<p>regroupid (Regroup ID)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>spid (Optional String)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional string that an application may use to Identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>spt (Optional Number)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>strokecolor (Shape Stroke Color)</p>	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>stroked (Shape Stroke Toggle)</p>	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>

Attributes	Description						
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>						
<b>strokeweight</b> (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>						
<b>style</b> (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="414 1367 1479 1871"> <thead> <tr> <th data-bbox="418 1367 662 1415">Property</th><th data-bbox="662 1367 1474 1415">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="418 1415 662 1682">flip</td><td data-bbox="662 1415 1474 1682"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="418 1682 662 1871">height</td><td data-bbox="662 1682 1474 1871"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the</li> </ul>
Property	Description						
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>						
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the</li> </ul>						

Attributes	Description	
		<p>page.</p> <ul style="list-style-type: none"> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>

Attributes	Description	
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>

Attributes	Description	
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-edited	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user.</p>

Attributes	Description	
		Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>square - Wraps text inside the shape in a square.</li> <li>none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>auto - Default position of an element in the flow of the page.</li> <li>&lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>&lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <code>inherit</code> - The visibility state is inherited from the parent of the shape.</li> </ul>
	<code>width</code>	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Default position of an element in the flow of the page.</li> <li>• <code>&lt;units&gt;</code>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code>- Value expressed as a percentage of the parent object's width.</li> </ul>
	<code>z-index</code>	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• <code>&lt;order&gt;</code>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	<code>direction</code>	<p>Specifies the direction of the text in the textbox. Default is <code>ltr</code>. This property is superceded by the <code>mso-direction-alt</code> property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>ltr</code> - Text is displayed left-to-right.</li> <li>• <code>rtl</code> - Text is displayed right-to-left.</li> </ul>
	<code>layout-flow</code>	<p>Determines the flow of the text layout in a textbox. Default is <code>horizontal</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>horizontal</code> - Text is displayed horizontally.</li> <li>• <code>vertical</code> - Text is displayed vertically.</li> <li>• <code>vertical-ideographic</code> - Ideographic text is displayed vertically.</li> <li>• <code>horizontal-ideographic</code> - Ideographic text is displayed horizontally.</li> </ul>

Attributes	Description	
	mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
	mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
	mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
	mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• middle</li> <li>• bottom</li> <li>• top-center</li> <li>• middle-center</li> <li>• bottom-center</li> <li>• top-baseline</li> <li>• bottom-baseline</li> <li>• top-center-baseline</li> <li>• bottom-center-baseline</li> </ul>

Attributes	Description												
	The following properties are only used by the textpath element (§6.1.2.23):												
	Property	Description											
	font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.											
	font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.											
	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.											
	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>											
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>											
	font-weight	Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>normal</td><td rowspan="6">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr><tr><td>300</td></tr><tr><td>400</td></tr><tr><td>bold</td><td>Treated as bold.</td></tr></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200	300	400	bold	Treated as bold.
	Value	Description											
	normal	Treated as non-bold.											
lighter													
100													
200													
300													
400													
bold	Treated as bold.												

Attributes	Description	
		<div> <div>bolder</div> <div>500</div> <div>600</div> <div>700</div> <div>800</div> <div>900</div> </div>
	mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.
	text-decoration	<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• underline</li> <li>• overline</li> <li>• line-through</li> <li>• blink</li> </ul>
	v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.

Attributes	Description							
	v-text-spacing-mode	Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are: <ul style="list-style-type: none"><li>• tightening</li><li>• tracking</li></ul>						
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.						
	<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"><li>• top</li><li>• left</li><li>• width</li><li>• height</li></ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"><li>• flip</li><li>• height</li><li>• left</li><li>• margin-left</li><li>• margin-top</li><li>• position</li><li>• rotation</li><li>• top</li><li>• visibility</li><li>• width</li><li>• z-index</li></ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>							
target (Hyperlink Display Target)	<p>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>&lt;targetname&gt;</td><td>String containing the name of the frame or window in which to load the document.</td></tr><tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr></table>		Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.
Value	Description							
<targetname>	String containing the name of the frame or window in which to load the document.							
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.							

Attributes	Description

title (Shape Title)	<p data-bbox="415 1071 1482 1134">Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p data-bbox="415 1176 535 1203"><i>[Example:</i></p> <pre data-bbox="451 1245 1000 1312"> &lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt; </pre> <p data-bbox="415 1354 574 1381"><i>end example]</i></p> <p data-bbox="415 1423 1430 1451">The possible values for this attribute are defined by the XML Schema string datatype.</p>										
userdrawn (Exists In Master Slide)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 1472 1482 1535">Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p> <p data-bbox="415 1577 535 1604"><i>[Example:</i></p> <pre data-bbox="451 1646 1045 1713"> &lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt; </pre> <p data-bbox="415 1755 574 1782"><i>end example]</i></p> <p data-bbox="415 1824 1390 1890">The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>										

