not permitted based on the data validations specified in the worksheet.

[Example:

```
<dataValidations count="1">
  <dataValidation type="whole" errorStyle="warning" operator="greaterThan"
    showInputMessage="1" showErrorMessage="1" errorTitle="Invalid Data"
    error="The value must be a whole number greater than 0."
    promptTitle="Whole Number"
    prompt="Please enter a whole number greater than 0." sqref="A1">
    <formula1>0</formula1>
  </dataValidation>
</dataValidations>
```

end example]

Attributes	Description
count (Data Validation Item Count)	The expected number of data validation items for this worksheet. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
disablePrompts (Disable Prompts)	A boolean value indicating whether all input prompts for the worksheet are disabled. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
xWindow (Top Left Corner (X Coodrinate))	The x-coordinate (relative to window) of top-left corner of the data validation input prompt (textbox). This is per sheet, not per cell. Units in pixels. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
yWindow (Top Left Corner (Y Coordinate))	The y-coordinate (relative to window) of top-left corner of the data validation input prompt (textbox). This is per sheet, not per cell. Units in pixels. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_DataValidations](#)) is located in §A.2.
end note]

18.3.1.34 dialogsheet (Dialog Sheet)

This is the root element for Dialogsheet parts within a SpreadsheetML document.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Dialogsheet](#)) is located in §A.2. *end note*]

18.3.1.35 dimension (Worksheet Dimensions)

This element specifies the used range of the worksheet. It specifies the row and column bounds of used cells in the worksheet. This is optional and is not required. Used cells include cells with formulas, text content, and cell formatting. When an entire column is formatted, only the first cell in that column is considered used.

[*Example:*

```
<dimension ref="A1:C2"/>
```

end example]

Attributes	Description
ref (Reference)	The row and column bounds of all cells in this worksheet. Corresponds to the range that would contain all c elements written under sheetData. Does not support whole column or whole row reference notation. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SheetDimension](#)) is located in §A.2. *end note*]

18.3.1.36 drawing (Drawing)

This element indicates that the sheet contains drawing components built on the drawingML platform. The relationship Id references the part containing the drawingML definitions.

Attributes	Description
id (Relationship id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship Id referencing a part containing drawingML definitions for this worksheet. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Drawing](#)) is located in §A.2. *end note*]

18.3.1.37 drawingHF (Drawing Reference in Header Footer)

This element specifies the usage of drawing objects rendered in the header / footer of the sheet. It specifies an explicit relationship to the part containing the DrawingML shapes used in the header / footer. It also indicates where in the header / footer each shape belongs. One drawing object can appear in each of the left side, center and right side of the header and footer.

[*Example:* This example shows a worksheet with graphics in the header. The DrawingML part referred to by rId2 contains at least two objects. The object with ID 6 is shown in the left side of the header on the first page only. The object with ID 7 is shown in the left side of the header for the other pages.

```
<worksheet ... >
...
<headerFooter differentFirst="1" ... >
...
</headerFooter>
<drawingHF r:id="rId2" lho="7" lhs="6"/>
</worksheet>
```

end example]

Attributes	Description
cfe (Center Footer for Even Pages)	<p>Specifies the DrawingML shape to be used for the center of the footer on even pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[<i>Example:</i></p> <pre><drawingHF ... cfe="5"/></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
cff (Center Footer for First Page)	<p>Specifies the DrawingML shape to be used for the center of the footer on the first page if the differentFirst attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[<i>Example:</i></p> <pre><drawingHF ... cff="5"/></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

Attributes	Description
cfo (Center Footer for Odd Pages)	<p>Specifies the DrawingML shape to be used for the center of the footer on odd pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true. If the differentOddEven attribute is false, this attribute specifies the DrawingML shape to be used for the center of the footer on both odd and even pages.</p> <p>[Example:</p> <pre data-bbox="451 499 808 531"><drawingHF ... cfo="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
che (Center Header for Even Pages)	<p>Specifies the DrawingML shape to be used for the center of the header on even pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre data-bbox="451 940 808 972"><drawingHF ... che="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
chf (Center Header for First Page)	<p>Specifies the DrawingML shape to be used for the center of the header on the first page if the differentFirst attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre data-bbox="451 1381 808 1413"><drawingHF ... chf="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
cho (Center Header for Odd Pages)	<p>Specifies the DrawingML shape to be used for the center of the header on odd pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true. If the differentOddEven attribute is false, this attribute specifies the DrawingML shape to be used for the center of the header on both odd and even pages.</p> <p>[Example:</p> <pre data-bbox="451 1854 808 1885"><drawingHF ... cho="5"/></pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>id (Relationship ID for Embedded Control Properties)</p> <p>Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships</p>	<p>Specifies the relationship ID for the relationship to the DrawingML part that contains the drawing objects used in the header and footer. This DrawingML part is a separate part within the package.</p> <p>[Example:</p> <pre><drawingHF r:id="rId2" lho="7" lhf="6"/></pre> <p>The id attribute in the relationship reference namespace specifies that the relationship with relationship ID rId5 must contain the drawing objects used in the header and footer. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
<p>lfe (Left Footer for Even Pages)</p>	<p>Specifies the DrawingML shape to be used for the left side of the footer on even pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre><drawingHF ... lfe="5"/></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>lff (Left Footer for First Page)</p>	<p>Specifies the DrawingML shape to be used for the left side of the footer on the first page if the differentFirst attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre><drawingHF ... lff="5"/></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>lfo (Left Footer for Odd Pages)</p>	<p>Specifies the DrawingML shape to be used for the left side of the footer on odd pages if the differentOddEven attribute of the corresponding headerFooter element</p>

Attributes	Description
	<p>(§18.3.1.46) is true. If the differentOddEven attribute is false, this attribute specifies the DrawingML shape to be used for the left side of the footer on both odd and even pages.</p> <p>[Example:</p> <pre data-bbox="456 428 808 457"><drawingHF ... lfo="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
lhe (Left Header for Even Pages)	<p>Specifies the DrawingML shape to be used for the left side of the header on even pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre data-bbox="456 869 808 898"><drawingHF ... lhe="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
lhf (Left Header for First Page)	<p>Specifies the DrawingML shape to be used for the left side of the header on the first page if the differentFirst attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre data-bbox="456 1306 808 1335"><drawingHF ... lhf="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
lho (Left Header for Odd Pages)	<p>Specifies the DrawingML shape to be used for the left side of the header on odd pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true. If the differentOddEven attribute is false, this attribute specifies the DrawingML shape to be used for the left side of the header on both odd and even pages.</p> <p>[Example:</p> <pre data-bbox="456 1780 808 1810"><drawingHF ... lho="5"/></pre> <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>rfe (Right Footer for Even Pages)</p>	<p>Specifies the DrawingML shape to be used for the right side of the footer on even pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre><drawingHF ... rfe="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>rff (Right Footer for First Page)</p>	<p>Specifies the DrawingML shape to be used for the right side of the footer on the first page if the differentFirst attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p> <pre><drawingHF ... rff="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>rfo (Right Footer for Odd Pages)</p>	<p>Specifies the DrawingML shape to be used for the right side of the footer on odd pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true. If the differentOddEven attribute is false, this attribute specifies the DrawingML shape to be used for the right side of the footer on both odd and even pages.</p> <p>[Example:</p> <pre><drawingHF ... rfo="5"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>rhe (Right Header for Even Pages)</p>	<p>Specifies the DrawingML shape to be used for the right side of the header on even pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p>[Example:</p>

Attributes	Description
	<p data-bbox="456 285 808 317"><drawingHF ... rhe="5"/></p> <p data-bbox="415 354 574 386"><i>end example]</i></p> <p data-bbox="415 426 1453 491">The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rhf (Right Header for First Page)	<p data-bbox="415 510 1429 611">Specifies the DrawingML shape to be used for the right side of the header on the first page if the differentFirst attribute of the corresponding headerFooter element (§18.3.1.46) is true.</p> <p data-bbox="415 651 532 682"><i>[Example:</i></p> <p data-bbox="456 722 808 753"><drawingHF ... rhf="5"/></p> <p data-bbox="415 791 574 823"><i>end example]</i></p> <p data-bbox="415 863 1453 928">The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rho (Right Header for Odd Pages)	<p data-bbox="415 951 1479 1121">Specifies the DrawingML shape to be used for the right side of the header on odd pages if the differentOddEven attribute of the corresponding headerFooter element (§18.3.1.46) is true. If the differentOddEven attribute is false, this attribute specifies the DrawingML shape to be used for the right side of the header on both odd and even pages.</p> <p data-bbox="415 1161 532 1192"><i>[Example:</i></p> <p data-bbox="456 1232 808 1264"><drawingHF ... rho="5"/></p> <p data-bbox="415 1302 574 1333"><i>end example]</i></p> <p data-bbox="415 1373 1453 1438">The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DrawingHF](#)) is located in §A.2. *end note]*

18.3.1.38 evenFooter (Even Page Footer)

Even page footer value. Corresponds to even printed pages. *[Example: Even page(s) in the sheet can not be printed if the print area is specified to be a range such that it falls outside an even page's scope. end example]*

If no even footer is specified, then the odd footer's value is assumed for even page footers. See the evenHeader element (§18.3.1.39) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element’s content model (ST_Xstring) is located in §A.6.9. *end note*]

18.3.1.39 **evenHeader (Even Page Header)**

Even page header value. Corresponds to even printed pages. [*Example: Even page(s) in the sheet can not be printed if the print area is specified to be a range such that it falls outside an even page's scope. end example*]

If no even header is specified, then odd header value is assumed for even page headers.

Header/Footer Formatting Syntax

There are a number of formatting codes that can be written inline with the actual header / footer text, which affect the formatting in the header or footer.

[*Example:*

This example shows the text "Center **Bold** Header" on the first line (center section), and the date on the second line (center section).

```
<headerFooter>  
  <oddHeader>&C;Center &B;"- ,Bold"Bold  
    &R;"- ,Regular"Header_x000A_&D</oddHeader>  
</headerFooter>
```

end example]

General Rules:

There is no required order in which these codes need to appear.

The first occurrence of the following codes turns the formatting ON, the second occurrence turns it OFF again:

- strikethrough
- superscript

- subscript

Superscript and subscript cannot both be ON at same time. Whichever comes first wins and the other is ignored, while the first is ON.

&L - code for "left section" (there are three header / footer locations, "left", "center", and "right"). When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the left section.

&P - code for "current page #"

&N - code for "total pages"

&font size - code for "text font size", where *font size* is a font size in points.

&K - code for "text font color"

RGB Color is specified as RRGGBB

Theme Color is specified as TTSSNN where TT is the theme color Id, S is either "+" or "-" of the tint/shade value, NN is the tint/shade value.

&S - code for "text strikethrough" on / off

&X - code for "text super script" on / off

&Y - code for "text subscript" on / off

&C - code for "center section". When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the center section.

&D - code for "date"

&T - code for "time"

&G - code for "picture as background"

&U - code for "text single underline"

&E - code for "double underline"

&R - code for "right section". When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the right section.

&Z - code for "this workbook's file path"

&F - code for "this workbook's file name"

&A - code for "sheet tab name"

&+ - code for add to page #.

&- - code for subtract from page #.

&"*font name,font type*" - code for "text font name" and "text font type", where *font name* and *font type* are strings specifying the name and type of the font, separated by a comma. When a hyphen appears in *font name*, it means "none specified". Both of *font name* and *font type* can be localized values. Although ISO/IEC 14496-22 permits commas in font family/subfamily/full names, name and font type, the lexically first comma in the string is the one recognized as the separating comma.

&"-,Bold" - code for "bold font style"

&B - also means "bold font style".

&"-,Regular" - code for "regular font style"

&"-,Italic" - code for "italic font style"

&I - also means "italic font style"

&"-,Bold Italic" code for "bold italic font style"

&O - code for "outline style"

&H - code for "shadow style"

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.3.1.40 f (Formula)

Formula for the cell. The formula expression is contained in the character node of this element.

[Example:

<f>SUM(C4:E4)</f>

end example]

The possible values for the t attribute are defined by the simple type ST_CellFormulaType, and are as follows:

Value	Description
array (Array formula)	Array formula. An array formula is a single formula, applied across a range of one or more cells. An array formula can return multiple results from one single calculation, the results spanning the cells in which it is contained (§18.17.2.7).
dataTable (Table	Data table. A <i>data table</i> is a range of cells that shows how changing certain values in one

Value	Description
formula)	<p>or more formulas affects the results of those formulas. A data table provides a shortcut for calculating multiple versions in one operation, and a way to include the results of all of the different variations in a sheet.</p> <p>Both one- and two-input variable data tables can be created (see attribute dt2D).<i>[Example: A one-input variable data table might be used to calculate how different interest rates affect a monthly mortgage payment, while a two-input variable data table might be used to calculate how different interest rates and loan terms will affect the mortgage payment. end example]</i></p> <p>In a one-input variable data table, values are listed either down a column (column-oriented) or across a row (row-oriented) (see attribute dtr).</p> <p>Formulas that are used in a one-input variable data table shall refer to an input cell (see attribute r1), the cell in which each input value from a data table is substituted. Any cell on a worksheet can be the input cell. Although the input cell does not need to be part of the data table, the formulas in data tables shall refer to that input cell.</p> <p>Two-input variable data tables use only one formula with two lists of input values. The formula shall refer to two input cells (see attributes r1 and r2).</p> <p>The top-left cell in the data table is called the <i>master cell</i>.</p> <p><i>[Guidance: It is recommended that Spreadsheet applications recalculate data tables whenever a worksheet is recalculated. end guidance]</i></p>
normal (Normal formula)	Normal cell formula (§18.17).
shared (Shared formula)	Shared formula. If a cell contains the same formula as another cell, the “shared” value can be used for the t attribute and the si attribute can be used to refer to the cell containing the formula. Two formulas are considered to be the same when their respective representations in R1C1-reference notation, are the same.

Attributes	Description
aca (Always Calculate Array)	<p>Only applies to array formulas. true indicates that the entire array shall be calculated in full. If false the individual cells of the array shall be calculated as needed. The aca value shall be ignored unless the value of the corresponding t attribute is array.</p> <p><i>[Note: The primary case where an array formula must be calculated in part instead of in full is when some cells in the array depend on other cells that are semi-calculated, e.g., contains the function =RAND(). end note]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
bx (Assigns Value to Name)	<p>Specifies that this formula assigns a value to a name.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ca (Calculate Cell)	<p>Indicates that this formula needs to be recalculated the next time calculation is performed. [<i>Example</i>: This is always set on volatile functions, like =RAND(), and circular references. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
del1 (Input 1 Deleted)	<p>Whether the first input cell for data table has been deleted. Applies to data table formula only. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
del2 (Input 2 Deleted)	<p>Whether the second input cell for data table has been deleted. Applies to data table formula only. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dt2D (Data Table 2-D)	<p>Data table is two-dimensional. Only applies to the data tables function. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dtr (Data Table Row)	<p>true if one-dimensional data table is a row, otherwise it's a column. Only applies to the data tables function. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
r1 (Data Table Cell 1)	<p>First input cell for data table. Only applies to the data tables array function "TABLE()". Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
r2 (Input Cell 2)	<p>Second input cell for data table when dt2D is 1. Only applies to the data tables array function "TABLE()". Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
ref (Range of Cells)	<p>Range of cells which the formula applies to. Only required for shared formula, array formula or data table. Only written on the master formula, not subsequent formulas belonging to the same shared group, array, or data table.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
si (Shared Group Index)	<p>Optional attribute to optimize load performance by sharing formulas.</p> <p>When a formula is a shared formula (t value is shared) then this value indicates the group to which this particular cell's formula belongs. The first formula in a group of shared formulas is saved in the f element. This is considered the 'master' formula cell. Subsequent cells sharing this formula need not have the formula written in their f element. Instead, the attribute si value for a particular cell is used to figure what the formula expression should be based on the cell's relative location to the master formula cell.</p> <p>A cell is shared only when si is used and t is shared. The formula expression for a cell that is specified to be part of a shared formula (and is not the master) shall be ignored, and the master formula shall override.</p> <p>If a master cell of a shared formula range specifies that a particular cell is part of the shared formula range, and that particular cell does not use the si and t attributes to indicate that it is shared, then the particular cell's formula shall override the shared master formula. If this cell occurs in the middle of a range of shared formula cells, the earlier and later formulas shall continue sharing the master formula, and the cell in question shall not share the formula of the master cell formula.</p> <p>Loading and handling of a cell and formula using an si attribute and whose t value is shared, located outside the range specified in the master cell associated with the si group, is implementation defined.</p> <p>Master cell references on the same sheet shall not overlap with each other.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
t (Formula Type)	<p>Type of formula.</p> <p>The possible values for this attribute are defined by the ST_CellFormulaType simple type (§18.18.6).</p>
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CellFormula](#)) is located in §A.2. *end note*]

18.3.1.41 firstFooter (First Page Footer)

First page footer content. Only used when headerFooter@differentFirst is '1'. Corresponds to first printed page. [*Example:*The first logical page in the sheet can not be printed if the print area is specified to be a range such that it falls outside the first page's scope. *end example*]

See evenHeader (§18.3.1.39) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note:* The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.3.1.42 firstHeader (First Page Header)

First page header content. Only used when headerFooter@differentFirst is 1. Corresponds to first printed page. [*Example:* The first logical page in the sheet can not be printed if the print area is specified to be a range such that it falls outside the first page's scope. *end example*]

See evenHeader (§18.3.1.39) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.3.1.43 formula (Formula)

The content of this element is a formula whose calculated value specifies the criteria for the conditional formatting rule.

The possible values for this element are defined by the ST_Formula simple type (§18.18.35).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Formula](#)) is located in §A.2. *end note*]

18.3.1.44 formula1 (Formula 1)

The first formula in the Data Validation dropdown. It is used as a bounds for 'between' and 'notBetween' relational operators, and the only formula used for other relational operators (equal, notEqual, lessThan, lessThanOrEqual, greaterThan, greaterThanOrEqual), or for custom or list type data validation. The content can be a formula or a constant or a list series (comma separated values).

The possible values for this element are defined by the ST_Formula simple type (§18.18.35).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Formula](#)) is located in §A.2. *end note*]

18.3.1.45 formula2 (Formula 2)

The second formula in the DataValidation dropdown. It is used as a bounds for 'between' and 'notBetween' relational operators only.

The possible values for this element are defined by the ST_Formula simple type (§18.18.35).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Formula](#)) is located in §A.2. *end note*]

18.3.1.46 headerFooter (Header Footer Settings)

Header and footer settings.

[Example:

This example demonstrates "Header" at the top and "Footer" at the bottom of a page.

```

<headerFooter>
  <oddHeader>&CHeader</oddHeader>
  <oddFooter>&CFooter</oddFooter>
</headerFooter>

```

end example]

The tokens in the header & footer elements can be localized. An application can decide which locales are supported. Even when a locale is not supported, the header and footer text shall be loaded, and only the formatting is discarded.

Attributes	Description
alignWithMargins (Align Margins)	Align header footer margins with page margins. When true, as left/right margins grow and shrink, the header and footer edges stay aligned with the margins. When false, headers and footers are aligned on the paper edges, regardless of margins. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
differentFirst (Different First Page)	Different first page header and footer. When true then firstHeader and firstFooter specify first page header and footer values. If false and firstHeader / firstFooter are present, they are ignored. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
differentOddEven (Different Odd Even Header Footer)	Different odd and even page headers and footers. When true then oddHeader / oddFooter and evenHeader / evenFooter specify page header and footer values for odd and even pages. If false then oddHeader / oddFooter is used, even when evenHeader / evenFooter are present. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
scaleWithDoc (Scale Header & Footer With Document)	Scale header and footer with document scaling. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_HeaderFooter](#)) is located in §A.2.
end note]

18.3.1.47 [hyperlink \(Hyperlink\)](#)

A single hyperlink

Attributes	Description
display (Display)	Display string, if different from string in string table. This is a property on the hyperlink

Attributes	Description
String)	object, but does not need to appear in the spreadsheet application UI. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship Id in this sheet's relationships part, expressing the target location of the resource. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
location (Location)	Location within target. If target is a workbook (or this workbook) this shall refer to a sheet and cell or a defined name. Can also be an HTML anchor if target is HTML file. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ref (Reference)	Cell location of hyperlink on worksheet. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
tooltip (Tool Tip)	This is additional text to help the user understand more about the hyperlink. <i>[Example: This can be displayed as hover text when the mouse is over the link. end example]</i> The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_Hyperlink](#)) is located in §A.2. end note]

18.3.1.48 hyperlinks (Hyperlinks)

Collection of hyperlinks.

[Example:

This example shows a hyperlink in cell A11, with hover text displaying "Search Page". The relationship Id references a relationship from the sheet to the external target resource.

```
<hyperlinks>
  <hyperlink ref="A11" r:id="rId1" tooltip="Search Page"/>
</hyperlinks>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_Hyperlinks](#)) is located in §A.2. *end note*]

18.3.1.49 **iconSet (Icon Set)**

Describes an icon set conditional formatting rule.

[Example: This example demonstrates the "3Arrows" style of icons. The first icon in the set must be shown if the cell's value is less than the 33rd percentile. The second icon in the set must be shown if the cell's value is less than the 67th percentile, and greater than or equal to the 33rd percentile. The third icon in the set must be shown if the cell's value is greater than or equal to the 67th percentile.

```
<iconSet iconSet="3Arrows">
  <cfvo type="percentile" val="0"/>
  <cfvo type="percentile" val="33"/>
  <cfvo type="percentile" val="67"/>
</iconSet>
```

end example]

Attributes	Description
iconSet (Icon Set)	The icon set to display. The possible values for this attribute are defined by the ST_IconSetType simple type (§18.18.42).
percent (Percent)	Indicates whether the thresholds indicate percentile values, instead of number values. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
reverse (Reverse Icons)	If 1, reverses the default order of the icons in this icon set. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showValue (Show Value)	Indicates whether to show the values of the cells on which this icon set is applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_IconSet](#)) is located in §A.2. *end note*]

18.3.1.50 **ignoredError (Ignored Error)**

A single ignored error for a range of cells.

A cell is considered to have an error condition when it meets one of the conditions specified in the attribute descriptions below. *[Example: If a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number, for example, in calculations. end example]*

This is simply a guess by the implementing application, and a recommendation to the user. Cells with the errors specified below might be deliberately defined as such. *[Example: A cell formatted as text which contains numeric Postal Codes or Order numbers. It is useful to format these cells as text so that leading zeros remain as part of the value instead of being removed. end example]*

An `<ignoreError>` element is not written in the file unless the user has specifically reviewed the error and decided to keep the cell state as it is, and no longer wishes to be alerted about it for this cell. This can be helpful for the application to decide which errors should be surfaced to the user vs kept quiet because the user doesn't want these to be surfaced (e.g., because they are legitimate cell states).

[Example: This example shows that cells A1 and B2 both contain numbers stored as text, and this error has been reviewed and specifically flagged to be no longer surfaced as an error to the user.

```
<ignoredErrors>
  <ignoreError sqref="A1 B2" numberStoredAsText="1"/>
</ignoredErrors>
```

end example]

More than one kind of error can exist on a cell. These flags are not mutually exclusive.

Attributes	Description
calculatedColumn (Calculated Column)	Ignore errors when cells contain a value different from a calculated column formula. In other words, for a calculated column, a cell in that column is considered to have an error if its formula is different from the calculated column formula, or doesn't contain a formula at all. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
emptyCellReference (Empty Cell Reference)	Ignore errors when formulas refer to empty cells. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
evalError (Evaluation Error)	Ignore errors when cells contain formulas that result in an error. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
formula (Formula)	Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region. The possible values for this attribute are defined by the W3C XML Schema boolean

Attributes	Description
	datatype.
formulaRange (Formula Range)	Ignore errors when formulas omit certain cells in a region. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
listDataValidation (List Data Validation)	Ignore errors when a cell's value in a Table does not comply with the Data Validation rules specified. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
numberStoredAsText (Number Stored As Text)	Ignore errors when numbers are formatted as text or are preceded by an apostrophe. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
sqref (Sequence of References)	Reference to a range of cells that have this ignored error. The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).
twoDigitTextYear (Two Digit Text Year)	Ignore errors when formulas contain text formatted cells with years represented as 2 digits. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
unlockedFormula (Unlocked Formula)	Ignore errors when unlocked cells contain formulas. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_IgnoredError](#)) is located in §A.2.
end note]

18.3.1.51 ignoredErrors (Ignored Errors)

A collection of ignored errors, by cell range.

[Note: The W3C XML Schema definition of this element's content model ([CT_IgnoredErrors](#)) is located in §A.2.
end note]

18.3.1.52 inputCells (Input Cells)

This collection describes each input cell for the scenario.

Attributes	Description
deleted (Deleted)	<p>Input cell was deleted. This input cell shall be present in the file format, but shall not be presented to the user as part of the scenario inputs, nor run as part of the scenario.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
numFmtId (Number Format Id)	<p>This number format Id is used only when displaying the scenario manager input UI, and is used to properly format for display the cached input values (see val attribute) for the scenario.</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).</p>
r (Reference)	<p>Cell reference indicating the input cell address.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
undone (Undone)	<p>Cell's deletion was undone. When true the r (reference) value shall not adjust in response to the cell moving due to row / column insert or delete, or cell move.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
val (Value)	<p>Value that should be used for the cell when this scenario is run.</p> <p>val does not need a corresponding data type, the value is put into the cell when the scenario is run.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_InputCells](#)) is located in §A.2. *end note*]

18.3.1.53 [is \(Rich Text Inline\)](#)

This element allows for strings to be expressed directly in the cell definition instead of implementing the shared string table.

[Example:

```
<c r="A1">
  <is>
    <t>String</t>
  </is>
</c>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Rst](#)) is located in §A.2. *end note*]

18.3.1.54 `mergeCell` (Merged Cell)

A single merged cell

[*Note:* The W3C XML Schema definition of this element's content model ([CT_MergeCell](#)) is located in §A.2. *end note*]

18.3.1.55 `mergeCells` (Merge Cells)

This collection expresses all the merged cells in the sheet.

[*Example:*

This example shows that three ranges are merged. The formatting and content for the merged range is always stored in the top left cell.

```
<mergeCells>
  <mergeCell ref="C2:F2"/>
  <mergeCell ref="B19:C20"/>
  <mergeCell ref="E19:G19"/>
</mergeCells>
```

end example]

Attributes	Description
count (Count)	<p>A count of merged cell collections.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_MergeCells](#)) is located in §A.2. *end note*]

18.3.1.56 `objectPr` (Embedded Object Properties)

This element specifies the visual, positional and cell linkage properties of an embedded object.

[*Example:* The following example demonstrates an embedded object that does not print and that is resized when the cells underlying it are resized:

```
<oleObjects>
  <oleObject ... >
    <objectPr print="false" autoLine="false" r:id="rId5">
      <anchor sizeWithCells="true">
```

```

        <from> ... </from>
        <to> ... </to>
    </anchor>
</objectPr>
</oleObject>
</oleObjects>

```

end example]

Attributes	Description
altText (Alternative Text)	<p>Specifies alternative text for the object, for use by assistive technologies or applications.</p> <p>[Example:</p> <pre><objectPr altText="Alternate text" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
autoFill (Automatic Fill Flag)	<p>Specifies whether the object's fill formatting is provided automatically by the application.</p> <p>[Example:</p> <pre><objectPr autoFill="false" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoLine (Automatic Line Flag)	<p>Specifies whether the object's line formatting is provided automatically by the application.</p> <p>[Example:</p> <pre><objectPr autoLine="false" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoPict (Automatic Size Flag)	<p>Specifies whether the object's size is formatted automatically by the application.</p> <p>[Example:</p> <pre><objectPr autoPict="false" ... /></pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>dde (Dynamic Data Exchange Flag)</p>	<p>Specifies whether the object is a Dynamic Data Exchange link.</p> <p>[Example:</p> <pre><objectPr dde="true" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>defaultSize (Default Size Flag)</p>	<p>Specifies whether the object is at its default size.</p> <p>[Example:</p> <pre><objectPr defaultSize="false" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>disabled (Disabled Flag)</p>	<p>Specifies whether the object is allowed to run an attached macro.</p> <p>[Example:</p> <pre><objectPr disabled="true" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>id (Relationship ID to Embedded Object Data)</p> <p>Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships</p>	<p>Specifies the relationship ID for the relationship which targets the Embedded Object Part containing the embedded object data.</p> <p>The specified relationship shall be of type http://purl.oclc.org/ooxml/officeDocument/relationships/oleObject or the document shall be considered non-conformant.</p> <p>[Example: Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId1" /></pre>

Attributes	Description
	<p>The markup specifies the associated relationship part with relationship ID rId1 targets the part containing the corresponding embedded object information. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
locked (Locked Flag)	<p>Specifies that the object is locked when the sheet is protected.</p> <p>[Example:</p> <pre><objectPr locked="false" ... /></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
macro (Custom Function)	<p>Specifies the custom function associated with the object. [Example: A macro script, add-in function, and so on. <i>end example</i></p> <p>[Example:</p> <pre><objectPr macro="Button1_Click()" ... /></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Formula simple type (§18.18.35).</p>
print (Print Flag)	<p>Specifies whether the object is printed when the document is printed.</p> <p>[Example:</p> <pre><objectPr print="false" ... /></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
uiObject (UI Object Flag)	<p>Specifies whether the object is a UI-only object. Applications should prevent UI-only objects from being selected and edited in their user interface.</p> <p>[Example:</p> <pre><objectPr uiObject="true" ... /></pre> <p><i>end example</i></p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_ObjectPr](#)) is located in §A.2. *end note*]

18.3.1.57 oddFooter (Odd Page Footer)

Odd page footer value. Corresponds to odd printed pages. [*Example*: Odd page(s) in the sheet can not be printed if the print area is specified to be a range such that it falls outside an odd page's scope. *end example*]

See evenHeader (§18.3.1.39) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.3.1.58 oddHeader (Odd Header)

Odd page header value. Corresponds to odd printed pages. [*Example*: Odd page(s) in the sheet can not be printed if the print area is specified to be a range such that it falls outside an odd page's scope. *end example*]

See evenHeader (§18.3.1.39) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.3.1.59 oleObject (Embedded Object)

Information for an individual embedded object.

Attributes	Description
autoLoad (Auto Load)	<p>Specifies whether the host application for the embedded object shall be called to load the object data automatically when the parent workbook is opened.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dvAspect (Data or View Aspect)	<p>Specifies the desired Data or View Aspect of the object when drawing or getting data</p> <p>The possible values for this attribute are defined by the ST_DvAspect simple type (§18.18.24).</p>
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Relationship Id of the relationship pointing to the object persistence part.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
link (Embedded Object's Link Moniker)	<p>The embedded object's link moniker.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
oleUpdate (Linked Embedded Object Update)	<p>Indicates whether the linked object updates the cached data automatically or only when the container requests an update, only present if the embedded object is linked.</p> <p>The possible values for this attribute are defined by the ST_OleUpdate simple type (§18.18.49).</p>

Attributes	Description
progId (Embedded Object ProgId)	<p>ProgId of the embedded object.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
shapeId (Shape Id)	<p>Id of the shape this object is associated with. Corresponds with the shape @id in the drawingML part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_OleObject](#)) is located in §A.2. *end note*]

18.3.1.60 [oleObjects \(Embedded Objects\)](#)

Embedded objects collection in this worksheet.

[Example:

This example shows two embedded objects.

```
<oleObjects>
  <oleObject progId="Word.Document.12" shapeId="1025" r:id="rId4"/>
  <oleObject progId="PowerPoint.Show.12" shapeId="1026" r:id="rId5"/>
</oleObjects>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_OleObjects](#)) is located in §A.2. *end note*]

18.3.1.61 [outlinePr \(Outline Properties\)](#)

Outline properties of the worksheet.

[Example: This example indicates that when an outline is applied to data, formatting must be applied to the outline result.

```
<sheetPr>
  <outlinePr applyStyles="1"/>
</sheetPr>
```

end example]

Attributes	Description
applyStyles (Apply Styles in Outline)	<p>Flag indicating whether to apply styles in an outline, when outline is applied. Outline styles are described in Styles (§18.8).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showOutlineSymbols (Show Outline Symbols)	<p>Flag indicating whether the sheet has outline symbols visible. This flag shall always be overridden by the showOutlineSymbols attribute on sheetView when there is a conflict.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
summaryBelow (Summary Below)	<p>Flag indicating whether summary rows appear below detail in an outline, when applying an outline.</p> <p>When true a summary row is inserted below the detailed data being summarized and a new outline level is established on that row.</p> <p>When false a summary row is inserted above the detailed data being summarized and a new outline level is established on that row.</p> <p>Note that toggling this flag on existing outlines requires an update to cell table, specifically, putting the summary functions in the proper rows, and flagging these rows as new outline levels, and possibly resetting their collapsed state.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
summaryRight (Summary Right)	<p>Flag indicating whether summary columns appear to the right of detail in an outline, when applying an outline.</p> <p>When true a summary column is inserted to the right of the detailed data being summarized and a new outline level is established on that column.</p> <p>When false a summary column is inserted to the left of the detailed data being summarized and a new outline level is established on that column.</p> <p>Note that toggling this flag on existing outlines requires an update to cell table, specifically, putting the summary functions in the proper columns, and flagging these columns as new outline levels, and possibly resetting their collapsed state.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_OutlinePr](#)) is located in §A.2. *end note*]

18.3.1.62 `pageMargins` (Page Margins)

Page margins for a sheet or a custom sheet view.

[Example:

```
<pageMargins left="0.7" right="0.7" top="0.75" bottom="0.75" header="0.3"
  footer="0.3"/>
```

end example]

Attributes	Description
bottom (Bottom Page Margin)	Bottom Page Margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
footer (Footer Page Margin)	Footer Page Margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
header (Header Page Margin)	Header Page Margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
left (Left Page Margin)	Left Page Margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
right (Right Page Margin)	Right page margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.
top (Top Page Margin)	Top Page Margin in inches. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PageMargins](#)) is located in §A.2.
end note]

18.3.1.63 `pageSetup` (Page Setup Settings)

Page setup settings for the worksheet.

[Example: The following example shows the `pageSetup` element for ISO A0 paper, printed in black and white, with graphics:

```
<pageSetup blackAndWhite="true" draft="false" paperHeight="1189mm"
paperWidth="841mm" />
```

end example]

Attributes	Description
blackAndWhite (Black And White)	Print black and white. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
cellComments (Print Cell Comments)	This attribute specifies how to print cell comments. The possible values for this attribute are defined by the ST_CellComments simple type (§18.18.5).
copies (Number Of Copies)	Number of copies to print. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
draft (Draft)	Print without graphics. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
errors (Print Error Handling)	Specifies how to print cell values for cells with errors. The possible values for this attribute are defined by the ST_PrintError simple type (§18.18.60).
firstPageNumber (First Page Number)	Page number for first printed page. If no value is specified, then 'automatic' is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
fitToHeight (Fit To Height)	Number of vertical pages to fit on. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
fitToWidth (Fit To Width)	Number of horizontal pages to fit on. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Horizontal print resolution of the device. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
id (Id)	Relationship Id of the devMode printer settings part.

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
orientation (Orientation)	Orientation of the page. The possible values for this attribute are defined by the ST_Orientation simple type (§18.18.50).
pageOrder (Page Order)	Order of printed pages. The possible values for this attribute are defined by the ST_PageOrder simple type (§18.18.51).
paperHeight (Paper Height)	Height of custom paper as a number followed by a unit identifier. [<i>Example: 297mm, 11in end example</i>] When paperHeight and paperWidth are specified, paperSize shall be ignored. The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).
paperSize (Paper Size)	Paper size 1 = Letter paper (8.5 in. by 11 in.) 2 = Letter small paper (8.5 in. by 11 in.) 3 = Tabloid paper (11 in. by 17 in.) 4 = Ledger paper (17 in. by 11 in.) 5 = Legal paper (8.5 in. by 14 in.) 6 = Statement paper (5.5 in. by 8.5 in.) 7 = Executive paper (7.25 in. by 10.5 in.) 8 = A3 paper (297 mm by 420 mm) 9 = A4 paper (210 mm by 297 mm) 10 = A4 small paper (210 mm by 297 mm) 11 = A5 paper (148 mm by 210 mm) 12 = B4 paper (250 mm by 353 mm) 13 = B5 paper (176 mm by 250 mm) 14 = Folio paper (8.5 in. by 13 in.) 15 = Quarto paper (215 mm by 275 mm) 16 = Standard paper (10 in. by 14 in.) 17 = Standard paper (11 in. by 17 in.) 18 = Note paper (8.5 in. by 11 in.) 19 = #9 envelope (3.875 in. by 8.875 in.) 20 = #10 envelope (4.125 in. by 9.5 in.) 21 = #11 envelope (4.5 in. by 10.375 in.) 22 = #12 envelope (4.75 in. by 11 in.) 23 = #14 envelope (5 in. by 11.5 in.) 24 = C paper (17 in. by 22 in.)

Attributes	Description
	<p>25 = D paper (22 in. by 34 in.)</p> <p>26 = E paper (34 in. by 44 in.)</p> <p>27 = DL envelope (110 mm by 220 mm)</p> <p>28 = C5 envelope (162 mm by 229 mm)</p> <p>29 = C3 envelope (324 mm by 458 mm)</p> <p>30 = C4 envelope (229 mm by 324 mm)</p> <p>31 = C6 envelope (114 mm by 162 mm)</p> <p>32 = C65 envelope (114 mm by 229 mm)</p> <p>33 = B4 envelope (250 mm by 353 mm)</p> <p>34 = B5 envelope (176 mm by 250 mm)</p> <p>35 = B6 envelope (176 mm by 125 mm)</p> <p>36 = Italy envelope (110 mm by 230 mm)</p> <p>37 = Monarch envelope (3.875 in. by 7.5 in.).</p> <p>38 = 6 3/4 envelope (3.625 in. by 6.5 in.)</p> <p>39 = US standard fanfold (14.875 in. by 11 in.)</p> <p>40 = German standard fanfold (8.5 in. by 12 in.)</p> <p>41 = German legal fanfold (8.5 in. by 13 in.)</p> <p>42 = ISO B4 (250 mm by 353 mm)</p> <p>43 = Japanese double postcard (200 mm by 148 mm)</p> <p>44 = Standard paper (9 in. by 11 in.)</p> <p>45 = Standard paper (10 in. by 11 in.)</p> <p>46 = Standard paper (15 in. by 11 in.)</p> <p>47 = Invite envelope (220 mm by 220 mm)</p> <p>50 = Letter extra paper (9.275 in. by 12 in.)</p> <p>51 = Legal extra paper (9.275 in. by 15 in.)</p> <p>52 = Tabloid extra paper (11.69 in. by 18 in.)</p> <p>53 = A4 extra paper (236 mm by 322 mm)</p> <p>54 = Letter transverse paper (8.275 in. by 11 in.)</p> <p>55 = A4 transverse paper (210 mm by 297 mm)</p> <p>56 = Letter extra transverse paper (9.275 in. by 12 in.)</p> <p>57 = SuperA/SuperA/A4 paper (227 mm by 356 mm)</p> <p>58 = SuperB/SuperB/A3 paper (305 mm by 487 mm)</p> <p>59 = Letter plus paper (8.5 in. by 12.69 in.)</p> <p>60 = A4 plus paper (210 mm by 330 mm)</p> <p>61 = A5 transverse paper (148 mm by 210 mm)</p> <p>62 = JIS B5 transverse paper (182 mm by 257 mm)</p> <p>63 = A3 extra paper (322 mm by 445 mm)</p> <p>64 = A5 extra paper (174 mm by 235 mm)</p> <p>65 = ISO B5 extra paper (201 mm by 276 mm)</p> <p>66 = A2 paper (420 mm by 594 mm)</p> <p>67 = A3 transverse paper (297 mm by 420 mm)</p> <p>68 = A3 extra transverse paper (322 mm by 445 mm)</p> <p>69 = Japanese Double Postcard (200 mm x 148 mm)</p> <p>70 = A6 (105 mm x 148 mm)</p> <p>71 = Japanese Envelope Kaku #2</p> <p>72 = Japanese Envelope Kaku #3</p>

Attributes	Description
	<p>73 = Japanese Envelope Chou #3 74 = Japanese Envelope Chou #4 75 = Letter Rotated (11in x 8 1/2 11 in) 76 = A3 Rotated (420 mm x 297 mm) 77 = A4 Rotated (297 mm x 210 mm) 78 = A5 Rotated (210 mm x 148 mm) 79 = B4 (JIS) Rotated (364 mm x 257 mm) 80 = B5 (JIS) Rotated (257 mm x 182 mm) 81 = Japanese Postcard Rotated (148 mm x 100 mm) 82 = Double Japanese Postcard Rotated (148 mm x 200 mm) 83 = A6 Rotated (148 mm x 105 mm) 84 = Japanese Envelope Kaku #2 Rotated 85 = Japanese Envelope Kaku #3 Rotated 86 = Japanese Envelope Chou #3 Rotated 87 = Japanese Envelope Chou #4 Rotated 88 = B6 (JIS) (128 mm x 182 mm) 89 = B6 (JIS) Rotated (182 mm x 128 mm) 90 = (12 in x 11 in) 91 = Japanese Envelope You #4 92 = Japanese Envelope You #4 Rotated 93 = PRC 16K (146 mm x 215 mm) 94 = PRC 32K (97 mm x 151 mm) 95 = PRC 32K(Big) (97 mm x 151 mm) 96 = PRC Envelope #1 (102 mm x 165 mm) 97 = PRC Envelope #2 (102 mm x 176 mm) 98 = PRC Envelope #3 (125 mm x 176 mm) 99 = PRC Envelope #4 (110 mm x 208 mm) 100 = PRC Envelope #5 (110 mm x 220 mm) 101 = PRC Envelope #6 (120 mm x 230 mm) 102 = PRC Envelope #7 (160 mm x 230 mm) 103 = PRC Envelope #8 (120 mm x 309 mm) 104 = PRC Envelope #9 (229 mm x 324 mm) 105 = PRC Envelope #10 (324 mm x 458 mm) 106 = PRC 16K Rotated 107 = PRC 32K Rotated 108 = PRC 32K(Big) Rotated 109 = PRC Envelope #1 Rotated (165 mm x 102 mm) 110 = PRC Envelope #2 Rotated (176 mm x 102 mm) 111 = PRC Envelope #3 Rotated (176 mm x 125 mm) 112 = PRC Envelope #4 Rotated (208 mm x 110 mm) 113 = PRC Envelope #5 Rotated (220 mm x 110 mm) 114 = PRC Envelope #6 Rotated (230 mm x 120 mm) 115 = PRC Envelope #7 Rotated (230 mm x 160 mm) 116 = PRC Envelope #8 Rotated (309 mm x 120 mm) 117 = PRC Envelope #9 Rotated (324 mm x 229 mm) 118 = PRC Envelope #10 Rotated (458 mm x 324 mm)</p>

Attributes	Description
	<p>When paperHeight and paperWidth are specified, paperSize should be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
paperWidth (Paper Width)	<p>Width of custom paper as a number followed by a unit identifier. <i>[Example: 21cm, 8.5in end example]</i></p> <p>When paperHeight and paperWidth are specified, paperSize shall be ignored.</p> <p>The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).</p>
scale (Print Scale)	<p>Print scaling. This attribute is restricted to values ranging from 10 to 400.</p> <p><i>[Example:</i></p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p><i>end example]</i></p> <p>This setting is overridden when fitToWidth and/or fitToHeight are in use.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
useFirstPageNumber (Use First Page Number)	<p>Use firstPageNumber value for first page number, and do not auto number the pages.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
usePrinterDefaults (Use Printer Defaults)	<p>Use the printer's defaults settings for page setup values and don't use the default values specified in the schema. <i>[Example: If dpi is not present or specified in the XML, the application must not assume 600dpi as specified in the schema as a default and instead must let the printer specify the default dpi. end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
verticalDpi (Vertical DPI)	<p>Vertical print resolution of the device.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PageSetup](#)) is located in §A.2. *end note*]

18.3.1.64 pageSetup (Chart Sheet Page Setup)

This element provides page setup properties for chart sheets.

[Example: The following example shows the pageSetup element for ISO A0 paper, printed in black and white, with graphics:

```
<pageSetup blackAndWhite="true" draft="false" paperHeight="1189mm"
  paperWidth="841mm" />
```

end example]

Attributes	Description
blackAndWhite (Black And White)	Print black and white. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
copies (Number Of Copies)	Number of copies to print. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
draft (Draft)	Print draft quality. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
firstPageNumber (First Page Number)	Page number for first printed page. If no value is specified, then 'automatic' is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Horizontal print resolution of the device. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
id (Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship Id of the devMode printer settings part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
orientation	Orientation of the page.

Attributes	Description
(Orientation)	The possible values for this attribute are defined by the ST_Orientation simple type (§18.18.50).
paperHeight (Paper Height)	<p>Height of custom paper as a number followed by a unit identifier. [<i>Example: 297mm, 11in end example</i>]</p> <p>When paperHeight and paperWidth are specified, paperSize shall be ignored.</p> <p>The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).</p>
paperSize (Paper Size)	<p>1 = Letter paper (8.5 in. by 11 in.) 2 = Letter small paper (8.5 in. by 11 in.) 3 = Tabloid paper (11 in. by 17 in.) 4 = Ledger paper (17 in. by 11 in.) 5 = Legal paper (8.5 in. by 14 in.) 6 = Statement paper (5.5 in. by 8.5 in.) 7 = Executive paper (7.25 in. by 10.5 in.) 8 = A3 paper (297 mm by 420 mm) 9 = A4 paper (210 mm by 297 mm) 10 = A4 small paper (210 mm by 297 mm) 11 = A5 paper (148 mm by 210 mm) 12 = B4 paper (250 mm by 353 mm) 13 = B5 paper (176 mm by 250 mm) 14 = Folio paper (8.5 in. by 13 in.) 15 = Quarto paper (215 mm by 275 mm) 16 = Standard paper (10 in. by 14 in.) 17 = Standard paper (11 in. by 17 in.) 18 = Note paper (8.5 in. by 11 in.) 19 = #9 envelope (3.875 in. by 8.875 in.) 20 = #10 envelope (4.125 in. by 9.5 in.) 21 = #11 envelope (4.5 in. by 10.375 in.) 22 = #12 envelope (4.75 in. by 11 in.) 23 = #14 envelope (5 in. by 11.5 in.) 24 = C paper (17 in. by 22 in.) 25 = D paper (22 in. by 34 in.) 26 = E paper (34 in. by 44 in.) 27 = DL envelope (110 mm by 220 mm) 28 = C5 envelope (162 mm by 229 mm) 29 = C3 envelope (324 mm by 458 mm) 30 = C4 envelope (229 mm by 324 mm) 31 = C6 envelope (114 mm by 162 mm) 32 = C65 envelope (114 mm by 229 mm) 33 = B4 envelope (250 mm by 353 mm) 34 = B5 envelope (176 mm by 250 mm) 35 = B6 envelope (176 mm by 125 mm)</p>

Attributes	Description
	<p>36 = Italy envelope (110 mm by 230 mm) 37 = Monarch envelope (3.875 in. by 7.5 in.). 38 = 6 3/4 envelope (3.625 in. by 6.5 in.) 39 = US standard fanfold (14.875 in. by 11 in.) 40 = German standard fanfold (8.5 in. by 12 in.) 41 = German legal fanfold (8.5 in. by 13 in.) 42 = ISO B4 (250 mm by 353 mm) 43 = Japanese double postcard (200 mm by 148 mm) 44 = Standard paper (9 in. by 11 in.) 45 = Standard paper (10 in. by 11 in.) 46 = Standard paper (15 in. by 11 in.) 47 = Invite envelope (220 mm by 220 mm) 50 = Letter extra paper (9.275 in. by 12 in.) 51 = Legal extra paper (9.275 in. by 15 in.) 52 = Tabloid extra paper (11.69 in. by 18 in.) 53 = A4 extra paper (236 mm by 322 mm) 54 = Letter transverse paper (8.275 in. by 11 in.) 55 = A4 transverse paper (210 mm by 297 mm) 56 = Letter extra transverse paper (9.275 in. by 12 in.) 57 = SuperA/SuperA/A4 paper (227 mm by 356 mm) 58 = SuperB/SuperB/A3 paper (305 mm by 487 mm) 59 = Letter plus paper (8.5 in. by 12.69 in.) 60 = A4 plus paper (210 mm by 330 mm) 61 = A5 transverse paper (148 mm by 210 mm) 62 = JIS B5 transverse paper (182 mm by 257 mm) 63 = A3 extra paper (322 mm by 445 mm) 64 = A5 extra paper (174 mm by 235 mm) 65 = ISO B5 extra paper (201 mm by 276 mm) 66 = A2 paper (420 mm by 594 mm) 67 = A3 transverse paper (297 mm by 420 mm) 68 = A3 extra transverse paper (322 mm by 445 mm)</p> <p>When paperHeight and paperWidth are specified, paperSize should be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
paperWidth (Paper Width)	<p>Width of custom paper as a number followed by a unit identifier. [<i>Example: 21cm, 8.5in end example</i>]</p> <p>When paperHeight and paperWidth are specified, paperSize shall be ignored.</p> <p>The possible values for this attribute are defined by the ST_PositiveUniversalMeasure simple type (§22.9.2.12).</p>
useFirstPageNumber (Use First Page)	<p>Use firstPageNumber value for first page number, and do not auto number the pages.</p>

Attributes	Description
Number)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
usePrinterDefaults (Use Printer Defaults)	Use the printer's defaults settings for page setup values and don't use the default values specified in the schema. <i>[Example: If dpi is not present or specified in the XML, the application must not assume 600dpi as specified in the schema as a default and instead must let the printer specify the default dpi. end example]</i> The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
verticalDpi (Vertical DPI)	Vertical print resolution of the device. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CsPageSetup](#)) is located in §A.2. end note]

18.3.1.65 [pageSetUpPr \(Page Setup Properties\)](#)

Page setup properties of the worksheet

Attributes	Description
autoPageBreaks (Show Auto Page Breaks)	Flag indicating whether the sheet displays Automatic Page Breaks. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
fitToPage (Fit To Page)	Flag indicating whether the Fit to Page print option is enabled. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PageSetUpPr](#)) is located in §A.2. end note]

18.3.1.66 [pane \(View Pane\)](#)

Worksheet view pane

Attributes	Description
activePane (Active Pane)	The pane that is active. The possible values for this attribute are defined by the ST_Pane simple type (§18.18.52).

Attributes	Description
state (Split State)	Indicates whether the pane has horizontal / vertical splits, and whether those splits are frozen. The possible values for this attribute are defined by the ST_PaneState simple type (§18.18.53).
topLeftCell (Top Left Visible Cell)	Location of the top left visible cell in the bottom right pane (when in Left-To-Right mode). The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).
xSplit (Horizontal Split Position)	Horizontal position of the split, in 1/20th of a point; 0 (zero) if none. If the pane is frozen, this value indicates the number of columns visible in the top pane. The possible values for this attribute are defined by the W3C XML Schema double datatype.
ySplit (Vertical Split Position)	Vertical position of the split, in 1/20th of a point; 0 (zero) if none. If the pane is frozen, this value indicates the number of rows visible in the left pane. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Pane](#)) is located in §A.2. *end note*]

18.3.1.67 [picture \(Background Image\)](#)

Background sheet image.

[Example:

```
<picture r:id="rId1"/>
```

end example]

Attributes	Description
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship Id pointing to the image part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetBackgroundPicture](#)) is located in §A.2. *end note*]

18.3.1.68 pivotArea (Pivot Area)

Rule describing a PivotTable selection.

Attributes	Description
axis (Axis)	<p>The region of the PivotTable to which this rule applies.</p> <p>The possible values for this attribute are defined by the ST_Axis simple type (§18.18.1).</p>
cacheIndex (Cache Index)	<p>Flag indicating whether any indexes refer to fields or items in the Pivot cache and not the view.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
collapsedLevelsAre Subtotals (Collapsed Levels Are Subtotals)	<p>Flag indicating if collapsed levels/dimensions are considered subtotals.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dataOnly (Data Only)	<p>Flag indicating whether only the data values (in the data area of the view) for an item selection are selected and does not include the item labels.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
field (Field Index)	<p>Index of the field that this selection rule refers to.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
fieldPosition (Field Position)	<p>Position of the field within the axis to which this rule applies.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
grandCol (Include Column Grand Total)	<p>Flag indicating whether the column grand total is included.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
grandRow (Include Row Grand Total)	<p>Flag indicating whether the row grand total is included.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
labelOnly (Labels Only)	<p>Flag indicating whether only the item labels for an item selection are selected and does not include the data values (in the data area of the view).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
offset (Offset Reference)	<p>A Reference that specifies a subset of the selection area. Points are relative to the top left of the selection area.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
outline (Outline)	<p>Flag indicating whether the rule refers to an area that is in outline mode.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
type (Rule Type)	<p>Indicates the type of selection rule.</p> <p>The possible values for this attribute are defined by the ST_PivotAreaType simple type (§18.18.58).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotArea](#)) is located in §A.2. *end note*]

18.3.1.69 [pivotSelection \(PivotTable Selection\)](#)

A collection of PivotTable structure selections. A PivotTable structure selection is a way of specifying what cells in the PivotTable are selected. Instead of specifying cell addresses in a sqref, a particular area or structure within the PivotTable is specified. In this way there is semantic meaning regarding what is selected, rather than simply a list of cell or ranges contained in the selection. Typically fields on the row or column axis are selected.

[Example: For example, the innermost field (Product SubCategory) is selected in this PivotTable:

	A	B	C
1			
2		State	{All} ▾
3		City	{All} ▾
4			
5			Column Labels ▾
6			2001
7			3
8			July
9		Row Labels ▾	Sum of Sales Amount
10		Bikes	209652.9046
11		Mountain Bikes	64424.81
12		Mountain-100 Black, 38	3374.99
13		Mountain-100 Black, 42	3374.99
14		Mountain-100 Black, 44	13499.96
15		Mountain-100 Black, 48	3374.99
16		Mountain-100 Silver, 38	6799.98
17		Mountain-100 Silver, 42	6799.98
18		Mountain-100 Silver, 44	16999.95
19		Mountain-100 Silver, 48	10199.97
20		Road Bikes	145228.0946
21		Road-150 Red, 44	25047.89
22		Road-150 Red, 48	42939.24
23		Road-150 Red, 52	21469.62
24		Road-150 Red, 56	25047.89
25		Road-150 Red, 62	28626.16
26		Road-650 Black, 44	699.0982
27		Road-650 Black, 52	
28		Road-650 Black, 62	699.0982
29		Road-650 Red, 44	699.0982
30		Road-650 Red, 48	
31		Road-650 Red, 52	
32		Road-650 Red, 58	
33		Road-650 Red, 60	
34		Grand Total	209652.9046

The corresponding pivotSelection XML should look like this:

```
<pivotSelection pane="bottomRight" showHeader="1" axis="axisRow" dimension="2"
  activeRow="11" activeCol="1" previousRow="11" previousCol="1" click="1"
  r:id="rId1">
```

```

<pivotArea dataOnly="0" labelOnly="1" fieldPosition="0">
  <references count="1">
    <reference field="9" count="0"/>
  </references>
</pivotArea>
</pivotSelection>

```

axis indicates that this selection is on the row axis, dimension indicates the field level within the row axis that is selected (zero-based index), activeCol and activeRow respectively indicate where in the grid the selection is located, and reference field indicates to which particular field the selection corresponds.

end example]

Attributes	Description
activeCol (Active Column)	The column (zero-based) of active cell for structure selection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
activeRow (Active Row)	The row (zero-based) of active cell for structure selection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
axis (Axis)	Axis of the PivotTable on which this selection lies. The possible values for this attribute are defined by the ST_Axis simple type (§18.18.1).
click (Click Count)	Number of clicks for this structure selection. For some selection combinations, subsequent clicks on the same target area cycles the actual selection through some variances. Therefore number of clicks on the selection shall be recorded, if it is desirable to restore this state of the selection cycle on load. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
count (Selection Count)	Number of selections for the structure selection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
data (Data Selection)	Flag indicating whether the structure selection is for data only. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dimension (Dimension)	Indicates the field level within the axis that is selected (zero-based index). The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

Attributes	Description
extendable (Extendable)	<p>Flag indicating whether the structure selection can have additional selections added to it.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	<p>Relationship Id pointing to the particular PivotTable Part corresponding to this selection.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
label (Label)	<p>Flag indicating whether the structure selection is for labels only (e.g., a grand total row is selected).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
max (Maximum)	<p>The maximum line the structure selection contains.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
min (Minimum)	<p>The minimum line the structure selection contains.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
pane (Pane)	<p>The pane to which this PivotTable structure selection belongs.</p> <p>The possible values for this attribute are defined by the ST_Pane simple type (§18.18.52).</p>
previousCol (Previous Column Selection)	<p>1-based index to the column immediately left of the structure selection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
previousRow (Previous Row)	<p>1-based index to the row immediately above the structure selection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
showHeader (Show Header)	<p>Flag indicating whether selection toggle from data only to header only to both is enabled. False means disabled.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
start (Start)	<p>The line the structure selection begins (zero-based). This is the line clicked to initiate the structure selection.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotSelection](#)) is located in §A.2. end note]

18.3.1.70 [printOptions \(Print Options\)](#)

Print options for the sheet. Printer-specific settings are stored separately in the Printer Settings part as defined in §15.2.15.

Attributes	Description
gridLines (Print Grid Lines)	Used in conjunction with gridLinesSet. If both gridLines and gridLinesSet are true, then grid lines shall print. Otherwise, they shall not (i.e., one or both have false values). The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
gridLinesSet (Grid Lines Set)	Used in conjunction with gridLines. If both gridLines and gridLinesSet are true, then grid lines shall print. Otherwise, they shall not (i.e., one or both have false values). The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
headings (Print Headings)	Print row and column headings. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
horizontalCentered (Horizontal Centered)	Center on page horizontally when printing. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
verticalCentered (Vertical Centered)	Center on page vertically when printing. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PrintOptions](#)) is located in §A.2. end note]

18.3.1.71 [protectedRange \(Protected Range\)](#)

A specified range to be protected. Ranges listed here are protected only when the sheet protection is ON and the cell is flagged as being locked. If no password is specified here, then read/write permissions are automatically given to all users, regardless of additional security descriptor information. In other words, the

security descriptor information (specific types of access) at the user level is only applied if a password for this range is specified.

When a password is to be hashed and stored in this element, it shall be hashed as defined below, starting from a UTF-16LE encoded string value. If there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation.

When a password is specified, then users not listed specifically as having access should be prompted with a password. If that user supplies the correct password, then they can edit the range or cell in question. This protection is optional and can be ignored by applications that choose not to support this functionality.

Attributes	Description														
algorithmName (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value.</p> <p>The following values are reserved:</p> <table data-bbox="418 793 1479 1875"> <tr> <th data-bbox="418 793 669 844">Value</th><th data-bbox="669 793 1479 844">Algorithm</th></tr> <tr> <td data-bbox="418 844 669 1066">MD2</td><td data-bbox="669 844 1479 1066"> Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i> </td></tr> <tr> <td data-bbox="418 1066 669 1289">MD4</td><td data-bbox="669 1066 1479 1289"> Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i> </td></tr> <tr> <td data-bbox="418 1289 669 1512">MD5</td><td data-bbox="669 1289 1479 1512"> Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i> </td></tr> <tr> <td data-bbox="418 1512 669 1747">RIPEMD-128</td><td data-bbox="669 1512 1479 1747"> Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i> </td></tr> <tr> <td data-bbox="418 1747 669 1831">RIPEMD-160</td><td data-bbox="669 1747 1479 1831"> Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. </td></tr> <tr> <td data-bbox="418 1831 669 1875">SHA-1</td><td data-bbox="669 1831 1479 1875"> Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118- </td></tr> </table>	Value	Algorithm	MD2	Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>	MD4	Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>	MD5	Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>	RIPEMD-128	Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. <i>[Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. end note]</i>	RIPEMD-160	Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.	SHA-1	Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-

Attributes	Description										
	<table border="1" data-bbox="418 247 1477 632"> <tr> <td></td><td>3:2004 shall be used.</td></tr> <tr> <td>SHA-256</td><td>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> <tr> <td>SHA-384</td><td>Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> <tr> <td>SHA-512</td><td>Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> <tr> <td>WHIRLPOOL</td><td>Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> </table> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="456 779 1175 842">< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>		3:2004 shall be used.	SHA-256	Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.	SHA-384	Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.	SHA-512	Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.	WHIRLPOOL	Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	3:2004 shall be used.										
SHA-256	Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.										
SHA-384	Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.										
SHA-512	Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.										
WHIRLPOOL	Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.										
hashValue (Password Hash Value)	<p>Specifies the hash value for the password required to edit this range. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="456 1499 1175 1562"><... AlgorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>										

Attributes	Description
name (Name)	<p>Range title. This is used as a descriptor, not as a named range definition.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
saltValue (Salt Value for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The saltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
spinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute.</p> <p>[<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the</p>

Attributes	Description
	<p>hashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sqref (Sequence of References)	<p>The range to be protected.</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ProtectedRange](#)) is located in §A.2. *end note*]

18.3.1.72 `protectedRanges` (Protected Ranges)

This collection specifies all protected ranges on this worksheet.

[Example:

This example demonstrates that A1:C5 have been protected, with no password specified.

```
<protectedRanges>
  <protectedRange sqref="A1:C5" name="Range1"/>
</protectedRanges>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_ProtectedRanges](#)) is located in §A.2. *end note*]

18.3.1.73 `row` (Row)

The element expresses information about an entire row of a worksheet, and contains all cell definitions for a particular row in the worksheet.

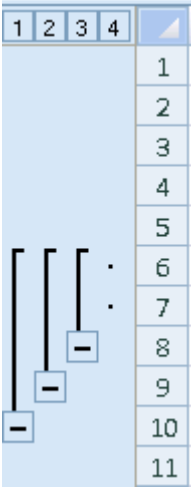

[Example:

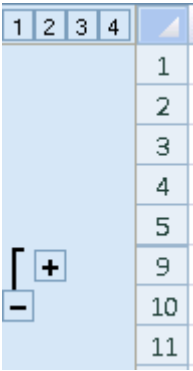

This row expresses information about row 2 in the worksheet, and contains 3 cell definitions.

```
<row r="2" spans="2:12">
  <c r="C2" s="1">
    <f>PMT(B3/12,B4,-B5)</f>
    <v>672.68336574300008</v>
  </c>
  <c r="D2">
    <v>180</v>
  </c>
```

```
<c r="E2">
  <v>360</v>
</c>
</row>
```

end example]

Attributes	Description
collapsed (Collapsed)	<p>1 if the rows 1 level of outlining deeper than the current row are in the collapsed outline state. It means that the rows which are 1 outline level deeper (numerically higher value) than the current row are currently hidden due to a collapsed outline state.</p> <p>It is possible for collapsed to be <code>false</code> and yet still have the rows in question hidden. This can be achieved by having a lower outline level collapsed, thus hiding all the child rows.</p> <p>[Example: This example shows 3 levels of outlining:</p>  <p>In the XML must be:</p> <pre><sheetData> <row r="6" outlineLevel="3"/> <row r="7" outlineLevel="3"/> <row r="8" outlineLevel="2"/> <row r="9" outlineLevel="1"/> </sheetData></pre> <p>end example]</p> <p>[Example: This example shows the same outline feature, with the middle level collapsed:</p>

Attributes	Description
	<div></div> <p>In the XML must be:</p> <pre><sheetData> <row r="6" hidden="1" outlineLevel="3"/> <row r="7" hidden="1" outlineLevel="3"/> <row r="8" hidden="1" outlineLevel="2"/> <row r="9" outlineLevel="1" collapsed="1"/> </sheetData></pre> <p><i>end example]</i></p> <p>[Example:</p> <p>This example shows the same outline feature as above, where both the middle and lowest level are collapsed:</p> <div></div> <p>In the XML must be:</p> <pre><sheetData> <row r="6" hidden="1" outlineLevel="3"/> <row r="7" hidden="1" outlineLevel="3"/> <row r="8" hidden="1" outlineLevel="2"/> <row r="9" hidden="1" outlineLevel="1" collapsed="1"/> <row r="10" collapsed="1"/> </sheetData></pre> <p>Note that in this case, if the lowest level were expanded, the middle level would remain</p>

Attributes	Description
	<p>collapsed due to collapsed being true on row 9.</p> <p><i>end example]</i></p> <p>See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
customFormat (Custom Format)	<p>1 if the row style should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
customHeight (Custom Height)	<p>1 if the row height has been manually set.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hidden (Hidden)	<p>1 if the row is hidden, e.g., due to a collapsed outline or by manually selecting and hiding a row.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ht (Row Height)	<p>Row height measured in point size. There is no margin padding on row height.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
outlineLevel (Outline Level)	<p>Outlining level of the row, when outlining is on. See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
ph (Show Phonetic)	<p>1 if the row should show phonetic.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
r (Row Index)	<p>Row index. Indicates to which row in the sheet this <row> definition corresponds.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
s (Style Index)	<p>Index to style record for the row (only applied if customFormat attribute is '1')</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

Attributes	Description
spans (Spans)	<p>Optimization only, and not required. Specifies the range of non-empty columns (in the format X:Y) for the block of rows to which the current row belongs. To achieve the optimization, span attribute values in a single block should be the same.</p> <p>There are 16 rows per block, beginning with the first row.</p> <p>[<i>Note</i>: this is an optimization, and is purely optional. Different span values within the same row block is allowed. Not writing the span value at all is also allowed. <i>end note</i>]</p> <p>Blank rows are not required to write out span values.</p> <p>[<i>Example</i>: If cells F8, E9, and D10 have data in them and the rest of the sheet is empty, then for those three rows (8,9, and 10), the spans value should each be "4:6":</p> <pre> <sheetData> <row r="8" spans="4:6"> <c r="F8"> <v>1</v> </c> </row> <row r="9" spans="4:6"> <c r="E9"> <v>2</v> </c> </row> <row r="10" spans="4:6"> <c r="D10"> <v>3</v> </c> </row> </sheetData> </pre> <p>If cells A1 and J10 have data in them and the rest of the sheet is empty, then the rows should be written like this:</p> <pre> <sheetData> <row r="1" spans="1:10"> <c r="A1"> <v>1</v> </c> </row> <row r="10" spans="1:10"> <c r="J10"> <v>2</v> </c> </row> </sheetData> </pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_CellSpans simple type (§18.18.9).</p>
thickBot (Thick Bottom)	<p>1 if any cell in the row has a medium or thick bottom border, or if any cell in the row directly below the current row has a thick top border. When true and customHeight is false, this flag means that the row height has been adjusted higher by .75 points of the normal style font height. This also means that if the row no longer contains these borders, then the height is automatically re-adjusted down.</p> <p>This adjustment is in addition to any adjustment of height due to thickTop.</p> <p>Medium borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> • mediumDashDotDot • slantDashDot • mediumDashDot • mediumDashed • medium • • Thick borders are these enumeration values from the Styles Part: • thick • double <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
thickTop (Thick Top Border)	<p>True if the row has a medium or thick top border, or if any cell in the row directly above the current row has a thick bottom border. When true and customHeight is false, this flag means that the row height has been adjusted higher by .75 points of the normal style font height. This also means that if the row no longer contains these borders, then the height is automatically re-adjusted down.</p> <p>This adjustment is in addition to any adjustment of height due to thickBot.</p> <p>Medium borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> • mediumDashDotDot • slantDashDot • mediumDashDot • mediumDashed • medium <p>Thick borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> • thick • double

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Row](#)) is located in §A.2. *end note*]

18.3.1.74 rowBreaks (Horizontal Page Breaks (Row))

Horizontal page break information used for print layout view, page layout view, drawing print breaks in normal view, and for printing the worksheet.

[Example: This example shows a break inserted at cell B25:

```
<rowBreaks count="1" manualBreakCount="1">
  <brk id="24" max="16383" man="1"/>
</rowBreaks>
```

end example]

Attributes	Description
count (Page Break Count)	Number of breaks in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
manualBreakCount (Manual Break Count)	Number of manual breaks in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PageBreak](#)) is located in §A.2. *end note*]

18.3.1.75 scenario (Scenario)

An individual scenario description. [Note: See parent element for an example. *end note*]

Attributes	Description
comment (Scenario Comment)	Comment for this scenario, rich text not supported. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
count (Changing Cell Count)	Number of input cells. The possible values for this attribute are defined by the W3C XML Schema unsignedInt

Attributes	Description
	datatype.
hidden (Hidden Scenario)	Scenario is hidden when the sheet is protected and 'edit scenarios' is not enabled in sheet protection options. If the scenario is marked as hidden but sheet protection options specify to allow editing scenarios, then the scenario shall not be hidden. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
locked (Scenario Locked)	Scenario is locked for editing when the sheet is protected. If sheet is protected and "edit scenarios" is enabled, then this setting is ignored. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (Scenario Name)	Scenario's name (user input). Shall be unique for the worksheet The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
user (User Name)	Name of user who last changed the scenario. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model (CT_Scenario) is located in §A.2. *end note*]

18.3.1.76 scenarios (Scenarios)

A collection of Scenarios. A scenario is a named what-if model that includes variable cells linked together by one or more formulas.

[Example: For example, you might want to compare best-case and worst-case scenarios for sales in a coffee shop, based on the number of cups of coffee sold in a week.

```
<scenarios current="1" show="0" sqref="G4 G6 G7 G8">
  <scenario name="Best Case" locked="1" count="3" user="anonymous"
    comment="Created on 6/9/2006_x000a_Modified on 6/9/2006">
    <inputCells r="D5" val="151" numFmtId="37"/>
    <inputCells r="D9" val="226"/>
    <inputCells r="D13" val="126"/>
  </scenario>
```

```

<scenario name="Worst Case" locked="1" count="3" user="anonymous"
  comment="Created on 6/9/2006">
  <inputCells r="D5" val="50" numFmtId="37"/>
  <inputCells r="D9" val="40"/>
  <inputCells r="D13" val="30"/>
</scenario>
</scenarios>

```

end example]

Attributes	Description
current (Current Scenario)	Zero-based index to current scenario selected. Can correspond to selection UI. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
show (Last Shown Scenario)	Zero-based index to last shown scenario. Indicates which scenario was last selected by the user to be run/shown. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
sqref (Sequence of References)	Range or sequence of cells used for scenario results summary. The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Scenarios](#)) is located in §A.2. *end note*]

18.3.1.77 securityDescriptor (Security Descriptor)

Optional setting to specify the relative security descriptor. The security descriptor defines user accounts who may edit this range without providing a password to access the range.

[*Note:* The format of a securityDescriptor is application defined; however, it is recommended that the following format be used for interoperability between implementations: `username@domain`. This format follows the form of `addr-spec` as defined in RFC 822, Standard for ARPA Internet Text Messages. *end note*]

[*Example:* This example demonstrates two user accounts in the security descriptor attribute:

```

<protectedRanges>
  <protectedRange sqref="A1:C5" name="Range1">
    <securityDescriptor>user1@iso.org</securityDescriptor>
    <securityDescriptor>user2@iso.org</securityDescriptor>
  </protectedRange>
</protectedRanges>

```

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

18.3.1.78 [selection \(Selection\)](#)

Worksheet view selection.

Attributes	Description
activeCell (Active Cell Location)	Location of the active cell. The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).
activeCellId (Active Cell Index)	0-based index of the range reference (in the array of references listed in sqref) containing the active cell. Only used when the selection in sqref is not contiguous. Therefore, this value needs to be aware of the order in which the range references are written in sqref. When this value is out of range then activeCell can be used. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
pane (Pane)	The pane to which this selection belongs. The possible values for this attribute are defined by the ST_Pane simple type (§18.18.52).
sqref (Sequence of References)	Range of the selection. Can be non-contiguous set of ranges. The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).

[Note: The W3C XML Schema definition of this element's content model ([CT_Selection](#)) is located in §A.2. *end note*]

18.3.1.79 [sheetCalcPr \(Sheet Calculation Properties\)](#)

This element contains calculation properties for the worksheet.

Attributes	Description
fullCalcOnLoad (Full Calculation On Load)	Indicates whether the application should do a full calculate on load due to contents on this sheet. After load and successful calc, the application shall set this value to false. Set this to true when the application should calculate the workbook on load. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetCalcPr](#)) is located in §A.2. *end note*]

18.3.1.80 [sheetData \(Sheet Data\)](#)

This collection represents the cell table itself. This collection expresses information about each cell, grouped together by rows in the worksheet.

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetData](#)) is located in §A.2. *end note*]

18.3.1.81 [sheetFormatPr \(Sheet Format Properties\)](#)

Sheet formatting properties.

Attributes	Description
baseColWidth (Base Column Width)	<p>Specifies the number of characters of the maximum digit width of the normal style's font. This value does not include margin padding or extra padding for gridlines. It is only the number of characters.</p> <p>See defaultColWidth description in this section for details on calculating this value.</p> <p>See the col element description, particularly the width attribute description, for more information on what is meant by "maximum digit width".</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
customHeight (Custom Height)	<p>'True' if defaultRowHeight value has been manually set, or is different from the default value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
defaultColWidth (Default Column Width)	<p>Default column width measured as the number of characters of the maximum digit width of the normal style's font.</p> <p>If the user has not set this manually, then it can be calculated: $\text{defaultColWidth} = \text{baseColumnWidth} + \{\text{margin padding (2 pixels on each side, totalling 4 pixels)}\} + \{\text{gridline (1pixel)}\}$</p> <p>If the user has set this manually, then there is no calculation, and simply a value is specified.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
defaultRowHeight (Default Row Height)	<p>Default row height measured in point size. Optimization so we don't have to write the height on all rows. This can be written out if most rows have custom height, to achieve the optimization.</p>

Attributes	Description
	<p>When the row height of all rows in a sheet is the default value, then that value is written here, and customHeight is not set. If a few rows have a different height, that information is written directly on each row. However, if most or all of the rows in the sheet have the same height, but that height isn't the default height, then that height value should be written here (as an optimization), and the customHeight flag should also be set. In this case, all rows having this height do not need to express the height, only rows whose height differs from this value need to be explicitly expressed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
outlineLevelCol (Column Outline Level)	<p>Highest number of outline levels for columns in this sheet. These values shall be in synch with the actual sheet outline levels.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
outlineLevelRow (Maximum Outline Row)	<p>Highest number of outline level for rows in this sheet. These values shall be in synch with the actual sheet outline levels.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
thickBottom (Thick Bottom Border)	<p>'True' if rows have a thick bottom border by default.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
thickTop (Thick Top Border)	<p>'True' if rows have a thick top border by default.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
zeroHeight (Hidden By Default)	<p>'True' if rows are hidden by default. This setting is an optimization used when most rows of the sheet are hidden. In this case, instead of writing out every row and specifying hidden, it is much shorter to only write out the rows that are not hidden, and specify here that rows are hidden by default, and only not hidden if specified.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetFormatPr](#)) is located in §A.2. end note]

18.3.1.82 [sheetPr \(Sheet Properties\)](#)

Sheet-level properties.

Attributes	Description
codeName (Code Name)	<p>Specifies a stable name of the sheet, which should not change over time, and does not change from user input. This name should be used by code to reference a particular sheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
enableFormatConditionsCalculation (Enable Conditional Formatting Calculations)	<p>Flag indicating whether the conditional formatting calculations shall be evaluated. If set to <code>false</code>, then the min/max values of color scales or databars or threshold values in Top N rules shall not be updated. Essentially the conditional formatting "calc" is off.</p> <p>This is useful when conditional formats are being set programmatically at runtime, recalculation of the conditional formatting does not need to be done until the program execution has finished setting all the conditional formatting properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
filterMode (Filter Mode)	<p>Flag indicating whether the worksheet has one or more autofilters or advanced filters on.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
published (Published)	<p>Flag indicating whether the worksheet is published.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
syncHorizontal (Synch Horizontal)	<p>Flag indicating whether this worksheet is horizontally synced to the <code>synchRef</code> anchor point. When true and scroll location is missing from the window properties, the window view shall be scrolled to the horizontal (row) aspect of the <code>synchRef</code> value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
synchRef (Synch Reference)	<p>Anchor point for worksheet's window.</p> <p>The possible values for this attribute are defined by the <code>ST_Ref</code> simple type (§18.18.62).</p>
syncVertical (Synch Vertical)	<p>Flag indicating whether this worksheet is vertically synced to the <code>synchRef</code> anchor point. When true and scroll location is missing from the window properties, the window view shall be scrolled to the vertical (column) aspect of the <code>synchRef</code> value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
transitionEntry (Transition Formula Entry)	<p>Flag indicating whether the Transition Formula Entry (Lotus compatibility) option is enabled.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
transitionEvaluation (Transition Formula Evaluation)	Flag indicating whether the Transition Formula Evaluation (Lotus compatibility) option is enabled. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_SheetPr](#)) is located in §A.2. *end note*]

18.3.1.83 [sheetPr \(Chart Sheet Properties\)](#)

This element specifies chart sheet properties.

Attributes	Description
codeName (Code Name)	Specifies a stable name of the sheet, which should not change over time, and does not change from user input. This name should be used by code to reference a particular sheet. The possible values for this attribute are defined by the W3C XML Schema string datatype.
published (Published)	Flag indicating whether the chart sheet is published. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_ChartsheetPr](#)) is located in §A.2. *end note*]

18.3.1.84 [sheetProtection \(Chart Sheet Protection\)](#)

This collection expresses the chart sheet protection options to enforce when the chart sheet is protected.

Attributes	Description				
algorithmName (Cryptographic Algorithm Name)	Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value. The following values are reserved: <table><tr><th>Value</th><th>Algorithm</th></tr><tr><td>MD2</td><td>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used. [Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known</td></tr></table>	Value	Algorithm	MD2	Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used. [Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known
Value	Algorithm				
MD2	Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used. [Note: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known				

Attributes	Description	
		breaks. <i>end note</i>]
	MD4	Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used. [<i>Note</i> : It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]
	MD5	Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used. [<i>Note</i> : It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]
	RIPEMD-128	Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. [<i>Note</i> : It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]
	RIPEMD-160	Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-1	Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-256	Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-384	Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-512	Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	WHIRLPOOL	Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
<p data-bbox="415 1518 1471 1583">[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="453 1623 1175 1688">< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p data-bbox="415 1728 1373 1829">The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example</i>]</p>		

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
content (Contents)	<p>When true prevents users from making changes to items that are part of the chart, such as data series, axes, and legends. The chart continues to reflect changes made to its source data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hashValue (Password Hash Value)	<p>Specifies the hash value for the password required to edit this chartsheet. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="456 951 1175 1016"><... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password shall be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting hash value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
objects (Objects Locked)	<p>When true prevents users from making changes to graphic objects— including shapes, text boxes, and controls— unless you unlock the specific objects before you protect the chart sheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saltValue (Salt Value for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password</p>

Attributes	Description
	<p>before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The saltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
spinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute.</p> <p>[<i>Rationale:</i> Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ChartsheetProtection](#)) is located in §A.2. *end note*]

18.3.1.85 [sheetProtection](#) (Sheet Protection Options)

This collection expresses the sheet protection options to enforce when the sheet is protected.

[*Example:*

This example demonstrates that the sheet is protected, objects and scenarios can be edited, cell formatting is allowed, and selection of locked cells is not allowed:

```
<sheetProtection sheet="1" objects="1" scenarios="1" formatCells="0"
  selectLockedCells="1"/>
```

end example]

Attributes	Description																
algorithmName (Cryptographic Algorithm Name)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and input password in order to compute the hash value.</p> <p>The following values are reserved:</p> <table> <tr> <th>Value</th><th>Algorithm</th></tr> <tr> <td>MD2</td><td> <p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>MD4</td><td> <p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>MD5</td><td> <p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>RIPEMD-128</td><td> <p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p> </td></tr> <tr> <td>RIPEMD-160</td><td> <p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td>SHA-1</td><td> <p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> <tr> <td>SHA-256</td><td> <p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> </td></tr> </table>	Value	Algorithm	MD2	<p>Specifies that the MD2 algorithm, as defined by RFC 1319, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD4	<p>Specifies that the MD4 algorithm, as defined by RFC 1320, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	MD5	<p>Specifies that the MD5 algorithm, as defined by RFC 1321, shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	RIPEMD-128	<p>Specifies that the RIPEMD-128 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p> <p>[<i>Note</i>: It is recommended that applications should avoid using this algorithm to store new hash values, due to publically known breaks. <i>end note</i>]</p>	RIPEMD-160	<p>Specifies that the RIPEMD-160 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-1	<p>Specifies that the SHA-1 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>	SHA-256	<p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>

SHA-256	<p>Specifies that the SHA-256 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</p>																

Attributes	Description	
	SHA-384	Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	SHA-512	Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	WHIRLPOOL	Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.
	<p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre>< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>	
autoFilter (AutoFilter Locked)	<p>If 1 or true then AutoFilters should not be allowed to operate when the sheet is protected.</p> <p>If 0 or false then AutoFilters should be allowed to operate when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>	
deleteColumns (Delete Columns Locked)	<p>If 1 or true then deleting columns should not be allowed when the sheet is protected.</p> <p>If 0 or false then deleting columns should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>	
deleteRows (Delete Rows Locked)	<p>If 1 or true then deleting rows should not be allowed when the sheet is protected.</p> <p>If 0 or false then deleting rows should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>	
formatCells (Format Cells Locked)	<p>If 1 or true then formatting cells should not be allowed when the sheet is protected.</p> <p>If 0 or false then formatting cells should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>	

Attributes	Description
	datatype.
formatColumns (Format Columns Locked)	<p>If 1 or true then formatting columns should not be allowed when the sheet is protected.</p> <p>If 0 or false then formatting columns should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
formatRows (Format Rows Locked)	<p>If 1 or true then formatting rows should not be allowed when the sheet is protected.</p> <p>If 0 or false then formatting rows should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hashValue (Password Hash Value)	<p>Specifies the hash value for the password required to edit this worksheet. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="451 1140 1175 1205"><... algorithmName="SHA-1" hashCode="9oN7nWkCAYEZib1RomSJTjmPpCY=" /></pre> <p>The hashCode attribute value of 9oN7nWkCAYEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting hash value must be 9oN7nWkCAYEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p>
insertColumns (Insert Columns Locked)	<p>If 1 or true then inserting columns should not be allowed when the sheet is protected.</p> <p>If 0 or false then inserting columns should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
insertHyperlinks (Insert Hyperlinks Locked)	<p>If 1 or true then inserting hyperlinks should not be allowed when the sheet is protected.</p>

Attributes	Description
Locked)	<p>If 0 or false then inserting hyperlinks should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
insertRows (Insert Rows Locked)	<p>If 1 or true then inserting rows should not be allowed when the sheet is protected.</p> <p>If 0 or false then inserting rows should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
objects (Objects Locked)	<p>If 1 or true then editing of objects should not be allowed when the sheet is protected.</p> <p>If 0 or false then objects are allowed to be edited when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pivotTables (Pivot Tables Locked)	<p>If 1 or true then PivotTables should not be allowed to operate when the sheet is protected.</p> <p>If 0 or false then PivotTables should be allowed to operate when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saltValue (Salt Value for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="451 1612 1177 1682"><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The saltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary</p>

Attributes	Description
	datatype.
scenarios (Scenarios Locked)	<p>If 1 or true then Scenarios should not be edited when the sheet is protected.</p> <p>If 0 or false then Scenarios are allowed to be edited when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
selectLockedCells (Select Locked Cells Locked)	<p>If 1 or true then selection of locked cells should not be allowed when the sheet is protected.</p> <p>If 0 or false then selection of locked cells should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
selectUnlockedCells (Select Unlocked Cells Locked)	<p>If 1 or true then selection of unlocked cells should not be allowed when the sheet is protected.</p> <p>If 0 or false then selection of unlocked cells should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sheet (Sheet Locked)	<p>If 1 or true then the sheet is protected.</p> <p>If 0 or false then the sheet is not protected.</p> <p>The value of this attribute dictates whether the other attributes of sheetProtection should be applied. If 1 or true then the other attributes of sheetProtection should be applied. If 0 or false then the other attributes of sheetProtection should not be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sort (Sort Locked)	<p>If 1 or true then sorting should not be allowed when the sheet is protected.</p> <p>If 0 or false then sorting should be allowed when the sheet is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
spinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute.</p> <p>[Rationale: Running the algorithm many times increases the cost of exhaustive search</p>

Attributes	Description
	<p>attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i></p> <p>[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SheetProtection](#)) is located in §A.2. *end note*]

18.3.1.86 sheetView (Chart Sheet View)

This element specifies a chart sheet view. [*Note:* See sheetView (§18.3.1.87) for an example. *end note*]

Attributes	Description
tabSelected (Sheet Tab Selected)	<p>Flag indicating whether the sheet tab is selected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
workbookViewId (Workbook View Id)	<p>Zero-based index of this workbook view, pointing to a workbookView element in the bookViews collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
zoomScale (Window Zoom Scale)	<p>Window zoom magnification, representing percent values. This attribute is restricted to values ranging from 10 to 400. Horizontal & Vertical scale together.</p> <p>[<i>Example:</i></p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p>

Attributes	Description
	<p>... 400 - 400%</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
zoomToFit (Zoom To Fit)	<p>Flag indicating whether chart sheet is zoom to fit window.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ChartsheetView](#)) is located in §A.2.
end note]

18.3.1.87 sheetView (Worksheet View)

A single sheet view definition. When more than one sheet view is defined in the file, it means that when opening the workbook, each sheet view corresponds to a separate window within the spreadsheet application, where each window is showing the particular sheet containing the same workbookViewId value, the last sheetView definition is loaded, and the others are discarded. When multiple windows are viewing the same sheet, multiple sheetView elements (with corresponding workbookView entries) are saved.