Attributes	Description
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the <code>mso-wrap-mode</code> style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Oval">
3 <choice maxOccurs="unbounded">
4 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
5 </choice>
6 <attributeGroup ref="AG_AllCoreAttributes"/>
7 <attributeGroup ref="AG_AllShapeAttributes"/>
8 </complexType>
```

9 **6.1.2.14 path (Shape Path)**

10 This element defines the path that makes up the shape. This is done through a string that contains a rich set of  
11 pen movement commands. This element also describes the limo-stretch point, inscribed textbox rectangle  
12 locations and connection site locations. The limo-stretch definition and the formulas element (§6.1.2.6) allow  
13 greater designer control of how the path scales. They allow, for example, definition of a true rounded corner  
14 rectangle where the corners remain circular even though the rectangle is scaled anisotropically.

**Parent Elements**

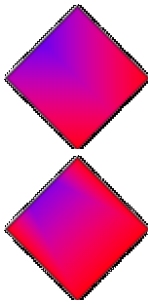

1

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
arrowok (Arrowhead Display Toggle)	<p>Specifies whether arrowheads are allowed to be displayed. This attribute overrides all other arrowhead attributes in the parent or the stroke element (§6.1.2.21). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape style="width:50;height:50"&gt;   &lt;v:stroke endarrow="block"/&gt;   &lt;v:path arrowok="true"     v="m 0,0 l 1000,0 1000,1000 e"/&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
connectangles (Connection Point Connect Angles)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the angle at which curves connect to a shape's connection points. The connection angles are defined by a string consisting of angle values delimited by commas. Default is no value.</p> <p>[Example: Connections are made along the horizontal and vertical axes:</p> <pre>&lt;v:path ... o:connectangles="0,90,180,270" ... &gt; &lt;/v:path&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
connectlocs (Connection Points)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the location of connection points on a path. The connection points are defined by a string consisting of pairs of x and y values, delimited by commas. This is used if connecttype is custom. Default is no value.</p> <p>[Example: Connection points exist at the midpoints of the sides of the square:</p> <pre>&lt;v:path ... v="m 0,0 l 100,0 100,100 0,100 x e"</pre>

Attributes	Description
	<pre>o:connectlocs="50,0;100,50;50,100;0,50" ... &gt; &lt;/v:path&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>connecttype (Connection Point Type)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies the type of connection points used for attaching shapes to other shapes. Default is none. If set to custom, connectlocs is used. Allowed values are:</p> <p>[Example:</p> <pre>&lt;v:path ... o:connecttype="custom" o:connectlocs="50,0;100,50;50,100;0,50" ... &gt; &lt;/v:path&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ConnectType simple type (§6.2.3.7).</p>
<p>extrusionok (Extrusion Toggle)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies whether an extrusion is allowed to be displayed. This attribute overrides all other extrusion attributes in the parent or the extrusion element (§6.2.2.10). Default is true.</p> <p>[Example:</p> <pre>&lt;v:rect fillcolor="lime" style="width:50;height:50"&gt; &lt;v:extrusion on="true"/&gt; &lt;v:path o:extrusionok="false"/&gt; &lt;/v:rect&gt;</pre> <div data-bbox="451 1360 553 1461" data-label="Image"> </div> <pre>&lt;v:path o:extrusionok="false"/&gt;</pre> <div data-bbox="451 1465 586 1604" data-label="Image"> </div> <pre>&lt;v:path o:extrusionok="true"/&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>fillok (Shape Fill Toggle)</p>	<p>Specifies whether a fill is allowed to be displayed. This attribute overrides all other fill attributes in the parent or fill element (§6.1.2.5). Default is true.</p>

Attributes	Description
	<p>[Example:</p> <pre> &lt;v:shape style="width:50;height:50"   fillcolor="red"&gt;   &lt;v:path fillok="false"     v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"/&gt; &lt;/v:shape&gt; </pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>gradientshapeok (Gradient Shape Toggle)</p>	<p>Specifies whether a gradient path will be made up of repeated concentric paths. Default is false.</p> <p>If true, a gradient fill can be produced by repeated drawing of scaled versions of the path - this must only be set if it is possible to scale the path in such a way that a fill is always contained in the original path. This controls the interpretation of the type="gradientradial" attribute of the fill element (§6.1.2.5).</p> <p>[Example: In the first case, the radial gradient is aligned irrespective of the shape's path:</p> <pre> &lt;v:shape style="width:50;height:50;rotation:45"   path="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"&gt;   &lt;v:path gradientshapeok="false"/&gt;   &lt;v:fill type="gradientradial"     color="red" color2="blue"/&gt; &lt;/v:shape&gt; </pre>  <p>gradientshapeok="false"</p> <p>gradientshapeok="true"</p> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type</p>

Attributes	Description
<b>id (Unique Identifier)</b>	<p>(§6.1.3.14).</p> <p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>insetpenok (Inset Stroke From Path Flag)</b>	<p>Specifies whether the stroke may be inset from the path. If this is false, it overrides the insetpen attribute and prevents the stroke from being inset.</p> <p>[Example: The stroke is not inset:</p> <pre>&lt;v:shape ... insetpen="true"&gt;   &lt;v:path ... insetpenok="false"/&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<b>limo (Limo Stretch Point)</b>	<p>Specifies a stretch point on the shape's edge that defines where and how a shape is allowed to be stretched by a user in a graphical editor. Default is "0,0".</p> <p>[Example:</p> <pre>&lt;v:line from="20pt,20pt" to="100pt,20pt"&gt;   &lt;v:path limo="60pt,20pt"/&gt; &lt;/v:line&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>shadowok (Shadow Toggle)</b>	<p>Specifies whether a shadow is allowed to be displayed. This attribute overrides all other shadow attributes in the parent or the shadow element (§6.1.2.18). Default is true.</p> <p>[Example: The shape has no shadow:</p> <pre>&lt;v:shape style="width:50;height:50"&gt;   &lt;v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"</pre>

Attributes	Description
	<pre>         shadowok="false"/&gt;         &lt;v:shadow on="true"/&gt;         &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
strokeok (Stroke Toggle)	<p>Specifies whether a stroke will be displayed. This attribute overrides all other stroke attributes in the parent or the stroke element (§6.1.2.21). Default is true.</p> <p>[<i>Example:</i> The shape's red stroke is not shown:</p> <pre>         &lt;v:shape style="width:50;height:50"           fillcolor="blue" strokecolor="red"&gt;           &lt;v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"             strokeok="false"/&gt;           &lt;/v:shape&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
textboxrect (Text Box Bounding Box)	<p>Specifies one or more text boxes inside a shape. Default is the same as the geometry's bounding box.</p> <p>A textbox is defined by one or more sets of numbers specifying (in order) the left, top, right, and bottom points of the rectangle. Multiple sets are delimited by a semicolon. The default value is the same dimension value as the containing rectangle. If more than one textbox is defined, the comma-delimited quadruple sets that define each textbox are separated by semicolons. Normally textboxes come in sets of 1, 2, 3, or 6 rectangles on a shape. The textboxrect dimensions clip any text that extends beyond its region.</p> <p>[<i>Example:</i> The textbox is 25% down from the top and the exclamation point is clipped:</p> <pre>         &lt;v:shape style="width:60;height:50"&gt;           &lt;v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"             textboxrect="0,250,850,1000"/&gt;           &lt;v:textbox&gt;VML!&lt;/v:textbox&gt;         &lt;/v:shape&gt; </pre>

Attributes	Description
	<div data-bbox="415 245 535 346" data-label="Image"> </div> <p data-bbox="415 386 574 415"><i>end example]</i></p> <p data-bbox="415 457 1430 487">The possible values for this attribute are defined by the XML Schema string datatype.</p>
textpathok (Text Path Toggle)	<p data-bbox="415 506 1187 535">Specifies whether a text path will be displayed. Default is false.</p> <p data-bbox="415 577 1401 644">If true, this indicates that the path is an appropriate warping path for the textpath element (§6.1.2.23). Otherwise, the textpath element must be ignored.</p> <p data-bbox="415 684 919 714"><i>[Example: The defined textpath is ignored:</i></p> <pre data-bbox="456 753 1256 953"> &lt;v:curve from="50,100" to="400,100"   control1="200,200" control2="300,200"&gt;   &lt;v:path textpathok="false"/&gt;   &lt;v:textpath on="false" style="font:normal normal     normal 36pt Arial" string="textpath"/&gt; &lt;/v:curve&gt; </pre> <div data-bbox="415 993 1114 1150" data-label="Image"> </div> <p data-bbox="415 1188 574 1218"><i>end example]</i></p> <p data-bbox="415 1260 1390 1327">The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
v (Path Definition)	<p data-bbox="415 1341 1406 1409">Specifies a string containing the commands that define the shape's path. This value consists of commands followed by zero or more parameters. Default is no value.</p> <p data-bbox="415 1449 899 1478">The following rules apply to path strings:</p> <ul data-bbox="464 1486 1479 1843" style="list-style-type: none"> <li>• Commas or spaces delimit parameters for each command. Both "m 0,0" and "m0 0" are acceptable.</li> <li>• A parameter that is omitted using commas is treated as having a value of zero. Thus, "c 10,10,0,0,25,13" and "c 10,10,,,25,13" are equivalent.</li> <li>• Parameterized paths are also allowed. In this case, the shape must also have a formulas element (§6.1.2.6) with a list of formulas that are substituted into the path using the @ symbol followed by the number of the formula. The adj property of the shape contains the input parameters for these formulas. For example, "moveto @1@4". The evaluations of the formulas are substituted into the appropriate positions. Note that @ also serves as a delimiter.</li> </ul>

Attributes	Description			
	The allowed commands are given below. An asterisk (*) indicates that the command is allowed to be repeated. For the qb command, the controlpoint parameter is also allowed to be repeated.			
	Command	Name	Parameters	Description
	m	moveto	2	Start a new sub-path at the given (x,y) coordinate.
	l	lineto	2*	Draw a line from the current point to the given (x,y) coordinate which becomes the new current point. Specifying a number of coordinate pairs forms a polyline.
	c	curveto	6*	Draw a cubic bézier curve from the current point to the coordinate given by the final two parameters. The control points are given by the first four parameters.
	x	close	0	Close the current sub-path by drawing a straight line from the current point to the original moveto point.
	e	end	0	End the current set of sub-paths. A given set of sub-paths (as delimited by end) is filled. Subsequent sets of sub-paths are filled independently and superimposed on existing ones.
	t	rmoveto	2*	Start a new sub-path at a coordinate relative to the current point, cp (cpx+x, cpy+y).
	r	rlineto	2*	Draw a line from the current point to the given relative coordinate (cpx+x, cpy+y).
	v	rcurveto	6*	Cubic bézier curve using the given coordinate relative to the current point.
	nf	nofill	0	The current set of sub-paths (delimited by e) will not be filled.
	ns	nostroke	0	The current set of sub-paths (delimited by e) will not be stroked.

Attributes	Description			
	ae	angleellipseto	6*	Draws a segment of an ellipse as described using these parameters. A straight line is drawn from the current point to the start point of the segment. The parameters are: center (x,y), size(w,h), start angle, end angle.
	al	angleellipse	6*	Same as angleellipseto except that there is an implied moveto the starting point of the segment.
	at	arcto	8*	A segment of the ellipse is drawn which starts at the angle defined by the start radius vector and ends at the angle defined by the end vector. A straight line is drawn from the current point to the start of the arc. The arc is always drawn in a counterclockwise direction. The parameters are: left, top, right, bottom, start(x,y), end(x,y). The first four values define the bounding box of an ellipse. The last four define two radial vectors.
	ar	arc	8*	Same as arcto except there is an implied moveto the start point of the arc.
	wa	clockwisearco	8*	Same as arcto but the arc is drawn in a clockwise direction.
	wr	clockwisearc	8*	Same as arc but the arc is drawn in a clockwise direction
	qx	ellipticalquadrant x	2*	A quarter ellipse is drawn from the current point to the given end point. The elliptical segment is initially tangential to a line parallel to the x-axis. (i.e. the segment starts out horizontal). The parameters are: end(x,y).
	qy	ellipticalquadrant y	2*	Same as ellipticalquadrantx except that the elliptical segment is initially tangential to a line parallel to the y-axis (i.e. the segment starts out vertical).

Attributes	Description			
	qb	quadraticbezier	2+2*	Defines one or more quadratic bézier curves by means of control points and an end point. Intermediate (on-curve) points are obtained by interpolation between successive control points as in the OpenType font specification. The sub-path need not be started in which case the sub-path will be closed. In this case the last point of the sub-path defines the start point of the quadratic bézier. The parameters are: controlpoint(x,y)*, end(x,y).
The possible values for this attribute are defined by the XML Schema string datatype.				

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Path">
 <attributeGroup ref="AG_Id"/>

Attributes	Description
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>alt (Alternate Text)</p>	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderbottomcolor (Bottom Border)</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p>

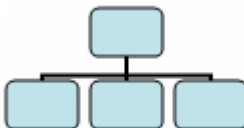

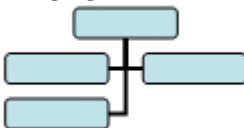

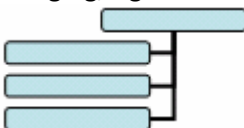

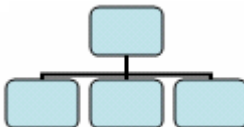

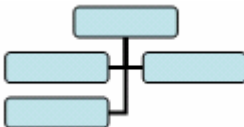

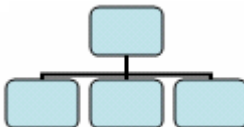

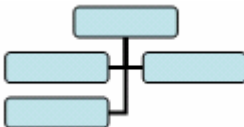

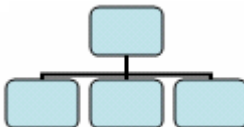

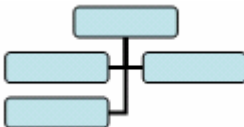

Attributes	Description
Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderleftcolor (Border Left Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderrightcolor (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bordertopcolor (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bullet (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is a graphical bullet. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre>

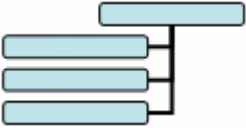

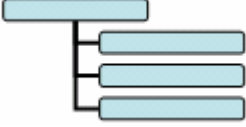

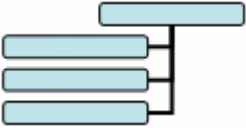

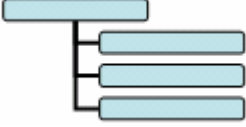

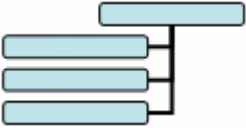

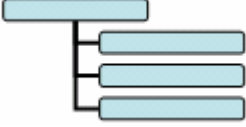

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>button (Button Behavior Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>bwmode (Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow greyscale and pure B&amp;W might not.</p> <p>[Example: This shape renders in grayscale in a black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>bwnormal (Normal Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type</p>

Attributes	Description
<p>bwpure (Pure Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>(§6.2.3.2).</p> <p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>chromakey (Image Transparency Color)</p>	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>class (CSS Reference)</p>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[<i>Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Attributes	Description
<p>clip (Clipping Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>coordorigin (Coordinate Space Origin)</p>	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p>

Attributes	Description		
	<p>[<i>Example:</i> The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>		
coordsize (Coordinate Space Size)	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[<i>Example:</i> The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>		
dgmlayout (Diagram Node Layout Identifier)  Namespace:	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table border="1" data-bbox="511 1814 1208 1864"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> </table>	Value	Description

3	Hanging, left side layout. 				
<b>dgmnodekind</b> (Diagram Node Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 903 1446 968">Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p data-bbox="415 1008 535 1039"><i>[Example:</i></p> <pre data-bbox="454 1079 919 1144">&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 1184 574 1215"><i>end example]</i></p> <p data-bbox="415 1255 1446 1287">The possible values for this attribute are defined by the XML Schema integer datatype.</p>				
<b>doubleclicknotify</b> (Double-click Notification Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 1302 1471 1333">Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p data-bbox="415 1373 535 1404"><i>[Example:</i></p> <pre data-bbox="454 1444 1175 1509">&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 1549 574 1581"><i>end example]</i></p> <p data-bbox="415 1621 1390 1686">The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>				
<b>fillcolor</b> (Fill Color)	<p data-bbox="415 1701 1463 1871">Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p>				

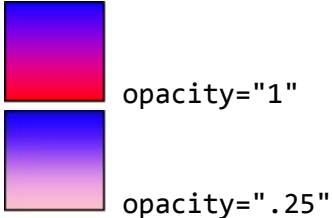

Attributes	Description
	<p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f" fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>forcedash (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type</p>

Attributes	Description
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>(§6.2.3.23).</p> <p>Specifies that a shape is a horizontal rule. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hralign (Horizontal Rule Alignment)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the alignment of a horizontal rule. Default is <code>left</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
<p>href (Hyperlink Target)</p>	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hrnoshade (Horizontal Rule 3D Shading Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the horizontal rule does not have 3-D shading. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hrpct (Horizontal</p>	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p>

Attributes	Description
<p>Rule Length Percentage)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>hrstd (Horizontal Rule Standard Display Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>insetmode (Text Inset Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>

Attributes	Description
<b>insetpen</b> (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<b>ole</b> (Embedded Object Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
<b>oleicon</b> (Embedded Object Icon Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>oned</b> (Shape Handle Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>opacity (Fill Color Opacity)</p>	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red"   color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>points (Points for Compound Line)</p>	<p>Specifies a set of straight line segments that are composed of a series of pairs of points. Default is "0,0 10,10".</p> <p>Points are specified in the coordinate system of the parent element. If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px. While commas are not required, they should be used for easier readability.</p> <p>See above for an example.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type</p>

Attributes	Description
	(§6.2.3.23).
print (Print Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape will be printed. Default is true.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
regroupid (Regroup ID)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p><i>[Example:</i> The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
spid (Optional String)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
spt (Optional Number)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p><i>[Example:</i></p>

Attributes	Description
	<pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
stroked (Shape Stroke Toggle)	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
strokeweight (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
style (Shape Styling	Specifies the CSS2 styling properties of the shape. This uses the syntax described in the

Attributes	Description										
Properties)	<p>"Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 422 1479 1885"> <thead> <tr> <th data-bbox="415 422 664 468">Property</th><th data-bbox="664 422 1479 468">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 468 664 737">flip</td><td data-bbox="664 468 1479 737"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 737 664 1146">height</td><td data-bbox="664 737 1479 1146"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> </td></tr> <tr> <td data-bbox="415 1146 664 1629">left</td><td data-bbox="664 1146 1479 1629"> <p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul> </td></tr> <tr> <td data-bbox="415 1629 664 1885">margin-bottom</td><td data-bbox="664 1629 1479 1885"> <p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Property	Description										
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>										
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>										
left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>										
margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> </ul>										

Attributes	Description	
		<ul style="list-style-type: none"> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-	<p>Specifies the distance from the left side of the shape to the text</p>

Attributes	Description	
	distance-left	that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group,

Attributes	Description	
		<p>in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
	<p>The following properties are only used by the textbox element (§6.1.2.22):</p>	

Attributes	Description	
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>ltr - Test is displayed left-to-right.</li> <li>rtl - Test is displayed right-to-left.</li> </ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>horizontal - Text is displayed horizontally.</li> <li>vertical - Text is displayed vertically.</li> <li>vertical-ideographic - Ideographic text is displayed vertically.</li> <li>horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-to-text	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>
	mso-fit-text-to-shape	<p>Specifies whether the text stretches to fit the textbox. Default is false.</p>
	mso-layout-flow-alt	<p>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</p>
	mso-next-textbox	<p>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</p>
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>0</li> <li>90</li> <li>180</li> <li>-90</li> </ul>
	mso-text-scale	<p>Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.</p>

Attributes	Description													
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"><li>• top</li><li>• middle</li><li>• bottom</li><li>• top-center</li><li>• middle-center</li><li>• bottom-center</li><li>• top-baseline</li><li>• bottom-baseline</li><li>• top-center-baseline</li><li>• bottom-center-baseline</li></ul>												
	The following properties are only used by the textpath element (§6.1.2.23):													
	<table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr><tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr><tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr><tr><td>font-style</td><td><p>Specifies the amount of slant for a font. Default is normal. Available in Microsoft Internet Explorer 5 or greater.</td></tr> <tr> <td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr> <tr> <td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr> </tbody> </table> <p>[Example:</p> <pre> &lt;v:shape ...   href="http://www.openxmlformats.org"   target="_self" ... &gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>	Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																
title (Shape Title)	<p>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p>[Example:</p>																

Attributes	Description
	<pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>userdrawn (Exists In Master Slide)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the user has added the shape to a master slide. Default is <code>false</code>. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the <code>mso-wrap-mode</code> style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

</complexType>
```