Attributes	Description
colorId (Color Id)	<p>Index to the color value for row/column text headings and gridlines. This is an 'index color value' (ICV) rather than rgb value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
defaultGridColor (Default Grid Color)	<p>Flag indicating that the consuming application should use the default grid lines color (system dependent). Overrides any color specified in colorId.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rightToLeft (Right To Left)	<p>Flag indicating whether the sheet is in 'right to left' display mode. When in this mode, Column A is on the far right, Column B ;is one column left of Column A, and so on. Also, information in cells is displayed in the Right to Left format.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showFormulas (Show Formulas)	<p>Flag indicating whether this sheet should display formulas.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
showGridLines (Show Grid Lines)	<p>Flag indicating whether this sheet should display gridlines.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showOutlineSymb ols (Show Outline Symbols)	<p>Flag indicating whether the sheet has outline symbols visible. This flag shall always override SheetPr element's outlinePr child element whose attribute is named showOutlineSymbols when there is a conflict.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showRowColHeade rs (Show Headers)	<p>Flag indicating whether the sheet should display row and column headings.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showRuler (Show Ruler)	<p>Show the ruler in Page Layout View.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showWhiteSpace (Show White Space)	<p>Flag indicating whether page layout view shall display margins. False means do not display left, right, top (header), and bottom (footer) margins (even when there is data in the header or footer).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showZeros (Show Zero Values)	<p>Flag indicating whether the window should show 0 (zero) in cells containing zero value. When false, cells with zero value appear blank instead of showing the number zero.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tabSelected (Sheet Tab Selected)	<p>Flag indicating whether this sheet is selected. When only 1 sheet is selected and active, this value should be in synch with the activeTab value. In case of a conflict, the Start Part setting wins and sets the active sheet tab.</p> <p>Multiple sheets can be selected, but only one sheet shall be active at one time.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
topLeftCell (Top Left Visible Cell)	<p>Location of the top left visible cell Location of the top left visible cell in the bottom right pane (when in Left-to-Right mode).</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>

Attributes	Description
view (View Type)	<p>Indicates the view type.</p> <p>The possible values for this attribute are defined by the ST_SheetViewType simple type (§18.18.69).</p>
windowProtection (Window Protection)	<p>Flag indicating whether the panes in the window are locked due to workbook protection. This is an option when the workbook structure is protected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
workbookViewId (Workbook View Index)	<p>Zero-based index of this workbook view, pointing to a workbookView element in the bookViews collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
zoomScale (Zoom Scale)	<p>Window zoom magnification for current view representing percent values. This attribute is restricted to values ranging from 10 to 400. Horizontal & Vertical scale together.</p> <p><i>[Example:</i></p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p><i>end example]</i></p> <p>Current view can be Normal, Page Layout, or Page Break Preview.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
zoomScaleNormal (Zoom Scale Normal View)	<p>Zoom magnification to use when in normal view, representing percent values. This attribute is restricted to values ranging from 10 to 400. Horizontal & Vertical scale together.</p> <p><i>[Example:</i></p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p><i>end example]</i></p>

Attributes	Description
	<p>Applies for worksheets only; zero implies the automatic setting.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
zoomScalePageLayoutView (Zoom Scale Page Layout View)	<p>Zoom magnification to use when in page layout view, representing percent values. This attribute is restricted to values ranging from 10 to 400. Horizontal & Vertical scale together.</p> <p><i>[Example:</i></p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p><i>end example]</i></p> <p>Applies for worksheets only; zero implies the automatic setting.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
zoomScaleSheetLayoutView (Zoom Scale Page Break Preview)	<p>Zoom magnification to use when in page break preview, representing percent values. This attribute is restricted to values ranging from 10 to 400. Horizontal & Vertical scale together.</p> <p><i>[Example:</i></p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p><i>end example]</i></p> <p>Applies for worksheet only; zero implies the automatic setting.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SheetView](#)) is located in §A.2. *end note*]

18.3.1.88 [sheetViews](#) (Sheet Views)

Worksheet views collection.

[*Example:*

This example shows one sheet view definition. The definition indicates that the current sheet is the active/selected sheet, and that there is a split pane applied to the view. This definition also indicates for each of the four window panes of the split which cell is the active cell for that pane.

```
<sheetViews>
  <sheetView tabSelected="1" workbookViewId="0">
    <pane xSplit="2310" ySplit="2070" topLeftCell="C1"
      activePane="bottomRight"/>
    <selection/>
    <selection pane="bottomLeft" activeCell="A6" sqref="A6"/>
    <selection pane="topRight" activeCell="C1" sqref="C1"/>
    <selection pane="bottomRight" activeCell="E13" sqref="E13"/>
  </sheetView>
</sheetViews>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SheetViews](#)) is located in §A.2. *end note*]

18.3.1.89 [sheetViews](#) (Chart Sheet Views)

This element specifies chart sheet views.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ChartsheetViews](#)) is located in §A.2. *end note*]

18.3.1.90 [smartTags](#) (Smart Tags)

This collection expresses all smart tags associated with cells on this sheet. There can be multiple smart tags associated with a particular cell, and many cells with smart tags for a given worksheet.

[*Example:*

This example shows three smart tags, each one associated with a unique cell on the worksheet.

```

<smartTags>
  <cellSmartTags r="A1">
    <cellSmartTag type="0"/>
  </cellSmartTags>
  <cellSmartTags r="B1">
    <cellSmartTag type="0"/>
  </cellSmartTags>
  <cellSmartTags r="B2">
    <cellSmartTag type="0"/>
  </cellSmartTags>
</smartTags>

```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_SmartTags](#)) is located in §A.2. *end note*]

18.3.1.91 [sortCondition \(Sort Condition\)](#)

Sort condition. When more than one sortCondition is specified, the first condition is applied first, then the second condition is applied, and so on.

Attributes	Description
customList (Custom List)	Sort by a custom list. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
descending (Descending)	Sort descending. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dxflId (Format Id)	Format Id when sortBy=cellColor or fontColor The possible values for this attribute are defined by the ST_DxflId simple type (§18.18.25).
iconId (Icon Id)	Zero-based index of an icon in an icon set. The absence of this attribute means "no icon" The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
iconSet (Icon Set)	Icon set index when sortBy=icon. The possible values for this attribute are defined by the ST_IconSetType simple type (§18.18.42).
ref (Reference)	Column/Row that this sort condition applies to. This shall be contained within the ref in CT_SortState.

Attributes	Description
	The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sortBy (Sort By)	Type of sort. The possible values for this attribute are defined by the ST_SortBy simple type (§18.18.72).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SortCondition](#)) is located in §A.2.
end note]

18.3.1.92 sortState (Sort State)

This collection preserves the AutoFilter sort state.

[*Example:* This example shows a sort which is case-sensitive, descending sort. While the range of data to sort is B4:E8, the range to sort by is B4:B8.

```
<sortState caseSensitive="1" ref="B4:E8">
  <sortCondition descending="1" ref="B4:B8"/>
</sortState>
```

end example]

Attributes	Description
caseSensitive (Case Sensitive)	Flag indicating whether or not the sort is case-sensitive. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
columnSort (Sort by Columns)	Flag indicating whether or not to sort by columns. Only applies to ranges that don't have AutoFilter applied. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
ref (Sort Range)	The whole range of data to sort (not just the sort-by column). The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sortMethod (Sort Method)	Strokes or PinYin sort method. Applies only to these application UI languages: <ul style="list-style-type: none"> Chinese Simplified Chinese Traditional Japanese For these languages, alternate sort methods can be selected, affecting how the data is sorted.

Attributes	Description
	The possible values for this attribute are defined by the ST_SortMethod simple type (§18.18.73).

[Note: The W3C XML Schema definition of this element's content model ([CT_SortState](#)) is located in §A.2. *end note*]

18.3.1.93 tabColor (Sheet Tab Color)

Background color of the sheet tab.

Attributes	Description
auto (Automatic)	<p>A boolean value indicating the color is automatic and system color dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indexed (Index)	<p>Indexed color value. Only used for backwards compatibility. References a color in indexedColors.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rgb (Alpha Red Green Blue Color Value)	<p>Standard Alpha Red Green Blue color value (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
theme (Theme Color)	<p>A zero-based index into the <clrScheme> collection (§20.1.6.2), referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p>[Example:</p>

Attributes	Description
	<p>Here are some examples of how to apply tint to color:</p> <p>If (tint < 0) $\text{Lum}' = \text{Lum} * (1.0 + \text{tint})$ <p>For example: Lum = 200; tint = -0.5; Darken 50% $\text{Lum}' = 200 * (0.5) \Rightarrow 100$ <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black) $\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0$ <p>If (tint > 0) $\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))$ <p>For example: Lum = 100; tint = 0.75; Lighten 75% $\begin{aligned} \text{Lum}' &= 100 * (1 - .75) + (\text{HLSMAX} - \text{HLSMAX} * (1 - .75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white) $\begin{aligned} \text{Lum}' &= 100 * (1 - 1) + (\text{HLSMAX} - \text{HLSMAX} * (1 - 1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> </p></p></p></p></p></p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.2. *end note*]

18.3.1.94 [tablePart \(Table Part\)](#)

A single Table Part reference.

Attributes	Description
id (Relationship Id)	This relationship Id is used to locate a particular table definition part.
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_TablePart](#)) is located in §A.2. *end note*]

18.3.1.95 [tableParts \(Table Parts\)](#)

This collection expresses a relationship Id pointing to every table on this sheet.

[Example: This example indicates that the current sheet has two tables, and their definitions can be found by locating the appropriate relationships from the sheet:

```
<tableParts count="2">
  <tablePart r:id="rId1"/>
  <tablePart r:id="rId2"/>
</tableParts>
```

end example]

Attributes	Description
count (Count)	A count of table elements in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_TableParts](#)) is located in §A.2. *end note*]

18.3.1.96 [v \(Cell Value\)](#)

This element expresses the value contained in a cell. If the cell contains a string, then this value is an index into the shared string table, pointing to the actual string value. Otherwise, the value of the cell is expressed directly in this element. Cells containing formulas express the last calculated result of the formula in this element.

For applications not wanting to implement the shared string table, an 'inline string' can be expressed in an <is> element under <c> (instead of a <v> element under <c>), in the same way a string would be expressed in the shared string table. [Note: See <is> for an example. *end note*]

[Example: In this example, cell B4 contains the number "360", cell C4 contains the local date and time 22 November 1976, 08:30, and cell C5 contains the 1900 date system serial date-time for the date-time in cell C4.

```
<c r="B4">
  <v>360</v>
</c>
<c r="C4" t="d">
  <v>1976-11-22T08:30</v>
</c>
```

```
<c r="C5">
  <f>C4</f>
  <v>28086.3541666667</v>
</c>
```

end example]

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.3.1.97 webPublishItem (Web Publishing Item)

This element represents information for a single item or object which can be published to HTML.

Attributes	Description
autoRepublish (Automatically Publish)	Automatically publish this item every time the workbook is saved. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
destinationFile (Destination File Name)	Destination file name. Indicates where to save the HTML publish file. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
divId (Destination Bookmark)	Destination bookmark. Identifies a specific <div> section in the published HTML file when a subset of the workbook is published to HTML. Each item that has been published from a workbook is written to a unique <div> element in HTML. On re-publishing a particular item from the workbook, only that item's corresponding <div> content is updated. Therefore each publish item corresponds to a unique <div> element. It is possible to add new publish items to an existing published page, and it is possible to re-publish individual items without republishing the entire workbook. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§22.9.2.19).
id (Id)	This is a unique number "nnnnn" of the webPublishItem. This value is used to generate the divId and styleId values. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
sourceObject (Source Object Name)	Source object name (required for sourceType = pivotTable, query, or label). The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
sourceRef (Source Id)	Source range (required for sourceType = 'range'). The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sourceType (Web Source Type)	Type of web source (or objects to publish). The possible values for this attribute are defined by the ST_WebSourceType simple type (§18.18.92).
title (Title)	HTML title of published item. [<i>Example</i> : This value can appear in the web browser window's title bar. <i>end example</i>] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_WebPublishItem](#)) is located in §A.2. *end note*]

18.3.1.98 webPublishItems (Web Publishing Items)

This represents a listing of individual objects in this workbook that have been published (to HTML).

When one of these objects is selected to be published, just the object is published to HTML, not the entire workbook contents.

[*Example*: This example shows two items which have been previously selected for publishing. One is a range (A6:C6), the other is a chart, named "Chart 1".

```
<webPublishItems count="2">
  <webPublishItem id="11289" divId="Views_11289" sourceType="range"
    sourceRef="A6:C6" destinationFile="D:\Publish.htm" published="0"/>
  <webPublishItem id="6433" divId="Views_6433" sourceType="chart"
    sourceObject="Chart 1" destinationFile="D:\Publish.mht" published="0"/>
</webPublishItems>
```

end example]

Attributes	Description
count (Web Publishing Items Count)	Number of items. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_WebPublishItems](#)) is located in §A.2. *end note*]

18.3.1.99 **worksheet (Worksheet)**

This is the root element of Worksheet parts within a SpreadsheetML document.

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Worksheet](#)) is located in §A.2. *end note*]

18.3.2 **AutoFilter Settings**

The following subclause defines the settings which can be specified as part of an AutoFilter definition. An *AutoFilter* temporarily hides rows based on a filter criteria, which is applied column by column to a table of data in the worksheet.

18.3.2.1 **colorFilter (Color Filter Criteria)**

This element specifies the color to filter by and whether to use the cell's fill or font color in the filter criteria. If the cell's font or fill color does not match the color specified in the criteria, the rows corresponding to those cells are hidden from view.

[*Example:*

```
<filterColumn colId="1">  
  <colorFilter dxfId="0" cellColor="0"/>  
</filterColumn>
```

end example]

Attributes	Description
cellColor (Filter By Cell Color)	Flag indicating whether or not to filter by the cell's fill color. 1 indicates to filter by cell fill. 0 indicates to filter by the cell's font color. For rich text in cells, if the color specified appears in the cell at all, it shall be included in the filter. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

Attributes	Description
dxfld (Differential Format Record Id)	Id of differential format record (dxfl) in the Styles Part which expresses the color value to filter by. The possible values for this attribute are defined by the ST_Dxfl simple type (§18.18.25).

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorFilter](#)) is located in §A.2. *end note*]

18.3.2.2 customFilter (Custom Filter Criteria)

A custom AutoFilter specifies an operator and a value. There can be at most two customFilters specified, and in that case the parent element specifies whether the two conditions are joined by 'and' or 'or'. For any cells whose values do not meet the specified criteria, the corresponding rows shall be hidden from view when the filter is applied.

[Example:

```
<customFilters and="1">
  <customFilter operator="greaterThanOrEqual" val="0.2"/>
  <customFilter operator="lessThanOrEqual" val="0.5"/>
</customFilters>
```

end example]

Attributes	Description
operator (Filter Comparison Operator)	Operator used by the filter comparison. The possible values for this attribute are defined by the ST_FilterOperator simple type (§18.18.31).
val (Top or Bottom Value)	Top or bottom value used in the filter criteria. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomFilter](#)) is located in §A.2. *end note*]

18.3.2.3 customFilters (Custom Filters)

When there is more than one custom filter criteria to apply (an 'and' or 'or' joining two criteria), then this element groups the customFilter elements together.

Attributes	Description
and (And)	<p>Flag indicating whether the two criteria have an "and" relationship. 1 indicates "and", 0 indicates "or".</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomFilters](#)) is located in §A.2.
end note]

18.3.2.4 dateGroupItem (Date Grouping)

This collection is used to express a group of dates or times which are used in an AutoFilter criteria. [*Note:* See parent element for an example. *end note*] Values are always written in the calendar type of the first date encountered in the filter range, so that all subsequent dates, even when formatted or represented by other calendar types, can be correctly compared for the purposes of filtering.

Attributes	Description
dateTimeGrouping (Date Time Grouping)	<p>Grouping level.</p> <p>The possible values for this attribute are defined by the ST_DateTimeGrouping simple type (§18.18.22).</p>
day (Day)	<p>Day (1-31)</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>
hour (Hour)	<p>Hour (0-23)</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>
minute (Minute)	<p>Minute (0-59)</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>
month (Month)	<p>Month (1-12)</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>
second (Second)	<p>Second (0-59)</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>
year (Year)	Year (4 digits)

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT DateGroupItem](#)) is located in §A.2.
end note]

18.3.2.5 `dynamicFilter` (Dynamic Filter)

This collection specifies dynamic filter criteria. These criteria are considered dynamic because they can change, either with the data itself (e.g., "above average") or with the current system date (e.g., show values for "today"). For any cells whose values do not meet the specified criteria, the corresponding rows shall be hidden from view when the filter is applied.

[Example:

```
<filterColumn colId="0">
  <dynamicFilter type="today"/>
</filterColumn>
```

end example]

Attributes	Description
maxValIso (Max ISO Value)	<p>A maximum value for dynamic filter. maxValIso shall be required for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate.</p> <p>The above criteria are based on a value range; that is, if today's date is September 22nd, then the range for thisWeek is the values greater than or equal to September 17 and less than September 24. In the thisWeek range, the lower value is expressed valIso. The higher value is expressed using maxValIso.</p> <p>These dynamic filters shall not require valIso or maxValIso: Q1, Q2, Q3, Q4, M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11 and M12.</p> <p>The above criteria shall not specify the range using valIso and maxValIso because Q1 always starts from M1 to M3, and M1 is always January.</p> <p>These types of dynamic filters shall use valIso and shall not use maxValIso:</p> <ul style="list-style-type: none"> • aboveAverage and belowAverage <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>

Attributes	Description
type (Dynamic filter type)	Dynamic filter type, e.g., “today” or “nextWeek”. The possible values for this attribute are defined by the ST_DynamicFilterType simple type (§18.18.26).
val (Value)	A minimum numeric value for dynamic filter. (See description of valIso to understand when val is required.) The possible values for this attribute are defined by the W3C XML Schema double datatype.
valIso (ISO Value)	A minimum value for dynamic filter. (See description of maxValIso to understand when <u>val</u> /valIso is required.) <u>Only these types of dynamic filters use numeric data, and therefore shall use val and shall not use valIso:</u> <ul style="list-style-type: none"> <u>aboveAverage and belowAverage</u> The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_DynamicFilter](#)) is located in §A.2. *end note*]

18.3.2.6 filter (Filter)

This element expresses a filter criteria value.

[Example:

```
<filters>
  <filter val="0.316588716"/>
  <filter val="0.667439395"/>
  <filter val="0.823086999"/>
</filters>
```

end example]

Attributes	Description
val (Filter Value)	Filter value used in the criteria. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element’s content model ([CT_Filter](#)) is located in §A.2. *end note*]

18.3.2.7 filterColumn (AutoFilter Column)

The filterColumn collection identifies a particular column in the AutoFilter range and specifies filter information that has been applied to this column. If a column in the AutoFilter range has no criteria specified, then there is no corresponding filterColumn collection expressed for that column.

Attributes	Description
colId (Filter Column Data)	Zero-based index indicating the AutoFilter column to which this filter information applies. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
hiddenButton (Hidden AutoFilter Button)	Flag indicating whether the AutoFilter button for this column is hidden. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
showButton (Show Filter Button)	Flag indicating whether the filter button is visible. [<i>Example</i> : When the cell containing the filter button is merged with another cell, the filter button can be hidden, and not drawn. <i>end example</i>] The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_FilterColumn](#)) is located in §A.2.
end note]

18.3.2.8 filters (Filter Criteria)

When multiple values are chosen to filter by, or when a group of date values are chosen to filter by, this element groups those criteria together.

[*Example*:

```
<filters>
  <dateGroupItem year="2006" month="1" day="2" dateTimeGrouping="day"/>
  <dateGroupItem year="2005" month="1" day="2" dateTimeGrouping="day"/>
</filters>
```

end example]

Attributes	Description
blank (Filter by Blank)	Flag indicating whether to filter by blank. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
calendarType	Calendar type for date grouped items. Used to interpret the values in dateGroupItem.

Attributes	Description
(Calendar Type)	<p>This is the calendar type used to evaluate all dates in the filter column, even when those dates are not using the same calendar system / date formatting.</p> <p>The possible values for this attribute are defined by the ST_CalendarType simple type (§22.9.2.1).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Filters](#)) is located in §A.2. *end note*]

18.3.2.9 iconFilter (Icon Filter)

This element specifies the icon set and particular icon within that set to filter by. For any cells whose icon does not match the specified criteria, the corresponding rows shall be hidden from view when the filter is applied.

[Example:

```
<filterColumn colId="3">
  <iconFilter iconSet="3Arrows" iconId="0"/>
</filterColumn>
```

end example]

Attributes	Description
iconId (Icon Id)	<p>Zero-based index of an icon in an icon set. The absence of this attribute means "no icon"</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
iconSet (Icon Set)	<p>Specifies which icon set is used in the filter criteria.</p> <p>The possible values for this attribute are defined by the ST_IconSetType simple type (§18.18.42).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_IconFilter](#)) is located in §A.2. *end note*]

18.3.2.10 top10 (Top 10)

This element specifies the top N (percent or number of items) to filter by.

[Example: This example filters the first column by the top 10 percent of the values in that column. For all cells in the column whose value falls outside the top 10 percent of the value in that column, the rows corresponding to those cells are hidden from the view. In this example, there are 6 cells in the range, containing 1, 2, 3, 4, 5, 6 respectively.

```
<filterColumn colId="0">
  <top10 percent="1" val="5" filterVal="6"/>
</filterColumn>
```

end example]

Attributes	Description
filterVal (Filter Value)	The actual cell value in the range which is used to perform the comparison for this filter. The possible values for this attribute are defined by the W3C XML Schema double datatype.
percent (Filter by Percent)	Flag indicating whether or not to filter by percent value of the column. A false value filters by number of items. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
top (Top)	Flag indicating whether or not to filter by top order. A false value filters by bottom order. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
val (Top or Bottom Value)	Top or bottom value to use as the filter criteria. <i>[Example: "Filter by Top 10 Percent" or "Filter by Top 5 Items". end example]</i> The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Top10](#)) is located in §A.2. end note]

18.4 Shared String Table

A workbook can contain thousands of cells containing string (non-numeric) data. Furthermore this data is very likely to be repeated across many rows or columns. The goal of implementing a single string table that is shared across the workbook is to improve performance in opening and saving the file by only reading and writing the repetitive information once.

[Example: Consider for example a workbook summarizing information for cities within various countries. There can be a column for the name of the country, a column for the name of each city in that country, and a column containing the data for each city. In this case the country name is repetitive, being duplicated in many cells. end example] In many cases the repetition is extensive, and significant savings are realized by making use of a shared string table when saving the workbook. When displaying text in the spreadsheet, the cell table will just contain an index into the string table as the value of a cell, instead of the full string.

The shared string table is permitted to contain all the necessary information for displaying the string: the text, formatting properties, and phonetic properties (for East Asian languages).

Most strings in a workbook have formatting applied at the cell level, that is, the entire string in the cell has the same formatting applied. In these cases, the formatting for the cell is stored in the styles part, and the string for the cell can be stored in the shared strings table. In this case, the strings stored in the shared strings table are very simple text elements.

[Example:

```
<sst xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main"
  count="8" uniqueCount="4">
  <si>
    <t>United States</t>
  </si>
  <si>
    <t>Seattle</t>
  </si>
  <si>
    <t>Denver</t>
  </si>
  <si>
    <t>New York</t>
  </si>
</sst>
```

In the above example we can see that the string table is just a collection of string items that consist of simple text elements. Note that any numeric data in the workbook is not shown in the shared string table. *end example]*

Some strings in the workbook can have formatting applied at a level that is more granular than the cell level. For instance, specific characters within the string can be bolded, have coloring, italicizing, etc. In these cases, the formatting is stored along with the text in the string table, and is treated as a unique entry in the table.

[Example:

```
<sst xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main"
  count="8" uniqueCount="4">
  <si>
    <r>
      <t xml:space="preserve">United </t>
    </r>
  </si>
```

```
<r>
  <rPr>
    <sz val="11"/>
    <color rgb="FFFF0000"/>
    <rFont val="Calibri"/>
    <family val="2"/>
    <scheme val="minor"/>
  </rPr>
  <t>States</t>
</r>
</si>
<si>
  <t>Seattle</t>
</si>
<si>
  <t>Denver</t>
</si>
<si>
  <t>New York</t>
</si>
</sst>
```

In the above example you can see that this time, the text "United States" has specific, colored, formatting applied to the text, "States." *end example*]

18.4.1 charset (Character Set)

This element defines the font character set of this font.

This field is used in font creation and selection if a font of the given facename is not available on the system. Although it is not required to have around when resolving font facename, the information can be stored for when needed to help resolve which font face to use of all available fonts on a system.

Charset represents the basic set of characters associated with a font (that it can display), and roughly corresponds to the ANSI codepage (8-bit or DBCS) of that character set used by a given language. Given more common use of Unicode where many fonts support more than one of the traditional charset categories, and the use of font linking, using charset to resolve font name is less and less common, but still can be useful.

These are operating-system-dependent values.

[Note: The following are some of the possible the character sets:

INT Value	Character Set
0	ANSI_CHARSET

INT Value	Character Set
1	DEFAULT_CHARSET
2	SYMBOL_CHARSET
77	MAC_CHARSET
128	SHIFTJIS_CHARSET
129	HANGUL_CHARSET
130	JOHAB_CHARSET
134	GB2312_CHARSET
136	CHINESEBIG5_CHARSET
161	GREEK_CHARSET
162	TURKISH_CHARSET
163	VIETNAMESE_CHARSET
177	HEBREW_CHARSET
178	ARABIC_CHARSET
186	BALTIC_CHARSET
204	RUSSIAN_CHARSET
222	THAI_CHARSET
238	EASTEUROPE_CHARSET
255	OEM_CHARSET

The OEM_CHARSET value specifies a character set that is operating-system dependent. *end note*

Fonts with other character sets can exist in the operating system. If an application uses a font with an unknown character set, it should not attempt to translate or interpret strings that are rendered with that font.

Attributes	Description
val (Value)	<p>The value of an integer, where each value corresponds to a different character set. This attribute is restricted to values ranging from 0 to 255.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_IntProperty](#)) is located in §A.2. *end note*]

18.4.2 outline (Outline)

This element displays only the inner and outer borders of each character. This is very similar to Bold in behavior.

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. end note]

18.4.3 phoneticPr (Phonetic Properties)

This element represents a collection of phonetic properties that affect the display of phonetic text for this String Item (si).

Phonetic text is used to give hints as to the pronunciation of an East Asian language, and the hints are displayed as text within the spreadsheet cells across the top portion of the cell. Since the phonetic hints are text, every phonetic hint is expressed as a phonetic run (rPh), and these properties specify how to display that phonetic run.

[Example:

```
<si>
  <t>課< 毛</t>
  <rPh sb="0" eb="1">
    <t>カ</t>
  </rPh>
  <rPh sb="4" eb="5">
    <t>ケ</t>
  </rPh>
  <phoneticPr fontId="1"/>
</si>
```

The above example shows a String Item that displays some Japanese text "課きく 毛こ." It also displays some phonetic text across the top of the cell. The phonetic text character, "カ" is displayed over the "課" character and the phonetic text "ケ" is displayed above the "毛" character, using the font record in the style sheet at index 1. end example]

Attributes	Description
alignment (Alignment)	<p>Specifies how the text for the phonetic run is aligned across the top of the cells, with respect to the main text in the body of the cell.</p> <p>The possible values for this attribute are defined by the ST_PhoneticAlignment simple</p>

Attributes	Description
	type (§18.18.56).
fontId (Font Id)	<p>An integer that is a zero-based index into the font record in the style sheet. Represents the font to be used to display this phonetic run.</p> <p>If this index is out of bounds, then the default font of the Normal style should be used in its place. This default font should be at index 0.</p> <p>The possible values for this attribute are defined by the ST_FontId simple type (§18.18.32).</p>
type (Character Type)	<p>An enumeration which specifies which East Asian character set should be used to display the phonetic run</p> <p>The possible values for this attribute are defined by the ST_PhoneticType simple type (§18.18.57).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PhoneticPr](#)) is located in §A.2. *end note*]

18.4.4 r (Rich Text Run)

This element represents a run of rich text. A rich text run is a region of text that share a common set of properties, such as formatting properties. The properties are defined in the rPr element, and the text displayed to the user is defined in the Text (t) element.

[Note: The W3C XML Schema definition of this element's content model ([CT_RElt](#)) is located in §A.2. *end note*]

18.4.5 rFont (Font)

This element is a string representing the name of the font assigned to display this run.

Attributes	Description
val (String Value)	<p>A string representing the name of the font. If the font doesn't exist (because it isn't installed on the system), or the charset not supported by that font, then another font should be substituted.</p> <p>The string length for this attribute shall be 0 to 31 characters.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FontName](#)) is located in §A.2. *end note*]

18.4.6 rPh (Phonetic Run)

This element represents a run of text which displays a phonetic hint for this String Item (si).

Phonetic hints are used to give information about the pronunciation of an East Asian language. The hints are displayed as text within the spreadsheet cells across the top portion of the cell.

Attributes	Description
eb (Base Text End Index)	<p>An integer used as a zero-based index representing the ending offset into the base text for this phonetic run. This represents the ending point in the base text the phonetic hint applies to.</p> <p>This value shall be between 0 and the total length of the base text. The following condition shall be true: $sb < eb$.</p> <p>It is recommended that the following condition also be satisfied: That for any two consecutive phonetic runs, $sb_1 < eb_1 \leq sb_2 < eb_2$ to avoid overlapping phonetic runs</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sb (Base Text Start Index)	<p>An integer used as a zero-based index representing the starting offset into the base text for this phonetic run. This represents the starting point in the base text the phonetic hint applies to.</p> <p>This value shall be between 0 and the total length of the base text. The following condition shall be true: $sb < eb$.</p> <p>It is recommended that the following condition also be satisfied: That for any two consecutive phonetic runs, $sb_1 < eb_1 \leq sb_2 < eb_2$ to avoid overlapping phonetic runs.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PhoneticRun](#)) is located in §A.2. *end note*]

18.4.7 rPr (Run Properties)

This element represents a set of properties to apply to the contents of this rich text run.

[Note: The W3C XML Schema definition of this element's content model ([CT_RPrElt](#)) is located in §A.2. *end note*]

18.4.8 si (String Item)

This element is the representation of an individual string in the Shared String table.

If the string is just a simple string with formatting applied at the cell level, then the String Item (si) should contain a single text element used to express the string. However, if the string in the cell is more complex - i.e., has formatting applied at the character level - then the string item shall consist of multiple rich text runs which collectively are used to express the string.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Rst](#)) is located in §A.2. *end note*]

18.4.9 sst (Shared String Table)

This element is the root of the Shared String Table, which serves as a collection of individual String Items (si).

Attributes	Description
count (String Count)	<p>An integer representing the total count of strings in the workbook. This count does not include any numbers, it counts only the total of text strings in the workbook.</p> <p>This attribute is optional unless uniqueCount is used, in which case it is required.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
uniqueCount (Unique String Count)	<p>An integer representing the total count of unique strings in the Shared String Table. A string is unique even if it is a copy of another string, but has different formatting applied at the character level.</p> <p>[Example: World, <i>World</i>, and <i>World</i>.</p> <p>The count would be 3, and the uniqueCount would be 2. Only one entry for "World" would show in the table because it is the same string, just with different formatting applied at the cell level (i.e., applied to the entire string in the cell). The "World" string would get a separate unique entry in the shared string table because it has different formatting applied to specific characters. <i>end example</i>]</p> <p>This attribute is optional unless count is used, in which case it is required.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_Sst](#)) is located in §A.2. *end note*]

18.4.10 strike (Strike Through)

This element draws a strikethrough line through the horizontal middle of the text.

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element.

Attributes	Description
	<p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. *end note*]

18.4.11 sz (Font Size)

This element represents the point size (1/72 of an inch) of the Latin and East Asian text.

Attributes	Description
val (Value)	<p>A double representing the value of a positive measurement in points (1/72 of an inch).</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FontSize](#)) is located in §A.2. *end note*]

18.4.12 t (Text)

This element represents the text content shown as part of a string.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
<p>xml:space (Content Contains Significant Whitespace)</p> <p>Namespace: http://www.w3.org/XML/1998/namespace</p>	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.</p>

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.4.13 **u (Underline)**

This element represents the underline formatting style.

Attributes	Description
val (Underline Value)	<p>An enumeration representing the style of underlining that is used.</p> <p>The none style is equivalent to not using underlining at all.</p> <p>The possible values for this attribute are defined by the ST_UnderlineValues simple type (§18.18.85).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UnderlineProperty](#)) is located in §A.2. *end note*]

18.4.14 **vertAlign (Vertical Alignment)**

This element adjusts the vertical position of the text relative to the text's default appearance for this run. It is used to get 'superscript' or 'subscript' texts, and shall reduce the font size (if a smaller size is available) accordingly.

Attributes	Description
val (Value)	<p>An enumeration representing the vertical-alignment setting.</p> <p>Setting this to either subscript or superscript shall make the font size smaller if a smaller font size is available.</p> <p>The possible values for this attribute are defined by the ST_VerticalAlignRun simple type (§22.9.2.17).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_VerticalAlignFontProperty](#)) is located in §A.2. *end note*]

18.5 **Tables**

A table helps organize and provide structure to lists of information in a worksheet. Tables have clearly labeled columns, rows, and data regions. Tables make it easier for users to sort, analyze, format, manage, add, and delete information.

If a region of data is designated as a Table, then special behaviors can be applied which help the user perform useful actions. [Example: if the user types additional data in the row adjacent to the bottom of the table, the table can expand and automatically add that data to the data region of the table. Similarly, adding a column is as easy as typing a new column heading to the right or left of the current column headings. Filter and sort abilities can automatically be surfaced to the user via the drop down arrows. Special calculated columns can be created

which summarize or calculate data in the table. These columns have the ability to expand and shrink according to size of the table, and maintain proper formula referencing. *end example*]

Tables can be created from data already present in the worksheet, from an external data query, or from mapping a collection of repeating XML elements to a worksheet range.

The sheet XML stores the numeric and textual data. The table XML records the various attributes for the particular table object.

[*Example:*

```
<table xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main"
  id="1" name="MarginTable" displayName="MarginTable" ref="D3:G6"
  totalsRowShown="0">
  <autoFilter ref="D3:G6"/>
  <tableColumns count="4">
    <tableColumn id="1" name="Product"/>
    <tableColumn id="2" name="Wholesale"/>
    <tableColumn id="3" name="Retail"/>
    <tableColumn id="4" name="Margin" dataDxfId="0">
      <calculatedColumnFormula d="1">[Retail]-
        [Wholesale]</calculatedColumnFormula>
    </tableColumn>
  </tableColumns>
  <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
    showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
</table>
```

The above xml example shows a table that spans cells D3 through G6, and has four columns: Product, Wholesale, Retail, and Margin. Margin is a column where each cell has its values calculated based on the formula (Retail - Wholesale), where those values are taken from the cells in the table columns on the corresponding row. The table has a style applied, "TableStyleMedium9", but the styles formatting isn't applied to the first column and the column striping isn't shown. Note that all the data and text values are stored in the sheet xml; the table xml just stores the properties that are specific to this table, and it is referenced by the sheet. *end example*]

18.5.1 Tables

Tables are ranges of data in the worksheet that have special behavior applied which allow users to better sort, analyze, format, manage, add, and delete data. Tables and table columns can also be referenced through formulas by the spreadsheet application using friendly names, making formula calculations that use tables much easier to understand and maintain. Tables provide a natural way for working with large sets of tabular data.

The tables described in this section are of the multi cell variety, as opposed to single cell tables created from XML mappings.

Each table gets its own xml part, and the relationship between a table part and the sheet is defined in the sheet's _rels directory. The sheet xml also references this id since there can be more than one table on a sheet. The sheet xml contains all the numeric and textual data, and the table xml records properties of the table as well as some formatting rules for data and text displayed in the table cells.

18.5.1.1 **calculatedColumnFormula (Calculated Column Formula)**

Columns in a table can have cells that are calculated, usually based on values in other cells in the table. This element stores the formula that is used to perform the calculation for each cell in this column.

It shall be understood that formulas which reference columns of this table, shall be calculated using the cells in those columns on the same row of the table as the cell that the formula resides in.

See §18.17 for details on the format required for formulas.

Attributes	Description
array (Array)	A Boolean value that indicates whether this formula is an array style formula. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TableFormula](#)) is located in §A.2. *end note*]

18.5.1.2 **table (Table)**

This element is the root element for a table that is not a single cell XML table.

Attributes	Description
comment (Table Comment)	A string representing a textual comment about the table. [<i>Note</i> : This can be used by the spreadsheet application in other UI. <i>end note</i>] [<i>Example</i> : There can be name UI that is used to organize defined names and function references, if tables are listed in that UI the comment can give more information about the table. <i>end example</i>] The maximum length of this string should be 32767 characters. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§22.9.2.19).
connectionId (Connection ID)	<p>An integer representing an ID to indicate which connection from the connections collection is used by this table.</p> <p>This shall only be used for tables that are based off of xml maps.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
dataCellStyle (Data Style Name)	<p>A string representing the name of the cell style that is applied to the data area cells of the table.</p> <p>If this string is missing or does not correspond to the name of a cell style, then the data cell style specified by the current table style should be applied.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
dataDxfId (Data Area Format Id)	<p>A zero based integer index into the differential formatting records <dxf> in the styleSheet indicating which format to apply to the data area of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§18.18.25).</p>
displayName (Table Name)	<p>A string representing the name of the table. This is the name that shall be used in formula references, and displayed in the UI to the spreadsheet user.</p> <p>This name shall not have any spaces in it, and it shall be unique amongst all other displayNames and definedNames in the workbook. The character lengths and restrictions are the same as for definedNames. See <i>SpreadsheetML Reference - Workbook definedNames</i> section for details</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
headerRowBorderDxfId (Header Row Border Format Id)	<p>A zero based integer index into the differential formatting records <dxf> in the styleSheet indicating what border formatting to apply to the header row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§18.18.25).</p>
headerRowCellStyle (Header Row Style)	<p>A string representing the name of the cell style that is applied to the header row cells of the table.</p> <p>If this string is missing or does not correspond to the name of a cell style, then the header</p>

Attributes	Description
	<p>row style specified by the current table style should be applied.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
headerRowCount (Header Row Count)	<p>An integer representing the number of header rows showing at the top of the table. 0 means that the header row is not shown.</p> <p>It is up to the spreadsheet application to determine if numbers greater than 1 are allowed. Unless the spreadsheet application has a feature where there might ever be more than one header row, this number should not be higher than 1.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
headerRowDxfId (Header Row Format Id)	<p>A zero based integer index into the differential formatting records <dxf> in the styleSheet indicating which format to apply to the header row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§18.18.25).</p>
id (Table Id)	<p>A non zero integer representing the unique identifier for this table. Each table in the workbook shall have a unique id.</p> <p>Ids can be used to refer to the specific table in the workbook. [Note: For instance a future records bucket could refer to the table using this id. end note]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
insertRow (Insert Row Showing)	<p>A Boolean value indicating whether the insert row is showing. True when the insert row is showing, false otherwise.</p> <p>The insert row should only be shown if the table has no data.</p> <p>When a user clicks the insert row in the UI, it provides them an easy way to enter data into a table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
insertRowShift (Insert Row Shift)	<p>A Boolean that indicates whether cells in the sheet had to be inserted when the insert row was shown for this table. True if the cells were shifted, false otherwise.</p> <p>[Note: This happens when there are values in cells immediately below the table when the table is created and the insert row is shown. In this case blank cells for the insert row are inserted, and the existing values in the sheet are shifted down by one row to make</p>

Attributes	Description
	<p>room.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
name (Name)	<p>A string representing the name of the table that is used to reference the table programmatically through the spreadsheet applications object model. This string shall be unique per table per sheet. It has the same length and character restrictions as for displayName.</p> <p>By default this should be the same as the table's displayName. This name should also be kept in synch with the displayName when the displayName is updated in the UI by the spreadsheet user.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
published (Published)	<p>A Boolean representing whether this table is marked as published for viewing by a server based spreadsheet application. True if it should be viewed by the server spreadsheet application, false otherwise.</p> <p>[Note: Such an application might only display objects from the workbook that are marked as published, thus being able to load and calculate the entire workbook but only show the specific items that are marked as published. This can allow the server spreadsheet rendering to provide a more restricted view of the workbook. end note]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ref (Reference)	<p>The range on the relevant sheet that the table occupies expressed using A1 style referencing.</p> <p>The reference shall include the totals row if it is shown.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).</p>
tableBorderDxfId (Table Border Format Id)	<p>A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating what border formatting to apply to the borders of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§18.18.25).</p>
tableType (Table Type)	<p>An optional enumeration specifying the type or source of the table.</p> <p>Indicates whether the table is based off of an external data query, data in a worksheet, or from an xml data mapped to a worksheet.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TableType simple type (§18.18.78).
totalsRowBorderDxflD (Totals Row Border Format Id)	<p>A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating what border formatting to apply to the totals row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxflD simple type (§18.18.25).</p>
totalsRowCellStyle (Totals Row Style)	<p>A string representing the name of the cell style that is applied to the totals row cells of the table.</p> <p>If this string is missing or does not correspond to the name of a cell style, then the totals row style specified by the current table style should be applied.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
totalsRowCount (Totals Row Count)	<p>An integer representing the number of totals rows that shall be shown at the bottom of the table.</p> <p>0 means that the totals row is not shown. It is up to the spreadsheet application to determine if numbers greater than 1 are allowed. Unless the spreadsheet application has a feature where their might ever be more than one totals row, this number should not be higher than 1.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
totalsRowDxflD (Totals Row Format Id)	<p>A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating which format to apply to the totals row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxflD simple type (§18.18.25).</p>
totalsRowShown (Totals Row Shown)	<p>A Boolean indicating whether the totals row has ever been shown in the past for this table. True if the totals row has been shown, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Table](#)) is located in §A.2. end note]

18.5.1.3 `tableColumn` (Table Column)

An element representing a single column for this table.

Attributes	Description
<code>dataCellStyle</code> (Data Area Style Name)	<p>A string representing the name of the cell style that is applied to the cells in the data area of this table column.</p> <p>If this string is missing or does not correspond to the name of a cell style, then the data cell style specified by the current table style should be applied.</p> <p>This cell style should get precedence over the <code>dataCellStyle</code> defined by the table.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19).</p>
<code>dataDxfId</code> (Data & Insert Row Format Id)	<p>A zero based integer index into the differential formatting records <code><dxfs></code> in the <code>styleSheet</code> indicating which format to apply to the data area of this column. This formatting shall also apply to cells on the insert row for this column.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the <code>ST_DxfId</code> simple type (§18.18.25).</p>
<code>headerRowCellStyle</code> (Header Row Cell Style)	<p>A string representing the name of the cell style that is applied to the header row cell of this column.</p> <p>If this string is missing or does not correspond to the name of a cell style, then header row style specified by the current table style should be applied.</p> <p>This cell style should get precedence over the <code>headerRowCellStyle</code> defined by the table.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19).</p>
<code>headerRowDxfId</code> (Header Row Cell Format Id)	<p>A zero based integer index into the differential formatting records <code><dxfs></code> in the <code>styleSheet</code> indicating which format to apply to the header cell of this column.</p> <p>The possible values for this attribute are defined by the <code>ST_DxfId</code> simple type (§18.18.25).</p>
<code>id</code> (Table Field Id)	<p>An integer representing the unique identifier of this column. This shall be unique per table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p>
<code>name</code> (Column name)	<p>A string representing the unique caption of the table column. This is what shall be displayed in the header row in the UI, and is referenced through functions. This name</p>

Attributes	Description
	<p>shall be unique per table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
queryTableFieldId (Query Table Field Id)	<p>An integer representing the query table field ID corresponding to this table column.</p> <p>The relationship between this table and the corresponding query table is expressed in <code>_rels</code> part for this table. Each <code>queryTableField</code> has a unique <code>id</code> attribute, and this <code>id</code> is what is referenced here.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p>
totalsRowCellStyle (Totals Row Style Name)	<p>A string representing the name of the cell style that is applied to the Totals Row cell of this column.</p> <p>If this string is missing or does not correspond to the name of a cell style, then the totals row cell style specified by the current table style should be applied.</p> <p>This cell style should get precedence over the <code>totalsRowCellStyle</code> defined by the table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
totalsRowDxfId (Totals Row Format Id)	<p>A zero based integer index into the differential formatting records <code><dxf></code> in the <code>styleSheet</code> indicating which format to apply to the totals row cell of this column.</p> <p>The spreadsheet shall not load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§18.18.25).</p>
totalsRowFunction (Totals Row Function)	<p>An enumeration indicating which type of aggregation to show in the totals row cell for this column.</p> <p>The possible values for this attribute are defined by the ST_TotalsRowFunction simple type (§18.18.83).</p>
totalsRowLabel (Totals Row Label)	<p>A String to show in the totals row cell for this column.</p> <p>This string shall be ignored unless the <code>totalsRowFunction="none"</code> for this column, in which case it is displayed in the totals row.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
uniqueName (Unique Name)	<p>An optional string representing the unique name of the table column. This string is used to bind the column to a field in a data table, so it should only be used when this table's</p>

Attributes	Description
	<p>tableType is queryTable or xml.</p> <p>This name shall be unique per table when it is used.</p> <p>For tables created from xml mappings, by default this should be the same as the name of the column, and should be kept in synch with the name of the column if that name is altered by the spreadsheet application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TableColumn](#)) is located in §A.2.
end note]

18.5.1.4 tableColumns (Table Columns)

An element representing the collection of all table columns for this table.

Attributes	Description
count (Column Count)	<p>An integer representing the total count of how many columns there are in this Table. This count shall include both query-defined and user-defined columns.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TableColumns](#)) is located in §A.2.
end note]

18.5.1.5 tableStyleInfo (Table Style)

This element describes which style is used to display this table, and specifies which portions of the table have the style applied.

Styles define a set of formatting properties that can be easily referenced by cells or other objects in the spreadsheet application. A style can be applied to a table, but tables can define specific parts of the table that should not have the style applied independently of other table parts. For instance a table can not apply the row striping of the style, and can not show the style's formatting of the last column, but will apply the column striping and the formatting to the first column.

Attributes	Description
name (Style Name)	<p>A string representing the name of the table style to use with this table.</p> <p>If the style name does not correspond to the name of a table style then the spreadsheet</p>

Attributes	Description
	<p>application should use default style.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
showColumnStripes (Show Column Stripes)	<p>A Boolean indicating whether column stripe formatting is applied. True when style column stripe formatting is applied, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showFirstColumn (Show First Column)	<p>A Boolean indicating whether the first column in the table should have the style applied. True if the first column has the style applied, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showLastColumn (Show Last Column)	<p>A Boolean indicating whether the last column in the table should have the style applied. True if the last column has the style applied, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showRowStripes (Show Row Stripes)	<p>A Boolean indicating whether row stripe formatting is applied. True when style row stripe formatting is applied, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyleInfo](#)) is located in §A.2.
end note]

18.5.1.6 totalsRowFormula (Totals Row Formula)

This element contains a custom formula for aggregating values from the column.

Each tableColumn has a totalsRowFunction that can be used for simple aggregations such as average, standard deviation, min, max, count, and others. If a more custom calculation is desired, then this element should be used, and the totalsRowFunction shall be set to "custom".

Attributes	Description
array (Array)	<p>A Boolean value that indicates whether this formula is an array style formula.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableFormula](#)) is located in §A.2.
end note]

18.5.1.7 `xmlColumnPr` (XML Column Properties)

An element defining the XML column properties for a column. This is only used for tables created from XML mappings.

[*Example:* Here is a simple example showing a table column that has an `xmlColumnPr`.

```
<tableColumn id="1" uniqueName="SomeElement" name="SomeElement">
  <xmlColumnPr mapId="1" xpath="/xml/foo/element" xmlDataType="string"/>
</tableColumn>
```

end example]

Attributes	Description								
denormalized (Denormalized)	<p>A Boolean that indicates whether the contents of the column have been filled down due to flattening. True if it has been filled down (denormalized), false otherwise.</p> <p>This should be used when an XML mapping parent value has many children, and both the parent and child fields are mapped to their own column in the table.</p> <p>[<i>Example:</i></p> <pre><Order ID="3"> <Item>Milk</Item> <Item>Bread</Item> <Item>Cheese</Item> </Order></pre> <p>The resulting table in the spreadsheet application would have two columns, the first with the item ID, filled down for each item in the table as follows:</p> <table> <tr> <td>Item ID</td><td>Item</td></tr> <tr> <td>3</td><td>Milk</td></tr> <tr> <td>3</td><td>Bread</td></tr> <tr> <td>3</td><td>Cheese</td></tr> </table> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>	Item ID	Item	3	Milk	3	Bread	3	Cheese
Item ID	Item								
3	Milk								
3	Bread								
3	Cheese								
mapId (XML Map Id)	<p>An integer representing the ID of the XML map this table field is associated with.</p> <p>The XML map is defined in the xml maps part, and the Map element should have the corresponding id.</p>								

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
xmlDataType (XML Data Type)	<p>An enumeration indicating which XML data type is used by this column.</p> <p>The possible values for this attribute are defined by the ST_XmlDataType simple type (§18.18.93).</p>
xpath (XPath)	<p>A string representing the XML path to the element this column is associated with.</p> <p>The spreadsheet application should support XPath limited to the following</p> <ul style="list-style-type: none"> • The XPath is an absolute path to a simple-content element or attribute • <p>[Example: "/ns1:root/ns1:row/ns1:column1" is supported if 'column1' is a child-most node, but not "/ns1:root/ns1:row" for the same document since 'row' is not a child. end example]</p> <ul style="list-style-type: none"> • The XPath does not express axes, but uses the default child axes • <p>[Example: "/ns1:root/ns1:row" is supported but not "/ns1:root/child::ns1:row" end example]</p> <ul style="list-style-type: none"> • An optional filter can be expressed at the end of the xpath • <p>[Example: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported but not "/ns1:root/ns1:row[@foo='abc']/ns1:column1" end example]</p> <ul style="list-style-type: none"> • The filter can only contain a single expression comparing a named attribute to a specific value • • Filters are only supported on XPaths that resolve to a simple-content element (not attributes) • • The named attribute shall be defined as an attribute of the simple-content element • • The attribute name shall be preceded by the short-hand (@) symbol representing the axes 'attribute' • <p>[Example: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported not "/ns1:root/ns1:row/ns1:column1[attribute::foo='abc']" end example]</p>

Attributes	Description
	<ul style="list-style-type: none"> An arbitrary amount of white-space can be embedded between filter tokens <p>[Example: "/ns1:root/ns1:row/ns1:column1[@ foo='abc']" is permitted<i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_XmlColumnPr](#)) is located in §A.2.
end note]

18.5.2 Single Cell Tables

A single cell table is generated from an XML mapping. These really just look like regular cells to the spreadsheet user, but shall be implemented as Tables "under the covers."

These tables don't have the full set of properties that multi cell tables do. They only have the various XML properties, and core table properties (such as `id` and `name`) that are needed to create a table and XML mapping. For instance the formatting properties, totals row, and headers row don't exist for the single cell XML tables. The formatting for these cells is maintained in the style sheet.

18.5.2.1 singleXmlCell (Table Properties)

This element represents the table properties for a single cell XML table.

Attributes	Description
connectionId (Connection ID)	<p>An integer representing an ID to indicate which connection from the connections collection is used by this table.</p> <p>This is only used for tables that are based off of xml maps</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
id (Table Id)	<p>An integer representing the unique identifier of the table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
r (Reference)	<p>An A1 cell style reference to the cell that the single cell xml table occupies.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SingleXmlCell](#)) is located in §A.2. *end note*]

18.5.2.2 [singleXmlCells \(Single Cells\)](#)

This element is a container for a collection of singleXmlCell tables.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SingleXmlCells](#)) is located in §A.2. *end note*]

18.5.2.3 [xmlCellPr \(Cell Properties\)](#)

This element stores the XML properties for the cell of a single cell xml table.

Attributes	Description
id (Table Field Id)	<p>The unique identifier of the XML properties for the cell.</p> <p>This should always be set to the value of 1 since this id is always meant to be for a single cell xml table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
uniqueName (Unique Table Name)	<p>An optional string representing the unique name of the table column. By default this is the same as the name of the column.</p> <p>This should hold the name of the element or attribute that this cell is referring to in the XML.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_XmlCellPr](#)) is located in §A.2. *end note*]

18.5.2.4 [xmlPr \(Column XML Properties\)](#)

This element represents the column properties for single cell XML tables.

Attributes	Description
mapId (XML Map Id)	<p>An integer representing the ID of the XML map this table field is associated with.</p> <p>The XML map is defined in the xml maps part, and the Map element should have the corresponding id.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

Attributes	Description
xmlDataType (XML Data Type)	<p>An enumeration indicating which XML data type is used by this column.</p> <p>The possible values for this attribute are defined by the ST_XmlDataType simple type (§18.18.93).</p>
xpath (XPath)	<p>A string representing the XML path to the element this column is associated with.</p> <p>The spreadsheet application should support XPath limited to the following:</p> <ul style="list-style-type: none"> The XPath is an absolute path to a simple-content element or attribute <p>[Example: "/ns1:root/ns1:row/ns1:column1" is supported if 'column1' is a child-most node, but not "/ns1:root/ns1:row" for the same document since 'row' is not a child. end example]</p> <ul style="list-style-type: none"> The XPath does not express axes, but uses the default child axes <p>[Example: "/ns1:root/ns1:row" is supported but not "/ns1:root/child::ns1:row" end example]</p> <ul style="list-style-type: none"> An optional filter can be expressed at the end of the xpath <p>[Example: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported but not "/ns1:root/ns1:row[@foo='abc']/ns1:column1" end example]</p> <ul style="list-style-type: none"> The filter can only contain a single expression comparing a named attribute to a specific value Filters are only supported on XPaths that resolve to a simple-content element (not attributes) The named attribute shall be defined as an attribute of the simple-content element The attribute name shall be preceded by the short-hand (@) symbol representing the axes 'attribute' <p>[Example: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported not "/ns1:root/ns1:row/ns1:column1[attribute::foo='abc']" end example]</p> <ul style="list-style-type: none"> An arbitrary amount of white-space can be embedded between filter tokens <p>[Example:</p>

Attributes	Description
	<p>"/ns1:root/ns1:row/ns1:column1[@ foo='abc']" is permitted <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_XmlPr](#)) is located in §A.2. *end note*]

18.6 Calculation Chain

The cells in a workbook can be calculated in different orders depending on various optimizations and dependencies. The calculation chain specifies the order in which the cells in a workbook were last calculated.

The calculation chain only deals with cells that require calculation - i.e., it only deals with cells that contain formulas. It does not track or express dependencies amongst the formulas, but rather only records the order in which the cells were last calculated.

The calculation chain order can change over time. One obvious way this can happen is that new formulas can be added, formulas can be removed or updated. The spreadsheet application can also optionally implement partial calculation as an optimization. Partial calculation is when the spreadsheet only recalculates cells that have had their dependencies or values changed. This way, when a number in a cell is changed, requiring an update to a dependent formula, only the cells that are affected by the update is recalculated, as opposed to recalculating the entire workbook.

The calculation chain described in this section is not required by the spreadsheet application, but can be used if the spreadsheet application finds it useful. It can be loaded by a spreadsheet application, or the application can optionally construct it at run time in memory based on formula dependencies. Since the xml data described in this section is not strictly required, the spreadsheet application is free to ignore the order in which the calculation chain specifies calculations - i.e., even if the calculation chain is loaded, the spreadsheet application is free to perform calculations in a different order at run time.

[Example:

Consider the following workbook (the formulas shown instead of cell values):

	A	B	C	D	E
1	1	=A1	=B1+A1	=C1+B1+A1	=D1+C1+B1+A1
2					
3					
4					
5	1	=A5	=B5+A5	=C5+B5+A5	=D5+C5+B5+A5
6					
7					

There is a constant entered in A1 and A5, and next to each of those cells are a series of cells which contain formulas that depend on those cells.

After entering the cells on the first row, and then the cells on the 5th row, the calc chain xml looks like this:

```
<calcChain xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main">
  <c r="E5" i="1"/>
  <c r="D5"/>
  <c r="C5"/>
  <c r="B5"/>
  <c r="E1"/>
  <c r="D1"/>
  <c r="C1"/>
  <c r="B1"/>
</calcChain>
```

It is in this order because B1 was calced first (it was the first formula entered in the workbook), followed by C1, D1, and so on. Then B5 was entered in the 5th row, followed by the other cells in the 5th row, ending with E5.

But, after a full recalculation, the spreadsheet application has realized that cells B5:E5 are on the same child chain, and cells B1:E1 are likewise on their own child chain. The xml now looks like this:

```
<calcChain xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main">
  <c r="B1" i="1"/>
  <c r="C1" s="1"/>
  <c r="D1" s="1"/>
  <c r="E1" s="1"/>
  <c r="B5"/>
  <c r="C5" s="1"/>
  <c r="D5" s="1"/>
  <c r="E5" s="1"/>
</calcChain>
```

end example]

18.6.1 c (Cell)

This element represents a single cell, which shall contain a formula, in the calc chain. Cells are calculated in the same order as the c elements appear in the Calculation Chain part.

Attributes	Description
a (Array)	<p>A Boolean flag indicating whether the cell's formula is an array formula. True if this cell's formula is an array formula, false otherwise. If there is a conflict between this attribute and the t attribute of the f element (§18.3.1.40), the t attribute takes precedence.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
i (Sheet Id)	<p>A sheet Id of a sheet the cell belongs to. If this is omitted, it is assumed to be the same as the i value of the previous cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
l (New Dependency Level)	<p>A Boolean flag indicating that the cell's formula starts a new dependency level. True if the formula starts a new dependency level, false otherwise.</p> <p>Starting a new dependency level means that all concurrent calculations, and child calculations, shall be completed - and the cells have new values - before the calc chain can continue. In other words, this dependency level might depend on levels that came before it, and any later dependency levels might depend on this level; but not later dependency levels can have any calculations started until this dependency level completes.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
r (Cell Reference)	<p>An A-1 style reference to a cell.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
s (Child Chain)	<p>A Boolean flag indicating whether the cell's formula is on a child chain. True if this cell is part of a child chain, false otherwise. If this is omitted, it is assumed to be the same as the s value of the previous cell .</p> <p>A child chain is a list of calculations that occur which depend on the parent to the chain. There shall not be cross dependencies between child chains. Child chains are not the same as dependency levels - a child chain and its parent are all on the same dependency level. Child chains are series of calculations that can be independently farmed out to other threads or processors.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
t (New Thread)	<p>A Boolean flag indicating whether the cell's formula starts a new thread. True if the cell's formula starts a new thread, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_CalcCell) is located in §A.2. *end note*]

18.6.2 calcChain (Calculation Chain Info)

This element represents the root of the calculation chain.

[Note: The W3C XML Schema definition of this element's content model ([CT_CalcChain](#)) is located in §A.2. *end note*]

18.7 Comments

A comment is a rich text note that is attached to and associated with a cell, separate from other cell content. Comment content is stored separate from the cell, and is displayed in a drawing object (like a text box) that is separate from, but associated with, a cell. Comments are used as reminders, such as noting how a complex formula works, or to provide feedback to other users. Comments can also be used to explain assumptions made in a formula or to call out something special about the cell.

[Example:

```
<comments>
  <authors>
    <author>Bob</author>
    <author>CBR</author>
  </authors>
  <commentList>
    <comment ref="D4" authorId="0">
      <text>
        <r>
          <rPr>
            <b/>
            <sz val="8"/>
            <color indexed="81"/>
            <rFont val="Calibri"/>
            <charset val="1"/>
            <scheme val="minor"/>
          </rPr>
          <t>Bob:</t>
        </r>
        <r>
          <rPr>
            <sz val="8"/>
            <color indexed="81"/>
            <rFont val="Calibri"/>
            <charset val="1"/>
            <scheme val="minor"/>
          </rPr>
```

```

        <t xml:space="preserve">Why such high expense?</t>
      </r>
    </text>
  </comment>
</commentList>
</comments>

```

end example]

This xml sample displays a comment by "Bob" (bolded) that says, "Why such high expense?" (non bolded).

18.7.1 author (Author)

This element holds a string representing the name of a single author of comments. Every comment shall have an author. The maximum length of the author string is an implementation detail, but a good guideline is 255 chars.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
xml:space (Content Contains Significant Whitespace) Namespace: http://www.w3.org/XML/1998/namespace	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. The possible values for this attribute are defined by §2.10 of the XML 1.0 specification.

[Note: The W3C XML Schema definition of this element’s content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.7.2 authors (Authors)

This element is a container that holds a list of comment author names. There can be many comment authors per sheet, but each author name shall be unique per sheet. The information for each author is stored only once for that sheet, and comments refer to the author by zero based index.

Note that there can be multiple lists of authors per workbook since each sheet contains its own comments part, and each comments part defines a list of authors for comments on that sheet.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Authors](#)) is located in §A.2. *end note*]

18.7.3 comment (Comment)

This element represents a single user entered comment. Each comment shall have an author and can optionally contain richly formatted text.

Attributes	Description
authorId (Author Id)	<p>Required. An unsigned integer which is used as the zero based index into the list of authors for this set of comments.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
guid (Unique Identifier for Comment)	<p>Unique identifier for this comment. The attribute is required and shall be unique across all comments in shared workbooks.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
ref (Cell Reference)	<p>Required. A string that serves as the A1 style reference to the cell that the comment is associated with. Shall only reference a single cell, not a range of cells, since comments are on a per cell basis.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).</p>
shapeId (Shape ID)	<p>Specifies the ID of the DrawingML shape that provides the visual representation of the comment.</p> <p>[Example:</p> <pre><comment shapeId="10 " ... ></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Comment](#)) is located in §A.2. end note]

18.7.4 commentList (List of Comments)

This element is a container that holds a list of comments for the sheet.

[Note: The W3C XML Schema definition of this element's content model ([CT_CommentList](#)) is located in §A.2. end note]

18.7.5 commentPr (Comment Properties)

This element specifies the visual and positional properties of a comment.

[Example: In the following example, the comment's visual representation resizes with the

```
<comment ... >
  <text> ... </text>
  <commentPr autoFill="false">
    <anchor moveWithCells="true" sizeWithCells="true">
      <from> ... </from>
      <to> ... </to>
    </anchor>
  </commentPr>
</comment>
```

end example]

Attributes	Description
altText (Alternative Text)	<p>Specifies alternative text for the object, for use by assistive technologies or applications.</p> <p>[Example:</p> <pre><commentPr altText="Alternate text" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
autoFill (Automatic Fill Flag)	<p>Specifies whether the object's fill formatting is provided automatically by the application.</p> <p>[Example:</p> <pre><commentPr autoFill="false" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoLine (Automatic Line Flag)	<p>Specifies whether the object's line formatting is provided automatically by the application.</p> <p>[Example:</p> <pre><commentPr autoLine="false" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
autoScale (Automatic Text Scaling Flag)	<p>Specifies whether the object's font is automatically scaled by the application when the object is resized.</p> <p>[Example:</p> <pre><commentPr autoScale="true" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
colHidden (Hidden Column Flag)	<p>Specifies that the column of the cell to which this comment points is hidden.</p> <p>[Example:</p> <pre><commentPr colHidden="true" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
defaultSize (Default Size Flag)	<p>Specifies whether the object is at its default size.</p> <p>[Example:</p> <pre><commentPr defaultSize="false" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
disabled (Disabled Flag)	<p>Specifies whether the object is allowed to run an attached macro.</p> <p>[Example:</p> <pre><commentPr disabled="true" ... /></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
justLastX (Far East Alignment Flag)	<p>Specifies that Far East alignment is set for the last line in the comment's text. Typically, justified text in Far East environments leaves the last line unjustified. Specifying this element also justifies the last line.</p>

Attributes	Description
	<p>[Example:</p> <pre><commentPr justLastX="true" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
locked (Locked Flag)	<p>Specifies that the object is locked when the sheet is protected.</p> <p>[Example:</p> <pre><commentPr locked="false" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
lockText (Text Lock Flag)	<p>Specifies that the object's text is locked.</p> <p>[Example:</p> <pre><commentPr lockText="true" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
print (Print Flag)	<p>Specifies whether the object is printed when the document is printed.</p> <p>[Example:</p> <pre><commentPr print="false" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rowHidden (Hidden Row Flag)	<p>Specifies that the row of the cell to which this comment points is hidden.</p> <p>[Example:</p> <pre><commentPr rowHidden="true" ... /></pre> <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>textHAlign (Text Horizontal Alignment)</p>	<p>Specifies the horizontal alignment of the comment's text field.</p> <p>[Example:</p> <pre data-bbox="451 512 1016 541"><commentPr textHAlign="center" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TextHAlign simple type (§18.18.80).</p>
<p>textVAlign (ext Vertical Alignment)</p>	<p>Specifies the vertical alignment of the comment's text field.</p> <p>[Example:</p> <pre data-bbox="451 879 1016 909"><commentPr textVAlign="center" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TextVAlign simple type (§18.18.81).</p>
<p>uiObject (UI Object Flag)</p>	<p>Specifies whether the object is a UI Object.</p> <p>[Example:</p> <pre data-bbox="451 1247 951 1276"><commentPr uiObject="true" ... /></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_CommentPr](#)) is located in §A.2. end note]

18.7.6 comments (Comments)

This element is the root container of a set of comments and comment authors for a particular sheet. Each set of comments for a sheet is stored in a separate xml part. The relationship part for a sheet defines a link to the correct comment part for that sheet.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Comments](#)) is located in §A.2. *end note*]

18.7.7 text (Comment Text)

This element contains rich text which represents the text of a comment. The maximum length for this text is a spreadsheet application implementation detail. A recommended guideline is 32767 chars.

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Rst](#)) is located in §A.2. *end note*]

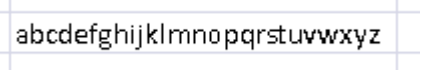

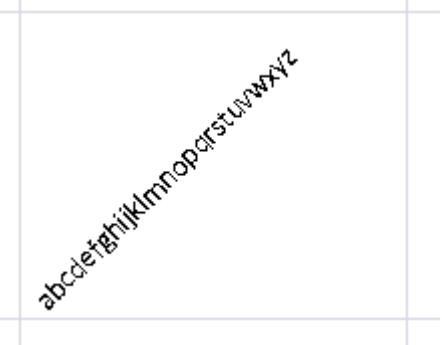

18.8 Styles

This subclause specifies the possible formatting information for the contents of the cells on a sheet in a SpreadsheetML document.

18.8.1 alignment (Alignment)

Formatting information pertaining to text alignment in cells. There are a variety of choices for how text is aligned both horizontally and vertically, as well as indentation settings, and so on.

Attributes	Description
horizontal (Horizontal Alignment)	<p>Specifies the type of horizontal alignment in cells.</p> <p>The possible values for this attribute are defined by the ST_HorizontalAlignment simple type (§18.18.40).</p>
indent (Indent)	<p>An integer value, where an increment of 1 represents 3 spaces. Indicates the number of spaces (of the normal style font) of indentation for text in a cell. The number of spaces to indent is calculated as following:</p> <p>Number of spaces to indent = indent value * 3</p> <p>[<i>Example</i>:For example, an indent value of 1 means that the text begins 3 space widths (of the normal style font) from the edge of the cell. <i>end example</i>]</p> <p>[<i>Note</i>: The width of one space character is defined by the font. <i>end note</i>]</p> <p>Only left, right, and distributed horizontal alignments are supported.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
justifyLastLine (Justify Last Line)	<p>A boolean value indicating if the cells justified or distributed alignment should be used on the last line of text. (This is typical for East Asian alignments but not typical in other contexts.)</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
readingOrder (Reading Order)	<p>An integer value indicating whether the reading order (bidirectionality) of the cell is left-to-right, right-to-left, or context dependent.</p> <p>0 - Context Dependent - reading order is determined by scanning the text for the first non-whitespace character: if it is a strong right-to-left character, the reading order is right-to-left; otherwise, the reading order left-to-right.</p> <p>1 - Left-to-Right- reading order is left-to-right in the cell, as in English.</p> <p>2 - Right-to-Left - reading order is right-to-left in the cell, as in Hebrew.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
relativeIndent (Relative Indent)	<p>An integer value (used only in a dxf element) to indicate the additional number of spaces of indentation to adjust for text in a cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
shrinkToFit (Shrink To Fit)	<p>A boolean value indicating if the displayed text in the cell should be shrunk to fit the cell width. Not applicable when a cell contains multiple lines of text.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
textRotation (Text Rotation)	<p>Text rotation in cells. Expressed in degrees. Values are in the range 0 to 180. The first letter of the text is considered the center-point of the arc.</p> <p>For 0 - 90, the value represents degrees above horizon. For 91-180 the degrees below the horizon is calculated as:</p> <p>[degrees below horizon] = 90 - textRotation.</p> <p>0</p>  <p>45</p> 

Attributes	Description
	<div><div>90</div><div><div></div><div>abcdefghijklmnopqrstuvwxyz</div></div></div> <div><div>135</div><div><div></div><div>abcdefghijklmnopqrstuvwxyz</div></div></div> <div><div>180</div><div><div></div><div>abcdefghijklmnopqrstuvwxyz</div></div></div> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
vertical (Vertical Alignment)	Vertical alignment in cells.

Attributes	Description
	The possible values for this attribute are defined by the ST_VerticalAlignment simple type (§18.18.88).
wrapText (Wrap Text)	A boolean value indicating if the text in a cell should be line-wrapped within the cell. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CellAlignment](#)) is located in §A.2. end note]

18.8.2 **b (Bold)**

Displays characters in bold face font style.

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is true. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. end note]

18.8.3 **bgColor (Background Color)**

Background color of the cell fill pattern. Cell fill patterns operate with two colors: a background color and a foreground color. These combine together to make a patterned cell fill.

Attributes	Description
auto (Automatic)	A boolean value indicating the color is automatic and system color dependent. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
indexed (Index)	Indexed color value. Only used for backwards compatibility. References a color in indexedColors. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
rgb (Alpha Red Green Blue Color)	Standard Alpha Red Green Blue color value (ARGB).

Attributes	Description
Value)	The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).
theme (Theme Color)	<p>A zero-based index into the <clrScheme> collection (§20.1.6.2), referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p>[Example:</p> <p>Here are some examples of how to apply tint to color:</p> <p>If (tint < 0) $\text{Lum}' = \text{Lum} * (1.0 + \text{tint})$ <p>For example: Lum = 200; tint = -0.5; Darken 50% $\text{Lum}' = 200 * (0.5) \Rightarrow 100$ <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black) $\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0$ <p>If (tint > 0) $\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))$ <p>For example: Lum = 100; tint = 0.75; Lighten 75% $\begin{aligned} \text{Lum}' &= 100 * (1 - .75) + (\text{HLSMAX} - \text{HLSMAX} * (1 - .75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white) $\begin{aligned} \text{Lum}' &= 100 * (1 - 1) + (\text{HLSMAX} - \text{HLSMAX} * (1 - 1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> </p></p></p></p></p></p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.2. *end note*]

18.8.4 border (Border)

Expresses a single set of cell border formats (left, right, top, bottom, diagonal). Color is optional. When missing, 'automatic' is implied.

Attributes	Description
diagonalDown (Diagonal Down)	<p>A boolean value indicating if the cell's diagonal border includes a diagonal line, starting at the top left corner of the cell and moving down to the bottom right corner of the cell.</p> <p>[Example:</p> <p>This example shows a thin diagonal down line:</p>  <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
diagonalUp (Diagonal Up)	<p>A boolean value indicating if the cell's diagonal border includes a diagonal line, starting at the bottom left corner of the cell and moving up to the top right corner of the cell.</p> <p>[Example:</p> <p>This example shows a thin diagonal up line:</p>  <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
outline (Outline)	<p>A boolean value indicating if left, right, top, and bottom borders should be applied only to outside borders of a cell range.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Border](#)) is located in §A.2. *end note*]

18.8.5 borders (Borders)

This element contains borders formatting information, specifying all border definitions for all cells in the workbook.

[*Example:* In this example the first border definition specifies that there are no borders, the second definition specifies that there is a thin bottom border and medium right border, and the third definition specifies that there is a double top border.

```
<borders count="3">
  <border>
    <begin/>
    <end/>
    <top/>
    <bottom/>
    <diagonal/>
  </border>
  <border>
    <begin/>
    <end style="medium">
      <color indexed="64"/>
    </end>
    <top/>
    <bottom style="thin">
      <color indexed="64"/>
    </bottom>
    <diagonal/>
  </border>
  <border>
    <begin/>
    <end/>
    <top style="double">
      <color auto="1"/>
    </top>
    <bottom/>
    <diagonal/>
  </border>
</borders>
```

end example]

Attributes	Description
count (Border Count)	Count of border elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Borders](#)) is located in §A.2. *end note*]

18.8.6 bottom (Bottom Border)

This element specifies the color and line style for the bottom border of a cell.

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).

[Note: The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.7 cellStyle (Cell Style)

This element represents the name and related formatting records for a named cell style in this workbook.

Annex G contains a listing of cellStyles whose corresponding formatting records are implied rather than explicitly saved in the file. In this case, a builtinId attribute is written on the cellStyle record, but no corresponding formatting records are written.

For all built-in cell styles, the builtinId determines the style, not the name. For all cell styles, Normal is applied by default.

Attributes	Description
builtinId (Built-In Style Id)	The index of a built-in cell style: The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
customBuiltin (Custom Built In)	True indicates that this built-in cell style has been customized. By default built-in styles are not persisted when not in use. This flag indicates that a built-in style has been modified, and therefore should be saved with the workbook, even if not currently in use.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
hidden (Hidden Style)	If 'true' do not show this style in the application UI. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
iLevel (Outline Style)	Indicates that this formatting is for an outline style . When styles are applied to outline levels (using the outline feature), this value is set and the formatting specified on this cell style is applied to the corresponding level of the outline. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (User Defined Cell Style)	The name of the cell style. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
xfId (Format Id)	Zero-based index referencing an xf record in the cellStyleXfs collection. This is used to determine the formatting defined for this named cell style. The possible values for this attribute are defined by the ST_CellStyleXfId simple type (§18.18.10).

[Note: The W3C XML Schema definition of this element's content model ([CT_CellStyle](#)) is located in §A.2. *end note*]

18.8.8 cellStyles (Cell Styles)

This element contains the named cell styles, consisting of a sequence of named style records. A named cell style is a collection of direct or themed formatting (e.g., cell border, cell fill, and font type/size/style) grouped together into a single named style, and can be applied to a cell.

[Example: For example, "Normal", "Heading 1", "Title", and "20% Accent1" are named cell styles expressed below. They have builtInId's associated with them, and use xfId to reference the specific formatting elements pertaining to the particular style. The xfId is a zero-based index, referencing an xf record in the cellStyleXfs collection.

```
<cellStyles count="4">
  <cellStyle name="20% - Accent1" xfId="3" builtinId="30"/>
  <cellStyle name="Heading 1" xfId="2" builtinId="16"/>
  <cellStyle name="Normal" xfId="0" builtinId="0"/>
  <cellStyle name="Title" xfId="1" builtinId="15"/>
</cellStyles>
```

end example]

Attributes	Description
count (Style Count)	Count of style elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CellStyles](#)) is located in §A.2. *end note*]

18.8.9 cellStyleXfs (Formatting Records)

This element contains the master formatting records (xf's) which define the formatting for all named cell styles in this workbook. Master formatting records reference individual elements of formatting (e.g., number format, font definitions, cell fills, etc) by specifying a zero-based index into those collections. Master formatting records also specify whether to apply or ignore particular aspects of formatting. [*Example: Whether to apply a border or not. end example*]

A cell can have both direct formatting (e.g., bold) and a cell style (e.g., Explanatory) applied to it. Therefore, both the cell style xf records and cell xf records shall be read to understand the full set of formatting applied to a cell.

[*Example: This example shows 4 master formatting records, each defining formatting for a named cell style (expressed in the cellStyles collection). Note that 0th record does not express any "apply" attributes, while the other records do express "apply" attribute values. For example, the last record specifies that number format, alignment, and protection formatting will not be applied to the cell, even when that information is specified in related formatting records.*

```
<cellStyleXfs count="4">
  <xf numFmtId="0" fontId="0" fillId="0" borderId="0"/>
  <xf numFmtId="0" fontId="2" fillId="0" borderId="0" applyNumberFormat="0"
    applyFill="0" applyBorder="0" applyAlignment="0" applyProtection="0"/>
  <xf numFmtId="0" fontId="3" fillId="0" borderId="1" applyNumberFormat="0"
    applyFill="0" applyAlignment="0" applyProtection="0"/>
  <xf numFmtId="0" fontId="4" fillId="2" borderId="2" applyNumberFormat="0"
    applyAlignment="0" applyProtection="0"/>
</cellStyleXfs>
```

end example]

Attributes	Description
count (Style Count)	Count of cell style (xf) elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt

Attributes	Description
	datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CellStyleXfs](#)) is located in §A.2. *end note*]

18.8.10 cellXfs (Cell Formats)

This element contains the master formatting records (xf) which define the formatting applied to cells in this workbook. These records are the starting point for determining the formatting for a cell. Cells in the Sheet Part reference the xf records by zero-based index.

A cell can have both direct formatting (e.g., bold) and a cell style (e.g., Explanatory) applied to it. Therefore, both the cell style xf records and cell xf records shall be read to understand the full set of formatting applied to a cell.

Attributes	Description
count (Format Count)	Count of xf elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CellXfs](#)) is located in §A.2. *end note*]

18.8.11 colors (Colors)

Color information associated with this stylesheet. This collection is written whenever the legacy color palette has been modified (backwards compatibility settings) or a custom color has been selected while using this workbook.

When the color palette is modified, the indexedColors collection is written. When a custom color has been selected, the mruColors collection is written.

[Note: The W3C XML Schema definition of this element's content model ([CT_Colors](#)) is located in §A.2. *end note*]

18.8.12 condense (Condense)

Macintosh compatibility setting. Represents special word/character rendering on Macintosh, when this flag is set. The effect is to condense the text (squeeze it together). SpreadsheetML applications are not required to render according to this flag.

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is true.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. *end note*]

18.8.13 diagonal (Diagonal)

This element specifies the color and line style for the diagonal border(s) of a cell, possibly including diagonally up and diagonally down. The line style for diagonal up and diagonal down lines shall be the same.

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).

[Note: The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.14 dxf (Formatting)

A single dxf record, expressing incremental formatting to be applied.

[Note: The W3C XML Schema definition of this element's content model ([CT_Dxf](#)) is located in §A.2. *end note*]

18.8.15 dxfs (Formats)

This element contains the master differential formatting records (dxf's) which define formatting for all non-cell formatting in this workbook. Whereas xf records fully specify a particular aspect of formatting (e.g., cell borders) by referencing those formatting definitions elsewhere in the Styles part, dxf records specify incremental (or differential) aspects of formatting directly inline within the dxf element. The dxf formatting is to be applied on top of or in addition to any formatting already present on the object using the dxf record.

Attributes	Description
count (Format Count)	Count of dxf elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Dxfs](#)) is located in §A.2. *end note*]

18.8.16 **end (Trailing Edge Border)**

This element specifies the color and line style for the trailing edge border of a cell (i.e., the right border for left-to-right cells and the left border for right-to-left cells)..

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.17 **extend (Extend)**

This element specifies a compatibility setting used for previous spreadsheet applications, resulting in special word/character rendering on those legacy applications, when this flag is set. The effect extends or stretches out the text. SpreadsheetML applications are not required to render according to this flag.

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. *end note*]

18.8.18 **family (Font Family)**

The font family this font belongs to. The font name overrides when there are conflicting values.

Attributes	Description
val (Value)	<p>The font family this font belongs to.</p> <p>The possible values for this attribute are defined by the ST_FontFamily simple type (§18.18.94).</p>

[*Note*: The W3C XML Schema definition of this element's content model (ST_FontFamily) is located in §A.2. *end note*]

18.8.19 fgColor (Foreground Color)

Foreground color of the cell fill pattern. Cell fill patterns operate with two colors: a background color and a foreground color. These combine together to make a patterned cell fill.

Attributes	Description
auto (Automatic)	<p>A boolean value indicating the color is automatic and system color dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indexed (Index)	<p>Indexed color value. Only used for backwards compatibility. References a color in indexedColors.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rgb (Alpha Red Green Blue Color Value)	<p>Standard Alpha Red Green Blue color value (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
theme (Theme Color)	<p>A zero-based index into the <clrScheme> collection (§20.1.6.2), referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p>[Example:</p> <p>Here are some examples of how to apply tint to color:</p> <p>If (tint < 0) $\text{Lum}' = \text{Lum} * (1.0 + \text{tint})$ <p>For example: Lum = 200; tint = -0.5; Darken 50% $\text{Lum}' = 200 * (0.5) \Rightarrow 100$ <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black)</p> </p></p>

Attributes	Description
	$\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0$ <p>If (tint > 0)</p> $\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))$ <p>For example: Lum = 100; tint = 0.75; Lighten 75%</p> $\begin{aligned} \text{Lum}' &= 100 * (1 - .75) + (\text{HLSMAX} - \text{HLSMAX} * (1 - .75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white)</p> $\begin{aligned} \text{Lum}' &= 100 * (1 - 1) + (\text{HLSMAX} - \text{HLSMAX} * (1 - 1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.2. *end note*]

18.8.20 fill (Fill)

This element specifies fill formatting.

[Note: The W3C XML Schema definition of this element's content model ([CT_Fill](#)) is located in §A.2. *end note*]

18.8.21 fills (Fills)

This element defines the cell fills portion of the Styles part, consisting of a sequence of fill records. A cell fill consists of a background color, foreground color, and pattern to be applied across the cell.

[Example: This cell has a yellow fill:

This is the corresponding XML:

```
<fill>
  <patternFill patternType="solid">
    <fgColor rgb="FFFFFF00"/>
    <bgColor indexed="64"/>
  </patternFill>
</fill>
```

This cell has a yellow fill with a thin horizontal crosshatch pattern applied (patternType = lightGrid):

This is the corresponding XML:

```
<fill>
  <patternFill patternType="lightGrid">
    <bgColor rgb="FFFFFF00"/>
  </patternFill>
</fill>
```

end example]

Attributes	Description
count (Fill Count)	Count of fill elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Fills](#)) is located in §A.2. *end note*]

18.8.22 font (Font)

This element defines the properties for one of the fonts used in this workbook.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Font](#)) is located in §A.2. *end note*]

18.8.23 fonts (Fonts)

This element contains all font definitions for this workbook.

[Example: This example expresses two fonts in the workbook. A Calibri family font, with font size of 11, and an Arial family font, with font size 12. The second font has strikethrough applied.