6.1.2.16 rect (Rectangle)

This element is used to draw a simple rectangle. The CSS2 style content width and height define the width and height of the rectangle.

[Example:

```
<v:rect fillcolor="red"
 style="position:relative;top:0;left:0;width:100;height:100">
</v:rect>
```

end example]

Parent Elements
background (§2.2.1); group (§6.1.2.7); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

Child Elements	Subclause
anchorlock (Anchor Location Is Locked)	§6.3.2.1
borderbottom (Bottom Border)	§6.3.2.2
borderleft (Left Border)	§6.3.2.3
borderright (Right Border)	§6.3.2.4
bordertop (Top Border)	§6.3.2.5
callout (Callout)	§6.2.2.2
ClientData (Attached Object Data)	§6.4.2.12
clippath (Shape Clipping Path)	§6.2.2.3
extrusion (3D Extrusion)	§6.2.2.10

Child Elements	Subclause
fill (Shape Fill Properties)	§6.1.2.5
formulas (Set of Formulas)	§6.1.2.6
handles (Set of Handles)	§6.1.2.9
imagedata (Image Data)	§6.1.2.11
lock (Shape Protections)	§6.2.2.17
path (Shape Path)	§6.1.2.14
shadow (Shadow Effect)	§6.1.2.18
signatureline (Digital Signature Line)	§6.2.2.29
skew (Skew Transform)	§6.2.2.30
stroke (Line Stroke Settings)	§6.1.2.21
textbox (Text Box)	§6.1.2.22
textdata (VML Diagram Text)	§6.5.2.2
textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description
<b>alt (Alternate Text)</b>	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p><i>[Example: The alt text describes the basic shape:</i></p> <pre>&lt;v:shape ... fillcolor="red"   alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>borderbottomcolor (Bottom Border Color)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>borderleftcolor (Border Left Color)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>borderrightcolor (Border Right Color)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

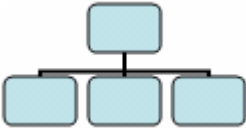

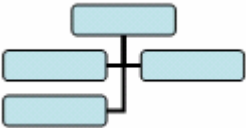

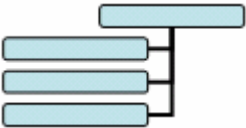

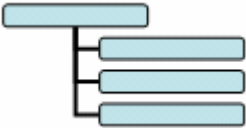

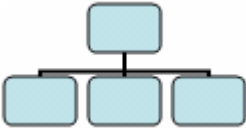

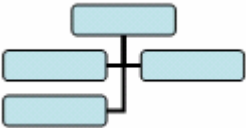

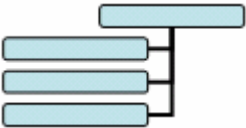

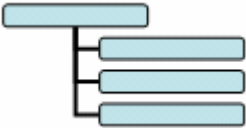

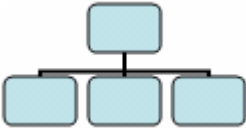

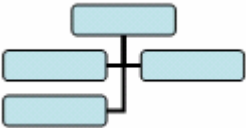

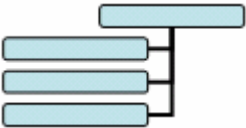

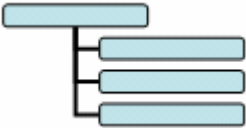

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
<b>bordertopcolor</b> <b>(Border Top Color)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value.  <i>[Example:</i> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt;</pre> <pre>&lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
<b>bullet</b> (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is false.  <i>[Example:</i> <pre>&lt;v:shape ... o:bullet="true" ... &gt;</pre> <pre>&lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>button</b> (Button Behavior Toggle)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is false.  <i>[Example:</i> <pre>&lt;v:shape ... o:button="true" ... &gt;</pre> <pre>&lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>bwmode</b> (Black-and-White Mode)  Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.  bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. <i>[Example:</i> This shape renders in grayscale in a black-and-white environment:

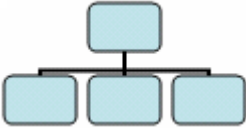

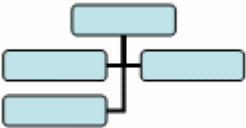

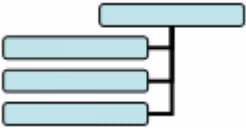

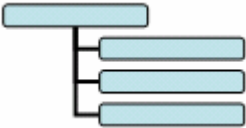

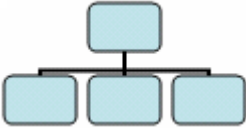

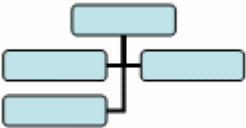

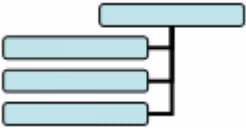

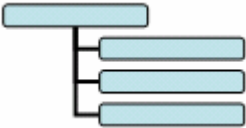

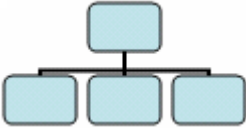

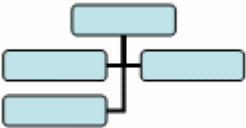

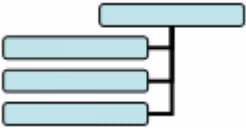

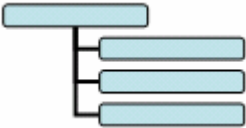

Attributes	Description
	<pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
bwnormal (Normal Black-and-White Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in a pale grayscale in a normal black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
bwpure (Pure Black-and-White Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
chromakey (Image Transparency Color)	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>

Attributes	Description
<b>class (CSS Reference)</b>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[Example: The snippets below are equivalent:</p> <pre> ... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;  &lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>clip (Clipping Toggle)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p>[Example:</p> <pre> &lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>cliptowrap (Clip to Wrapping Polygon)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre> &lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>connectortype (Shape Connector)</b>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p>

Attributes	Description
Type)  Namespace: urn:schemas- microsoft- com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
coordorigin (Coordinate Space Origin)	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
coordsize (Coordinate Space Size)	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate</p>

Attributes	Description										
	<p>space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> <div></div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>										
<p>dgmlayout (Diagram Node Layout Identifier)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p><i>[Example:</i></p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>	Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 	3	Hanging, left side layout. 
Value	Description										
0	Top-down, centered layout. 										
1	Hanging, both sides layout. 										
2	Hanging, right side layout. 										
3	Hanging, left side layout. 										

Attributes	Description										
	The possible values for this attribute are defined by the XML Schema integer datatype.										
<div>dgmlayoutmru (Diagram Node Recent Layout Identifier)</div> <div>Namespace: urn:schemas-microsoft-com:office:office</div>	<div>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.<div></div></td></tr><tr><td>3</td><td>Hanging, left side layout.<div></div></td></tr></table> <div>[Example: <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> end example]</div> <div>The possible values for this attribute are defined by the XML Schema integer datatype.</div>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout. <div></div>	3	Hanging, left side layout. <div></div>
Value	Description										
0	Top-down, centered layout. <div></div>										
1	Hanging, both sides layout. <div></div>										
2	Hanging, right side layout. <div></div>										
3	Hanging, left side layout. <div></div>										
<div>dgmnodekind (Diagram Node Identifier)</div> <div>Namespace: urn:schemas-microsoft-com:office:office</div>	<div>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</div> <div>[Example: <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> end example]</div>										

Attributes	Description
<p>doubleclicknotify (Double-click Notification Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>The possible values for this attribute are defined by the XML Schema integer datatype.</p> <p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>fillcolor (Fill Color)</p>	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f" fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre> 

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>forcedash (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hralign (Horizontal Rule Alignment)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the alignment of a horizontal rule. Default is left.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
<p>href (Hyperlink Target)</p>	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p>

Attributes	Description
	<p><code>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hrnoshade (Horizontal Rule 3D Shading Toggle)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:hrnoshade="true" ... &gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hrpct (Horizontal Rule Length Percentage)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:hrpct="85" ... &gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>hrstd (Horizontal Rule Standard Display Toggle)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:hrstd="true" ... &gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p>

Attributes	Description
	<pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
insetmode (Text Inset Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
ole (Embedded Object Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
oleicon (Embedded Object Icon Toggle)	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
oned (Shape Handle Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
opacity (Fill Color Opacity)	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red"   color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="451 1360 779 1583">  opacity="1"   opacity=".25" </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
preferrelative (Relative Resize Toggle)	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
print (Print Toggle)	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
regroupid (Regroup ID)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
spid (Optional String)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
spt (Optional Number)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>

Attributes	Description
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
stroked (Shape Stroke Toggle)	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
strokeweight (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description								
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 724 1479 1890"> <thead> <tr> <th data-bbox="415 724 662 772">Property</th><th data-bbox="662 724 1479 772">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 772 662 1039">flip</td><td data-bbox="662 772 1479 1039"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1039 662 1449">height</td><td data-bbox="662 1039 1479 1449"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Property	Description								
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>								
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>								
left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the</li> </ul>								