```
<fonts count="2">
  <font>
    <sz val="11"/>
    <color theme="1"/>
    <name val="Calibri"/>
    <family val="2"/>
    <scheme val="minor"/>
  </font>
```

```
<font>
  <strike/>
  <sz val="12"/>
  <color theme="1"/>
  <name val="Arial"/>
  <family val="2"/>
</font>
</fonts>
```

end example]

Attributes	Description
count (Font Count)	Count of font elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Fonts](#)) is located in §A.2. *end note*]

18.8.24 gradientFill (Gradient)

This element defines a gradient-style cell fill. Gradient cell fills can use one or two colors as the end points of color interpolation.

[Example:

This example shows a gradient cell fill, with color green at the top transitioning into blue at the bottom.

This is the XML:

```
<fill>
  <gradientFill degree="90">
    <stop position="0">
      <color rgb="FF92D050"/>
    </stop>
    <stop position="1">
      <color rgb="FF0070C0"/>
    </stop>
  </gradientFill>
</fill>
```

This example shows a gradient cell fill, from the center. Note the left, right, top, and bottom values (and see explanation in the attribute section):

```
<fill>
  <gradientFill type="path" left="0.2" right="0.8" top="0.2" bottom="0.8">
    <stop position="0">
      <color theme="0"/>
    </stop>
    <stop position="1">
      <color theme="4"/>
    </stop>
  </gradientFill>
</fill>
```

end example]

Attributes	Description
bottom (Bottom Convergence)	<p>This attribute is restricted to values ranging from 0 to 1. Specifies in percentage format (from the top to the bottom) the position of the bottom edge of the inner rectangle (color 1). For bottom, 0 means the bottom edge of the inner rectangle is on the top edge of the cell, and 1 means it is on the bottom edge of the cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
degree (Linear Gradient Degree)	<p>Angle of the linear gradient - vertical, horizontal, diagonal.</p> <p>[Example: In these examples, color 1 is white and color 2 is blue.</p> <p>90 = Horizontal & color 1 to color 2</p>  <p>270 = Horizontal & color 1 to color 2</p>  <p>0 = Vertical & color 1 to color 2</p>

Attributes	Description
	 <p>180 = Vertical & color 1 to color 2</p>  <p>45 = Diagonal Up & top to bottom (color 1 to color 2)</p> <p>225 = Diagonal Up & bottom to top (color 1 to color 2)</p> <p>135 = Diagonal Down & top to bottom (color 1 to color 2)</p> <p>315 = Diagonal Down & bottom to top (color 1 to color 2)</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
left (Left Convergence)	<p>This attribute is restricted to values ranging from 0 to 1. Specifies in percentage format (from the left to the right) the position of the left edge of the inner rectangle (color 1). For left, 0 means the left edge of the inner rectangle is on the left edge of the cell, and 1 means it is on the right edge of the cell. (applies to From Corner and From Center gradients).</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
right (Right Convergence)	<p>This attribute is restricted to values ranging from 0 to 1. Specifies in percentage format (from the left to the right) the position of the right edge of the inner rectangle (color 1). For right, 0 means the right edge of the inner rectangle is on the left edge of the cell, and 1 means it is on the right edge of the cell. (applies to From Corner and From Center gradients).</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
top (Top Gradient Convergence)	<p>This attribute is restricted to values ranging from 0 to 1. Specifies in percentage format (from the top to the bottom) the position of the top edge of the inner rectangle (color 1). For top, 0 means the top edge of the inner rectangle is on the top edge of the cell, and 1 means it is on the bottom edge of the cell. (applies to From Corner and From Center gradients).</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
type (Gradient Fill)	Type of this gradient fill.

Attributes	Description
Type)	The possible values for this attribute are defined by the ST_GradientType simple type (§18.18.37).

[Note: The W3C XML Schema definition of this element's content model ([CT_GradientFill](#)) is located in §A.2. *end note*]

18.8.25 horizontal (Horizontal Inner Borders)

This element specifies the color and line style for the horizontal inner border(s) of a range of cells. Used in the context of dxf elements only. [Example: see the borders definitions for **TableStyleMedium28**. *end example*]

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).

[Note: The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.26 i (Italic)

Displays characters in italic font style. The italic style is defined by the font at a system level and is not specified by ECMA-376.

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is true. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. *end note*]

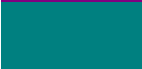

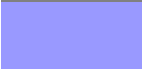

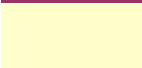

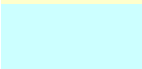

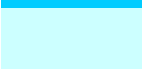

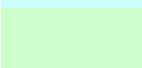

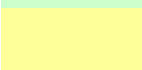

18.8.27 indexedColors (Color Indexes)

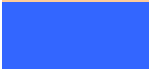

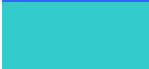

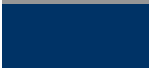

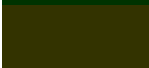

A legacy indexing scheme for colors that is still required for some records, and for backwards compatibility with legacy formats.

This element contains a sequence of RGB color values that correspond to color indexes (zero-based). When using the default indexed color palette, the values are not written out, but instead are implied. When the color palette has been modified from default, then the entire color palette is written out.

Here is the table of default mappings from indexed color value to ARGB value. Note that 0-7 are redundant of 8-15 to preserve backwards compatibility.

Color Index	ARGB Value	[Example:
indexed="0"	00000000	
indexed="1"	00FFFFFF	
indexed="2"	00FF0000	
indexed="3"	0000FF00	
indexed="4"	000000FF	
indexed="5"	00FFFF00	
indexed="6"	00FF00FF	
indexed="7"	0000FFFF	
(none)	(none)	
indexed="8"	00000000	
indexed="9"	00FFFFFF	
indexed="10"	00FF0000	
indexed="11"	0000FF00	
indexed="12"	000000FF	
indexed="13"	00FFFF00	
indexed="14"	00FF00FF	
indexed="15"	0000FFFF	
indexed="16"	00800000	
indexed="17"	00008000	
indexed="18"	00000080	

indexed="19"	00808000

[Note: The W3C XML Schema definition of this element’s content model ([CT_IndexedColors](#)) is located in §A.2.
end note]

18.8.28 mruColors (MRU Colors)

This element contains sequence of RGB values that correspond to custom colors selected by the user for this workbook.

[Note: The W3C XML Schema definition of this element's content model ([CT_MRUColors](#)) is located in §A.2. *end note*]

18.8.29 name (Font Name)

This element specifies the face name of this font.

Attributes	Description
val (String Value)	<p>A string representing the name of the font. If the font doesn't exist (because it isn't installed on the system), or the charset not supported by that font, then another font should be substituted.</p> <p>The string length for this attribute shall be 0 to 31 Unicode scalar values.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_FontName](#)) is located in §A.2. *end note*]

18.8.30 numFmt (Number Format)

This element specifies number format properties which indicate how to format and render the numeric value of a cell.

Following is a listing of number formats whose formatCode value is implied rather than explicitly saved in the file. In this case a numFmtId value is written on the xf record, but no corresponding numFmt element is written. Some of these Ids can be interpreted differently, depending on the UI language of the implementing application.

Ids not specified in the listing, such as 5, 6, 7, and 8, shall follow the number format specified by the formatCode attribute.

All Languages

ID	formatCode
0	General
1	0
2	0.00
3	#,##0

49	@

"General" Format

Some additional comments about the "General" number format are appropriate.

The primary goal when a cell is using "General" formatting is to render the cell content without user-specified guidance to the best ability of the application.

Alignment

(Specified for Left-to-Right mode)

- Strings: left aligned
- Boolean/error values: centered
- Numbers: right aligned
- Dates: do not follow the "General" format, instead automatically convert to date formatting.

Numbers

The application shall attempt to display the full number up to 11 digits (inc. decimal point). If the number is too large, the application shall attempt to show exponential format. If the number has too many significant digits, the display shall be truncated. The optimal method of display is based on the available cell width. If the number cannot be displayed using any of these formats in the available width, the application shall show "#" across the width of the cell.

Conditions for switching to exponential format:

3. The cell value shall have at least five digits for xE-xx
4. If the exponent is bigger than the size allowed, a floating point number cannot fit, so try exponential notation.
5. Similarly, for negative exponents, check if there is space for even one (non-zero) digit in floating point format.
6. Finally, if there isn't room for all of the significant digits in floating point format (for a negative exponent), exponential format shall display more digits if the exponent is less than -3. (The 3 is because E-xx takes 4 characters, and the leading 0 in floating point takes only 1 character. Thus, for an exponent less than -3, there is more than 3 additional leading 0's, more than enough to compensate for the size of the E-xx.)

Floating point rule:

For general formatting in cells, max overall length for cell display is 11, not including negative sign, but includes leading zeros and decimal separator.

Attributes	Description
formatCode (Number Format Code)	The number format code for this number format. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
numFmtId (Number Format Id)	Id used by the master style records (xf's) to reference this number format. The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).

[Note: The W3C XML Schema definition of this element's content model ([CT_NumFmt](#)) is located in §A.2. *end note*]

18.8.31 numFmts (Number Formats)

This element defines the number formats in this workbook, consisting of a sequence of numFmt records, where each numFmt record defines a particular number format, indicating how to format and render the numeric value of a cell.

[Example:

This cell is formatting as US currency:

\$1.23

The XML expressing this format shows that the formatId is "166" and the decoded formatCode is \$#,##0.00

```
<numFmts count="1">
  <numFmt numFmtId="166" formatCode="&quot;$&quot;;#,##0.00"/>
</numFmts>
```

end example]

Number Format Codes

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. To skip a section, the ending semicolon for that section shall be written.

`#,###.00_);[Red](#,###.00);0.00;"sales"@`
 Format for positive numbers Format for zeros
 Format for negative numbers Format for text

The first section, "Format for positive numbers", is the format code that applies to the cell when the cell value contains a positive number.

The second section, "Format for negative numbers", is the format code that applies to the cell when the cell value contains a negative number.

The third section, "Format for zeros", is the format code that applies to the cell when the cell value is zero.

The fourth, and last, section, "Format for text", is the format code that applies to the cell when the cell value is text.

The & (ampersand) text operator is used to join, or concatenate, two values.

The following table describes the different symbols that are available for use in custom number formats.

Format symbol	Description and result
0	Digit placeholder. [Example: If the value 8.9 is to be displayed as 8.90, use the format #.00 end example]
#	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. [Example: If the custom format is #.##, and 8.9 is in the cell, the number 8.9 is displayed. end example]
?	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. [Example: The custom format 0.0? aligns the decimal points for the numbers 8.9 and 88.99 in a column. end example]
. (period)	Decimal point.
%	Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and add the percentage symbol in the cell.
, (comma)	Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (#) or by zeros. A comma that follows a placeholder scales the number by one thousand. [Example: If the format is #.0,, and the cell value is 12,200,000 then the number 12.2 is displayed. end example]

Format symbol	Description and result
E- E+ e- e+	Scientific format. The application shall display a number to the right of the "E" symbol that corresponds to the number of places that the decimal point was moved. [<i>Example</i> : If the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is #0.0E+0, then the number 12.2E+6 is displayed. <i>end example</i>]
\$-+():space	Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (\). Alternatively, enclose the character in quotation marks. [<i>Example</i> : If the number format is (000), and the value 12 is in the cell, the number (012) is displayed. <i>end example</i>]
/	If this symbol is preceded and followed by a number symbol (0, #, and ?), it is interpreted as the fraction format symbol and will display the number in the format of a fraction. Otherwise, it is interpreted as the forward slash character and is displayed as such.
\	Displays the next character in the format. The application shall not display the backslash. [<i>Example</i> : If the number format is 0\!, and the value 3 is in the cell, the value 3! is displayed. <i>end example</i>]
*	Repeats the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. [<i>Example</i> : if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column. <i>end example</i>]
_ (underline)	Skips the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. [<i>Example</i> : The number format _(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses. <i>end example</i>]
"text"	Displays whatever text is inside the quotation marks. [<i>Example</i> : The format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell. <i>end example</i>]
@	Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. [<i>Example</i> : If the number format is "Bob "@ Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed. <i>end example</i>]

Text and spacing

Display both text and numbers

To display both text and numbers in a cell, enclose the text characters in double quotation marks (" ") or precede a single character with a backslash (\). Single quotation marks shall not be used to denote text. Characters inside double quotes, or immediately following backslash shall never be interpreted as part of the format code lexicon; instead they shall always be treated as literal strings. Remember to include the characters

in the appropriate section of the format codes. [Example: Use the format "\$0.00" Surplus";\$-0.00" Shortage" to display a positive amount as "\$125.74 Surplus" and a negative amount as "\$-125.74 Shortage." end example]

The following characters are displayed without the use of quotation marks.

\$	Dollar sign			-	Minus sign
+	Plus sign			/	Slash mark
(Left parenthesis)	Right parenthesis
:	Colon			!	Exclamation point
^	Circumflex accent (caret)			&	Ampersand
'	Apostrophe			~	Tilde
{	Left curly bracket			}	Right curly bracket
<	Less-than sign			>	Greater-than sign
=	Equal sign				Space character

Include a section for text entry

If included, a text section shall be the last section in the number format. Include an "at" sign (@) in the section, precisely where the cell's text value should be displayed. If the @ character is omitted from the text section, text typed in the cell will not be displayed. To always display specific text characters with the typed text, enclose the additional text in double quotation marks (" "). [Example: If "June" is typed into the cell, and the text format is "gross receipts for "@ , then the cell will display "gross receipts for June". end example]

If the format does not include a text section, text entered in a cell is not affected by the format code.

Add spaces

To create a space that is the width of a character in a number format, include an underscore, followed by the character. [Example: When an underscore is followed with a right parenthesis, such as _), positive numbers line up correctly with negative numbers that are enclosed in parentheses because positive numbers are displayed with a blank space after them exactly the width of the right parenthesis character. end example]

Repeat characters

To repeat the next character in the format to fill the column width, include an asterisk (*) in the number format. [Example: Use 0*- to include enough dashes after a number to fill the cell, or use *0 before any format to include leading zeros. end example]

Decimal places, spaces, colors, and conditions

Include decimal places and significant digits

To format fractions or numbers with decimal points, include the following digit placeholders in a section. If a number has more digits to the right of the decimal point than there are placeholders in the format, the number rounds to as many decimal places as there are placeholders. If there are more digits to the left of the decimal

point than there are placeholders, the extra digits are displayed. If the format contains only number signs (#) to the left of the decimal point, numbers less than 1 begin with a decimal point.

(number sign) displays only significant digits and does not display insignificant zeros.

0 (zero) displays insignificant zeros if a number has fewer digits than there are zeros in the format.

? (question mark) adds spaces for insignificant zeros on either side of the decimal point so that decimal points align when they are formatted with a fixed-width font, such as Courier New. ? can also be used for fractions that have varying numbers of digits.

To display	As	Use this code
1234.59	1234.6	####.#
8.9	8.900	#.000
.631	0.6	0.#
12 1234.568	12.0 1234.57	#.0#
44.398 102.65 2.8	44.398 102.65 2.8 (with aligned decimals)	???.???
5.25 5.3	5 1/4 5 3/10 (with aligned fractions)	# ???/???

Display a thousands separator

To display a comma as a thousands separator or to scale a number by a multiple of 1,000, include a comma in the number format.

To display	As	Use this code
12000	12,000	#,###
12000	12	#,
12200000	12.2	0.0,,

Specify colors

To set the text color for a section of the format, use the name of one of the following eight colors in square brackets in the section. The color code shall be the first item in the section.

[Black]			[Blue]			[Cyan]
---------	--	--	--------	--	--	--------

[Green]		[Magenta]		[Red]
[White]		[Yellow]		

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Numeric indexes for color are restricted to the range from 1 to 56, which reference by index to the legacy color palette.

[*Note:* the default legacy color palette values are listed in §18.8.27. In the format codes, [Color1] refers to the color associated with indexed="8", or black (by default), [Color2] refers to the color associated with indexed="9", or white (by default), and so on up to [Color56] referring to the color associated with indexed="63". If the color palette has been customized from default values, then the colors associated with these indexes will reflect those customizations.

Specify conditions

To set number formats that are applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; > Greater than; < Less than; >= Greater than or equal to, <= Less than or equal to, and <> Not equal to. [*Example:* The following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.

[Red][<=100];[Blue][>100]

end example]

If the cell value does not meet any of the criteria, then pound signs ("#") are displayed across the width of the cell.

Currency, percentages, and scientific notation

Include currency symbols

To include currency symbols, place the currency symbol in the location it should when displayed.

Display percentages

To display numbers as a percentage of 100 — [*Example:* To display .08 as 8% or 2.8 as 280% *end example]*— include the percent sign (%) in the number format.

Display scientific notations

To display numbers in scientific format, use exponent codes in a section — [*Example:* E-, E+, e-, or e+. *end example]*

If a format contains a zero (0) or number sign (#) to the right of an exponent code, the application displays the number in scientific format and inserts an "E" or "e". The number of zeros or number signs to the right of a code

determines the number of digits in the exponent. "E-" or "e-" places a minus sign by negative exponents. "E+" or "e+" places a minus sign by negative exponents and a plus sign by positive exponents.

Dates and times

Display days, months, and years

To display	As	Use this code
Months	1–12	m
Months	01–12	mm
Months	Jan–Dec	mmm
Months	January–December	mmmm
Months	J–D	mmmmm
Days	1–31	d
Days	01–31	dd
Days	Sun–Sat	ddd
Days	Sunday–Saturday	dddd
Years	00–99	yy
Years	date-base minimum value –9999	yyyy

See §18.17.4.1 for details on possible date systems.

Month versus minutes

If "m" or "mm" code is used immediately after the "h" or "hh" code (for hours) or immediately before the "ss" code (for seconds), the application shall display minutes instead of the month.

Display hours, minutes, and seconds

To display	As	Use this code
Hours	0–23	h

Hours	00–23	hh
Minutes	0–59	m
Minutes	00–59	mm
Seconds	0–59	s
Seconds	00–59	ss
Time	4 AM	h AM/PM
Time	4:36 PM	h:mm AM/PM
Time	4:36:03 P	h:mm:ss A/P
Time	4:36:03.75	h:mm:ss.00
Elapsed time (hours and minutes)	1:02	[h]:mm
Elapsed time (minutes and seconds)	62:16	[mm]:ss
Elapsed time (seconds and hundredths)	3735.80	[ss].00

Minutes versus month

The "m" or "mm" code shall appear immediately after the "h" or "hh" code or immediately before the "ss" code; otherwise, these will display as the month instead of minutes.

AM and PM

If the format contains AM or PM, the hour is based on the 12-hour clock, where "AM" or "A" indicates times from midnight until noon and "PM" or "P" indicates times from noon until midnight. Otherwise, the hour is based on the 24-hour clock.

Illegal date and time values

Cells formatted with a date or time format and which contain date or time values which do not meet the requirements specified shall show the pound sign ("#") across the width of the cell.

International Considerations

Format Code	Description
r	ja-jp/zh-tw only. When loading in ja-jp locale, code becomes "ee". When loading in zh-tw locale, code becomes "e".
rr	ja-jp/zh-tw only. When loading in ja-jp locale, code becomes "gggee". When loading in zh-tw locale, code becomes "e".
g	When loading in ja-jp locale: Single Roman character emperor reign When loading in zh-tw (Taiwan only) locale: treat same as "gg".
gg	When loading in ja-jp locale: Single Kanji character emperor reign When loading in zh-tw locale: Last era short name (since 1911)
ggg	When loading in ja-jp locale: Tow Kanji character emperor reign When loading in zh-tw locale: Last era long name (since 1911)
e	When loading in ja-jp locale: Era year When lading in zh-tw (Taiwan only) locale: Era year since 1912. If preceded by "g", "gg", or "ggg" then year of 1912, and years before 1912 are special, otherwise years before 1912 are Gregorian. OTHER locales: becomes "yyyy"
ee	When loading in ja-jp locale: Era year w/ leading zero When loading in zh-tw (Taiwan only) locale: Era year since 1911 OTHER locales: becomes "yy"
b2	Hijri calander
b1	Gregorian calendar
[\$USD-409]	Specifies currency and locale/date system/number system information. Syntax is [\$<Currency String>-<language info>]. Currency string is a string to use as a currency symbol. Language info is a 32-bit value entered in hexadecimal format. Language info format (byte 3 is most significant byte): Bytes 0,1: 16-bit Language ID (LID). Byte 2: Calendar type. High bit indicates that input is parsed using specified calendar. Byte 3: Number system type. High bit indicates that input is parsed using specified number system.

Format Code	Description
	Special language info values: 0xf800: System long date format 0xf400: System time format

Attributes	Description
count (Number Format Count)	Count of number format elements. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_NumFmts](#)) is located in §A.2. *end note*]

18.8.32 patternFill (Pattern)

This element is used to specify cell fill information for pattern and solid color cell fills. For solid cell fills (no pattern), fgColor is used. For cell fills with patterns specified, then the cell fill color is specified by the bgColor element.

Attributes	Description
patternType (Pattern Type)	Specifies the fill pattern type (including solid and none) Default is none, when missing. The possible values for this attribute are defined by the ST_PatternType simple type (§18.18.55).

[Note: The W3C XML Schema definition of this element's content model ([CT_PatternFill](#)) is located in §A.2. *end note*]

18.8.33 protection (Protection Properties)

Contains protection properties associated with the cell. Each cell has protection properties that can be set. The cell protection properties do not take effect unless the sheet has been protected.

Attributes	Description
hidden (Hidden Cell)	A boolean value indicating if the cell is hidden. When the cell is hidden and the sheet on which the cell resides is protected, then the cell value is displayed in the cell grid location, but the contents of the cell will not be displayed in the formula bar. This is true for all types of cell content, including formula, text, or numbers. Therefore the cell A4 can contain a formula "=SUM(A1:A3)", but if the cell protection

Attributes	Description
	<p>property of A4 is marked as hidden, and the sheet is protected, then the cell should display the calculated result [<i>Example: "6" end example</i>], but will not display the formula used to calculate the result.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
locked (Cell Locked)	<p>A boolean value indicating if the cell is locked. When cells are marked as "locked" and the sheet is protected, then the options specified in the Sheet Part's sheetProtection element (§18.3.1.85) are prohibited for these cells.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_CellProtection](#)) is located in §A.2. end note*]

18.8.34 rgbColor (RGB Color)

A single ARGB entry for the corresponding color index.

Attributes	Description
rgb (Alpha Red Green Blue)	<p>Color value expressed in Alpha Red Green Blue format (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_RgbColor](#)) is located in §A.2. end note*]

18.8.35 scheme (Scheme)

Defines the font scheme, if any, to which this font belongs. When a font definition is part of a theme definition, then the font is categorized as either a major or minor font scheme component. When a new theme is chosen, every font that is part of a theme definition is updated to use the new major or minor font definition for that theme. Usually major fonts are used for styles like headings, and minor fonts are used for body and paragraph text.

Attributes	Description
val (Font Scheme)	<p>Sets font scheme property.</p> <p>The possible values for this attribute are defined by the ST_FontScheme simple type (§18.18.33).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FontScheme](#)) is located in §A.2. *end note*]

18.8.36 shadow (Shadow)

Macintosh compatibility setting. Represents special word/character rendering on Macintosh, when this flag is set. The effect is to render a shadow behind, beneath and to the right of the text. SpreadsheetML applications are not required to render according to this flag.

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BooleanProperty](#)) is located in §A.2. *end note*]

18.8.37 start (Leading Edge Border)

This element specifies the color and line style for the leading edge border of a cell (i.e., the left border for left-to-right cells and the right border for right-to-left cells).

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.38 stop (Gradient Stop)

One of a sequence of two or more gradient stops, constituting this gradient fill.

Attributes	Description
position (Gradient Stop Position)	<p>Position information for this gradient stop. Interpreted exactly like gradientFill left, right, bottom, top. The position indicated here indicates the point where the color is pure. Before and after this position the color can be in transition (or pure, depending on if this is the last stop or not).</p> <p>The possible values for this attribute are defined by the W3C XML Schema double</p>

Attributes	Description
	datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GradientStop](#)) is located in §A.2. *end note*]

18.8.39 styleSheet (Style Sheet)

This is the root element of the Styles part.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Stylesheet](#)) is located in §A.2. *end note*]

18.8.40 tableStyle (Table Style)

This element represents a single table style definition that indicates how a spreadsheet application should format and display a table.

Each of the tableStyle elements contains a collection of tableStyleElement elements that define formatting for a particular region of the table.

Annex G contains a listing of table styles whose tableStyleElement elements are implied rather than explicitly saved in the file. In this case, a name attribute is written on the tableStyle record, but no corresponding tableStyleElement elements are written.

All of the built-in, named table styles defined in Annex D shall be supported by applications that implement table styles.

[*Note:* Each of the table styles is made up of a collection of formatting definitions, each of which corresponds to a particular structured region of the table. An application can decide to support these built-in types, and can also decide to define more styles, each with their own definitions. An application can also decide whether the user is allowed to customize or further define additional table styles. *end note*]

Attributes	Description
count (Table Style Count)	Count of table style elements defined for this table style. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Table Style Name)	Name of this table style. The possible values for this attribute are defined by the W3C XML Schema string datatype.
pivot (Pivot Style)	'True' if this table style should be shown as an available pivot table style. Not mutually exclusive with table - both can be true.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
table (Table)	<p>True if this table style should be shown as an available table style.</p> <p>Not mutually exclusive with pivot - both can be true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyle](#)) is located in §A.2. *end note*]

18.8.41 tableStyleElement (Table Style)

This element specifies formatting for one area of a table or PivotTable. Together the sequence of these elements makes up one entire Table style or PivotTable style definition.

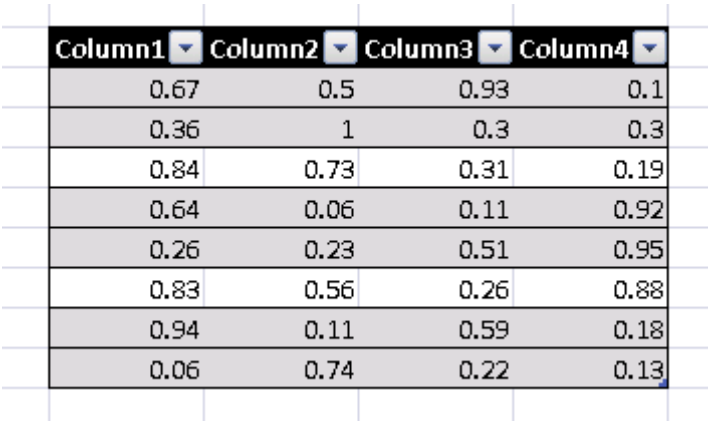

The order in which table style element formatting is applied is as follows:

Table Style Element Order

- Whole Table
 - First Column Stripe
 - Second Column Stripe
 - First Row Stripe
 - Second Row Stripe
 - Last Column
 - First Column
 - Header Row
 - Total Row
 - First Header Cell
 - Last Header Cell
 - First Total Cell
 - Last Total Cell
1. For instance, row stripe formatting 'wins' over column stripe formatting, and both 'win' over whole table formatting.
1. **PivotTable Style Element Order**
 - Whole Table

- Page Field Labels
- Page Field Values
- First Column Stripe
- Second Column Stripe
- First Row Stripe
- Second Row Stripe
- First Column
- Header Row
- First Header Cell
- Subtotal Column 1
- Subtotal Column 2
- Subtotal Column 3
- Blank Row
- Subtotal Row 1
- Subtotal Row 2
- Subtotal Row 3
- Column Subheading 1
- Column Subheading 2
- Column Subheading 3
- Row Subheading 1
- Row Subheading 2
- Row Subheading 3
- Grand Total Column
- Grand Total Row

Attributes	Description
dxfld (Formatting Id)	<p>Zero-based index to a dxf record in the dxfs collection, specifying differential formatting to use with this Table or PivotTable style element.</p> <p>The possible values for this attribute are defined by the ST_Dxfld simple type (§18.18.25).</p>
size (Band Size)	<p>Number of rows or columns in a single band of striping. Applies only when type is firstRowStripe, secondRowStripe, firstColumnStripe, or secondColumnStripe.</p> <p><i>[Example:</i></p> <p>In this example, the firstRowStripe size is set to 2, and the secondRowStripe size is set to 1:</p>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
type (Table Style Type)	<p>Identifies this table style element's type.</p> <p>The possible values for this attribute are defined by the ST_TableStyleType simple type (§18.18.77).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyleElement](#)) is located in §A.2. *end note*]

18.8.42 tableStyles (Table Styles)

This element represents a collection of Table style definitions for Table styles and PivotTable styles used in this workbook. It consists of a sequence of tableStyle records, each defining a single Table style.

A Table style is a collection of formatting that applies to structured regions of a Table or PivotTable [*Example*: make the header row & totals bold face, and apply light gray fill to alternating rows in the data portion of the table to achieve striped or banded rows. *end example*]

See the enumeration values in ST_TableStyleType for a listing of structured Table regions to which formatting can be applied, and which together make up a single Table style definition.

Attributes	Description
count (Table Style Count)	<p>Count of table styles defined in this collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
defaultPivotStyle (Default Pivot Style)	<p>Name of the default table style to apply to new PivotTables. This can be set by the user interface.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.
defaultTableStyle (Default Table Style)	Name of default table style to apply to new Tables. This can be set by the user interface. The possible values for this attribute are defined by the W3C XML Schema string datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TableStyles](#)) is located in §A.2. *end note*]

18.8.43 top (Top Border)

This element specifies the color and line style for the top border of a cell.

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.44 vertical (Vertical Inner Border)

This element specifies the color and line style for the vertical inner border(s) of a range of cells. Used in the context of dxf elements only. [*Example:* see the borders definitions for **TableStyleMedium28**. *end example*]

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§18.18.3).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BorderPr](#)) is located in §A.2. *end note*]

18.8.45 xf (Format)

A single xf element describes all of the formatting for a cell.

Attributes	Description
applyAlignment (Apply Alignment)	<p>A boolean value indicating whether the alignment formatting specified for this xf should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyBorder (Apply Border)	<p>A boolean value indicating whether the border formatting specified for this xf should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyFill (Apply Fill)	<p>A boolean value indicating whether the fill formatting specified for this xf should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyFont (Apply Font)	<p>A boolean value indicating whether the font formatting specified for this xf should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyNumberFormat (Apply Number Format)	<p>A boolean value indicating whether the number formatting specified for this xf should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyProtection (Apply Protection)	<p>A boolean value indicating whether the protection formatting specified for this xf should be applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
borderId (Border Id)	<p>Zero-based index of the border record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_BorderId simple type (§18.18.2).</p>
fillId (Fill Id)	<p>Zero-based index of the fill record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_FillId simple type (§18.18.30).</p>
fontId (Font Id)	<p>Zero-based index of the font record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_FontId simple type (§18.18.32).</p>
numFmtId	<p>Id of the number format (numFmt) record used by this cell format.</p>

Attributes	Description
(Number Format Id)	The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).
pivotButton (Pivot Button)	<p>A boolean value indicating whether the cell rendering includes a pivot table dropdown button.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
quotePrefix (Quote Prefix)	<p>A boolean value indicating whether the text string in a cell should be prefixed by a single quote mark (e.g., 'text). In these cases, the quote is not stored in the Shared Strings Part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
xfId (Format Id)	<p>For xf records contained in cellXfs this is the zero-based index of an xf record contained in cellStyleXfs corresponding to the cell style applied to the cell.</p> <p>Not present for xf records contained in cellStyleXfs.</p> <p>The possible values for this attribute are defined by the ST_CellStyleXfId simple type (§18.18.10).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Xf](#)) is located in §A.2. *end note*]

18.9 Metadata

A cell in a spreadsheet application can have metadata associated with it. Metadata is just a set of additional properties about the particular cell, and this metadata is stored in the metadata xml part.

There are two types of metadata: cell metadata and value metadata. Cell metadata contains information about the cell itself, and this metadata can be carried along with the cell as it moves (insert, shift, copy/paste, merge, unmerge, etc). Value metadata is information about the value of a particular cell. Value metadata properties can be propagated along with the value as it is referenced in formulas.

The file format is architected such that it supports both value and cell metadata, as well as even allowing for future extensions. Formulas, such as CUBEMEMBER() or CUBE*, shall make use of value metadata as part of the SpreadsheetML standard. So, only value metadata shall be implemented as it is used by MDX cube functions for retrieving data from OLAP data sources. The other parts are allowed for future extensibility.

See the informative material for background information on OLAP and the various CUBE* functions.

[Example: The CUBEMEMBER() function is used to return a specific member from an OLAP cube. The metadata will express the connection name (used as a friendly identifier for the external data connection to the OLAP server and cube), the MDX statement retrieving that member, and a set of operational attributes of the

metadata that specify how it behaves in the spreadsheet application (i.e., whether it propagates through formula assignment, is able to be copy/pasted, etc).

```
<metadata xmlns="http://purl.oclc.org/ooxml/spreadsheetml/main">
  <metadataTypes count="1">
    <metadataType name="XLMDX" minSupportedVersion="120000" copy="1"
      pasteAll="1" pasteValues="1" merge="1" splitFirst="1" rowColShift="1"
      clearFormats="1" clearComments="1" assign="1" coerce="1"/>
  </metadataTypes>
  <metadataStrings count="2">
    <s v="My Connection"/>
    <s v="[Measures].[Internet Sales Amount]"/>
  </metadataStrings>
  <mdxMetadata count="1">
    <mdx n="0" f="m">
      <t c="1">
        <n x="1"/>
      </t>
    </mdx>
  </mdxMetadata>
  <valueMetadata count="1">
    <bk>
      <rc t="1" v="0"/>
    </bk>
  </valueMetadata>
</metadata>
```

As seen above, the metadata string table contains two entries: the name of the connection (My Connection), and the expression that returns the Internet Sales Amount member from the cube. The metadataType specifies that the metadata persists with assignment, cell merging, copy/pasting, shifting rows/columns, when the formatting or comments are deleted from the cell, and is assigned to the upper left most cell if a merged cell is split. In the valueMetadata collection, the metadata block specifies that the first metadataType is used, and indexes the first (0th) entry in the mdxMetadata collection. This MDX element in the mdxMetadata collection in turn specifies the cube function type (m= cube member) and an index into the string table that specifies the connection name. It also contains a tuple (t) element which specifies, via index into the string table, which tuple is returned. *end example*

[Note: When copying a cell with metadata, and the cell contains an array formula, each pasted cell must contain the value from the corresponding position in the array and should contain the metadata corresponding to that cell. *end note*]

18.9.1 bk (Metadata Block)

This element represents a block of metadata records.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_MetadataBlock](#)) is located in §A.2. *end note*]

18.9.2 **bk (Future Metadata Block)**

This element represents a block of future metadata information. This is a location for storing feature extension information.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FutureMetadataBlock](#)) is located in §A.2. *end note*]

18.9.3 **cellMetadata (Cell Metadata)**

This element represents cell metadata information. Cell metadata is information metadata about a specific cell, and it stays tied to that cell position.

[*Note:* Applications should not use this for storing metadata, but instead use `valueMetadata`. Cell metadata is included for storing information from future application. *end note*]

Attributes	Description
count (Metadata Block Count)	Number of blocks of metadata records. The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_MetadataBlocks](#)) is located in §A.2. *end note*]

18.9.4 **futureMetadata (Future Metadata)**

This element represents future metadata information.

Future data storage areas are xml storage areas that a later version of the spreadsheet application can store data into. So a V2 spreadsheet application can store data for new features that don't exist in the V1 version in a future storage area when saving to a format that the V1 version can open. The V1 version might be able to open the file, but won't necessarily be able to understand data that is stored in a future storage area. So the V1 version might ignore this data, but still round trip it in the file format so that V2 and V1 users can collaborate on the same spreadsheet.

Attributes	Description
count (Future Metadata Block Count)	Number of future metadata blocks. The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.
name (Metadata	Metadata type name.

Attributes	Description
Type Name)	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_FutureMetadata](#)) is located in §A.2. *end note*]

18.9.5 k (KPI MDX Metadata)

This element represents key performance indicator (KPI) MDX metadata. A KPI is typically an image that represents the state of some specific business measure at a given point in time. For instance, an image of a green traffic light indicating that customer satisfaction is good.

Attributes	Description
n (Member Unique Name Index)	Index of member unique name in string store. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
np (KPI Index)	Index of key performance indicator name in string store. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
p (KPI Property)	Key performance indicator property. The possible values for this attribute are defined by the ST_MdxKPIProperty simple type (§18.18.45).

[Note: The W3C XML Schema definition of this element's content model ([CT_MdxKPI](#)) is located in §A.2. *end note*]

18.9.6 mdx (MDX Metadata Record)

This element represents a single record of MDX metadata information which can express a tuple, KPI, set, or member property.

Attributes	Description
f (Cube Function Tag)	This is an enumeration representing the function type of the calling cube function from the spreadsheet. The possible values for this attribute are defined by the ST_MdxFunctionType simple type (§18.18.44).
n (Connection	The zero based index of connection name in metadata string store, <code>metadataStrings</code> .

Attributes	Description
Name Index)	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Mdx](#)) is located in §A.2. *end note*]

18.9.7 mdxMetadata (MDX Metadata Information)

This element represents a collection of specific MDX metadata records for the spreadsheet. This is used to build up the members, sets, tuples, KPIs, and member properties for the spreadsheet.

Attributes	Description
count (MDX Metadata Record Count)	Number of MDX metadata metadata records. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MdxMetadata](#)) is located in §A.2. *end note*]

18.9.8 metadata (Metadata)

This element represents the root node for all metadata information in the spreadsheet.

[Note: The W3C XML Schema definition of this element's content model ([CT_Metadata](#)) is located in §A.2. *end note*]

18.9.9 metadataStrings (Metadata String Store)

This element represents the metadata string store. This is a collection of strings that are used as a resource for the rest of the metadata part. It contains all the required OLAP strings used in the spreadsheet including the connection name, as well as MDX expressions identifying specific members and sets. It is indexed from individual metadata records so that the records can use these strings to build up the necessary MDX statements to retrieve the correct data from the OLAP cube.

Attributes	Description
count (MDX Metadata String Count)	Number of records in the string store. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MetadataStrings](#)) is located in §A.2.
end note]

18.9.10 metadataType (Metadata Type Information)

This element represents information about metadata on cells - it defines a specific set of behaviors that the metadata shall adhere to when subject to other spreadsheet operations.

In general, many of these attributes represent operations that can be performed on a cell that allow the metadata to remain associated with the cell. Operations that are set to 0 or false, will cause the metadata to be disassociated from the cell when that operation is performed.

Attributes	Description
adjust (Adjust Metadata)	<p>A Boolean flag indicating that metadata corresponding to a particular cell needs to be notified when that cell's location is changed.</p> <p>[Note: This is included in the file format for future extensibility.end note]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
assign (Metadata Formula Assignment)	<p>A Boolean flag indicating whether metadata is propagated by formula assignment operation. True when metadata should be propagated by assignment, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
cellMeta (Cell Metadata)	<p>A Boolean flag indicating whether metadata is cell metadata. True when the metadata is cell metadata, false otherwise - in the false case it is considered to be value metadata.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
clearAll (Metadata Clear All)	<p>A Boolean flag indicating whether metadata survives a "Clear: All" operation. True if the metadata persists after a clear all, false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
clearComments (Metadata Clear Comments)	<p>A Boolean flag indicating whether metadata remains after comments have been cleared from the cell. True if the metadata persists after Clear:Comments, false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments</p>

Attributes	Description
	<p>(Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
clearContents (Metadata Clear Contents)	<p>A Boolean flag indicating whether metadata remains after the contents of a cell are removed. True if metadata persists after a "Clear: Contents" action, false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
clearFormats (Metadata Clear Formats)	<p>A Boolean flag indicating whether metadata remains after formatting is removed from a cell. True if metadata persists after a "Clear: Formats", false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
coerce (Metadata Coercion)	<p>A Boolean flag indicating whether value metadata can be removed when this metadata data type is coerced to another data type. True if the value metadata is removed upon coercion, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
copy (Metadata Copy)	<p>A Boolean flag indicating whether metadata is copied with a cell. True if the metadata is copied to other cells when this cell is copied, false otherwise.</p> <p>This shall be set to true if the paste attributes for the metadataType are going to be used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
delete (Metadata Cell Value Delete)	<p>A Boolean flag indicating whether metadata survives deletion of a cell value. True when the metadata persists after the deletion of a cell value, false otherwise.</p>

Attributes	Description
	<p>This attribute is equivalent to the <code>clearContents</code> attribute.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
edit (Metadata Edit)	<p>A Boolean flag indicating whether metadata survives the editing of the cell's value. True if the metadata remains unchanged after the cell's value edit, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ghostCol (Metadata Ghost Column)	<p>A Boolean flag indicating whether metadata is copied to/from a ghost column. True when the metadata is copied to/from a ghost column, false otherwise.</p> <p>A ghost column is a single column that exists for the row header. It is not displayed to the end user. It is used to store default formatting for an entire row (i.e. the row gets the formatting for the corresponding cell in the ghost column). For instance, when an entire row is selected and a cell color is applied, this is stored once for the cell in the ghost column instead of for each cell in the row.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ghostRow (Metadata Ghost Row)	<p>A Boolean flag indicating whether metadata is copied to/from a ghost row. True when the metadata is copied to/from a ghost row, false otherwise.</p> <p>A ghost row is a single row that exists for the column header. It is not displayed to the end user. It is used to store default formatting for an entire column (i.e. the column gets the formatting for the corresponding cell in the ghost row). For instance, when an entire column is selected and a cell color is applied, this is stored once for the cell in the ghost row instead of for each cell in the column.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
merge (Metadata Merge)	<p>A Boolean flag indicating whether metadata survives cell merge. True if the metadata persists after a cell merge, false otherwise.</p> <p>It is up to the spreadsheet application on how to deal with conflicts when two cells that each have metadata are merged. The guidance here is to treat it the same as a 'regular' cell merge with the default behavior being that the data in the upper left cell wins.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
minSupportedVersion (Minimum Supported Version)	<p>The earliest version of the spreadsheet application that supports this metadata type.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.
name (Metadata Type Name)	<p>Represents the name of this particular metadata type. This name shall be unique amongst all other metadataTypes.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
pasteAll (Metadata Paste All)	<p>A Boolean flag indicating whether metadata is populated to a new cell by "Paste: All". True when the metadata is populated on a Paste:All, false otherwise. Paste:All and regular paste should be implemented so that they are equivalent by the spreadsheet application.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[Note: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteBorders (Metadata Paste Borders)	<p>A Boolean flag indicating whether metadata is populated with Paste: Borders. True when the metadata is populated when only borders are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[Note: The spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteColWidths (Metadata Paste Column Widths)	<p>A Boolean flag indicating whether metadata is populated by Paste: Column Widths. True if the metadata is populated when only column widths are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[Note: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteComments (Metadata Paste Comments)	<p>A Boolean flag indicating whether metadata is populated by Paste: Comments. True when metadata is populated when only comments are pasted, false otherwise.</p>

Attributes	Description
	<p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteDataValidation (Metadata Paste Data Validation)	<p>A Boolean flag indicating whether metadata is populated by Paste: Validation. True when metadata is populated when only data validation is pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteFormats (Metadata Paste Formats)	<p>A Boolean flag indicating whether metadata is populated by Paste Special: Formats. True when metadata is populated when only formatting is pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteFormulas (Metadata Paste Formulas)	<p>A Boolean flag indicating whether metadata is populated by Paste: Formulas. True when the metadata is populated when only formulas are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteNumberFormats (Metadata Paste Number Formats)	<p>A Boolean flag indicating whether metadata is populated with Paste: Number Formats. True when metadata is populated when only number formatting is pasted, false otherwise.</p>

Attributes	Description
	<p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pasteValues (Metadata Paste Special Values)	<p>A Boolean flag indicating whether metadata is populated by Paste: Values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rowColShift (Metadata Insert Delete)	<p>A Boolean flag indicating whether metadata survives shifting due to row/column insertion/deletion. True if the metadata persists after the cell has been shifted, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
splitAll (Metadata Split All)	<p>A Boolean flag indicating whether a merged cell split action has its metadata copied to all of the resulting cells. True if the metadata is copied to all new cells resulting from a split, false otherwise.</p> <p>If <code>splitFirst</code> is also set to true, <code>splitAll</code> wins - that is all the cells shall have the metadata copied to them.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
splitFirst (Metadata Split First)	<p>A Boolean flag indicating whether when a merged cell is split its metadata is copied to only the first resulting cell. True when the metadata from a split cell is only copied to the first resulting cell, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_MetadataType](#)) is located in §A.2. *end note*]

18.9.11 metadataTypes (Metadata Types Collection)

This element is a collection of metadata types.

Attributes	Description
count (Metadata	Number of metadata types.

Attributes	Description
Type Count)	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MetadataTypes](#)) is located in §A.2. end note]

18.9.12 ms (Set MDX Metadata)

This element represents an MDX set.

Attributes	Description
c (Sort By Member Index Count)	Number of sort-by member indices. This is essentially the number of coordinates in the cube that this member is defined by. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
ns (Set Definition Index)	Zero based index of the set definition in the metadata string store. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
o (Set Sort Order)	An enumeration specifying what sort order is used to sort the set. The possible values for this attribute are defined by the ST_MdxSetOrder simple type (§18.18.46).

[Note: The W3C XML Schema definition of this element's content model ([CT_MdxSet](#)) is located in §A.2. end note]

18.9.13 n (Member Unique Name Index)

This element represents an index of a member unique name in metadata string store that is used to define the sort-by set.

Attributes	Description
s (String is a Set)	A Boolean flag indicating whether this string represents a set. True if the string represents a set, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
x (Index Value)	Value of the zero based index.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MetadataStringIndex](#)) is located in §A.2. end note]

18.9.14 p (Member Property MDX Metadata)

This element represents an MDX member property.

Attributes	Description
n (Member Unique Name Index)	The zero based index of member unique name in the metadata string store. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
np (Property Name Index)	The zero based index of the property name in metadata string store. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MdxMemeberProp](#)) is located in §A.2. end note]

18.9.15 rc (Metadata Record)

This element represents a reference to a specific metadata record.

Attributes	Description
t (Metadata Record Type Index)	A 1-based index to the metadata record type in metadataTypes. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
v (Metadata Record Value Index)	A zero based index to a specific metadata record. If the corresponding metadataType has name="XLMDX", then this is an index to a record in mdxMetadata, otherwise this is an index to a record in the futureMetadata section whose name matches the name of the metadataType. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MetadataRecord](#)) is located in §A.2. end note]

18.9.16 t (Tuple MDX Metadata)

This element represents an MDX tuple. A tuple is the intersection of two or more members of distinct dimensions in the cube. For instance, the three members (product, City, month) that are used to show the data point for how many products were sold.

The spreadsheet application should allow the values for the attributes of this element to be specified by the OLAP server.

Attributes	Description
b (Server Formatting Bold Font)	<p>A Boolean flag indicating whether the bold style is applied. True if bold shall be applied, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bc (Server Formatting Background Color)	<p>Specifies the background color in RGB values. It is in hex and is read in the form of 0x00RRGGBB.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
c (Member Index Count)	<p>The number of member expressions in the tuple.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
ct (Server Formatting Culture Currency)	<p>The culture tag to use for currency number format.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
fc (Server Formatting Foreground Color)	<p>Represents the foreground color in RGB. It is in hex and is read in the form of 0x00RRGGBB.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
fi (Server Formatting Built-In Number Format Index)	<p>Server formatting built-in number format index. This is an index into the spreadsheet application's built in number formats that is used to specify formatting.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
i (Server Formatting Italic Font)	<p>A Boolean flag indicating that the italic formatting shall be applied. True if italic formatting is applied, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
si (Server Formatting String)	<p>Server formatting string index in the metadata string store, used to index to a string that contains information on how to format the number.</p>

Attributes	Description
Index)	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
st (Server Formatting Strikethrough Font)	A Boolean flag indicating whether the strikethrough font style is applied. True if strikethrough shall be applied, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
u (Server Formatting Underline Font)	A Boolean flag indicating whether the underline font style is applied. True if underline shall be applied, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MdxTuple](#)) is located in §A.2. *end note*]

18.9.17 valueMetadata (Value Metadata)

This element represents the value metadata information for the spreadsheet. It is essentially a collection of block elements that each define the value metadata for a particular cell. Cells in the workbook index into this collection, and each block element in this collection in turn references the `mdxMetadata` records.

Attributes	Description
count (Metadata Block Count)	Number of blocks of metadata records. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MetadataBlocks](#)) is located in §A.2. *end note*]

18.10 Pivot Tables

PivotTables display aggregated views of data easily and in an understandable layout. Hundreds or thousands of pieces of underlying information can be aggregated on row and column axes, revealing the meanings behind the data. PivotTable reports are used to organize and summarize your data in different ways. Creating a PivotTable report is about moving pieces of information around to see how they fit together. In a few gestures the pivot rows and columns can be moved into different arrangements and layouts.

A PivotTable object has a row axis area, a column axis area, a data area, and a page/report filter area. Additionally, PivotTables have a corresponding field list pane, or similar user interface, that displays all the fields

of data that can be placed on one of the PivotTable areas. In SpreadsheetML, each PivotTable area maps to a collection of fields in the PivotTableDefinition that correspond to each area.

The following image shows the layout for the PivotTable areas.

Page/Filter Fields	
	Column Fields
Row Fields	Data Items

[Example:

The following image shows a table of data in a worksheet.

	A	C	F	H	I	O	P	Q	Z	AA	AB
1	Customer Name	Country	City	Product Category	Product Subcategory	Year	Quarter	Month	Sales Amount	Tax Amount	Freight
2	Michele Raman	Australia	Bendigo	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
3	Misty Raji	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
4	Tabitha E Arthur	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
5	Clarence D Rai	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3399.99	271.9992	84.9998
6	Jimmy L Moreno	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3399.99	271.9992	84.9998
7	Rob Verhoff	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3374.99	269.9992	84.3748
8	Levi Sai	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
9	Logan Gonzales	Australia	Brisbane	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
10	Dalton J Lee	Australia	Brisbane	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
11	Jessie J Ortega	Australia	Brisbane	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
12	Paul J. Shakespear	Australia	Caloundra	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
13	Joan R Martin	Australia	Caloundra	Bikes	Road Bikes	2001	3	September	699.0982	55.9279	17.4775
14	Casey Pal	Australia	Caloundra	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
15	Ethan G Coleman	Australia	Caloundra	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
16	Kendra Rubio	Australia	Caloundra	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
17	Bethany G Yuan	Australia	Cloverdale	Bikes	Mountain Bikes	2001	3	August	3399.99	271.9992	84.9998
18	Jasmine Wilson	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
19	Micah Wu	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
20	Warren L Zhang	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	July	699.0982	55.9279	17.4775
21	Ariana Stewart	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
22	Suzanne K Lu	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
23	Randall M Rubio	Australia	Cranbourr	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
24	Deborah K Kumar	Australia	Cranbourr	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
25	Krystal Holt	Australia	Cranbourr	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
26	Patricia T Raman	Australia	Cranbourr	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
27	Wendy Dominguez	Australia	Cranbourr	Bikes	Mountain Bikes	2001	3	August	3374.99	269.9992	84.3748
28	Willie She	Australia	Darlinghu	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
29	Alan Zhu	Australia	Darlinghu	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
30	Dawn R Tang	Australia	Darlinghu	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568

The following image shows a PivotTable summary of the worksheet table data.

	A	B	C	D	E	F	G
1							
2		Country	(All)				
3		State	(All)				
4		City	(All)				
5							
6		Sum of Sales Amount	Column Labels				
7			2001			2001 Total	
8			3			3 Total	
9		Row Labels	July	August	September		
10		Bikes	209652.9046	222538.2892	173993.5128	606184.7066	606184.7066
11		Mountain Bikes	64424.81	60899.82	10174.97	135499.6	135499.6
12		Road Bikes	145228.0946	161638.4692	163818.5428	470685.1066	470685.1066
13		Grand Total	209652.9046	222538.2892	173993.5128	606184.7066	606184.7066

The filter area consists of the "Country", "State", and "City" fields. The row area consists of the "Product Category" and "Product Subcategory" fields. "Bikes" belongs to the "Product Category" field and both "Mountain Bikes" and "Road Bikes" belong to the "Product Subcategory" field. The column consists of the "Year" ("2001"), "Quarter" ("3"), and "Month" ("July", "August", and "September") fields.

The following image shows the field list for the PivotTable in the previous image.

PivotTable Field List

Choose fields to add to report:

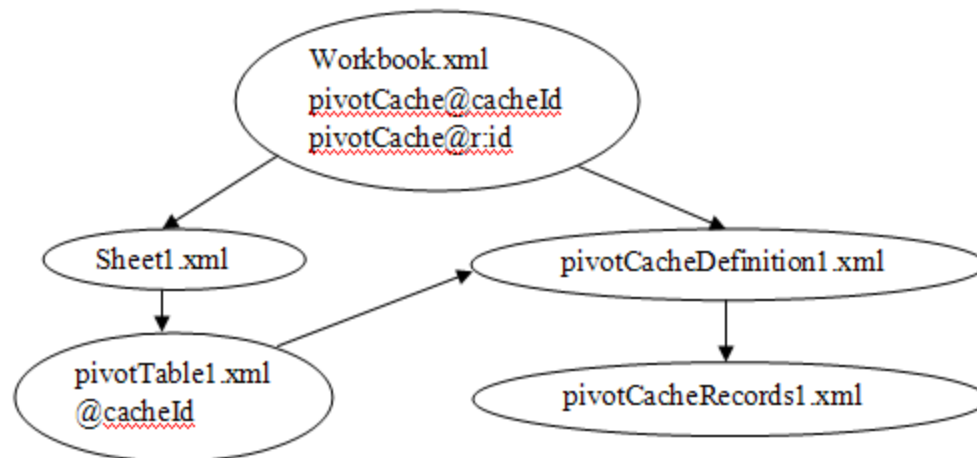

- ☒ **City**
- ☒ **Country**
- ☐ Currency
- ☒ **Customer Name**
- ☐ Discount Amount
- ☐ Discount Pct
- ☐ Extended Amount
- ☐ Freight
- ☐ Group
- ☐ Month
- ☐ Order Quantity
- ☐ Postal Code
- ☒ **Product Category**
- ☐ Product Description
- ☐ Product Name
- ☐ Product Standard Cost
- ☐ Product Subcategory
- ☐ Promotion

File Structure

The workbook points to (and owns the longevity of) the *pivotCacheDefinition* part, which in turn points to and owns the *pivotCacheRecords* part. The workbook also points to and owns the sheet part, which in turn points to and owns a *pivotTable* part definition, when a PivotTable is on the sheet. There can be multiple PivotTables on a sheet. The *pivotTable* part points to the appropriate *pivotCacheDefinition* which it is using. Since multiple PivotTables can use the same cache, the *pivotTable* part does not own the longevity of the *pivotCacheDefinition*.

The *pivotTable* part describes the particulars of the layout of the PivotTable on the sheet. It indicates what fields are on the row axis, the column axis, report filter, and values areas of the PivotTable. It also indicates formatting information about the PivotTable. If conditional formatting has been applied to the PivotTable, that is also expressed in the *pivotTable* part.

Outline of XML for pivotTableDefinition

```

<pivotTableDefinition>
  <location/>
  <pivotFields/>
  <rowFields/>
  <rowItems/>
  <colFields/>
  <colItems/>
  <pageFields/>
  <dataFields/>
  <conditionalFormats/>
  <pivotTableStyleInfo/>
</pivotTableDefinition>

```

The *pivotCacheRecords* part contains the underlying data to be aggregated. It is a cache of the source data.

Outline of XML for pivotCacheRecords

```
<pivotCacheRecords/>
  <r/>
</pivotCacheRecords>
```

The *pivotCacheDefinition* part defines each field in the *pivotCacheRecords* part, including field name and information about the data contained in the field. The *pivotCacheDefinition* part also defines pivot items that are shared among the *pivotTableDefinition* and *pivotCacheRecords* parts.

Outline of XML for *pivotCacheDefinition*

```
<pivotCacheDefinition>
  <cacheSource/>
  <cacheFields>
    <cacheField>
      <sharedItems>
        <d/>
      </sharedItems>
      <fieldGroup/>
    </cacheField>
  </cacheFields>
</pivotCacheDefinition>
```

18.10.1 Pivot Tables

This section describes the definition of PivotTables in SpreadsheetML.

18.10.1.1 autoSortScope (AutoSort Scope)

Represents the sorting scope for the PivotTable.

[Note: The W3C XML Schema definition of this element's content model ([CT_AutoSortScope](#)) is located in §A.2. end note]

18.10.1.2 b (Boolean)

Represents a boolean value for an item in the PivotTable.

Attributes	Description
c (Caption)	Specifies the caption for the item. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
cp (Member Property Count)	Specifies the number of property values for this item. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
f (Calculated Item)	Specifies a boolean value that indicates whether this item has a calculated value.

Attributes	Description
	<p>A value of 1 or true indicates the item has a calculated value.</p> <p>A value of 0 or false indicates the item does not have a calculated value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of 1 or true indicates this item is unused.</p> <p>A value of 0 or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item. This attribute is required.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Boolean](#)) is located in §A.2. *end note*]

18.10.1.3 cacheField (PivotCache Field)

Represent a single field in the PivotCache. This definition contains information about the field, such as its source, data type, and location within a level or hierarchy. The sharedItems element stores additional information about the data in this field. If there are no shared items, then values are stored directly in the pivotCacheRecords part.

[Example:

```
<cacheField name="Group" numFmtId="0">
  <sharedItems count="3">
    <s v="Pacific"/>
    <s v="North America"/>
    <s v="Europe"/>
  </sharedItems>
</cacheField>
```

end example]

Attributes	Description
caption (PivotCache Field Caption)	<p>Specifies the caption of the cache field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
databaseField (Database Field)	<p>Specifies a boolean value that indicates whether this field came from the source database rather having been created by the application.</p> <p>A value of 1 or true indicates the field is from the source database.</p> <p>A value of 0 or false indicates the field was created by the application.</p> <p>[<i>Note</i>: This attribute could be used for a defined grouped or calculated field. In this case, source database fields should precede defined grouped or calculated fields. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
formula (Calculated Field Formula)	<p>Specifies the formula for the calculated field. This formula is specified by the end-user. Calculated fields can perform calculations by using the contents of other fields in the PivotTable.</p> <p>In formulas you create for calculated fields or calculated items, you can use operators and expressions as you do in other worksheet formulas. You can use constants and refer to data from the PivotTable, but you cannot use cell references or defined names. You cannot use worksheet functions that require cell references or defined names as arguments, and you cannot use array functions.</p> <p>Further behaviors and restrictions apply to formulas for calculated fields:</p> <ul style="list-style-type: none"> Formulas for calculated fields operate on the sum of the underlying data for any fields in the formula. [<i>Example</i>: The formula =Sales * 1.2 multiplies the sum of the sales for each type and region by 1.2; it does not multiply each individual sale by 1.2 and then sum the multiplied amounts. <i>end example</i>] Formulas cannot refer to totals. <p>For more information about formulas see §18.17 in Formulas. For more information about defined names see §18.2.6 in Workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
hierarchy (Hierarchy)	<p>Specifies the hierarchy that this field is part of.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
level (Hierarchy Level)	<p>Specifies the hierarchy level that this field is part of.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.
mappingCount (Member Property Count)	<p>Specifies the number of property mappings for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
memberPropertyField (Member Property Field)	<p>Specifies a boolean value that indicates whether the field contains OLAP member property information.</p> <p>A value of 1 or true indicates this field contains OLAP member property information.</p> <p>A value of 0 or false indicates this field does not contain OLAP member property information.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
name (PivotCache Field Name)	<p>Specifies the name of the cache field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
numFmtId (Number Format Id)	<p>Specifies the number format that is applied to all items in the field. Number formats are written to the styles part. For more information see §18.8.31 in Styles.</p> <p>[<i>Note:</i> Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout of the PivotTable, the PivotTable formatting will then take precedence. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).</p>
propertyName (Property Name)	<p>Specifies the name of the property if this field is an OLAP property field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
serverField (Server-based Field)	<p>Specifies a boolean value that indicates whether the field is a server-based page field.</p> <p>A value of 1 or true indicates this field is a server-based page field.</p> <p>A value of 0 or false indicates this field is not a server-based page field.</p> <p>This attribute applies to ODBC sources only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sqlType (SQL Data Type)	<p>Specifies the SQL data type of the field. This attribute stores an ODBC data type and applies to ODBC data sources only. A value is supplied for this</p>

Attributes	Description
	<p>attribute only if it is provided to the application.</p> <p>The following are data types supported by ODBC. For a more information, see the ODBC specification.</p> <ul style="list-style-type: none"> • 0 SQL_UNKNOWN_TYPE • 1 SQL_CHAR • 2 SQL_VARCHAR • -1 SQL_LONGVARCHAR • -8 SQL_WCHAR • -9 SQL_WVARCHAR • -10 SQL_WLONGVARCHAR • 3 SQL_DECIMAL • 2 SQL_NUMERIC • 5 SQL_SMALLINT • 4 SQL_INTEGER • 7 SQL_REAL • 6 SQL_FLOAT • 8 SQL_DOUBLE • -7 SQL_BIT • -6 SQL_TINYINT • -5 SQL_BIGINT • -2 SQL_BINARY • -3 SQL_VARBINARY • -4 SQL_LONGVARBINARY • 9 SQL_TYPE_DATE or SQL_DATE • 10 SQL_TYPE_TIME or SQL_TIME • 11 SQL_TYPE_TIMESTAMP or SQL_TIMESTAMP • 102 SQL_INTERVAL_MONTH • 101 SQL_INTERVAL_YEAR • 107 SQL_INTERVAL_YEAR_TO_MONTH • 103 SQL_INTERVAL_DAY • 104 SQL_INTERVAL_HOUR • 105 SQL_INTERVAL_MINUTE • 106 SQL_INTERVAL_SECOND • 108 SQL_INTERVAL_DAY_TO_HOUR • 109 SQL_INTERVAL_DAY_TO_MINUTE • 110 SQL_INTERVAL_DAY_TO_SECOND • 111 SQL_INTERVAL_HOUR_TO_MINUTE • 112 SQL_INTERVAL_HOUR_TO_SECOND • 113 SQL_INTERVAL_MINUTE_TO_SECOND • -11 SQL_GUID • -20 SQL_SIGNED_OFFSET • -22 SQL_UNSIGNED_OFFSET

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema int datatype.
uniqueList (Unique List Retrieved)	<p>Specifies a boolean value that indicates whether the application was able to get a list of unique items for the field. The attribute only applies to PivotTables that use ODBC and is intended to be used in conjunction with optimization features in the application. <i>[Example: the application can optimize memory usage when populating PivotCache records if it has a list of unique items for a field before all the records are retrieved from ODBC. end example]</i></p> <p>A value of 1 or true indicates the application was able to get a list of unique values for the field.</p> <p>A value of 0 or false indicates the application was unable to get a list of unique values for the field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT CacheField](#)) is located in §A.2. end note]

18.10.1.4 cacheFields (PivotCache Fields)

Represents the collection of field definitions in the source data.

[Example:

```
<cacheFields count="1">
  <cacheField name="Group" numFmtId="0">
    <sharedItems count="3">
      <s v="One"/>
      <s v="Two"/>
      <s v="Three"/>
    </sharedItems>
  </cacheField>
</cacheFields>
```

end example]

Attributes	Description
count (Field Count)	<p>Specifies the number of fields in the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_CacheFields](#)) is located in §A.2. *end note*]

18.10.1.5 `cacheHierarchies` (PivotCache Hierarchies)

Represents the collection of OLAP hierarchies in the PivotCache.

[Example:

```
<cacheHierarchies count="2">
  <cacheHierarchy uniqueName="[Account].[Account]" caption="Account"
    attribute="1" keyAttribute="1"
    defaultMemberUniqueName="[Account].[Account].[All Accounts]"
    allUniqueName="[Account].[Account].[All Accounts]"
    dimensionUniqueName="[Account]" count="0"/>
  <cacheHierarchy uniqueName="[Account].[Account Number]" caption="Account
    Number" attribute="1" defaultMemberUniqueName="[Account].[Account
    Number].[All Accounts]" allUniqueName="[Account].[Account Number].[All
    Accounts]" dimensionUniqueName="[Account]" count="0"/>
</cacheHierarchies>
```

end example]

Attributes	Description
count (Hierarchy Count)	Specifies the number of OLAP hierarchies in the cache. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CacheHierarchies](#)) is located in §A.2. *end note*]

18.10.1.6 `cacheHierarchy` (PivotCache Hierarchy)

Represents an OLAP hierarchy in the PivotCache.

[Example:

```
<cacheHierarchy uniqueName="[Account].[Account Number]" caption="Account Number"
  attribute="1" defaultMemberUniqueName="[Account].[Account Number].[All
  Accounts]" allUniqueName="[Account].[Account Number].[All Accounts]"
  dimensionUniqueName="[Account]" count="0"/>
```

end example]

Attributes	Description
allCaption (Display Name of 'All')	<p>Specifies the display name of the "all" member of this hierarchy.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
allUniqueName (Unique Name of 'All')	<p>Specifies the unique name of the "all" member of this hierarchy.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
attribute (Attribute Hierarchy)	<p>Specifies a boolean value that indicates whether this hierarchy is an attribute hierarchy. An attribute hierarchy is an OLAP member that is exposed as a flat, single-level hierarchy on the OLAP server.</p> <p>A value of 1 or true indicates this hierarchy is an attribute hierarchy.</p> <p>A value of 0 or false indicates this hierarchy is not an attribute hierarchy.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
caption (Hierarchy Display Name)	<p>Specifies the display name of the hierarchy.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
count (Levels Count)	<p>Specifies the number of levels in this hierarchy.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
defaultMemberUniqueName (Default Member Unique Name)	<p>Specifies the unique name of the default member of this hierarchy</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
dimensionUniqueName (Dimension Unique Name)	<p>Specifies the unique name of the dimension to which this hierarchy belongs.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
displayFolder (Display Folder)	<p>Specifies the display folder in which this hierarchy should be displayed.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
hidden (Hidden)	<p>Specifies a boolean value that indicates whether the hierarchy is hidden.</p> <p>A value of 1 or true indicates this hierarchy is hidden.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
iconSet (KPI Icon Set)	<p>Specifies the icon set to use to visualize a KPI trend or status expression. PivotTables use the icon sets available for conditional formatting in SpreadsheetML. See associated simple type definition for details. The following values are used by PivotTables:</p> <ul style="list-style-type: none"> • no value: default iconset. For status KPI this corresponds to 3 traffic lights. For trend KPI this corresponds to 3-arrows. • 1: Variance Arrow - 3 arrow. • 2: 3 arrows • 3: Status Arrow Ascending - 5 arrows. • 4: Status Arrow Descending - 5 arrows • 5: Standard Arrow - 5 arrows gray. • 6: Traffic Light Single - 3 traffic lights 1. • 7: Traffic Light, Traffic Light Multiple - 3 traffic lights 2. • 8: Gauge Ascending - 5 quarters. • 9: Gauge Descending - 5 quarters. • 10: Thermometer, Cylinder, Smiley Face - 3 signs. • 11: Road Signs - 3 symbols. <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
keyAttribute (Key Attribute Hierarchy)	<p>Specifies a boolean value that indicates whether this hierarchy is the key attribute hierarchy in an OLAP dimension.</p> <p>A value of 1 or true indicates this hierarchy is the key attribute hierarchy in an OLAP dimension.</p> <p>A value of 0 or false indicates this hierarchy is not a key attribute hierarchy.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
measure (Measure Hierarchy)	<p>Specifies a boolean value that indicates whether this hierarchy is a measure.</p> <p>A value of 1 or true indicates this hierarchy is a measure.</p> <p>A value of 0 or false indicates this hierarchy is not a measure.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
measureGroup (Measure Group Name)	<p>Specifies the name of the measure group to which this hierarchy belongs.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
measures (Measures)	<p>Specifies a boolean value that indicates whether this hierarchy contains all the measures.</p> <p>A value of 1 or true indicates this hierarchy contains all the measures.</p>

Attributes	Description
	<p>A value of 0 or false indicates this hierarchy does not contain all the measures.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
memberValueDatatype (Member Value Data Type)	<p>Specifies the data type of the member value. This attribute stores an OLEDB data type.</p> <p>[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbtype_indicators.asp end note]</p> <p>memberValueDataType is stored for key attribute hierarchies in order to tell when the application will offer date filtering instead of label filtering in OLAP PivotTables. Date filtering is only offered when the data type is Date/Time. memberValueDatatype="7" indicates a date/time data type.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedShort datatype.</p>
oneField (One Field)	<p>Specifies a boolean value that indicates whether this hierarchy is associated with only one field due to its position in the view.</p> <p>A value of 1 or true indicates this hierarchy is associated with only one field.</p> <p>A value of 0 or false indicates this field is not restricted to only one association due to its position in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
parentSet (Parent Set)	<p>Specifies the parent hierarchy of the set. If the attribute is missing it means that the parent hierarchy is unknown or doesn't exist in the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
set (Set)	<p>Specifies a boolean value that indicates whether this hierarchy is a set.</p> <p>A value of 1 or true indicates this hierarchy is a set.</p> <p>A value of 0 or false indicates this hierarchy is not a set.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
time (Time)	<p>Specifies a boolean value that indicates whether this hierarchy is of type time.</p>

Attributes	Description
	<p>A value of 1 or true indicates this hierarchy is of type time.</p> <p>A value of 0 or false indicates is of a different type.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
unbalanced (Unbalanced)	<p>Specifies a boolean value that indicates whether this hierarchy is an unbalanced hierarchy. If value is not written, then this attribute either cannot be determined or does not apply to the current hierarchy.</p> <p>A value of 1 or true indicates this hierarchy is unbalanced.</p> <p>A value of 0 or false indicates is balanced.</p> <p>For more information on balanced hierarchies, see the documentation provided for your OLAP server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
unbalancedGroup (Unbalanced Group)	<p>Specifies a boolean value that indicated whether the grouped version of this hierarchy is an unbalanced hierarchy. If value is not written, then this attribute either cannot be determined or does not apply to the current hierarchy.</p> <p>A value of 1 or true indicates this hierarchy is unbalanced when grouped.</p> <p>A value of 0 or false indicates is balanced when grouped.</p> <p>For more information on balanced hierarchies, see the documentation provided for your OLAP server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
uniqueName (Hierarchy Unique Name)	<p>Specifies the unique name of the hierarchy.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_CacheHierarchy](#)) is located in §A.2.
end note]

18.10.1.7 [cacheSource \(PivotCache Source Description\)](#)

Represents the description of data source whose data is stored in the pivot cache. The data source refers to the underlying rows or database records that provide the data for a PivotTable. You can create a PivotTable report

from a SpreadsheetML table, an external database (including OLAP cubes), multiple SpreadsheetML worksheets, or another PivotTable.

Quarter	Region	Sport	Sales
Qtr1	East	Golf	\$5,000
Qtr1	East	Safari	\$9,000
Qtr1	East	Tennis	\$1,500
Qtr2	East	Golf	\$2,000
Qtr2	East	Safari	\$6,000
Qtr2	East	Tennis	\$500
Qtr1	West	Golf	\$3,500
Qtr1	West	Tennis	\$6,000
Qtr2	West	Golf	\$2,500
Qtr2	West	Tennis	\$3,200

Information about the data source is stored in the connection element and is retrieved using the `connectionId` attribute.

[Example:

```
<cacheSource type="external" connectionId="1"/>
```

end example]

OLAP data sources are distinguished from other data sources in SpreadsheetML. OLAP records are not stored in the *pivotCacheRecords* part, whereas all records for non-OLAP data sources are stored in the cache.

Attributes	Description
connectionId (Connection Index)	Specifies the index to the workbook connection. This attribute is used when the cache type is 'External.' See §18.13.1 for more information about the connection element. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
type (Cache Type)	Specifies the cache type. The possible values for this attribute are defined by the ST_SourceType simple type (§18.18.75).

[Note: The W3C XML Schema definition of this element’s content model ([CT_CacheSource](#)) is located in §A.2.
end note]

18.10.1.8 **calculatedItem** (Calculated Item)

Represents an item within a PivotTable field that uses a formula . The formula is specified in the `formula` attribute.

Calculations and options available for a PivotTable depend on whether the source data came from an OLAP database or another type of database. This complex type applies to non-OLAP external data or on worksheet data. See `calculatedMember` for information on calculations on OLAP data sources.

Attributes	Description
field (Field Index)	<p>Specifies the index of the pivotField with which this calculated item is associated.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
formula (Calculated Item Formula)	<p>Specifies the formula of the calculated item. In formulas you create for calculated items, you can use operators and expressions as you do in other worksheet formulas. You can use constants and refer to data from the PivotTable, but you cannot use cell references or defined names. You cannot use worksheet functions that require cell references or defined names as arguments, and you cannot use array functions.</p> <p>Further behaviors and restrictions apply to formulas for calculatedItems:</p> <ul style="list-style-type: none"> Formulas for calculated items operate on the individual records; the calculated item formula =Dairy *115% multiplies each individual sale of Dairy times 115%, after which the multiplied amounts are summarized together in the data area. Formulas cannot refer to totals. You can include the field name in a reference to an item. The item name shall be in square brackets. Use this format to avoid #NAME? errors when two items in two different fields in a report have the same name. You can refer to an item by its position in the PivotTable as currently sorted and displayed. The item referred to in this way can change whenever the positions of items change or different items are displayed or hidden. Hidden items are not counted in this index. You can use relative positions to refer to items. The positions are determined relative to the calculated item that contains the formula. If the position you give is before the first item or after the last item in the field, the formula results in a #REF! error. <p>For more information about formulas see §18.17 in Formulas. For more information about defined names see §18.2.6 in Workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_CalculatedItem](#)) is located in §A.2. end note]

18.10.1.9 [calculatedItems \(Calculated Items\)](#)

Represents the collection of calculated items.

Attributes	Description
count (Calculated Item Formula Count)	<p>Specifies the number of calculated item formulas in the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CalculatedItems](#)) is located in §A.2.
end note]

18.10.1.10 **calculatedMember** (Calculated Member)

A calculated member is a member in an OLAP hierarchy for which the value is calculated by an OLAP server using a Multidimensional Expressions (MDX) expression. For PivotTables that are created from OLAP cubes the summarized values are calculated by an OLAP server before the SpreadsheetML application displays the results. In OLAP PivotTables, the consuming application cannot change the summary function used to calculate totals and subtotals.

Calculated members are defined by the Multidimensional Expressions (MDX) expression in the `mdx` attribute.

[*Example:*

```
<calculatedMembers count="1">
  <calculatedMember name="[Product].[Product Categories].[All
    Products].[Calculated Member]" mdx="'[Product].[Product Categories].[All
    Products].[Accessories]'" memberName="Calculated Member"
    hierarchy="[Product].[Product Categories]" parent="[Product].[Product
    Categories].[All Products]"/>
</calculatedMembers>
```

end example]

Attributes	Description
hierarchy (Hierarchy Name)	Specifies the name of the hierarchy to which the calculated member belongs. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
mdx (Calculated Member MDX Formula)	Specifies the MDX formula for the calculated member. [<i>Note:</i> Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx <i>end note</i>] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
memberName (OLAP Calculated Member Name)	Specifies the OLAP member name for the calculated member. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

Attributes	Description
name (Calculated Member Name)	Specifies the name of the calculated member. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
parent (Parent Name)	Specifies the name of the parent of the calculated member. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
set (Set)	Specifies a boolean value that indicates whether this calculated member describes a calculated set rather than a calculated member. A value of 1 or true indicates this is a calculated set. A value of 0 or false indicates this is a calculated member. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
solveOrder (Calculated Members Solve Order)	Specifies the order in which this calculated member is calculated in relation to other calculated members. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_CalculatedMember](#)) is located in §A.2. end note]

18.10.1.11 [calculatedMembers \(Calculated Members\)](#)

Represents the collection of calculated members in an OLAP PivotTable.

[Example:

```
<calculatedMembers count="1">
  <calculatedMember name="[Product].[Product Categories].[All
    Products].[Calculated Member]" mdx="'[Product].[Product Categories].[All
    Products].[Accessories]'" memberName="Calculated Member"
    hierarchy="[Product].[Product Categories]" parent="[Product].[Product
    Categories].[All Products]"/>
</calculatedMembers>
```

end example]

Attributes	Description
count (Calculated Members Count)	Specifies the number of calculated members.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_CalculatedMembers](#)) is located in §A.2. end note]

18.10.1.12 `chartFormat` (PivotChart Format)

Represents the format defined in the PivotChart that is associated with this PivotTable.

[Example:

```
<sh:pivotTableDefinition xmlns:sh="..." name="PivotTable1" cacheId="0"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
  applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="1"
  dataCaption="Values" updatedVersion="3" minRefreshableVersion="3"
  showCalcMbrs="0" useAutoFormatting="1" colGrandTotals="0" itemPrintTitles="1"
  createdVersion="3" indent="0" outline="1" outlineData="1"
  multipleFieldFilters="0" chartFormat="1" fieldListSortAscending="1">
```

end example]

Attributes	Description
chart (Chart Index)	<p>Specifies the index of the chart part to which the formatting applies. For more information see the DrawingML specification for more information on the chart part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
format (Pivot Format Id)	<p>Specifies the index of the pivot format that is currently in use. This index corresponds to a dxf element in the Styles part. For more information see the Styles section (§18.8).</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
series (Series Format)	<p>Specifies a boolean value that indicates whether format applies to a series.</p> <p>A value of 1 or true indicates this format applies to a series.</p> <p>A value of 0 or false indicates this format applies to a data point.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ChartFormat](#)) is located in §A.2.
end note]

18.10.1.13 `chartFormats` (PivotChart Formats)

Represents the collection of formats applied to PivotChart.

[Example:

```
<sh:chartFormats count="4">
  <sh:chartFormat chart="0" format="0" series="1">
    <sh:pivotArea type="data" outline="0">
      <sh:references count="3">
        <sh:reference field="4294967294" count="1" selected="0">
          <sh:x v="0"/>
        </sh:reference>
        <sh:reference field="14" count="1" selected="0">
          <sh:x v="0"/>
        </sh:reference>
        <sh:reference field="15" count="1" selected="0">
          <sh:x v="2"/>
        </sh:reference>
      </sh:references>
    </sh:pivotArea>
  </sh:chartFormat>
  <sh:chartFormat chart="0" format="1" series="1">
    <sh:pivotArea type="data" outline="0">
      <sh:references count="3">
        <sh:reference field="4294967294" count="1" selected="0">
          <sh:x v="0"/>
        </sh:reference>
        <sh:reference field="14" count="1" selected="0">
          <sh:x v="0"/>
        </sh:reference>
        <sh:reference field="15" count="1" selected="0">
          <sh:x v="3"/>
        </sh:reference>
      </sh:references>
    </sh:pivotArea>
  </sh:chartFormat>
```

```
<sh:chartFormat chart="0" format="2" series="1">
  <sh:pivotArea type="data" outline="0">
    <sh:references count="3">
      <sh:reference field="4294967294" count="1" selected="0">
        <sh:x v="1"/>
      </sh:reference>
      <sh:reference field="14" count="1" selected="0">
        <sh:x v="0"/>
      </sh:reference>
      <sh:reference field="15" count="1" selected="0">
        <sh:x v="2"/>
      </sh:reference>
    </sh:references>
  </sh:pivotArea>
</sh:chartFormat>
<sh:chartFormat chart="0" format="3" series="1">
  <sh:pivotArea type="data" outline="0">
    <sh:references count="3">
      <sh:reference field="4294967294" count="1" selected="0">
        <sh:x v="1"/>
      </sh:reference>
      <sh:reference field="14" count="1" selected="0">
        <sh:x v="0"/>
      </sh:reference>
      <sh:reference field="15" count="1" selected="0">
        <sh:x v="3"/>
      </sh:reference>
    </sh:references>
  </sh:pivotArea>
</sh:chartFormat>
</sh:chartFormats>
```

end example]

Attributes	Description
count (Format Count)	Specifies the number of formats in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_ChartFormats](#)) is located in §A.2.
end note]

18.10.1.14 colFields (Column Fields)

Represents the collection of fields that are on the column axis of the PivotTable.

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a column field.

[Example: In the following SpreadsheetML example, "Year", "Quarter" and "Month" are on the column axis of the PivotTable, in that order.

```
<colFields count="3">
  <field x="14"/>
  <field x="15"/>
  <field x="16"/>
</colFields>
```

end example]

Attributes	Description
count (Repeated Items Count)	Specifies the number of items in this collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_ColFields](#)) is located in §A.2. *end note]*

18.10.1.15 colHierarchiesUsage (Column OLAP Hierarchy References)

Represents the collection of references to OLAP hierarchies on the column axis of a PivotTable.

[Example:

```
<sh:colHierarchiesUsage count="2">
  <sh:colHierarchyUsage hierarchyUsage="33"/>
  <sh:colHierarchyUsage hierarchyUsage="-2"/>
</sh:colHierarchiesUsage>
```

end example]

Attributes	Description
count (Items Count)	Specifies the number of items in the collection.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColHierarchiesUsage](#)) is located in §A.2. *end note*]

18.10.1.16 colHierarchyUsage (Column OLAP Hierarchies)

Represents the collection of references to OLAP Hierarchies on the column axis of a PivotTable.

[*Example:*

```
<sh:colHierarchyUsage hierarchyUsage="33"/>
```

end example]

Attributes	Description
hierarchyUsage (Hierarchy Usage)	Specifies the reference to an OLAP hierarchy in a PivotTable. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_HierarchyUsage](#)) is located in §A.2. *end note*]

18.10.1.17 colItems (Column Items)

Represents the collection of column items of the PivotTable.

[*Example:* In the following SpreadsheetML example the item values are found in cells C6:H8. For example "2001" / "3" / "July" values are in C7:C9. Those are the first column item values and are referenced by the first `<i>` element below.

```
<colItems count="5">
  <i>
    <x/>
    <x/>
    <x/>
  </i>
  <i r="2">
    <x v="1"/>
  </i>
```

```
<i r="2">
  <x v="2"/>
</i>
<i t="default" r="1">
  <x/>
</i>
<i t="default">
  <x/>
</i>
</colItems>
```

end example]

The first `<i>` collection represents all item values for the first column in the column axis area of the PivotTable. The first `<x>` in the first `<i>` corresponds to the first field in the columns area of the PivotTable, namely "Year". The implied index value of '0' on this `<x>` indicates that the item value for this first item in the column is the 0th item for this pivotField. The 0th item for this pivotField is itself an index to an item value into this field's shared items collection in the pivotCacheDefinition part, namely "2001".

The item values corresponding to the second and third `<x>` elements can be found in the same way, arriving at "3" for the second item value, and arriving at "July" for the third item value for this first column.

The second `<i>` collection expresses all 3 item values for the second column in the column axis area. The `@r` value of '2' indicates that the first two item values from the previous column is repeated here, which means that the first item value for this second column is "2001" again and the second item value for this second column is "3". The third item value is expressed by the only `<x>` element under this second `<i>` element, and without further explanation is understood to reference the item value "August".

Attributes	Description
count (Column Item Count)	Specifies the number of items on the column axis of the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_collItems](#)) is located in §A.2. *end note*]

18.10.1.18 conditionalFormat (Conditional Formatting)

Represents the conditional formatting defined in the PivotTable.

Attributes	Description
priority (Priority)	Specifies the priority of PivotTable conditional formatting rule. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
scope (Conditional Formatting Scope)	Specifies the scope of PivotTable conditional formatting rule. The possible values for this attribute are defined by the ST_Scope simple type (§18.18.67).
type (Conditional Formatting Rule Type)	Specifies the type of PivotTable conditional formatting rule. See associated simple type definition for details. The possible values for this attribute are defined by the ST_Type simple type (§18.18.84).

[Note: The W3C XML Schema definition of this element's content model ([CT_ConditionalFormat](#)) is located in §A.2. end note]

18.10.1.19 conditionalFormats (Conditional Formats)

Represents the collection of conditional formats applied to a PivotTable.

[Example:

```
<sh:conditionalFormats count="1">
  <sh:conditionalFormat priority="1">
    <sh:pivotAreas count="1">
      <sh:pivotArea type="data" collapsedLevelsAreSubtotals="1">
        <sh:references count="5">
          <sh:reference field="4294967294" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
          <sh:reference field="2" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
          <sh:reference field="14" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
        </sh:references>
      </sh:pivotArea>
    </sh:pivotAreas>
  </sh:conditionalFormat>
</sh:conditionalFormats>
```

```

    <sh:reference field="15" count="2" selected="0">
      <sh:x v="2"/>
      <sh:x v="3"/>
    </sh:reference>
  </sh:references>
</sh:pivotArea>
</sh:pivotAreas>
</sh:conditionalFormat>
</sh:conditionalFormats>

```

end example]

Attributes	Description
count (Conditional Format Count)	<p>Specifies the number of conditional formats defined for the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ConditionalFormats](#)) is located in §A.2. *end note*]

18.10.1.20 consolidation (Consolidation Source)

Represents the description of the PivotCache source using multiple consolidation ranges. This element is used when the source of the PivotTable is a collection of ranges in the workbook. The ranges are specified in the rangeSets collection. The logic for how the application consolidates the data in the ranges is application-defined. [*Example:* the application might consolidate data based on its position in the worksheet that the end-user specifies. *end example*]

Attributes	Description
autoPage (Auto Page)	<p>Specifies a boolean value that indicates whether the application will automatically create one additional page field to describe/qualify the source ranges.</p> <p>A value of 1 or true indicates the application will create an additional page field.</p> <p>A value of 0 or false indicates will not create an additional page field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Consolidation](#)) is located in §A.2. *end note*]

18.10.1.21 d (Date Time)

Represents a date-time value in the PivotTable.

Attributes	Description
c (Caption)	<p>Specifies the caption for the item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
cp (Member Property Count)	<p>Specifies the number of member property values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
f (Calculated Item Value)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of 1 or true indicates this is a calculated item value.</p> <p>A value of 0 or false indicates this is not a calculated item value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of 1 or true indicates this is an unused item.</p> <p>A value of 0 or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_DateTime) is located in §A.2. *end note*]

18.10.1.22 dataField (Data Field Item)

Represents a field from a source list, table, or database that contains data that is summarized in a PivotTable.

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

A data field represents data that is derived from a field in the source list or database. *[Example: The Sport field, for example, might come from a column in the source list that is labeled Sport and contains the names of various sports (Golf, Tennis) for which the source list has sales figures. end example]*

Source data can be taken from an SpreadsheetML list or range, an external database or cube, or another PivotTable. Data fields use summary functions to combine values from the underlying source data. You can also use custom calculations to compare data values, or add your own formulas that use elements of the report or other worksheet data.

[Example:

```
<dataFields count="1">
  <dataField name="Sum of Sales Amount" fld="25" baseField="0" baseItem="0"/>
</dataFields>
```

end example]

Attributes	Description
baseField ('Show Data As' Base Field)	Specifies the index to the base field when the ShowDataAs calculation is in use. The possible values for this attribute are defined by the W3C XML Schema int datatype.
baseItem ('Show Data As' Base Setting)	Specifies the index to the base item when the ShowDataAs calculation is in use. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
fld (Field)	Specifies the index to the field (<r>) in the pivotCacheRecords part that this data item summarizes. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Data Field Name)	Specifies the name of the data field. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
numFmtId (Number Format Id)	Specifies the index to the number format applied to this data field. Number formats are written to the styles part. See the Styles section (§18.8) for more information on number formats. Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout

Attributes	Description
	<p>the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).</p>
showDataAs (Show Data As Display Format)	<p>Specifies the display format for this data field.</p> <p>Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_ShowDataAs simple type (§18.18.70).</p>
subtotal (Subtotal)	<p>Specifies the aggregation function that applies to this data field.</p> <p>The possible values for this attribute are defined by the ST_DataConsolidateFunction simple type (§18.18.17).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DataField](#)) is located in §A.2. *end note*]

18.10.1.23 dataFields (Data Fields)

Represents the collection of items in the data region of the PivotTable.

[Example:

```
<dataFields count="1">
  <dataField name="Sum of Sales Amount" fld="25" baseField="0" baseItem="0"/>
</dataFields>
```

end example]

Attributes	Description
count (Data Items Count)	<p>Specifies the number of items in the data region of the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DataFields](#)) is located in §A.2. *end note*]

18.10.1.24 dimension (OLAP Dimension)

Represents a PivotTable OLAP Dimension. A dimension is a field that organizes a single type of data into a hierarchy with levels of detail. *[Example: An OLAP database could contain a Time dimension providing data for levels Year, Month, Week, and Day, allowing you to create reports that let you compare day-to-day sales results or view a summary of your sales for an entire year. end example]*

Attributes	Description
caption (Dimension Display Name)	Specifies the display name of the dimension. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
measure (Measure)	Specifies a boolean value that indicates whether this is a measure dimension. A value of 1 or true indicates this dimension is a measure dimension. A value of 0 or false indicates this dimension is not a measure dimension. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (Dimension Name)	Specifies the name of the dimension. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
uniqueName (Dimension Unique Name)	Specifies the unique name of the dimension. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotDimension](#)) is located in §A.2. end note]

18.10.1.25 dimensions (OLAP Dimensions)

Represents the collection of PivotTable OLAP dimensions.

[Example:

```
<dimensions count="22">
  <dimension name="Account" uniqueName="[Account]" caption="Account"/>
  <dimension name="Customer" uniqueName="[Customer]" caption="Customer"/>
  <dimension name="Date" uniqueName="[Date]" caption="Date"/>
  <dimension name="Delivery Date" uniqueName="[Delivery Date]"
    caption="Delivery Date"/>
```

```
<dimension name="Department" uniqueName="[Department]" caption="Department"/>
<dimension name="Destination Currency" uniqueName="[Destination Currency]"
  caption="Destination Currency"/>
<dimension name="Employee" uniqueName="[Employee]" caption="Employee"/>
<dimension name="Geography" uniqueName="[Geography]" caption="Geography"/>
<dimension name="Internet Sales Order Details" uniqueName="[Internet Sales
  Order Details]" caption="Internet Sales Order Details"/>
<dimension measure="1" name="Measures" uniqueName="[Measures]"
  caption="Measures"/>
<dimension name="Organization" uniqueName="[Organization]"
  caption="Organization"/>
<dimension name="Product" uniqueName="[Product]" caption="Product"/>
<dimension name="Promotion" uniqueName="[Promotion]" caption="Promotion"/>
<dimension name="Reseller" uniqueName="[Reseller]" caption="Reseller"/>
<dimension name="Reseller Sales Order Details" uniqueName="[Reseller Sales
  Order Details]" caption="Reseller Sales Order Details"/>
<dimension name="Sales Channel" uniqueName="[Sales Channel]" caption="Sales
  Channel"/>
<dimension name="Sales Reason" uniqueName="[Sales Reason]" caption="Sales
  Reason"/>
<dimension name="Sales Summary Order Details" uniqueName="[Sales Summary Order
  Details]" caption="Sales Summary Order Details"/>
<dimension name="Sales Territory" uniqueName="[Sales Territory]"
  caption="Sales Territory"/>
<dimension name="Scenario" uniqueName="[Scenario]" caption="Scenario"/>
<dimension name="Ship Date" uniqueName="[Ship Date]" caption="Ship Date"/>
<dimension name="Source Currency" uniqueName="[Source Currency]"
  caption="Source Currency"/>
</dimensions>
```

end example]

Attributes	Description
count (OLAP Dimensions Count)	Specifies the number of OLAP dimensions in the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Dimensions](#)) is located in §A.2. *end note*]

18.10.1.26 [discretePr \(Discrete Grouping Properties\)](#)

Represents the collection of discrete grouping properties for a field group.

[Example:

```

...
    <fieldGroup par="6" base="0">
      <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
        endDate="2006-05-06T00:00:00"/>
      <groupItems count="14">
        <s v="&lt;1/1/2002"/>
        <s v="Jan"/>
        <s v="Feb"/>
        <s v="Mar"/>
        <s v="Apr"/>
        <s v="May"/>
        <s v="Jun"/>
        <s v="Jul"/>
        <s v="Aug"/>
        <s v="Sep"/>
        <s v="Oct"/>
        <s v="Nov"/>
        <s v="Dec"/>
        <s v="&gt;5/6/2006"/>
      </groupItems>
    </fieldGroup>
  </cacheField>
  <cacheField name="Name" numFmtId="0">
    <sharedItems count="4">
      <s v="Joe"/>
      <s v="John"/>
      <s v="Bob"/>
      <s v="Robert"/>
    </sharedItems>
    <fieldGroup par="4"/>
  </cacheField>
  <cacheField name="ProductID" numFmtId="0">
    <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
      containsInteger="1" minValue="1" maxValue="4" count="4">
      <n v="1"/>
      <n v="2"/>
      <n v="3"/>
      <n v="4"/>
    </sharedItems>

```

```

<fieldGroup base="2">
  <rangePr startNum="1" endNum="4" groupInterval="2"/>
  <groupItems count="4">
    <s v="&lt;1"/>
    <s v="1-2"/>
    <s v="3-4"/>
    <s v="&gt;5"/>
  </groupItems>
</fieldGroup>
</cacheField>

```

end example]

Attributes	Description
count (Mapping Index Count)	<p>Specifies the number of mapping indexes for this grouped field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_DiscretePr](#)) is located in §A.2. *end note*]

18.10.1.27 e (Error Value)

Represents an error value. The use of this item indicates that an error value is present in the PivotTable source. The error is recorded in the value attribute.

Attributes	Description
b (Bold)	<p>Specifies a boolean value that indicates whether the value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains bold formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bc (background Color)	<p>Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
c (Item Caption)	<p>Specifies the item/member caption</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type</p>

Attributes	Description
	(§22.9.2.19).
cp (Member Property Count)	<p>Specifies the number of member property values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of 1 or true indicates value is a calculated item value.</p> <p>A value of 0 or false indicates this value is not a calculated item value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains italic formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains strikethrough formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of 1 or true indicates this item is not used.</p>

Attributes	Description
	<p>A value of 0 or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item. This attribute depends on how the application records errors.</p> <p>[Note: While the error values are determined by the application, the following are some example error values that could be used:</p> <ul style="list-style-type: none"> • #DIV/0! • #NAME? • #VALUE! • #NULL! • #NUM! • #REF! • #N/A • #GETTING_DATA <p>end note]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Error](#)) is located in §A.2. end note]

18.10.1.28 entries (Entries)

Represents the collection of OLAP sheet data entries.

Attributes	Description
count (Tuple Count)	<p>Specifies the number of tuple entries.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PCDSDTCEntries](#)) is located in §A.2. end note]

18.10.1.29 field (Field)

Represents a generic field that can appear either on the column or the row region of the PivotTable. There areas many <x> elements as there are item values in any particular column or row.

[Example:

```
<sh:field x="2"/>
```

end example]

Attributes	Description
x (Field Index)	Specifies the index to a pivotField item value. There are as many x elements as there are item values in any particular column. Note that these x elements sometimes are not explicitly written, but instead "inherited" from the previous column or i element, via the value of @r. The pivotField items don't list values explicitly, but instead reference a shared item value in the pivotCacheDefinition part. The first instance of x has no attribute value @v associated with it, so the default value for @v is assumed to be "0". The possible values for this attribute are defined by the W3C XML Schema int datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Field](#)) is located in §A.2. end note]

18.10.1.30 fieldGroup (Field Group Properties)

Represents the collection of properties for a field group.

[Example:

```
...
<fieldGroup par="6" base="0">
  <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
    endDate="2006-05-06T00:00:00"/>
  <groupItems count="14">
    <s v="1/1/2002"/>
    <s v="Jan"/>
    <s v="Feb"/>
    <s v="Mar"/>
    <s v="Apr"/>
    <s v="May"/>
    <s v="Jun"/>
    <s v="Jul"/>
    <s v="Aug"/>
    <s v="Sep"/>
```

```

        <s v="Oct"/>
        <s v="Nov"/>
        <s v="Dec"/>
        <s v="&gt;5/6/2006"/>
    </groupItems>
</fieldGroup>
</cacheField>
<cacheField name="Name" numFmtId="0">
    <sharedItems count="4">
        <s v="Joe"/>
        <s v="John"/>
        <s v="Bob"/>
        <s v="Robert"/>
    </sharedItems>
    <fieldGroup par="4"/>
</cacheField>
<cacheField name="ProductID" numFmtId="0">
    <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
        containsInteger="1" minValue="1" maxValue="4" count="4">
        <n v="1"/>
        <n v="2"/>
        <n v="3"/>
        <n v="4"/>
    </sharedItems>
    <fieldGroup base="2">
        <rangePr startNum="1" endNum="4" groupInterval="2"/>
        <groupItems count="4">
            <s v="&lt;1"/>
            <s v="1-2"/>
            <s v="3-4"/>
            <s v="&gt;5"/>
        </groupItems>
    </fieldGroup>
...

```

end example]

Attributes	Description
base (Field Base)	Specifies the base of this field, if any. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
par (Parent)	Specifies the parent of this field, if any.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_FieldGroup](#)) is located in §A.2. *end note*]

18.10.1.31 fieldsUsage (Fields Usage)

Represents the fields in the cache that are being used by this hierarchy.

[Example:

```
<fieldsUsage count="6">
  <fieldUsage x="-1"/>
  <fieldUsage x="2"/>
  <fieldUsage x="3"/>
  <fieldUsage x="4"/>
  <fieldUsage x="5"/>
  <fieldUsage x="6"/>
</fieldsUsage>
```

end example]

Attributes	Description
count (Field Count)	Specifies the number of fields that are being used by this hierarchy.
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_FieldsUsage](#)) is located in §A.2. *end note*]

18.10.1.32 fieldUsage (PivotCache Field Id)

Represents a cache field used in this hierarchy.

[Example:

```
<fieldUsage x="-1"/>
```

end example]

Attributes	Description
x (Field Index)	Specifies the index of a field.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema int datatype.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FieldUsage](#)) is located in §A.2. *end note*]

18.10.1.33 filter (PivotTable Advanced Filter)

Represents a PivotTable advanced filter.

[*Example:*

```
<sh:filter fld="3" type="count" id="1" iMeasureHier="187">
  <sh:autoFilter ref="A1">
    <sh:filterColumn colId="0">
      <sh:top10 val="5"/>
    </sh:filterColumn>
  </sh:autoFilter>
</sh:filter>
```

end example]

Attributes	Description
description (Pivot Filter Description)	Specifies the description of the pivot filter. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
evalOrder (Evaluation Order)	Specifies the evaluation order of the pivot filter. This attribute is zero-based. The possible values for this attribute are defined by the W3C XML Schema int datatype.
fld (Field Index)	Specifies the index of the field to which this pivot filter belongs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
id (Pivot Filter Id)	Specifies the unique identifier of the pivot filter as assigned by the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
iMeasureFld (Measure Field Index)	Specifies the index of the measure field. This attribute is used only by filters in Relational pivots and specifies on which measure a value filter should apply. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

Attributes	Description
iMeasureHier (Measure Index)	Specifies the index of the measure cube field. This attribute is used only by filters in OLAP pivots and specifies on which measure a value filter should apply. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
mpFld (Member Property Field Id)	Specifies the index of the field representing the member property field on which this pivot filter is defined. This attribute is used only by label pivot filters. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Pivot Filter Name)	Specifies the name of the pivot filter. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
stringValue1 (Label Pivot)	Specifies the string value "1" used by label pivot filters. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
stringValue2 (Label Pivot Filter String Value 2)	Specifies the string value "2" used by label pivot filters. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
type (Pivot Filter Type)	Specifies the type of the pivot filter. The possible values for this attribute are defined by the ST_PivotFilterType simple type (§18.18.59).

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotFilter](#)) is located in §A.2. *end note*]

18.10.1.34 filters (Filters)

Represents the collection of filters that apply to this PivotTable.

[Example:

```
<sh:filters count="1">
  <sh:filter fld="3" type="count" id="1" iMeasureHier="187">
    <sh:autoFilter ref="A1">
      <sh:filterColumn colId="0">
        <sh:top10 val="5"/>
      </sh:filterColumn>
    </sh:autoFilter>
  </sh:filter>
</sh:filters>
```

end example]

Attributes	Description
count (Pivot Filter Count)	<p>Specifies the number of pivot filters in the collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_PivotFilters](#)) is located in §A.2. *end note*]

18.10.1.35 format (PivotTable Format)

Represents the format defined in the PivotTable.

Attributes	Description
action (Format Action)	<p>Specifies the formatting behavior for the area indicated in the pivotArea element. The default value for this attribute is "formatting," which indicates that the specified cells have some formatting applied. The format is specified in the dxflId attribute. If the formatting is cleared from the cells, then the value of this attribute becomes "blank."</p> <p>The possible values for this attribute are defined by the ST_FormatAction simple type (§18.18.34).</p>
dxflId (Format Id)	<p>Specifies the identifier of the format the application is currently using for the PivotTable. Formatting information is written to the styles part. See the Styles section (§18.8) for more information on formats.</p> <p>Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_DxflId simple type (§18.18.25).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Format](#)) is located in §A.2. *end note*]

18.10.1.36 formats (PivotTable Formats)

Represents the collection of formats applied to PivotTable.

Attributes	Description
count (Formats Count)	Specifies the number of formats in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Formats](#)) is located in §A.2. *end note*]

18.10.1.37 group (OLAP Group)

Represents an OLAP level group.

[Example:

```
<group name="CategoryX1_Grp_1" uniqueName="[Product].[Product Categories].
[Product Categories1].[GROUPMEMBER.[CategoryX1_Grp_1]].[Product]].
[Product Categories]].[All Products]]]" caption="Group1"
uniqueParent="[Product].[Product Categories].[All Products]" id="1">
  <groupMembers count="2">
    <groupMember
      uniqueName="[Product].[Product Categories].[Category].&[4]"/>
    <groupMember
      uniqueName="[Product].[Product Categories].[Category].&[1]"/>
  </groupMembers>
</group>
```

end example]

Attributes	Description
caption (Group Caption)	Specifies the caption for this group. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
id (Group Id)	Specifies the unique number for this group within the level. The possible values for this attribute are defined by the W3C XML Schema int datatype.
name (Group	Specifies the name of this group.

Attributes	Description
Name)	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
uniqueName (Unique Group Name)	Specifies the unique name of this group. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
uniqueParent (Parent Unique Name)	Specifies the unique name of the parent of this group. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_LevelGroup](#)) is located in §A.2. *end note*]

18.10.1.38 groupItems (OLAP Group Items)

Represents the collection of items in a field group.

[Example:

```

...
<fieldGroup par="6" base="0">
  <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
    endDate="2006-05-06T00:00:00"/>
  <groupItems count="14">
    <s v="&lt;1/1/2002"/>
    <s v="Jan"/>
    <s v="Feb"/>
    <s v="Mar"/>
    <s v="Apr"/>
    <s v="May"/>
    <s v="Jun"/>
    <s v="Jul"/>
    <s v="Aug"/>
    <s v="Sep"/>
    <s v="Oct"/>
    <s v="Nov"/>
    <s v="Dec"/>
    <s v="&gt;5/6/2006"/>
  </groupItems>
</fieldGroup>
</cacheField>

```

```
<cacheField name="Name" numFmtId="0">
  <sharedItems count="4">
    <s v="Joe"/>
    <s v="John"/>
    <s v="Bob"/>
    <s v="Robert"/>
  </sharedItems>
  <fieldGroup par="4"/>
</cacheField>
<cacheField name="ProductID" numFmtId="0">
  <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
    containsInteger="1" minValue="1" maxValue="4" count="4">
    <n v="1"/>
    <n v="2"/>
    <n v="3"/>
    <n v="4"/>
  </sharedItems>
  <fieldGroup base="2">
    <rangePr startNum="1" endNum="4" groupInterval="2"/>
    <groupItems count="4">
      <s v="&lt;1"/>
      <s v="1-2"/>
      <s v="3-4"/>
      <s v="&gt;5"/>
    </groupItems>
  </fieldGroup>
...
end example]
```

Attributes	Description
count (Items Created Count)	Specifies the number of items created for this grouped field. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_GroupItems](#)) is located in §A.2. *end note*]

18.10.1.39 [groupLevel \(OLAP Grouping Levels\)](#)

Represents the collection of OLAP grouping levels.

[Example:

```

<groupLevel uniqueName="[Product].[Product Categories].[Category]"
  caption="Category">
  <groups count="1">
    <group name="CategoryXl_Grp_1" uniqueName="[Product].[Product
      Categories].[Product Categories1].
      [GROUPMEMBER.[CategoryXl_Grp_1]].[Product]].[Product Categories]].
      [All Products]]]" caption="Group1" uniqueParent="[Product].
      [Product Categories].[All Products]" id="1">
      <groupMembers count="2">
        <groupMember
          uniqueName="[Product].[Product Categories].[Category].&[4]"/>
        <groupMember
          uniqueName="[Product].[Product Categories].[Category].&[1]"/>
      </groupMembers>
    </group>
  </groups>
</groupLevel>

```

end example]

Attributes	Description
caption (Grouping Level Display Name)	<p>Specifies the display name for this grouping level.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
customRollUp (Custom Roll Up)	<p>Specifies a boolean value that indicates whether this group level has a custom roll up. A value of 1 or true indicates this group level has a custom roll up.</p> <p>A value of 0 or false indicates this group level does not have a custom roll up.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
uniqueName (Unique Name)	<p>Specifies the unique name for this grouping level.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
user (User-Defined Group Level)	<p>Specifies a boolean value that indicates whether this is a user-defined group level.</p> <p>A value of 1 or true indicates this is a user-defined group.</p> <p>A value of 0 or false indicates this group is not user-defined.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupLevel](#)) is located in §A.2. *end note*]

18.10.1.40 groupLevels (OLAP Grouping Levels)

Represents the collection of OLAP grouping levels.

[Example:

```
<groupLevels count="5">
  <groupLevel uniqueName="[Product].[Product Categories].[All]"
    caption="(All)"/>
  <groupLevel uniqueName="[Product].[Product Categories].[Product Categories1]"
    caption="Product Categories1" user="1"/>
  <groupLevel uniqueName="[Product].[Product Categories].[Category]"
    caption="Category">
    <groups count="1">
      <group name="CategoryXl_Grp_1" uniqueName="[Product].[Product Categories].
        [Product Categories1].[GROUPMEMBER.[CategoryXl_Grp_1]].
        [Product]].[Product Categories]].[All Products]]" caption="Group1"
        uniqueParent="[Product].[Product Categories].[All Products]" id="1">
        <groupMembers count="2">
          <groupMember
            uniqueName="[Product].[Product Categories].[Category].&[4]"/>
          <groupMember
            uniqueName="[Product].[Product Categories].[Category].&[1]"/>
        </groupMembers>
      </group>
    </groups>
  </groupLevel>
  <groupLevel uniqueName="[Product].[Product Categories].[Subcategory]"
    caption="Subcategory"/>
  <groupLevel uniqueName="[Product].[Product Categories].[Product]"
    caption="Product"/>
</groupLevels>
```

end example]

Attributes	Description
count (Grouping Level Count)	<p>Specifies the number of grouping levels.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupLevels](#)) is located in §A.2. *end note*]

18.10.1.41 groupMember (OLAP Group Member)

Represents an OLAP group member.

[Example:

```
<groupMember uniqueName="[Product].[Product Categories].[Category].&[1]"/>
```

end example]

Attributes	Description
group (Group)	Specifies a boolean value that indicates whether this member represents a group. A value of 1 or true indicates this member represents a group. A value of 0 or false indicates this member does not represent a group. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
uniqueName (Group Member Unique Name)	Specifies the unique name of this group member. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupMember](#)) is located in §A.2. *end note*]

18.10.1.42 groupMembers (OLAP Group Members)

Represents the collection of OLAP group members.

[Example:

```
<groupMembers count="2">  
  <groupMember uniqueName="[Product].[Product Categories].[Category].&[4]"/>  
  <groupMember uniqueName="[Product].[Product Categories].[Category].&[1]"/>  
</groupMembers>
```

end example]

Attributes	Description
count (Group Member Count)	Specifies the number of group members in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt

Attributes	Description
	datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupMembers](#)) is located in §A.2. end note]

18.10.1.43 groups (OLAP Level Groups)

Represents the collection of OLAP level groups.

[Example:

```
<groups count="1">
  <group name="CategoryX1_Grp_1" uniqueName="[Product].[Product Categories].
    [Product Categories1].[GROUPMEMBER].[CategoryX1_Grp_1].[Product]].
    [Product Categories]].[All Products]]]" caption="Group1"
    uniqueParent="[Product].[Product Categories].[All Products]" id="1">
    <groupMembers count="2">
      <groupMember
        uniqueName="[Product].[Product Categories].[Category].&[4]"/>
      <groupMember
        uniqueName="[Product].[Product Categories].[Category].&[1]"/>
    </groupMembers>
  </group>
</groups>
```

end example]

Attributes	Description
count (Level Group Count)	Specifies the number of level groups in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Groups](#)) is located in §A.2. end note]

18.10.1.44 i (Row Items)

Represents the collection of items in the row region of the PivotTable.

[Example: In this example the item values are found in cells B10:B13. For example "Bikes" is in B10, and corresponds to the first <i> element below.

```
<rowItems count="4">
  <i>
    <x/>
  </i>
  <i r="1">
    <x/>
  </i>
  <i r="1">
    <x v="1"/>
  </i>
  <i t="grand">
    <x/>
  </i>
</rowItems>
```

end example]

Attributes	Description
i (Data Field Index)	<p>Specifies a zero-based index indicating the referenced data item it in a data field with multiple data items.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
r (Repeated Items Count)	<p>Specifies the number of items to repeat from the previous row item. The first item has no @r explicitly written. Since a default of "0" is specified in the schema, for any item whose @r is missing, a default value of "0" is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
t (Item Type)	<p>Specifies the type of the item. Value of 'default' indicates a grand total as the last row item value</p> <p>The possible values for this attribute are defined by the ST_ItemType simple type (§18.18.43).</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_I](#)) is located in §A.2. *end note*]

18.10.1.45 [item \(PivotTable Field Item\)](#)

Represents a single item in PivotTable field.

[Example:

```
<sh:item x="66"/>
```

end example]

Attributes	Description
c (Child Items)	<p>Specifies a boolean value that indicates whether the approximate number of child items for this item is greater than zero.</p> <p>A value of 1 or true indicates the approximate number of child items for this item is greater than zero.</p> <p>A value of 0 or false indicates the approximate number of child items for this item is zero.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
d (Expanded)	<p>Specifies a boolean value that indicates whether this item has been expanded in the PivotTable view.</p> <p>A value of 1 or true indicates this item has been expanded.</p> <p>A value of 0 or false indicates this item is collapsed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
e (Drill Across Attributes)	<p>Specifies a boolean value that indicates whether attribute hierarchies nested next to each other on a PivotTable row or column will offer drilling "across" each other or not. <i>[Example: if the application offers drill across for attribute hierarchies and not for user hierarchies, this attribute would only be written when two attribute hierarchies are placed next to each other on an axis. end example]</i></p> <p>A value of 1 or true indicates there is a drill across attribute hierarchies positioned next to each other on a pivot axis.</p> <p>A value of 0 or false indicates there is not drill across attribute hierarchies.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
f (Calculated Member)	<p>Specifies a boolean value that indicates whether this item is a calculated member.</p> <p>A value of 1 or true indicates this item is a calculated member.</p> <p>A value of 0 or false indicates this item is not calculated.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
h (Hidden)	<p>Specifies a boolean value that indicates whether the item is hidden.</p>

Attributes	Description
	<p>A value of 1 or true indicates item is hidden.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
m (Missing)	<p>Specifies a boolean value that indicate whether the item has a missing value.</p> <p>A value of 1 or true indicates the item value is missing. The application should still retain the item settings in case the item reappears during a later refresh.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
n (Item User Caption)	<p>Specifies the user caption of the item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
s (Character)	<p>Specifies a boolean value that indicates whether the item has a character value.</p> <p>A value of 1 or true indicates the item has a string/character value.</p> <p>A value of 0 or false indicates item the item has a value of a different type.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sd (Hide Details)	<p>Specifies a boolean value that indicates whether the details are hidden for this item.</p> <p>A value of 1 or true indicates item details are hidden.</p> <p>A value of 0 or false indicates item details are shown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
t (Item Type)	<p>Specifies the type of this item. A value of 'default' indicates the subtotal or total item.</p> <p>The possible values for this attribute are defined by the ST_ItemType simple type (§18.18.43).</p>
x (Item Index)	<p>Specifies the item index in pivotFields collection in the PivotCache.</p> <p>[Example: In the following example, "Product Category" and "Product Subcategory" are on the row axis of the PivotTable, in that order.</p> <pre><rowFields count="2"> <field x="7"/> <x="8"/> </rowFieldsfield ></pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Item](#)) is located in §A.2. *end note*]

18.10.1.46 items (Field Items)

Represents the collection of items in a PivotTable field. The items in the collection are ordered by index. Items represent the unique entries from the field in the source data.

In the following image, the item Golf represents all rows of data in the source list for which the Sport field contains the entry Golf.

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

The order in which the items are listed is the order they would appear on a particular axis [*Example: Row or column. end example*]

[*Example:* In the following SpreadsheetML example, the first field is "Customer Name" and the first item referenced here is `<item x="66"/>`, which references the value "Adam L Flores" in the pivotCacheDefinition. Therefore, if you added "Customer Name" to the row axis, "Adam L Flores" would be the first row item listed.

```
<pivotFields count="28">
  <pivotField showAll="0" includeNewItemsInFilter="1">
    <items count="8">
      <item x="66"/>
      <item x="133"/>
      <item x="74"/>
      <item x="27"/>
      <item x="118"/>
      <item x="63"/>
      <item x="141"/>
      <item t="default"/>
    </items>
  </pivotField>
  <pivotField showAll="0" includeNewItemsInFilter="1"/>
```

```

<pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
  <items count="2">
    <item x="0"/>
    <item t="default"/>
  </items>
</pivotField>
<pivotField showAll="0" includeNewItemsInFilter="1"/>

```

end example]

Attributes	Description
count (Field Count)	Specifies the number of fields in the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Items](#)) is located in §A.2. *end note*]

18.10.1.47 kpi (OLAP KPI)

Represents the KPI defined on the OLAP server and stored in the PivotCache.

[Example:

```

<kpi uniqueName="Growth in Customer Base" caption="Growth in Customer Base"
  displayFolder="Customer Perspective\Expand Customer Base"
  measureGroup="Internet Sales" value="[Measures].[Growth in Customer Base]"
  goal="[Measures].[Growth in Customer Base Goal]"
  status="[Measures].[Growth in Customer Base Status]"
  trend="[Measures].[Growth in Customer Base Trend]"/>

```

end example]

Attributes	Description
caption (KPI Display Name)	Specifies the display name of the KPI. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
displayFolder (KPI Display Folder)	Specifies the folder where this KPI is displayed in a list of fields for the PivotTable. This attribute depends on how the application exposes a list of fields in the user interface. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
goal (KPI Goal Unique Name)	Specifies the unique name of the KPI goal measure.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
measureGroup (KPI Measure Group Name)	Specifies the name of the measure group to which this KPI belongs. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
parent (Parent KPI)	Specifies the name of the parent KPI for this KPI. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
status (KPI Status Unique Name)	Specifies the unique name of the KPI status measure. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
time (Time Member KPI Unique Name)	Specifies the unique name of the KPI current time member. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
trend (KPI Trend Unique Name)	Specifies the unique name of the KPI trend measure. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
uniqueName (KPI Unique Name)	Specifies the unique name of the KPI. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
value (KPI Value Unique Name)	Specifies the unique name of the KPI value measure. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
weight (KPI Weight Unique Name)	Specifies the unique name of the KPI weight measure. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_PCDKPI](#)) is located in §A.2. *end note*]

18.10.1.48 kpis (OLAP KPIs)

Represents the collection of Key Performance Indicators (KPIs) defined on the OLAP server and stored in the PivotCache.

[Example:

```
<kpis count="3">
  <kpi uniqueName="Growth in Customer Base" caption="Growth in Customer Base"
    displayFolder="Customer Perspective\Expand Customer Base"
    measureGroup="Internet Sales" value="[Measures].[Growth in Customer Base]"
    goal="[Measures].[Growth in Customer Base Goal]"
    status="[Measures].[Growth in Customer Base Status]"
    trend="[Measures].[Growth in Customer Base Trend]"/>
  <kpi uniqueName="Net Income" caption="Net Income"
    displayFolder="Financial Perspective\Maintain Overall Margins"
    measureGroup="Financial Reporting" value="[Measures].[Net Income Value]"
    goal="[Measures].[Net Income Goal]" status="[Measures].[Net Income Status]"
    trend="[Measures].[Net Income Trend]"/>
  <kpi uniqueName="Operating Profit" caption="Operating Profit"
    displayFolder="Financial Perspective\Maintain Overall Margins"
    measureGroup="Financial Reporting" parent="Net Income"
    value="[Measures].[Operating Profit Value]"
    goal="[Measures].[Operating Profit Goal]"
    status="[Measures].[Operating Profit Status]"
    trend="[Measures].[Operating Profit Trend]"/>
  ...
end example]
```

Attributes	Description
count (KPI Count)	Specifies the number of KPIs stored in the PivotCache. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_PCDKPIs](#)) is located in §A.2. end note]

18.10.1.49 location (PivotTable Location)

Represents location information for the PivotTable.

[Example:

```
<location ref="B6:G13" firstHeaderRow="1" firstDataRow="4" firstDataCol="1"
  rowPageCount="3" colPageCount="1"/>
```

end example]

Attributes	Description
colPageCount (Columns Per Page)	Specifies the number of columns per page for this PivotTable that the filter area will occupy. By default there is a single column of filter fields per page and the fields occupy as many rows as there are fields. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
firstDataCol (First Data Column)	Specifies the first column of the PivotTable data, relative to the top left cell in the ref value. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
firstDataRow (PivotTable Data First Row)	Specifies the first row of the PivotTable data, relative to the top left cell in the ref value. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
firstHeaderRow (First Header Row)	Specifies the first row of the PivotTable header, relative to the top left cell in the ref value. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
ref (Reference)	Specifies the first row of the PivotTable. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
rowPageCount (Rows Per Page Count)	Specifies the number of rows per page for this PivotTable that the filter area will occupy. By default there is a single column of filter fields per page and the fields occupy as many rows as there are fields. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Location](#)) is located in §A.2. *end note*]

18.10.1.50 m (No Value)

Represents a value that was not specified.

[Example:

```
<sharedItems containsString="0" containsBlank="1" count="1">
  <m/>
</sharedItems>
```

end example]

Attributes	Description
b (Bold)	<p>Specifies a boolean value that indicates whether the value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains bold formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
bc (background Color)	<p>Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
c (Caption)	<p>Specifies the caption for this item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
cp (Member Property Count)	<p>Specifies the number of member property values for this item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of 1 or true indicates this item is a calculated value.</p> <p>A value of 0 or false indicates this item is not calculated.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this</p>

Attributes	Description
	<p>entry is stored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of 1 or true indicates this item is unused.</p> <p>A value of 0 or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Missing](#)) is located in §A.2. *end note*]

18.10.1.51 map (OLAP Measure Group)

Represents a PivotTable OLAP measure group - Dimension map.

[Example:

```
<map measureGroup="0" dimension="2"/>
```

end example]

Attributes	Description
dimension (Dimension Id)	Specifies the identifier for the dimension. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
measureGroup (Measure Group Id)	Specifies the identifier of the measure group. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MeasureDimensionMap](#)) is located in §A.2. *end note*]

18.10.1.52 maps (OLAP Measure Group)

Represents the PivotTable OLAP measure group - Dimension maps.

[Example:

```
<maps count="3">
  <map measureGroup="0" dimension="2"/>
  <map measureGroup="1" dimension="19"/>
  <map measureGroup="2" dimension="8"/>
</maps>
```

end example]

Attributes	Description
count (Measure Group Count)	Specifies the number of measure groups, or dimension maps, in the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MeasureDimensionMaps](#)) is located in §A.2. *end note*]

18.10.1.53 measureGroup (OLAP Measure Group)

Represents a PivotTable OLAP measure group.

[Example:

```
<measureGroup name="Sales Orders" caption="Sales Orders"/>
```

end example]

Attributes	Description
caption (Measure Group Display Name)	Specifies the display name of the measure group. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
name (Measure Group Name)	Specifies the name of the measure group. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_MeasureGroup](#)) is located in §A.2.
end note]

18.10.1.54 [measureGroups](#) (OLAP Measure Groups)

Represents the collection of PivotTable OLAP measure groups.

[Example:

```
<measureGroups count="11">
  <measureGroup name="Exchange Rates" caption="Exchange Rates"/>
  <measureGroup name="Financial Reporting" caption="Financial Reporting"/>
  <measureGroup name="Internet Customers" caption="Internet Customers"/>
  <measureGroup name="Internet Orders" caption="Internet Orders"/>
  <measureGroup name="Internet Sales" caption="Internet Sales"/>
  <measureGroup name="Reseller Orders" caption="Reseller Orders"/>
  <measureGroup name="Reseller Sales" caption="Reseller Sales"/>
  <measureGroup name="Sales Orders" caption="Sales Orders"/>
  <measureGroup name="Sales Reasons" caption="Sales Reasons"/>
  <measureGroup name="Sales Summary" caption="Sales Summary"/>
  <measureGroup name="Sales Targets" caption="Sales Targets"/>
</measureGroups>
```

end example]

Attributes	Description
count (Measure Group Count)	Specifies the number of measure groups in the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MeasureGroups](#)) is located in §A.2.
end note]

18.10.1.55 member (Member)

Represents an item that can be included or excluded.

Attributes	Description
name (Hidden Item Name)	Specifies the name of a hidden item. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_Member](#)) is located in §A.2. *end note*]

18.10.1.56 members (Members)

Represents the collection of items that can be included or excluded.

Attributes	Description
count (Item Count)	Specifies the number of items in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
level (Hierarchy Level)	Specifies the hierarchy level with which these items are associated. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Members](#)) is located in §A.2. *end note*]

18.10.1.57 mp (OLAP Member Property)

Represents an OLAP member property.

[Example:

```
<sh:mp field="7"/>
```

end example]

Attributes	Description
field (Field Index)	Specifies the index of the field with which this member property is associated. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

Attributes	Description
level (Level Index)	<p>Specifies the index of the level to which this member property applies.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
name (OLAP Member Property Unique Name)	<p>Specifies the unique name of the OLAP member property. The following attributes depend on the name attribute:</p> <ul style="list-style-type: none"> • nameLen • pLen • pPos <p>These attributes consist of metadata about a member in an OLAP cube and are usually displayed in a tooltip or mechanism in the user interface.</p> <p>[<i>Example</i>: If the value for name equals "[Store].[Store Name].[Store Manager]":</p> <ul style="list-style-type: none"> • nameLen will equal 20. This would refer to "[Store].[Store Name]" • pPos will equal 22. This would refer to starting character of "Store Manager" • pLen will equal 13. This would to length of "Store Manager" <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
nameLen (Name Length)	<p>Specifies the length of the unique name portion of name. [<i>Example</i>: If the value for name equals "[Store].[Store Name].[Store Manager]", nameLen will equal 20. This would refer to "[Store].[Store Name]". <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
pLen (Property Name Length)	<p>Specifies the length of the property name portion of name. [<i>Example</i>: If the value for name equals "[Store].[Store Name].[Store Manager]", pLen will equal 13. This would to length of "Store Manager". <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
pPos (Property Name Character Index)	<p>Specifies the index of the character where the property name portion begins in name. [<i>Example</i>: If the value for name equals "[Store].[Store Name].[Store Manager]", pPos will equal 22. This would refer to starting character of "Store Manager". <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
showAsCaption (Show As Caption)	<p>Specifies a boolean value that indicates whether to show the property a member caption.</p> <p>A value of 1 or true indicates member property value is shown in as a caption.</p>

Attributes	Description
	<p>A value of 0 or false indicates member property value will not be shown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showCell (Show Cell)	<p>Specifies a boolean value that indicates whether to show the member property value in a PivotTable cell.</p> <p>A value of 1 or true indicates member property value is shown in a cell.</p> <p>A value of 0 or false indicates member property value will not be shown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showTip (Show Tooltip)	<p>Specifies a boolean value that indicates whether to show the member property value in a tooltip on the appropriate PivotTable view cells.</p> <p>A value of 1 or true indicates member property value is shown in a tooltip.</p> <p>A value of 0 or false indicates member property value will not be shown. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_MemberProperty](#)) is located in §A.2. *end note*]

18.10.1.58 mpMap (Member Properties Map)

Represents a mapping to cached member properties.

[Example:

```
<mpMap v="7"/>
```

end example]

Attributes	Description
v (Shared Items Index)	<p>Specifies the index into the shared items table in the PivotCache that identifies this item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_X](#)) is located in §A.2. *end note*]

18.10.1.59 mps (OLAP Member Properties)

Represents the collection of OLAP member property. Member properties contain additional information that is available about the items in an OLAP dimension field. *[Example: If a Geography dimension has property fields Population and Average Income available, you could create a PivotTable report that displays the sales figures for cities where your products are selling well. By displaying and analyzing the population and income figures for these cities, you could target cities with similar demographics for your marketing campaign. end example]*

[Example:

```
<sh:mps count="3">
  <sh:mp field="7"/>
  <sh:mp field="8"/>
  <sh:mp field="9"/>
</sh:mps>
```

end example]

Attributes	Description
count (OLAP Member Properties Count)	Specifies the number of OLAP member properties in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_MemberProperties](#)) is located in §A.2. end note]

18.10.1.60 n (Numeric)

Represents a numeric value in the PivotTable.

[Example:

```
<sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
  containsInteger="1" minValue="3" maxValue="3" count="1">
  <n v="3"/>
</sharedItems>
```

end example]

Attributes	Description
b (Bold)	Specifies a boolean value that indicates whether this value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of 1 or true indicates this value contains italic formatting on the server.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
bc (Background Color)	<p>Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
c (Caption)	<p>Specifies the caption for this item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
cp (Member Property Count)	<p>Specifies the number of member property values for this item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of 1 or true indicates this item is a calculated value.</p> <p>A value of 0 or false indicates this item is not calculated.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains italic formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
st (Strikethrough)	Specifies a boolean value that indicates whether the value contains strikethrough

Attributes	Description
	<p>formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains strikethrough formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of 1 or true indicates this item is not used.</p> <p>A value of 0 or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of this item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Number](#)) is located in §A.2. *end note*]

18.10.1.61 [page \(Page Items\)](#)

Represents the collection of page item values for a page field.

Attributes	Description
count (Page Item String Count)	<p>Specifies the number of page item strings in the collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_PCDSCPage](#)) is located in §A.2. *end note*]

18.10.1.62 **pageField (Page Field)**

Represents a field on the page or report filter of the PivotTable.

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a page or report filter field. Page/filter fields allow you to filter the entire PivotTable to display data for a single item or all the items.

[Example:

```
<sh:pageField fld="43" hier="103"
  name="[Product].[Product Categories].[All Products]" cap="All Products"/>
```

end example]

Attributes	Description
cap (Hierarchy Display Name)	Specifies the display name of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
fld (Field)	Specifies the index of the field that appears on the page or filter report area of the PivotTable. The possible values for this attribute are defined by the W3C XML Schema int datatype.
hier (OLAP Hierarchy Index)	Specifies the index of the OLAP hierarchy to which this item belongs. The possible values for this attribute are defined by the W3C XML Schema int datatype.
item (Item Index)	Specifies the index of the item in the PivotCache. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
name (Hierarchy Unique Name)	Specifies the unique name of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element’s content model ([CT_PageField](#)) is located in §A.2. *end note*]

18.10.1.63 `pageFields` (Page Field Items)

Represents the collection of items in the page or report filter region of the PivotTable.

[Example:

```
<sh:pageFields count="2">
  <sh:pageField fld="43" hier="103"
    name="[Product].[Product Categories].[All Products]" cap="All Products"/>
  <sh:pageField fld="66" hier="126"
    name="[Promotion].[Promotions].[All Promotions]" cap="All Promotions"/>
</sh:pageFields>
```

end example]

Attributes	Description
count (Page Item Count)	Specifies the number of items in the page region of the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PageFields](#)) is located in §A.2. *end note]*

18.10.1.64 `pageItem` (Page Item)

Represents an item value for a PivotTable page.

Attributes	Description
name (Page Item Name)	Specifies the name of this page item. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_PageItem](#)) is located in §A.2. *end note]*

18.10.1.65 `pages` (Page Item Values)

Represents the collection of page item values for each page field.

Attributes	Description
count (Page Item String Count)	Specifies the number of page item strings in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt

Attributes	Description
	datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_Pages](#)) is located in §A.2. *end note*]

18.10.1.66 [pivotAreas \(Pivot Areas\)](#)

Represents the collection of pivot areas that comprise the PivotTable location.

[Example:

```
<sh:pivotAreas count="1">
  <sh:pivotArea field="2" dataOnly="0" outline="0"/>
</sh:pivotAreas>
```

end example]

Attributes	Description
count (Pivot Area Count)	Specifies the number of PivotAreas for the PivotTable location. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_PivotAreas](#)) is located in §A.2. *end note*]

18.10.1.67 [pivotCacheDefinition \(PivotCache Definition\)](#)

Represents the pivotCacheDefinition part. This part defines each field in the source data, including the name, the string resources of the instance data (for shared items), and information about the type of data that appears in the field.

[Example:

```
<pivotCacheDefinition xmlns="..." xmlns:r="..." r:id="rId1" refreshedBy="AnonUser"
  refreshedDateIso="2006-05-22T10:07:16Z" createdVersion="3"
refreshedVersion="3"
  minRefreshableVersion="3" recordCount="182">
  <cacheSource type="worksheet">
    <worksheetSource name="Table1"/>
  </cacheSource>
```

```

<cacheFields count="28">
  <cacheField name="Customer Name" numFmtId="0">
    <cacheField name="Postal Code" numFmtId="0">
      <sharedItems/>
    </cacheField>
    <cacheField name="Product Category" numFmtId="0">
      <sharedItems count="1">
        <s v="Bikes"/>
      </sharedItems>
    </cacheField>
    <cacheField name="Year" numFmtId="0">
      <sharedItems count="1">
        <s v="2001"/>
      </sharedItems>
    </cacheField>
    <cacheField name="Quarter" numFmtId="0">
      <sharedItems containsSemiMixedTypes="0" containsString="0"
        containsNumber="1" containsInteger="1" minValue="3" maxValue="3"
        count="1">
        <n v="3"/>
      </sharedItems>
    </cacheField>
  </cacheFields>
</pivotCacheDefinition>

```

end example]

Attributes	Description
backgroundQuery (Background Query)	<p>Specifies a boolean value that indicates whether the application should query and retrieve records asynchronously from the cache.</p> <p>A value of 1 or true indicates the application will retrieve records asynchronously from the cache.</p> <p>A value of 0 or false indicates the application will retrieve records synchronously.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
createdVersion (PivotCache Created Version)	<p>Specifies the version of the application that created the cache. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
enableRefresh	Specifies a boolean value that indicates whether the end-user can refresh the cache. This

Attributes	Description
(Enable PivotCache Refresh)	<p>attribute depends on whether the application exposes a method for allowing end-users control over refreshing the cache via the user interface.</p> <p>A value of 1 or true indicates the end-user can refresh the cache.</p> <p>A value of 0 or false indicates the end-user cannot refresh the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>id (Relationship Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships</p>	<p>Specifies the unique identifier that corresponds to the related pivotCacheRecords part. See (§18.10.1.68) for more information.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p>
invalid (Invalid Cache)	<p>Specifies a boolean value that indicates whether the cache needs to be refreshed.</p> <p>A value of 1 or true indicates the cache needs to be refreshed.</p> <p>A value of 0 or false indicates the cache does not need to be refreshed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
minRefreshableVersion (Minimum Version Required for Refresh)	<p>Specifies the earliest version of the application that is required to refresh the cache. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
missingItemsLimit (Missing Items Limit)	<p>Specifies the number of unused items to allow before discarding unused items. This attribute is application-dependent. The application shall specify a threshold for unused items.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
optimizeMemory (Optimize Cache for Memory)	<p>Specifies a boolean value that indicates whether the application will apply optimizations to the cache to reduce memory usage. This attribute is application-dependent. This application shall define its own cache optimization methods. The application shall also decide whether to expose cache optimization status via the user interface or an object model.</p> <p>A value of 1 or true indicates the application will apply optimizations to the cache.</p>

Attributes	Description
	<p>A value of <code>0</code> or <code>false</code> indicates the application will not apply optimizations to the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
recordCount (PivotCache Record Count)	<p>Specifies the number of records in the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
refreshedBy (Last Refreshed By)	<p>Specifies the name of the end-user who last refreshed the cache. This attribute is application-dependent and is specified by applications that track and store the identity of the current user. This attribute also depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
refreshedDateIso (PivotCache Last Refreshed Date ISO)	<p>Specifies the date when the cache was last refreshed. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>
refreshedVersion (PivotCache Last Refreshed Version)	<p>Specifies the version of the application that last refreshed the cache. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
refreshOnLoad (Refresh On Load)	<p>Specifies a boolean value that indicates whether the application will refresh the cache when the workbook has been opened.</p> <p>A value of <code>1</code> or <code>true</code> indicates that application will refresh the cache when the workbook is loaded.</p> <p>A value of <code>0</code> or <code>false</code> indicates the application will not automatically refresh cached data. The end user shall trigger refresh of the cache manually via the application user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saveData (Save Pivot Records)	<p>Specifies a boolean value that indicates whether the pivot records are saved with the cache.</p> <p>A value of <code>1</code> or <code>true</code> indicates pivot records are saved in the cache.</p> <p>A value of <code>0</code> or <code>false</code> indicates are not saved in the cache.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
supportAdvancedDrill (Supports Attribute Drilldown)	<p>Specifies whether the cache's data source supports attribute drilldown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
supportSubquery (Supports Subqueries)	<p>Specifies whether the cache's data source supports subqueries.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tupleCache (Stores Cache for OLAP Functions)	<p>Specifies a boolean value that indicates whether the PivotCache is used store information for OLAP sheet data functions.</p> <p>A value of 1 or true indicates information about OLAP sheet data functions are stored in the cache.</p> <p>A value of 0 or false indicates the PivotCache does not contain information about OLAP sheet data functions.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
upgradeOnRefresh (Upgrade PivotCache on Refresh)	<p>Specifies a boolean value that indicates whether the cache is scheduled for version upgrade. This attribute depends on whether the application exposes mechanisms via the user interface whereby the cache might be upgraded.</p> <p>A value of 1 or true indicates the cache is scheduled for upgrade.</p> <p>A value of 0 or false indicates the cache is not scheduled for upgrade.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT PivotCacheDefinition](#)) is located in §A.2. end note]

18.10.1.68 pivotCacheRecords (PivotCache Records)

Represents the collection of records in the PivotCache. This part stores the underlying source data that the PivotTable aggregates.

[Example:

```
<pivotCacheRecords xmlns="..." xmlns:r="..." count="2">
  <r>
    <x v="0"/>
    <s v="Pacific"/>
    <x v="0"/>
    <s v="Australia"/>
    <x v="0"/>
    <x v="0"/>
    <s v="3550"/>
    <x v="0"/>
    <x v="0"/>
    <s v="Road-150 Red, 62"/>
    <s v="This bike is ridden by race winners. Developed with the Adventure
      Works Cycles professional race team, it has a extremely light
      heat-treated aluminum frame, and steering that allows precision
      control."/>
    <s v="No Discount"/>
  ...
  <n v="89.456800000000001"/>
</r>
...
```

end example]

Attributes	Description
count (PivotCache Records Count)	Specifies the number of records in the cache. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT PivotCacheRecords](#)) is located in §A.2. *end note*]

18.10.1.69 pivotField (PivotTable Field)

Represents a single field in the PivotTable. This element contains information about the field, including the collection of items in the field.

[Example:

```
<pivotField axis="axisRow" allDrilled="1" showAll="0" measureFilter="1"
  sortType="descending">
```

```

<items count="8">
  <item s="1" c="1" x="0"/>
  <item s="1" c="1" x="1"/>
  <item c="1" x="2"/>
  <item c="1" x="3"/>
  <item c="1" x="4"/>
  <item c="1" x="5"/>
  <item c="1" x="6"/>
  <item t="default"/>
</items>
<autoSortScope>
  <pivotArea dataOnly="0" outline="0" fieldPosition="0">
    <references count="2">
      <reference field="4294967294" count="1" selected="0">
        <x v="0"/>
      </reference>
      <reference field="25" count="1" selected="0">
        <x v="0"/>
      </reference>
    </references>
  </pivotArea>
</autoSortScope>
</pivotField>

```

end example]

Attributes	Description
allDrilled (All Items Expanded)	<p>Specifies a boolean value that indicates whether all items in the field are expanded. Applies only to OLAP PivotTables.</p> <p>A value of 1 or true indicates all items in the field are expanded.</p> <p>A value of 0 or false indicates all items are not expanded. However some items might be expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoShow (Auto Show)	<p>Specifies a boolean value that indicates whether an "AutoShow" filter is applied to this field. This attribute depends on the implementation of filtering in the application.</p> <p>A value of 1 or true indicates an "AutoShow" filter is applied to the field.</p> <p>A value of 0 or false indicates an "AutoShow" filter is not applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
avgSubtotal (Average)	<p>Specifies a boolean value that indicates whether to apply the 'Average' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates the subtotal for this field is 'Average.'</p> <p>A value of 0 or false indicates a different aggregation function is applied to the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
axis (Axis)	<p>Specifies the region of the PivotTable that this field is displayed.</p> <p>The possible values for this attribute are defined by the ST_Axis simple type (§18.18.1).</p>
compact (Compact)	<p>Specifies a boolean value that indicates whether the application will display fields compactly in the sheet on which this PivotTable resides.</p> <p>A value of 1 or true indicates the next field should be displayed in the same column of the sheet.</p> <p>A value of 0 or false indicates each pivot field will display in its own column in the sheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
countASubtotal (CountA)	<p>Specifies a boolean value that indicates whether to apply the 'countA' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates the subtotal for this field is 'countA.'</p> <p>A value of 0 or false indicates a different aggregation function is applied to the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
countSubtotal (Count)	<p>Specifies a boolean value that indicates whether to apply the 'count' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates the subtotal for this field is 'count.'</p> <p>A value of 0 or false indicates a different aggregation function is applied to the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
dataField (Data Field)	<p>Specifies a boolean value that indicates whether this field appears in the data region of the PivotTable.</p> <p>A value of 1 or true indicates this field appears in the data region of the PivotTable.</p> <p>A value of 0 or false indicates this field appears in another region of the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dataSourceSort (Data Source Sort)	<p>Specifies a boolean value that indicates whether sort is applied to this field in the data source.</p> <p>A value of 1 or true indicates this field is sorted in the data source.</p> <p>A value of 0 or false indicates this field is not sorted in the data source.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
defaultAttributeDrillState (Drill State)	<p>Specifies a boolean value that indicates the drill state of the attribute hierarchy in an OLAP-based PivotTable.</p> <p>A value of 1 or true indicates the attribute hierarchy is expanded.</p> <p>A value of 0 or false indicates the attribute hierarchy is collapsed.</p> <p>This attribute is designed to allow the application to issue more optimized queries when all items of each field have the same drill state.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
defaultSubtotal (Show Default Subtotal)	<p>Specifies a boolean value that indicates whether the default subtotal aggregation function is displayed for this field.</p> <p>A value of 1 or true indicates the default subtotal aggregation function is displayed for this field.</p> <p>A value of 0 or false indicates the default aggregation function is not displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragOff (Drag Off)	<p>Specifies a boolean value that indicates whether the field can be removed from the PivotTable.</p> <p>A value of 1 or true indicates the field can be removed from the PivotTable.</p>

Attributes	Description
	<p>A value of 0 or false indicates the field cannot be removed from the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragToCol (Drag To Column)	<p>Specifies a boolean value that indicates whether the field can be dragged to the column axis.</p> <p>A value of 1 or true indicates the field can be dragged to the column axis.</p> <p>A value of 0 or false indicates the field cannot be dragged to the column axis.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragToData (Field Can Drag to Data)	<p>Specifies a boolean value that indicates whether the field can be dragged to the data region.</p> <p>A value of 1 or true indicates the field can be dragged to the data region.</p> <p>A value of 0 or false indicates the field cannot be dragged to the data region.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragToPage (Drag Field to Page)	<p>Specifies a boolean value that indicates whether the field can be dragged to the page region.</p> <p>A value of 1 or true indicates the field can be dragged to the page region.</p> <p>A value of 0 or false indicates the field cannot be dragged to the page region.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragToRow (Drag To Row)	<p>Specifies a boolean value that indicates whether the field can be dragged to the row axis.</p> <p>A value of 1 or true indicates the field can be dragged to the row axis.</p> <p>A value of 0 or false indicates the field cannot be dragged to the row axis.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hiddenLevel (Hidden Level)	<p>Specifies a boolean value that indicates whether there is a hidden level in the PivotTable. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates the OLAP PivotTable contains a hidden level.</p>

Attributes	Description
	<p>A value of 0 or false indicates the OLAP PivotTable does not contain any hidden levels.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
hideNewItem (Hide New Items)	<p>Specifies a boolean value that indicates whether new items that appear after a refresh should be hidden by default.</p> <p>A value of 1 or true indicates that items that appear after a refresh should be hidden by default.</p> <p>A value of 0 or false indicates that items that appear after a refresh should be shown by default.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
includeNewItemsInFilter (Inclusive Manual Filter)	<p>Specifies a boolean value that indicates whether manual filter is in inclusive mode.</p> <p>A value of 1 or true indicates the manual filter is inclusive.</p> <p>A value of 0 or false indicates the manual filter is not inclusive.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
insertBlankRow (Insert Blank Row)	<p>Specifies a boolean value that indicates whether to insert a blank row after each item.</p> <p>A value of 1 or true indicates that a blank row is inserted after each item.</p> <p>A value of 0 or false indicates no additional rows are inserted after each item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
insertPageBreak (Insert Item Page Break)	<p>Specifies a boolean value that indicates whether to insert a page break after each item.</p> <p>A value of 1 or true indicates that a page break is inserted after each item.</p> <p>A value of 0 or false indicates no page breaks are inserted after items.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
itemPageCount (Items Per Page Count)	<p>Specifies the number of items showed per page in the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

Attributes	Description
maxSubtotal (Max Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'max' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates that the 'max' aggregation function is applied in the subtotal for this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
measureFilter (Measure Filter)	<p>Specifies a boolean value that indicates whether field has a measure based filter.</p> <p>A value of 1 or true indicates the field has a measure-based filter.</p> <p>A value of 0 or false indicates does not have a measure-based filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
minSubtotal (Min Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'min' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates that the 'min' aggregation function is applied in the subtotal for this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
multipleItemSelectionAllowed (Multiple Field Filters)	<p>Specifies a boolean value that indicates whether the field can have multiple items selected in the page field.</p> <p>A value of 1 or true indicates the PivotTable can have multiple items selected in the page field.</p> <p>A value of 0 or false indicates the PivotTable cannot have multiple items selected in the page field. This attribute depends on the application support for selecting multiple items in page fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
name (Field Name)	<p>Specifies the name of the field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type</p>

Attributes	Description
	(§22.9.2.19).
nonAutoSortDefault (Auto Sort)	<p>Specifies a boolean value that indicates whether sort operation that is applied to field should be AutoSort operation or simple data sort operation.</p> <p>A value of 1 or true indicates that an AutoSort operation is applied to the field.</p> <p>A value of 0 or false indicates a simple data sort operation is applied to the field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
numFmtId (Number Format Id)	<p>Specifies the identifier of the number format to apply to this field. Number formats are written to the styles part. See the Styles section (§18.8) for more information on number formats.</p> <p>Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).</p>
outline (Outline Items)	<p>Specifies a boolean value that indicates whether the items in this field should be shown in Outline form.</p> <p>A value of 1 or true indicates the items in this field is shown in Outline form.</p> <p>A value of 0 or false indicates the items in this field will not be shown in Outline form. This attribute depends on the application support for displaying items in Outline form.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
productSubtotal (Product Subtotal)	<p>Specifies a boolean value that indicates whether to apply 'product' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates that the 'product' aggregation function is applied in the subtotal for this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rankBy (Auto Show Rank By)	<p>Specifies the index of the data field by which AutoShow will rank.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt</p>

Attributes	Description
	datatype.
serverField (Server-based Page Field)	<p>Specifies a boolean value that indicates whether this is a server-based page field.</p> <p>A value of 1 or true indicates this is a server-based page field.</p> <p>A value of 0 or false indicates this is a local page field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showAll (Show All Items)	<p>Specifies a boolean value that indicates whether to show all items for this field.</p> <p>A value of 1 or true indicates that all items be shown.</p> <p>A value of 0 or false indicates items be shown according to user specified criteria.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showDropDowns (Show PivotField Header Drop Downs)	<p>Specifies a boolean value that indicates whether to hide drop down buttons on PivotField headers. This attribute depends on the application implementation for filtering in the user interface.</p> <p>A value of 1 or true indicates the application will display some mechanism for selecting and applying filters – <i>[Example: A dropdown menu end example]</i> – in the user interface.</p> <p>A value of 0 or false indicates for mechanism for applying a filter is displayed in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showPropAsCaption (Show As Caption)	<p>Specifies a boolean value that indicates whether to show the property as a member caption.</p> <p>A value of 1 or true indicates the property is shown as a member caption.</p> <p>A value of 0 or false indicates the property will not be shown as a member caption.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showPropCell (Show Member Property in Cell)	<p>Specifies a boolean value that indicates whether to show the member property value in a PivotTable cell.</p> <p>A value of 1 or true indicates the property value is shown in a PivotTable cell.</p> <p>A value of 0 or false indicates the property value will not be shown in a PivotTable cell.</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showPropTip (Show Member Property ToolTip)</p>	<p>Specifies a boolean value that indicates whether to show the member property value in a tooltip on the appropriate PivotTable cells.</p> <p>A value of 1 or true indicates the property value is shown in a tooltip in the user interface.</p> <p>A value of 0 or false indicates the property will not be shown in a tooltip. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>sortType (Auto Sort Type)</p>	<p>Specifies the type of sort that is applied to this field.</p> <p>The possible values for this attribute are defined by the ST_FieldSortType simple type (§18.18.28).</p>
<p>stdDevPSubtotal (StdDevP Subtotal)</p>	<p>Specifies a boolean value that indicates whether to apply the 'stdDevP' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates that the 'stdDevP' aggregation function is applied in the subtotal for this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>stdDevSubtotal (StdDev Subtotal)</p>	<p>Specifies a boolean value that indicates whether to use 'stdDev' in the subtotal of this field.</p> <p>A value of 1 or true indicates that the 'stdDev' aggregation function is applied in the subtotal for this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>subtotalCaption (Custom Subtotal Caption)</p>	<p>Specifies the custom text that is displayed for the subtotals label.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type</p>

Attributes	Description
	(§22.9.2.19).
subtotalTop (Subtotals At Top)	<p>Specifies a boolean value that indicates whether to display subtotals at the top of the group. Applies only when Outline its true.</p> <p>A value of 1 or true indicates a subtotal is display at the top of the group.</p> <p>A value of 0 or false indicates subtotal will not be displayed at the top of the group.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sumSubtotal (Sum Subtotal)	<p>Specifies a boolean value that indicates whether apply the 'sum' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates the 'sum' aggregation function is applied in the subtotal of this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal of this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
topAutoShow (Top Auto Show)	<p>Specifies a boolean value that indicates whether an AutoShow filter applied to this field is set to show the top ranked values.</p> <p>A value of 1 or true indicates whether an AutoShow filter will show top values for this field.</p> <p>A value of 0 or false indicates bottom ranked values are shown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
uniqueMemberProperty (Unique Member Property)	<p>Specifies the unique name of the member property to be used as a caption for the field and field items.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
varPSubtotal (VarP Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'varP' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates the 'varP' aggregation function is applied in the subtotal of this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal of this field.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
varSubtotal (Variance Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'variance' aggregation function in the subtotal of this field.</p> <p>A value of 1 or true indicates the 'variance' aggregation function is applied in the subtotal of this field.</p> <p>A value of 0 or false indicates another aggregation function is applied in the subtotal of this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotField](#)) is located in §A.2. *end note*]

18.10.1.70 pivotFields (PivotTable Fields)

Represents the collection of fields that appear on the PivotTable.

[Example:

```
<pivotFields count="28">
  <pivotField showAll="0" includeNewItemInFilter="1">
    <items count="8">
      <item x="66"/>
      <item x="133"/>
      <item x="74"/>
      <item x="27"/>
      <item x="118"/>
      <item x="63"/>
      <item x="141"/>
      <item t="default"/>
    </items>
  </pivotField>
  <pivotField showAll="0" includeNewItemInFilter="1"/>
</pivotFields>
```

```

<pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
  <items count="2">
    <item x="0"/>
    <item t="default"/>
  </items>
</pivotField>
<pivotField showAll="0" includeNewItemsInFilter="1"/>

```

end example]

Attributes	Description
count (Field Count)	Specifies the number of fields in the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotFields](#)) is located in §A.2. *end note*]

18.10.1.71 pivotHierarchies (PivotTable OLAP Hierarchies)

Represents the collection of OLAP hierarchies associated with the PivotTable.

[Example:

```

<sh:pivotHierarchies count="3">
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
</sh:pivotHierarchies>

```

end example]

Attributes	Description
count (OLAP Hierarchy Count)	Specifies the number of OLAP hierarchies in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotHierarchies](#)) is located in §A.2. *end note*]

18.10.1.72 pivotHierarchy (OLAP Hierarchy)

Represents a OLAP hierarchy associated with the PivotTable. A hierarchy is a hierarchical representation of related OLAP dimensions. Hierarchies are defined on the OLAP server and cannot be changed in the PivotTable.

[Example: Hierarchy "A" might be defined as follows:

Level 1 Country/Region

Level 2 State\Provence

Level 3 City

end example]

[Example:

```
<sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
```

end example]

Attributes	Description
caption (Hierarchy Caption)	Specifies the user defined caption of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
dragOff (Drag Off)	Specifies a boolean value that indicates whether the user is allowed to remove this hierarchy from the PivotTable. A value of 1 or true indicates the user can remove this hierarchy from the PivotTable. A value of 0 or false indicates the user cannot remove the hierarchy from the PivotTable. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dragToCol (Drag To Column)	Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the column area of the PivotTable. A value of 1 or true indicates the user can put this hierarchy into the column area of the PivotTable. A value of 0 or false indicates the user cannot remove this hierarchy. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dragToData (Drag To Data)	Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the data area of the view.

Attributes	Description
	<p>A value of 1 or true indicates</p> <p>A value of 0 or false indicates</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragToPage (Drag to Page)	<p>Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the page area of the PivotTable.</p> <p>A value of 1 or true indicates the user can put this hierarchy into the page area of the PivotTable.</p> <p>A value of 0 or false indicates cannot put this hierarchy into the page area.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dragToRow (Drag To Row)	<p>Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the row area of the PivotTable.</p> <p>A value of 1 or true indicates the user can put this hierarchy into the row area of the PivotTable.</p> <p>A value of 0 or false indicates cannot put this hierarchy into the row area.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
includeNewItemsl nFilter (Inclusive Manual Filter)	<p>Specifies a boolean value that indicates whether the application will show only the items the user has selected.</p> <p>A value of 1 or true indicates the application will show only items the user has selected; all other items are hidden.</p> <p>A value of 0 or false indicates the application will show all items.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
multipleItemSelect ionAllowed (Multiple Field Filters)	<p>Specifies a boolean value that indicates whether the user can select multiple members when the hierarchy is in the page field area of the view.</p> <p>A value of 1 or true indicates the user can select multiple members.</p> <p>A value of 0 or false indicates the user cannot select multiple members.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
outline (Outline New Levels)	<p>Specifies a boolean value that indicates whether new levels added to the PivotTable are shown in Outline mode.</p> <p>A value of 1 or true indicates new levels are shown in Outline mode.</p> <p>A value of 0 or false indicates new items are not shown in Outline mode.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showInFieldList (Show In Field List)	<p>Specifies a boolean value that indicates whether this hierarchy is omitted from the field list. This attribute depends on how the application exposes a list of fields for PivotTables in the user interface.</p> <p>A value of 1 or true indicates this hierarchy is show in the field list or similar mechanism in the user interface.</p> <p>A value of 0 or false indicates is not shown in the field list.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
subtotalTop (New Levels Subtotals At Top)	<p>Specifies a boolean value that indicates whether new levels added to the view will show their subtotals at the top.</p> <p>A value of 1 or true indicates new levels added to the view show their subtotals at the top.</p> <p>A value of 0 or false indicates new levels added to the view show their subtotals at the bottom.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotHierarchy](#)) is located in §A.2. end note]

18.10.1.73 pivotTableDefinition (PivotTable Definition)

Represents the PivotTable root element for non-null PivotTables. There exists one pivotTableDefinition for each PivotTableDefinition part. The PivotTable definition encompasses the following information:

Structure

- Top-level attributes

- Location information
- Collection of fields
- Fields on the row axis
- Items on the row axis (specific values)
- Fields on the column axis
- Items on the column axis (specific values)
- Fields on the report filter region
- Fields in the values region
- Style information

Outline of the XML for a pivotTableDefinition