Attributes	Description	
		parent object's width.
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the</li> </ul>

Attributes	Description	
		normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page,</li> </ul>

Attributes	Description	
		<p>bottom to top.</p> <ul style="list-style-type: none"><li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li></ul>
	The following properties are only used by the textbox element (§6.1.2.22):	
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"><li>• ltr - Test is displayed left-to-right.</li><li>• rtl - Test is displayed right-to-left.</li></ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"><li>• horizontal - Text is displayed horizontally.</li><li>• vertical - Text is displayed vertically.</li><li>• vertical-ideographic - Ideographic text is displayed vertically.</li><li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li></ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-to-text	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>
	mso-fit-text-to-shape	<p>Specifies whether the text stretches to fit the textbox. Default is false.</p>
	mso-layout-flow-alt	<p>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</p>
mso-next-textbox	<p>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</p>	

Attributes	Description										
	mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: <ul style="list-style-type: none"><li>0</li><li>90</li><li>180</li><li>-90</li></ul>									
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.									
	v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: <ul style="list-style-type: none"><li>top</li><li>middle</li><li>bottom</li><li>top-center</li><li>middle-center</li><li>bottom-center</li><li>top-baseline</li><li>bottom-baseline</li><li>top-center-baseline</li><li>bottom-center-baseline</li></ul>									
	The following properties are only used by the textpath element (§6.1.2.23):										
	<table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. Available in Microsoft® Internet Explorer 6 or later.</td></tr> <tr> <td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr> <tr> <td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr> <tr> <td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr> <tr> <td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr> </tbody> </table> <p>[Example:</p> <pre> &lt;v:shape ...   href="http://www.openxmlformats.org"   target="_self" ... &gt; &lt;/v:shape&gt; </pre>	Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>title (Shape Title)</p>	<p>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>userdrawn (Exists In Master Slide)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is false. If true, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rect">
 <choice maxOccurs="unbounded">
 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
 </choice>
 <attributeGroup ref="AG_AllCoreAttributes"/>
 <attributeGroup ref="AG_AllShapeAttributes"/>
</complexType>
```

6.1.2.17      roundrect (Rounded Rectangle)

This element is used to draw a rectangle with rounded corners. The CSS2 style content width and height define the width and height of the rectangle.

[Example:

```
<v:roundrect fillcolor="red" arcsize="35%"
 style="position:relative;top:0;left:0;width:200;height:100">
</v:roundrect>
```

end example]

Parent Elements
background (§2.2.1); group (§6.1.2.7); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

Child Elements	Subclause

Attributes	Description
allowincell (Allow in Table Cell)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
allowoverlap (Allow Shape Overlap)	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
alt (Alternate Text)	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
arcsizes (Rounded Corner Arc Size)	<p>Specifies the amount of roundness for a rounded rectangle as a percentage of half the smaller dimension of the length and width of the rectangle. Default is 20%. An arc size of 0% yields square corners and 100% forms circular corners. A square with an arc size value of 100% is a circle. This numeric value may also be specified in 1/65536ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre>&lt;v:roundrect ... arcsizes="35%"&gt; &lt;/v:roundrect&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderbottomcolor (Bottom Border Color)	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p>

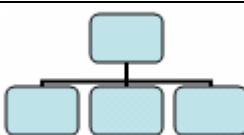

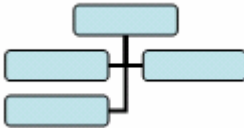

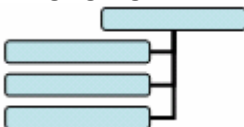

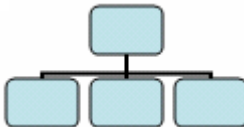

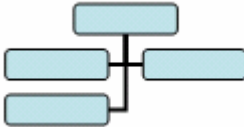

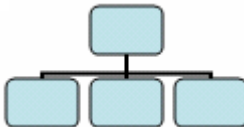

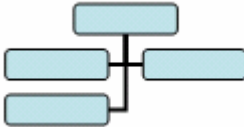

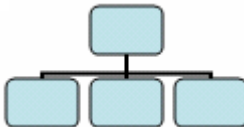

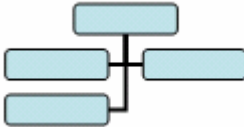

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderleftcolor (Border Left Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderrightcolor (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bordertopcolor (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bullet (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is a graphical bullet. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

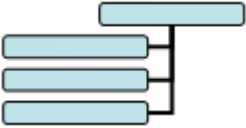

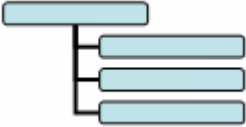

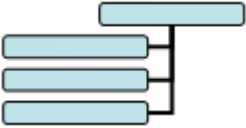

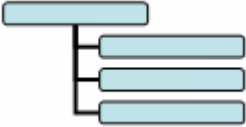

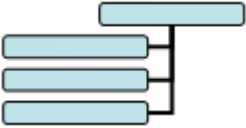

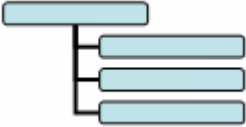

Attributes	Description
<p>button (Button Behavior Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p> <p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>bwmode (Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow greyscale and pure B&amp;W might not.</p> <p>[Example: This shape renders in grayscale in a black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>bwnormal (Normal Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>bwpure (Pure</p>	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is</p>

Attributes	Description
<p>Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>chromakey (Image Transparency Color)</p>	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>class (CSS Reference)</p>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[<i>Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>clip (Clipping Toggle)</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p>

Attributes	Description
<p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[Example:</p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>coordorigin (Coordinate Space Origin)</p>	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100).</p>

Attributes	Description				
	<p>The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
<b>coordsize</b> (Coordinate Space Size)	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[<i>Example:</i> The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
<b>dgmlayout</b> (Diagram Node Layout Identifier)  Namespace: urn:schemas-microsoft-	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table border="1" data-bbox="511 1743 1209 1837"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>0</td><td>Top-down, centered layout.</td></tr> </tbody> </table>	Value	Description	0	Top-down, centered layout.
Value	Description				
0	Top-down, centered layout.				

Attributes	Description									
com:office:office										
	1	Hanging, both sides layout. 								
	2	Hanging, right side layout. 								
	3	Hanging, left side layout. 								
	<p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>									
dgmlayoutmru (Diagram Node Recent Layout Identifier)	Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:									
Namespace: urn:schemas-microsoft-com:office:office	<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout.</td></tr></table>		Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout.
Value	Description									
0	Top-down, centered layout. 									
1	Hanging, both sides layout. 									
2	Hanging, right side layout.

	<table border="1" data-bbox="511 243 1208 569"> <tr> <td data-bbox="511 243 643 386"></td><td data-bbox="643 243 1208 386">  </td></tr> <tr> <td data-bbox="511 386 643 569">3</td><td data-bbox="643 386 1208 569">           Hanging, left side layout.            </td></tr> </table> <p data-bbox="415 604 535 636"><i>[Example:</i></p> <pre data-bbox="456 678 886 741">&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 783 574 814"><i>end example]</i></p> <p data-bbox="415 856 1446 888">The possible values for this attribute are defined by the XML Schema integer datatype.</p>			3	Hanging, left side layout. 
					
3	Hanging, left side layout. 				
<b>dgmnodekind</b> (Diagram Node Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 905 1446 968">Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p data-bbox="415 1010 535 1041"><i>[Example:</i></p> <pre data-bbox="456 1083 919 1146">&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 1188 574 1220"><i>end example]</i></p> <p data-bbox="415 1262 1446 1293">The possible values for this attribute are defined by the XML Schema integer datatype.</p>				
<b>doubleclicknotify</b> (Double-click Notification Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 1304 1471 1335">Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p data-bbox="415 1377 535 1409"><i>[Example:</i></p> <pre data-bbox="456 1451 1175 1514">&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 1556 574 1587"><i>end example]</i></p> <p data-bbox="415 1629 1390 1692">The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>				
<b>fillcolor</b> (Fill Color)	<p data-bbox="415 1703 1463 1881">Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p>				

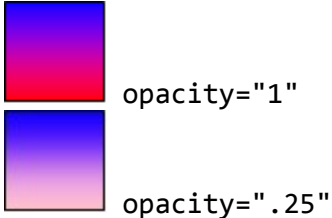

Attributes	Description
	<p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f" fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>forcedash (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type</p>

Attributes	Description
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>(§6.2.3.23).</p> <p>Specifies that a shape is a horizontal rule. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hralign (Horizontal Rule Alignment)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the alignment of a horizontal rule. Default is <code>left</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
<p>href (Hyperlink Target)</p>	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hrnoshade (Horizontal Rule 3D Shading Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the horizontal rule does not have 3-D shading. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hrpct (Horizontal</p>	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p>

Attributes	Description
<p>Rule Length Percentage)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>hrstd (Horizontal Rule Standard Display Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>insetmode (Text Inset Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>

Attributes	Description
<b>insetpen</b> (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<b>ole</b> (Embedded Object Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
<b>oleicon</b> (Embedded Object Icon Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>oned</b> (Shape Handle Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>opacity (Fill Color Opacity)</p>	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p><i>[Example: The red color is 25% opaque:</i></p> <pre>&lt;v:fill type="gradient" color="red"   color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>print (Print Toggle)</p>	<p>Specifies whether the shape will be printed. Default is true.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[<i>Example:</i> The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
spid (Optional String)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional string that an application may use to Identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
spt (Optional Number)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[<i>Example:</i></p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type</p>

Attributes	Description				
stroked (Shape Stroke Toggle)	<p>(§6.1.3.1).</p> <p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>				
strokeweight (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1732 1481 1892"> <thead> <tr> <th data-bbox="415 1732 664 1780">Property</th><th data-bbox="664 1732 1481 1780">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1780 664 1892">flip</td><td data-bbox="664 1780 1481 1892">Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</td></tr> </tbody> </table>	Property	Description	flip	Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:
Property	Description				
flip	Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:				

Attributes	Description	
		<ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>
	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-	Specifies relative horizontal position data for objects in

Attributes	Description	
	horizontal-relative	<p>WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>

Attributes	Description	
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.

Attributes	Description	
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only <code>inherit</code> and <code>hidden</code> are used; any other values are mapped to <code>inherit</code>. Default is <code>inherit</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>

Attributes	Description																		
	<p>The following properties are only used by the textbox element (§6.1.2.22):</p> <table border="1"> <thead> <tr> <th>Property</th><th>Description</th></tr> </thead> <tbody> <tr> <td>direction</td><td> <p>Specifies the direction of the text in the textbox. Property	Description												
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.												
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.												
font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.												
font-style	<p>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:</p> <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>												
font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:												

Attributes	Description																		
		<ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>																	
	font-weight	<p>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>normal</td><td rowspan="6">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr><tr><td>300</td></tr><tr><td>400</td></tr><tr><td>bold</td><td rowspan="6">Treated as bold.</td></tr><tr><td>bolder</td></tr><tr><td>500</td></tr><tr><td>600</td></tr><tr><td>700</td></tr><tr><td>800</td></tr><tr><td>900</td></tr></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200	300	400	bold	Treated as bold.	bolder	500	600	700	800	900
	Value	Description																	
	normal	Treated as non-bold.																	
	lighter																		
	100																		
200																			
300																			
400																			
bold	Treated as bold.																		
bolder																			
500																			
600																			
700																			
800																			
900																			
mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.																		
text-decoration	<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"><li>none</li><li>underline</li><li>overline</li><li>line-through</li><li>blink</li></ul>																		
v-rotate-	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.																		

Attributes	Description	
	letters	
	v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode	<p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.
<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> </ul>		

Attributes	Description																
	<ul style="list-style-type: none"> <li>• height</li> <li>• left</li> <li>• margin-left</li> <li>• margin-top</li> <li>• position</li> <li>• rotation</li> <li>• top</li> <li>• visibility</li> <li>• width</li> <li>• z-index</li> </ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>																
target (Hyperlink Display Target)	<p>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:</p> <table border="1" data-bbox="415 814 1482 1451"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>&lt;targetname&gt;</td><td>String containing the name of the frame or window in which to load the document.</td></tr> <tr> <td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr> <tr> <td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr> <tr> <td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr> <tr> <td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr> <tr> <td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr> <tr> <td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr> </tbody> </table> <p>[Example:</p> <pre> &lt;v:shape ...   href="http://www.openxmlformats.org"   target="_self" ... &gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>	Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																
title (Shape Title)	Specifies the text displayed when the mouse pointer moves over the shape. Default is no																

Attributes	Description
	<p>value.</p> <p>[Example:</p> <pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>userdrawn (Exists In Master Slide)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the user has added the shape to a master slide. Default is <code>false</code>. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the <code>mso-wrap-mode</code> style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_RoundRect">
3 <choice maxOccurs="unbounded">
4 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
5 </choice>
6 <attributeGroup ref="AG_AllCoreAttributes"/>
7 <attributeGroup ref="AG_AllShapeAttributes"/>
8 <attribute name="arcsize" type="xsd:string" use="optional"/>
9 </complexType>
```