```
<pivotTableDefinition>
  <location/>
  <pivotFields/>
  <rowFields/>
  <rowItems/>
  <colFields/>
  <colItems/>
  <pageFields/>
  <dataFields/>
  <conditionalFormats/>
  <pivotTableStyleInfo/>
</pivotTableDefinition>
```

Layout

The reference specified in the ref attribute on the location element specifies the location of the PivotTable body. The data area, row, column, and data fields and value items are located in this area. More specifically, the row fields begin below the A1-most cell in the reference, and the column fields begin adjacent to that cell, in the same row, extending out into the PivotTable body away from column A. *[Note: How far below or across the field labels begin are dependent upon how many row, column, and data fields are shown in the PivotTable. More detail is provided below. end note]*

[Note: All layout discussion and examples are given for outline mode layout. There two additional layout modes: compact and tabular. See Other layout modes below for a discussion of how those differ from outline mode. end note]

When encountering sheet boundaries, the PivotTable is truncated rather than wrapped, and as much as possible shall be shown.

The graphics given in this section are meant to illustrate layout only, and do not require implementation of any implied controls, like dropdowns or expand/collapse functionality.

Page Field Layout

	A	B	C	D
1				
2		SSN	(All) ▼	
3				
4		State ▼	City ▼	Sum of Amount
5		CA		195.51
6			San Diego	195.51
7		OR		54.97
8			Portland	12.54
9			Tillamook	42.43
10		WA		244.12
11			Seattle	96.72
12			Tacoma	79.83
13			Everett	67.57
14		Grand Total		494.6

In the above picture, SSN is a page field, State and City are row fields, and Amount is a data field. There are no column fields.

Page fields allow you to filter the entire PivotTable report to display data for a single item or all items.

The page field area always ends (vertically) so that there is always 1 row of space between the page field area and the top row of the PivotTable body, and always begins (horizontally) in the same column as the A1-most column of the PivotTable body. Each page field occupies two cells: the A1-most for displaying the field name, and the next cell over for displaying the selected item values. *[Example: (see above picture) If the top row in the PivotTable body reference is row 4, then page field layout ends (vertically) in row 2, and if the A1-most column of the PivotTable body is column B, then page field layout begins (horizontally) in column B. end example]*

Aside from the number of fields in the page field area, there are two attributes of `pivotTableDefinition` that affect page field layout: `pageOverThenDown` and `pageWrap`. `pageOverThenDown = 1` specifies that when there is more than 1 page field, lay them out horizontally across the sheet (extending in the direction of the PivotTable body area, away from column A) until the maximum specified in `pageWrap` is reached, and then begin a new row. If the `pageWrap` value is high and there are many page fields, then it is possible (and allowed) for page fields to extend beyond the edge of the PivotTable body. When laying out page fields in the same row (side by side), each shall be separated by a single column. However, multiple rows of page fields are not separated by single rows between them. `pageOverThenDown = 0` specifies that when there is more than 1 page

field, lay them out vertically down the sheet (always keeping 1 row of space between the PivotTable body and page field area) until the maximum specified in `pageWrap` is reached, and then begin a new column. Again, for multiple page fields, if they shall occupy more than 1 column, then each column of page fields is separated by a single column, and multiple rows of page fields are not separated by single rows between them.

[*Example:* This example shows a PivotTable body occupying B5:B6 and 6 page fields in the page field area, where `pageOverThenDown` = 0 and `pageWrap` = 2. This means that the first column of the page field area contains 2 page fields, and then, because the `pageWrap` value only allows 2 page fields per column, a new column of page fields is started, and so on until all 6 page fields are shown.

	A	B	C	D	E	F	G	H	I	J
1										
2		Postal Code	(All) ▾		City	(All) ▾		Last Name	(All) ▾	
3		State	(All) ▾		SSN	(All) ▾		Home Phone	(All) ▾	
4										
5		Sum of Amount								
6		494.6								
7										

The order of assignment of position within page field layout for this example is:

- Postal Code
- State
- City
- SSN
- Last Name
- Home Phone

Aside from the 6 page fields, the only other field in this PivotTable example is a data field called Amount.

end example]

[*Note:* When the user gestures to add a page field and there are not enough free cells above the PivotTable body area to allow for page fields to be added, the application must determine the best response. The application may decide to shift the PivotTable down some number of rows to make room, or overwrite existing data or features that might be above the PivotTable, or simply block the user gesture completely. In any result, however, the application should adhere to the layout principles given above. *end note]*

Row Field Layout

	A	B	C	D
1				
2		SSN	(All) ▼	
3				
4		State ▼	City ▼	Sum of Amount
5		CA		195.51
6			San Diego	195.51
7		OR		54.97
8			Portland	12.54
9			Tillamook	42.43
10		WA		244.12
11			Seattle	96.72
12			Tacoma	79.83
13			Everett	67.57
14		Grand Total		494.6

The **State** and **City** fields are row fields, **SSN** is a page field, there are no column fields, and **Amount** is a data field.

Row fields provide for and specify how the data is summarized, grouped, and viewed as rows in the PivotTable.

The row field area always begins in the A1-most column of the PivotTable body area. The layout of page fields does not affect the layout of row fields.

Row Field Layout - 1 Row Field and 0 Column Fields

When there is only 1 row field and 0 column fields,

the first row field is located in the A1-most cell of the PivotTable body, and
the values for that field are expressed in the cells directly under that row field, in the same column.

[Example:

State ▼	Sum of Amount
CA	195.51
OR	54.97
WA	244.12
Grand Total	494.6

In this example, there are no page fields, no column fields, **State** is a row field, and **Amount** is a data field. *end example]*

Row Field Layout - 2 or More Row Fields and 0 Column Fields

When there are 2 or more row fields and 0 column fields to be displayed,

- the row field labels are located adjacent to each other and in the same row as the first row field label
- Each corresponding set of values for the row field in question are located in the cells under that row field (same column)

- Innermost row field values (the ones closest to the data summary area) are grouped and organized by values in the next outer row field, in the following fashion: starting with the outermost row field, the first value is listed. For the next innermost row field, starting on the next row and over one column (toward the data summary area), the value list for that field begins. If that is the innermost row field, all values are listed for that row field, and then moving down a row and back to the outer column, the next value for the outermost row field is listed. If there are more inner row fields, the same layout rules apply until the innermost row field is reached.
- In this case of 0 column fields, only the top row of the PivotTable body is used for row field labels.

[Example:

	A	B	C	D	E
1					
2					
3					
4		Postal Co	State	City	Sum of Amount
5		09999			54.97
6			OR		54.97
7				Portland	12.54
8				Tillamook	42.43
9		12345			195.51
10			CA		195.51
11				San Diego	195.51
12		456789			244.12
13			WA		244.12
14				Seattle	96.72
15				Tacoma	79.83
16				Everett	67.57
17		Grand Total			494.6

In this example **Postal Code**, **State**, and **City** are row fields and **Amount** is a data field. There are no page fields and no column fields. *end example*]

Row Field Layout - 1 or More Row Fields and 1 or More Column Fields

When there are row fields and 1 or more column fields, the row fields are not located in the topmost row of the PivotTable body. Instead the row fields are located in the n+1st topmost row of the PivotTable body, where n is the number of column fields in the PivotTable.

[Example:

	A	B	C	D	E
1					
2					
3					
4					
5		Sum of Amount	Postal Code <input type="button" value="v"/>	State <input type="button" value="v"/>	City <input type="button" value="v"/>
6			<input type="button" value="v"/> 09999		
7			<input type="button" value="v"/> OR		OR Total
8		Last Name <input type="button" value="v"/>	Portland	Tillamook	
9		Cencini	12.54		12.54
10		Freehafer			
11		Giussani			
12		Hellung-Larsen			
13		Kotas		42.43	42.43
14		Neipper			
15		Sergienko			
16		Thorpe			
17		Zare			
18		Grand Total	12.54	42.43	54.97

This example shows 3 column fields in the PivotTable (**Postal Code**, **State**, and **City**), a single row field **Last Name**, and a single data field **Amount**. The PivotTable body area begins at B5 and the row field label **Last Name** is located in the 4th row of the PivotTable body area, in row 8 of the spreadsheet, cell B8. Since **Last Name** is the only row field in this example, its row field values begin and are listed directly under the label. *end example*]

Column Field Layout

	A	B	C	D	E	F	G	H
1								
2								
3								
4								
5		Sum of Amount	State	City				
6			CA	OR	WA			
7		Last Name	San Diego	Portland	Tillamook	Seattle	Tacoma	Everett
8		Cencini		12.54				
9		Freehafer				53.34		
10		Giussani					79.83	
11		Hellung-Larsen						67.57
12		Kotas			42.43			
13		Neipper	63.67					
14		Sergienko	50.69					
15		Thorpe	81.15					
16		Zare				43.38		

State and **City** are column fields, **Last Name** is a row field, and **Amount** is a data field.

Column fields provide for and specify how the data is summarized, grouped, and viewed horizontally in the PivotTable.

The layout of page fields does not affect the layout of column fields.

The column field label area is always located in the top row of the PivotTable body.

Column Field Layout - 0 Row Fields and 0 Data Fields

- When there are no row fields and no data fields, then the first column field is located in the A1-most column of the PivotTable body.
- When there are multiple column fields
- the labels are located adjacent to each other in the same row as the first column field label.
- Each corresponding set of values for each of the column fields are located in the rows directly below the column field label row and above the data area, one row of values for each column field.
- The first column field's values are located in the row directly under the column field row.
- Column field values are displayed starting directly underneath the first column field label's cell and filling adjacent cells in the same row. The second column field's values are located two rows under the column field label row, and values are again displayed starting directly underneath the first column field label's cell, filling adjacent cells in the same manner as the first set of values. The layout of column field values continues in this way until all column field values are displayed.

Inner column field values (the ones closer to the data summary area) are grouped and organized by values in the next outer column field, similarly to how row field values are grouped. [Example:

	A	B	C	D	E	F	G
1							
2							
3							
4							
5		State	City				
6		CA	OR	WA			
7		San Diego	Portland	Tillamook	Seattle	Tacoma	Everett
8							
9							
10							
11							
12							

In this example, **State** and **City** are column fields, and there are no row fields, no page fields, and no data fields.
end example]

Column Field Layout – 1 or More Column Fields and 1 or More Row Fields

When there are 1 or more column fields and 1 or more row fields in the PivotTable, then:

- First, row fields are displayed according to the row field layout described earlier
- The first column field label is located in the top row of the PivotTable body area, and adjacent to any row field labels that are displayed.
- Multiple column fields shall be displayed as described earlier

[*Example:* In this example, **State** and **City** are column fields, **Amount** is a data field, and **Last Name** is a row field.

	A	B	C	D	E	F	G	H
1								
2								
3								
4								
5		Sum of Amount	State	City				
6			CA	OR	WA			
7		Last Name	San Diego	Portland	Tillamook	Seattle	Tacoma	Everett
8		Cencini		12.54				
9		Freehafer				53.34		
10		Giussani					79.83	
11		Hellung-Larsen						67.57
12		Kotas			42.43			
13		Neipper	63.67					
14		Sergienko	50.69					
15		Thorpe	81.15					
16		Zare				43.38		

end example]

Data Field Layout

	A	B	C
1			
2			
3			
4			
5		Last Name	Sum of Amount
6		Cencini	12.54
7		Freehafer	53.34
8		Giussani	79.83
9		Hellung-Larsen	67.57
10		Kotas	42.43
11		Neipper	63.67
12		Sergienko	50.69
13		Thorpe	81.15
14		Zare	43.38

Last Name is a row field, **Sum of Amount** is a data field label, and the data underneath Sum of Amount are the summarized data values.

Data fields specify which fields are summarized in the PivotTable report.

The summarized data always appears below the column field and value area, and any row field values are closer to column A than any of the summarized data. When there are no row fields and no column fields, the summarized data is located directly under the A1-most cell of the PivotTable body. Each cell in the summarized data area represents an aggregation of a set of records. The set of records that a particular cell is summarizing is determined by looking at the row field value(s) and column field value(s) that intersect on that particular cell, and then determining which records in the source data contain all of those row and column field values.

Data Field Layout - 0 Row Fields and 0 Column Fields and 1 Data Field

When there are no row fields and no column fields and only 1 data field being summarized, the data field label is located in the A1-most cell of the PivotTable body.

[Example:

	A	B
1		
2		Sum of Amount
3		494.6

In this example there is only 1 field in the PivotTable, a data field **Amount**. *end example]*

Data Field Layout - More Than 1 Data Field

When there is more than 1 data field being summarized,

- An additional field (in these examples labeled “Values”, but the label can be specified by the user) is added to the field list, located as either a row field label or a column field label (depending on user choice and behaviour as specified by the dataOnRows and dataPosition attributes), and
- each data field being summarized is displayed either in the row area (when the additional field is a row field) as if it were an item value of that row field (see row field layout description above), or in the column area (when the additional field is a column field) as if it were an item value of that column field (see column field layout description above).

[Example:

	A	B	C
1			
2		Values	
3		Sum of Amount	Sum of Tax
4		494.6	28.71

In this example there are 2 data fields **Amount** and **Tax**. There are no page fields, no column fields, no row fields, and the additional field labeled Values is placed on the column area.

	A	B	C
1			
2		Values	
3		Sum of Amount	494.6
4		Sum of Tax	28.71

Above is the same PivotTable, with the Values field placed on the row area.

end example]

Data Field Layout - 0 Row Fields, 1 or More Column Fields, and 1 Data Field

When there are no row fields, 1 or more column fields, and only 1 data field being summarized, the data field label is located in the A1-most column of the PivotTable body, directly under the column field area.

[Example:

	A	B	C	D	E
1					
2		State ▼			
3		CA	OR	WA	
4		Sum of Amount	195.51	54.97	244.12

In this example there is 1 column field **State** and 1 data field **Amount**. There are no row fields or page fields. *end example]*

Data Field Layout - 0 Column Fields, 1 or More Row Fields, and 1 Data Field

When there are no column fields, 1 or more row fields, and only 1 data field being summarized, the data field label is located in the same row as the row field labels, above the data summary area.

[Example:

	A	B	C
1			
2		State ▼	Sum of Amount
3		CA	195.51
4		OR	54.97
5		WA	244.12

In this example there is 1 data field **Amount** and 1 row field **State**. There are no column fields or page fields. *end example]*

Subtotal and grand total layout

If subtotals are *on*, the values for row subtotals are placed at either the top of each group of data being summarized or at the bottom of each group, as indicated by the `subtotalTop` attribute value on the `pivotField` element. Row subtotal values appear in the same column as the data being subtotalled. If placed at the top of the group, then the subtotal value for the group appears in the row above the group of values, in the same row as the group's parent row field value. When there is only a single row field, no subtotal is shown.

[Example:

	A	B	C	D	E
1					
2		Postal Code ▾	State ▾	City ▾	Sum of Amount
3		09999			54.97
4			OR		54.97
5				Portland	12.54
6				Tillamook	42.43
7		12345			195.51
8			CA		195.51
9				San Diego	195.51
10		456789			244.12
11			WA		244.12
12				Seattle	96.72
13				Tacoma	79.83
14				Everett	67.57

Subtotal for Postal Code 09999

Subtotal for State OR

Subtotal for Postal Code 12345

Subtotal for State CA

Subtotal for Postal Code 456789

Subtotal for State WA

In this example, there are 3 row fields (**Postal Code**, **State**, and **City**) and 1 data field **Amount**.

end example]

If row subtotals are placed at the bottom of each data group, then a new row is inserted directly below the data group in question, and a new row field value is inserted, in the same column as the row field in question, whose caption indicates that this row represents a subtotal value.

[Example:

	A	B	C	D	E
1					
2		Postal Code ▾	State ▾	City ▾	Sum of Amount
3		09999			
4			OR		
5				Portland	12.54
6				Tillamook	42.43
7			OR Total		54.97
8		09999 Total			54.97
9		12345			
10			CA		
11				San Diego	195.51
12			CA Total		195.51
13		12345 Total			195.51
14		456789			
15			WA		
16				Seattle	96.72
17				Tacoma	79.83
18				Everett	67.57
19			WA Total		244.12
20		456789 Total			244.12

Subtotal for State OR

Subtotal for Postal Code 09999

Subtotal for State CA

Subtotal for Postal Code 12345

Subtotal for State WA

Subtotal for Postal Code 456789

In this example, there are 3 row fields (**Postal Code**, **State**, and **City**) and 1 data field **Amount**.

end example]

If subtotals are *on*, for column subtotals a new column is inserted directly after the data group being subtotalled. A new column field value is inserted, in the same row as the column field in question, whose caption indicates that this column represents a subtotal value. When there is only a single column field, no subtotal is shown.

[Example:

	A	B	C	D	E	F	G	H	I
1									
2		Postal Code ▾	State ▾	City ▾					
3		09999				09999 Total	12345		12345 Total
4		OR			OR Total		CA	CA Total	
5		Portland	Tillamook				San Diego		
6		Sum of Amount	12.54	42.43	54.97	54.97	195.51	195.51	195.51

Subtotal for State OR

Subtotal for State CA

Subtotal for Postal Code 09999

Subtotal for Postal Code 12345

In this example, there are 3 column fields (**Postal Code**, **State**, and **City**) and a data field **Amount**. *end example]*

If row grand totals are on and there are column fields, a new column item is inserted at the very edge of the PivotTable body furthest away from column A, in the same row as the outermost column field values. The caption indicates that this is a grand total, and the values total all values across the row. When row grand totals are *on* but there are no column fields, no row grand total is shown.

[*Example:*

	A	B	C	D	E	F
1						
2		State ▼				
3		CA	OR	WA	Grand Total	
4		Sum of Amount	195.51	54.97	244.12	494.6

In this example there is 1 column field **State** and 1 data field **Amount**, and row grand totals are on.

end example]

When column grand totals are *on* and there are row fields, a new row item is inserted at the very bottom of the PivotTable body, in the same column as the outermost row field values. The caption indicates that this is a grand total, and the values total all values in the column. When column grand totals are *on* but there are no row fields, no column grand total is shown.

[*Example:*

	A	B	C
1			
2		State ▼	Sum of Amount
3		CA	195.51
4		OR	54.97
5		WA	244.12
6		Grand Total	494.6

In this example there is 1 row field **State** and 1 data field **Amount**, and column grand totals are on.

end example]

Other Layout Modes

A PivotTable can be displayed in Compact, Outline, or Tabular form. In addition, Classic layout can be applied to any of the 3 layout forms.

Outline mode has been discussed in the above sections, and all examples are shown using outline mode with classic layout off (`gridDropZones = 0`).

For Compact mode, the layout differs from outline mode by:

- Instead of multiple row fields occupying multiple columns, the A1-most column of the PivotTable body contains all row field labels and values. A single label, “Row Labels”, is located where the first (outermost) row label is placed. When there are multiple row fields, the outermost list of values is not indented, then next inner row field values are indented (as specified in the indent attribute), and so on until each set of values for inner row fields are shown.
- Instead of multiple column fields being listed and located across a row, the first column field position is labeled “Column Labels”, and there is only this label, located in the first column field position.

[Example:

Outline mode:

	A	B	C	D	E	F	G
1							
2		Sum of Amount	Postal Code	▼	Last Name	▼	
3			09999			12345	
4		State	▼	City	▼	Cencini	Kotas
5		CA				Neipper	Sergienko
6			San Diego			63.67	50.69
7		OR					
8			Portland	12.54			
9			Tillamook		42.43		
10		WA					
11			Seattle				
12			Tacoma				
13			Everett				

The above picture shows 2 column fields (**Postal Code** and **Last Name**), 1 data field (**Amount**), and 2 row fields (**State** and **City**). There are no page fields shown.

Same PivotTable in compact mode:

	A	B	C	D	E	F
1						
2		Sum of Amount	Column Labels			
3			09999		12345	
4		Row Labels	Cencini	Kotas	Neipper	Sergienko
5		CA				
6		San Diego			63.67	50.69
7		OR				
8		Portland	12.54			
9		Tillamook		42.43		
10		WA				
11		Seattle				
12		Tacoma				
13		Everett				

The above picture shows all column field labels collapsed into a single label **Column Labels** and all row field labels collapsed into a single label **Row Labels**. There is 1 data field **Amount** and no page fields. *end example]*

For Tabular mode, the layout differs from outline mode by:

Instead of beginning new inner row field values on the next row down from the outer row field value parent, the first next-inner row field value is located on the same row as the parent value.

Row subtotals can only appear at the bottom of a group, not at the top

[Example:

Outline mode:

	A	B	C	D	E
1					
2		Postal Code	State	City	Sum of Amount
3		09999			
4			OR		
5				Portland	12.54
6				Tillamook	42.43
7		12345			
8			CA		
9				San Diego	195.51
10		456789			
11			WA		
12				Seattle	96.72
13				Tacoma	79.83
14				Everett	67.57

The above picture shows 3 row fields (**Postal Code**, **State**, and **City**) and 1 data field, **Amount**.

Same PivotTable in tabular mode:

	A	B	C	D	E
1					
2		Postal Code ▼	State ▼	City ▼	Sum of Amount
3		09999	OR	Portland	12.54
4				Tillamook	42.43
5		12345	CA	San Diego	195.51
6		456789	WA	Seattle	96.72
7				Tacoma	79.83
8				Everett	67.57

The above picture shows 3 row fields (**Postal Code**, **State**, and **City**) and 1 data field, **Amount**.

end example]

For Classic layout, the layout differs by:

- When there are row fields, no column fields, and 1 data field, instead of displaying the data field label adjacent to and in the same row as the row field labels, the data field label is located in the A1-most cell of the PivotTable body, and the row directly under this cell contains the row field labels.
- In the exact location where the data field label is located when classic layout is off, a label titled “Total” is displayed when classic layout is on.

[Example:

Outline mode, classic layout off:

	A	B	C	D	E
1					
2		Postal Code ▼	State ▼	City ▼	Sum of Amount
3		09999			
4			OR		
5				Portland	12.54
6				Tillamook	42.43
7		12345			
8			CA		
9				San Diego	195.51
10		456789			
11			WA		
12				Seattle	96.72
13				Tacoma	79.83
14				Everett	67.57

The above picture shows 3 row fields (**Postal Code**, **State**, and **City**) and 1 data field, **Amount**.

Same PivotTable in Outline mode, classic layout applied:

	A	B	C	D	E
1					
2		Sum of Amount			
3		Postal Code	State	City	Total
4		09999			
5		OR			
6			Portland	12.54	
7			Tillamook	42.43	
8		12345			
9		CA			
10			San Diego	195.51	
11		456789			
12		WA			
13			Seattle	96.72	
14			Tacoma	79.83	
15			Everett	67.57	

The above picture shows 3 row fields (**Postal Code**, **State**, and **City**) and 1 data field, **Amount**.

end example]

Attributes	Description
applyAlignmentFor mats (Apply Alignment Formats)	If true apply legacy table autoformat alignment properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyBorderForma ts (Apply Border Formats)	If true apply legacy table autoformat border properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyFontFormats (Apply Font Formats)	If true apply legacy table autoformat font properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyNumberForm ats (Apply Number Formats)	If true apply legacy table autoformat number format properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyPatternForm ats (Apply Pattern Formats)	If true apply legacy table autoformat pattern properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

Attributes	Description
applyWidthHeightFormats (Apply Width / Height Formats)	<p>If true apply legacy table autoformat width/height properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
asteriskTotals (Asterisk Totals)	<p>Specifies a boolean value that indicates whether an asterisks should be displayed in subtotals and totals when visual totals are not used in OLAP -based PivotTables.</p> <p>A value of 1 or true indicates an asterisks are displayed in subtotals and totals for OLAP PivotTables when visual tools are not available.</p> <p>A value of 0 or false indicates an asterisk will not be displayed. This attribute depends on the implementation and availability of visual tools in the application user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoFormatId (Auto Format Id)	<p>Identifies which legacy table autoformat to apply.</p> <p>Annex D contains a listing of the supported PivotTable AutoFormats, example formatting, and a sample workbook with each of those AutoFormats applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
cacheId (PivotCache Definition Id)	<p>Specifies the identifier of the related PivotCache definition. This Id is listed in the pivotCaches collection in the workbook part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
chartFormat (Chart Format Id)	<p>Specifies the next chart formatting identifier to use on the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
colGrandTotals (Grand Totals On Columns)	<p>Specifies a boolean value that indicates whether grand totals should be displayed for the PivotTable columns.</p> <p>A value of 1 or true indicates grand totals should be displayed.</p> <p>A value of 0 or false indicates grand totals should not be displayed for PivotTable columns.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
colHeaderCaption (Column Header Caption)	<p>Specifies the string to be displayed in column header in compact mode. This attribute depends on whether the application implements a compact mode for displaying PivotTables in the user interface.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
compact (Compact New Fields)	<p>Specifies a boolean value that indicates whether new fields should have their compact flag set to true.</p> <p>A value of 1 or true indicates new fields should default to compact mode equal to true.</p> <p>A value of 0 or false indicates new fields should default to compact mode equal to false. This attribute depends on whether the application implements a compact mode in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
compactData (Compact Data)	<p>Specifies a boolean value that indicates whether the field next to the data field in the PivotTable should be displayed in the same column of the spreadsheet</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
createdVersion (PivotCache Created Version)	<p>Specifies the version of the application that created the cache. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
customListSort (Custom List AutoSort)	<p>Specifies a boolean value that indicates whether the "custom lists" option is offered when sorting this PivotTable.</p> <p>A value of 1 or true indicates custom lists are offered when sorting this PivotTable.</p> <p>A value of 0 or false indicates custom lists are not offered. This attribute depends on the implementation of sorting features in the application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dataCaption (Data Field Header Name)	<p>Specifies the name of the value area field header in the PivotTable. This caption is shown when the PivotTable when two or more fields are in the values area.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
dataOnRows (Data On Rows)	<p>Specifies a boolean value that indicates whether the field representing multiple fields in the data region is located in the row area or the column area.</p>

Attributes	Description
	<p>A value of 1 or true indicates that this field is located in the row area.</p> <p>A value of 0 or false indicates that this field is located in the column area.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dataPosition (Default Data Field Position)	<p>Specifies the position for the field representing multiple data field in the PivotTable, whether that field is located in the row area or column area.</p> <p>Missing attribute indicates this field is last, or innermost in the field list.</p> <p>0 indicates this field is first, or outermost in the field list.</p> <p>1 indicates this field is second in the field list.</p> <p>2 indicates this field is third in the field list, and increasing values follow this pattern.</p> <p>If this value is higher than the number of fields in the field list, then this field is last, or innermost in the field list.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
disableFieldList (Disable Field List)	<p>Specifies a boolean value that indicates whether to disable the PivotTable field list.</p> <p>A value of 1 or true indicates the field list, or similar mechanism for selecting fields in the user interface, is disabled.</p> <p>A value of 0 or false indicates the field list is enabled.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
editData (Allow Edit Data)	<p>Specifies a boolean value that indicates whether the user is allowed to edit the cells in the data area of the PivotTable.</p> <p>A value of 1 or true indicates the user can edit values in the data area.</p> <p>A value of 0 or false indicates the cells in the data area are not editable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
enableDrill (Enable Drill Down)	<p>Specifies a boolean value that indicates whether the user is prevented from drilling down on a PivotItem or aggregate value.</p> <p>A value of 1 or true indicates the user can drill down on a pivot item or aggregate value.</p>

Attributes	Description
	<p>A value of 0 or false indicates the user is prevented from drilling down pivot item.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
enableFieldProperties (Enable Field Properties)	<p>Specifies a boolean value that indicates whether the user is prevented from displaying PivotField properties.</p> <p>A value of 1 or true indicates the user can display pivot field properties.</p> <p>A value of 0 or false indicates the user cannot display pivot field properties. This attribute depends on how pivot field properties are exposed in the application user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
enableWizard (Enable PivotTable Wizard)	<p>Specifies a boolean value that indicates whether the user is prevented from displaying the PivotTable wizard.</p> <p>A value of 1 or true indicates the user can display the PivotTable wizard.</p> <p>A value of 0 or false indicates the user can not display the PivotTable wizard. This attribute depends on whether the application exposes a wizard or similar mechanism for creating and working with PivotTables in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
errorCaption (Error Caption)	<p>Specifies the string to be displayed in cells that contain errors.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
fieldListSortAscending (Default Sort Order)	<p>Specifies a boolean value that indicates whether fields in the PivotTable are sorted in non-default order in the field list.</p> <p>A value of 1 or true indicates fields for the PivotTable are sorted in the field list. The sort order from the data source is applied for range-based PivotTables. Alphabetical sorting is applied for external data PivotTables.</p> <p>A value of 0 or false indicates fields in the field list are not sorted.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fieldPrintTitles (Field Print Titles)	<p>Specifies a boolean value that indicates whether the row and column titles from the PivotTable should be printed.</p>

Attributes	Description
	<p>A value of 1 or true indicates row and column titles should be printed.</p> <p>A value of 0 or false indicates row and column titles should not be printed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
grandTotalCaption (Grand Totals Caption)	<p>Specifies the string to be displayed for grand totals.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
gridDropZones (Enable Drop Zones)	<p>Specifies a boolean value that indicates whether the in-grid drop zones should be displayed at runtime, and whether classic layout is applied.</p> <p>A value of 1 or true indicates in-grid drop zones should be displayed and classic layout should be applied to the PivotTable.</p> <p>A value of 0 or false indicates in-grid drop zones should be disabled and classic layout should not be applied.</p> <p>[Note: Grid drop zones are optional runtime UI, determined by the application, that indicate to the user the locations of the page, row, column, and data fields in the PivotTable report. See layout discussion under pivotTableDefinition for the precise locations of these areas. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
immersive (Stop Immersive UI)	<p>Specifies a boolean value that indicates whether PivotTable immersive experience user interface should be turned off.</p> <p>A value of 1 or true indicates the PivotTable immersive experience should be turned off for this PivotTable.</p> <p>A value of 0 or false indicates the immersive experience should be left on. This attribute depends on whether the application implements an immersive experience in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
indent (Indentation for Compact Axis)	<p>Specifies the indentation increment for compact axis and can be used to set the Report Layout to Compact Form.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

Attributes	Description
itemPrintTitles (Item Print Titles)	<p>Specifies a boolean value that indicates whether PivotItem names should be repeated at the top of each printed page.</p> <p>A value of 1 or true indicates pivot items names should be repeated at the top of each page.</p> <p>A value of 0 or false indicates should not be repeated.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
mdxSubqueries (MDX Subqueries Supported)	<p>Specifies a boolean value that indicates whether MDX sub-queries are supported by OLAP data provider for this PivotTable.</p> <p>A value of 1 or true indicates MDX sub-queries are supported by the OLAP data provider.</p> <p>A value of 0 or false indicates MDX sub-queries are not supported.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
mergeItem (Merge Titles)	<p>Specifies a boolean value that indicates whether row or column titles that span multiple cells should be merged into a single cell.</p> <p>A value of 1 or true indicates that titles that span multiple cells are merged into a single cell.</p> <p>A value of 0 or false indicates titles are not merged.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
minRefreshableVersion (Minimum Refreshable Version)	<p>Specifies the minimum version of the application required to update this PivotTable view. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
missingCaption (Caption for Missing Values)	<p>Specifies the string to be displayed in cells with no value</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
multipleFieldFilters (Multiple Field Filters)	<p>Specifies a boolean value that indicates whether the fields of a PivotTable can have multiple filters set on them.</p> <p>A value of 1 or true indicates the fields of a PivotTable can have multiple filters.</p> <p>A value of 0 or false indicates the fields of a PivotTable can only have a simple filter.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (Name)	<p>Specifies the PivotTable name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
outline (Outline New Fields)	<p>Specifies a boolean value that indicates whether new fields should have their outline flag set to true.</p> <p>A value of 1 or true indicates new fields are created with outline equal to true.</p> <p>A value of 0 or false indicates new fields are created with outline equal to false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
outlineData (Outline Data Fields)	<p>Specifies a boolean value that indicates whether data fields in the PivotTable should be displayed in outline form.</p> <p>A value of 1 or true indicates data fields will display in outline form.</p> <p>A value of 0 or false indicates data fields will not display in outline form.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pageOverThenDown (Page Over Then Down)	<p>Specifies a boolean value that indicates how the page fields are laid out when there are multiple PivotFields in the page area.</p> <p>A value of 1 or true indicates the fields will display "Over, then down"</p> <p>A value of 0 or false indicates the fields will display "down, then Over"</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
pageStyle (Page Header Style Name)	<p>Specifies the name of the style to apply to each of the field item headers in the page area of the PivotTable.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
pageWrap (Page Wrap)	<p>Specifies the number of page fields to display before starting another row or column.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
pivotTableStyle	Specifies the name of the style to apply to the main table area of the PivotTable.

Attributes	Description
(Table Style Name)	<p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
preserveFormatting (Preserve Formatting)	<p>Specifies a boolean value that indicates whether the formatting applied by the user to the PivotTable cells is discarded on refresh.</p> <p>A value of 1 or true indicates the formatting applied by the end user is discarded on refresh.</p> <p>A value of 0 or false indicates the end-user formatting is retained on refresh.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
printDrill (Print Drill Indicators)	<p>Specifies a boolean value that indicates whether drill indicators expand collapse buttons should be printed.</p> <p>A value of 1 or true indicates that these buttons should be printed.</p> <p>A value of 0 or false indicates that these buttons should not be printed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
published (Data Fields Published)	<p>Specifies a boolean value that indicates whether data fields in the PivotTable are published and available for viewing in a server rendering environment.</p> <p>A value of 1 or true indicates that the data fields in the PivotTable are published and shall be available for viewing in a server rendering environment.</p> <p>A value of 0 or false indicates that the data fields in the PivotTable are not published and shall not be available for viewing in a server rendering environment.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rowGrandTotals (Row Grand Totals)	<p>Specifies a boolean value that indicates whether grand totals should be displayed for the PivotTable rows. The default value for this attribute is true.</p> <p>A value of 1 or true indicates grand totals are displayed for the PivotTable rows.</p> <p>A value of 0 or false indicates grand totals will not be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rowHeaderCaption (Row Header)	<p>Specifies the string to be displayed in row header in compact mode.</p>

Attributes	Description
Caption)	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
showCalcMbrs (Show Calculated Members)	<p>Specifies a boolean value that indicates whether calculated members should be shown in the PivotTable view. This attribute applies to PivotTables from OLAP-sources only.</p> <p>A value of 1 or true indicates that calculated members should be shown.</p> <p>A value of 0 or false indicates calculated members should not be shown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showDataDropDo wn (Show Drop Down)	<p>Specifies a boolean value that indicates whether the drop-down lists for the fields in the PivotTable should be hidden. This attribute depends on whether the application implements drop down lists or similar mechanism in the user interface.</p> <p>A value of 1 or true indicates drop down lists are displayed for fields.</p> <p>A value of 0 or false indicates drop down lists will not be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showDataTips (Show ToolTips on Data)	<p>Specifies a boolean value that indicates whether tooltips should be displayed for PivotTable data cells.</p> <p>A value of 1 or true indicates tooltips are displayed.</p> <p>A value of 0 or false indicates tooltips will not be displayed. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showDrill (Show Expand Collapse)	<p>Specifies a boolean value that indicates whether drill indicators should be hidden.</p> <p>A value of 1 or true indicates drill indicators are displayed.</p> <p>A value of 0 or false indicates drill indicators will not be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showDropZones (Show Drop Zones)	<p>Specifies a boolean value that indicates whether the PivotTable should display large drop zones when there are no fields in the data region.</p> <p>A value of 1 or true indicates a large drop zone is displayed.</p>

Attributes	Description
	<p>A value of 0 or false indicates a large drop zone will not be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showEmptyCol (Show Empty Column)	<p>Specifies a boolean value that indicates whether to include empty columns in the table.</p> <p>A value of 1 or true indicates empty columns are included in the PivotTable.</p> <p>A value of 0 or false indicates empty columns are excluded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showEmptyRow (Show Empty Row)	<p>Specifies a boolean value that indicates whether to include empty rows in the table.</p> <p>A value of 1 or true indicates empty rows are included in the PivotTable.</p> <p>A value of 0 or false indicates empty rows are excluded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showError (Show Error)	<p>Specifies a boolean value that indicates whether to show error messages in cells.</p> <p>A value of 1 or true indicates error messages are shown in cells.</p> <p>A value of 0 or false indicates error messages are shown through another mechanism the application provides in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showHeaders (Show Field Headers)	<p>Specifies a boolean value that indicates whether to suppress display of pivot field headers.</p> <p>A value of 1 or true indicates field headers are shown in the PivotTable.</p> <p>A value of 0 or false indicates field headers are excluded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showItems (Show Item Names)	<p>Specifies a boolean value that indicates whether to display item names when adding a field onto a PivotTable that has no data fields.</p> <p>A value of 1 or true indicates item names are displayed.</p> <p>A value of 0 or false indicates item names will not be displayed.</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showMemberPropertyTips (Show Member Property ToolTips)</p>	<p>Specifies a boolean value that indicates whether member property information should be omitted from PivotTable tooltips.</p> <p>A value of 1 or true indicates member property information is included.</p> <p>A value of 0 or false indicates member property information is excluded. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showMissing (Show Missing)</p>	<p>Specifies a boolean value that indicates whether to show a message in cells with no value.</p> <p>A value of 1 or true indicates to show a message string in cells without values.</p> <p>A value of 0 or false indicates no message string will shown in cells without values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>showMultipleLabel (Show Multiple Labels)</p>	<p>Specifies a boolean value that indicates whether a page field with multiple selected items should display "(multiple items)" instead of "All". This attribute applies only to non-OLAP PivotTables. The messages displayed depend on the application implementation.</p> <p>A value of 1 or true indicates a different message string is displayed for a page field with multiple items.</p> <p>A value of 0 or false indicates the same message string is displayed for all page fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>subtotalHiddenItems (Subtotal Hidden Items)</p>	<p>Specifies a boolean value that indicates whether data for hidden pivotItems for PivotFields in the data area should be included in subtotals.</p> <p>A value of 1 or true indicates that data for hidden pivot items in the data area is included in subtotals.</p> <p>A value of 0 or false indicates hidden pivot items will not be included in subtotals.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
tag (PivotTable Custom String)	<p>Specifies a user-defined string that is associated with this PivotTable.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
updatedVersion (PivotTable Last Updated Version)	<p>Specifies the version of the application that last updated the PivotTable view. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
useAutoFormatting (Auto Formatting)	<p>Specifies a boolean value that indicates whether legacy auto formatting has been applied to the PivotTable view.</p> <p>A value of 1 or true indicates that legacy auto formatting has been applied to the PivotTable.</p> <p>A value of 0 or false indicates that legacy auto formatting has not been applied to the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
vacatedStyle (Vacated Style)	<p>Specifies the name of the style to apply to the cells left blank when a PivotTable shrinks during a refresh operation</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
visualTotals (Total Visual Data)	<p>Specifies a boolean value that indicates whether totals should be based on visible data only. This attribute applies to OLAP PivotTables only.</p> <p>A value of 1 or true indicates subtotals are computed on visible data only.</p> <p>A value of 0 or false indicates subtotals are computed on all data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_pivotTableDefinition](#)) is located in §A.2. end note]

18.10.1.74 pivotTableStyleInfo (PivotTable Style)

Represent information on style applied to the PivotTable.

[Example:

```
<sh:pivotTableStyleInfo name="PivotStyleLight16" showRowHeaders="1"
  showColHeaders="1" showRowStripes="0" showColStripes="0" showLastColumn="1"/>
```

end example]

Attributes	Description
name (Table Style Name)	<p>Specifies the name of the table style to use with this table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
showColHeaders (Show Table Style Column Header Formatting)	<p>Specifies a boolean value that indicates whether to show column headers for the table.</p> <p>A value of 1 or true indicates column headers are shown.</p> <p>A value of 0 or false indicates column headers are omitted.</p> <p>'True' if table style column header formatting should be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showColStripes (Show Column Stripes)	<p>Specifies a boolean value that indicates whether to show column stripe formatting for the table.</p> <p>A value of 1 or true indicates column stripe formatting is shown.</p> <p>A value of 0 or false indicates no column formatting is shown.</p> <p>True if table style column stripe formatting should be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showLastColumn (Show Last Column)	<p>Specifies a boolean value that indicates whether to show the last column.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showRowHeaders (Show Row Header Formatting)	<p>Specifies a boolean value that indicates whether to show row headers for the table.</p> <p>A value of 1 or true indicates table style formatting is displayed.</p> <p>A value of 0 or false indicates table style formatting will not be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
showRowStripes (Show Row Stripes)	<p>Specifies a boolean value that indicates whether to show row stripe formatting for the table.</p>

Attributes	Description
	<p>A value of 1 or true indicates row stripe formatting is displayed.</p> <p>A value of 0 or false indicates no row formatting is shown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotTableStyle](#)) is located in §A.2. *end note*]

18.10.1.75 query (Query)

Represents an OLAP sheet data cached query.

Attributes	Description
mdx (MDX Query String)	<p>Specifies the Multidimensional Expressions (MDX) query string.</p> <p>[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx <i>end note</i>]</p> <p>See the MDX Language Reference for more information:</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Query](#)) is located in §A.2. *end note*]

18.10.1.76 queryCache (OLAP Query Cache)

Represents the cache of OLAP sheet data queries.

Attributes	Description
count (Cached Query Count)	<p>Specifies the number of cached queries in the collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryCache](#)) is located in §A.2. *end note*]

18.10.1.77 `r` (PivotCache Record)

Represents a single record of data in the PivotCache.

[Example:

```
<r>
  <s v="3550"/>
  <s v="Road-150 Red, 62"/>
  <s v="This bike is ridden by race winners. Developed with the Adventure Works
    Cycles professional race team, it has a extremely light heat-treated
    aluminum frame, and steering that allows precision control."/>
  <s v="No Discount"/>
  <x v="0"/>
  <s v="Australian Dollar"/>
  <n v="1"/>
  <n v="3578.27"/>
  <n v="0"/>
  <n v="2171.29419999999998"/>
  <n v="3578.27"/>
  <n v="89.4568000000000001"/>
</r>
```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_Record](#)) is located in §A.2. *end note]*

18.10.1.78 `rangePr` (Range Grouping Properties)

Represents the collection of range grouping properties.

[Example:

```
<rangePr groupBy="months" startDate="2002-01-01T00:00:00"
  endDate="2006-05-06T00:00:00"/>
```

end example]

Attributes	Description
autoEnd (Source Data Ending Range)	<p>Specifies a boolean value that indicates whether the application uses the source data to set the ending range value.</p> <p>A value of 1 or true indicates the ending range value is set from the source data.</p> <p>A value of 0 or false indicates ending range values are set by the value specified in endDate or endNum.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
autoStart (Source Data Set Beginning Range)	<p>Specifies a boolean value that indicates whether we use source data to set the beginning range value.</p> <p>A value of 1 or true indicates the beginning range value is set from the source data.</p> <p>A value of 0 or false indicates the beginning range value is set from the value specified in startDate or startNum.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
endDate (Date Grouping End Value)	<p>Specifies the ending value for date grouping if autoEnd is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>
endNum (Numeric Grouping End Value)	<p>Specifies the ending value for numeric grouping if autoEnd is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
groupBy (Group By)	<p>Specifies the grouping.</p> <p>The possible values for this attribute are defined by the ST_GroupBy simple type (§18.18.38).</p>
groupInterval (Grouping Interval)	<p>Specifies the grouping interval for numeric range grouping. Specifies the number of days to group by in date range grouping.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
startDate (Date Grouping Start Value)	<p>Specifies the starting value for date grouping if autoStart is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p>
startNum (Numeric Grouping Start Value)	<p>Specifies the starting value for numeric grouping if autoStart is false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RangePr](#)) is located in §A.2. *end note*]

18.10.1.79 rangeSet (Range Set)

Represents a single range in the rangeSets collection. element is intended to facilitate creating a PivotTable report by consolidating SpreadsheetML ranges that have similar categories of data to be summarized. The simplest layout for the data source is for each rangeSets of data to be in list-like format, with column labels in the first row, row labels in the first column, the rest of the rows having similar items in the same row and column, and no blank rows or columns within the range. A particular rangeSet can consist of a built-in named range that is provided by the application, a user defined named range, a range reference, or a reference to an external workbook.

When multiple ranges are consolidated using this functionality, up to 4 custom report filters (also known as page fields) can be created to help filter the PivotTable report, by specifically enabling one or more of the individual ranges to be selected in the report filter. For each custom page field created, a custom label can be specified and assigned to each range participating in the consolidation range, so that the PivotTable can be filtered by one or more of the ranges being summarized.

[Example: Consider a workbook with 6 worksheets. On Sheet1 we have:

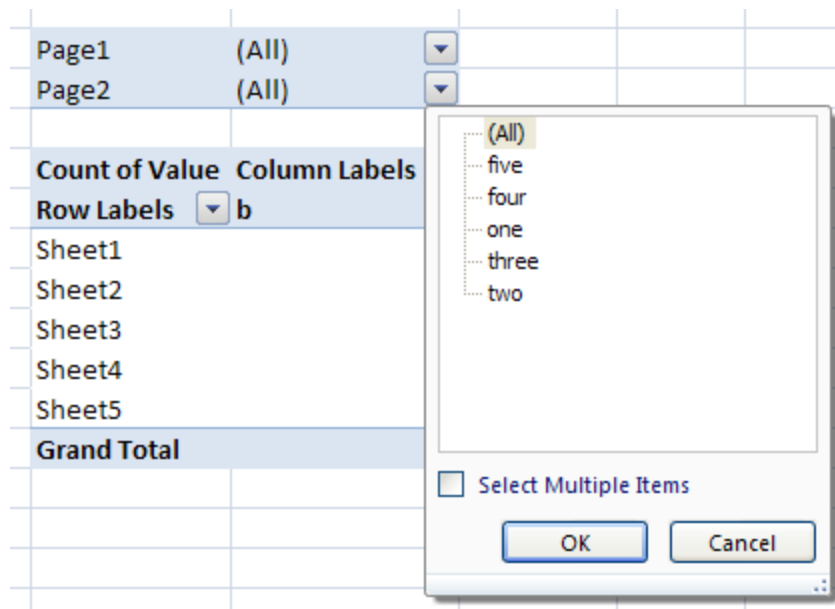

a	b
Sheet1	Sheet1
Sheet1	Sheet1

On Sheet2 we have:

a	b
Sheet2	Sheet2
Sheet2	Sheet2

... and so on up through Sheet5.

On Sheet6, we have the consolidated ranges being summarized by a PivotTable, and two page filters exist for the PivotTable.

Notice that for the second page filter, the items have been assigned a custom label, "one", "two", ..., "five", for each of Sheet1, Sheet2, ..., Sheet5 data sources, respectively. Similarly, the items have been assigned a custom label, "1", "2", ..., "5" for each of Sheet1, Sheet2, ..., Shet5 data sources, respectively.

The XML representing these custom page filters must be like the following:

```
<cacheSource type="consolidation">
  <consolidation autoPage="0">
    <pages count="2">
      <page count="5">
        <pageItem name="1"/>
        <pageItem name="2"/>
        <pageItem name="3"/>
        <pageItem name="4"/>
        <pageItem name="5"/>
      </page>
      <page count="5">
        <pageItem name="one"/>
        <pageItem name="two"/>
        <pageItem name="three"/>
        <pageItem name="four"/>
        <pageItem name="five"/>
      </page>
    </pages>
  </consolidation>
</cacheSource>
```

```

<rangeSets count="5">
  <rangeSet i1="0" i2="0" ref="A1:B3" sheet="Sheet1"/>
  <rangeSet i1="1" i2="1" ref="A1:B3" sheet="Sheet2"/>
  <rangeSet i1="2" i2="2" ref="A1:B3" sheet="Sheet3"/>
  <rangeSet i1="3" i2="3" ref="A1:B3" sheet="Sheet4"/>
  <rangeSet i1="4" i2="4" ref="A1:B3" sheet="Sheet5"/>
</rangeSets>
</consolidation>
</cacheSource>

```

end example]

[*Note:* Attributes i1, i2, i3, and i4 correspond to custom page fields created in the user interface. Spreadsheet ML only supports 4 custom page fields. *end note*]

Attributes	Description
i1 (Field Item Index Page 1)	Specifies the index of a page field item in page filter one. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
i2 (Field Item Index Page 2)	Specifies the index of a page field item in page filter two. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
i3 (Field Item Index Page 3)	Specifies the index of a page field item in page filter three. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
i4 (Field Item Index Page 4)	Specifies the index of a page field item in page filter four. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the unique identifier of the Workbook part where the range set is stored. See Workbook (§18.2) for more information. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
name (Named Range)	Specifies the named range. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ref (Reference)	Specifies the cell range.

Attributes	Description
	The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sheet (Sheet Name)	Specifies the sheet name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element’s content model ([CT_RangeSet](#)) is located in §A.2. *end note*]

18.10.1.80 rangeSets (Range Sets)

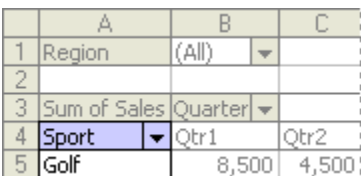

Represents the collection of reference-page items pairs.

Attributes	Description
count (Reference and Page Item Count)	Specifies the number of reference and page items. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_RangeSets](#)) is located in §A.2. *end note*]

18.10.1.81 rowFields (Row Fields)

Represents the collection of row fields for the PivotTable.

The image shows a PivotTable report with the following structure:

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

In this example, 'Region' and 'Sum of Sales' are column fields, while 'Sport' and 'Golf' are row fields. 'Sport' is highlighted in blue, indicating it is the active row field.

In the image above, the blue field is a row field. A PivotTable report that has more than one row field has one inner row field (Sport, in the example below), the one closest to the data area. Any other row fields are outer row fields (Region, in the example below). Items in the outermost row field are displayed only once, but items in the rest of the row fields are repeated as needed.

[Example:

	A	B	C
3	Sum of Sales		Quarter ▼
4	Region ▼	Sport ▼	Qtr1
5	East	Golf	5,000
6		Safari	9,000
7		Tennis	1,500
8	East Total		15,500
9	West	Golf	3,500

In the image above, Region is an outer row field. Sport is an inner row field.

```
<rowFields count="2">
  <field x="7"/>
  <field x="8"/>
</rowFields>
```

end example]

Attributes	Description
count (Repeated Items Count)	Specifies the number of repeated items in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RowFields](#)) is located in §A.2. *end note*]

18.10.1.82 rowHierarchiesUsage (Row OLAP Hierarchy References)

Represents the collection of references to OLAP hierarchies on the row axis of a PivotTable.

[Example:

```
<sh:rowHierarchiesUsage count="1">
  <sh:rowHierarchyUsage hierarchyUsage="9"/>
</sh:rowHierarchiesUsage>
```

end example]

Attributes	Description
count (Item Count)	Specifies the number of items in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RowHierarchiesUsage](#)) is located in §A.2. *end note*]

18.10.1.83 rowHierarchyUsage (Row OLAP Hierarchies)

Represents a references to an OLAP Hierarchy on the row axis of a PivotTable.

[Example:

```
<sh:rowHierarchyUsage hierarchyUsage="9"/>
```

end example]

Attributes	Description
hierarchyUsage (Hierarchy Usage)	Specifies the reference to an OLAP hierarchy in a PivotTable. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[Note: The W3C XML Schema definition of this element’s content model ([CT_HierarchyUsage](#)) is located in §A.2.
end note]

18.10.1.84 rowItems (Row Items)

Represents the collection of items in row axis of the PivotTable.

[Example: In the SpreadsheetML example below, the item values are found in cells B10:B13. For example "Bikes" is in B10, and corresponds to the first <i> element below.

```
<rowItems count="4">
  <i>
    <x/>
  </i>
  <i r="1">
    <x/>
  </i>
  <i r="1">
    <x v="1"/>
  </i>
  <i t="grand">
    <x/>
  </i>
</rowItems>
```

Looking at the layout of the PivotTable in this example, "Bikes" is the first (and only) item value in the first row, in cell B10. In the XML defining the PivotTable row item values, the first <i> element corresponds to the first row. There is a single index element <x>. The first (and only) <x> element corresponds to the first field on the row axis, namely "Product Category", and an index value of "0" indicates that the 0th item in the items collection for that pivotField definition is how to obtain the item value. Note that "Bikes" isn't explicitly listed

as a value here, but instead the 0th item is an index to this field's shared items collection in the `pivotCacheDefinition` part.

For the second row there are two item values, one item value (Bikes) from the first field in that row (Product Category) and one item value (Mountain Bikes) from the second field in that row (Product Subcategory). In the PivotTable, the first item value "Bikes" is hidden from view. In the XML for this example, the second `<i>` element expresses both item values for this row. The first item value "Bikes" is expressed implicitly, because the value of `@r` on the second `<i>` element is '1', indicating that the first item value from the previous row is reused again as the first item value for the current row. The second item value is expressed explicitly via the `<x>` element under the second `<i>` element. The index of '0' indicates that the 0th item in the `<pivotField>` element for that field is how to obtain the item value. Note again that the 0th item is itself an index into this field's shared items collection in the `pivotCacheDefinition` part.

The item values for the third row can be discovered in a similar way. *end example]*

Attributes	Description
count (Items in a Row Count)	Specifies the number of items in the row axis of the PivotTable. The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.

[Note: The W3C XML Schema definition of this element's content model (`CT_rowItems`) is located in §A.2. *end note]*

18.10.1.85 `s` (Character Value)

Represents a character value in a PivotTable.

[Example:

```
<sharedItems count="2">
  <s v="7527 Brook Way"/>
  <s v="3310 Harvey Way"/>
</sharedItems>
```

end example]

Attributes	Description
b (Bold)	Specifies a boolean value that indicates whether this value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of 1 or true indicates this value contains bold formatting on the server. The possible values for this attribute are defined by the W3C XML Schema <code>boolean</code> datatype.

Attributes	Description
bc (Background Color)	<p>Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
c (Item Caption)	<p>Specifies the caption for the this item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
cp (Member Property Count)	<p>Specifies the number of member property values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of 1 or true indicates this item is a calculated value.</p> <p>A value of 0 or false indicates this item is not a calculated value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains italic formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains strikethrough formatting on the server.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in <code>missingItemsLimit</code> is reached.</p> <p>A value of 1 or <code>true</code> indicates this item is unused.</p> <p>A value of 0 or <code>false</code> indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or <code>true</code> indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model (`CT_String`) is located in §A.2. *end note*]

18.10.1.86 `serverFormat` (Server Format)

Represents the numeric format specified by the OLAP server for a tuple.

Attributes	Description
culture (Culture)	<p>Specifies a language used to determine the currency symbol to display for currency values. [Example: if the culture is "en-us", the values in the application will format the values with a dollar sign. If the culture is "fr-fr" the application will format the values with a euro sign. <i>end example</i>]</p> <p>This value conforms to the language tagging conventions of RFC 3066 and later. The pattern <code><language>-<REGION></code> is used, e.g., "en-us" or "fr-fr".</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19).</p>
format (Format)	Specifies the format string to use for all other numeric values. This string is supplied by

Attributes	Description
	<p>the OLAP server. Therefore, the syntax for reading the format string depends on the server implementation.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ServerFormat](#)) is located in §A.2.
end note]

18.10.1.87 [serverFormats \(Server Formats\)](#)

Represents the collection of numeric and currency formats specified by the OLAP server for a tuple

Attributes	Description
count (Format Count)	<p>Specifies the number of formats in the collection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ServerFormats](#)) is located in §A.2.
end note]

18.10.1.88 [set \(OLAP Set\)](#)

Represents an OLAP sheet data set or tuple set. The set is defined by a Multidimensional Expressions (MDX) query that specifies criteria for the dimension members that belong to the set.

[Example: the following MDX expression defines the set for the 10 salespersons with the lowest sales:

```
BottomCount([Salesperson].[Salesperson Name].Members,10,[Measures].[Sales])
```

end example]

The MDX expression is specified in the setDefinition attribute.

Attributes	Description
count (Number of Tuples)	<p>Specifies the number of tuples in the set.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
maxRank (Maximum Rank Requested)	<p>Specifies the largest rank entry the user has requested.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

Attributes	Description
queryFailed (Query Failed)	<p>Specifies a boolean value that indicates whether querying on this set failed.</p> <p>A value of 1 or true indicates a query against this set failed.</p> <p>A value of 0 or false indicates a query against this set succeeded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
setDefinition (MDX Set Definition)	<p>Specifies the Multidimensional Expressions (MDX) set definition.</p> <p>[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx end note]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
sortType (Set Sort Order)	<p>Specifies the sort order of the set.</p> <p>The possible values for this attribute are defined by the ST_SortType simple type (§18.18.74).</p>

[Note: The W3C XML Schema definition of this element's content model (CT_Set) is located in §A.2. end note]

18.10.1.89 sets (Sets)

Represents the collection of OLAP sheet data entries or tuple sets.

Attributes	Description
count (Tuple Set Count)	<p>Specifies the number of tuple sets.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_Sets) is located in §A.2. end note]

18.10.1.90 sharedItems (Shared Items)

Represents the collection of unique items for a field in the PivotCacheDefinition. The sharedItems complex type stores data type and formatting information about the data in a field. Items in the PivotCacheDefinition can be shared in order to reduce the redundancy of those values that are referenced in multiple places across all the PivotTable parts. [Example: A value might be part of a filter, it might appear on a row or column axis, and will appear in the pivotCacheRecords definition as well. However, because of the performance cost of creating the optimized shared items, items are only shared if they are actually in use in the PivotTable. Therefore, depending

on user actions on the PivotTable layout, the pivotCacheDefinition and underlying PivotCacheRecords part can be updated. *end example*]

If there are no shared items, then field values are stored directly in the pivotCacheRecords part.

[*Example:*

```
<sharedItems count="1">
  <s v="[Customer].[Customer Geography].[Country].&[United States]"
    c="United States"/>
</sharedItems>
```

end example]

The following attributes are not required or used if there are no items in sharedItems.

- containsBlank
- containsSemiMixedTypes
- containsMixedTypes
- longText

The following attributes are not used unless there is more than one item in sharedItems or the one and only item is not a blank item. If the first item is a blank item the data type the field cannot be verified.

- containsNumber
- containsDates
- containsString
- containsInteger

The following attributes can be omitted without loss of functionality.

- containsNonDate
- count

The following attributes are not required and can be omitted. However, refreshing the PivotTable could produce different groupings than before.

- maxDate
- minDate
- maxValue
- minValue

Applications should ensure that “date” attributes are not mixed with “value” attributes.

Attributes	Description
containsBlank	Specifies a boolean value that indicates whether this field contains a blank value.

Attributes	Description
(Contains Blank)	<p>A value of 1 or true indicates this field contains one or more blank values.</p> <p>A value of 0 or false indicates this field does not contain blank values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsDate (Contains Date)	<p>Specifies a boolean value that indicates that the field contains at least one date.</p> <p>A value of 1 or true indicates the field contains at least one date value.</p> <p>A value of 0 or false indicates the field does not contain any date values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsInteger (Contains Integer)	<p>Specifies a boolean value that indicates whether this field contains integer values.</p> <p>A value of 1 or true indicates this field contains integer values.</p> <p>A value of 0 or false indicates non-integer or mixed values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsMixedTypes (Contains Mixed Data Types)	<p>Specifies a boolean value that indicates whether this field contains more than one data type.</p> <p>A value of 1 or true indicates this field contains more than one data type.</p> <p>A value of 0 or false indicates contains only one data type. The field can still contain blank values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsNonDate (Contains Non Date)	<p>Specifies a boolean value that indicates that the field contains at least one value that is not a date.</p> <p>A value of 1 or true indicates the field contains at least one non-date values.</p> <p>A value of 0 or false indicates this field contains no date fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsNumber (Contains Numbers)	<p>Specifies a boolean value that indicates whether this field contains numeric values.</p>

Attributes	Description
	<p>A value of 1 or true indicates this field contains at least one numeric value.</p> <p>A value of 0 or false indicates this field contains no numeric values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsSemiMixedTypes (Contains Semi Mixed Data Types)	<p>Specifies a boolean value that indicates that this field contains text values. The field can also contain a mix of other data type and blank values.</p> <p>A value of 1 or true indicates at least one text value, and can also contain a mix of other data types and blank values.</p> <p>A value of 0 or false indicates the field does not have a mix of text and other values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
containsString (Contains String)	<p>Specifies a boolean value that indicates whether this field contains a text value.</p> <p>A value of 1 or true indicates this field contains at least one text value.</p> <p>A value of 0 or false indicates this field does not contain any text values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
count (Shared Items Count)	<p>Specifies the number of shared items to load for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
longText (Long Text)	<p>Specifies a boolean value that indicates whether this field contains a long text value. A string is considered long if it is over 255 Unicode scalar values.</p> <p>A value of 1 or true indicates the value contains more than 255 Unicode scalar values of text.</p> <p>A value of 0 or false indicates the value contains less than 255 Unicode scalar values.</p> <p>[Note: This is used as many legacy spreadsheet application support a limit of 255 characters for text values. end note]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
maxDate (Maximum Date Time Value)	<p>Specifies the maximum date/time value found in a date field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime</p>

Attributes	Description
	datatype.
maxValue (Maximum Numeric Value)	Specifies the maximum numeric value found in a numeric field. The possible values for this attribute are defined by the W3C XML Schema double datatype.
minDate (Minimum Date Time)	Specifies the minimum date/time value found in a date field. The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.
minValue (Minimum Numeric Value)	Specifies the minimum numeric value found in a numeric field. The possible values for this attribute are defined by the W3C XML Schema double datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_SharedItems](#)) is located in §A.2. *end note*]

18.10.1.91 sortByTuple (Sort By Tuple)

Represents the sort applied to a tuple.

Attributes	Description
c (Member Name Count)	Specifies the number of member names. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Tuples](#)) is located in §A.2. *end note*]

18.10.1.92 tpl (Tuple)

Represents an OLAP sheet data entry member.

Attributes	Description
fld (Field Index)	Specifies the index of the field to which the member belongs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
hier (Hierarchy Index)	Specified the index of the hierarchy to which the member belongs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

Attributes	Description
item (Item Index)	Specifies the index of the item in the field that represents this item. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Tuple](#)) is located in §A.2. *end note*]

18.10.1.93 [tpls \(Tuples\)](#)

Represents members for the OLAP sheet data entry, also known as a tuple.

Attributes	Description
c (Member Name Count)	Specifies the number of member names. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Tuples](#)) is located in §A.2. *end note*]

18.10.1.94 [tupleCache \(Tuple Cache\)](#)

Represents the cache of OLAP sheet data members, or tuples.

[Note: The W3C XML Schema definition of this element's content model ([CT_TupleCache](#)) is located in §A.2. *end note*]

18.10.1.95 [worksheetSource \(Worksheet PivotCache Source\)](#)

Represents the location of the source of the data that is stored in the cache.

[Example:

```
<cacheSource type="worksheet">
  <worksheetSource name="Table1" r:id="rId2"/>
</cacheSource>
```

end example]

Attributes	Description
id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Specifies the identifier to the Sheet part whose data is stored in the cache. See the Sheet section (§18.2) for more information. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

Attributes	Description
ps	
name (Named Range)	Specifies the named range that is the source of the data. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ref (Reference)	Specifies the reference that defines a cell range that is the source of the data. This attribute depends on how the application implements cell references. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sheet (Sheet Name)	Specifies the name of the sheet that is the source for the cached data. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_WorksheetSource](#)) is located in §A.2. *end note*]

18.10.1.96 x (Member Property Index)

Represents an array of indexes to cached member property values.

Attributes	Description
v (Shared Items Index)	Specifies the index into the shared items table in the PivotCache that identifies this item. The possible values for this attribute are defined by the W3C XML Schema int datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_X](#)) is located in §A.2. *end note*]

18.10.1.97 x (Shared Items Index)

This element represents an array of indexes to cached shared item values

Attributes	Description
v (Shared Items Index)	Specifies the index into the shared items table in the PivotCache that identifies this item. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Index](#)) is located in §A.2. *end note*]

18.10.2 Shared Pivot Table Data

This section defines the part where shared PivotTable data is stored.

18.10.2.1 [reference \(Reference\)](#)

Represents a set of selected fields and selected items within those fields.

[Example:

```
<sh:reference field="4294967294" count="1" selected="0">
  <sh:x v="0"/>
</sh:reference>
```

end example]

Attributes	Description
avgSubtotal (Include Average Filter)	<p>Specifies a boolean value that indicates whether the 'average' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the average aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
byPosition (Positional Reference)	<p>Specifies a boolean value that indicates whether the item is referred to by position rather than item index.</p> <p>A value of 1 or true indicates the item is referred to by position.</p> <p>A value of 0 or false indicates the item is referred to by index.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
count (Item Index Count)	<p>Specifies the number of item indexes in the collection of indexes (x tags).</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
countASubtotal (Include CountA Filter)	<p>Specifies a boolean value that indicates whether the 'countA' subtotal is included in the filter.</p> <p>A value of 1 or true indicates the count aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
countSubtotal (Include Count)	<p>Specifies a boolean value that indicates whether the count aggregate function is included in the filter.</p>

Attributes	Description
Subtotal)	<p>A value of 1 or true indicates the count aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
defaultSubtotal (Include Default Filter)	<p>Specifies a boolean value that indicates whether the default subtotal is included in the filter.</p> <p>A value of 1 or true indicates the default subtotal is included in the filter. The default is to display the total or the grand total.</p> <p>A value of 0 or false indicates another subtotal or aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
field (Field Index)	<p>Specifies the index of the field to which this filter refers. A value of -2 indicates the 'data' field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
maxSubtotal (Include Maximum Filter)	<p>Specifies a boolean value that indicates whether the 'maximum' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the maximum aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
minSubtotal (Include Minimum Filter)	<p>Specifies a boolean value that indicates whether the 'minimum' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the minimum aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
productSubtotal (Include Product Filter)	<p>Specifies a boolean value that indicates whether the 'product' aggregate function is included in the filter.</p>

Attributes	Description
	<p>A value of 1 or true indicates the product aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
relative (Relative Reference)	<p>Specifies a boolean value that indicates whether the item is referred to by a relative reference rather than an absolute reference. This attribute is used if posRef is set to true.</p> <p>A value of 1 or true indicates the item is referred to by a relative reference.</p> <p>A value of 0 or false indicates the item is referred to by an absolute reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
selected (Selected)	<p>Specifies a boolean value that indicates whether this field has selection. This attribute is used when the PivotTable is in Outline view. It is also used when both header and data cells have selection.</p> <p>A value of 1 or true indicates the field has selection.</p> <p>A value of 0 or false indicates the field does not have selection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
stdDevPSubtotal (Include StdDevP Filter)	<p>Specifies a boolean value that indicates whether the population standard deviation aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the population standard deviation aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
stdDevSubtotal (Include StdDev Filter)	<p>Specifies a boolean value that indicates whether the standard deviation aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the standard deviation aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p>

Attributes	Description
	datatype.
sumSubtotal (Include Sum Filter)	<p>Specifies a boolean value that indicates whether the sum aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the sum aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
varPSubtotal (Include VarP Filter)	<p>Specifies a boolean value that indicates whether the population variance aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the population variance aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
varSubtotal (Include Var Filter)	<p>Specifies a boolean value that indicates whether the variance aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the variance aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotAreaReference](#)) is located in §A.2. end note]

18.10.2.2 references (References)

Represents the set of selected fields and the selected items within those fields.

[Example:

```
<sh:references count="5">
  <sh:reference field="4294967294" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
```

```

    <sh:reference field="2" count="1" selected="0">
      <sh:x v="0"/>
    </sh:reference>
    <sh:reference field="14" count="1" selected="0">
      <sh:x v="0"/>
    </sh:reference>
    <sh:reference field="15" count="2" selected="0">
      <sh:x v="2"/>
      <sh:x v="3"/>
    </sh:reference>
  </sh:references>

```

end example]

Attributes	Description
count (Pivot Filter Count)	<p>Specifies the number of filtered records available in the PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element’s content model ([CT_PivotAreaReferences](#)) is located in §A.2. *end note*]

18.11 Shared Workbook Data

The Shared Workbooks architecture enables a spreadsheet application to record revisions made to a workbook (e.g., track changes), and is designed to enable either single, or multiple users editing the same workbook at the same time. Therefore, the application needs to support the ability to read changes made by another user and update its own state of the same workbook with those changes, even when those changes are made concurrently with other changes made by other users. Inevitably there are conflicts, and therefore merge conflict resolution should be supported the runtime application. The file format only contains enough information so that the spreadsheet application can deal with conflicts, and can undo/redo changes from the change history at run time.

18.11.1 Shared Workbook Data

Within a shared workbook, the changes made to the spreadsheet at runtime are persisted as sets of different revisions collectively forming a revision history. These are persisted to the file on disk during a save event, and are saved in different xml parts known as revision logs. There is a headers table xml part that summarizes when changes were made, who made them, and it lists the relationship from each header to the individual revision log that records the specific changes.

[Example: This example shows the header and revision log for two simple events: adding text to a cell, and inserting a new sheet.

First, take a look at the header table, and revision log:

```
<headers xmlns="..." xmlns:r="..." guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
    r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
</headers>
```

And the revision log is essentially empty:

```
<revisions xmlns="..." xmlns:r="..." />
```

Now, after inserting the text "foo" into cell A1, and saving, the header looks like this:

```
<headers xmlns="..." xmlns:r="..." guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
  diskRevisions="1" revisionId="1" version="2">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
    r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
    dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
    r:id="rId2" minRId="1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
</headers>
```

A new header entry is added, with a GUID and a revision ID (rId2) that specifies which log to look into to see the details about the revision.

The old log is saved, and the newly created log (corresponding to rId2) now looks like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rcc rId="1" sId="1">
    <nc r="A1" t="inlineStr">
      <is>
        <t>foo</t>
        <phoneticPr fontId="0"/>
      </is>
    </nc>
  </rcc>
</revisions>
```

The log shows that the contents of a cell were revised, and the new cell contents is text containing "foo" as the string.

After inserting a new sheet, the header looks like this:

```
<headers xmlns="..." xmlns:r="..." guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
  diskRevisions="1" revisionId="2" version="3">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4"
    userName="UserName" r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
    dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
    r:id="rId2" minRId="1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
    dateTime="2006-07-14T13:48:56" maxSheetId="5" userName="UserName"
    r:id="rId3" minRId="2">
```

```
<sheetIdMap count="4">
  <sheetId val="1"/>
  <sheetId val="2"/>
  <sheetId val="3"/>
  <sheetId val="4"/>
</sheetIdMap>
</header>
</headers>
```

You can see that the last, most recent, header entry shows an entry for the new sheet. The most recent log looks like this:

```
<revisions xmlns="..." xmlns:r="...">
  <ris rId="2" sheetId="4" name="[shared example.xlsx]Sheet4"
    sheetPosition="3"/>
  <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="delete"/>
  <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="add"/>
</revisions>
```

This shows the new sheet, sheetId 4, is added to the workbook. The custom view (rcv) for the user is updated as a new sheet was added.

end example]

18.11.1.1 [header \(Header\)](#)

This element is essentially a table that contains metadata about a list of specific changes that have taken place for this workbook. It lists when the changes were made, who made them, and the relationship IDs so that the log detailing the specific change can be found. If tracking changes, or sharing workbooks, are enabled, then changes are persisted on the Save event, or at a specified time interval. A header is created for each set of changes.

Attributes	Description
dateTime (Date Time)	The date and time when this set of revisions was saved. [Note: This can happen when the user explicitly saves, or the save can occur due to a time interval, specified in the spreadsheet application, elapsing. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.
guid (GUID)	A globally unique identifier for this set of revisions. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).
id (Relationship ID)	This is the ID that is used to find the corresponding log record of the changes made for this header.

Attributes	Description
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Use the corresponding relationship expressed in the revisionHeaders part to locate the log record that lists the specific changes. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
maxRId (Max Revision Id)	The highest revision Id that belongs to this header. <i>[Note: This can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access. end note]</i> The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
maxSheetId (Last Sheet Id)	Internal identifier of the next available sheet in this workbook. The numbering here is the index of the next available sheet in the workbook in a 1-based index system. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
minRId (Minimum Revision Id)	The lowest revision id that belongs to this header. <i>[Note: this can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access. end note]</i> The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
userName (User Name)	A string representing the name of the user making the revision.. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionHeader](#)) is located in §A.2. end note]

18.11.1.2 headers (Revision Headers)

This element represents the list of revision headers.

This section contains many references to history, versions, and revisions, and it is helpful to clarify the relationships here. In general, a series of changes (revisions) can be made to a spreadsheet. When a batch of those revisions is saved to disk, the version number of the spreadsheet is incremented. The batch of changes is saved to the revision history, which is persisted on disk with the file in the form of different log files and headers.

There are some attributes that deal with history which might seem redundant (such as `diskRevisions`, and `history`, among others) - these are there for backwards compatibility with older versions of spreadsheet applications and do not need to be used for creating new files.

Attributes	Description
<code>diskRevisions</code> (Disk Revisions)	<p>A Boolean value indicating that this shared workbook file contains revisions. <code>True</code> when the workbook does have revisions, <code>false</code> otherwise.</p> <p>[<i>Note: this attribute is used for backwards compatibility. end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<code>exclusive</code> (Exclusive Mode)	<p>A Boolean value indicating that this shared workbook is in exclusive mode.</p> <p>A workbook is in exclusive mode when a user has a lock on it for appending revisions to the file.</p> <p>[<i>Note: This is used for backwards compatibility with older spreadsheet applications. end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<code>guid</code> (Last Revision GUID)	<p>The globally unique identifier of the last set of revisions. This shall match the GUID for the most recent header.</p> <p>The possible values for this attribute are defined by the <code>ST_Guid</code> simple type (§22.9.2.4).</p>
<code>history</code> (History)	<p>A Boolean value indicating that this shared workbook maintains a revision history. <code>True</code> if a history is maintained, <code>false</code> otherwise.</p> <p>[<i>Note: This is used for backwards compatibility with older spreadsheet applications. end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<code>keepChangeHistory</code> (Keep Change History)	<p>A Boolean value indicating whether the revision history should be kept for this shared workbook. <code>True</code> if the history should be kept, <code>false</code> otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<code>lastGuid</code> (Last GUID)	<p>Unique identifier of the last set of revisions that was saved into the file.</p> <p>The spreadsheet application can have certain modes, such as a timed save mode, where the application doesn't do a full save, but instead just appends the most recent revision records. In cases like this, for a new user that opens such a file while it is being edited, the file that was loaded from disk only have the changes that were saved during a full</p>

Attributes	Description
	<p>save. To get the current state of the file which includes edits by other users, the spreadsheet application would need to apply all the revisions from lastGuid to guid.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
preserveHistory (Preserve History)	<p>An integer representing the number of days the spreadsheet application shall keep the change history for this workbook.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
protected (Protected)	<p>A Boolean value indicating whether the change tracking in this shared workbook can be removed. True if the tracking can be removed, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
revisionId (Revision Id)	<p>The current revision number of this shared workbook.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
shared (Shared Workbook)	<p>A Boolean value indicating that this workbook is shared. True when the workbook is shared, false otherwise.</p> <p>[Note: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
trackRevisions (Track Revisions)	<p>A Boolean value indicating that revisions are tracked in this shared workbook. True when revisions are tracked, false otherwise.</p> <p>[Note: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
version (Version)	<p>An integer representing the current version of this shared workbook. The integer should begin counting from 1 for the first version.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionHeaders](#)) is located in §A.2. *end note*]

18.11.1.3 `nc` (New Cell Data)

This element represents new cell data that was added to the worksheet.

For most spreadsheet application purposes, only the data type and reference need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the `<rfmt>` element can be used to record style information instead of the `S (style index)` attribute.

Attributes	Description
<code>cm</code> (Cell Metadata Index)	<p>The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p>
<code>ph</code> (Show Phonetic)	<p>A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>boolean</code> datatype.</p>
<code>r</code> (Reference)	<p>An A1 style reference to the location of this cell</p> <p>The possible values for this attribute are defined by the <code>ST_CellRef</code> simple type (§18.18.7).</p>
<code>s</code> (Style Index)	<p>The index of this cell's style. Style records are stored in the Styles Part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p>
<code>t</code> (Cell Data Type)	<p>An enumeration representing the cell's data type.</p> <p>The possible values for this attribute are defined by the <code>ST_CellType</code> simple type (§18.18.11).</p>
<code>vm</code> (Value Metadata Index)	<p>The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (`CT_Cell`) is located in §A.2. *end note*]

18.11.1.4 ndxf (New Formatting Information)

This element represents new differential formatting information for this cell. This formatting is applied to the existing formatting of the cell.

[Note: The W3C XML Schema definition of this element's content model ([CT_Dxf](#)) is located in §A.2. *end note*]

18.11.1.5 oc (Old Cell Data)

This element represents old cell data. Old cell data is data that was previously stored in the cell.

For most spreadsheet application purposes, only the data type and reference need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the <rfmt> element can be used to record style information instead of the S (style index) attribute.

Attributes	Description
cm (Cell Metadata Index)	<p>The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
ph (Show Phonetic)	<p>A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
r (Reference)	<p>An A1 style reference to the location of this cell</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
s (Style Index)	<p>The index of this cell's style. Style records are stored in the Styles Part.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
t (Cell Data Type)	<p>An enumeration representing the cell's data type.</p> <p>The possible values for this attribute are defined by the ST_CellType simple type (§18.18.11).</p>
vm (Value Metadata Index)	<p>The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value</p>

Attributes	Description
	<p>metadata is accessible via formula reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Cell](#)) is located in §A.2. *end note*]

18.11.1.6 [odxf \(Old Formatting Information\)](#)

This element represents the old differential formatting information for this cell. Old differential formatting is differential formatting that was previously applied to the cell.

[Note: The W3C XML Schema definition of this element's content model ([CT_Dxf](#)) is located in §A.2. *end note*]

18.11.1.7 [oldFormula \(Old Formula\)](#)

This element represents the old formula for a defined name in this cell. This is only used for named cells. Formulas that are entered in a cell with no name are represented by the formula element <f>.

The possible values for this element are defined by the ST_Formula simple type (§18.18.35).

[Note: The W3C XML Schema definition of this element's content model ([ST_Formula](#)) is located in §A.2. *end note*]

18.11.1.8 [raf \(Revision AutoFormat\)](#)

This element represents a revision record of auto formatting change information for a table.

Attributes	Description
applyAlignmentFormats (Apply Alignment Formats)	<p>If true apply legacy table autoformat alignment properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyBorderFormats (Apply Border Formats)	<p>If true apply legacy table autoformat border properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyFontFormats (Apply Font Formats)	<p>If true apply legacy table autoformat font properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyNumberFormats (Apply Number Formats)	<p>If true apply legacy table autoformat number format properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
applyPatternFormats (Apply Pattern Formats)	<p>If true apply legacy table autoformat pattern properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
applyWidthHeightFormats (Apply Width / Height Formats)	<p>If true apply legacy table autoformat width/height properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoFormatId (Auto Format Id)	<p>Identifies which legacy table autoformat to apply.</p> <p>Annex D contains a listing of the supported PivotTable AutoFormats, example formatting, and a sample workbook with each of those AutoFormats applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
ref (Reference)	<p>A-1 style reference to the location where the formatting was applied</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).</p>
sheetId (Sheet Id)	<p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionAutoFormatting](#)) is located in §A.2. *end note*]

18.11.1.9 rcc (Revision Cell Change)

This element stores information about the contents of the cell that was replaced.

Attributes	Description
dxfl (Formatting)	<p>A Boolean flag indicating that there was a differential formatting change for this cell - true if there was a formatting change, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
endOfListFormulaUpdate (End of List Formula Update)	<p>A Boolean flag indicating that indicates that the formula used at the end of a list has been updated. True if the formula was updated, false otherwise.</p> <p>List in this context does not mean table, rather it refers to the feature where the</p>

Attributes	Description
	<p>spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
numFmtId (Number Format Id)	<p>Zero-based index of the number format (Fmt) record used by this cell format (XF).</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).</p>
odxf (Old Formatting)	<p>Flag indicating that there is old formatting information available for this cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
oldPh (Old Phonetic Text)	<p>A Boolean flag indicating whether there is old phonetic text information available. True when there is old phonetic text information available, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
oldQuotePrefix (Old Quote Prefix)	<p>A Boolean value indicating if a single quote prefix is was used on this cell previously. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix was used previously, false otherwise</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ph (Phonetic Text)	<p>A Boolean flag indicating whether this cell contains phonetic text or not. True when the cell contains phonetic text, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
quotePrefix (Quote Prefix)	<p>A Boolean value indicating if a single quote prefix is used. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix is used, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

Attributes	Description
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
s (Style Revision)	<p>Flag indicating that formatting change for this cell affected the cell's style. (Only applicable for Undo operations)</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sId (Sheet Id)	<p>Internal identifier of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
ua (Revision From Rejection)	<p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
xDxf (Row Column Formatting Change)	<p>Flag indicating that the formatting change had an effect on the formatting of the entire row or column that this cell belongs to. (Only applicable for Undo operations).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionCellChange](#)) is located in §A.2. end note]

18.11.1.10 rcft (Revision Merge Conflict)

This element represents a revision record which indicates that there was a merge conflict.

Attributes	Description
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

Attributes	Description
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionConflict](#)) is located in §A.2.
end note]

18.11.1.11 rcmt (Revision Cell Comment)

This element represents a revision record of a cell comment change.

Attributes	Description
action (User Action)	An enumeration identifying what kind of an operation the user performed on the comment. The possible values for this attribute are defined by the ST_RevisionAction simple type (§18.18.65).
alwaysShow (Always Show Comment)	A Boolean value indicating that the user has set this comment to always be visible. True if the comment is set to always be visible, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
author (Author)	A string representing the name of the author who changed this comment. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
cell (Cell)	An A-1 style reference to the cell where the comment was changed. The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).
guid (GUID)	A globally unique identifier of this comment. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).
hiddenColumn (Hidden Column)	A Boolean value indicating that the comment belongs to a cell in a hidden column. True if the comment is in a hidden column, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean

Attributes	Description
	datatype.
hiddenRow (Comment In Hidden Row)	<p>A Boolean value indicating that the comment belongs to a cell in a hidden row. True if the comment is in a hidden row, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
newLength (New Comment Length)	<p>Length of the comment text added in this revision.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
old (Old Comment)	<p>An ignorable Boolean value used for backwards compatibility that indicates that the original comment was created by a legacy spreadsheet application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
oldLength (Original Comment Length)	<p>Length of the comment before this revision was made.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sheetId (Sheet Id)	<p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionComment](#)) is located in §A.2. end note]

18.11.1.12 rcv (Revision Custom View)

This element represents a revision record of adding or removing a custom view to the workbook

Attributes	Description
action (User Action)	<p>An enumeration representing the action that the user performed.</p> <p>The possible values for this attribute are defined by the ST_RevisionAction simple type (§18.18.65).</p>
guid (GUID)	<p>A globally unique identifier of the custom view.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionCustomView](#)) is located in §A.2. end note]

18.11.1.13 rdn (Revision Defined Name)

This element represents a revision record of a defined name change.

Attributes	Description																		
comment (Name Comment)	<p>A string representing a comment about the defined name.</p> <p>This comment can be shown by the spreadsheet application in a names management UI so that users have more information about what the defined name is used for.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>																		
customMenu (New Custom Menu)	<p>A string representing the new custom menu text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>																		
customView (Custom View)	<p>A Boolean flag indicating that this named range belongs to a custom view</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																		
description (Description)	<p>A string representing the new description text for the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>																		
function (Function)	<p>A Boolean value indicating that the defined name refers to a function. True if the defined name is a function, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																		
functionGroupId (Function Group Id)	<p>Represents the new function group id.</p> <p>Function group ids are used to help classify functions. For instance, functions in the same group can be searched or selected easily from the spreadsheet applications UI. For instance, filtering the list of all functions to allow the user to choose from functions used for financial data.</p> <p>The following group ids should be used:</p> <table> <tr> <td>ID</td><td>Function group</td></tr> <tr> <td>1</td><td>Financial</td></tr> <tr> <td>2</td><td>Date and Time</td></tr> <tr> <td>3</td><td>Math and Trig</td></tr> <tr> <td>4</td><td>Statistical</td></tr> <tr> <td>5</td><td>Lookup & Reference</td></tr> <tr> <td>6</td><td>Database</td></tr> <tr> <td>7</td><td>Text</td></tr> <tr> <td>8</td><td>Logical</td></tr> </table>	ID	Function group	1	Financial	2	Date and Time	3	Math and Trig	4	Statistical	5	Lookup & Reference	6	Database	7	Text	8	Logical
ID	Function group																		
1	Financial																		
2	Date and Time																		
3	Math and Trig																		
4	Statistical																		
5	Lookup & Reference																		
6	Database																		
7	Text																		
8	Logical																		

Attributes	Description
	<p>9 Information</p> <p>10 Commands</p> <p>11 Customizing</p> <p>12 Macro Control</p> <p>13 DDE/External</p> <p>14 User Defined</p> <p>15 Engineering</p> <p>14 Cube</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
help (New Help Topic)	<p>A string representing the new help topic text.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
hidden (Named Range Hidden)	<p>A Boolean value indicating whether the named range is now hidden.</p> <p>Hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
localSheetId (Local Name Sheet Id)	<p>An integer representing the id of the sheet to which this defined name belongs. This shall be used local defined names only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
name (Name)	<p>A string representing the name for this defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
oldComment (Old Name Comment)	<p>A string representing the old comment about the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
oldCustomMenu (Old Custom Menu Text)	<p>A string representing the old custom menu text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
oldDescription (Old Description)	<p>A string representing the old description text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

Attributes	Description
oldFunction (Old Function)	<p>A Boolean flag indicating that the old name was a function</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
oldFunctionGroupID (Old Function Group Id)	<p>Old function group ID.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
oldHelp (Old Help Topic)	<p>A string representing the old help topic text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
oldHidden (Old Hidden)	<p>A Boolean flag indicating whether the named range was hidden</p> <p>Hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
oldShortcutKey (Old Short Cut Key)	<p>Old keyboard shortcut.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
oldStatusBar (Old Status Bar)	<p>A string representing the old status bar text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
shortcutKey (Shortcut Key)	<p>Represents the new keyboard shortcut.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
statusBar (Status)	<p>A string representing the new status bar text.</p>

Attributes	Description
Bar)	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ua (Revision From Rejection)	<p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionDefinedName](#)) is located in §A.2. *end note*]

18.11.1.14 reviewed (Reviewed)

This element represents an identifier of a single reviewed revision. A reviewed revision, is a revision that has been reviewed via the spreadsheet application's track changes feature, has been accepted, and has been saved.

Attributes	Description
rId (revision Id)	<p>ID of a reviewed revision.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Reviewed](#)) is located in §A.2. *end note*]

18.11.1.15 reviewedList (Reviewed List)

This element maintains a list of reviewed revisions.

Attributes	Description
count (Reviewed Revisions Count)	<p>Number of reviewed revisions.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ReviewedRevisions](#)) is located in §A.2. *end note*]

18.11.1.16 revisions (Revisions)

This element represents the root node of a list of revisions made in this shared workbook. This root node shows up at the beginning of every log file that contains specific revisions made to the workbook.

When multiple users are sharing, and editing, a workbook at the same time, there can be conflicting changes. The spreadsheet application should have logic to resolve such conflicts, and the file format should only contain enough information so that the spreadsheet application can restore the workbook to the correct state after conflict resolution. Revisions can also be tracked by the spreadsheet application for review by the user at a later time (as opposed to only dealing with conflicts on a save event.) Some edits to workbooks are made as a result of this conflict resolution. So, there are cases where a revision is effectively undone by another user, and as a result that undoing is itself a revision that adds or changes data in the file. These operations are tracked by the `ua` and `ra` attributes of many different elements.