10 6.1.2.18 shadow (Shadow Effect)

11 This element adds shadow effects to a shape. The on attribute must be true for the shadow to be displayed.

12 [Example:

```
13 <v:shadow on="true" type="perspective"
14 matrix="1.25,-2,,1.5,,.000001"
15 offset="38pt,-6pt">
16 </v:shadow>
```

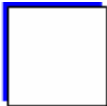

18 *end example]*

19

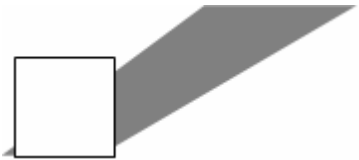

Attributes	Description
color (Shadow Primary Color)	Specifies the color of the primary shadow. Default is gray (RGB 128,128,128).  [Example:  <v:shadow on="true" color="green">

Attributes	Description
	<p><code>&lt;/v:shadow&gt;</code></p> <p>Applied to a simple square the shadow looks like this:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
color2 (Shadow Secondary Color)	<p>Specifies the color of the second shadow, or highlight in an embossed or engraved shadow. Default is light gray (RGB 203,203,203).</p> <p>[Example:</p> <pre> &lt;v:shadow on="true" type="double"   color="green" color2="blue"&gt; &lt;/v:shadow&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre> &lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
matrix (Shadow Perspective Matrix)	<p>Specifies a perspective transform for a shadow. Default is no value.</p> <p>The matrix is given in the form "<math>s_{xx}</math>, <math>s_{xy}</math>, <math>s_{yx}</math>, <math>s_{yy}</math>, <math>p_x</math>, <math>p_y</math>" where <math>s</math> = scale and <math>p</math> = perspective. If the offset attribute is in absolute units then <math>p_x</math>, <math>p_y</math> are in 1/EMU units;</p>

Attributes	Description
	<p>otherwise they are an inverse fraction of the shape size.</p> <p>[<i>Example:</i> The following snippets explain the matrix parameters. The shadow is applied to a simple square with no fill and a red stroke color (note there is a default shadow offset):</p> <div><code>matrix=",,,,,"</code></div> <p><math>s_{xx}</math>, <math>s_{yy}</math> specify scaling factors for the x and y dimensions:</p> <div><code>matrix="2,,,,,"</code></div> <div><code>matrix=",,,2,,"</code></div> <p><math>s_{xy}</math>, <math>s_{yx}</math> specify skews in the x and y dimensions:</p> <div><code>matrix=",,2,,,,,"</code></div> <div><code>matrix=",,, -2,,,,,"</code></div> <p><math>p_x</math>, <math>p_y</math> effectively set the perspective trapezoid skews along the x and y dimensions:</p> <div><code>matrix=",,,,.000001,,"</code></div>

Attributes	Description
	<div></div> <div>matrix=",,,,-.000002"</div> <div>end example]</div> <div>[Example:</div> <div><pre>&lt;v:shadow on="true" type="perspective"   matrix="1.25,-2,,1.5,,.000001"   offset="38pt,-6pt"&gt; &lt;/v:shadow&gt;</pre></div> <div></div> <div>end example]</div> <div>The possible values for this attribute are defined by the XML Schema string datatype.</div>
obscured (Shadow Transparency)	<div>Specifies whether a shadow is transparent. Default is false. If true, the shadow is transparent if there is no fill on the shape.</div> <div>[Example:</div> <div><pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:50;height:50"   filled="false" fillcolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:shadow on="true" offset="50%,25%"     obscured="true"&gt;   &lt;/v:shadow&gt; &lt;/v:shape&gt;</pre></div> <div></div> <div>end example]</div> <div>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</div>

Attributes	Description
offset (Shadow Primary Offset)	<p>Specifies the primary shadow's x,y offset from the shape's location. Default is "2pt,2pt".</p> <p>Values are either an absolute measurement or a fractional value of the shape dimensions, from -50% to 50%.</p> <p>[Example:</p> <pre data-bbox="451 499 1047 562">&lt;v:shadow on="true" offset="50%,25%"&gt; &lt;/v:shadow&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
offset2 (Shadow Secondary Offset)	<p>Specifies the secondary shadow's x,y offset from the shape's location. Default is "-2pt,-2pt".</p> <p>[Example:</p> <pre data-bbox="451 1060 1031 1192">&lt;v:shadow type="double" on="true"   color="blue" offset="10pt,5pt"   color2="red" offset2="-10pt,-5pt"&gt; &lt;/v:shadow&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
on (Shadow Toggle)	<p>Specifies whether to show a shadow. Default is true.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
opacity (Shadow Opacity)	<p>Specifies the opacity of the shadow. Default is 1. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p>

Attributes	Description												
	<pre>&lt;v:shadow type="double" on="true" opacity=".5"   color="blue" offset="10pt,5pt"   color2="red" offset2="-10pt,-5pt"&gt; &lt;/v:shadow&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>												
origin (Shadow Origin)	<p>Specifies the center of the shadow relative to the shape's origin. Specified as a pair of fractional values of the shape dimensions, ranging from 50% to -50%. Default is "0,0".</p> <p>[<i>Example:</i> This example is unchanged from above except for the addition of the origin attribute:</p> <pre>&lt;v:shadow on="true" type="perspective"   matrix="1.25,-2,,1.5,,.000001"   offset="38pt,-6pt" origin="10%,-10%"&gt; &lt;/v:shadow&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>												
type (Shadow Type)	<p>Specifies the type of shadow. Default is single. Allowed values are:</p> <table border="1" data-bbox="414 1465 1357 1839"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>single</td><td>Single shadow.</td></tr> <tr> <td>double</td><td>Double shadow. color2 and offset2 are used for the second shadow's color and offset.</td></tr> <tr> <td>perspective</td><td>Perspective shadow.</td></tr> <tr> <td>shaperelative</td><td>The shadow is created relative to the shape.</td></tr> <tr> <td>drawingrelative</td><td>The shadow is created relative to the drawing.</td></tr> </tbody> </table>	Value	Description	single	Single shadow.	double	Double shadow. color2 and offset2 are used for the second shadow's color and offset.	perspective	Perspective shadow.	shaperelative	The shadow is created relative to the shape.	drawingrelative	The shadow is created relative to the drawing.
Value	Description												
single	Single shadow.												
double	Double shadow. color2 and offset2 are used for the second shadow's color and offset.												
perspective	Perspective shadow.												
shaperelative	The shadow is created relative to the shape.												
drawingrelative	The shadow is created relative to the drawing.												

Attributes	Description	
	emboss	The shadow has an embossed look.
	The possible values for this attribute are defined by the ST_ShadowType simple type (§6.1.3.7).	

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shadow">
 <attributeGroup ref="AG_Id"/>
 <attribute name="on" type="ST_TrueFalse" use="optional"/>
 <attribute name="type" type="ST_ShadowType" use="optional"/>
 <attribute name="obscured" type="ST_TrueFalse" use="optional"/>
 <attribute name="color" type="ST_ColorType" use="optional"/>

 <attribute name="offset" type="xsd:string" use="optional"/>
 <attribute name="color2" type="ST_ColorType" use="optional"/>
 <attribute name="offset2" type="xsd:string" use="optional"/>
 <attribute name="origin" type="xsd:string" use="optional"/>
 <attribute name="matrix" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.19 shape (Shape Definition)

This element is used to describe a shape, the core object in VML. This element may appear by itself or within a group element (§6.1.2.7). If a shapetype element (§6.1.2.20) is referenced using the type attribute, any attributes specified in the shape will override those found in the shapetype.

[Example:

```
<v:shape style="position:absolute;top:50;left:20;width:50;height:50"
 path="m 0,0 l 0,1000 1000,1000 1000,0 x e">
 <v:shadow on="true" type="perspective"
 matrix="1.25,-2,,1.5,,.000001" offset="38pt,-6pt"/>
</v:shape>

<v:shape style="position:absolute;top:50;left:20;width:50;height:50"
 fillcolor="yellow" path="m 0,0 l 0,1000 1000,1000 1000,0 x e">
 <v:extrusion on="true" lightposition="0,-2000,10000"/>
</v:shape>
```

Attributes	Description
adj (Adjustment Parameters)	Specifies a comma-delimited list of parameters, or adjustment values, used to define values for a parameterized formula. Values may be omitted. There can be up to 8 adjust

Attributes	Description
	<p>values. Each value is referenced using # followed by a number corresponding to the zero-based index for that value in the list of adjustment values. For example, #2 references the second value in the adj list.</p> <p>[Example: The following shape uses formulas to define a simple rectangle. The adj values are referenced by the eqn attribute of the f element (§6.1.2.4) and in turn referenced by the path element (§6.1.2.14).</p> <pre> &lt;v:shape   coordorigin="0 0" coordsize="200 200"   style="position:relative;top:30;left:30;width:20;height:20"   adj="1, 1, 1, 200, 200, 200, 200, 1"&gt;   &lt;v:path v="m @0,@1 l @2,@3, @4,@5, @6,@7 x e"/&gt;   &lt;v:formulas&gt;     &lt;v:f eqn="val #0"/&gt;     &lt;v:f eqn="val #1"/&gt;     &lt;v:f eqn="val #2"/&gt;     &lt;v:f eqn="val #3"/&gt;     &lt;v:f eqn="val #4"/&gt;     &lt;v:f eqn="val #5"/&gt;     &lt;v:f eqn="val #6"/&gt;     &lt;v:f eqn="val #7"/&gt;   &lt;/v:formulas&gt; &lt;/v:shape&gt; </pre> <p>This is the equivalent of:</p> <pre> &lt;v:shape   coordorigin="0 0" coordsize="200 200"   style="position:relative;top:30;left:30;width:20;height:20"   path="m 1,1 l 1,200, 200,200, 200,1 x e"&gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre> &lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

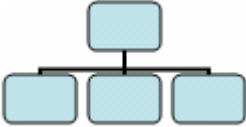

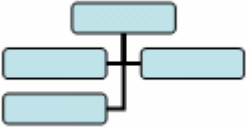

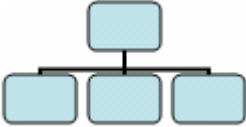

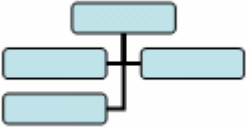

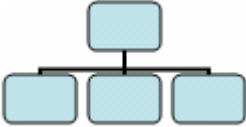

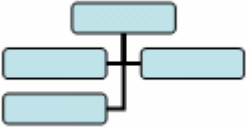

Attributes	Description
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>alt (Alternate Text)</p>	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderbottomcolor (Bottom Border Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderleftcolor (Border Left Color)</p> <p>Namespace: urn:schemas-</p>	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt;</pre>

Attributes	Description
microsoft-com:office:office	<p>&lt;/v:shape&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderrightcolor (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bordertopcolor (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bullet (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is a graphical bullet. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
button (Button Behavior Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

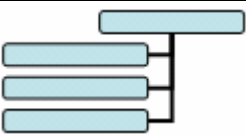

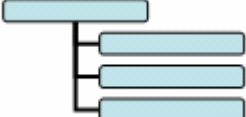

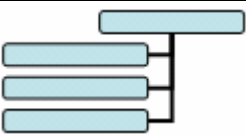

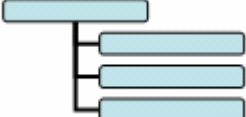

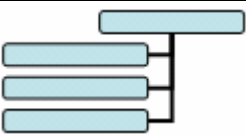

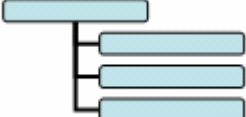

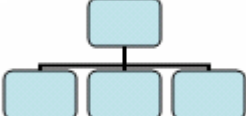

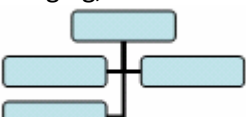

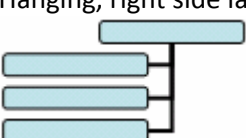

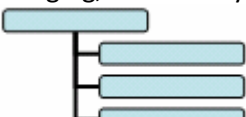

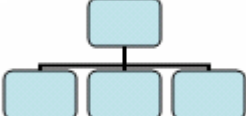

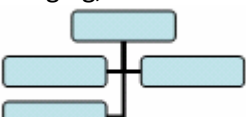

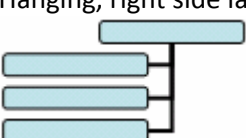

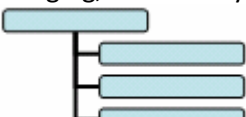

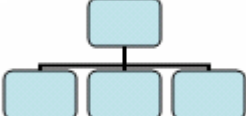

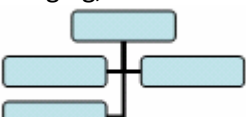

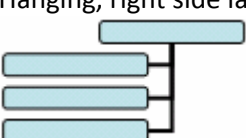

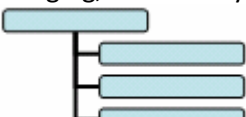

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>bwmode (Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow grayscale and pure B&amp;W might not.  <i>[Example: This shape renders in grayscale in a black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwnormal (Normal Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwpure (Pure Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in high contrast when in a pure black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type</p>

Attributes	Description
<p>chromakey (Image Transparency Color)</p>	<p>(§6.2.3.2).</p> <p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p><i>[Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>class (CSS Reference)</p>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p><i>[Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>clip (Clipping Toggle)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that</p>

Attributes	Description
<p>Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>coordorigin (Coordinate Space Origin)</p>	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> 

Attributes	Description								
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
<p>coordsize (Coordinate Space Size)</p>	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> <div></div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
<p>dgmlayout (Diagram Node Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.</td></tr></table>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout.
Value	Description								
0	Top-down, centered layout. <div></div>								
1	Hanging, both sides layout. <div></div>								
2	Hanging, right side layout.								