[Example:

Step 1:

User 1 inserts Column A. So the XML in the revision log would look like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rrc rId="1" sId="1" ref="A1:A1048576" action="insertCol"/>
</revisions>
```

Step 2:

User 2 synchronizes the file to pick up that change, but then activates the Track Changes feature, and rejects that change. This effectively performs an undo on User 1's insertion. This is denoted in the file with the `ua` attribute meaning that this change happened as the result of an undo. The XML for the revision log would look like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rrc rId="2" ua="1" sId="1" ref="A1:A1048576" action="deleteCol"/>
  <rcft rId="1" ua="1" sheetId="1"/>
</revisions>
```

Step 3:

User 1 enters "foo" in A1, and saves the file. A conflict resolution dialog is shown since User 2's version of the file removed the inserted Column A. User 1 chooses to accept their own changes. This undoes the change that User 2 made. So, in effect, it performed an undo on a previous undo operation. This is denoted in the file format by the `ra` attribute meaning that the change occurred because a previous undo was undone. So the resulting XML for the newest log file looks like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rrc rId="3" ua="1" ra="1" sId="1" ref="A1:A1048576" action="insertCol"/>
  <rcft rId="2" ua="1" sheetId="1"/>
  <rcc rId="4" sId="1">
    <nc r="A1" t="inlineStr">
      <is>
        <t>foo</t>
      </is>
    </nc>
  </rcc>
  <rcft rId="2" sheetId="1"/>
</revisions>
```

end example]

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Revisions](#)) is located in §A.2. *end note*]

18.11.1.17 rfmt (Revision Format)

This element represents a revision record of information about a formatting change.

Attributes	Description
length (Length)	<p>The number of characters that were affected by a string change, counting from start.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
s (Style)	<p>Flag indicating that this formatting change affected a cell's style. (Only applicable for Undo operations).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sheetId (Sheet Id)	<p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sqref (Sequence Of References)	<p>A worksheet range to which this formatting was applied. [<i>Note:</i> For applications supporting the default grid size (see §18.17.5), full column and row references shall explicitly state the row and column components, e.g., "A1:A1048576" For column "A", and A1:XFD1 for row "1". Applications with larger grid sizes shall interpret these to mean "column A" and "row 1" respectively, for their larger grid size. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).</p>
start (Start index)	<p>An integer representing an index showing which character a string change starts at within</p>

Attributes	Description
	<p>the string in the cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
xfDxf (Row or Column Formatting Change)	<p>A Boolean flag indicating that this formatting change had an affect on the formatting of an entire row or column that an affected cell(s) belongs to. (Only applicable for Undo operations)</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionFormatting](#)) is located in §A.2. *end note*]

18.11.1.18 [ris](#) (Revision Insert Sheet)

This element represents a revision record of a sheet that was inserted.

Attributes	Description
name (Sheet Name)	<p>The name of the new sheet.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sheetId (Sheet Id)	<p>An integer representing the internal id of the sheet on which the revision occurred</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sheetPosition (Sheet Position)	<p>An integer representing the zero based position of the new sheet in the sheet tab bar.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
ua (Revision From Rejection)	<p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionInsertSheet](#)) is located in §A.2. *end note*]

18.11.1.19 **rm** (Revision Cell Move)

This element represents a revision record on a cell(s) that moved.

Attributes	Description
destination (Destination)	New A1 style location of the cell(s) that were moved The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
source (Source)	The original A1 style location of the cell(s) that were moved The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sourceSheetId (Source Sheet Id)	An integer representing the internal id of the sheet where the cell(s) originally resided. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionMove](#)) is located in §A.2. *end note*]

18.11.1.20 [rqt \(Revision Query Table\)](#)

This element represents a revision record of a query table field change.

Attributes	Description
fieldId (Field Id)	ID of the specific query table field that was removed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
ref (QueryTable Reference)	Location of the affected query table. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionQueryTableField](#)) is located in §A.2. *end note*]

18.11.1.21 [rrc \(Revision Row Column Insert Delete\)](#)

This element represents a revision record of a row/column insert/delete action.

Attributes	Description
action (User Action)	Indicates the action most recently performed on the row or column. The possible values for this attribute are defined by the ST_rwColActionType simple type (§18.18.66).
edge (Edge Deleted)	A Boolean flag indicating that a row or column is being deleted at the edge of a sorted range (only applicable to a Delete Row/Column revision types). The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
eol (End Of List)	A Boolean flag indicating that a row or a column is being inserted at the end of a list of data. List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those

Attributes	Description
	<p>cells are treated as a list.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
ref (Reference)	<p>A reference to the location of the rows/columns that were inserted or deleted.</p> <p>[<i>Note: A reference to a whole column or row must include both the column and row components. For example, column A is referenced by "A1:A1048576", and row 1 is referenced by "A1:XFD1". However, because this attribute value is occurring in the context of an entire row or column insert, the column component of a row reference can be ignored, and the row component of a column reference can be ignored. end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sId (Sheet Id)	<p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
ua (Revision From Rejection)	<p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_RevisionRowColumn](#)) is located in §A.2. end note*]

18.11.1.22 rsnm (Revision Sheet Name)

This element represents a revision record tracking the renaming a sheet.

Attributes	Description
newName (New Sheet Name)	A string representing the new sheet name

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
oldName (Old Sheet Name)	A string representing the old sheet name The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionSheetRename](#)) is located in §A.2. *end note*]

18.11.1.23 sheetId (Sheet Id)

This element represents a sheet that revision can take place on. Each sheet in the workbook should be represented by one of these elements, and each sheet has an id associated with it. Sheet ids are used to refer to sheets internally by the spreadsheet application.

Attributes	Description
val (Sheet Id)	An integer serving as a number by which to reference the sheet internally. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetId](#)) is located in §A.2. *end note*]

18.11.1.24 [sheetIdMap \(Sheet Id Map\)](#)

This element represents a list of sheets and corresponding ids that are used for tracking revision records.

Attributes	Description
count (Sheet Count)	Number of sheets. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetIdMap](#)) is located in §A.2. *end note*]

18.11.1.25 [undo \(Undo\)](#)

This element represents undo information for row/column deletion when there are functions in the spreadsheet that reference the deleted rows/columns. This element is not applicable for insert revisions.

Attributes	Description
array (Array Formula)	Flag indicating that the affected formula is an array formula. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
cs (Cross Sheet Move)	A Boolean flag indicating this was a cross-sheet move. True if it was a cross sheet move, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
dn (Defined Name)	Identifies the named range that referenced the deleted cell range. Mutually exclusive with the cell reference attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
dr (Range)	The range which was deleted that is referenced by the affected formula. The possible values for this attribute are defined by the ST_RefA simple type (§18.18.63).
exp (Expression)	Identifies the expression that should be adjusted in the corresponding formula. The possible values for this attribute are defined by the ST_FormulaExpression simple type (§18.18.36).
index (Index)	Index of the expression within the corresponding formula that was affected by this change.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
nf (Defined Name Formula)	<p>A Boolean flag indicating that the corresponding formula is part of a defined name. True if this formula is part of a defined name, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
r (Cell Reference)	<p>Location of the cell whose formula referenced the deleted cell range. Mutually exclusive with the defined name attribute</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
ref3D (Reference 3D)	<p>A Boolean flag indicating that the expression contained the sheet name in addition to the cell reference. True if it contained the sheet name, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
sId (Sheet Id)	<p>Internal Id of the worksheet that contained the formula that referenced the deleted cell range. Mutually exclusive with the defined name attribute.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
v (Value Needed)	<p>A Boolean flag indicating the formula needs the actual value of the cell(s) it's referencing. True if the formula requires the value of the cell it references, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_UndoInfo](#)) is located in §A.2. *end note*]

18.11.2 Shared Workbook User Data

This subclause specifies information about the users of a shared workbook.

18.11.2.1 userInfo (User Information)

This element represents a user, and it stores information about a specific user as it relates to revisions.

Attributes	Description
dateTime (Date Time)	<p>Date and time when this user opened the shared workbook.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime</p>

Attributes	Description
	datatype.
guid (User Revisions GUID)	<p>A globally unique identifier identifying the last set of revisions that this uses is synchronized to.</p> <p>This attribute can be used by the spreadsheet application to ensure that revisions this user depends on aren't deleted.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p>
id (User Id)	<p>An integer representing an internal user id for this user.</p> <p>This number can be negative.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
name (User Name)	<p>Display name for this user</p> <p>[<i>Note: User name strings should not be longer than 54 characters. end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_SharedUser](#)) is located in §A.2. end note*]

18.11.2.2 users (User List)

This element represents a list of users who currently have this shared workbook open. This list does not include any users who have the workbook open in Read-Only mode.

Attributes	Description
count (Active User Count)	<p>Number of users who currently have this shared workbook open.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_Users](#)) is located in §A.2. end note*]

18.12 QueryTable Data

Query tables are 2 dimensional tables of data bound to an external query of some kind. [*Example: A query table could for example show specific data from a text file, from a web query, or from a database query. end example*]

[*Example:*

Data connectivity can use a number of different technologies. The following spreadsheetML fragment is one an example of a query table connected to a database:

```
<queryTable xmlns="..." name="Northwind Orders" rowNumbers="1"
  growShrinkType="overwriteClear" connectionId="1" autoFormatId="16"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
  applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="0">
  <queryTableRefresh nextId="15">
    <queryTableFields count="12">
      <queryTableField id="1" name="OrderID" tableColumnId="1"/>
      <queryTableField id="2" name="CustomerID" tableColumnId="2"/>
      <queryTableField id="3" name="EmployeeID" tableColumnId="3"/>
      <queryTableField id="4" name="OrderDate" tableColumnId="4"/>
      <queryTableField id="5" name="RequiredDate" tableColumnId="5"/>
      <queryTableField id="6" name="ShippedDate" tableColumnId="6"/>
      <queryTableField id="7" name="ShipName" tableColumnId="7"/>
      <queryTableField id="8" name="ShipAddress" tableColumnId="8"/>
      <queryTableField id="9" name="ShipCity" tableColumnId="9"/>
      <queryTableField id="10" name="ShipRegion" tableColumnId="10"/>
      <queryTableField id="11" name="ShipPostalCode" tableColumnId="11"/>
      <queryTableField id="12" name="ShipCountry" tableColumnId="12"/>
    </queryTableFields>
  </queryTableRefresh>
</queryTable>
```

end example]

[*Example:* And here's an example of the SpreadsheetML fragment defining a query table connected to a text import:

```
<queryTable xmlns="..." name="data in text" connectionId="1" autoFormatId="16"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="1"
  applyPatternFormats="1" applyAlignmentFormats="0"
  applyWidthHeightFormats="0"/>
```

Elsewhere in the spreadsheetML file, a connection element is defined with the name "Northwind Orders" that describes how to connect to the appropriate database to refresh data for the query table. *end example]*

18.12.1 deletedField (Deleted Field)

This element specifies a field that has been deleted from the query table.

[*Example:*

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

Attributes	Description
name (Deleted Fields Name)	Specifies the name of the deleted field. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element’s content model ([CT_DeletedField](#)) is located in §A.2.
end note]

18.12.2 queryTable (Query Table)

This element specifies all the relevant properties for a query table, one query table element is stored for each query table object in the spreadsheetML document.

Attributes	Description
adjustColumnWidth (Adjust Column Width On Refresh)	Specifies whether to automatically adjust column widths on refresh to fit the data retrieved. <code>true</code> if column widths should be adjusted. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyAlignmentFormats (Apply Alignment Formats)	If <code>true</code> apply legacy table autoformat alignment properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyBorderFormats (Apply Border Formats)	If <code>true</code> apply legacy table autoformat border properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyFontFormats (Apply Font Formats)	If <code>true</code> apply legacy table autoformat font properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyNumberFormats (Apply Number Formats)	If <code>true</code> apply legacy table autoformat number format properties. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyPatternForm	If <code>true</code> apply legacy table autoformat pattern properties.

Attributes	Description
ats (Apply Pattern Formats)	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
applyWidthHeight Formats (Apply Width / Height Formats)	<p>If <code>true</code> apply legacy table autoformat width/height properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
autoFormatId (Auto Format Id)	<p>Identifies which legacy table autoformat to apply.</p> <p>Annex D contains a listing of the supported PivotTable AutoFormats, example formatting, and a sample workbook with each of those AutoFormats applied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
backgroundRefresh (Background Refresh)	<p>Specifies whether or not the query table shall try to refresh data in the background.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
connectionId (Connection Id)	<p>Specifies the ID number of the external data connection to use to refresh data in the query table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
disableEdit (Disable Edit)	<p>Specifies whether the connection element used with this query table shall be editable. If <code>true</code>, then the connection is not editable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
disableRefresh (Disable Refresh)	<p>Specifies whether the query table shall be refreshable. If <code>true</code>, then the query table is not refreshable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fillFormulas (Fill Adjacent Formulas)	<p>Specifies whether or not formulas in columns adjacent to the query table should be filled down whenever the query table is refreshed. This is helpful since the number of rows returned by a query table refresh operation can vary.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
firstBackgroundRe	Specifies whether or not data has ever been refreshed for this query table. If the very

Attributes	Description
fresh (First Background Refresh)	<p>first background data refresh had not completed at the time the file was saved, this attribute is set to true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
growShrinkType (Grow Shrink Type)	<p>Specifies the type of behavior expected for dealing with a variable number of rows of data in the query table between refresh operations.</p> <p>The meaning of the possible values of this attribute {insertClear, insertDelete, overwriteClear} are explained in detail in the definition of the simple type.</p> <p>The possible values for this attribute are defined by the ST_GrowShrinkType simple type (§18.18.39).</p>
headers (First Row Column Titles)	<p>Specifies whether or not the query table has first row with column titles.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
intermediate (Intermediate)	<p>Specifies whether this query table is in an intermediate state, having been defined but not fully formed and populated with data.</p> <p>In this state, fields and ranges of the query table can be unknown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
name (QueryTable Name)	<p>Specifies the name of the query table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
preserveFormatting (Preserve Formatting On Refresh)	<p>Specifies whether the application should try to preserve formatting in the query table and copy this formatting to any new rows of data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
refreshOnLoad (Refresh On Load)	<p>Specifies whether the query table shall refresh its data automatically when the spreadsheetML document is loaded or opened.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
removeDataOnSave (Remove Data On Save)	<p>Specifies whether the query table shall remove all data from the worksheet before the spreadsheetML document is saved.</p> <p>This is very helpful for situations where people who have different permissions to view data want to share the same spreadsheetML document. All data from the last user is</p>

Attributes	Description
	removed, and new users re-query the external data sources with their own credentials. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
rowNumbers (Row Numbers)	Specifies whether the query table shall include a first column of row numbers. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTable](#)) is located in §A.2. *end note*]

18.12.3 queryTableDeletedFields (Deleted Fields)

This element is the collection for deletedField (§18.12.1) elements, each of which represents a column or field that has been deleted from the query table.

[Example:

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

Attributes	Description
count (Deleted Fields Count)	Specifies how many deleted fields there are. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTableDeletedFields](#)) is located in §A.2. *end note*]

18.12.4 queryTableField (QueryTable Field)

This element holds the properties related to a specific field or column in a query table.

Attributes	Description
clipped (Clipped Column)	Specifies whether this field/column is currently clipped and thus not visible in the worksheet.

Attributes	Description
	<p>[<i>Note</i>: this state might occur for example when a query table is defined near the edge of a worksheet or other object in the spreadsheet that can't be overwritten with external data. In this case some of the fields are displayed, but not all of them. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
dataBound (Data Bound Column)	<p>Specifies whether this column is a user-defined column or comes from the external data query. User defined columns shall be preserved during data refresh operations. User-defined columns are only supported on query tables that are attached to table objects.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
fillFormulas (Fill This Formula On Refresh)	<p>Specifies whether the formula in this field/column should be filled down on data refresh.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
id (Field Id)	<p>Specifies the unique identifier of the query table field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
name (Name)	<p>Specifies the unique name of the query table field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
rowNumbers (Row Numbers)	<p>true if this column contains the row numbers for the records returned.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tableColumnId (Table Column Id)	<p>Specifies the unique identifier for the table column if the query table is attached to a table object rather than just a range in the sheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note*: The W3C XML Schema definition of this element's content model ([CT_QueryTableField](#)) is located in §A.2. *end note*]

18.12.5 queryTableFields (Query table fields)

This element is the collection for queryTableField elements.

Attributes	Description
count (Column	Specifies the number of columns there are in this query table. Includes both query-

Attributes	Description
Count)	defined and user-defined columns, but not deleted columns. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTableFields](#)) is located in §A.2. end note]

18.12.6 queryTableRefresh (QueryTable Refresh Information)

This element contains information related to refreshing the query table.

Attributes	Description
fieldIdWrapped (Next Field Id Wrapped)	Whether or not the idFieldNext value wrapped around. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
headersInLastRefresh (Headers In Last Refresh)	Whether or not the Query Table had titles last refresh. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
minimumVersion (Minimum Refresh Version)	For backward compatibility with legacy versions of spreadsheet applications, this attribute specifies the minimum version of the application that is expected to correctly refresh the data in the query table without any problems. If this attribute is specified, an earlier version of a spreadsheet application should alert the user to the potential incompatibilities when a refresh is attempted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.
nextId (Next field id)	Specifies the next unique queryTableField (§18.12.4) id number available for assignment. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
preserveSortFilterLayout (Preserve Sort & Filter Layout)	Specifies whether sorting, autofilter, layout, and table block formatting should be preserved for this query table across data refresh operations. If this attribute is set to false, the query table might be more or less recreated from scratch when data is refreshed. In this case, all user deleted or rearranged columns, user inserted columns that aren't bound to external data, and table column formatting are discarded.

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
unboundColumnsLeft (Columns Left)	Specifies the number of extra columns included at the left end of the field array that aren't bound to external data. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
unboundColumnsRight (Columns Right)	Specifies the number of extra columns included at the right end of the Table that aren't bound to external data. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTableRefresh](#)) is located in §A.2. *end note*]

18.13 External Data Connections

SpreadsheetML allows for the definition of top level data connection objects that describe how to retrieve data from external sources. These connection objects are independent of the constructs in the spreadsheet application that display data such as tables, PivotTables, etc.

Some information about a connection is considered part of the connection's definition. Other information is not inherently part of the connection, but it describes the way the connection is to be used by the containing workbook. Note that in many cases, the spreadsheet application does not need knowledge of the command syntax for the external data source (e.g., database query language), and simply stores a command string that was created by a data provider API (e.g., an ODBC driver).

A connection's definition can be established in a standalone connection file for easier sharing and reuse, but this reference documentation deals with the XML representation for external data connections that is directly embedded within a SpreadsheetML document. This embedded representation is expected whenever external data is used, and ensures portability of the document and continued operation of the external query in the most cases.

18.13.1 connection (Connection)

This element contains both the definition of how to get at an external data source as well as information describing how the connection is used within the workbook. Specific constructs in a worksheet, such as OLAP formulas, QueryTables, or PivotTables make use of information in the connection to retrieve or refresh data based on default events or the user's explicit request.

Attributes	Description
background	Indicates whether the connection can be refreshed in the background (asynchronously).

Attributes	Description
(Background Refresh)	<p>true if preferred usage of the connection is to refresh asynchronously in the background; false if preferred usage of the connection is to refresh synchronously in the foreground.</p> <p>This flag should be intentionally ignored in specific cases.</p> <p>[<i>Example:</i> An example of when the flag would be ignored is in the case of a connection to OLAP data on Microsoft SQL Server Analysis Services, where the connection is used by both a PivotTable and also by CUBE functions within the workbook. That connection will always be refreshed synchronously by the PivotTable and will always be refreshed asynchronously by the CUBE functions. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
credentials (Reconnection Method)	<p>Specifies the authentication method to be used when establishing (or re-establishing) the connection.</p> <p>The possible values for this attribute are defined by the ST_CredMethod simple type (§18.18.16).</p>
deleted (Deleted Connection)	<p>Indicates whether the associated workbook connection has been deleted. true if the connection has been deleted; otherwise, false.</p> <p>Deleted connections contain only the attributes name and deleted=true, all other information is removed from the SpreadsheetML file.</p> <p>If a new connection is created with the same name as a deleted connection, then the deleted connection is overwritten by the new connection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
description (Connection Description)	<p>Specifies the user description for this connection.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
id (Connection Id)	<p>Specifies The unique identifier of this connection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
interval (Automatic Refresh Interval)	<p>Specifies the number of minutes between automatic refreshes of the connection. When this attribute is not present, the connection is not automatically refreshed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
keepAlive (Keep Connection Open)	<p>true when the spreadsheet application should make efforts to keep the connection open. When false, the application should close the connection after retrieving the</p>

Attributes	Description
	<p>information. This corresponds to the MaintainConnection property of a PivotCache object.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
minRefreshableVersion (Minimum Version Required for Refresh)	<p>For compatibility with legacy spreadsheet applications. This represents the minimum version # that is required to be able to correctly refresh the data connection. This attribute applies to connections that are used by a QueryTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
name (Connection Name)	<p>Specifies the name of the connection. Each connection shall have a unique name.</p> <p>When a connection has been marked as deleted and then a new connection is added with the same name, the deleted connection is replaced with the new connection.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
new (New Connection)	<p>true if the connection has not been refreshed for the first time; otherwise, false. This state can happen when the user saves the file before a query has finished returning.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
odcFile (Connection File)	<p>Specifies the full path to external connection file from which this connection was created. If a connection fails during an attempt to refresh data, and reconnectionMethod=1, then the spreadsheet application will try again using information from the external connection file instead of the connection object embedded within the workbook.</p> <p>This is a benefit for data source and spreadsheetML document manageability. If the definition in the external connection file is changed (e.g., because of a database server name change), then the workbooks that made use of that connection will fail to connect with their internal connection information, and reload the new connection information from this file.</p> <p>This attribute is cleared by the spreadsheet application when the user manually edits the connection definition within the workbook. Can be expressed in URI or system-specific file path notation.</p> <p>[Note: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type</p>

Attributes	Description
	(§22.9.2.19).
onlyUseConnectionFile (Only Use Connection File)	<p>Indicates whether the spreadsheet application should always and only use the connection information in the external connection file indicated by the odcFile attribute when the connection is refreshed.</p> <p>If false, then the spreadsheet application should follow the procedure indicated by the reconnectionMethod attribute described below.</p> <p>Applies to ODBC connections, and may be applied to custom data connections. This attribute is ignored for other types of connections.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
reconnectionMethod (Reconnection Method)	<p>Specifies what the spreadsheet application should do when a connection fails.</p> <p>The values are as follows:</p> <p>1 = As required: On refresh use the existing connection information. If the existing information cannot be used to establish a connection, get updated connection information, if available from the external connection file.</p> <p>2 = Always: On every refresh get updated connection information from the external connection file, if available, and use that instead of the existing connection information. In this case the data refresh will fail if the external connection file is unavailable.</p> <p>3 = Never: Never get updated connection information from the external connection file even if it is available and even if the existing connection information cannot be used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
refreshedVersion (Last Refresh Version)	<p>For backward compatibility purposes, this attribute indicates the version of the spreadsheet application that last refreshed the connection.</p> <p>This attribute applies to connections that are used by a query table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p>
refreshOnLoad (Refresh on Open)	<p>true if this connection should be refreshed when opening the file; otherwise, false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
saveData (Save Data)	<p>true if the external data fetched over the connection to populate a table is to be saved with the workbook; otherwise, false.</p>

Attributes	Description
	<p>This exists for data security purposes - if no external data is saved in (or "cached") in the workbook, then current user credentials can be required every time to retrieve the relevant data, and people won't see the data the workbook author had last been using before saving the file.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
savePassword (Save Password)	<p>true if the password is to be saved as part of the connection string; otherwise, False.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
singleSignOnId (SSO Id)	<p>Identifier for Single Sign On (SSO) used for authentication between an intermediate spreadsheetML server and the external data source.</p> <p>[<i>Note</i>: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/spptsdk/html/cSSOReturnCodes_SV01001109.asp <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
sourceFile (Source Database File)	<p>Used when the external data source is file-based. When a connection to such a data source fails, the spreadsheet application attempts to connect directly to this file. Can be expressed in URI or system-specific file path notation.</p> <p>[<i>Note</i>: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
type (Database Source Type)	<p>Specifies the data source type.</p> <p>Values are as follows:</p> <ol style="list-style-type: none"> 1. ODBC-based source 2. DAO-based source 3. File based database source 4. Web query 5. Custom data connection source 6. Text-based source 7. ADO record set 8. DSP <p>Custom data connection source represents an application-defined connection technology. [<i>Note</i>: For example, Microsoft Office uses this value to represent OLE DB connections. <i>end note</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_Connection](#)) is located in §A.2. *end note*]

18.13.2 connections (Connections)

This element exists when there are one or more connections in the workbook. It is a container for the individual connection objects.

[Note: The W3C XML Schema definition of this element's content model ([CT_Connections](#)) is located in §A.2. *end note*]

18.13.3 dbPr (Database Properties)

This element stores all properties associated with an ODBC or OLE DB external data connection.

[Example:

Data connectivity can use a number of different technologies. The following is one example XML fragment defining an OLE DB connection and the associated dbPr element:

```
<connection id="2"
  odcFile="C:\My Documents\My Data Sources\Northwind Orders.odc" keepAlive="1"
  name="Northwind Orders" description="northwind" type="5" refreshedVersion="3">
  <dbPr connection="Provider=SQLOLEDB.1;Persist
    Security Info=True;Initial Catalog=Northwind;Data Source=dataserver1;Use
    Procedure for Prepare=1;Auto Translate=True;Packet Size=4096;Workstation
    ID=LOCAL_MACHINE_NAME;Use Encryption for Data=False;Tag with column
    collation when possible=False"
    command=""Northwind"."dbo"."Orders""
    commandType="3"/>
</connection>
```

end example]

Attributes	Description
command (Command Text)	The string containing the database command to pass to the data provider API that will interact with the external source in order to retrieve data. These strings can be constructed in a variety of ways (from simple UIs built into the spreadsheet application for browsing and choosing tables and fields, to external applications providing user interface to build up complex queries, to advanced users editing text queries). The

Attributes	Description
	<p>spreadsheetML application need not understand the command syntax; it can simply pass the command string to the data provider API in order to retrieve the latest external data.</p> <p>[Example: Data connectivity can use a number of different technologies. The following is one example of an ODBC command string of commandType=2 (for a Microsoft SQL Server database):</p> <pre>command="SELECT Orders.OrderID, Orders.OrderDate, Orders.ShipName, Orders.ShipAddress, Orders.ShipCity, Orders.ShipRegion, Orders.ShipPostalCode, Orders.ShipCountry_x000d__x000a_FROM Northwind.dbo.Orders Orders_x000d__x000a_WHERE (Orders.ShipCountry=?)"</pre> <p>Some characters in this string have been escaped - for more information on the escaping scheme, please refer to the ST_Xstring simple type definition. <i>end example]</i></p> <p>[Note: the "?" syntax in the string is something that the ODBC data provider is aware of and might replace with a parameter before execution. <i>end note]</i></p> <p>[Example: Data connectivity can use a number of different technologies. The following is one example of an OLE DB command string of commandType=3 (for an Oracle database):</p> <pre>command="&quot;TESTDB&quot;;.&quot;ShippersTable&quot;;"</pre> <p><i>end example]</i></p> <p>[Note: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:</p> <ul style="list-style-type: none"> • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_statements.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_minimum_grammar.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbusing_commands.asp <p><i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
commandType (custom data source Command Type)	<p>Specifies the custom data source command type. Values are passed to the custom data source provider.</p> <p>[Example: For the OLE DB custom data source provider, valid values are as follows:</p> <ol style="list-style-type: none"> 1. Query specifies a cube name 2. Query specifies a SQL statement

Attributes	Description
	<p>3. Query specifies a table name</p> <p>4. Query specifies that default information has been given, and it is up to the provider how to interpret.</p> <p>5. Query is against a web based List Data Provider. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
connection (Connection String)	<p>The connection string is used to make contact with an ODBC or custom data source. These can be constructed in a variety of ways (from UI wizards built into the data provider code, to external query applications, to advanced users editing text files). The spreadsheetML application need not understand the connection syntax at all; it can simply pass the command string to the data provider API in order to re-establish a connection with the external data source.</p> <p>[Example: ODBC connection string to a database:</p> <pre>connection="DRIVER=SQL Server;SERVER=example_server;UID=example_useralias;APP=Microsoft Office 2007;WSID=user_alias;Trusted_Connection=Yes"</pre> <p><i>end example]</i></p> <p>[Example: of an OLE DB connection string to an Oracle database:</p> <pre>connection="Provider=OraOLEDB.Oracle.1;Password=example_password;Persist Security Info=True;User ID=example_useralias;Data Source=example_server;Extended Properties="""</pre> <p><i>end example]</i></p> <p>[Note: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:</p> <ul style="list-style-type: none"> • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/dasdkodbcoverview.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbcsql/od_odbc_d_4x4k.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdreforacleprovspec.asp <p><i>end note]</i></p> <p>Connection strings syntaxes are specific to individual ODBC or custom data provider drivers.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

Attributes	Description
serverCommand (Command Text)	<p>Specifies a second command text string that is persisted when PivotTable server-based page fields are in use.</p> <p>For ODBC connections, serverCommand is usually a broader query than command (no WHERE clause is present in the former). Based on these 2 commands, parameter UI can be populated and parameterized queries can be constructed.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_DbPr](#)) is located in §A.2. *end note*]

18.13.4 m (No Value)

This element is present when tables in a web query are missing.

[Note: The W3C XML Schema definition of this element's content model ([CT_TableMissing](#)) is located in §A.2. *end note*]

18.13.5 olapPr (OLAP Properties)

This element contains all the properties needed for an OLAP data connection. OLAP connections contain both the dbPr and olapPr child elements.

[Example:

Data connectivity can use a number of different technologies. The following is an example of a connection to an SAP BW OLAP data source:

```
<connection id="1" odcFile="C:\My Documents\My Data Sources\$_INFOCUBE.odc"
  keepAlive="1" name="SAP demo cube" description="SAP DemoCube" type="5"
  refreshedVersion="3" background="1">
  <dbPr connection="Provider=MDrmSap.2;Data Source=BI2;User
    ID=TESTUSER;Location=TESTSERVERNAME;Cache Authentication=False;Encrypt
    Password=False;Integrated Security="";Mask Password=False;Persist
    Encrypted=False;Persist Security Info=True;Impersonation
    Level=Anonymous;Mode=Read;Protection Level=None;Extended
    Properties=";SFC_CLIENT=800;";Initial Catalog=$_INFOCUBE"
    command="$_OD_DECU" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000" serverFill="0"
    serverNumberFormat="0" serverFont="0" serverFontColor="0"/>
</connection>
```

end example]

[Example:

Data connectivity can use a number of different technologies. The following is an example of a connection to a Microsoft SQL Server Analysis Services OLAP data source:

```
<connection id="1"
  odcFile="C:\My Documents\My Data Sources\Adventure Works DW.odc" keepAlive="1"
  name="Adventure Works DW" type="5" refreshedVersion="3" background="1">
  <dbPr connection="Provider=MSOLAP.3;Cache Authentication=False;Persist
Security Info=True;Initial Catalog=Adventure Works
  DW;Data Source=DATASERVER1;Impersonation
  Level=Impersonate;Mode=ReadWrite;Protection Level=Pkt Privacy;Auto Synch
  Period=20000;Default Isolation Mode=0;Default MDX Visual Mode=0;MDX
  Compatibility=1;MDX Unique Name Style=0;Non Empty
  Threshold=0;SQLQueryMode=Calculated;Safety Options=2;Secured Cell
  Value=0;SOURCE_DSN_SUFFIX="&quot;Prompt=CompleteRequired;Window
  Handle=0x6A903CC;&quot;;SQL Compatibility=0;Compression Level=0;Real Time
  Olap=False;Packet Size=4096" command="Adventure Works" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000"/>
</connection>
```

end example]

[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/dasdkoledboverview.asp> end note]

Attributes	Description
local (Local Cube)	<p>Flag indicating whether we should get data from the local cube on refresh versus the original data source. true if a local cube has been created for OLAP data, and it should be used instead of the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
localConnection (Local Cube Connection)	<p>Specifies a connection string to use when a local cube is available. This is used when local is set to true.</p> <p>[Example:</p> <pre><olapPr local="true" localConnection="OLEDB;Provider=MSOLAP;Data Source=C:\Data\DataCube.cub" ></pre> <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
localRefresh (Local Refresh)	<p>Flag indicating whether we should refresh the local cube from the original data source. When true, the original OLAP data source is queried each time the user explicitly refreshes the data in the application, and a new local cube is constructed from this query.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
rowDrillCount (Drill Through Count)	<p>Maximum number of drill-through rows to return when the user drills through an aggregate value in a PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
sendLocale (Send Locale to OLAP)	<p>When true, the spreadsheetML app should send the user interface locale ID to the OLAP provider to retrieve localized member names and properties, etc. When false, no locale ID is expected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
serverFill (OLAP Fill Formatting)	<p>When true a PivotTable based on an OLAP source should format the data and aggregate cells in the PivotTable view using the background color from the OLAP source if this information is available. When false, OLAP server background fill colors are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
serverFont (OLAP Server Font)	<p>When true, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font from the OLAP source (e.g., Arial or Tahoma). When false, OLAP server fonts are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
serverFontColor (OLAP Font Formatting)	<p>When true a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font color from the OLAP source. When false, OLAP server font colors are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
serverNumberFormat (OLAP Number Format)	<p>When true, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the number format from the OLAP source. When false, OLAP server number formats are ignored, and standard formatting rules within</p>

Attributes	Description
	<p>the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_OlapPr](#)) is located in §A.2. *end note*]

18.13.6 parameter (Parameter Properties)

This element stores properties about any parameters used with external data connections. Parameters are used to change the query executed externally and cause different data to be retrieved into the workbook. The type of parameter used – see `ST_parameterType` (§18.18.54) – determines whether the user is prompted for a value before data is refreshed, or the value is pulled from a cell in the workbook, or whether the same value should be used until explicitly changed in the data connection. Parameters are permitted for ODBC and web queries.

[Example:

Data connectivity can use a number of different technologies. The following is an example of XML defining a connection to a Microsoft Access database, with a parameter based on the value in cell C1 on the first sheet.

```
<connection id="1" name="Connection" type="1" refreshedVersion="2"
  background="1" saveData="1">
  <dbPr connection="DSN=MS Access
    Database;DBQ=C:\Desktop\db1.mdb;DefaultDir=C:\Desktop;DriverId=25;FIL=MS
    Access;MaxBufferSize=2048;PageTimeout=5;" command="SELECT Table1.Field1,
    Table1.Field2_x000d__x000a_FROM `C:\Desktop\db1`.Table1
    Table1_x000d__x000a_WHERE (Table1.Field2=?)" />
  <parameters count="1">
    <parameter name="user specified value" sqlType="4" parameterType="cell"
      cell="Sheet1!$C$1" />
  </parameters>
</connection>
```

end example]

Note that the command string in the `dbPr` element contains a "?" character. This character serves as a parameter marker.

[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcstatement_parameters.asp *end note*]

Attributes	Description
boolean (Boolean)	<p>Boolean value to use as the query parameter. Used only when parameterType = value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
cell (Cell Reference)	<p>Cell reference indicating which cell's value to use for the query parameter. Used only when parameterType = cell.</p> <p><i>[Example:</i></p> <p style="padding-left: 40px;"><code><Parameter parameterType="cell" cell="Sheet1!\$C\$1"></code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
double (Double)	<p>Non-integer numeric value to use as the query parameter. Used only when parameterType = value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p>
integer (Integer)	<p>Integer value to use as the query parameter. Used when parameterType = value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p>
name (Parameter Name)	<p>The name of the parameter.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
parameterType (Parameter Type)	<p>Type of parameter used. If the parameterType=value, then the value from boolean, double, integer, or string are used. In this case, it is expected that only one of {boolean, double, integer, or string} is specified.</p> <p>The possible values for this attribute are defined by the ST_ParameterType simple type (§18.18.54).</p>
prompt (Parameter Prompt String)	<p>Prompt string for the parameter. Presented to the spreadsheet user along with input UI to collect the parameter value before refreshing the external data. Used only when parameterType = prompt.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
refreshOnChange (Refresh on Change)	<p>Flag indicating whether the query should automatically refresh when the contents of a cell that provides the parameter value changes. If true, then external data is refreshed using the new parameter value every time there's a change. If false, then external data is only refreshed when requested by the user, or some other event triggers refresh (e.g., workbook opened).</p>

Attributes	Description																																																						
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.																																																						
sqlType (SQL Data Type)	<p>SQL data type of the parameter. Only supported for ODBC sources.</p> <p>Supported values include:</p> <table data-bbox="415 472 1193 1890"> <tr> <th data-bbox="415 472 545 525">-22</th><th data-bbox="545 472 1193 525">SQL_UNSIGNED_OFFSET</th></tr> <tr><td data-bbox="415 525 545 577">-20</td><td data-bbox="545 525 1193 577">SQL_SIGNED_OFFSET</td></tr> <tr><td data-bbox="415 577 545 630">-11</td><td data-bbox="545 577 1193 630">SQL_GUID</td></tr> <tr><td data-bbox="415 630 545 682">-10</td><td data-bbox="545 630 1193 682">SQL_WLONGVARCHAR</td></tr> <tr><td data-bbox="415 682 545 735">-9</td><td data-bbox="545 682 1193 735">SQL_WVARCHAR</td></tr> <tr><td data-bbox="415 735 545 787">-8</td><td data-bbox="545 735 1193 787">SQL_WCHAR</td></tr> <tr><td data-bbox="415 787 545 840">-7</td><td data-bbox="545 787 1193 840">SQL_BIT</td></tr> <tr><td data-bbox="415 840 545 892">-6</td><td data-bbox="545 840 1193 892">SQL_TINYINT</td></tr> <tr><td data-bbox="415 892 545 945">-5</td><td data-bbox="545 892 1193 945">SQL_BIGINT</td></tr> <tr><td data-bbox="415 945 545 997">-4</td><td data-bbox="545 945 1193 997">SQL_LONGVARBINARY</td></tr> <tr><td data-bbox="415 997 545 1050">-3</td><td data-bbox="545 997 1193 1050">SQL_VARBINARY</td></tr> <tr><td data-bbox="415 1050 545 1102">-2</td><td data-bbox="545 1050 1193 1102">SQL_BINARY</td></tr> <tr><td data-bbox="415 1102 545 1155">-1</td><td data-bbox="545 1102 1193 1155">SQL_LONGVARCHAR</td></tr> <tr><td data-bbox="415 1155 545 1207">0</td><td data-bbox="545 1155 1193 1207">SQL_UNKNOWN_TYPE</td></tr> <tr><td data-bbox="415 1207 545 1260">1</td><td data-bbox="545 1207 1193 1260">SQL_CHAR</td></tr> <tr><td data-bbox="415 1260 545 1312">2</td><td data-bbox="545 1260 1193 1312">SQL_NUMERIC</td></tr> <tr><td data-bbox="415 1312 545 1365">3</td><td data-bbox="545 1312 1193 1365">SQL_DECIMAL</td></tr> <tr><td data-bbox="415 1365 545 1417">4</td><td data-bbox="545 1365 1193 1417">SQL_INTEGER</td></tr> <tr><td data-bbox="415 1417 545 1470">5</td><td data-bbox="545 1417 1193 1470">SQL_SMALLINT</td></tr> <tr><td data-bbox="415 1470 545 1522">6</td><td data-bbox="545 1470 1193 1522">SQL_FLOAT</td></tr> <tr><td data-bbox="415 1522 545 1575">7</td><td data-bbox="545 1522 1193 1575">SQL_REAL</td></tr> <tr><td data-bbox="415 1575 545 1627">8</td><td data-bbox="545 1575 1193 1627">SQL_DOUBLE</td></tr> <tr><td data-bbox="415 1627 545 1680">9</td><td data-bbox="545 1627 1193 1680">SQL_TYPE_DATE or SQL_DATE</td></tr> <tr><td data-bbox="415 1680 545 1732">10</td><td data-bbox="545 1680 1193 1732">SQL_TYPE_TIME or SQL_TIME</td></tr> <tr><td data-bbox="415 1732 545 1785">11</td><td data-bbox="545 1732 1193 1785">SQL_TYPE_TIMESTAMP or SQL_TIMESTAMP</td></tr> <tr><td data-bbox="415 1785 545 1837">12</td><td data-bbox="545 1785 1193 1837">SQL_VARCHAR</td></tr> <tr><td data-bbox="415 1837 545 1890">101</td><td data-bbox="545 1837 1193 1890">SQL_INTERVAL_YEAR</td></tr> </table>	-22	SQL_UNSIGNED_OFFSET	-20	SQL_SIGNED_OFFSET	-11	SQL_GUID	-10	SQL_WLONGVARCHAR	-9	SQL_WVARCHAR	-8	SQL_WCHAR	-7	SQL_BIT	-6	SQL_TINYINT	-5	SQL_BIGINT	-4	SQL_LONGVARBINARY	-3	SQL_VARBINARY	-2	SQL_BINARY	-1	SQL_LONGVARCHAR	0	SQL_UNKNOWN_TYPE	1	SQL_CHAR	2	SQL_NUMERIC	3	SQL_DECIMAL	4	SQL_INTEGER	5	SQL_SMALLINT	6	SQL_FLOAT	7	SQL_REAL	8	SQL_DOUBLE	9	SQL_TYPE_DATE or SQL_DATE	10	SQL_TYPE_TIME or SQL_TIME	11	SQL_TYPE_TIMESTAMP or SQL_TIMESTAMP	12	SQL_VARCHAR	101	SQL_INTERVAL_YEAR

string (String)	<p>String value to use as the query parameter. Used only when parameterType = value.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>																								

[Note: The W3C XML Schema definition of this element's content model (CT_Parameter) is located in §A.2. *end note*]

18.13.7 parameters (Query Parameters)

This element serves as a collection of parameters for an ODBC or web query.

Attributes	Description
count (Parameter Count)	<p>The number of parameters used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model (CT_Parameters) is located in §A.2. *end note*]

18.13.8 `table` (Character Value)

This element is used to specify an HTML table to import by name. If the tables are not named, they shall be specified with the `<x v="[index]">` syntax instead.

Attributes	Description
v (Value)	<p>The name of the table to retrieve when the web query is refreshed. This corresponds to the string used for the id attribute of the HTML <code><table></code> tag.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_XStringElement](#)) is located in §A.2. *end note*]

18.13.9 `tables` (Tables)

This element serves as the collection of tables to be returned via a web query data connection. Tables are then most commonly referenced by `<x>` via their indices (in order of the `<Table>` tags in the HTML page).

Attributes	Description
count (Count of Tables)	<p>Number of tables to pull data from when refreshing from a web query.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Tables](#)) is located in §A.2. *end note*]

18.13.10 `textField` (Text Import Field Settings)

This element specifies field settings for text import.

Attributes	Description
position (Position)	<p>The character position the field starts at for fixed-length fields. The index is 0-based. If this attribute does not exist, position=0 is assumed. Subsequent <code>textField</code> elements or carriage returns in the text stream serve to denote endpoints for text fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
type (Field Type)	<p>Specifies the field Type. When text is imported into cells in the worksheet, the data in the cells are converted to the field type defined here.</p> <p>Types can be specified by the user, or determined algorithmically via heuristics and text</p>

Attributes	Description
	<p>analysis.</p> <p>The possible values for this attribute are defined by the ST_ExternalConnectionType simple type (§18.18.27).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextField](#)) is located in §A.2. *end note*]

18.13.11 textFields (Fields)

This element denotes a set of fields to retrieve from a text file. Contains 1 or more textField elements.

Attributes	Description
count (Count of Fields)	<p>Number of distinct fields to retrieve.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextFields](#)) is located in §A.2. *end note*]

18.13.12 textPr (Text Import Settings)

This element contains all of the text import settings.

[Example: Here's an example of the XML for a text connection:

```
<connection id="1" name="text data" type="6" refreshedVersion="3" background="1"
  saveData="1">
  <textPr prompt="0" characterSet="IBM437" sourceFile="C:\Desktop\text data.txt"
    delimiter="|">
    <textFields count="5">
      <textField/>
      <textField type="text" position="7"/>
      <textField type="text" position="28"/>
      <textField position="36"/>
      <textField type="text" position="41"/>
    </textFields>
  </textPr>
</connection>
```

example]

Attributes	Description																																				
characterSet (Character Set)	<p>Name of the character set associated with the text file. Values for this attribute are restricted to the names and aliases listed in the IANA CHARACTER SETS listing found at http://www.iana.org/assignments/character-sets.</p> <p>[<i>Note</i>: When reading this value, if a system does not support a particular character set, the application is allowed to decide what is the best course of fallback action. <i>end note</i>]</p> <p>If this attribute is not present then the codePage attribute are used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>																																				
comma (Comma is Delimiter)	<p>Flag indicating whether to treat comma characters as field delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																																				
consecutive (Consecutive Delimiters)	<p>Flag indicating whether consecutive delimiters should be treated as just one delimiter. If this flag is true than it's possible or even likely that some rows will return more fields than others, and these fields will always fill cells in the worksheet from left to right.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>																																				
decimal (Decimal Separator)	<p>The decimal separator character. This and the thousands attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used.</p> <p>The following table shows the results when you import text into a spreadsheet application using various separators. Numeric results are displayed in the rightmost column.</p> <table><tr><th>System decimal separator</th><th>System thousands separator</th><th>Text file decimal separator value</th><th>Text file thousands Separator value</th><th>Text imported</th><th>Cell value (data type)</th></tr><tr><td>Period</td><td>Comma</td><td>Comma</td><td>Period</td><td>123.123,45</td><td>123,123.45 (numeric)</td></tr><tr><td>Period</td><td>Comma</td><td>Comma</td><td>Comma</td><td>123.123,45</td><td>123.123,45 (text)</td></tr><tr><td>Comma</td><td>Period</td><td>Comma</td><td>Period</td><td>123,123.45</td><td>123,123.45 (numeric)</td></tr><tr><td>Period</td><td>Comma</td><td>Period</td><td>Comma</td><td>123 123.45</td><td>123 123.45 (text)</td></tr><tr><td>Period</td><td>Comma</td><td>Period</td><td>Space</td><td>123 123.45</td><td>123,123.45 (numeric)</td></tr></table> <p>Strings values of this attribute are expected to be one character in length.</p>	System decimal separator	System thousands separator	Text file decimal separator value	Text file thousands Separator value	Text imported	Cell value (data type)	Period	Comma	Comma	Period	123.123,45	123,123.45 (numeric)	Period	Comma	Comma	Comma	123.123,45	123.123,45 (text)	Comma	Period	Comma	Period	123,123.45	123,123.45 (numeric)	Period	Comma	Period	Comma	123 123.45	123 123.45 (text)	Period	Comma	Period	Space	123 123.45	123,123.45 (numeric)
System decimal separator	System thousands separator	Text file decimal separator value	Text file thousands Separator value	Text imported	Cell value (data type)																																
Period	Comma	Comma	Period	123.123,45	123,123.45 (numeric)																																
Period	Comma	Comma	Comma	123.123,45	123.123,45 (text)																																
Comma	Period	Comma	Period	123,123.45	123,123.45 (numeric)																																
Period	Comma	Period	Comma	123 123.45	123 123.45 (text)																																
Period	Comma	Period	Space	123 123.45	123,123.45 (numeric)																																

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
<p>delimited (Delimited File)</p>	<p>true if the file is Tab or character delimited. false if the file should be parsed according to fixed length fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>delimiter (Custom Delimiter)</p>	<p>User-specified character to be treated as a field delimiter. Only single characters are supported.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
<p>fileType (File Type)</p>	<p>Ignorable attribute with enum value that defined by ST_FileType. Determines the kind of character set to use during import.</p> <p>Only one of fileType and characterSet or codePage shall be specified for a textPr.</p> <p>The possible values for this attribute are defined by the ST_FileType simple type (§18.18.29).</p>
<p>firstRow (First Row)</p>	<p>Indicates at what row of the file to start the data import. All unsignedInt values are permitted, although it's possible that firstRow is higher than the number of rows in the text file, in which case no data is imported.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
<p>prompt (Prompt for File Name)</p>	<p>Flag indicating whether the user wants to be prompted for the file name on refresh. If false, then the user is not prompted. If true or not present, then the user is prompted.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>qualifier (Qualifier)</p>	<p>Character used as the text string qualifier.</p> <p>The possible values for this attribute are defined by the ST_Qualifier simple type (§18.18.61).</p>
<p>semicolon (Semicolon is Delimiter)</p>	<p>Flag indicating whether to treat semicolon characters as field delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
<p>sourceFile (Source File Name)</p>	<p>Path to the text file to use to import external data. Can be expressed in URI or system-specific file path notation.</p> <p>[Note: Applications can decide what forms of URI they support, and whether system-</p>

Attributes	Description
	<p>specific file path notations are supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
space (Space is Delimiter)	<p>Flag indicating whether to treat space characters as field delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
tab (Tab as Delimiter)	<p>Flag indicating whether to treat tab characters as field delimiters. If false, then tabs will not be used as delimiters. If true or not present, then they are used as delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
thousands (Thousands Separator)	<p>The thousands separator character. This and the decimal attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used. Please refer to the decimal attribute description above for a Table describing the behavior.</p> <p>Strings values of this attribute are expected to be one character in length.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_TextPr](#)) is located in §A.2. *end note*]

18.13.13 webPr (Web Query Properties)

This element specifies the properties for a web query source. A web query will retrieve data from HTML tables, and can also supply HTTP "Get" parameters to be processed by the web server in generating the HTML by including the parameters and parameter elements.

Here's an example of a web query connection:

[Example:

```

<connection id="1" name="Connection" type="4" refreshedVersion="0"
  background="1" saveData="1">
  <webPr sourceData="1" parsePre="1" consecutive="1"
    url="http://ServerName/Image%20Library/Forms/AllItems.aspx" htmlTables="1">
    <tables count="1">
      <s v="contentthumbnail"/>
    </tables>
  </webPr>
</connection>

```

end example]

Attributes	Description
consecutive (Consecutive Delimiters)	<p>Flag indicating whether consecutive delimiters should be treated as just one delimiter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
editPage (Edit Query URL)	<p>The URL of the user-facing web page showing the web query data. This URL is persisted in the case that sourceData="true" and url has been redirected to reference an XML file. Then the user-facing page can be shown in the UI, and the XML data can be retrieved behind the scenes.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
firstRow (Use First Row)	<p>Flag indicating whether to parse all tables inside a PRE block with the same width settings as the first row.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
htmlFormat (HTML Formatting Handling)	<p>How to handle formatting from the HTML source when bringing web query data into the worksheet. Relevant when sourceData is True.</p> <p>Values are as follows:</p> <ol style="list-style-type: none"> 1. None - no formatting at all 2. RTF - honor just rich text formatting 3. All - honor all html formatting. <p>The possible values for this attribute are defined by the ST_HtmlFmt simple type (§18.18.41).</p>
htmlTables (HTML Tables Only)	<p>Flag indicating whether web queries should only work on HTML tables.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
parsePre (Parse PRE)	<p>Flag indicating whether data contained within HTML <PRE> tags in the web page is parsed into columns when you import the page into a query table.</p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
post (Web Post)	<p>Returns or sets the string used with the post method of inputting data into a web server to return data from a web query.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
sourceData (Import XML Source Data)	<p>Flag indicating that XML source data should be imported instead of the HTML table itself.</p> <p>Used when a web query exists to an HTML table with the following attribute.</p> <p style="text-align: center;"><code><TABLE ... o:WebQuerySourceHRef="http://..." ... > ... </TABLE></code></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
textDates (Dates as Text)	<p>Flag indicating whether dates should be imported into cells in the worksheet as text rather than dates.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
url (URL)	<p>URL to use to refresh external data.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
xl2000 (Refreshed in Excel 2000)	<p>This flag exists for backward compatibility with older existing spreadsheet files, and is set to true if this web query was refreshed in a spreadsheet application newer than or equal to Microsoft Excel 2000.</p> <p>This is an optional attribute that can be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
xl97 (Created in Excel 97)	<p>This flag exists for backward compatibility with older existing spreadsheet files, and is set to true if this web query was created in Microsoft Excel 97.</p> <p>This is an optional attribute that can be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
xml (XML Source)	<p>true if the web query source is XML (versus HTML), otherwise false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WebPr](#)) is located in §A.2. *end note*]

18.14 Supplementary Workbook Data

External links are used when linking the workbook to other workbooks or external data. The most frequent feature for linking a workbook to other workbooks is through the use of formulas. In this case the formula references a range or defined name in another workbook. Hyperlinks on cells and other spreadsheet objects are also considered an external link. Object-linking technologies are yet another technology used to link the workbook to another object. [*Example:* KParts or OLE. *end example*] Finally, Dynamic Data Exchange, or DDE, servers can be used to access external data. DDE servers are accessed through formulas in the workbook.

External links are saved with the target source in a relationship file so that external resources are easily discoverable in lightweight relationship XML rather than deep in the application's XML.

For a workbook `consumer.xlsx` that makes use of data in another workbook called `data.xlsx`, the following XML would exist in `consumer.xlsx` to describe the external link:

[*Example:*

```
<Relationships xmlns="...">
  <Relationship Id="rId1" Type=".../externalLinkPath" Target="data.xlsx"
    TargetMode="External"/>
</Relationships>
```

end example]

And the following XML would exist to describe cached data retrieved from the external workbook:

[*Example:*

```
<externalLink xmlns="...">
  <externalBook xmlns:r="..." r:id="rId1">
    <sheetNames>
      <sheetName val="Sheet1"/>
      <sheetName val="Sheet2"/>
      <sheetName val="Sheet3"/>
    </sheetNames>
```

```

<sheetDataSet>
  <sheetData sheetId="0"/>
  <sheetData sheetId="1"/>
  <sheetData sheetId="2">
    <row r="11">
      <cell r="B11">
        <v>47</v>
      </cell>
    </row>
    <row r="12">
      <cell r="B12">
        <v>19</v>
      </cell>
    </row>
    <row r="13">
      <cell r="B13">
        <v>38</v>
      </cell>
    </row>
  </sheetData>
</sheetDataSet>
</externalBook>
</externalLink>

```

end example]

The Supplementary Workbook Data section of SpreadsheetML is complimentary to the External Data Connections (§18.13) section in maintaining all the information about external information that impacts the workbook.

18.14.1 cell (External Cell Data)

This element is used to store cached values from external sources such as other workbooks. Formulas from external cells are not stored in the consuming workbook. Also, for this context, the attribute `t` cannot have a value of `inlineStr`. Rich text is not supported in this context either.

Attributes	Description
r (Reference)	<p>Describes the cell location in the external book.</p> <p>[Example:</p> <pre> <cell r="B12"> <v>74</v> </cell> </pre>

Attributes	Description
	<i>end example]</i> The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).
t (Type)	Indicates the data type of the cell value. The possible values for this attribute are defined by the ST_CellType simple type (§18.18.11).
vm (Value Metadata)	The index of the cell's value metadata, if any exists. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalCell](#)) is located in §A.2. *end note*]

18.14.2 ddeItem (DDE Item definition)

This element represents a DDE item.

Attributes	Description
advise (Advise)	Specifies whether the DDE server should notify the application when the external data changes. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (DDE Name)	Specifies the DDE item name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ole (Object Linking TechnologyE)	Set to <code>true</code> if this is item uses an object linking technology. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
preferPic (Data is an Image)	Set to <code>true</code> if data from this DDE item is an image format. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_DdeItem](#)) is located in §A.2. *end note*]

18.14.3 ddeItems (DDE Items Collection)

This element serves as a collection for ddeItem elements.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DdeItems](#)) is located in §A.2. *end note*]

18.14.4 ddeLink (DDE Connection)

This element represents a connection to an external Dynamic Data Exchange (DDE) server. DDE is a method of sending data between applications using Windows messages according to a documented protocol that has been stable since about 1990.

The hierarchy of names defined by a DDE server is Application, Topics, and Items. Topics often correspond to units such as files or documents or database names, and Items refer to subsets of the data such as cell ranges, rows, fields, columns. DDE items can have multiple values as well.

[*Example:*

Data connectivity can use a number of different technologies. The following is just one example of a spreadsheetML fragment describing the product Microsoft Excel being used as a DDE server to provide data to the current spreadsheet document:

```
<ddeLink xmlns:r="..." ddeService="excel" ddeTopic="[dsource.xls]Sheet1">
  <ddeItems>
    <ddeItem name="R1C1" advise="1"/>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>
```

end example]

Attributes	Description
ddeService (Service name)	Service name (i.e., application name) for the DDE connection. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
ddeTopic (Topic for DDE server)	Describes something for the DDE application to which the channel pertains— usually a document of that application. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DdeLink](#)) is located in §A.2. *end note*]

18.14.5 **definedName (Defined Name)**

This element contains information about a named range in an external workbook.

Attributes	Description
name (Defined Name)	<p>The defined name. This attribute is required.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
refersTo (Refers To)	<p>Name range definition string.</p> <p><i>[Example:</i></p> <pre><definedNames> <definedName name="namedrange" refersTo="'Sheet1'!\$D\$5:\$D\$10"/> </definedNames></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>
sheetId (Sheet Id)	<p>The index of the worksheet that the named range applies to for named ranges that are scoped to a particular worksheet rather than the full workbook. This attribute is optional.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalDefinedName](#)) is located in §A.2. *end note*]

18.14.6 **definedNames (Named Links)**

This element is a collection of the defined names associated with the supporting workbook.

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalDefinedNames](#)) is located in §A.2. *end note*]

18.14.7 **externalBook (External Workbook)**

This element represents an external workbook which is supplying data to the current workbook.

Attributes	Description
id (Relationship to supporting book file)	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the worksheet XML file in the current

Attributes	Description
path)	spreadsheetML document ZIP archive that makes use of this externalbook.
Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalBook](#)) is located in §A.2. *end note*]

18.14.8 externalLink (External Reference)

This element is a container for specific types of external links.

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalLink](#)) is located in §A.2. *end note*]

18.14.9 oleItem (Object Link Item)

This element represents a single link within the object referenced by the parent element.

Attributes	Description
advise (Advise)	Set to true if the linked object should notify the application when the external data changes. Default value is false. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
icon (Icon)	Set to true if the linked object is represented by an icon. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
name (Object Name)	The linked object's name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).
preferPic (Object is an Image)	Set to true if the linked object is represented by an image. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_OleItem](#)) is located in §A.2. *end note*]

18.14.10 oleItems (Object Link Items)

This element is a collection of items within the link specified by the parent element.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OleItems](#)) is located in §A.2. *end note*]

18.14.11 oleLink (Generic Object Link Connection)

This element represents an external link to an embedded object, specified by a progID/object pair. The type of object link is determined by reading the target of the id attribute.

[*Example:* The following markup defines a reference to a linked object using Bonobo. The progId attribute contains the shared library that contains the widget. The r:id identifies the referenced Bonobo object.

```
<oleLink r:id="rb1" progId="OAFIID:Bonobo_Sample_Calculator">
...
</oleLink>
```

The target of the relationship with ID rb1, defines the Bonobo object itself. This example shows a link to a sample Bonobo widget taken from the following article, which also provides an introduction to Bonobo – <http://www.ibm.com/developerworks/webservices/library/co-bnbo2.html>. *end example*]

[*Example:* The following markup defines a reference to a linked object using KParts. The progId attribute contains the shared library that contains the plugin. The r:id identifies the referenced KParts object.

```
<oleLink r:id="rKp1" progId="libhtmlvalidatorplugin">
...
</oleLink>
```

The following XML, contained in the target of the relationship with ID rKp1, defines the KPart object, and will follow the kpartgui DTD:

```
<!DOCTYPE kpartgui SYSTEM "kpartgui.dtd">
<kpartgui library="libhtmlvalidatorplugin" name="htmlvalidatorplugin"
version="1" >
  <MenuBar>
    <Menu name="tools"><Text>&Tools</Text>
      <Action name="validatewebpage"/>
    </Menu>
  </MenuBar>
</kpartgui>
```

This example is taken from the kde.org web site, and contains a tutorial on building the plugin referenced by the above markup – <http://developer.kde.org/documentation/tutorials/dot/writing-plugins.html>. *end example*]

Attributes	Description
id (Object Link Relationship) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the external file name used for this oleLink. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).
progId (Object Link Identifier)	The ID for the object link connection. [<i>Example</i> : For a KParts link, this would store the name of the appropriate KParts library. For an OLE link, this would store the ProgID of the appropriate OLE object. <i>end example</i>] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[*Note*: The W3C XML Schema definition of this element's content model ([CT_OleLink](#)) is located in §A.2. *end note*]

18.14.12 row (Row)

This element contains data for an external worksheet row.

Attributes	Description
r (Row)	Row number of the row in the external book containing the cell data referenced. This attribute is required. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ExternalRow](#)) is located in §A.2. *end note*]

18.14.13 sheetData (External Sheet Data Set)

This element contains the cached worksheet data associated with a supporting workbook.

[*Note*: For an example, please refer to example at the beginning of this section. *end note*]

Attributes	Description
refreshError (Last Refresh Resulted in Error)	Specifies that the last external data refresh for this sheet did not succeed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.

Attributes	Description
sheetId (Sheet Id)	<p>Index of sheet in the external workbook that is referenced and partially cached in this data set. This is a 1-based index. This attribute is required.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetData](#)) is located in §A.2. *end note*]

18.14.14 sheetDataSet (Cached Worksheet Data)

This element serves as the collection for 1 or more sheetData elements.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetDataSet](#)) is located in §A.2. *end note*]

18.14.15 sheetName (Sheet Name)

Name of a worksheet in the supporting workbook

Attributes	Description
val (Sheet Name Value)	<p>Name of the sheet. This attribute is required.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetName](#)) is located in §A.2. *end note*]

18.14.16 sheetNames (Supporting Workbook Sheet Names)

This element is the container for all of the worksheet names in a supporting workbook.

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetNames](#)) is located in §A.2. *end note*]

18.14.17 val (DDE Link Value)

This element specifies a value associated with a particular DDE item.

[*Example:* Here's an example of how values, value, and val elements are written out in the spreadsheetML for a ddeItem supplied by a DDE server. In this example different cells in the workbook are bound to these specific DDE items:

```

<ddeLink xmlns:r="..." ddeService="StockSrv" ddeTopic="Prices">
  <ddeItems>
    <ddeItem name="Bread" advise="1">
      <values>
        <value>
          <val>3.5</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="Milk" advise="1">
      <values>
        <value>
          <val>5.7400000000000002</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="MSFT" advise="1">
      <values>
        <value>
          <val>54.130000000000003</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>

```

end example]

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.14.18 value (Value)

This element contains a value associated with a particular DDE item. This serves as a container for the val element.

Attributes	Description
t (DDE Value Type)	Indicates the DDE value type. The possible values for this attribute are defined by the ST_DdeValueType simple type (§18.18.23).

[*Note: The W3C XML Schema definition of this element's content model ([CT_DdeValue](#)) is located in §A.2. end note*]

18.14.19 values (DDE Name Values)

This element defines a collection of values associated with DDE item.

Attributes	Description
cols (Columns)	<p>The number of columns of data that is returned by the DDE server for this DDE item. The default value of this attribute is 1.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
rows (Rows)	<p>The number of rows of data that is returned by the DDE server for this DDE item. The default value of this attribute is 1.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_DdeValues](#)) is located in §A.2. end note*]

18.15 Volatile Dependencies

The volatileDependencies part provides a cache of data that supports Real Time Data (RTD) and CUBE functions in the workbook. Both of these types of functions require connectivity to external servers to retrieve their data. For RTD functions, an RTD interface defines how data is provided on the server, and how it is retrieved on the client. Similarly, CUBE functions access data in OLAP cubes via their own function syntax. The volatileDependencies part provides that cache of data and supporting information about these functions and their data servers and connections. This allows the spreadsheet application to work with cached values when recalculating the workbook when the external server is not available.

[*Note: How users of SpreadsheetML access RTD data depends on the integration the user's spreadsheet application provides for RTD. end note*]

[*Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vbaxl11/html/xlobjIRtdServer_HV03085058.asp end note*]

File Architecture

The workbook holds the relationship to the volatile dependencies part.

Illustration

[Example: The following image shows an example implementation of CUBE and Real Time Data (RTD) functions in a worksheet.

	A
1	=RTD("jrtdx.rtd",,"aaa")
2	
3	=CUBEMEMBER("xlextat9 Adventure Works DW Adventure Works","[Department].[Departments].[Corporate]")
4	=CUBEVALUE("xlextat9 Adventure Works DW Adventure Works",A3)
5	=CUBESET("xlextat9 Adventure Works DW Adventure Works","[Customer].[Customer Geography].[All Customers].[United Kingdom].children","Set")
6	=CUBERANKEDMEMBER("xlextat9 Adventure Works DW Adventure Works",\$A\$3,ROW(A1))
7	=CUBESETCOUNT(A3)
8	=CUBEMEMBERPROPERTY("xlextat9 Adventure Works DW Adventure Works","[Product].[Product].[All Products].[Blade]","Class")
9	=CUBEKPIMEMBER("xlextat9 Adventure Works DW Adventure Works","Growth in Customer Base",2)
10	

The following example shows the XML that describes the functions in the illustration.

```

<volTypes xmlns="...">
  <volType type="realTimeData">
    <main first="jrtdx.rtd">
      <tp t="s">
        <v>aaa: 4447</v>
        <stp/>
        <stp>aaa</stp>
        <tr r="A1" s="1"/>
      </tp>
    </main>
  </volType>

```

```
<volType type="olapFunctions">
  <main first="xlextdat9 Adventure Works DW Adventure Works">
    <tp t="e">
      <v>#N/A</v>
      <stp>1</stp>
      <tr r="A6" s="1"/>
      <tr r="A9" s="1"/>
      <tr r="A8" s="1"/>
      <tr r="A5" s="1"/>
      <tr r="A4" s="1"/>
      <tr r="A3" s="1"/>
    </tp>
  </main>
</volType>
</volTypes>
```

end example]

While RTD and Cube functions share the cache, there are differences in how the data is interpreted. [Example: RTD dependencies, volTypes/volType/main@first specifies the ProgId of the RTD server. Whereas for OLAP dependencies, main@first indicates the connection name. *end example]*

18.15.1 main (Main)

Represents dependency information for all topics within a volatile dependency type that share the same first string or function argument.

Attributes	Description
first (First String)	<p>Specifies the first string of all topics within this main. This string corresponds to the first argument to the RTD or CUBE function.</p> <p>For RTD functions, this argument represents the progID of the IRTDServer.</p> <p>[Example: <main first="jrtdx.rtd"> <i>end example]</i></p> <p>For CUBE functions, this argument represents the CUBE connection.</p> <p>[Example: <main first="xlextdat9 Adventure Works DW Adventure Works"> <i>end example]</i></p> <p>For more information on RTD and CUBE functions in SpreadsheetML, see §18.17 in Formulas.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([CT_VolMain](#)) is located in §A.2. *end note*]

18.15.2 stp (Strings in Subtopic)

Represents all strings in the topic except for the first. An stp is allocated for each additional argument. [Example: For the topic {"progid", "", "foo"}, there would be two STPs: "" and "foo". *end example*]

For Cube functions, value of "1" indicates that all of the related cells with calling cube functions have been refreshed.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

[Note: The W3C XML Schema definition of this element's content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.15.3 tp (Topic)

Represents dependency information for all topics within a volatile dependency type that share the same first string or argument.

For the RTD function, this collection will contain the remaining parameters of the function, and indicate the last known value and data type of that value.

Attributes	Description
t (Type)	<p>Specifies the type of the cell value. This value corresponds to the type of data returned by the RTD or CUBE function.</p> <p>[Example: In the following RTD example, the value "aaa: 4447" has a string data type.</p> <pre><tp t="s"> <v>aaa: 4447</v> </tp></pre> <p><i>end example</i>]</p> <p>For Cube functions, this attribute can be ignored when stp value is "1".</p> <p>The possible values for this attribute are defined by the ST_VolValueType simple type (§18.18.91).</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_VolTopic](#)) is located in §A.2. *end note*]

18.15.4 tr (References)

Represents the reference to a cell that depends on this topic. Each topic can have one or more cells dependencies.

For CUBE functions, each <tr> element contains a cell whose cube function call dependent on the connection in main@first.

Attributes	Description
r (Reference)	<p>Specifies a reference to the cell location. The location is scoped to the sheet specified in s.</p> <p>[Example: <tr r="A6" s="1"/> end example]</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p>
s (Sheet Id)	<p>Specifies the sheet index.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_VolTopicRef](#)) is located in §A.2. *end note*]

18.15.5 volType (Volatile Dependency Type)

Represents dependency information for a specific type of external data server. There is no limit on the number of external dependencies that can exist for a workbook in SpreadsheetML.

Attributes	Description
type (Type)	<p>Specifies the type of the external dependency.</p> <p>[Example: <volType type="olapFunctions"> end example]</p> <p>The possible values for this attribute are defined by the ST_VolDepType simple type (§18.18.90).</p>

[*Note: The W3C XML Schema definition of this element's content model ([CT_VolType](#)) is located in §A.2. end note*]

18.15.6 volTypes (Volatile Dependency Types)

Represents the collection of external dependencies for a workbook. This element defines the structure of the volatileDependencies part. There can only be one volatileDependencies part for each workbook. However, the part can contain one or more dependency types.

The volatileDependencies part stores the following information for Real Time Data (RTD) and CUBE functions:

- Cached values
- Parameters used
- Connection and Server names

[*Example: Outline of XML Structure*

```
<volTypes xmlns="...">
  <volType type="realTimeData">
  </volType>
  <volType type="olapFunctions">
  </volType>
</volTypes>
```

end example]

[*Note: The W3C XML Schema definition of this element's content model ([CT_VolTypes](#)) is located in §A.2. end note*]

18.16 Custom XML Mappings

Custom XML Mappings enable binding of arbitrary XML data structures and arbitrary XML schema definitions to the workbook. Once a DataBinding has been established, then various XML nodes can be mapped to table columns, ranges of cells, or even single cells (for non-repeating attributes and elements). Once an XML Mapping is fully defined, the application is able to import and export XML instance structures according to the schema definition. ECMA-376 does not require any particular XML schema language.

[*Note: Some examples of XML schema languages that might be used to implement Custom XML Mappings include:*

- W3C XML Schema - <http://www.w3.org/XML/Schema>
- RELAX NG – ISO/IEC 19757-2
- Schematron – ISO/IEC 19757-3
- NVDL – ISO/IEC 19757-4

end note]

While the original schema or XML definition can reside on disk or at some file location outside the workbook, a copy of the schema is stored in the workbook.

Every time an XML instance or schema is added to the workbook, a new map object is created which ties together the schemas and where the various elements are mapped in the workbook.

[Example:

```
<MapInfo SelectionNamespaces="">
  <Schema ID="Schema1">
    <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema">
      <xsd:element nillable="true" name="Root">
        <xsd:complexType>
          <xsd:sequence minOccurs="0">
            <xsd:element minOccurs="0" nillable="true" name="EmployeeInfo"
              form="unqualified">
              <xsd:complexType>
                <xsd:sequence minOccurs="0">
                  <xsd:element minOccurs="0" nillable="true" type="xsd:string"
                    name="Name" form="unqualified"></xsd:element>
                  <xsd:element minOccurs="0" nillable="true" type="xsd:date"
                    name="Date" form="unqualified"></xsd:element>
                  <xsd:element minOccurs="0" nillable="true" type="xsd:integer"
                    name="Code" form="unqualified"></xsd:element>
                </xsd:sequence>
              </xsd:complexType></xsd:element>

            <xsd:element minOccurs="0" maxOccurs="unbounded" nillable="true"
              name="ExpenseItem" form="unqualified">
              <xsd:complexType>
                <xsd:sequence minOccurs="0">
                  <xsd:element minOccurs="0" nillable="true" type="xsd:date"
                    name="Date" form="unqualified"></xsd:element>
                  <xsd:element minOccurs="0" nillable="true" type="xsd:string"
                    name="Description" form="unqualified"></xsd:element>
                  <xsd:element minOccurs="0" nillable="true" type="xsd:double"
                    name="Amount" form="unqualified"></xsd:element>
                </xsd:sequence>
              </xsd:complexType></xsd:element>
            </xsd:sequence>
          </xsd:complexType></xsd:element>
        </xsd:sequence>
      </xsd:complexType></xsd:element>
    </xsd:schema>
  </Schema>
</MapInfo>
```

```

        <xsd:attribute name="Currency" form="unqualified"
            type="xsd:string"></xsd:attribute>
        <xsd:attribute name="Approved" form="unqualified"
            type="xsd:string"></xsd:attribute>
    </xsd:complexType>
</xsd:element>
</xsd:schema>
</Schema>
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
    ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
    PreserveSortAFLayout="true" PreserveFormat="true">
    <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
</MapInfo>

```

end example]

For XML mapped into a SpreadsheetML Table there will also be additional information in the SpreadsheetML file which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in a `xmlColumnPr` element, under the `tableColumn` node.

[Example:

```

<table xmlns="..." id="1" name="Table1" displayName="Table1" ref="A1:H11"
    tableType="xml" totalsRowShown="0" connectionId="1">
    <tableColumns count="5">
        <tableColumn id="1" uniqueName="Name" name="Name">
            <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Name"
                xmlDataType="string"/>
        </tableColumn>
        <tableColumn id="2" uniqueName="Date" name="Date">
            <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Date"
                xmlDataType="date"/>
        </tableColumn>
        <tableColumn id="3" uniqueName="Code" name="Code">
            <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Code"
                xmlDataType="integer"/>
        </tableColumn>
        <tableColumn id="4" uniqueName="Description" name="Description">
            <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Description"
                xmlDataType="string"/>
        </tableColumn>
    </tableColumns>

```

```

    <tableColumn id="5" uniqueName="Amount" name="Amount">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Amount"
        xmlDataType="double"/>
    </tableColumn>
  </tableColumns>
  <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
    showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
</table>

```

end example]

For XML mapped into a single SpreadsheetML cell there will also be additional information in the TableSingleCells part which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in the xmlPr element under the xmlCellPr node.

[Example:

```

<singleXmlCells xmlns="...">
  <singleXmlCell id="2" name="Table2" displayName="Table2" r="D19"
    connectionId="1">
    <xmlCellPr id="1" uniqueName="Currency">
      <xmlPr mapId="1" xpath="/Root/@Currency" xmlDataType="string"/>
    </xmlCellPr>
  </singleXmlCell>
  <singleXmlCell id="3" name="Table3" displayName="Table3" r="D20"
    connectionId="1">
    <xmlCellPr id="1" uniqueName="Approved">
      <xmlPr mapId="1" xpath="/Root/@Approved" xmlDataType="string"/>
    </xmlCellPr>
  </singleXmlCell>
  <singleXmlCell id="4" name="Table4" displayName="Table4" r="D18"
    connectionId="1">
    <xmlCellPr id="1" uniqueName="Name">
      <xmlPr mapId="1" xpath="/Root/EmployeeInfo/Name" xmlDataType="string"/>
    </xmlCellPr>
  </singleXmlCell>
</singleXmlCells>

```

end example]

18.16.1 DataBinding (XML Mapping)

This element contains properties which specify how the XML mapping should work.

[Example:

```
<DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
```

end example]

[*Note:* This element is not intended to reintroduce transitional schema into the strict conformance class. *end note]*

Attributes	Description
ConnectionID (Reference to Connection ID)	<p>Specifies the Connection ID to the external connection in the External Data Connections part.</p> <p>Required if FileBinding is true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
DataBindingLoadMode (XML Data Loading Behavior)	<p>Specifies the mode for loading XML data related to this DataBinding.</p> <p>Supported values are as follows:</p> <ul style="list-style-type: none"> 0 - None 1 - Normal 2 - Delay Load 3 - Asynchronous 4 - Object Model <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p>
DataBindingName (Unique Identifier)	<p>Specifies the data binding name. These shall be unique for each DataBinding.</p> <p>[<i>Example:</i> <pre><DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/></pre> <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
FileBinding (Binding to External File)	<p>Specifies whether the data should be retrieved directly from an XML file. The path to the file is in the corresponding connection element</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
FileBindingName (File Binding Name)	<p>Specifies the file binding name. These shall be unique for each DataBinding.</p> <p>[<i>Example:</i> <pre><DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/></pre> <i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the W3C XML Schema string datatype.

[Note: The W3C XML Schema definition of this element's content model ([CT_DataBinding](#)) is located in §A.2. *end note*]

18.16.2 Map (XML Mapping Properties)

This element contains all of the properties related to the XML map, and the behaviors expected during data refresh operations.

[Example:

```
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
  ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
  PreserveSortAFLayout="true" PreserveFormat="true">
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
```

end example]

Attributes	Description
Append (Append Data to Table)	Specifies whether XML data should overwrite or be appended to the end of the table or range of mapped cells when data is refreshed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
AutoFit (AutoFit Table on Refresh)	Specifies whether columns should be resized to fit the XML data after a data refresh operation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype.
ID (XML Mapping ID)	Specifies the ID of the XML map. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.
Name (XML Mapping Name)	Specifies the name of the XML map. The possible values for this attribute are defined by the W3C XML Schema string datatype.
PreserveFormat (Preserve Cell	Specifies whether cell number formatting in the sheet should be preserved during data refresh operations, or whether the number formatting defined by the XML data type

Attributes	Description
Formatting)	<p>should be used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
PreserveSortAFLay out (Preserve AutoFilter State)	<p>Specifies whether to keep the filter state of the Table or cell range intact during a data refresh.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>
RootElement (Root Element Name)	<p>Specifies the names of the root XML element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
SchemaID (Schema Name)	<p>Specifies the unique name of the schema used for the mapping.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
ShowImportExport ValidationErrors (Show Validation Errors)	<p>Specifies whether XML schema validation errors should be displayed during data refresh or data export.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Map](#)) is located in §A.2. *end note*]

18.16.3 MapInfo (XML Mapping)

This element acts as the container for all of the XML schemas and maps attached to the SpreadsheetML document.

Attributes	Description
SelectionNamespaces (Prefix Mappings for XPath Expressions)	<p>Specifies namespaces for use in XPath expressions when it is necessary to define new namespaces externally. Namespaces are defined in the XML style, as a space-separated list of namespace declaration attributes</p> <p>[Example: The following example contains elements that belong to "a" and "b", in addition to elements that do not belong to any namespace.</p> <pre><?xml version="1.0"?> <root> <branch>branch</branch> <a:root xmlns:a="http://myserver.com"> <a:branch>a-branch</a:branch> <b:branch xmlns:b="http://yourserver.com"></pre>

Attributes	Description
	<pre> b-branch</b:branch> </a:root> </root> end example] This is used when writing Xpath expressions at runtime against the XML instance structures, because the Xpath expressions use namespace prefixes instead of the fully spelled out namespace. The possible values for this attribute are defined by the W3C XML Schema string datatype. </pre>

[*Note:* The W3C XML Schema definition of this element's content model ([CT_MapInfo](#)) is located in §A.2. *end note*]

18.16.4 Schema (XML Schema)

This element contains the XML tree for an attached schema.

[*Note:* This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

Attributes	Description
ID (Schema ID)	<p>Specifies the unique name or ID for this attached schema.</p> <p>[<i>Example:</i></p> <pre> ID = "Schema1" end example]</pre> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
Namespace (Schema Root Namespace)	<p>Specifies the namespace used by the schema.</p> <p>[<i>Example:</i></p> <pre> <MapInfo SelectionNamespaces="..."> <Schema ID="Schema1" Namespace="..."> end example]</pre> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>
SchemaLanguage (Schema Language)	<p>Specifies the media type of the schema language.</p> <p>[<i>Example:</i></p>

Attributes	Description
	<p><Schema ... SchemaLanguage="application/relax-ng-compact-syntax"/></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p>
SchemaRef (Schema Reference)	<p>The schemaRef attribute is used in the specific case where the schema definition happens to include another schema file that contributes to the same namespace. The value of this attribute is the relative path to a "root" schema file on disk which in turn references the other schema files contributing type definitions to the same namespace.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p>

[Note: The W3C XML Schema definition of this element's content model ([CT_Schema](#)) is located in §A.2. *end note*]

18.17 Formulas

18.17.1 Introduction

A SpreadsheetML *formula* is the syntactic representation of a series of calculations that is parsed or interpreted by the spreadsheet application into a function that calculates a value or array of values based upon zero-to-many inputs.

A formula is an expression that can contain the following: constants, operators, cell references, calls to functions, and names.

[Example: Consider the formula $\text{PI}()*(A2^2)$. In this case,

- $\text{PI}()$ results in a call to the function PI , which returns the value of π .
- The cell reference $A2$ returns the value in that cell.
- 2 is a numeric constant.
- The caret (^) operator raises its left operand to the power of its right operand.
- The parentheses, (and), are used for grouping.
- The asterisk (*) operator performs multiplication of its two operands.

end example]

18.17.2 Syntax

The syntax rules in this subclause follow the system shown in ISO/IEC 14977: literal text is surrounded by double-quotes (or by apostrophes); the left-square-bracket and right-square-bracket designate the start and end of an option; the left-curly-bracket and right-curly-bracket designate the start and end of a sequence of one-or-more items; the vertical-line indicates an alternative; and each rule ends with a semicolon. Whenever hyphen is used as the exception-symbol (as per ISO/IEC 14977), it is surrounded by white space, and further clarified by a comment.

The syntax rules below are modified by the context-sensitive rules stated in other subclauses of §18.17.*, as indicated by an EBNF comment of the form “(* see semantic rules at 18.17... *)”. [Note: Thus, in order to produce an automated verifier, the context-sensitive rules in subclauses 18.17.* must all be considered. The context-free syntax rules shown in this subclause provide an overview to assist comprehension by the reader, but do not represent the entirety of the context-sensitive rules. *end note*]

When used in narrative, production names are set in an italic style, as in *array-constant*, *expression*, and *function-name*.

The syntax of a formula is as follows:

```
formula=
    expression ;
expression=
    "(", expression, ")" |
    constant |
    prefix-operator, expression |
    expression, infix-operator, expression |
    expression, postfix-operator |
    cell-reference |
    function-call |
    name ;
```

where *expression* is an arbitrarily complex expression involving constants (§18.17.2.1), operators (§18.17.2.2), cell references (§18.17.2.3), calls to functions (§18.17.2.4), and names (§18.17.2.5).

A *token* is the minimal lexical element of a formula. The categories of tokens are: constants (except for *array-constant*), operators, cell references, function names, names, and punctuators. The *punctuators* are:

- Left parenthesis (() and right parenthesis ()) used for expression grouping and in a function call.
- Comma (,) used in a function call and an *array-constant*.
- Left brace ({ }, right brace (}), and semicolon (;) used in an *array-constant*.

In a formula, an arbitrary number of space characters (U+0020) can precede the first token or follow the final token. An arbitrary number of space characters can separate two adjacent tokens, except that no space characters shall separate a *function-name* from the left parenthesis (() that follows it. Such space characters

have no effect on the semantics of a formula; however, such spaces shall be distinguished from the space operator (§18.17.2.2).

All arithmetic terms in an *expression* are numbers that can be represented by the workbook's value space. For any given workbook, the default value space is IEC 60559's double precision. However, an implementation is permitted to override that default value space by use of the characteristics markup (§22.7). [*Example*: In the expression 1/3, although the operands appear to be integers, they are, in fact, floating-point numbers, and the result is 0.33..., not 0, as would result from integer division. *end example*]

As ranges of data are fundamental to spreadsheet calculations, many SpreadsheetML functions are able to take arrays as inputs and to return arrays as outputs. Based on whether the formula is an *array formula* or not, the way in which input ranges are interpreted and output values are understood to relate to cells sharing the formula can mean one of two things.

For an array formula: All range arguments are interpreted to be their full range. If the result of the formula is an array, the values of the array are meant to be returned across all of the cells in the sheet sharing the formula. (When the size of the range for an array formula exceeds in either dimension the size of the returned array, the excess cells take on a value of #N/A.)

For a normal (non-array) formula:

- Implicit intersection (§18.17.2.2) is performed on all arguments to functions except for those that allow a range.
- If the formula results in an array, only the first value from the array is returned to the cell.

Implicit intersection is determined as follows: When a range is passed to a function which expects only a single cell, a test is made to discover whether the calling cell intersects that range at any point horizontally or vertically. If it does, the cell at the point of intersection is passed to the function. [*Example*: The formula ABS(B1:B3) is entered into A2. Because the ABS function does not expect a range, implicit intersection is performed. A2 intersects B1:B3 horizontally on row 2, and so the value in B2 is passed into the function. *end example*]

The list of function arguments that allow a range is as follows:

- AND - all arguments
- AREAS – *reference* argument
- AVEDEV - all arguments
- AVERAGE - all arguments
- AVERAGEA - all arguments
- AVERAGEIF - all arguments except for *criteria*
- AVERAGEIFS - all arguments except for *criteria1*, *criteria2*, etc.
- CELL - *reference* argument
- CHITEST - all arguments
- COLUMN - all arguments

- COLUMNS - all arguments
- CORREL - all arguments
- COUNT - all arguments
- COUNTA - all arguments
- COUNTBLANK - all arguments
- COUNTIF - all arguments except *criteria*
- COUNTIFS - all arguments except for *criteria1, criteria2, etc.*
- COVAR - all arguments
- DAVERAGE - all arguments
- DCOUNT - all arguments
- DCOUNTA - all arguments
- DEVSQ - all arguments
- DGET - all arguments
- DMAX - all arguments
- DMIN - all arguments
- DPRODUCT - all arguments
- DSTDEV - all arguments
- DSTDEVP - all arguments
- DSUM - all arguments
- DVAR - all arguments
- DVARP - all arguments
- FORECAST - all arguments except for *x*
- FREQUENCY - all arguments
- FTEST - all arguments
- FVSCHEDULE - *schedule* argument
- GCD - all arguments
- GEOMEAN - all arguments
- GROWTH - all arguments
- HARMEAN - all arguments
- HLOOKUP - *table_array* argument
- IMPRODUCT - all arguments
- IMSUM - all arguments
- INDEX - *array* or *reference* argument
- INTERCEPT - all arguments
- LARGE - *array* argument
- LCM - all arguments
- LINEST - *known-xs* and *known-ys* arguments
- LOGEST - *known-xs* and *known-ys* arguments
- LOOKUP - all arguments except *lookup_value*
- MATCH - *lookup_array* argument

- MAX - all arguments
- MAXA - all arguments
- MDETERM – *array* argument
- MEDIAN - all arguments
- MIN - all arguments
- MINA - all arguments
- MINVERSE - all arguments
- MIRR - *values* argument
- MMULT - all arguments
- MODE - all arguments
- MULTINOMIAL - all arguments
- NETWORKDAYS - *holidays* argument
- NETWORKDAYS.INTL - *holidays* argument
- NPV - all arguments except *rate*
- OFFSET - *reference* argument
- OR - all arguments
- PEARSON - all arguments
- PERCENTILE - *array* argument
- PERCENTRANK - *array* argument
- PROB - *x_range* and *prob_range* arguments
- PRODUCT - all arguments
- QUARTILE – *array* argument
- RANK - *ref* argument
- ROW – *reference* argument
- ROWS – *array* argument
- RSQ - all arguments
- SKEW - all arguments
- SLOPE - all arguments
- SMALL - *array* argument
- STDEV - all arguments
- STDEVA - all arguments
- STDEVP - all arguments
- STDEVPA - all arguments
- STEYX - all arguments
- SUBTOTAL - all arguments except *function_num*
- SUM - all arguments
- SUMIF - all arguments except *criteria*
- SUMIFS - all arguments except *criteria1*, *criteria2*, etc.
- SUMPRODUCT - all arguments
- SUMSQ - all arguments

- SUMX2MY2 - all arguments
- SUMX2PY2 - all arguments
- SUMXMY2 - all arguments
- TRANSPOSE – all arguments
- TREND – all arguments except *const-flag*
- TRIMMEAN – *array* argument
- TRUNC – *x* argument
- TTEST – *array-1* and *array-2* arguments
- TYPE – all arguments
- VALUE – all arguments
- VAR – all arguments
- VARA – all arguments
- VARP – all arguments
- VARPA – all arguments
- VLOOKUP – *table-array* argument
- WORKDAY – *holidays* argument
- WORKDAY.INTL – *holidays* argument
- XIRR – all arguments except *guess*
- XNPV – all arguments except *rate*
- ZTEST – *array* argument

[Example: Here are some formulas taking array constants and ranges:

- $(B2:B4*C2:C4)+10.5$ performs three calculations: $(B2*C2)+10.5$, $(B3*C3)+10.5$, and $(B4*C4)+10.5$.
- $SQRT(\{1, 2, 3, 4\})$ returns 1 when entered normally.
- $SQRT(\{1, 2, 3, 4\})$ returns 1 when used in an array formula in a single cell, but if the array formula spans four or more contiguous cells in a row, it will return 1, 1.41, 1.73, and 2 in the first four cells, respectively, and #N/A in any additional cells in the horizontal range spanned by the array formula. (For display purposes, the values returned have been truncated to two decimal places.)
- $SUM(SQRT(\{1, 2, 3, 4\}))$ returns 6.14 when entered normally; when used in an array formula, the intermediate calculation (in this instance performed by the SQRT function) is performed upon each element of the array.

With A1:A4 holding the values 1, 2, 3, and 4, respectively:

- $SQRT(A1:A4)$ entered normally will do implicit intersection if it is in any of the rows 1–4, and return the SQRT of the number in the same row.
- $SQRT(A1:A4)$ returns 1 when used in an array formula in a single cell, since it does not do implicit intersection in this case. If it is used in an array formula spanning multiple contiguous cells in a column, it will return 1, 1.41, 1.73, 2, #N/A, ..., respectively, in the cells in its vertical output range. *end example]*

18.17.2.1 Constants

A *constant* represents a fixed value that can be used in the calculation of a formula. A constant has the following form:

```

constant=
  error-constant |
  logical-constant |
  numerical-constant |
  string-constant |
  array-constant ;
error-constant=
  "#DIV/0!" | "#N/A" | "#NAME?" | "#NULL!" |
  "#NUM!" | "#REF!" | "#VALUE!" | "#GETTING_DATA" ;
logical-constant=
  "FALSE" | "TRUE" ;
numerical-constant=
  whole-number-part, [full-stop], [exponent-part] |
  full-stop, fractional-part, [exponent-part] |
  whole-number-part, full-stop, fractional-part [exponent-part] ;
full-stop=
  "." ; (* also known as "period" *)
whole-number-part=
  digit-sequence ;
fractional-part=
  digit-sequence ;
exponent-part=
  "e" [ sign ] digit-sequence |
  "E" [ sign ] digit-sequence ;
sign=
  "+" |
  "-" ;
digit-sequence=
  decimal-digit, {decimal-digit} ;
decimal-digit=
  "0" | "1" | "2" | "3" | "4" |
  "5" | "6" | "7" | "8" | "9" ;
string-constant=
  double-quote, [string-chars], double-quote ;
double-quote=
  '"' ; (* one double-quote character*)
string-chars=
  string-char, {string-char} ;

```

```

string-char=
  '""' | (* consecutive double-quotes, with no space between them *)
  character - double-quote ; (* any character except double-quote *)
character=
  as defined by the production Char in the XML 1.0 specification, §2.2.

```

[*Example*: =\$A\$1/3 divides the value in A1 by the constant value three; =\$A\$1&"a" appends the constant string "a" to the string representation of the contents of cell A1. *end example*]

To include a double-quote character (") in *string-chars*, precede it with another double-quote character.

[*Example*: "ab""cd" contains the characters ab"cd, and """"abcd"""" contains the characters "abcd". *end example*]

An *array constant* is a list of one or more constants organized in one or two dimensions, and delimited by braces. An array constant has the following form:

```

array-constant=
  "{", constant-list-rows, "}" ;
constant-list-rows=
  constant-list-row, { semicolon, constant-list-row } ;
semicolon=
  ";" ;
constant-list-row=
  constant, { comma, constant } ;

```

An *array-constant* shall not contain

- An *array-constant*.
- Columns or rows of unequal length.

Any *numerical-constant* in an *array-constant* can be preceded immediately by a *prefix-operator*.

The *constants* in an *array-constant* can have different types.

[*Guidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in an *array-constant*. *end guidance*]

[*Example*: {1,3.5,TRUE,"Hello"} is a 1x4 array of constants.

To represent the values 10, 20, 30, and 40, as a 1x4 array, use {10,20,30,40}.

To represent the values 10, 20, 30, and 40 in the first row, and 50, 60, 70, and 80 in the second row, use the following 2x4 array constant: {10,20,30,40;50,60,70,80}. *end example*]

error-constant is described in §18.17.3.

Each *constant* has a corresponding type (§18.17.2.6), as follows:

Constant Form	Type
<i>array-constant</i>	array
<i>error-constant</i>	error
<i>logical-constant</i>	logical
<i>numerical-constant</i>	number
<i>string-constant</i>	text

In the context of cell formulas and values in SpreadsheetML, the following definition of precision shall apply:

By default, default representation of precision shall be as defined by the XML schema double type:
<http://www.w3.org/TR/xmlschema-2/#double>. The default is therefore 53-bits of mantissa precision.

An application that uses XML schema double can optionally state the precision in the Additional Characteristics part by writing out the number of bits in the mantissa and exponent.

A compliant consumer shall parse numbers of arbitrary precision without error.

18.17.2.2 Operators

An *operator* is a symbol that specifies the type of operation to perform on one or more operands. There are arithmetic, comparison, text, and reference operators.

operator=

":" | comma | space | "^" | "*" | "/" | "+" | "-"
 | "&" | "=" | "<>" | "<" | "<=" | ">" | ">=" | "%" ;

infix-operator=

":" | comma | space | "^" | "*" | "/" | "+" | "-" | "&"
 | "=" | "<>" | "<" | "<=" | ">" | ">=" ;

postfix-operator=

"%" ;

prefix-operator=

"-" ;

The *operators* permitted in *expression* are:

Operators			
Family	Operator	Description	Precedence
Reference operators	:	Binary range operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to the cells inclusive of, and between, those references. [Example: SUM(B5:C15), which references 11 cells. end example]	highest
	,	Binary union operator, which takes two cell reference (§18.17.2.3) operands, and results	

Operators			
		in one reference to all those, possibly non-contiguous, cells. [<i>Example</i> : SUM((B5:B15,D5:D15))], which references 22 cells, 11 from column B, and 11 from column D. The grouping parentheses are necessary to indicate that the comma is an operator rather than a punctuator separating two arguments. <i>end example</i>]	
	space	Binary intersection operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to those, possibly non-contiguous, cells that are common. If the intersection is empty, the result is #NULL!. [<i>Example</i> : ((B1:C1) (C1:D1)) results in a reference to C1, while ((B1:D1) (B1,D1)) results in a single reference to B1 and D1. <i>end example</i>]	
Arithmetic operators	-	Unary minus	
	%	Percentage (unary postfix), which divides its operand by 100. [<i>Example</i> : 10.5%, which results in 0.105. <i>end example</i>]	
	^	Exponentiation	
	*	Multiplication	
	/	Division	
	+	Addition	
	-	Subtraction	
Text operator	&	Text concatenation (Each of the two operands is converted to text, if necessary, before concatenation.)	
Comparison operators	=	Equal-to	lowest
	<>	Not-equal-to	
	<	Less-than	
	<=	Less-than or equal-to	
	>	Greater-than	
	>=	Greater-than-or-equal-to	

expression can contain grouping parentheses to document the default precedence or to override it.

operators in *expression* having the same precedence associate left-to-right.

[*Example*: Given that cell E38 contains the value 4, and cell F38 contains the value 2, the formula

$$((-1+E38^2)*3-F38)/2$$

produces the result 21.5. *end example*]

The comparison operators yield TRUE for true and FALSE for false. An expression with value 0 tests logically false while one with any non-zero numeric value tests true.

For any given operator in an expression, if only one operand is an error value, the result is that error value. If more than one operand has an error value and those error values are the same, the result is that error value. If more than one operand has an error value and those error values are not all the same, as to which of those error values is used as the result is unspecified.

If the semantics of an operator having a given operand are not specified by ECMA-376, the result is #VALUE!.

[*Example*: "abc"+1 results in #VALUE!, and "abc"/0 results in #VALUE! rather than #DIV/0!. *end example*]

18.17.2.3 Cell References

Each set of horizontal cells in a worksheet is a *row*, and each set of vertical cells is a *column*. A cell's row and column combination designates the location of that cell. [*Guidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in a worksheet. *end guidance*]

A *cell reference* designates one or more cells on the same worksheet. Using references, one can:

- Use data contained in different parts of the same worksheet in a single formula.
- Use the value from a single cell in several formulas.
- Refer to cells on other sheets in the same workbook, and even to other workbooks. (References to cells in other workbooks are called *links*.)

A cell reference has the following form:

```
cell-reference=
  name          |
  [work-sheet-prefix] A1-reference      |
  [work-sheet-prefix] A1-reference, ":" , A1-reference      |
  [work-sheet-prefix] R1C1-reference    |
  [work-sheet-prefix] R1C1-reference, ":" , R1C1-reference    ;
work-sheet-prefix=
  work-sheet-prefix-special |
  sheet-name, "!"          |
  sheet-name, ":", sheet-name, "!" |
  "[", workbook-name, "]", sheet-name, ":", sheet-name, "!" ;
```

```

work-sheet-prefix-special=
    apostrophe, sheet-name-special, apostrophe, "!" |
    apostrophe, sheet-name-special, ":",
        sheet-name-special, apostrophe, "!" |
    apostrophe, "[", workbook-name-special, "]",
        sheet-name-special, apostrophe, "!" |
    apostrophe, "[", workbook-name-special, "]",
        sheet-name-special, ":", sheet-name-special,
        apostrophe, "!" ;

workbook-name=
    book-name-characters ;
book-name-characters=
    book-name-character, {book-name-character} ;
book-name-character=
    character - (operator | apostrophe | "[" | "]" | "?") ;
    (* any character except operator or ', [, ], or ? *)
apostrophe=
    "'" ; (* one apostrophe character *)
sheet-name=
    sheet-name-characters ;
sheet-name-character=
    character - (operator | apostrophe | "[" | "]" | "\" | "?") ;
    (* any character except operator or ', [, ], \, or ? *)
sheet-name-characters=
    sheet-name-character, {sheet-name-character} ;
workbook-name-special=
    book-name-start-character-special,
    [ book-name-characters-special ];
book-name-start-character-special=
    character - (apostrophe | "*" | "[" | "]" | ":" | "?") ;
    (* any character, including operator, except ', *, [, ], :, or ? *)
book-name-characters-special=
    book-name-character-special, {book-name-character-special} ;
book-name-character-special=
    apostrophe, apostrophe |
    character - (apostrophe | "*" | "[" | "]" | ":" | "?") ;
    (* any character, including operator, except ', *, [, ], :, or ? *)
sheet-name-special=
    sheet-name-start-character-special,
    [ [sheet-name-characters-special], sheet-name-end-character-special] ;

```

```

sheet-name-start-character-special=
  character - (apostrophe | "*" | "[" | "]" | "\" | ":" | "/"
              | "?") ;
  (* any character, including operator, except ', *, [, ], \, :, /, or ? *)
sheet-name-end-character-special=
  sheet-name-start-character-special ;
sheet-name-characters-special=
  sheet-name-character-special, {sheet-name-character-special} ;
sheet-name-character-special=
  apostrophe, apostrophe |
  character - (apostrophe | "*" | "[" | "]" | "\" | ":" | "/"
              | "?") ;
  (* any character, including operator, except ' *, [, ], \, :, /, or ? *)

```

A *relative cell reference* is based on the relative position of the cell that contains the formula and the cell to which the reference refers. If the position of the cell that contains the formula changes, the reference is changed along with it.

An *absolute cell reference* always refers to the absolute location of a cell. If the position of the cell that contains the formula changes, the absolute reference remains the same.

A *mixed cell reference* has either an absolute column and relative row, or an absolute row and relative column.

A *link or external reference* to a workbook is a reference that specifies the location of the workbook, including file or network path, book name, sheet name, and cell reference. Instead of writing the full file path or network location and workbook name directly in the f (formula) element, in order to make all external references more accessible, the workbook name shall be written in a Relationship part according to the Relationships semantic:

- Type shall be set to `http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath`,
- Target shall specify the full file path and file name, and
- TargetMode shall be set to `External`.

Additionally, in order to support the possibility that the external workbook is offline or otherwise inaccessible, a cache of the relevant sheet values in the referenced external workbook shall be stored within the referencing workbook according to §18.14.

This Supplementary Workbook Data part shall be the source part of the relationship that points to the external workbook as a target resource, and the Id of this relationship shall be referenced within the markup of the Supplementary Workbook Data part, using the `externalBook` element (§18.14.7).

The Supplementary Workbook Data part shall also be the target of a relationship whose source is the Workbook part (§18.2). The markup within the Workbook part shall reference this relationship Id using the `externalReference` element (§18.2.8).

Finally, a 1-based index referencing an externalReference within the collection externalReferences shall be written inline within the formula expression containing the reference to the external workbook. The index in this context shall be enclosed within square brackets, i.e.; left square bracket ([), followed by the index, followed by a right square bracket (]).

In this way, external resource files can more easily be accessed and updated.

[Example:

Consider the formula =SUM('C:\[Source.xlsx]Sheet1'!\$A\$1:\$A\$3)

This formula is expressed in the f element (formula) like this:

```
<f>SUM([1]Sheet1!$A$1:$A$3)</f>
```

The external reference to another workbook in this case is tokenized to [1]. The value inside the brackets is a 1-based index to the externalReferences collection in the workbook part, referencing a specific externalReference element.

The corresponding content of externalReferences in the workbook part is:

```
<externalReferences>
  <externalReference r:id="rId4"/>
</externalReferences>
```

The workbook part's externalReferences collection indicates that there is an external workbook reference in this workbook. The Supplementary Workbook Data cache, also stored in this workbook, can be found by following the relationship from the workbook whose id value is rId4.

That particular relationship (rId4) is expressed as:

```
<Relationship Id="rId4" Type=
"http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath"
Target="externalLinks/externalLink1.xml"/>
```

The above relationship indicates that the formula is supported by the Supplementary Workbook Data cache located at externalLinks/externalLink1.xml in the package.

The corresponding content in externalLink1.xml follows the markup specified in §18.14, Supplementary Workbook Data. The externalBook element in that markup indicates the id of the relationship that points from the source part externalLink1.xml to the location of the actual external workbook:

```
<externalBook xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships"
r:id="rId1">
```

That relationship (rId1) is shown here:

```
<Relationship Id="rId1" Type=
"http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath"
Target="file:///C:/Source.xlsx" TargetMode="External"/>
```

This relationship indicates that the external workbook that the formula references resides on a local drive, at c:\source.xlsx. *end example*

It is possible to process the same cell or set of cells on multiple worksheets within a workbook, using a 3-D *reference*. A reference of this type is made up of the cell reference, preceded by a range of worksheet names, and an exclamation mark character (!), in that order. A 3-D reference can be used to refer to cells on other sheets, to defined names, and to create formulas by using the following functions: AVERAGE, AVERAGEA, COUNT, COUNTA, MAX, MAXA, MIN, MINA, PRODUCT, STDEV, STDEVA, STDEVP, STDEVPA, SUM, VAR, VARA, VARP, and VARPA.

3-D references shall not be used in array formulas.

By default, a cell reference is understood to refer to one or more cells in the current worksheet. However, a cell reference can be preceded by its parent worksheet name and an exclamation mark (!), in that order. This allows cells in one worksheet to be referenced in another worksheet of the same workbook. [*Example*: The cell reference `MonthlyTotals!D1:D12` might be used from within a sibling (or the same) worksheet of `MonthlyTotals` to refer to those 12 cells. *end example*]

An *area* is a set of rectangular-shaped contiguous cells. An area can be a single cell. [*Example*: `A5` and `B6:C10` each designate one area, and `D3:D5, E12:F15` designates two areas (the comma (,) being the union operator). *end example*] [*Note*: The number of areas designated by a cell reference can be obtained by calling the function `AREAS` (§18.17.7.10). *end note*]

There are two cell reference styles: `A1` (§18.17.2.3.1) and `R1C1` (§18.17.2.3.2).

18.17.2.3.1 A1-Style Cell References

A cell reference using the A1 reference style has the following form:

```
A1-reference=
  A1-column, ":", A1-column    |
  A1-row, ":", A1-row         |
  A1-column, A1-row ;
A1-column=
  A1-relative-column |
  A1-absolute-column ;
A1-relative-column=
  letter, {letter} ; (* see semantic rules at 3.17.2.3.1 *)
```

```

letter=
  "a"|"b"|"c"|"d"|"e"|"f"|"g"|"h"|"i"|"j"|"k"|"l"|"m"|
  "n"|"o"|"p"|"q"|"r"|"s"|"t"|"u"|"v"|"w"|"x"|"y"|"z"|
  "A"|"B"|"C"|"D"|"E"|"F"|"G"|"H"|"I"|"J"|"K"|"L"|"M"|
  "N"|"O"|"P"|"Q"|"R"|"S"|"T"|"U"|"V"|"W"|"X"|"Y"|"Z" ;
A1-absolute-column=
  "$", A1-relative-column ;
A1-row=
  A1-relative-row |
  A1-absolute-row ;
A1-relative-row=
  digit-sequence ; (* shall be non-zero; see 3.17.2.3.1 *)
A1-absolute-row=
  "$", A1-relative-row ;

```

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has an alphabetic heading named sequentially from left-to-right, A–Z, then AA–AZ, BA–BZ, ..., ZA–ZZ, AAA–AAZ, ABA–ABZ, and so on. Column letters are not case-sensitive.

A relative reference to a single cell is written as its column letter immediately followed by its row number. A relative reference to a whole row is written as its row number. A relative reference to a whole column is written as its column letter. A reference to a range of two or more cells is written as two single-cell references separated by the binary range operator (:). An absolute A1 reference is made up of a cell's column letter followed by its row number, with each being preceded by a dollar character (\$). [*Example*: A2, B34, and B5:D8 are relative A1 references. \$A\$2, \$B\$34, and \$B\$5:\$D\$8 are absolute A1 references. \$A2, B\$34, and \$B5:D\$8 are mixed A1 references. *end example*]

[*Example*: SUM(Sheet2:Sheet13!B5) adds all the values contained in cell B5 on all the worksheets between and including Sheet2 and Sheet13. *end example*]

For rules on how deal with potential ambiguities between cell references and defined names, see §18.17.5.1.

18.17.2.3.2 R1C1-Style Cell Reference

A cell reference using the R1C1 reference style has the following form:

```

R1C1-reference=
  R1C1-row-only      |
  R1C1-column-only   |
  R1C1-row, R1C1-column ;
R1C1-row-only=
  "R", R1C1-absolute-number, |
  "R[", R1C1-relative-number, "]" ;

```

```

R1C1-row=
  R1C1-relative-row |
  R1C1-absolute-row ;
R1C1-relative-row=
  "R[", R1C1-relative-number, "]" ;
R1C1-absolute-row=
  "R" |
  "R", R1C1-absolute-number ;
R1C1-column-only=
  "C", R1C1-absolute-number |
  "C[", R1C1-relative-number, "]" ;
R1C1-column=
  R1C1-relative-column |
  R1C1-absolute-column ;
R1C1-relative-column=
  "C[", R1C1-relative-number, "]" ;
R1C1-absolute-column=
  "C" |
  "C", R1C1-absolute-number ;
R1C1-relative-number=
  ["-"], digit-sequence ;
R1C1-absolute-number=
  digit-sequence ; (* shall be non-zero; see 3.17.2.3.2 *)

```

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has a numeric heading numbered sequentially from left-to-right, starting at 1.

A whole row is referenced by omitting the column, and a whole column is referenced by omitting the row. An absolute row or column reference uses absolute row or column numbers, respectively. A relative row or column reference uses, respectively, row or column offsets from the cell containing the formula, with a negative offset indicating a row to the left or a column above, and a positive offset indicating a row to the right or a column below. Specifying an offset of zero is equivalent to omitting that offset and its delimiting brackets. *[Example: R[-2]C refers to the cell two rows up and in the same column, R[2]C[2] refers to the cell two rows down and two columns to the right, R2C2 refers to the cell in the second row and in the second column, R[-1] refers to the entire row above the active cell, and R refers to the current row. end example]*

The R1C1 alternate reference style can only be used at runtime. See §18.17.6.1 for XML-related details.

18.17.2.4 Functions

A *function* is a named formula that takes zero or more arguments, performs an operation, and, optionally, returns a result. A function call has the following form:

```

function-call=
  function-name, "(", [argument-list], ")" ;

```

```

function-name=
    prefixed-function-name      |
    predefined-function-name    |
    user-defined-function-name  ;
predefined-function-name=
    "ABS" | "ACOS" | "ACOSH"
    | ( any of the other functions defined in §18.17.7) ;
prefixed-function-name=
    "ISO.", predefined-function-name |
    "ECMA.", predefined-function-name
user-defined-function-name=
    letter, [ user-defined-name-characters ] ;
user-defined-name-characters=
    user-defined-name-character, {user-defined-name-character} ;
user-defined-name-character=
    letter | decimal-digit | full-stop ;
argument-list=
    argument, { comma, argument } ;
comma=
    "," ;
argument=
    expression ;

```

predefined-function-names and *user-defined-function-names* are not case-sensitive.

A *user-defined-function-name* shall not have any of the following forms:

- TRUE or FALSE
- *name*
- *cell-reference*

[*Guidance*: An implementation is encouraged to support *user-defined-function-names* at least as long as 255 characters. *end guidance*]

The semantics of a call to a function having a *user-defined-function-name* are unspecified.

[*Example*: Here are some function calls: PI(), POWER(A1,B3), and SUM(C6:C10). *end example*]

An argument to a function can be a call to a function. That is, function calls can nest. [*Guidance* An implementation is encouraged to support at least 64 levels of nested function calls. *end guidance*]

Some functions take a variable number of arguments. This is indicated in the Syntax sections of §18.17.7 by their having *argument-list* as all, or the trailing part, of their argument list. The total number of arguments that shall be passed to such functions is at least 1.

[*Guidance* An implementation is encouraged to support function calls having at least 255 arguments. *end guidance*]

Expressions can have one or more values. Scalar expressions designate a single value, and cell references and array constants can designate multiple values. In the case of a multi-value expression, the way in which this is handled by a function when passed as an argument depends on a number of factors.

Most functions and operators expect either single- or multi-valued arguments and perform all of the array calculations whenever multi-valued arguments are present. [*Example*: `SQRT({1;2;3;4})`; see the examples in §18.17.2. *end example*]

When a function expects a single-valued argument but a multi-valued expression is passed, an attempt can be made to convert that set of values to a single value. For an array value or constant, the value of the expression is the value of the first element within that array value or constant. For a cell range, the first element can be used, or implicit intersection can be performed—the exact behavior is unspecified.

When a function expects a multi-valued argument but a single-valued expression is passed, that single-valued argument is treated as a 1x1 array.

For rules on how deal with potential ambiguities between function names and defined names, see §18.17.5.1.

18.17.2.5 Names

A *name* is an alias for a constant, a cell reference, or a formula. [*Note*: A name in a formula can make it easier to understand the purpose of that formula. For example, the formula `SUM(FirstQuarterSales)` is easier to identify than `SUM(C20:C30)`. *end note*]

Here is the syntax for *name*:

```
name=
  [ workbook-name, "!" ], name-start-character, [ name-characters ] ;
name-start-character=
  letter | underscore | backslash ;
underscore=
  "_" ;
backslash=
  "\" ;
name-characters=
  name-character, {name-character} ;
name-character=
  letter | decimal-digit | underscore | full-stop ;
```

names are not case-sensitive.

All *names* within a workbook shall be unique. If the same *names* are defined in two workbooks, both *names* can be used in the same context by prefixing them with their corresponding workbook name and an exclamation

mark (!). [Example: SUM(Sales.xlsx!ProjectedSales) refers to the named range ProjectedSales in the workbook named Sales.xlsx. end example]

A *name* shall not have any of the following forms:

- TRUE or FALSE
- *user-defined-function-name*
- *cell-reference*

[Guidance An implementation is encouraged to support *names* at least as long as 255 characters. end guidance]

For rules on how deal with potential ambiguities between function names and defined names, or between cell references and defined names, see §18.17.5.1.

18.17.2.6 Types and Values

Each *expression* has a type. SpreadsheetML formulas support the following types: array, error, logical, number, and text.

An array value or constant represents a collection of one or more elements, whose values can have any type (i.e., the elements of an array need not all have the same type).

An error value (§18.17.3) or constant represents an error, and can have any value defined for *error-constant* (§18.17.2.1).

A logical value or constant represents a truth value, and can have any value defined for *logical-constant* (§18.17.2.1).

A numeric value or constant represents a real number, and can have any value defined for *numeric-constant* (§18.17.2.1). The term "number" is used as a generic name for any expression of type *number*.

A text value or constant represents arbitrary text, and can have any value defined for *string-constant* (§18.17.2.1). The term "string" is used as a generic name for any expression of type *text*.

An implementation is permitted to provide an implicit conversion from *string-constant* to number. However, the rules by which such conversions take place are implementation-defined. [Example: An implementation might choose to accept "123"+10 by converting the string "123" to the number 123. Such conversions might be locale-specific in that a *string-constant* such as "10,56" might be converted to 10.56 in some locales, but not in others, depending on the radix point character. end example]

[Guidance An implementation is encouraged to support strings at least as long as 32,767 characters. end guidance]

A complex number is represented as a string in one of two equivalent text formats: $x + yi$ or $x + yj$, where x is the real part, and y is the imaginary part. [Example: "3+4i" and "-2.5-34.6j" end example]

18.17.2.7 Single- and Array Formulas

A formula can either be a single-cell formula, or an array formula.

A single-cell formula is applied to a single cell while an array formula is applied to a range of cells as a group.

When a single-cell formula results in a single value, the designated cell takes on that value. [*Example: When cell A10 contains $\text{SIN}(0.3)$, the result stored in that cell is 0.295520207 . end example*]

When a single-cell formula results in multiple values, the designated cell takes on the first of those values. [*Example: When cell A10 contains $\text{SIN}(\{0.3, 0.4, 0.5\})$, the result stored in that cell is 0.295520207 ($\text{SIN}(0.3)$). end example*]

Array formulas are an extension of the formula paradigm. They allow for combining of several formula operations into one, and the returning of multiple results. Array formulas span one or more cells. There are three primary functions that array formulas perform:

2. Returning multiple results from one single function call. [*Example: the function LINEST returns an array of several results, and, therefore, ought to be spanned across several cells as an array formula in order to display those results. end example*]
3. Executing one formula several times to generate an array of results. [*Example: The array formula $\text{SIN}(A1:A3)$ returns an array with three elements, those being the sines of A1, A2 and A3, respectively. end example*]
4. Returning one single result from an operation that incorporated arrays as an intermediate step. [*Example: The array formula $\text{SUM}(\text{SIN}(A1:A3))$ returns a single result, that being the SUM of the sines of A1, A2 and A3, respectively. end example*]

When an array formula results in a single value, all of the cells spanned by the array formula take on that value. [*Example: When the group of cells A10:A12 contains $\text{SIN}(0.3)$, the result stored in each of those cells is 0.295520207 . end example*]

When an array formula results in multiple values, the designated cells take on corresponding values, according to the shape of the cell group and the values. Specifically,

- If the cell group and values have the same shape (i.e., the same number of rows and columns), each cell takes on the value corresponding to its relative position.
- If the cell group has fewer columns than the values, the left-most columns of the values are stored in the cells.
- If the cell group has fewer rows than the values, the top-most rows of the values are stored in the cells.
- If the cell group has more columns than the values, each cell takes on the value corresponding to its relative position, except that
 - For a cell group $1 \times N$ array or a two-dimensional array, the excess right-most cells take on an unspecified value.
 - For a cell group $N \times 1$ array, the excess columns are clones of the first column.

- If the cell group has more rows than the values, each cell takes on the value corresponding to its relative position, except that:
 - For a cell group Nx1 array or a two-dimensional array, the excess bottom-most cells take on an unspecified value.
 - For a cell group 1xN array, the excess rows are clones of the first row.

[Example: Case 1: The 1x3 group of cells A20:C20 has applied to it the array formula $\text{SIN}(\{0.3, 0.4, 0.5\})$. The number of rows and columns in the group exactly matches the number of rows and columns in the result. Those cells then contain 0.295520207, 0.389418342, and 0.479425539, which correspond to $\text{SIN}(0.3)$, $\text{SIN}(0.4)$, and $\text{SIN}(0.5)$, respectively.

Case 2: The 1x2 group of cells A20:B20 has applied to it the array formula $\text{SIN}(\{0.3, 0.4, 0.5\})$. The number of columns in the group is less than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207 and 0.389418342, which correspond to $\text{SIN}(0.3)$ and $\text{SIN}(0.4)$, respectively, the left-most part of the set of values.

Case 3: The 1x4 group of cells A20:D20 has applied to it the array formula $\text{SIN}(\{0.3, 0.4, 0.5\})$. The number of columns in the group is greater than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207, 0.389418342, 0.479425539, and an unspecified value, which correspond to $\text{SIN}(0.3)$, $\text{SIN}(0.4)$, and $\text{SIN}(0.5)$, respectively, with the fourth value being unspecified.

Case 4: The 2x2 group of cells A30:B31 has applied to it the array formula $\text{SIN}(\{0.1, 0.2, 0.3\})$. The number of columns in the group is less than the number of columns in the result. As a result, the cells in row 30 contain 0.295520207 and 0.389418342, which correspond to $\text{SIN}(0.3)$ and $\text{SIN}(0.4)$, respectively. The number of rows in the group is greater than the number of rows in the result, so the cells in 31 are a copy of the cells in row 30. The left-most part of the set of values is propagated into the cells.

Case 5: The 2x2 group of cells A40:B41 has applied to it the array formula $\text{SIN}(\{0.1, 0.2, 0.3; 0.4, 0.5, 0.6; 0.7, 0.8, 0.9\})$. The number of columns in the group is less than the number of columns in the result. As a result, the left-most column values are stored. The number of rows in the group is less than the number of rows in the result. As a result, the top-most column values are stored. *end example*]

18.17.3 Error values

The evaluation of an expression can result in an error having one of a number of *error values*. These error values are:

Error Value	Reason for Occurrence
#DIV/0!	Intended to indicate when any number (including zero) or any error code is divided by zero.
#GETTING_DATA	Intended to indicate when a cell reference cannot be evaluated because the value for the cell has not been retrieved or calculated. [Note: This can happen when connected to an OLAP cube. <i>end note</i>]

Error Value	Reason for Occurrence
	This error constant differs from #N/A in that #GETTING_DATA is used when there is an expectation that the value for the cell will eventually be available, whereas #N/A is used when there is no such expectation.
#N/A	Intended to indicate when a designated value is not available. [Example: Some functions, such as SUMX2MY2, perform a series of operations on corresponding elements in two arrays. If those arrays do not have the same number of elements, then for some elements in the longer array, there are no corresponding elements in the shorter one; that is, one or more values in the shorter array are not available. end example] This error value can be produced by calling the function NA (§18.17.7.223).
#NAME?	Intended to indicate when what looks like a name is used, but no such name has been defined. [Example: XYZ/3, where XYZ is not a defined name. Total is & A10, where neither Total nor is is a defined name. Presumably, "Total is " & A10 was intended. SUM(A1C10), where the range A1:C10 was intended. end example]
#NULL!	Intended to indicate when two areas are required to intersect, but do not. [Example: In the case of SUM(B1 C1), the space between B1 and C1 is treated as the binary intersection operator, when a comma was intended. end example]
#NUM!	Intended to indicate when an argument to a function has a compatible type, but has a value that is outside the domain over which that function is defined. (This is known as a <i>domain error</i> .) [Example: Certain calls to ASIN, ATANH, FACT, and SQRT might result in domain errors. end example] Intended to indicate that the result of a function cannot be represented in a value of the specified type, typically due to extreme magnitude. (This is known as a <i>range error</i> .) [Example: FACT(1000) might result in a range error. end example]
#REF!	Intended to indicate when a cell reference cannot be evaluated. [Example: If a formula contains a reference to a cell, and then the row or column containing that cell is deleted, a #REF! error results. If a worksheet does not support 20,001 columns, OFFSET(A1,0,20000) will result in a #REF! error. end example]
#VALUE!	Intended to indicate when an incompatible type argument is passed to a function, or an incompatible type operand is used with an operator. [Example: In the case of a function argument, text was expected, but a number was provided end example]

Each error value has a corresponding *error-constant* (§18.17.2.1).

[Note: A number of functions operate on error values: They include ERROR.TYPE (§18.17.7.110), ISERR (§18.17.7.175), ISERROR (§18.17.7.176), and ISNA (§18.17.7.179). end note]

18.17.4 Dates and Times

Dates and times in cells in SpreadsheetML are stored as strings, using the ISO 8601 lexical formats defined below.

The earliest date permitted is 0001-01-01, 00:00. The latest date permitted is 9999-12-31, 23:59:59.999. The time midnight shall be expressed always with hour component 0 and not with hour component 24. Leap seconds are not permitted – the maximum number of seconds expressed in a minute shall be 60.

Values with only a date component shall be expressed using the Complete, Extended Format Calendar Date representation, as defined in ISO 8601, §B.1.1 and §B2.1.

[*Example:* The date 5 October 1975 is expressed in SpreadsheetML as

1975-10-05

end example]

Values with only a time-of-day component shall be expressed using the Complete, Extended Format Time Of Day representation, as defined in ISO 8601, §B.1.2 and §B2.2. The decimal separator shall be a full stop (period), and fractional seconds shall be expressed with no more than three decimal places.

[*Example:* The time-of-day 08:30 can be expressed in the following ways within SpreadsheetML:

08:30

08:30:00

08:30:00.000

end example]

Values with both date and time-of-day components shall be expressed using the Complete, Extended Format Calendar Date and Time Of Day representation, as defined in ISO 8601, §B.1.3 and §B2.3. For the time component, only seconds may use a decimal separator, the decimal separator shall be a full stop (period) and fractional seconds shall be expressed with no more than three decimal places.

[*Example:* The date 22 November 1976 at local time 08:30 can be expressed in the following ways within SpreadsheetML:

1976-11-22T08:30

1976-11-22T08:30:00

1976-11-22T08:30:00.000

The date 15 October 1582—the day the Gregorian calendar went into effect for some countries—can be expressed in the following ways:

1582-10-15

1582-10-15T00:00

1582-10-15T00:00:00
 1582-10-15T00:00:00.000

end example]

[*Note:* SpreadsheetML relates all dates to the proleptic Gregorian calendar of ISO 8601, treating time periods extending into the past and into the distant future as if the Gregorian calendar is in effect for all of those days. January 1 is always the first day of each year, ignoring historical changes to the period of the calendar year. The gaps and shifts introduced as part of calendar reforms and for introduction of leap seconds are ignored under the proleptic Gregorian calendar system. *end note]*

Wherever a calculation in a formula is specified to apply to number values and a date or time is provided, the effect shall be the same as if the date and/or time value is converted to the corresponding serial date-time. Wherever a calculation in a formula is specified to apply to or to deliver a date and/or time value, and a number value is supplied, the number value is interpreted as a serial date-time for the date and/or time. The relationships between serial date-times and dates and times are specified in §18.17.4.1, §18.17.4.2, and §18.17.4.3.

18.17.4.1 Date Conversion for Serial Date-Times

A serial date-time is a number that represents a date and time. This signed value is in units of days relative to the base date for the selected date system. Serial date-times increase by 1 into each successive day and decrease by 1 into each preceding day. Fractional portions of serial date-times represent fractions of a single day. [*Example:* When using the 1900 date system, which has a base date of 30th December 1899, a serial date-time of 1.5 represents midday on the 31st December 1899 (serial date-time day 1), or 1899-12-31T12:00. A serial date-time of -4.25 represents 6 pm on the 25th December 1899, or 1899-12-25T18:00. *end example]* The base dates and the related serial date-times represent local date and time.

Two different bases are used for converting dates to and from serial date-times:

- In the *1900 date system*, the lower limit is January 1st, 0001 00:00:00, which has a serial date-time of -693593. The upper-limit is December 31st, 9999, 23:59:59.999, which has a serial date-time of 2,958,465.9999884. The base date for this system is 00:00:00 on December 30th, 1899, which has a serial date-time of 0.
- In the *1904 date system*, the lower limit is January 1st, 0001, 00:00:00, which has a serial date-time of -695055. The upper limit is December 31st, 9999, 23:59:59.999, which has a serial date-time of 2,957,003.9999884. The base date for this system is 00:00:00 on January 1st, 1904, which has a serial date-time of 0.

A serial date-time outside the temporal range for the selected date system is invalid.

The date system is specified by the value of the date1904 attribute of the workbookPr element. [*Example:*

1900 date system: <workbookPr showObjects="all"/>

1904 date system: <workbookPr date1904="1" showObjects="all"/>

end example]

18.17.4.2 Time Conversion for Serial Date-Times

Time of day is represented by a serial date-time less than 1, but not less than 0. Values from 0–0.99999999 represent times from *the* starting instant 0:00:00 (12:00:00 AM) to the last instant 23:59:59 (11:59:59 P.M.).

For any serial date-time, the serial time-of-day is the serial date-time minus the serial date-time of the day in which the time-of-day occurs. The serial date-time of the day in which a serial date-time occurs is the greatest integer that does not exceed the serial date-time.

[Example:

The serial date-time 4.66666667 is in serial day 4, and the time-of-day serial date-time is $4.66666667 - 4$, which is 0.66666667.

The serial date-time -2.00000001 is in serial day -3, and the time-of-day serial date-time is $-2.00000001 - (-3)$, which is 0.99999999.

end example]

Going forward in time, the time component of a serial date-time increases by 1/86,400 each second. *[Note: As such, the time 12:00 has a serial date-time time component of 0.5. end note]*

[Example:

The serial date-time 0.0000000... represents 00:00:00

The serial date-time 0.0000115... represents 00:00:01

The serial date-time 0.4207639... represents 10:05:54

The serial date-time 0.5000000... represents 12:00:00

The serial date-time 0.9999884... represents 23:59:59

end example]

18.17.4.3 Combined Date and Time Conversion for Serial Date-Times

The serial date-time corresponding to a date component can be added to any serial date-time for a time-of-day component to determine the serial date-time for the combined date-time.

[Note: In the 1900 date system, the serial date-time -1.25 represents December 28, 1899, 18:00. end note]

[Example: For the 1900 date system:

The serial date-time -2337.999989... represents 1893-08-05T00:00:01

The serial date-time 3687.4207639... represents 1910-02-03T10:05:54

The serial date-time 2.5000000... represents 1900-01-01T12:00:00

The serial date-time 2958465.9999884... represents 9999-12-31T23:59:59

For the 1904 date system:

The serial date-time -3799.999989... represents 1893-08-05T00:00:01

The serial date-time 2225.4207639... represents 1910-02-03T10:05:54

The serial date-time 0.5000000... represents 1904-01-01T12:00:00

The serial date-time 2957003.9999884... represents 9999-12-31T23:59:59

end example]

18.17.5 Limits and Precision

18.17.5.1 Limits

In SpreadsheetML, cell references range from column A1–A1048576 (column A:A) to column XFD1–XFD1048576 (column XFD:XFD).

An implementation can extend this range. However, to avoid ambiguities, it is necessary to ensure that defined names are distinct from cell references, or that one takes precedence over the other. With this in mind, the following rules apply:

- A producer or consumer shall consider a defined name of the form used by cells in the range A1–XFD1048576 to be an error.
- All other names outside this range can be defined names and shall override a cell reference if an ambiguity exists.

[*Example:* LOG10 is always a cell reference, LOG10(...) is always a formula, and LOG01000 can be a defined name that overrides a cell reference. *end example]*

18.17.5.2 Precision

In order to clarify the semantics of cell formulas and values in SpreadsheetML, it is necessary to specify the precision of the numbers being represented in the file format. These numbers are therefore regarded as ranging over a specific value space, which defaults to the following:

The *value space* consists of the values $(-1)^s \times m \times 2^n$, where s is 0 or 1, m is an integer greater than or equal to 0 and less than 2^{53} , and n is an integer between -1074 and 971, inclusive. m is herein referred to as the *binary mantissa*, and n is herein referred to as the *binary exponent*. [*Note:* The default precision is patterned after the IEC double-precision 64-bit floating-point type [IEC 60559]. *end note]*

Implementing applications can use the characteristics markup (§22.7) to specify other value spaces to replace the default in a given workbook. When present in the workbook, the value space defined using the characteristics markup overrides the default value space.

Regardless of the specific value space in use, values shall have a lexical representation as described in §18.17.5.3. Any numerical expression conforming to this lexical description is permitted. However, numbers

of higher precision than available in the value space, and numbers that lie outside the range representable in the value space shall be handled as prescribed in §18.17.5.4.

18.17.5.3 Lexical Representation

The value space shall have a lexical representation consisting of a base 10 mantissa followed, optionally, by the character "E" or "e", followed by a base 10 exponent. The exponent shall be an integer. The mantissa shall be a decimal number. The representations for exponent and mantissa shall follow the lexical rules for integer and decimal below. If the "E" or "e" and the following exponent are omitted, an exponent value of 0 is assumed.

Lexical representations for zero can take a positive or negative sign.

[*Example:* -1E4, 1267.43233E12, 12.78e-2, 12, -0, and 0 are all literals for numbers in the default value space. 4503599627370497.5 is also a literal, although it represents the same value as 4503599627370497 ($2^{52} + 1$) in the default value space (as explained in §18.17.5.4). *end example*]

An *Integer* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) with an optional leading sign. If the sign is omitted, "+" is assumed. [*Example:* -1, 0, 12678967543233, +100000. *end example*]

A *Decimal Number* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) separated by a period as a decimal indicator. An optional leading sign is allowed. If the sign is omitted, "+" is assumed. Leading and trailing zeroes are optional. If the fractional part is zero, the period and following zero(s) can be omitted. [*Example:* -1.23, 12678967.543233, +100000.00, 210. *end example*]

18.17.5.4 Interpretation

Strings that are permitted according to the lexical definition in §18.17.5.3 shall be interpreted as values in the value space as follows:

1. The mantissa shall be interpreted as a real number expressed in base 10
2. The exponent shall be interpreted as an integer expressed in base 10
3. The raw value for a numerical expression shall be interpreted as
mantissa $\times 10^{\text{exponent}}$
4. If the absolute value is larger than the largest value in the value space (2^{1024} minus 2^{971}) then a consuming application shall treat this as equivalent to the error value #NUM! (§18.17.3). Otherwise the value in the value space that is closest to the raw value is chosen as the interpretation. In the case that two values are equally close, the one with the smaller absolute value is chosen.

18.17.6 XML Representation

18.17.6.1 Cell Reference Style

A workbook saved with reference style A1 (§18.17.2.3.1), shall have the refMode attribute of the calcPr element (§18.2.2) in the Workbook part's XML omitted or set to A1. A workbook saved with reference style R1C1 (§18.17.2.3.2) shall have that refMode attribute set to R1C1. [*Example:* With R1C1 mode set, here is how the XML might look:

```

<workbook ...>
...
  <calcPr calcId="122211" fullCalcOnLoad="1" refMode="R1C1"/>
...
</workbook>

```

end example]

Regardless of the value of the refMode attribute, cell references shall be stored in XML in the A1 form. This attribute's value tells an implementation which reference style to use at runtime.

18.17.6.2 Scalar Formulas

A scalar formula shall be represented in a worksheet's XML by an f element that contains the text of the formula, and a v element that contains the text version of the last computed value for that formula. This pair of elements shall be inside a c element, which is, in turn, shall be inside a row element. [Example: Consider the scalar formula SQRT(C2^2+D2^2), where C2 refers to a cell containing the number 12.5, and D2 refers to a cell containing the number 9.6. The corresponding XML might be as follows:

```

<row r="2" spans="2:4">
  <c r="B2" s="40">
    <f>SQRT(C2^2+D2^2)</f>
    <v>15.761027885261798</v>
  </c>
  <c r="C2" s="0">
    <v>12.5</v>
  </c>
  <c r="D2" s="0">
    <v>9.6</v>
  </c>
</row>

```

In the scalar formula CONCATENATE("The total is ",C7," units"), C7 refers to a cell containing the number 23. The corresponding XML might be as follows:

```

<row r="7" spans="2:4" ht="285">
  <c r="B7" s="4" t="str">
    <f>CONCATENATE("The total is ",C7," units")</f>
    <v>The total is 23 units</v>
  </c>
  <c r="C7" s="0">
    <v>23</v>
  </c>
</row>

```

As the function CONCATENATE returns a string, the value for the cell's t attribute is str.

end example]

18.17.6.3 Array Formulas

An array formula shall be represented in XML just like other formulas, except that the array formula's *f* element shall contain an attribute *t*, whose value shall be *array*.

For a single-cell formula, the *r* attribute shall designate that cell. [*Example:* Consider the array formula SUM(C11:C12*D11:D12). The corresponding XML might be as follows:

```
<row r="11" spans="2:4" ht="300">
  <c r="B11" s="16">
    <f t="array" r="B11">SUM(C11:C12*D11:D12)</f>
    <v>110</v>
  </c>
  <c r="C11" s="4">
    <v>10</v>
  </c>
  <c r="D11" s="0">
    <v>3</v>
  </c>
</row>
<row r="12" spans="2:4" ht="285">
  <c r="C12" s="4">
    <v>20</v>
  </c>
  <c r="D12" s="0">
    <v>4</v>
  </c>
</row>
```

As this formula is a single-cell formula, the *r* attribute contains the name of that cell, B11. *end example]*

For an array formula spanning multiple cells, the *r* attribute of the top-left cell of the range of cells to which that formula applies shall designate the range of cells to which that formula applies. The *c* elements for all cells except the top-left cell in that range shall not have an *f* element; however, they shall each have a *v* element.

[*Example:* Consider the array formula A1:A3*B1:B3, which is applied to the cell range C1:C3. The corresponding XML might be as follows:

```
<row r="1" spans="1:3">
  <c r="A1" s="0">
    <v>112</v>
  </c>
  <c r="B1" s="0">
    <v>2.34</v>
  </c>
```

```

    <c r="C1" s="0">
      <f t="array" r="C1:C3">A1:A3*B1:B3</f>
      <v>262.08</v>
    </c>
  </row>
  <row r="2" spans="1:3">
    <c r="A2" s="0">
      <v>209</v>
    </c>
    <c r="B2" s="0">
      <v>1.28</v>
    </c>
    <c r="C2" s="0">
      <v>267.52</v>
    </c>
  </row>
  <row r="3" spans="1:3">
    <c r="A3" s="0">
      <v>128</v>
    </c>
    <c r="B3" s="0">
      <v>3.12</v>
    </c>
    <c r="C3" s="0">
      <v>399.36</v>
    </c>
  </row>

```

As this formula is an array formula spanning multiple cells, the *r* attribute of cell C1 contains the name of that cell range, C1:C3, and cells C2 and C3 do not have an *f* element. *end example*]

18.17.6.4 Formula Evaluation Order

The order in which formulas are evaluated is determined by the order of their corresponding *c* elements in the *calcChain* element of the Calculation Chain part (§18.6.2).

18.17.6.5 Name Representation

A formula can contain one or more names. These names shall be defined in the Workbook part's XML with each being the subject of a *definedName* element, inside a *definedNames* element. [*Example*: Consider the scalar formula `SUM(value1,value2)`. The corresponding XML might be as follows:

```

<definedNames>
  <definedName name="value1" localSheetId="0">Sheet2!$B$2</definedName>
  <definedName name="value2" localSheetId="0">Sheet2!$B$3</definedName>
</definedNames>
...

```

```
<c r="E5" s="0">
  <f ce="1">SUM(value1,value2)</f>
  <v>8</v>
</c>
```

end example]

Each name shall be the subject of an lpstr element in the Application-Defined File Properties part.

```
<TitlesOfParts>
  <vt:vector ... baseType="lpstr">
    <vt:lpstr>Sheet1</vt:lpstr>
    <vt:lpstr>Sheet2</vt:lpstr>
    <vt:lpstr>Sheet3</vt:lpstr>
    <vt:lpstr>value1</vt:lpstr>
    <vt:lpstr>value2</vt:lpstr>
  </vt:vector>
</TitlesOfParts>
```

18.17.6.6 Value Representation

The most recent value of a formula shall be stored in the corresponding v element, as follows:

Result Type	Representation
array	The text form of the array's value.
error	The text form of the error value.
logical	The text 0 for FALSE and 1 for TRUE.
number	The unformatted text form of the number, as accurately as possible.
text	All of the characters in the text.

18.17.6.7 Dates and Times

When a SpreadsheetML cell contains a date-time, the value of the cell is expressed as a string conforming to one of the ISO 8601 lexical formats specified in §18.17.4.

[Example:

```
<c t="d">
  <f>DATE(1582,10,15)+0.5</f>
  <v>1582-10-15T12:00</v>
</c>
```

end example]

18.17.7 Predefined Function Definitions

Each of the subclauses below this subclause describes a separate function, and each description contains a section marked **Syntax**. That section contains pieces of the function grammar as they pertain to that specific function. These pieces are presented in a slightly simpler form to aid in the understanding of the description. In those sections, the left-square-bracket and right-square-bracket designate the start and end of an option, as used in ISO/IEC 14977. However, the function-name, the open-parenthesis and the close-parenthesis designate actual literal text, as does each comma. [Note: Therefore, in a strict presentation according to ISO/IEC 14977, each would appear with double-quotes surrounding each instance. *end note*]

The **Syntax** section for each function defined in this subclause corresponds to a call to that function. Except for *argument-list*, the names in any **Syntax** section typeset as in *number* and *string-l*, are parameter names for that function, and are local to that function definition's description. *argument-list* is the name of a production in the grammar, and, as defined in §18.17.2, permits a comma-separated list of *arguments*.

When the type of an argument passed to a function is incompatible with the type expected the error value #VALUE! is returned by that function.

The set of predefined functions is divided into the following functional categories [Note: The predefined functions defined here reflect current spreadsheet semantics and might not match common practice in other contexts. New functions might be added in future versions of the specification. *end note*]:

All predefined functions can be used with their simple name, with the prefix ECMA., or with the prefix ISO., with the following exception: the predefined function named CEILING in ECMA-376 can only be used with the prefix ECMA.. The predefined function named ISO.CEILING is specified in ECMA-376.

18.17.7.1 ABS

Syntax:

ABS (*x*)

Description: Computes the absolute value of *x*.

Arguments:

Name	Type	Description
<i>x</i>	number	The value whose absolute value is to be determined.

Return Type and Value: number – The absolute value of *x*.

[Example:

ABS(10.5) results in 10.5

ABS(0) results in 0

ABS(-10.5) results in 10.5

end example]

18.17.7.2 ACCRINT

Syntax:

ACCRINT (*issue* , *first-interest* , *settlement* , *rate* , [*par*] , *frequency* [, [*basis*]])

Description: Computes the accrued interest for a security that pays periodic interest.

Mathematical Formula:

$$ACCRINT = par \times \frac{rate}{frequency} \times \sum_{i=1}^{NC} \frac{A_i}{NL_i}$$

where:

- A_i = number of accrued days for the i^{th} quasi-coupon period within odd period.
- *frequency* = argument *frequency*
- *NC* = number of quasi-coupon periods that fit in odd period. If this number contains a fraction, raise it to the next whole number. The quasi-coupon period can be calculated in one of two following ways:
 - Odd long first coupon: by working backwards in time from the long coupon's interest payment date (first coupon date) and adding together the number of standard coupon periods that would fit in the long coupon, rounding up to the next whole number;
 - Odd long last coupon: by working forward in time from the long coupon's interest payment date (last coupon date before redemption) and adding together the number of standard coupon periods that would fit in the long coupon, rounding up to the next whole number.
- NL_i = normal length in days of the i^{th} quasi-coupon period within odd period.
- *par* = argument *par*
- *rate* = argument *rate*

Arguments:

Name	Type	Description
<i>issue</i>	number	The security's issue date.
<i>first-interest</i>	number	The security's first interest date.
<i>settlement</i>	number	The security's settlement date.
<i>rate</i>	number	The security's annual coupon rate.
<i>par</i>	number	The security's par value. If omitted, 1,000 is used.
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.
<i>basis</i>	number	The truncated integer type of day count basis to use, as

Name	Type	Description												
		<div>follows:</div> <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays periodic interest.

However, if

- *issue*, *first-interest*, or *settlement* is out of range for the current date system, #NUM! is returned
- *issue* ≥ *settlement*, #NUM! is returned
- *rate* or *par* ≤ 0, #NUM! is returned
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned
- *basis* < 0 or *basis* > 4, #NUM! is returned

[Example:

ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,1100,2,0) results in 18.33

ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,,2,0) results in 16.67

end example]

18.17.7.3 ACCRINTM

Syntax:

ACCRINTM (*issue* , *settlement* , *rate* , [[*par*] [, [*basis*]]])

Description: Computes the accrued interest for a security that pays interest at maturity.

Mathematical Formula:

$$ACCRINTM = par \times rate \times \frac{A}{D}$$

where:

- *A* = Number of accrued days counted according to a monthly basis. For interest at maturity items, the number of days from the issue date to the maturity date is used.
- *D* = Annual Year Basis.
- *par* = argument *par*
- *rate* = argument *rate*

Arguments:

Name	Type	Description
<i>issue</i>	number	The security's issue date.
<i>settlement</i>	number	The security's settlement date.

Name	Type	Description						
rate	number	The security's annual coupon rate.						
par	number	The security's par value. If omitted, 1,000 is used.						
basis	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div></td></tr><tr><td>1</td><td><div>Actual/actual. 1	<div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.</div>							

Name	Type	Description	
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays interest at maturity.

However, if

- *issue* or *settlement* is out of range for the current date system, #NUM! is returned

- $issue \geq settlement$, #NUM! is returned
- $rate$ or $par \leq 0$, #NUM! is returned
- $basis < 0$ or $basis > 4$, #NUM! is returned

[Example:

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,1100,0) results in 18.33333333

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,,0) results in 16.66666667

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,) results in 16.66666667

end example]

18.17.7.4 ACOS

Syntax:

ACOS (x)

Description: Computes the arc cosine of x .

Arguments:

Name	Type	Description
x	number	The value whose arc cosine is to be determined.

Return Type and Value: number – The arc cosine of x , in radians.

However, if x is outside the interval $[-1,+1]$, #NUM! is returned

[Example:

ACOS(-1) results in 3.141592654

ACOS(0) results in 1.570796327

ACOS(1) results in 0

end example]

18.17.7.5 ACOSH

Syntax:

ACOSH (x)

Description: Computes the inverse hyperbolic cosine of x .

Arguments:

Name	Type	Description
x	number	The value whose inverse hyperbolic cosine is to be determined.

Return Type and Value: number – The inverse hyperbolic cosine of x .

However, if $x < 1$, #NUM! is returned.

[Example:

ACOSH(1) results in 0

ACOSH(10) results in 2.993222846

ACOSH(100) results in 5.298292366

end example]

18.17.7.6 ADDRESS

Syntax:

ADDRESS (*row-number* , *col-number* [, [*ref-type*] [, [*A1-ref-style-flag*]
[, *sheet-name*]])

Description: Creates a cell address, given the specified row and column numbers.

Arguments:

Name	Type	Description										
<i>row-number</i>	number	The number of the row.										
<i>col-number</i>	number	The number of the column.										
<i>ref-type</i>	number	<div>The type of reference to return, as follows:<table><tr><th>Value</th><th>Type of Reference Returned</th></tr><tr><td>1 or omitted</td><td>Absolute row and column</td></tr><tr><td>2</td><td>Absolute row; relative column</td></tr><tr><td>3</td><td>Relative row; absolute column</td></tr><tr><td>4</td><td>Relative row and column</td></tr></table></div>	Value	Type of Reference Returned	1 or omitted	Absolute row and column	2	Absolute row; relative column	3	Relative row; absolute column	4	Relative row and column
Value	Type of Reference Returned											
1 or omitted	Absolute row and column											
2	Absolute row; relative column											
3	Relative row; absolute column											
4	Relative row and column											
<i>A1-ref-style-flag</i>	logical	The style of the reference. If TRUE or omitted, an A1-style reference (§18.17.2.3.1) is returned; otherwise, an R1C1-style reference (§18.17.2.3.2) is returned.										
<i>sheet-name</i>	text	The name of the worksheet to be used. If omitted, no										

Name	Type	Description
		sheet name is used.

Return Type and Value: text – A cell address, given the specified row and column numbers.

However, if

- *row-number* or *col-number* < 1, #NUM! is returned.
- *ref-type* is outside the range 1–4, #NUM! is returned.

[Example:

In A1-reference style mode:

ADDRESS(5,7,1) results in \$G\$5

ADDRESS(5,7,2) results in G\$5

ADDRESS(5,7,3) results in \$G5

ADDRESS(5,7,4) results in G5

ADDRESS(5,7,,,"Sheet1") results in Sheet1!\$G\$5

In R1C1-reference style mode:

ADDRESS(5,7,1,FALSE) results in R5C7

ADDRESS(5,7,2,FALSE) results in R5C[7]

ADDRESS(5,7,3,FALSE) results in R[5]C7

ADDRESS(5,7,4,FALSE) results in R[5]C[7]

end example]

18.17.7.7 AMORDEGRC

Syntax:

AMORDEGRC (*cost* , *date-purchased* , *first-period* , *salvage* , *period* ,
rate [, [*basis*]])

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account. The function is similar to AMORLINC (§18.17.7.7), except that a depreciation coefficient is applied in the calculation depending on the life of the assets.)

Arguments:

Name	Type	Description
<i>cost</i>	number	The cost of the asset.

Name	Type	Description						
<i>date-purchased</i>	number	The date of the purchase of the asset.						
<i>first-period</i>	number	The date of the end of the first period.						
<i>salvage</i>	number	The salvage value at the end of the life of the asset.						
<i>period</i>	number	The period.						
<i>rate</i>	number	The rate of depreciation.						
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.	1	Actual/actual. The actual number of days between the two dates are counted. If the
Value	Day Count Basis							
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.							
1	Actual/actual. The actual number of days between the two dates are counted. If the							

Name	Type	Description	
			date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Return Type and Value: number – The depreciation for each accounting period.

However, if

- *cost, salvage, period, or rate* < 0, #NUM! is returned.
- *date-purchased* or *first-period* is out of range for the current date system, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

- The life of the assets is between 0 and 1, 1 and 2, 2 and 3, or 4 and 5, #NUM! is returned.

This function returns the depreciation until the last period of the life of the assets or until the cumulated value of depreciation is greater than the cost of the assets minus the salvage value.

The depreciation coefficients are:

Life of assets (1/rate)	Depreciation Coefficient
Between 3 and 4 years	1.5
Between 5 and 6 years	2
More than 6 years	2.5

The depreciation rate grows to 50 percent for the period preceding the last period, and grows to 100 percent for the last period.

[Example:

AMORDEGRC (2400, DATE (2008, 8, 19), DATE (2008, 12, 31), 300, 1, 0.15, 1) results in 776.00

end example]

18.17.7.8 AMORLINC

Syntax:

AMORLINC (*cost* , *date-purchased* , *first-period* , *salvage* , *period* ,
rate [, [*basis*]])

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account.)

Arguments:

Name	Type	Description
<i>cost</i>	number	The cost of the asset.
<i>date-purchased</i>	number	The date of the purchase of the asset.
<i>first-period</i>	number	The date of the end of the first period.
<i>salvage</i>	number	The salvage value at the end of the life of the asset.
<i>period</i>	number	The period.
<i>rate</i>	number	The rate of depreciation.
<i>basis</i>	number	The truncated integer type of day count basis to use, as

Name	Type	Description								
		<div>follows:</div> <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. 1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.									
2	Actual/360. Similar to Basis 1, but only has 360 days per year.									

Name	Type	Description	
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Return Type and Value: number – The depreciation for each accounting period.

However, if:

- *cost, salvage, period, or rate* < 0, #NUM! is returned.
- *date-purchased* or *first-period* is out of range for the current date system, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

AMORLINC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1) results in 360.00

end example]

18.17.7.9 AND

Syntax:

AND (*argument-list*)

Description: Tests if all *arguments* in *argument-list* are TRUE. The function evaluates all arguments prior to returning a value.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, array, or cell reference	The <i>arguments</i> in <i>argument-list</i> designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

Return Type and Value: logical – TRUE if all *arguments* in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, #VALUE! is returned.

[Example:

AND(TRUE) results in TRUE

AND(TRUE, FALSE) results in FALSE

AND(10>5, 3=1+2, 5) results in TRUE

AND({10,5,6,7}, TRUE, E6:F6) results in TRUE, when E6 contains TRUE and F6 contains 10

end example]

18.17.7.10 AREAS

Syntax:

AREAS (*reference*)

Description: Finds the number of areas (§18.17.2.3) designated by *reference*.

Arguments:

Name	Type	Description
<i>reference</i>	reference	A reference to a single cell or to a range of cells that can refer to multiple areas.

Return Type and Value: number – The number of areas designated by *reference*.

However, if the reference designates no areas, #NUM! is returned.

[Example:

AREAS(E312) results in 1

AREAS(E311:F313) results in 1

AREAS((E312:F314,G316:H316,G311)) results in 3, given the union of the three areas

AREAS((E312:F314 E313:F314 F312:F314)) results in 1, given the intersection of the three areas

end example]

18.17.7.11 ASC

Syntax:

ASC (*string*)

Description: For double-byte character set (DBCS) languages, converts all full-width (double-byte) characters to half-width (single-byte) characters.

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the text to be converted. If <i>string</i> does not contain any full-width characters, nothing in <i>string</i> is converted.

Return Type and Value: text – The text resulting from the conversion.

[Example:

ASC("ABC") results in ABC

ASC("エクセル") results in エクセル

end example]

18.17.7.12 ASIN

Syntax:

ASIN (x)

Description: Computes the arc sine of x .

Arguments:

Name	Type	Description
x	number	The value whose arc sine is to be determined.

Return Type and Value: number – The arc sine of x , in radians.

However, if x is outside the interval $[-1,+1]$, #NUM! is returned.

[Example:

ASIN(-1) results in -1.570796327

ASIN(0) results in 0

ASIN(1) results in 1.570796327

end example]

18.17.7.13 ASINH

Syntax:

ASINH (x)

Description: Computes the inverse hyperbolic cosine of x .

Arguments:

Name	Type	Description
x	number	The value whose inverse hyperbolic sine is to be determined.

Return Type and Value: number – The inverse hyperbolic cosine of x .

[Example:

ASINH(1) results in 0.881373587

ASINH(10) results in 2.99822295

ASINH(100) results in 5.298342366

ASINH(0.5) results in 0.481211825

end example]

18.17.7.14 ATAN

Syntax:

$$\text{ATAN} (x)$$

Description: Computes the arc tangent of x .

Arguments:

Name	Type	Description
x	number	The value whose arc tangent is to be determined.

Return Type and Value: number – The arc tangent of x , in radians.

[Example:

ATAN(-1) results in -0.785398163

ATAN(0) results in 0

ATAN(1) results in 0.785398163

ATAN(-10) results in 1.471127674

ATAN(10) results in 1.471127674

end example]

18.17.7.15 ATAN2

Syntax:

$$\text{ATAN2} (x , y)$$

Description: Computes the arc tangent of the coordinates x and y .

Arguments:

Name	Type	Description
x	number	The first coordinate.
y	number	The second coordinate.

Return Type and Value: number – The arc tangent of y/x , in radians.

However, if both x and y are zero, #DIV/0! is returned.

[Example:

ATAN2(1,1) results in 0.785398163

ATAN2(-2,2) results in 2.35619449

ATAN2(3,-3) results in -0.785398163

end example]

18.17.7.16 ATANH

Syntax:

ATANH (*x*)

Description: Computes the inverse hyperbolic tangent of *x*.

Arguments:

Name	Type	Description
<i>x</i>	number	The value whose inverse hyperbolic tangent is to be determined.

Return Type and Value: number – The inverse hyperbolic tangent of *x*.

However, if *x* is outside the interval [-1,+1], #NUM! is returned.

[*Example:*

ATANH(-0.999999) results in -7.254328619

ATANH(0) results in 0

ATANH(0.999999) results in 7.254328619

end example]

18.17.7.17 AVEDEV

Syntax:

AVEDEV (*argument-list*)

Description: Computes the average of the absolute deviations of a set of data points from their mean. AVEDEV is a measure of the variability in a data set.

Mathematical Formula:

The average of the absolute deviations of a set of data points from their mean is as follows:

$$\frac{1}{n} \sum |x - \bar{x}|$$

where:

- n = the number of *arguments* in *argument-list*
- x = an *argument* in *argument-list*
- \bar{x} = the x mean value

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, array, or reference that contains a number. The list can be a single argument that is an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the average of the absolute deviations is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The average of the absolute deviations of a set of data points from their mean.

[Example:

AVEDEV(-3.5,1.4,6.9,-4.5) results in 4.075

AVEDEV({-3.5,1.4,6.9,-4.5}) results in 4.075

end example]

18.17.7.18 AVERAGE

Syntax:

AVERAGE (*argument-list*)

Description: Computes the arithmetic mean of the numeric values of its arguments.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, or reference that contains a number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. If an array or cell reference argument contains logical values, text, or empty cells, those values shall be ignored; however, cells having the value 0 shall be counted. [Note: The function AVERAGEA (§18.17.7.18) does include cell

Name	Type	Description
		reference arguments that refer to logical values or text representations of numbers. <i>end note</i>

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[Example:

AVERAGE(1, 2, 3, 4, 5) results in 3

AVERAGE({1, 2; 3, 4}) results in 2.5

AVERAGE({1, 2, 3, 4, 5}, 6, "7") results in 4

AVERAGE({1, "2", TRUE, 4}) results in 2.5, as the logical value and numeric text are ignored

end example]

18.17.7.19 AVERAGEA

Syntax:

AVERAGEA (*argument-list*)

Description: Computes the arithmetic mean of the values of its arguments.

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, text, or reference that contains a number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. Arguments with value TRUE evaluate to 1; arguments with value FALSE evaluate to 0. An array or cell reference argument that contains text evaluates to 0. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Note: The function AVERAGE (§18.17.7.18) does not include cell reference arguments that refer to logical values or text representations of numbers. *end note*]

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[Example:

AVERAGEA(10, E1), where E1 is an empty cell, results in 10, as E1 is ignored

AVERAGEA(10, E2), where E2 contains TRUE, results in 5.5

AVERAGEA(10, E3), where E3 contains FALSE, results in 5

end example]

18.17.7.20 AVERAGEIF

Syntax:

AVERAGEIF (*cell-range* , *selection-criteria* [, *average-range*])

Description: Applies selection criteria on the values in one range of cells and averages the values of the cells in a corresponding range.

Arguments:

Name	Type	Description
<i>cell-range</i>	reference	The range of cells to be inspected. Cells in <i>cell-range</i> that contain TRUE or FALSE are ignored. If a cell is an empty cell, it is ignored.
<i>selection-criteria</i>	number, expression, reference, text	Designates the cells that are to be averaged. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). If a cell in <i>selection-criteria</i> is empty, it is treated as if it contained 0.
<i>average-range</i>	reference	Designates the cells whose values are averaged. In this case, <i>average-range</i> need not have the same size and shape as <i>cell-range</i> . The actual cells that are averaged are determined by using the top, left cell in <i>average-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range</i> . If <i>average-range</i> is omitted, <i>cell-range</i> also designates the cells whose values are averaged. If a cell is an empty cell, it is ignored.

Return Type and Value: number – The average of the values of the cells corresponding to those selected.

However, if no cells in the range meet the criteria, the return value is unspecified.

[Example: Assuming A2:A4 contains 10, 20, and 30:

AVERAGEIF (A2:A4, ">15") results in 25, the average of 20 and 30.

end example]

18.17.7.21 AVERAGEIFS

Syntax:

AVERAGEIFS (*average-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, ...]])

Description: The average of the values of all cells that meet multiple criteria.

Arguments:

Name	Type	Description
<i>average-range</i>	reference	Designates the cells whose values are averaged. In this case, <i>average-range</i> need not have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>average-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . If a cell in <i>average-range</i> is empty, that cell is ignored. Each cell in <i>average-range</i> is used in the average calculation only if all of the corresponding criteria specified are true for that cell.
<i>cell-range-1</i>	number, expression, reference, text	Designates the first range of cells to be inspected.
<i>selection-criteria-1</i>	reference, text	<i>selection-criteria-1</i> specifies the criteria for the first range of cells that is averaged. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If a cell in any selection criteria range is empty, it is treated as if its value was 0. Cells that contain TRUE evaluate to 1; cells in any range that contain FALSE evaluate to 0. <i>selection-criteria-1</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>cell-range-n</i>	number, expression,	The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-</i>

Name	Type	Description
	reference, text	<i>range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively.
<i>selection-criteria-n</i>	reference, text	

Return Type and Value: number – The average of the cells corresponding to those selected.

However, if

- Cells in *average-range* are empty or contain text values that cannot be translated into numbers, the return value is unspecified.
- There are no cells that meet all the criteria, the return value is unspecified.

[Example: Given the following data:

	A	B	C	D
1	Student	First Quiz Grade	Second Quiz Grade	Final Exam Grade
2	Emilio	75	85	87
3	Julie	94	80	88
4	Hans	86	93	Incomplete
5	Frederique	Incomplete	75	75

AVERAGEIFS(B2:B5,B2:B5,">70",B2:B5,"<90") results in 80.5 (the average for all students all first quiz grades that are between 70 and 90)

AVERAGEIFS(D2:D5,D2:D5,"<>Incomplete",D2:D5,">80") results in 87.5 (the average for all students all first quiz grades that are above 80 and not marked "Incomplete")

AVERAGEIFS(B2:D5,B2:B5,"<>Incomplete",C2:C5,"<>Incomplete",D2:D5,"<>Incomplete") results in 82.375 (the average grades for all students who do not have incomplete grades)

end example]

18.17.7.22 BAHTTEXT

Syntax:

BAHTTEXT (*number*)

Description: Produces a string containing *number* formatted according to the Thai convention.

Arguments:

Name	Type	Description
<i>number</i>	number	The value to be formatted.

Return Type and Value: text – The text containing *number* formatted.

[Example:

BAHTTEXT(1234) results in หนึ่งพันสองร้อยสามสิบลีบาทถ้วน

end example]

18.17.7.23 BESSELI

Syntax:

BESSELI (*x* , *n*)

Description: The modified Bessel function $I_n(x)$, which is equivalent to the Bessel function $J_n(x)$ evaluated for purely imaginary arguments.

Mathematical Formula:

The *n*-th order modified Bessel function of the variable *x* is:

$$I_n(x) = (i)^{-n} J_n(ix)$$

where:

- *x* = argument *x*
- *n* = argument *n*

Arguments:

Name	Type	Description
<i>x</i>	number	The value at which to evaluate the function.
<i>n</i>	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function $I_n(x)$.

However, if *n* < 0, #NUM! is returned.

[Example:

BESSELI(-5.6,0) results in 46.73755194

BESSELI(2.345,5) results in 0.023137792

end example]

18.17.7.24 BESSELJ

Syntax:

BESSELJ (*x* , *n*)

Description: The Bessel function $J_n(x)$.

Mathematical Formula:

The n -th order Bessel function of the variable x is:

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

where:

$$\Gamma(n+k+1) = \int_0^{\infty} e^{-x} x^{n+k} dx$$

is the Gamma function, and

- x = argument x
- n = argument n

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function $J_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELJ(-5.6,0) results in 0.026970887

BESSELJ(2.345,5) results in 0.014627862

end example]

18.17.7.25 BESSELK

Syntax:

BESSELK (x , n)

Description: The modified Bessel function $K_n(x)$, which is equivalent to using the Bessel function $J_n(x)$ and $Y_n(x)$.

Mathematical Formula:

The n -th order modified Bessel function of the variable x is:

$$K_n(x) = \frac{p}{2} i^{n+1} [J_n(ix) + iY_n(ix)]$$

where:

- J_n is the J Bessel function
- n = argument n
- $p = \pi$
- x = argument x
- Y_n is the Y Bessel function
- **Arguments:**

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function $K_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELK(2.345,5) results in 3.904137225

end example]

18.17.7.26 BESSELY

Syntax:

BESSELY (x , n)

Description: Weber's Bessel function $Y_n(x)$.

Mathematical Formula:

The n -th order Bessel function of the variable x is:

$$Y_n(x) = \lim_{v \rightarrow n} \frac{J_v(x) \cos(v \pi) - J_{-v}(x)}{\sin(v \pi)}$$

where:

- n = argument n
- x = argument x

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Weber's Bessel function $Y_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELY(2.345,5) results in -4.98977884

end example]

18.17.7.27 BETADIST

Syntax:

BETADIST (x , $alpha$, $beta$ [, [A] , [B]])

Description: Computes the cumulative beta probability density function.

Arguments:

Name	Type	Description
x	number	The value between A and B at which to evaluate the function.
$alpha$	number	A parameter of the distribution.
$beta$	number	A parameter of the distribution.

Name	Type	Description
<i>A</i>	number	The lower bound to the interval of <i>x</i> . If omitted, the lower bound is 0.
<i>B</i>	number	The upper bound to the interval of <i>x</i> . If omitted, the upper bound is 1.

Return Type and Value: number – The cumulative beta probability density function.

However, if

- *alpha* or *beta* ≤ 0 , #NUM! is returned.
- $x < A$, $x > B$, or $A = B$, #NUM! is returned.

[Example:

BETADIST(0.5,1,2) results in 0.75

BETADIST(0.5,1,2,-4.5,7.3) results in 0.66791152

BETADIST(0.5,1,2,,2.3) results in 0.387523629

end example]

18.17.7.28 BETAINV

Syntax:

BETAINV (*probability* , *alpha* , *beta* [, [*A*] , [*B*]])

Description: Computes the inverse of the cumulative distribution function for a specified beta distribution. Given a value for *probability*, BETAINV is used to seek for the value *x* such that BETADIST(*x*, *alpha*, *beta*, *A*, *B*) = *probability*. Thus, precision of BETAINV depends on precision of BETADIST.

Arguments:

Name	Type	Description
<i>probability</i>	number	A probability associated with the beta distribution.
<i>alpha</i>	number	A parameter of the distribution.
<i>beta</i>	number	A parameter of the distribution.
<i>A</i>	number	The lower bound to the interval of <i>x</i> . If omitted, the lower bound is 0.
<i>B</i>	number	The upper bound to the interval of <i>x</i> . If omitted, the upper bound is 1.

Return Type and Value: number – The inverse of the cumulative distribution function for a specified beta distribution.

However, if

- *alpha* or *beta* ≤ 0 , #NUM! is returned.
- *probability* < 0 or *probability* > 1 , #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[Example:

BETAINV(0.5,1,2) results in 0.29289341

BETAINV(0.5,1,2,-4.5,7.3) results in -1.043857765

BETAINV(0.5,1,2,,2.3) results in 0.673654842

end example]

18.17.7.29 BIN2DEC

Syntax:

BIN2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
<i>number</i>	number	A 10-digit binary number that is to be converted to a decimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (-512 decimal) to 0111111111 (511 decimal), inclusive, #NUM! is returned.

[Example:

BIN2DEC(111) results in 7

BIN2DEC(11111111) results in 255

BIN2DEC(1111111110) results in -2

BIN2DEC(1000000000) results in -512

end example]

18.17.7.30 BIN2HEX

Syntax:

BIN2HEX (*number* [, *num-hex-digits*])

Description: Makes the uppercase hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	number	A 10-digit binary number that is to be converted to a hexadecimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
<i>num-hex-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer.

Return Type and Value: text – The uppercase hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (200 hex, -512 decimal) to 0111111111 (1FF hex, 511 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

BIN2HEX(1) results in 1

BIN2HEX(1,4) results in 0001

BIN2HEX(111111) results in 3F

BIN2HEX(1111000000) results in FFFFFFFC0

BIN2HEX(1000000000,3) results in FFFFFFFE00

end example]

18.17.7.31 BIN2OCT

Syntax:

BIN2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	number	A 10-digit binary number that is to be converted to an octal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use two's-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
<i>num-oct-digits</i>	number	<i>num-oct-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (1000 octal, -512 decimal) to 0111111111 (0777 octal, 511 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* < 0 or > 10, #NUM! is returned.

[Example:

BIN2OCT(1) results in 1

BIN2OCT(1,4) results in 0001

BIN2OCT(111111) results in 77

BIN2OCT(1111000000) results in 7777777700

BIN2OCT(1000000000,3) results in 7777777000

end example]

18.17.7.32 BINOMDIST

Syntax:

BINOMDIST (*number-successes* , *number-trials* , *success-probability* , *cumulative-flag*)

Description: Computes the individual term binomial distribution probability.

Mathematical Formula:

The binomial probability mass function is:

$$b(x, n, p) = \binom{n}{x} p^x (1 - p)^{n-x}$$

where:

$$\binom{n}{x}$$

is COMBIN(*n*, *x*).

The cumulative binomial distribution is:

$$B(x, n, p) = \sum_{y=0}^x b(y, n, p)$$

where:

- *n* = argument *number-trials*
- *p* = argument *success-probability*
- *x* = argument *number-successes*

Arguments:

Name	Type	Description
<i>number-successes</i>	number	The number of successes in <i>number-trials</i> , truncated to an integer.
<i>number-trials</i>	number	The number of independent trials, truncated to an integer.
<i>success-probability</i>	number	The probability of success on each trial.

Name	Type	Description
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned, which is the probability that there are at most <i>number-successes</i> successes; if FALSE, the probability mass function is returned, which is the probability that there are <i>number-successes</i> successes.

Return Type and Value: number – The individual term binomial distribution probability.

However, if

- *number-successes* < 0 or *number-successes* > *number-trials*, #NUM! is returned.
- *success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[Example:

BINOMDIST(6,10,0.5,FALSE) results in 0.205078125

BINOMDIST(6,10,0.5,TRUE) results in 0.828125

end example]

18.17.7.33 CEILING

Syntax:

CEILING (*x* , *significance*)

Description: Computes a value that is *x* rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded
<i>significance</i>	number	The multiple to which <i>x</i> is to be rounded. If <i>x</i> is negative, and <i>significance</i> is negative, then the value is rounded down (away from zero). If <i>x</i> is negative, and <i>significance</i> is positive, then the value is rounded up, towards zero.

Return Type and Value: number – The rounded-up value of *x*.

However, if *x* and *significance* have different signs, #NUM! is returned.

[Example:

CEILING(2.5,1) rounds 2.5 up to nearest multiple of 1; that is, to 3

CEILING(-2.5, -2) rounds -2.5 up to nearest multiple of -2; that is, to -4

CEILING(1.5,0.1) rounds 1.5 up to the nearest multiple of 0.1; that is, to 1.5

CEILING(0.234,0.01) rounds 0.234 up to the nearest multiple of 0.01; that is, to 0.24

end example]

18.17.7.34 CELL

Syntax:

CELL (*category* [, *reference*])

Description: Retrieves information about the formatting, location, or contents of the upper-left cell indicated by *reference*. *category* indicates the kind of information to be retrieved.

Arguments:

Name	Type	Description
<i>category</i>	text	The category string as defined in the table following.
<i>reference</i>	reference	Refers to the cell whose category information is being requested. If <i>reference</i> is a cell range, the first cell in that range is the cell whose category information is being requested. If <i>reference</i> is omitted, the information retrieved pertains to the most recent cell whose value was changed. For the category "format", if <i>reference</i> designates a cell formatted with a built-in number format, the number format string is as defined in the table following.

<i>category</i>	Meaning	Result Type
"address"	Reference of the first cell in <i>reference</i> .	text
"col"	Column number of the cell in <i>reference</i> .	number
"color"	1 if the cell is formatted in color for negative values; otherwise, 0. 0 if the cell does not contain a number.	number
"contents"	Value of the upper-left cell in <i>reference</i> .	Text or number
"filename"	Fully qualified filename of the file that contains <i>reference</i> . However, if the worksheet that contains <i>reference</i> has not yet been saved, the filename is an empty string.	text
"format"	Number format of the cell. (See the discussion of formats below.) The number format string has "-" appended if the	text

<i>category</i>	Meaning	Result Type
	cell is formatted in color for negative values. The number format string has "()" appended if the cell is formatted in color for positive or all values.	
"parentheses"	1 if the cell is formatted with parentheses for positive or all values; otherwise, 0. 0 if the cell does not contain a number.	number
"prefix"	Text value corresponding to the label prefix of the cell, as follows: <ul style="list-style-type: none"> • Single quotation mark (') if the cell contains left-aligned text • Double quotation mark (") if the cell contains right-aligned text • Caret (^) if the cell contains centered text • Backslash (\) if the cell contains fill-aligned text • Empty string if the cell contains anything else 	text
"protect"	0 if the cell is not locked; otherwise, 1.	number
"row"	Row number of the cell in reference.	number
"type"	Text value corresponding to the type of data in the cell. <ul style="list-style-type: none"> • "b" (blank) if the cell is empty • "l" (label) if the cell contains a text constant • "v" (value) if the cell contains anything else 	text
"width"	Column width of the cell rounded off to an integer. Each unit of column width is equal to the width of one character in the default font size.	number

If the SpreadsheetML is intended to be used in certain non-English locales, the *category* string can be the English value shown in the table above, or the translation shown in the following table. Locales not specified in the table below shall only use the English versions of the *category* string.

[Note: Using translated versions of the *category* string is strongly discouraged, as spreadsheet applications might not support these translations. *end note*]

Return Type and Value: various (see table above) – The value corresponding to *category*, and whose type is shown in the category value table above.

When the category parameter is "format", then the value returned depends upon the number format of the upper-left cell of *reference*, and, more specifically, upon the number format code of the upper-left cell of *reference*. Depending upon the number format code of the appropriate cell, the result value of CELL when the category is "format" is based upon the rules defined below.

First, some observations regarding the rules are in order:

- The various "sections" of the number format code are referred to within the rules. For more information on sections in the number format code, see numFmts (Number Formats) (§18.8.31).
- There are cases in which it is useful to discuss the characters from the number format code that are dependent upon the value in the cell. Instead of representing text or spacing in the cell's display text, these characters interpret, in some fashion, the value to be displayed. In the rules, these characters are referred to as "interpreted characters" of the number format code. The following table shows all the interpreted characters:

Interpreted Characters
0
#
@
d

Interpreted Characters
m
y
h
s
?
AM/PM
A/P
g
e
r

- There are cases in which it is also useful to discuss runs of similar interpreted characters. [*Example:* Each "d", "m", and "y" within the number format code "dd/mm/yyyy" does not represent a separate interpretation of the day of the date value to be represented, and instead helps to make up a representation of the day of the date that is two digits in length. *end example*] These runs of similar characters are referred to below as "interpreted symbols" since multiple characters are used, but the result is a single symbolic representation of at least part of the value.
- Since there are multiple different symbols for days, months, years, hours, minutes, seconds, and AM/PM, it is sometimes useful to discuss all of the representations of each of these. When any of "Day", "Month", "Year", "Hour", "Minute", etc., is referred to within a rule, what is meant is any of the possible representations for that date/time portion. For example, a "Day" symbol would be any of d, dd, ddd, or dddd.
- The use of characters such as "0", "E", and "%" as a symbol within a number format code does not include usages of these same characters either escaped (by preceding them with a backslash character "\") or as a part of a quoted string.

Here are the rules to determine the result value:

1. If the first interpreted symbols within the first section are any of the date or time characters (any of "y", "m", "d", "h", "m", "s") then the first one or two characters of the return value are determined by the order of interpreted symbols (including any interpreted symbols, not just date/time symbols) according to the following table. ("anything" can mean "no additional symbols". If the type is "anything except <type>", then the excepted symbol type cannot follow the previously specified symbol.)

Interpreted Symbols in Order	Return Value Characters
Day, month, year, anything	"D1"

Interpreted Symbols in Order	Return Value Characters
Day, month, anything besides year, anything	"D2"
Month, year, anything	"D3"
Month, day, year, anything	"D4"
Month, day, anything besides year, anything	"D5"
Hours, minutes, seconds, AM/PM, anything	"D6"
Hours, minutes, AM/PM, anything	"D7"
Hours, minutes, seconds, anything besides AM/PM, anything	"D8"
Hours, minutes, anything besides seconds or AM/PM, anything	"D9"
Any other combination of symbols	"G" or "C" depending on whether there is a \$ in the first condition

2. Otherwise, the first character of the return value is determined based upon the referenced cell's number format code according to the rules in the table below:

First Section of the Number Format Code		First Return Value Character
Absent Characters (as Symbols)	Present Characters (as Symbols)	
	@	"G"
@	\$	"C"
@, \$	%	"P"
@, \$, %	E	"S"
@, \$, %, E	A run of any combination of one or more "0", "#", and "?" characters, followed by a comma, followed by a run of any combination of one or more "0", "#", and "?" characters. This run can not be preceded by a period (".") or by any interpreted characters.	" , "
@, \$, %, E, or a run of characters	At least one of "0", "?", or "#"	"F"

First Section of the Number Format Code		First Return
containing a comma as described in the row above		
Any of the above conditions	Anything	"G"

3. The final value is determined by appending any of the applicable characters from the table below to the return value characters obtained from the previous two tables:

Case	Characters to Append
The first character of the return value is C, F, S, P, or ", and the number format code contains any of "?", "0", or "#" as a symbol.	The decimal number equal to the total number of "#", "?", and "0" characters to the right of the first "." within the first section
The first character of the return value was C, and the number format code does not contain any of "?", "0", or "#" as a symbol.	15 or the length of the string immediately following the first "\$" sign in the number format code that is a symbol.
The first section of the number format code contains an open parenthesis "(" as a symbol.	"()"
The second section of the number format code contains [Red], [Black], [Green], [White], [Blue], [Magenta], [Yellow], or [Cyan] as a symbol.	"_"

However, if *category* is not one of the defined values, #VALUE! is returned.

[Example:

CELL("address",A10) might result in \$\$289

CELL("contents",A10:B10), results in xxx, when A10 contains xxx, and B10 contains anything

CELL("filename",A10) might result in E:\Formulas\[Test.xlsx]Sheet1

CELL("format",A10) results in G, when A10 contains xxx

CELL("format",A10) results in F2-, when A10 contains (123.00)

CELL("format",A10) results in C3-, when A10 contains \$123,456.780

CELL("format",A10) results in S3, when A10 contains 1.235E+05

CELL("prefix",A10) results in ', when A10 contains xxx

CELL("type",A10) results in l, when A10 contains xxx

end example]

18.17.7.35 CHAR

Syntax:

CHAR (*x*)

Description: Determines the character that is represented by the value *number*. On the Macintosh platform, the Macintosh character set is used. On all other platforms, the Latin character set with IANA name *iso-8859-1* is used.

Arguments:

Name	Type	Description
<i>x</i>	number	A value in the range 1–255, which designates the character.

Return Type and Value: text – The character represented by the value *number*.

[Example:

CHAR(65) results in A

CHAR(A10) results in A, when A10 contains 65

end example]

18.17.7.36 CHIDIST

Syntax:

CHIDIST (*x* , *degrees-freedom*)

Description: Computes the one-tailed probability of the chi-squared distribution.

Mathematical Formula:

$$CHIDIST = P(X > x)$$

where:

- X = an χ^2 random variable
- x = argument x

Arguments:

Name	Type	Description
<i>x</i>	number	The value at which the distribution is to be evaluated.
<i>degrees-freedom</i>	number	The number of degrees of freedom, truncated to an integer.

Return Type and Value: number – The one-tailed probability of the chi-squared distribution.

However, if

- $x < 0$, #NUM! is returned.
- $degrees-freedom < 1$ or $degrees-freedom > 10^{10}$, #NUM! is returned.

[Example:

CHIDIST(3.5,4) results in 0.47787835

CHIDIST(12.34,7) results in 0.089917721

end example]

18.17.7.37 CHIINV

Syntax:

CHIINV (*probability* , *degrees-freedom*)

Description: Computes the inverse of the one-tailed probability of the chi-squared distribution. Given a value for *probability*, CHIINV seeks for a value x such that $\text{CHIDIST}(x, \text{degrees-freedom}) = \text{probability}$. Thus, precision of CHIINV depends on precision of CHIDIST.

Arguments:

Name	Type	Description
<i>probability</i>	number	A probability associated with the chi-squared distribution.
<i>degrees-freedom</i>	number	The number of degrees of freedom, truncated to an integer.

Return Type and Value: number – The inverse of the one-tailed probability of the chi-squared distribution.

However, if

- $probability < 0$ or $probability > 1$, #NUM! is returned.
- $degrees-freedom < 1$ or $degrees-freedom \geq 10^{10}$, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned

[Example:

CHIINV(0.5,4) results in 3.356694001

CHIINV(0.3,7) results in 8.38343064

end example]

18.17.7.38 CHITEST

Syntax:

CHITEST (*actual-range* , *expected-range*)

Description: Computes the test for independence. CHITEST returns the value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

Mathematical Formula:

The χ^2 test first calculates a χ^2 statistic using the formula:

$$\chi^2 = \sum_{i=1}^r \sum_{j=1}^c \frac{(A_{ij} - E_{ij})^2}{E_{ij}}$$

where:

- A_{ij} = actual frequency in the i-th row, j-th column of the argument *actual-range*
- c = number of columns in argument *actual-range* (or argument *expected-range*)
- E_{ij} = expected frequency in the i-th row, j-th column of the argument *expected-range*
- r = number of rows in argument *actual-range* (or argument *expected-range*)

CHITEST uses the χ^2 distribution with an appropriate number of degrees of freedom, df. If $r > 1$ and $c > 1$, then $df = (r - 1)(c - 1)$. If $r = 1$ and $c > 1$, then $df = c - 1$ or if $r > 1$ and $c = 1$, then $df = r - 1$.

Arguments:

Name	Type	Description
<i>actual-range</i>	reference	The range of data that contains observations to test against expected values.
<i>expected-range</i>	reference	The range of data that contains the ratio of the product of row totals and column totals to the grand total.

Return Type and Value: number – The value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

However, if:

- The number of rows and columns is exactly one, the return value is unspecified.
- *actual-range* and *expected-range* have a different number of data points, #N/A is returned.

[Example: Given the following data:

	A	B	C
1	Men (Actual)	Women (Actual)	Description
2	58	35	Agree
3	11	25	Neutral
4	10	23	Disagree
5	Men (Expected)	Women (Expected)	Description
6	45.35	47.65	Agree
7	17.56	18.44	Neutral
8	16.09	16.91	Disagree

CHITEST(A2:B4,A6:B8) results in 0.000308

end example]

18.17.7.39 CHOOSE

Syntax:

CHOOSE (*index* , *argument-list*)

Description: Selects the *argument* in *argument-list* that corresponds by position to *index*.

Arguments:

Name	Type	Description
<i>index</i>	number	An index into <i>argument-list</i> , truncated to an integer. The value of <i>index</i> shall be in the position range 1– <i>n</i> , where <i>argument-1</i> is position 1, <i>argument-2</i> is position 2, and so on up to <i>argument-n</i> . If <i>index</i> is an array, the value or every element in that array is evaluated, and if the formula is an array formula, the result is an array of chosen values.
<i>argument-list</i>	any	The <i>arguments</i> in any given <i>argument-list</i> need not all have the same type.

Return Type and Value: any, including array – The *argument* in *argument-list* that corresponds by position to *index*.

However, if the value of *index* is not an index into *argument-list*, #VALUE! is returned.

[Example:

CHOOSE(E7,F7,G7,H7,I7,J7,K7,L7) results in Monday, when E7 contains 2, and the cells F7:L7 each contain the names of the week, from Sunday to Saturday

SUM(CHOOSE(E1,F20:G20,H20:J24)) results in the sum of the elements designated by F20:G20 or H20:J24, as determined by the value of E1

If B9:B11 contain 1, 3, and 3, respectively, and CHOOSE(B9:B11,10,20,30) is an array formula spanning 3 cells, the values of those 3 cells is 10, 30, and 30, respectively.

end example]

18.17.7.40 CLEAN

Syntax:

CLEAN (*string*)

Description:

Makes a string that is a copy of *string* with all so-called "non-printable" characters—those with internal values in the range U+0000–001F—removed.

Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string to be cleaned.

Return Type and Value: text – The trimmed copy of *string*.

[*Example:*

CLEAN("A" & CHAR(2) & "BC") results in ABC, which is stored in A10
LEN(A10) results in 3

end example]

18.17.7.41 CODE

Syntax:

CODE (*string*)

Description: Determines the numeric code of the first character in *string*.

Arguments:

Name	Type	Description
<i>string</i>	text	Designates a string containing one or more characters.

Return Type and Value: number – The numeric code of the first character in *string*.

However, if *string* is empty, #VALUE! is returned.

[Example:

CODE("abc") results in 97

CODE(A10) results in 97, when A1 contains abc

end example]

18.17.7.42 COLUMN

Syntax:

COLUMN ([*reference*])

Description: Finds the number of the column(s) corresponding to *reference*.

Arguments:

Name	Type	Description
<i>reference</i>	reference	A reference to a single cell or to a range of contiguous cells. If omitted, the behavior is as if <i>reference</i> referred to the cell containing the formula.

Return Type and Value: number – If *reference* refers to a single cell or to a single column of cells, the corresponding column is returned. If *reference* refers to a range of cells involving multiple columns, a horizontal array of the corresponding columns as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[Example:

COLUMN() results in 4, when the cell containing the formula is in column 4

COLUMN(E17:E19) results in 5

COLUMN(E16:F17) results in a horizontal array containing 5 and 6, respectively

end example]

18.17.7.43 COLUMNS

Syntax:

COLUMNS (*array*)

Description: Finds the number of columns corresponding to *array*.

Arguments:

Name	Type	Description
<i>array</i>	array, reference	Any array.

Return Type and Value: number – The number of columns corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, #NULL! is returned.

[Example:

COLUMNS(E16:F16) results in 2

COLUMNS(E16:G18) results in 3

COLUMNS({1,2;3,4}) results in 2

end example]

18.17.7.44 COMBIN

Syntax:

COMBIN (*number* , *number-chosen*)

Description: Computes the possible number of groups of size *number-chosen* that can be formed from *number* objects. [Note: A combination is any set or subset of objects, regardless of their internal order. Combinations are distinct from permutations, for which the internal order is significant. end note]

Mathematical Formula:

The number of combinations is as follows, where *number* = *n* and *number-chosen* = *k*:

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

where:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

where:

- k = argument *number-chosen*
- n = argument *number*

Arguments:

Name	Type	Description
<i>number</i>	number	The total number of objects available, truncated to an integer.
<i>number-chosen</i>	number	The number of objects in each combination, truncated to an integer.

Return Type and Value: number – The number of different combinations of *number-chosen* in *number*.

However, if

- $number < 0$, #NUM! is returned.
- $number-chosen < 0$, #NUM! is returned.
- $number < number-chosen$, #NUM! is returned.

[Example:

COMBIN(8,2) results in 28

COMBIN(10,4) results in 210

COMBIN(6,5) results in 6

end example]

18.17.7.45 COMPLEX

Syntax:

COMPLEX (*real-number* , *imaginary-number* [, *suffix*])

Description: Makes a complex number in $x + yi$ or $x + yj$ text format from the arguments.

Arguments:

Name	Type	Description
<i>real-number</i>	number	The real number coefficient.
<i>imaginary-number</i>	number	The imaginary number coefficient.
<i>suffix</i>	text	"i" or "j". If omitted, "i" is used.

Return Type and Value: text – The complex number string specified by the arguments.

If *real-number* has the value 0 and *imaginary-number* has a non-zero value, the resulting string contains just the real number. If *real-number* has a non-zero value and *imaginary-number* has a zero value, the resulting string contains just the imaginary number and suffix. If both *real-number* and *imaginary-number* have a zero value, the resulting string is "0".

However, if *suffix* is neither "i" nor "j", #VALUE! is returned.

[Example:

COMPLEX(-3.5,19.6) results in -3.5+19.6i

COMPLEX(3.5, -19.6, "j") results in 3.5-19.6j

COMPLEX(3.5,0) results in 3.5

COMPLEX(0,2.4) results in 2.4i

COMPLEX(0,0) results in 0

end example]

18.17.7.46 CONCATENATE

Syntax:

CONCATENATE (*argument-list*)

Description: Makes a string that is the concatenation of all the strings corresponding to the *arguments* in *argument-list*, taken left-to-right.

Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> shall designate a string.

Return Type and Value: text – The concatenated string.

[Example:

CONCATENATE("text") results in text

CONCATENATE("The total is ",A10," units") results in The total is 43 units, when A10 contains 43

CONCATENATE(3, " + ",4, " = ",3+4) results in 3 + 4 = 7

end example]

18.17.7.47 CONFIDENCE

Syntax:

CONFIDENCE (*alpha* , *standard-dev* , *size*)

Description: Computes a value that can be used to construct a confidence interval for a population mean. The CONFIDENCE function assumes a normal distribution for calculation.

Arguments:

Name	Type	Description
<i>alpha</i>	number	The significance level used to compute the confidence level.
<i>standard-dev</i>	number	The population standard deviation for the data range.
<i>size</i>	number	The sample size, truncated to an integer.

Return Type and Value: number – A value that can be used to construct a confidence interval for a population mean.

However, if

- *alpha* ≤ 0 or *alpha* ≥ 1, #NUM! is returned.
- *standard-dev* ≤ 0, #NUM! is returned.
- *size* < 1, #NUM! is returned.

[Example:

CONFIDENCE(0.4,5,12) results in 1.214775614

CONFIDENCE(0.75,9,7) results in 1.083909234

end example]

18.17.7.48 CONVERT

Syntax:

CONVERT (*number* , *from-unit* , *to-unit*)

Description: Converts a number from one measurement system to another.

Arguments:

Name	Type	Description
<i>number</i>	number	The value to be converted from <i>from-units</i> to <i>to-units</i> .
<i>from-unit</i>	text	The unit to be converted from, where the permitted string values are shown in the tables below.
<i>to-unit</i>	text	The unit to be converted to, where the permitted string values are shown in the tables below.

Weight and Mass	
<i>Unit String</i>	<i>Meaning</i>
g	Gram
lbm	Pound mass (avoirdupois)
ozm	Ounce mass (avoirdupois)
sg	Slug
u	U (atomic mass unit)

Distance	
<i>Unit String</i>	<i>Meaning</i>
ang	Angstrom
ft	Foot
in	Inch
m	Meter
mi	Statute mile
Nmi	Nautical mile
Pica	Point (1/72 inch)
yd	Yard

Time	
<i>Unit String</i>	<i>Meaning</i>
day	Day
hr	Hour
mn	Minute
sec	Second
yr	Year

Pressure	
<i>Unit String</i>	<i>Meaning</i>
at or atm	Atmosphere
mmHg	mm of Mercury
P or p	Pascal

Force	
<i>Unit String</i>	<i>Meaning</i>
dy or dyn	Dyne
lbf	Pound force
N	Newton

Energy	
<i>Unit String</i>	<i>Meaning</i>
BTU or btu	BTU _{IT}
c	Thermodynamic calorie
cal	IT calorie
e	Erg
ev or eV	Electron volt
flb	Foot-pound
HPh or hh	Horsepower-hour
J	Joule
Wh or wh	Watt-hour

Power	
<i>Unit String</i>	<i>Meaning</i>
H or hp	Horsepower
W or w	Watt

Magnetism	
<i>Unit String</i>	<i>Meaning</i>
ga	Gauss
T	Tesla

Temperature	
<i>Unit String</i>	<i>Meaning</i>
C or cel	Degrees Celsius
F or fah	Degrees Fahrenheit
K or kel	Degrees Kelvin

Liquid Measure			
<i>Unit String</i>	<i>Meaning</i>	<i>Family Conversion Factor (Informative)</i>	<i>Metric Conversion Factor (Informative)</i>
AU_tbs	Australian tablespoon		20 ml
cup	U.S. cup (reduced accuracy)	½ pt	236.59 ml +/-0.025%
CZ_mass	Czech mass		1.4147 l
CZ_mug	Czech mug	¼ CZ_mass	0.358 l
gal	U.S. gallon (reduced accuracy)	8 pt	3.7854 l +/-0.025% For the purpose of comparison with calculations by applications using the antecedents to ECMA-376, the specific metric conversion factor value of 3.78624 l might be appropriate.
GB_tbs or CA_tbs or JP_tbs	United Kingdom tablespoon		15 ml
imperial_gal or AU_gal or CA_gal or GB_gal	Imperial gallon	8 imperial_pt	4.54609 l
imperial_oz or AU_oz or CA_oz or GB_oz	Imperial fluid ounce	1/20 imperial_pt	28.4130625 ml
imperial_pt or AU_pt or CA_pt or GB_pt or uk_pt	Imperial pint		0.56826125 l uk_pt might be reduced accuracy: +/- 0.025%
imperial_qt or AU_qt or CA_qt or GB_qt	Imperial quart	2 imperial_pt	1.1365225 l
JP_cup	Japanese cup		200 ml
l or lt	Liter		
metric_cup or AU_cup or	Metric cup		250 ml

Liquid Measure			
CA_cup or NZ_cup			
metric_tsp or AU_tsp or CA_tsp or JP_tsp or GB_tsp	Metric teaspoon		5 ml
ml	Milliliter	1/1000 l	1/1000 l
oz	U.S. fluid ounce (reduced accuracy)	1/16 pt	29.573 ml +/-0.025%
pt or us_pt	U.S. liquid pint		473.18 ml +/-0.025%
qt	U.S. liquid quart	2 pt	946.35 ml +/-0.025%
tbs	U.S. tablespoon (reduced accuracy)	½ oz	14.787 ml +/-0.025%
tsp	U.S. teaspoon (reduced accuracy)	1/6 oz	4.9289 ml +/-0.025%
US_cup	U.S. cup	½ US_pt	236.5882 ml
US_gal	U.S. gallon	8 US_pt	3.785412 l
US_oz	U.S. fluid ounce	1/16 US_pt	29.57353 ml
US_pt	U.S. liquid pint		473.1765 ml
US_qt	U.S. liquid quart	2 US_pt	946.3529 ml
US_tbs	U.S. tablespoon	½ US_oz	14.78676 ml
US_tsp	U.S. teaspoon	1/6 US_oz	4.928922 ml

The following abbreviated unit prefixes can be used with any metric unit:

Abbreviated Unit Prefixes	
Prefix String	Meaning
E	exa (1E+18)
P	peta (1E+15)
T	tera (1E+12)
G	giga (1E+09)
M	mega (1E+06)
k	kilo (1E+03)
h	hecto (1E+02)
e	deka (1E+01)

Abbreviated Unit Prefixes	
d	deci (1E-01)
c	centi (1E-02)
m	milli (1E-03)
u	micro (1E-06)
n	nano 1E-09)
p	pico (1E-12)
f	femto (1E-15)
a	atto (1E-18)

Unit names and prefixes are case-sensitive.

Return Type and Value: number – The value of *number* in *from-units* converted to *to-units*.

However, if

- The value of *from-unit* or *to-unit* is not one of the defined values, #N/A is returned.
- The *from-unit* and *to-unit* are from different measurement categories, #N/A is returned.
- The value of *from-unit* or *to-unit* has an abbreviated unit prefix, yet none is supported for that unit, #N/A is returned.

[Example:

```

CONVERT(10, "ozm", "g") results in 283.4951521
CONVERT(1, "yd", "mm") results in 914.4000003
CONVERT(1, "yd", "cm") results in 91.44000003
CONVERT(1, "yd", "m") results in 0.9144
CONVERT(1, "yd", "km") results in 0.0009144
CONVERT(1, "mi", "Nmi") results in 0.868976242
CONVERT(1, "day", "sec") results in 86400
CONVERT(0, "K", "C") results in -273.15

```

end example]

18.17.7.49 CORREL

Syntax:

```
CORREL ( array-1 , array-2 )
```

Description: Computes the correlation coefficient of the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The equation for the correlation coefficient is:

$$\text{Correl}(X, Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(array-1)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(array-2)`

Arguments:

Name	Type	Description
<i>array-1</i>	array, reference	The first cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>	array, reference	The second cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The correlation coefficient of the cells in two cell ranges.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* and *array-2* is empty, the return value is unspecified.
- The standard deviation of the values in *array-1* or *array-2* equals zero, the return value is unspecified.

[Example:

`CORREL({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in `-0.714976`

end example]

18.17.7.50 COS

Syntax:

`COS (x)`

Description: Computes the cosine of x .

Arguments:

Name	Type	Description
x	number	The value, in radians, whose cosine is to be determined.

Return Type and Value: number – The cosine of x .

[Example:

COS(-1) results in 0.540302306

COS(0) results in 1

COS(1) results in 0.540302306

end example]

18.17.7.51 COSH

Syntax:

COSH (x)

Description: Computes the hyperbolic cosine of x .

Arguments:

Name	Type	Description
x	number	The value whose hyperbolic cosine is to be determined.

Return Type and Value: number – The hyperbolic cosine of x .

However, if the magnitude of x is too large, #NUM! is returned.

[Example:

COSH(-1) results in 1.543080635

COSH(0) results in 1

COSH(1) results in 1.543080635

end example]

18.17.7.52 COUNT

Syntax:

COUNT (*argument-list*)

Description: Counts the number of *arguments* in *argument-list* that contain numbers, and the number of cells referred to by *arguments* in *argument-list*, which contain numbers.

Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> designates a value. Arguments that are numbers, logical values, dates, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, text, or error values in the array or reference shall be ignored. [Note: To count logical values, text, or error values as well, use the COUNTA (§18.17.7.53) function. <i>end note</i>]

Return Type and Value: number – The numeric argument and reference to numeric argument count.

[Example:

COUNT(1,2,3,4,5) results in 5

COUNT({1,2,3,4,5}) results in 5

COUNT({1,2,3,4,5},6,"7") results in 7

COUNT(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored

COUNT(10,E2), where E2 contains TRUE, results in 1, as E2 is ignored

end example]

18.17.7.53 COUNTA

Syntax:

COUNTA (*argument-list*)

Description: Counts the number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> designates a value. Arguments with values of any type shall be counted. However, empty cells shall not be counted. If an argument is an array or reference, only values in that array or reference shall be counted. Empty cells and text values in the array or reference shall be ignored. [Note: To exclude logical values, text, or error values, use the COUNT (§18.17.7.52) function. <i>end note</i>]

Return Type and Value: number – The number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

[Example:

COUNTA(1,2,3,4,5) results in 5

COUNTA({1,2,3,4,5}) results in 15

COUNTA({1,2,3,4,5},6,"7") results in 7

COUNTA(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored

COUNTA(10,E2), where E2 contains TRUE, results in 2, as E2 is counted

end example]

18.17.7.54 COUNTBLANK

Syntax:

COUNTBLANK (*cell-range*)

Description: Counts the number of cells in a specified range of cells, which are empty. A cell containing a formula that returns an empty string is counted, whereas a cell containing a zero value is not.

Arguments:

Name	Type	Description
<i>cell-range</i>	reference	Designates the range of cells to be inspected.

Return Type and Value: number – The number of empty cells in the range specified.

[Example:

COUNTBLANK(A2:C2), where A2 and B2 are empty, but C2 is not, results in 2

end example]

18.17.7.55 COUNTIF

Syntax:

COUNTIF (*cell-range* , *selection-criteria*)

Description: Counts the number of cells in a specified range of cells, whose values meet the specified criteria.

Arguments:

Name	Type	Description
<i>cell-range</i>	reference	Designates the range of cells to be inspected.

Name	Type	Description
<i>selection-criteria</i>	number, expression, reference, text	Designates the cells to be counted. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).

Return Type and Value: number – The number of cells in the range specified that meet the criteria.

[Example: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

COUNTIF(A1:D1, "=10") results in 2

COUNTIF(A1:D1, ">5") results in 30

COUNTIF(A1:D1, "<>10") results in 2

Given that A2, B2, C2, and D2, respectively, contain the values apples, oranges, grapes, and melons

COUNTIF(A2:D2, "*es") results in 3

COUNTIF(A2:D2, "?a*") results in 2

COUNTIF(A2:D2, "*1*") results in 2

end example]

18.17.7.56 COUNTIFS

Syntax:

COUNTIFS (*count-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, ...]])

Description: Counts the number of cells within a range that meet multiple criteria.

Arguments:

Name	Type	Description
<i>count-range</i>	reference	Designates the cells whose values are included. <i>count-range</i> does not have to have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>count-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> .

Name	Type	Description
<i>cell-range-1</i>	reference	Designates the first range of cells to be inspected. Each cell in a range is counted only if all of the corresponding criteria specified are true for that cell.
<i>selection-criteria-1</i>	number, expression, reference, text	Designates the first range of cells to be counted. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>cell-range-n</i>	reference	The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively.
<i>selection-criteria-n</i>	number, expression, reference, text	

If a cell in any argument is an empty cell, it is treated as if it had the value 0.

Return Type and Value: number – The count of the cells corresponding to those selected.

[Example: Given the following data:

	A	B	C	D
1	Sales Person	Exceeded Tables Quota	Exceeded Chairs Quota	Exceeded Desks Quota
2	Davolio	Yes	No	No
3	Buchanan	Yes	Yes	No
4	Suyama	Yes	Yes	Yes
5	Leverling	No	Yes	Yes

COUNTIFS(B2:D2, "=Yes") results in 1 (counts how many times Davolio exceeded a sales quota for tables, chairs, and desks)

COUNTIFS(B2:B5, "=Yes", C2:C5, "=Yes") results in 2 (counts how many sales people exceeded both their tables and chairs quota)

COUNTIFS(B5:D5, "=Yes", B3:D3, "=Yes") results in 1 (counts how many times Leverling and Buchanan exceeded the same quota for tables, chairs, and desks)

end example]

18.17.7.57 COUPDAYBS

Syntax:

COUPDAYBS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days from the beginning of the coupon period to the settlement date.

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30
Value	Day Count Basis					
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30					

Name	Type	Description	
			days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to

Name	Type	Description	
			day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days from the beginning of the coupon period to the settlement date.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

COUPDAYBS (DATE (2007, 1, 25), DATE (2008, 11, 15), 2, 1) results in 71

COUPDAYBS (DATE (2007, 1, 25), DATE (2008, 11, 15), 2) results in 70

end example]

18.17.7.58 COUPDAYS

Syntax:

COUPDAYS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days in the coupon period that contains the settlement date.

Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4.

Name	Type	Description								
		<i>frequency</i> is truncated to an integer.								
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows:								
		<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. Time information in the date arguments is ignored.

Return Type and Value: number – The previous coupon date before the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPPCD(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 15-Nov-2006

end example]

18.17.7.63 COVAR

Syntax:

COVAR (*array-1* , *array-2*)

Description: Computes covariance; that is, the average of the products of deviations for each data point pair in the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The covariance is:

$$\text{Cov}(X, Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{n}$$

where

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*array-1*)
- y = a sample value
- \bar{y} = the sample mean AVERAGE(*array-2*)

Arguments:

Name	Type	Description
<i>array-1</i>	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>		

Return Type and Value: number – The covariance.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[Example:

COVAR({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7}) results in -1.375374

end example]

18.17.7.64 CRITBINOM

Syntax:

CRITBINOM (*number-trials* , *success-probability* , *alpha*)

Description: Computes the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

Arguments:

Name	Type	Description
<i>number-trials</i>	number	The number of Bernoulli trials.
<i>success-probability</i>	number	The probability of success on each trial.
<i>alpha</i>	number	The criterion value.

Return Type and Value: number – The smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

However, if

- *number-trials* < 0, #NUM! is returned.
- *success-probability* is < 0 or *success-probability* > 1, #NUM! is returned.
- *alpha* < 0 or *alpha* > 1, #NUM! is returned.

[Example:

CRITBINOM(6,0.5,0.75) results in 4

CRITBINOM(12,0.3,0.95) results in 6

end example]

18.17.7.65 CUBEKPIMEMBER

Syntax:

CUBEKPIMEMBER (*connection* , *kpi-name* , *kpi-property* [, [*caption*]])

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, a Key Performance Indicator (KPI) name, property, and measure, and displays the name and property in the cell. A KPI is a quantifiable measurement, such as monthly gross profit or quarterly employee turnover, used to monitor an organization's performance.

Arguments:

Name	Type	Description														
connection	text	The name of the connection to the cube.														
kpi-name	text	The name of the KPI in the cube.														
kpi-property	number	<div>The KPI component to be returned, truncated to integer; it shall be one of the following:<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>The actual value, at the time the function is executed.</td></tr><tr><td>2</td><td>A target value of the KPI, which can be compared to the actual value in order to determine if the underlying indicator is meeting its goal.</td></tr><tr><td>3</td><td>The state of the KPI at a specific moment in time</td></tr><tr><td>4</td><td>A measure of the value over time</td></tr><tr><td>5</td><td>The relative importance assigned to the KPI on the server. If this KPI is assigned a parent KPI, then this number can be used on the server to proportionally adjust the results of this KPI value when calculating the value of the parent KPI. While this number can be shown in the spreadsheet application, it is assumed that it is used by the server for any calculations affecting the KPI.</td></tr><tr><td>6</td><td>The unique name of the member in the time dimension that defines the timeframe of the KPI.</td></tr></table></div>	Value	Description	1	The actual value, at the time the function is executed.	2	A target value of the KPI, which can be compared to the actual value in order to determine if the underlying indicator is meeting its goal.	3	The state of the KPI at a specific moment in time	4	A measure of the value over time	5	The relative importance assigned to the KPI on the server. If this KPI is assigned a parent KPI, then this number can be used on the server to proportionally adjust the results of this KPI value when calculating the value of the parent KPI. While this number can be shown in the spreadsheet application, it is assumed that it is used by the server for any calculations affecting the KPI.	6	The unique name of the member in the time dimension that defines the timeframe of the KPI.
Value	Description															
1	The actual value, at the time the function is executed.															
2	A target value of the KPI, which can be compared to the actual value in order to determine if the underlying indicator is meeting its goal.															
3	The state of the KPI at a specific moment in time															
4	A measure of the value over time															
5	The relative importance assigned to the KPI on the server. If this KPI is assigned a parent KPI, then this number can be used on the server to proportionally adjust the results of this KPI value when calculating the value of the parent KPI. While this number can be shown in the spreadsheet application, it is assumed that it is used by the server for any calculations affecting the KPI.															
6	The unique name of the member in the time dimension that defines the timeframe of the KPI.															

Name	Type	Description	
			[<i>Example</i> : A KPI could be associated with the first quarter of the year 2007. <i>end example</i>]
		If 1 is specified, only <i>kpi-name</i> is displayed in the cell.	
<i>caption</i>	text	An alternative string whose value is displayed in the cell instead of <i>kpi-name</i> and <i>kpi-property</i> .	

Return Type and Value: any – The selected key performance indicator.

However, if

- *kpi-name* is not the name of a KPI in the cube, the return value is unspecified.
- *kpi-property* is outside the range 1–6, #N/A is returned.
- The *connection* name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.

[*Example*:

```
CUBEKPIMEMBER("Sales","MySalesKPI",1)
CUBEKPIMEMBER("Sales","MySalesKPI",2,"Sales KPI Goal")
```

end example]

18.17.7.66 CUBEMEMBER

Syntax:

```
CUBEMEMBER ( connection , member-expression , [ , [ caption ] ] )
```

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, the member or tuple defined by *member-expression*. [*Note*: This function is used to ensure that the member or tuple exists in the cube. *end note*]

When a call to CUBEMEMBER is used as an argument to another CUBExxx function, the MDX expression that identifies the member or tuple is used by that CUBExxx function, rather than the displayed value in the cell of the CUBEMEMBER function.

Arguments:

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.
<i>member-expression</i>	text, reference, array	A multidimensional expression (MDX) that evaluates to a unique member in the cube. Alternatively, <i>member-expression</i> can be a tuple, specified as a cell range or an array constant. [Note: MDX is a standard query language for OLAP cubes. <i>end note</i>]
<i>caption</i>	text	The string displayed in the cell instead of the caption from the cube (assuming it defines such a caption). When a tuple is returned, the caption used is the one for the last member in the tuple.

Return Type and Value: any – A member or tuple in a cube hierarchy.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```

CUBEMEMBER("Sales","[Time].[Fiscal].[2004]")
CUBEMEMBER($A$1,D$12)
CUBEMEMBER("Sales",(B4,C6,D5),"SalesFor2004")
CUBEMEMBER("Sales",{[Products].[Food];[Time].[Fiscal].[2004]})
CUBEMEMBER($A$1,C$12:D$12)

```

end example]

18.17.7.67 CUBEMEMBERPROPERTY

Syntax:

```
CUBEMEMBERPROPERTY ( connection , member-expression , property )
```

Description: Fetches a property of a member in the OLAP cube on an OLAP server. [*Note: Use this function to ensure that a member name exists within the cube and to return the specified property for this member. end note*]

Arguments:

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.
<i>member-expression</i>	text	A multidimensional expression (MDX) that evaluates to a unique member in the cube. [<i>Note: MDX is a standard query language for OLAP cubes. end note</i>]
<i>property</i>	text	The name of the property returned or a reference to a cell that contains the name of the property.

Return Type and Value: any – A property of a member in the OLAP cube.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.

[*Example:*

```
CUBEMEMBERPROPERTY("Sales","[Time].[Fiscal].[2004]",$A$3)
CUBEMEMBERPROPERTY("Sales","[Store].[MyFavoriteStore]",
"[Store].[Store Name].[Store Sqft]")
```

end example]

18.17.7.68 CUBERANKEDMEMBER

Syntax:

CUBERANKEDMEMBER (*connection* , *set-expression* , *rank* [, *caption*])

Description: Fetches the n^{th} , or ranked, member in a set.

Arguments:

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.

Name	Type	Description
<i>set-expression</i>	text	A set expression, such as "[{Item1}.children]".
<i>rank</i>	number	Specifies the top value to return, truncated to integer. If 1, the top value is returned; if 2, the second-most top value is returned; and so on.
<i>caption</i>	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).

Return Type and Value: any – The n^{th} member in the set.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified. , the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```
CUBERANKEDMEMBER("Sales",$D$4,1,"Top Month")
CUBERANKEDMEMBER("Sales",CUBESET("Sales","Summer","[2004].[June]",
"[2004].[July]","[2004].[August]"),3,"Top Month")
```

end example]

18.17.7.69 CUBESET

Syntax:

```
CUBESET ( connection , set-expression [ , [ caption ] [ , [ sort-order ]
[ , [ sort-by ] ] ] ] )
```

Description: Fetches from the OLAP cube on the OLAP server designated by *connection* the set of members or tuples that is defined by *set-expression*. [Note: Use this function to build dynamic reports that aggregate and filter data, by using the return value as a slicer in the CUBEVALUE function, the CUBERANKEDMEMBER function to choose specific members from the calculated set, and the CUBESETCOUNT function to control the size of the set. end note]

Arguments:

Name	Type	Description																								
<i>connection</i>	text	The name of the connection to the cube.																								
<i>set-expression</i>	text, reference	A set expression that results in a set of members or tuples. <i>set-expression</i> can also be a cell reference to range that contains one or more members, tuples, or sets included in the set.																								
<i>caption</i>	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).																								
<i>sort-order</i>	text	<p>The type of sort, if any, to perform; it can be one of the following:</p> <table data-bbox="766 640 1357 1453"> <tr> <th>Value</th><th>Description</th><th><i>sort-by</i> argument</th></tr> <tr> <td>0 or default</td><td>Leaves the set in existing order</td><td>Ignored</td></tr> <tr> <td>1</td><td>Sorts set in ascending order by <i>sort_by</i></td><td>Required</td></tr> <tr> <td>2</td><td>Sorts set in descending order by <i>sort_by</i></td><td>Required</td></tr> <tr> <td>3</td><td>Sorts set in alphabetic ascending order</td><td>Ignored</td></tr> <tr> <td>4</td><td>Sorts set in alphabetic descending order</td><td>Ignored</td></tr> <tr> <td>5</td><td>Sorts set in natural ascending order</td><td>Ignored</td></tr> <tr> <td>6</td><td>Sorts set in natural descending order</td><td>Ignored</td></tr> </table> <p>An alphabetic sort for a set of tuples sorts on the last element in each tuple.</p>	Value	Description	<i>sort-by</i> argument	0 or default	Leaves the set in existing order	Ignored	1	Sorts set in ascending order by <i>sort_by</i>	Required	2	Sorts set in descending order by <i>sort_by</i>	Required	3	Sorts set in alphabetic ascending order	Ignored	4	Sorts set in alphabetic descending order	Ignored	5	Sorts set in natural ascending order	Ignored	6	Sorts set in natural descending order	Ignored
Value	Description	<i>sort-by</i> argument																								
0 or default	Leaves the set in existing order	Ignored																								
1	Sorts set in ascending order by <i>sort_by</i>	Required																								
2	Sorts set in descending order by <i>sort_by</i>	Required																								
3	Sorts set in alphabetic ascending order	Ignored																								
4	Sorts set in alphabetic descending order	Ignored																								
5	Sorts set in natural ascending order	Ignored																								
6	Sorts set in natural descending order	Ignored																								
<i>sort-by</i>	text	The value by which to sort. [Example: To get the city with the highest sales, set-expression would be a set of cities, and sort-by would be the sales measure. To get the city with the highest population, set-expression would be a set of cities, and sort-by would be the population measure. end example]																								

Return Type and Value: any – The set of members or tuples.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.
- *sort-order* is outside the range 0–6, #N/A is returned.
- *sort-order* requires *sort-by*, but *sort-by* is omitted, #VALUE! is returned.

[Example:

```
CUBESet("Finance", "Order([Product].[Product].[Product Category]
.Members,[Measures].[Unit Sales],ASC)", "Products")
```

```
CUBESet("Sales", "[Product].[All Products].Children",
"Products", 1, "[Measures].[Sales Amount]")
```

end example]

18.17.7.70 CUBESetCOUNT

Syntax:

```
CUBESetCOUNT ( set )
```

Description: Computes the number of items in a set.

Arguments:

Name	Type	Description
<i>set</i>	text	An expression that evaluates to a set defined by the CUBESet function.

Return Type and Value: number – The number of items in a set.

[Example:

```
CUBESetCOUNT(A3)
```

```
CUBESetCOUNT(CUBESet("Sales", "[Product].[All Products].Children",
"Products", 1, "[Measures].[Sales Amount]"))
```

end example]

18.17.7.71 CUBEVALUE

Syntax:

CUBEVALUE (*connection* , *argument-list*)

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, the aggregated value defined by a series of member-expression *arguments* in *argument-list*.

Arguments:

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.
<i>argument-list</i>	text, reference	Each <i>argument</i> in <i>argument-list</i> is text containing a multidimensional expression (MDX) that evaluates to a member or tuple within the cube. Alternatively, an <i>argument</i> can be a set defined with the CUBESET function. Use any <i>argument</i> as a slicer to define the portion of the cube for which the aggregated value is returned. If no measure is specified in an <i>argument</i> , the default measure for that cube is used. If a cell reference is used for an <i>argument</i> , and that cell reference contains a CUBE function, then that <i>argument</i> uses the MDX expression for the item in the referenced cell, and not the value displayed in that referenced cell. [Note: MDX is a standard query language for OLAP cubes. end note]

Return Type and Value: any – The aggregated value.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by an *argument* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified. (This can occur with multiple elements from the same hierarchy.)
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```

CUBEVALUE("Sales", "[Measures].[Profit]", "[Time].[2004]",
  "[All Product].[Beverages]")
CUBEVALUE($A$1, "[Measures].[Profit]", D$12, $A23)
CUBEVALUE("Sales", $B$7, D$12, $A23)

```

end example]

18.17.7.72 CUMIPMT

Syntax:

CUMIPMT (*rate* , *nper* , *pv* , *start-period* , *end-period* , *type*)

Description: Computes the cumulative interest paid on a loan between *start-period* and *end-period*.

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>nper</i>	number	The total number of payment periods, truncated to integer.						
<i>pv</i>	number	The present value.						
<i>start-period</i>	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)						
<i>end-period</i>	number	The last period in the calculation.						
<i>type</i>	number	<div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative interest paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0 , #NUM! is returned.
- *start-period* < 1 or *end-period* < 1 , or *start-period* $> end_period$, #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

CUMIPMT(0.09/12, 30*12, 125000, 13, 24, 0) results in -11135.23

CUMIPMT(0.09/12, 30*12, 125000, 1, 1, 0) results in -937.50

end example]

18.17.7.73 CUMPRINC

Syntax:

CUMPRINC (*rate* , *nper* , *pv* , *start-period* , *end-period* , *type*)

Description: Computes the cumulative principal paid on a loan between *start-period* and *end-period*.

Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>nper</i>	number	The total number of payment periods, truncated to integer.						
<i>pv</i>	number	The present value.						
<i>start-period</i>	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)						
<i>end-period</i>	number	The last period in the calculation.						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative principal paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0, #NUM! is returned.
- *start-period* < 1 or *end-period* < 1, or *start-period* > *end-period*, #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

CUMPRINC(0.09/12,30*12,125000,13,24,0) results in -934.11

CUMPRINC(0.09/12,30*12,125000,1,1,0) results in -68.28

end example]

18.17.7.74 DATE

Syntax:

DATE (*year* , *month* , *day*)

Description: Computes the serial date-time for the given date.

Arguments:

Name	Type	Description
<i>year</i>	number	<p>A positive number, truncated to an integer representing the year, that together with <i>month</i> and <i>day</i> specifies the date whose serial date-time is to be computed.</p> <p>For the 1900 date system:</p> <ul style="list-style-type: none"> If <i>year</i> is in the range 0–99, inclusive, the year shall be interpreted as <i>year</i> + 1900. If <i>year</i> is in the range 100–9999, inclusive, the year shall be interpreted as <i>year</i>. <p>For the 1904 date system:</p> <ul style="list-style-type: none"> If <i>year</i> is in the range 0–1899, inclusive, the year shall be interpreted as <i>year</i> + 1900. If <i>year</i> is in the range 1900–9999, inclusive, the year shall be interpreted as <i>year</i>.
<i>month</i>	number	<p>A month, truncated to integer, that together with <i>year</i> and <i>day</i> specifies the date whose serial date-time is to be computed.</p> <p><i>month</i> shall be interpreted as the number of months relative to the final month of the year prior to the specified year.</p>
<i>day</i>	number	<p>A day, truncated to integer, that together with <i>month</i> and <i>year</i> specifies the date whose serial date-time is to be computed.</p> <p><i>day</i> shall be interpreted as the number of days relative to the last day of the month (and its associated year) prior to the month (and its associated year) as determined from <i>month</i> and <i>year</i> (see below).</p>

The value of *month* or *day* in a *year-month-day* argument triplet can be out of range. *month* is simply an instance of counting a given number of months, minus one, relative to January of the year specified, using the Gregorian calendar [ISO 8601]. This calendar defines that there are 12 months in a year, and that when counting forward, the month following December of one year is January of the following year, and when counting backward, the month preceding January of one year is December of the previous year. Likewise, *day* is simply an instance of counting a given number of days, minus one, relative to the first day of the adjusted month, using the Gregorian calendar. This calendar defines the number of days in each month, and that when counting forward, the day following the final day of one month is the first day of the following month, and when counting backward, the day preceding the first day of one month is the final day of the previous month. [Example: The *year-month-day* argument triplets (2007, 12,32), (2007,13,1), and (2008,1,1) all result in the same serial date. end example]

[Note: One way to handle out-of-range values for *month* or *day* is as follows:

Compute $\text{yearAdjust} = \text{INT}((\text{month} - 1)/12)$

Compute $\text{adjustedMonth} = \text{month} - (\text{yearAdjust} * 12)$

Compute $\text{adjustedYear} = \text{year} + \text{yearAdjust}$.

A *serialDateBase* can now be computed for the first day of the *adjustedYear* and *adjustedMonth*. Finally, compute the serial date for the full triplet by adding (*day*-1) to this *serialDateBase*. end note]

Return Type and Value: number – The serial date-time for the given date.

However, if *year* is outside the acceptable range for the date system currently in use, #NUM! is returned.

[Example: For the 1900 backward compatibility date-base date system:

DATE(0,1,1) results in a serial date-time of 1

DATE(1899,1,1) results in a serial date-time of 693598

DATE(1900,1,1) results in a serial date-time of 1

DATE(9999,12,31) results in a serial date-time of 2958465

For the 1904 date system:

DATE(4,1,1) results in a serial date-time of 0

DATE(1899,1,1) results in a serial date-time of 692136

DATE(1904,1,1) results in a serial date-time of 0

DATE(9999,12,31) results in a serial date-time of 2957003

end example]

18.17.7.75 DATEDIF

Syntax:

DATEDIF (*start-date* , *end-date* , *unit*)

Description: Calculates the number of days, months, or years between two dates.

Arguments:

Name	Type	Description														
<i>start-date</i>	number	The first date in the period, truncated to integer.														
<i>end-date</i>	number	The last date in the period, truncated to integer.														
<i>unit</i>	text	<div>The count to be returned, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>"Y"</td><td>The number of complete years in the period.</td></tr><tr><td>"M"</td><td>The number of complete months in the period.</td></tr><tr><td>"D"</td><td>The number of days in the period.</td></tr><tr><td>"MD"</td><td>The difference between the days in <i>start-date</i> and <i>end-date</i>. The months and years of the dates are ignored.</td></tr><tr><td>"YM"</td><td>The difference between the months in <i>start-date</i> and <i>end-date</i>. The days and years of the dates are ignored.</td></tr><tr><td>"YD"</td><td>The difference between the days of <i>start-date</i> and <i>end-date</i>. The years of the dates are ignored.</td></tr></table></div>	Value	Day Count Basis	"Y"	The number of complete years in the period.	"M"	The number of complete months in the period.	"D"	The number of days in the period.	"MD"	The difference between the days in <i>start-date</i> and <i>end-date</i> . The months and years of the dates are ignored.	"YM"	The difference between the months in <i>start-date</i> and <i>end-date</i> . The days and years of the dates are ignored.	"YD"	The difference between the days of <i>start-date</i> and <i>end-date</i> . The years of the dates are ignored.
Value	Day Count Basis															
"Y"	The number of complete years in the period.															
"M"	The number of complete months in the period.															
"D"	The number of days in the period.															
"MD"	The difference between the days in <i>start-date</i> and <i>end-date</i> . The months and years of the dates are ignored.															
"YM"	The difference between the months in <i>start-date</i> and <i>end-date</i> . The days and years of the dates are ignored.															
"YD"	The difference between the days of <i>start-date</i> and <i>end-date</i> . The years of the dates are ignored.															

Return Type and Value: number – The number of days, months, or years between two dates, depending on the value of *unit*.

However, if

- *start-date* or *end-date* is out of range for the current date system, #NUM! is returned.
- *start-date* ≥ *end-date* #NUM! is returned.
- *unit* is any value other than those shown in the table above, #NUM! is returned.

[Example:

DATEDIF (DATE(2001,1,1),DATE(2003,1,1),"Y") results in 2 complete years

DATEDIF (DATE (2001,6,1),DATE (2002,8,15) ,"D") results in 440 days
DATEDIF (DATE (2001,6,1),DATE (2002,8,15) ,"YD") results in 75 days
DATEDIF (DATE (2001,6,1),DATE (2002,8,15) ,"MD") results in 14 days

end example]

18.17.7.76 DATEVALUE

Syntax:

DATEVALUE (*date-time-string*)

Description: Computes the serial date-time of the date represented by the string *date-time-string*, taking into account the current date system.

Arguments:

Name	Type	Description
<i>date-time-string</i>	text	The date and/or time whose serial date-time is to be computed. <i>date-time-string</i> can have any supported date and/or time format. If the year portion of <i>date-time-string</i> is omitted, the current year is used. Any time information in <i>date-time-string</i> shall be ignored. When <i>date-time-string</i> contains both a date and time part, times in <i>date-time-string</i> are truncated. Time-only values for <i>date-time-string</i> are special cased to return 0 so that when they are used in date addition and subtraction, time-only strings are ignored.

Return Type and Value: number – The serial date-time of the date represented by the string *date-time-string*.

However, if

- *date-time-string* is out of range for the current date system, #VALUE! is returned.
- *date-time-string* does not represent a date, #VALUE! is returned.
- *date-time-string* contains only a time, 0 is returned so that when it used in date addition and subtraction, time-only strings are ignored.

[Example: When the current year is 2006,

DATEVALUE ("2/1/2006")
DATEVALUE ("01-Feb-2006 10:06 AM")
DATEVALUE ("2006/2/1")
DATEVALUE ("2006-2-1")
DATEVALUE ("1-Feb")

all result in 38749 for the 1900 date system, or 37287 for the 1904 date system. *end example*]

18.17.7.77 DAVERAGE

Syntax:

DAVERAGE (*database* , *field* , *criteria*)

Description: Averages the values in a column of a list or database that match the specified criteria.

In order to perform an operation on an entire column in a database, a blank line shall be entered below the column labels in the criteria range.

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database, which shall be a list of related data in which rows of related information are records, and columns of data are fields. The first row of the list shall contain labels for each column.
<i>field</i>	text, number	Indicates the column to which <i>criteria</i> shall be applied. It can either be a string containing the column's label, or the column's position number, where columns are numbered starting at 1. [Example: If column 3's label is "Age" then either 3 or "Age" can be used. <i>end example</i>]
<i>criteria</i>	reference	The range of cells that contains the specified conditions. Each cell in that range that contains a condition shall have a value that is the form of a number, an expression, a cell reference, or text that defines which cells are selected. In the case of text, <i>criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). A text <i>criteria</i> can also consist of any comparison operator followed by the operand against which each cell's value is to be compared. If the text does not begin with a comparison operator, the criteria matches any string starting with that text, as though the criteria were suffixed by an asterisk (*). [Example: A criteria of "Pea" can result in Pea, Pear, and Peach's being matched, whereas a criteria of "=Pea" only matches Pea. <i>end example</i>] Comparison operators do not require a prefix if used in the string, however it is not possible to specifically search for a string which begins with a comparison operator.

Name	Type	Description
		<p>The range shall include at least one column label and at least one cell below the column label in which a condition for the column is specified. [Example: If the range G1:G2 contains the column label Income in G1 and the amount 10,000 in G2, one could define the range as MatchIncome and use that name as <i>criteria</i>. end example] The value of <i>criteria</i> shall not overlap the range specified by <i>database</i>.</p> <p>To find rows that meet multiple criteria for a single column, all of the criteria shall be specified directly below one another in separate rows of the <i>criteria</i> range.</p> <p>To find rows that meet multiple criteria for multiple columns, all of the criteria shall be specified in the same row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple criteria for multiple columns, where any criteria can be true, each of the criteria shall be specified in a different row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple sets of criteria, where each set includes criteria for multiple columns, each set of criteria shall be specified in a separate row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple sets of criteria, where each set includes criteria for one column, multiple columns with the same column heading shall be included in the <i>criteria</i> range.</p>

Return Type and Value: number – The average of the values of the cells that correspond to the specified criteria.

[Example: Given the following data:

	A	B	C	D	E	F
1	Tree	Height	Age	Yield	Profit	Height
2	=Apple	>10				<16
3	=Pear					
4	Tree	Height	Age	Yield	Profit	
5	Apple	18	20	14	105.00	
6	Pear	12	12	10	96.00	
7	Cherry	13	14	9	105.00	
8	Apple	14	15	10	75.00	
9	Pear	9	8	8	76.80	

	A	B	C	D	E	F
10	Apple	8	9	6	45.00	

the average yield of apple trees over 10 feet in height is computed by `DAVERAGE(A4:E10,"Yield",A1:B2)`, which results in 12

The average age of all trees is computed by `DAVERAGE(A4:E10,3,A4:E10)`, which results in 13

end example]

18.17.7.78 DAY

Syntax:

`DAY (date-value)`

Description: Computes the numeric day of the month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date system.

Arguments:

Name	Type	Description
<i>date-value</i>	number, text	The date and/or time whose day is to be computed. That date and/or time shall be expressed either as a serial date-time, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The day of the month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*. The returned value shall be in the range 1–31.

However, if *date-value* is out of range for the current date system, `#NUM!` is returned.

[Example:

`DAY(DATE(2006,1,2))` results in 2

`DAY(DATE(2006,0,2))` results in 31

`DAY("2006/1/2 10:45 AM")` results in 2

`DAY(30000)` results in 18 for the 1900 date system, or 19 for the 1904 date system

end example]

18.17.7.79 DAYS360

Syntax:

DAYS360 (*start-date* , *end-date* [, *method-flag*])

Description: Computes the signed number of days between two dates based on a 360-day year (twelve 30-day months).

Arguments:

Name	Type	Description						
<i>start-date</i>	number	<i>start-date</i> and <i>end-date</i> are the dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .						
<i>start-date</i>	number							
<i>method-flag</i>	logical	Specifies whether to use the U.S. or European method in the calculation, as follows: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>FALSE or omitted</td><td>U.S. (NASD) method: If the <i>start-date</i> is the 31st day of a month, it is changed to the 30th day of that same month. If the <i>end-date</i> is the 31st day of a month and the <i>start-date</i> is earlier than the 30th day of a month, the <i>end-date</i> is changed to the 1st day of the following month; otherwise the <i>end-date</i> is changed to the 30th day of the same month.</td></tr><tr><td>TRUE</td><td>European method: <i>start-dates</i> and <i>end-dates</i> that occur on the 31st day of a month are changed to the 30th day of the same month.</td></tr></table>	Value	Meaning	FALSE or omitted	U.S. (NASD) method: If the <i>start-date</i> is the 31st day of a month, it is changed to the 30th day of that same month. If the <i>end-date</i> is the 31st day of a month and the <i>start-date</i> is earlier than the 30th day of a month, the <i>end-date</i> is changed to the 1st day of the following month; otherwise the <i>end-date</i> is changed to the 30th day of the same month.	TRUE	European method: <i>start-dates</i> and <i>end-dates</i> that occur on the 31st day of a month are changed to the 30th day of the same month.
Value	Meaning							
FALSE or omitted	U.S. (NASD) method: If the <i>start-date</i> is the 31st day of a month, it is changed to the 30th day of that same month. If the <i>end-date</i> is the 31st day of a month and the <i>start-date</i> is earlier than the 30th day of a month, the <i>end-date</i> is changed to the 1st day of the following month; otherwise the <i>end-date</i> is changed to the 30th day of the same month.							
TRUE	European method: <i>start-dates</i> and <i>end-dates</i> that occur on the 31st day of a month are changed to the 30th day of the same month.							

Return Type and Value: number – The signed number of days between two dates based on a 360-day year (12 30-day months). If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the difference in days.

However, if *start-date* or *end-date* is out of range for the current date system, #NUM! is returned.

[Example:

DAYS360(DATE(2002,2,3),DATE(2005,5,31)) results in 1198

DAYS360(DATE(2005,5,31),DATE(2002,2,3)) results in -1197

DAYS360(DATE(2002,2,3),DATE(2005,5,31),FALSE) results in 1198

DAYS360(DATE(2002,2,3),DATE(2005,5,31),TRUE) results in 1197

| end example]

18.17.7.80 DB

Syntax:

DB (*cost* , *salvage* , *life* , *period* [, [*month*]])

Description: Computes the depreciation of an asset for a specified period using the fixed-declining balance method.

Mathematical Formula:

The fixed-declining balance method computes depreciation at a fixed rate. DB uses the following formulas to calculate depreciation for a period:

$$(cost - total\ depreciation\ from\ prior\ periods) \times rate$$

where:

$$rate = 1 - \left(\frac{salvage}{cost} \right)^{\frac{1}{life}}, \text{ rounded to three decimal places}$$

Depreciation for the first and last periods is a special case. If argument *month* is omitted, depreciation for the first period is calculated using the formula $cost \times rate$.

If month argument is entered, use the following formulas:

For the first period, DB uses this formula:

$$\frac{cost \times rate \times month}{12}$$

For the last period, DB uses this formula:

$$\frac{(cost - total\ depreciation\ from\ prior\ periods) \times rate \times (12 - month)}{12}$$

where:

- *cost* = argument *cost*
- *life* = argument *life*
- *rate* = $1 - (salvage / cost)^{(1 / life)}$, rounded to three decimals
- *salvage* = argument *salvage*

- *total depreciation from prior periods* = DB(cost, salvage, life, 1, [month]) + DB(cost, salvage, life, 2, [month]) + ... + DB(cost, salvage, life, period-1, [month]), where period > 1

Arguments:

Name	Type	Description
<i>cost</i>	number	The initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>period</i>	number	The period for which the depreciation is to be calculated. (<i>period</i> shall use the same units as <i>life</i> .)
<i>month</i>	number	The number of months in the first year. If omitted, a value of 12 is used.

Return Type and Value: number – The depreciation of an asset for a specified period using the fixed-declining balance method.

However, if

- *cost*, *salvage*, *life*, or *period* < 0, #NUM! is returned.
- *month* is outside the range 1–12, #NUM! is returned.

[Example:

DB(1000000,100000,6,1,7) results in 186,083.33
 DB(1000000,100000,6,2,7) results in 259,639.42
 DB(1000000,100000,6,3,7) results in 176,814.44
 DB(1000000,100000,6,4,7) results in 120,410.64
 DB(1000000,100000,6,5,7) results in 81,999.64
 DB(1000000,100000,6,6,7) results in 55,841.76
 DB(1000000,100000,6,7,7) results in 15,845.10

end example]

18.17.7.81 DCOUNT

Syntax:

DCOUNT (*database* , *field* , *criteria*)

Description: Counts the number of values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The count of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Age fields that contain numbers is computed by DCOUNT(A4:E10, "Age", A1:F2), which results in 1.

end example]

18.17.7.82 DCOUNTA

Syntax:

DCOUNTA (*database* , *field* , *criteria*)

Description: Counts the number of non-blank cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.)

Return Type and Value: number – The count of the non-blank cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is

computed by DCOUNTA(A4:E10, "Profit", A1:F2), which results in 1.

end example]

18.17.7.83 DDB

Syntax:

DDB (*cost* , *salvage* , *life* , *period* [, *factor*])

Description: Computes the depreciation of an asset for a specified period using the double-declining balance or some other specified method. [Note: Use VDB (§18.17.7.341) for a straight-line depreciation method when depreciation is greater than the declining balance calculation. *end note*]

Mathematical Formula:

$$\text{MIN}((\text{cost} - \text{total depreciation from prior periods}) \times \left(\frac{\text{factor}}{\text{life}}\right), (\text{cost} - \text{salvage} - \text{total depreciation from prior periods}))$$

where:

cost = argument *cost*

factor = argument *factor*

life = argument *life*

salvage = argument *salvage*

total depreciation from prior periods = DDB(*cost*, *salvage*, *life*, 1, [*factor*]) + DDB(*cost*, *salvage*, *life*, 2, [*factor*]) + ... + DDB(*cost*, *salvage*, *life*, *period*-1, [*factor*]), where *period* > 1. Depreciation for period = 1 can be calculated by using *cost* × *factor*/*life*.

Arguments:

Name	Type	Description
<i>cost</i>	number	The initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>period</i>	number	The period for which the depreciation is to be calculated. (<i>period</i> shall use the same units as <i>life</i> .)

Name	Type	Description
<i>factor</i>	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).

Return Type and Value: number – The depreciation of an asset for a specified period.

However, if

- salvage < 0 #NUM! is returned.
- cost life <= 0, #NUM! is returned.
- life <= 0 #NUM! is returned.
- period <= 0, #NUM! is returned.
- factor <= 0, #NUM! is returned.

[Example:

DDB(2400,300,10*365,1) results in 1.32

DDB(2400,300,10*12,1,2) results in 40.00

DDB(2400,300,10,1,2) results in 480.00

DDB(2400,300,10,2,1.5) results in 306.00

DDB(2400,300,10,10) results in 22.12

end example]

18.17.7.84 DEC2BIN

Syntax:

DEC2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	number	The decimal number that is to be converted to a binary string.
<i>num-bin-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number* using twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -512 (1000000000 binary) to 511 (0111111111 binary), inclusive, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2BIN(23) results in 10111

DEC2BIN(-256) results in 1100000000

DEC2BIN(18,7) results in 0010010

end example]

18.17.7.85 DEC2HEX

Syntax:

DEC2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	number	The decimal number that is to be converted to a hexadecimal string.
<i>num-bin-digits</i>	number	<i>num-hex-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer.

Return Type and Value: text – The hexadecimal equivalent of *number* using twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -549,755,813,888 (8000000000 hex) to 549,755,813,887 (7FFFFFFF hex), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.

- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2HEX(23) results in 17

DEC2HEX(-256) results in FFFFFFFF00

DEC2HEX(18,7) results in 0000012

end example]

18.17.7.86 DEC2OCT

Syntax:

DEC2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
<i>number</i>	number	The decimal number that is to be converted to an octal string.
<i>num-bin-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number* using twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -536,870,912 (4000000000 octal) to 536,870,911 (3777777777 octal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2OCT(23) results in 27

DEC2OCT(-256) results in 7777777400

DEC2OCT(18,7) results in 0000022

end example]

18.17.7.87 DEGREES

Syntax:

DEGREES (*angle*)

Description: Converts *angle* in radians into degrees.

Arguments:

Name	Type	Description
<i>angle</i>	number	The number of radians that is to be converted into degrees.

Return Type and Value: number – *angle* in degrees.

[*Example:*

DEGREES(2 * PI()) results in 360

DEGREES(PI()) results in 180

DEGREES(PI()/2) results in 90

DEGREES(8.5) results in 487.0141259

end example]

18.17.7.88 DELTA

Syntax:

DELTA (*number-1* [, *number-2*])

Description: Compares two numbers for equality.

Arguments:

Name	Type	Description
<i>number-1</i>	number	The numbers that are to be compared for equality. If <i>number-2</i> is omitted, it is assumed to be zero.
<i>number-2</i>	number	

Return Type and Value: number – 1 if *number-1* equals *number-2*; otherwise, 0.

[*Example:*

DELTA(10.5,10.5) results in 1

DELTA(10.5,10.6) results in 0

DELTA(10.5) results in 0

DELTA(0) results in 1

end example]

18.17.7.89 DEVSQ

Syntax:

DEVSQ (*argument-list*)

Description: Computes the sum of squares of deviations of data points from their sample mean.

Mathematical Formula:

$$DEVSQ = \sum (x - \bar{x})^2$$

where:

- x = each element in *argument-list*
- \bar{x} = the mean of the elements in *argument-list*

Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, array, or reference to a number. Argument list can be a single argument that is an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the sum of squared deviations is to be calculated. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The sum of squares of deviations of data points from their sample mean.

[*Example:*

DEVSQ(5.6,8.2,9.2) results in 6.906666667

DEVSQ({5.6,8.2,9.2}) results in 6.906666667

end example]

18.17.7.90 DGET

Syntax:

DGET (*database* , *field* , *criteria*)

Description: Extracts a single value from a column of a list that matches the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The value of the cell that corresponds to the specified criteria.

However, if

- No record matches the criteria, #VALUE! is returned.
- More than one record matches the criteria, #NUM! is returned.

[Example: Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by DGET(A4:E7,"Yield",A1:A2), which results in 14.

end example]

18.17.7.91 DISC

Syntax:

DISC (*settlement* , *maturity* , *pr* , *redemption* [, [*basis*]])

Description: Computes the discount rate for a security.

Mathematical Formula:

$$DISC = \frac{\text{redemption} - \text{par}}{\text{par}} \times \frac{B}{SM}$$

where:

- *B* = number of days in a year, depending on the year basis.

- DSM = number of days between settlement and maturity.
- par = argument pr
- $redemption$ = argument $redemption$

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>pr</i>	number	The security's price per 100 currency units face value.				
<i>redemption</i>	number	The security's redemption value per 100 currency units face value.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
Value	Day Count Basis					
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.					

Name	Type	Description	
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	<p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar

Name	Type	Description	
			y.

Time information in the date arguments is ignored.

The currency units of *pr* and *redemption* are assumed to be the same currency.

Return Type and Value: number – The discount rate for a security.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *pr* or *redemption* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

DISC(DATE(2007,1,25),DATE(2007,6,15),97.975,100,1) results in 5.2420%

end example]

18.17.7.92 DMAX

Syntax:

DMAX (*database* , *field* , *criteria*)

Description: Computes the maximum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The maximum of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The maximum profit of apple and pear trees is computed by DMAX(A4:E10, "Profit", A1:A3), which results in 105.

end example]

18.17.7.93 DMIN

Syntax:

DMIN (*database* , *field* , *criteria*)

Description: Computes the minimum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The minimum of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The minimum profit of apple trees over 10 in height is computed by DMIN(A4:E10, "Profit", A1:B2), which results in 75.

end example]

18.17.7.94 DOLLAR

Syntax:

DOLLAR (*number* [, *num-decimal*])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The formatting applied to the string for the thousands separator, radix point, and currency symbol are implementation-specific.

Arguments:

Name	Type	Description
<i>number</i>	number	The number that is to be formatted.
<i>num-decimal</i>	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If <i>num-decimal</i> is negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[*Example:* When the spreadsheet application defines the currency symbol to be “\$”, the thousands separator to be “,” and the radix to be “.”:

DOLLAR(1234.567) results in \$1,234.57

DOLLAR(1234.567, -2) results in \$1,200

DOLLAR(-1234.567, 4) results in (\$1,234.5670)

When the spreadsheet application defines the currency symbol to be “€”, the thousands separator to be “ ” and the radix to be “,”:

DOLLAR(1234.567) results in 1 234,57 €

DOLLAR(1234.567, -2) results in 1 200 €

DOLLAR(-1234.567, 4) results in -1 234,5670 €

When the spreadsheet application defines the currency symbol to be “SFr.”, the thousands separator to be “'” and the radix to be “.”:

DOLLAR(1234.567) results in SFr. 1'234.57

DOLLAR(1234.567, -2) results in SFr. 1'200

DOLLAR(-1234.567, 4) results in SFr. -1'234.5670

When the spreadsheet application defines the currency symbol to be “kr”, the thousands separator to be “ ” and the radix to be “,”:

DOLLAR(1234.567) results in kr 1 234,57

DOLLAR(1234.567, -2) results in kr 1 200

DOLLAR(-1234.567, 4) results in kr -1 234,5670

end example]

18.17.7.95 DOLLARDE

Syntax:

DOLLARDE (*fractional-dollar* , *fraction*)

Description: Converts a fractional dollar price into a dollar price expressed as a decimal number. [Note: Fractional dollar numbers are sometimes used for securities prices. *end note*] The fractional part of *fractional-dollar* is scaled to match the magnitude of *fraction* by moving the decimal place right by the number of digits in *fraction*. The *fractional-dollar* m.n is computed into a decimal dollar value as $m + i$, where i is an intermediate result equal to $((0.n) * (10^x)) / \text{fraction}$, and x is the base 10 log of *fraction*, rounded up to the nearest whole number.

[Example: Given a *fractional-dollar* value of 1.02 and a *fraction* value of 16, the fractional part of *fractional-dollar* is multiplied by 100, giving a value of 2 to be divided by *fraction* before being added to the integral part of *fractional-dollar*, yielding a decimal price of 1.125. *end example*]

Arguments:

Name	Type	Description
<i>fractional-dollar</i>	number	The number to be interpreted as a fractional dollar price.
<i>fraction</i>	number	The integer to use in the denominator of the fraction.

Return Type and Value: number – The dollar price expressed as a decimal number.

However, if

- *fraction* < 0, #NUM! is returned.
- *fraction* = 0, #DIV/0! is returned.

[Example:

DOLLARDE(1.02,16) results in 1.125

DOLLARDE(1.1,32) results in 1.3125

end example]

18.17.7.96 DOLLARFR

Syntax:

DOLLARFR (*decimal-dollar* , *fraction*)

Description: Converts a dollar price expressed as a decimal into a dollar price expressed as a fraction. This function is used to convert decimal dollar numbers, such as securities prices, to fractional numbers.

Arguments:

Name	Type	Description
<i>decimal-</i>	number	The number expressed as a decimal.

Name	Type	Description
<i>dollar</i>		
<i>fraction</i>	number	The integer to use in the denominator of the fraction.

Return Type and Value: number – The dollar price expressed as a fractional number. [Example: A result of $m.n$ means $m + n/fraction$ dollars. end example] The fractional part of the return value is scaled to have the same number of digits after the decimal point, as there are digits in *fraction*. [Example: DOLLARFR(1.125, 16) has a two-digit *fraction* value and so returns the two-digit fractional number 1.02 end example] If an exact numerator cannot be found, the function returns the lowest numerator that could be used with *fraction*, multiplied by a power of ten. [Example: DOLLARFR(1.5,3) returns 1.15, as there is no exact fraction which satisfies $n/3 = 0.5$, and $15/30$ represents the lowest power of ten *fraction* can be multiplied by to obtain an exact value. end example]

However, if

- *fraction* < 0, #NUM! is returned.
- *fraction* = 0, #DIV/0! is returned.

[Example:

DOLLARFR(1.125,16) results in 1.02

DOLLARFR(1.125,32) results in 1.04

end example]

18.17.7.97 DPRODUCT

Syntax:

DPRODUCT (*database* , *field* , *criteria*)

Description: Computes the product of the values of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The product of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The product of the yields from apple trees with a height greater than 10 is computed by DPRODUCT(A4:E10, "Yield", A1:B2), which results in 140.

end example]

18.17.7.98 DSTDEV

Syntax:

DSTDEV (*database* , *field* , *criteria*)

Description: Estimates the standard deviation of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – An estimate of the standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The estimated standard deviation in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DSTDEV(A4:E10, "Yield", A1:A3), which results in 2.97.

end example]

18.17.7.99 DSTDEVP

Syntax:

DSTDEVP (*database* , *field* , *criteria*)

Description: Computes the standard deviation of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The true standard deviation in the yield of apple and pear trees if the data in the database is the entire population is computed by DSTDEVP(A4:E10, "Yield", A1:A3), which results in 2.65.

end example]

18.17.7.100 DSUM

Syntax:

DSUM (*database* , *field* , *criteria*)

Description: Computes the sum of the values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The sum of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The total profit from apple trees is computed by DSUM(A4:E10, "Profit", A1:A2), which results in 225.

The total profit from apple trees with a height between 10 and 16 is computed by DSUM(A4:E10, "Profit", A1:F2), which results in 75.

end example]

18.17.7.101 DURATION

Syntax:

DURATION (*settlement* , *maturity* , *coupon* , *yld* , *frequency* [, [*basis*]])

Description: Computes the Macaulay duration for an assumed par value of 100. Duration is defined as the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price.

Arguments:

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>coupon</i>	number	The security's annual coupon rate.				
<i>yld</i>	number	The security's annual yield.				
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the
Value	Day Count Basis					
0 or omitted	US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the					

Name	Type	Description	
			second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.
		1	Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.
		2	Actual/360. Similar to Basis 1, but only has 360 days per year.
		3	Actual/365. Similar to Basis 1, but always has 365 days per year.
		4	European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all

Name	Type	Description	
			dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.

Time information in the date arguments is ignored.

Return Type and Value: number – The Macaulay duration for an assumed par value of 100.

However, if

- *settlement* or *maturity* is out of range for the current date system, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *coupon* or *yld* < 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

DURATION (DATE (2008,1,1),DATE (2016,1,1),0.08,0.09,2,1) results in 5.993774956

end example]

18.17.7.102 DVAR

Syntax:

DVAR (*database* , *field* , *criteria*)

Description: Estimates the variance of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.

Name	Type	Description
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – An estimate of the variance of a population based on the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The estimated variance in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DVAR(A4:E10, "Yield", A1:A3), which results in 8.8.

end example]

18.17.7.103 DVARP

Syntax:

DVARP (*database* , *field* , *criteria*)

Description: Calculates the variance of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The variance of a population based on the entire population using the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The true variance in the yield of apple and pear trees if the data in the database is the entire orchard population is computed by DVARP(A4:E10, "Yield", A1:A3), which results in 7.04.

end example]

18.17.7.104 ECMA.CEILING

Syntax:

ECMA.CEILING (*x* , *significance*)

Description: Computes a value that is *x* rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded
<i>significance</i>	number	The multiple to which <i>x</i> is to be rounded. If <i>x</i> is negative, and <i>significance</i> is negative, then the value is rounded down (away from zero). If <i>x</i> is negative, and <i>significance</i> is positive, then the value is rounded up, towards zero.

Return Type and Value: number – The rounded-up value of *x*.

However, if

- *x* is positive and *significance* is negative, #NUM! is returned.
- *x* and/or *significance* is zero, zero is returned.

[Example:

ECMA.CEILING(4.3,2) rounds 4.3 up to nearest multiple of 2; that is, to 6

ECMA.CEILING(4.3,-2) rounds 4.3 up to nearest multiple of -2; that is, to #NUM!

ECMA.CEILING(-4.3,2) rounds -4.3 up to the nearest multiple of 2; that is, to -4

ECMA.CEILING(-4.3,-2) rounds -4.3 up to the nearest multiple of -2; that is, to -6

end example]

18.17.7.105 EDATE

Syntax:

EDATE (*start-date* , *month-offset*)

Description: Computes the serial date-time of the date that is *month-offset* months from the date specified by the date *date-string*, taking into account the current date system.

Arguments:

Name	Type	Description
<i>start-date</i>	number	The start date.
<i>month-offset</i>	number	The number of months before or after <i>start-date</i> , truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> .

Return Type and Value: number – The serial date-time of the date that is *month-offset* months from the date specified by the date *date-string*, as a whole number.

However, if

- *start-value* is out of range for the current date system, #NUM! is returned.
- *start-value* plus *month-offset* is out of range for the current date system, #NUM! is returned.

[Example: For the 1900 date system:

EDATE(DATE(2006,1,31),5) results in a serial date-time of 38898
 EDATE(DATE(2004,2,29),12) results in a serial date-time of 38411
 EDATE(DATE(2004,2,28),12) results in a serial date-time of 38411
 EDATE(DATE(2004,1,15),-23) results in a serial date-time of 37302

For the 1904 date system:

EDATE(DATE(2006,1,31),5) results in a serial date-time of 37436
 EDATE(DATE(2004,2,29),12) results in a serial date-time of 36949
 EDATE(DATE(2004,2,28),12) results in a serial date-time of 36949
 EDATE(DATE(2004,1,15),-23) results in a serial date-time of 35840

end example]

18.17.7.106 EFFECT

Syntax:

EFFECT (*nominal-rate* , *npery*)

Description: Computes the effective annual interest rate, given the nominal annual interest rate and the number of compounding periods per year.

Mathematical Formula:

$$EFFECT = \left(1 + \frac{Nominal_rate}{Npery} \right)^{Npery} - 1$$

where:

- *Nominal_rate* = argument *nominal-rate*
- *Npery* = argument *npery*

Arguments:

Name	Type	Description
<i>nominal-rate</i>	number	The nominal interest rate.
<i>npery</i>	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: number – The effective annual interest rate.

However, if

- *nominal-rate* ≤ 0 , #NUM! is returned.
- *npery* < 1 , #NUM! is returned.

[Example:

EFFECT(0.0525,4) results in 5.3543%

end example]

18.17.7.107 EOMONTH

Syntax:

EOMONTH (*start-date* , *month-offset*)

Description: Computes the serial date-time of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, taking into account the current date system.

Arguments:

Name	Type	Description
<i>start-date</i>	number	The start date.
<i>month-offset</i>	number	The number of months before or after <i>start-date</i> , truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> .

Return Type and Value: number – The serial date-time of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, as a whole number.

However, if

- *start-date* is not a date, #NUM! is returned.
- *start-date* plus *month-offset* does not yield a date, #NUM! is returned.

[Example: For the 1900 date system:

EOMONTH(DATE(2006,1,31),5) results in a serial date-time of 38898
 EOMONTH(DATE(2004,2,29),12) results in a serial date-time of 38411
 EOMONTH(DATE(2004,2,28),12) results in a serial date-time of 38411
 EOMONTH(DATE(2004,1,15),-23) results in a serial date-time of 37315

For the 1904 date system:

EOMONTH(DATE(2006,1,31),5) results in a serial date-time of 37436
 EOMONTH(DATE(2004,2,29),12) results in a serial date-time of 36949
 EOMONTH(DATE(2004,2,28),12) results in a serial date-time of 36949
 EOMONTH(DATE(2004,1,15),-23) results in a serial date-time of 35853

end example]

18.17.7.108 ERF

Syntax:

ERF (*lower-bound* [, *upper-bound*])

Description: Computes the error function integrated between *lower-bound* and *upper-bound*.

Mathematical Formula:

If *upper-bound* is omitted:

$$ERF(z) = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2} dt$$

where:

- *z* = argument *lower-bound*

If *upper-bound* is present:

$$ERF(a,b) = \frac{2}{\sqrt{\pi}} \int_a^b e^{-t^2} dt = ERF(b) - ERF(a)$$

where:

- b = argument *upper-bound*
- a = argument *lower-bound*

Arguments:

Name	Type	Description
<i>lower-bound</i>	number	The lower bound for integrating ERF.
<i>upper-bound</i>	number	The upper bound for integrating ERF. If omitted, the value of the upper bound is <i>lower-bound</i> , and the lower bound becomes zero.

Return Type and Value: number – The error function integrated between *lower-bound* and *upper-bound*.

However, if

- *lower-bound* is negative, #NUM! is returned.
- *upper-bound* is negative, #NUM! is returned.

[Example:

ERF(1.234,4.5432) results in 0.08096060

ERF(0,1.345) results in 0.94284416

ERF(0,1.345) results in 0.94284416

end example]

18.17.7.109 ERFC

Syntax:

ERFC (*lower-bound*)

Description: Computes the complementary error function integrated between *lower-bound* and ∞ .

Mathematical Formula:

$$ERFC(x) = \frac{2}{\sqrt{\pi}} \int_x^{\infty} e^{-t^2} dt = 1 - ERF(x)$$

where:

- x = argument *lower-bound*

Arguments:

Name	Type	Description
<i>lower-bound</i>	number	The lower bound for integrating ERFC.

Return Type and Value: number – The complementary error function integrated between *lower-bound* and ∞ .

However, if *lower-bound* is negative

lower-bound or *upper-bound* is negative, #NUM! is returned.

[Example:

ERFC(1.234) results in 0.08096060

ERFC(0) results in 1.00000000

end example]

18.17.7.110 ERROR.TYPE

Syntax:

ERROR.TYPE (*value*)

Description: Determines the kind of the error value designated by *value*.

Arguments:

Name	Type	Description
<i>value</i>	any	A value whose type is to be determined. No conversion shall take place on the argument passed to this function.

Return Type and Value: number – The kind of the error value designated by *value*, as follows:

<i>value</i>	Return Value
#NULL!	1
#DIV/0!	2
#VALUE!	3
#REF!	4
#NAME?	5
#NUM!	6
#N/A	7
#GETTING_DATA	8

<i>value</i>	Return Value
Anything else	#N/A

[Example:

ERROR.TYPE(A1) results in 2 if A1 evaluates to #DIV/0!
ERROR.TYPE(A1) results in 4 if A1 evaluates to #REF/0!
ERROR.TYPE(A1) results in 7 if A1 evaluates to #N/A
ERROR.TYPE(A1) results in #N/A if A1 evaluates to a non-error value, such as a number or text

end example]

18.17.7.111 EVEN

Syntax:

EVEN (*x*)

Description: Computes *x* rounded to the nearest even integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded.

Return Type and Value: number – The rounded value of *x*. If *x* is zero, the result is zero.

[Example:

EVEN(1.5) rounds 1.5 up to the nearest even integer; that is, to 2.
EVEN(3) rounds 3 up to the nearest even integer; that is, to 4.
EVEN(2) rounds 2 up to the nearest even integer; that is, to 2.
EVEN(-1) rounds -1 up to the nearest even integer; that is, to -2.

end example]

18.17.7.112 EXACT

Syntax:

EXACT (*string-1* , *string-2*)

Description: Performs a case-sensitive, character-by-character, lexical comparison of *string-1* and *string-2*.

Arguments:

Name	Type	Description
<i>string-1</i>	text	The two strings to be compared.
<i>string-2</i>	text	

Return Type and Value: logical – TRUE if *string-1* and *string-2* have the exact same length and contents; otherwise, FALSE.

[Example:

EXACT("ABC", "ABC") results in TRUE

EXACT("ABC", "ABCD") results in FALSE

EXACT("Abc", "aBC") results in FALSE

EXACT("", "") results in TRUE

end example]

18.17.7.113 EXP

Syntax:

EXP (*x*)

Description: Computes e^x , where the constant e is the base of the natural logarithm.

Arguments:

Name	Type	Description
<i>x</i>	number	The exponent to which e is to be raised.

Return Type and Value: number – e^x .

However, if x is too large for the result to be representable, #NUM! is returned.

[Example:

EXP(-1) results in 0.367879441

EXP(0) results in 1

EXP(1) results in 2.718281828

EXP(2) results in 7.389056099

end example]

18.17.7.114 EXPONDIST

Syntax:

EXPONDIST (*x* , *lambda* , *cumulative-flag*)

Description: Computes the exponential distribution.

Mathematical Formula:

The equation for the probability density function is:

$$f(x, \lambda) = \lambda e^{-\lambda x}$$

The equation for the cumulative distribution function is:

$$F(x, \lambda) = 1 - e^{-\lambda x}$$

where:

- x = argument *x*
- λ = argument *lambda*

Arguments:

Name	Type	Description
<i>x</i>	number	The value at which the function is evaluated.
<i>lambda</i>	number	The inverse of the mean.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, EXPONDIST returns the cumulative distribution function; if FALSE, EXPONDIST returns the probability density function.

Return Type and Value: number – The exponential distribution.

However, if

- $x < 0$, #NUM! is returned.
- $lambda \leq 0$, #NUM! is returned.

[Example:

EXPONDIST(0.2,10,FALSE) results in 1.353352832

EXPONDIST(2.3,1.5,TRUE) results in 0.968254364

end example]

18.17.7.115 FACT

Syntax:

$$\text{FACT} (x)$$

Description: Computes the factorial of x .

Arguments:

Name	Type	Description
x	number	The non-negative value whose factorial is to be computed. x is truncated to an integer.

Return Type and Value: number – The factorial of x .

However, if

- x is negative, #NUM! is returned.
- x is too large for the result to be representable, #NUM! is returned.

[Example:

FACT(5) results in 120

FACT(3.5) results in 6

FACT(0) results in 1

end example]

18.17.7.116 FACTDOUBLE

Syntax:

$$\text{FACTDOUBLE} (n)$$

Description: Computes the double factorial of n .

Mathematical Formula:

If n is even:

$$n!! = n(n-2)(n-4) \dots (4)(2)$$

If n is odd:

$$n!! = n(n-2)(n-4) \dots (3)(1)$$

where:

- n = argument n

Arguments:

Name	Type	Description
n	number	The non-negative value whose double factorial is to be computed. n is truncated to an integer.

Return Type and Value: number – The double factorial of n .

However, if

- n is negative, #NUM! is returned.
- n is too large for the result to be representable, #NUM! is returned.

[Example:

FACTDOUBLE(5) results in 15

FACTDOUBLE (3.5) results in 3

FACTDOUBLE (0) results in 1

end example]

18.17.7.117 FALSE

Syntax:

FALSE ()