Attributes	Description										
	<table><tr><td></td><td></td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>			3	Hanging, left side layout. 						
											
3	Hanging, left side layout. 										
<p>dgmlayoutmru (Diagram Node Recent Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p>[Example:</p>	Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 	3	Hanging, left side layout. 
Value	Description										
0	Top-down, centered layout. 										
1	Hanging, both sides layout. 										
2	Hanging, right side layout. 										
3	Hanging, left side layout. 										

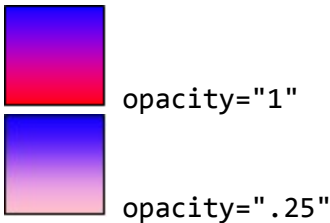

Attributes	Description
	<pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmnodekind</b> (Diagram Node Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>doubleclicknotify</b> (Double-click Notification Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>equationxml</b> (Storage for Alternate Math Content)	<p>Specifies alternate XML markup which may be used to rehydrate an equation using the Office Open XML Math syntax. The actual format of the contents of this attribute are application-defined, but shall contain Office Open XML Math as well as any application-specific content.</p> <p>The XML markup stored in this attribute shall be escaped as needed to contain only those characters legal in an attribute value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>fillcolor</b> (Fill Color)	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p>

Attributes	Description
	<pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>forcedash (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description
<p>gfxdata (Encoded Package)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies a base-64 encoded package as defined in Part 2 of this Standard that contains DrawingML content. The contents of this package are application-defined, but the contents of the package shall use the Parts defined by this Standard whenever possible.</p> <p>[<i>Rationale:</i> This attribute allows an application to use VML to represent graphical content while still persisting DrawingML for consuming applications that support DrawingML. For example, a diagram stored within this attribute would have the four parts defined for a DrawingML diagram, as well as any number of application-defined parts and relationships. <i>end rationale</i>]</p> <p>[<i>Example:</i> A DrawingML object is encoded in the gfxdata attribute, leaving VML to handle the visual display:</p> <pre>&lt;v:shape id="Diagram 1" o:spid="_x0000_i1025"   type="#_x0000_t75" style="width:446.25pt;height:252pt;   visibility:visible" o:gfxdata="UESDBBQABgAIAAAAIQDIu8KcTQE..."&gt; &lt;v:imagedata r:id="rId4" o:title=""/&gt; &lt;/v:shape&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema base64Binary datatype.</p>
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[<i>Example:</i></p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hralign (Horizontal Rule Alignment)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the alignment of a horizontal rule. Default is left.</p> <p>[<i>Example:</i></p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
<p>href (Hyperlink)</p>	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p>

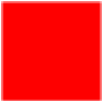

Attributes	Description
Target)	<p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hrnoshade (Horizontal Rule 3D Shading Toggle)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hrpct (Horizontal Rule Length Percentage)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
hrstd (Horizontal Rule Standard Display Toggle)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>insetmode (Text Inset Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
<p>insetpen (Inset Border From Path)</p>	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>ole (Embedded Object Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>

Attributes	Description
<p>oleicon (Embedded Object Icon Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>oned (Shape Handle Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>opacity (Fill Color Opacity)</p>	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="451 1467 779 1688" data-label="Figure">  <p>opacity="1"</p> <p>opacity=".25"</p> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>path (Edge Path)</p>	<p>Specifies the line that makes up the edges of a shape. See the v attribute of the path</p>

Attributes	Description
	<p>element (§6.1.2.14) for a full description.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>print (Print Toggle)</p>	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>regroupid (Regroup ID)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>spid (Optional String)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Attributes	Description
<p>spt (Optional Number)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>strokecolor (Shape Stroke Color)</p>	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>stroked (Shape Stroke Toggle)</p>	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>strokeweight (Shape Stroke)</p>	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element</p>

Attributes	Description								
Weight)	<p>(§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 968 1479 1879"> <thead> <tr> <th data-bbox="415 968 664 1014">Property</th><th data-bbox="664 968 1479 1014">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1014 664 1287">flip</td><td data-bbox="664 1014 1479 1287"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1287 664 1696">height</td><td data-bbox="664 1287 1479 1696"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> </td></tr> <tr> <td data-bbox="415 1696 664 1879">left</td><td data-bbox="664 1696 1479 1879"> <p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p>
Property	Description								
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>								
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>								
left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p>								

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>

Attributes	Description	
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>

Attributes	Description	
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-edited	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.</p>
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <b>static</b> - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• <b>absolute</b> - The element is positioned relative to the parent, using the top and left properties.</li> <li>• <b>relative</b> - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <b>&lt;percentage&gt;</b>- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• <b>inherit</b> - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• ltr - Text is displayed left-to-right.</li> <li>• rtl - Text is displayed right-to-left.</li> </ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>• horizontal - Text is displayed horizontally.</li> <li>• vertical - Text is displayed vertically.</li> <li>• vertical-ideographic - Ideographic text is displayed vertically.</li> <li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-to-text	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>
	mso-fit-text-to-shape	<p>Specifies whether the text stretches to fit the textbox. Default is false.</p>
	mso-layout-	<p>Specifies the alternate layout flow for text in textboxes. This</p>

Attributes	Description	
	flow-alt	property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• middle</li> <li>• bottom</li> <li>• top-center</li> <li>• middle-center</li> <li>• bottom-center</li> <li>• top-baseline</li> <li>• bottom-baseline</li> <li>• top-center-baseline</li> <li>• bottom-center-baseline</li> </ul>
The following properties are only used by the textpath element (§6.1.2.23):		
Property		Description
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.	
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.	

Attributes	Description																		
	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.																	
	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>																	
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>																	
	font-weight	<div>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>normal</td><td rowspan="6">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr><tr><td>300</td></tr><tr><td>400</td></tr><tr><td>bold</td><td rowspan="7">Treated as bold.</td></tr><tr><td>bolder</td></tr><tr><td>500</td></tr><tr><td>600</td></tr><tr><td>700</td></tr><tr><td>800</td></tr><tr><td>900</td></tr></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200	300	400	bold	Treated as bold.	bolder	500	600	700	800	900
	Value	Description																	
normal	Treated as non-bold.																		
lighter																			
100																			
200																			
300																			
400																			
bold	Treated as bold.																		
bolder																			
500																			
600																			
700																			
800																			
900																			
mso-text-	Specifies whether a shadow is applied to the text on a text path.																		

Attributes	Description	
	shadow	Default is false.
	text-decoration	<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• underline</li> <li>• overline</li> <li>• line-through</li> <li>• blink</li> </ul>
	v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode	<p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.

Attributes	Description																
	<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> <li>• height</li> <li>• left</li> <li>• margin-left</li> <li>• margin-top</li> <li>• position</li> <li>• rotation</li> <li>• top</li> <li>• visibility</li> <li>• width</li> <li>• z-index</li> </ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>																
target (Hyperlink Display Target)	<p>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:</p> <table border="1" data-bbox="415 1251 1479 1887"> <thead> <tr> <th data-bbox="415 1251 626 1299">Value</th><th data-bbox="626 1251 1479 1299">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1299 626 1383">&lt;targetname&gt;</td><td data-bbox="626 1299 1479 1383">String containing the name of the frame or window in which to load the document.</td></tr> <tr> <td data-bbox="415 1383 626 1467">_blank</td><td data-bbox="626 1383 1479 1467">Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr> <tr> <td data-bbox="415 1467 626 1551">_media</td><td data-bbox="626 1467 1479 1551">Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr> <tr> <td data-bbox="415 1551 626 1635">_parent</td><td data-bbox="626 1551 1479 1635">Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr> <tr> <td data-bbox="415 1635 626 1719">_search</td><td data-bbox="626 1635 1479 1719">Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr> <tr> <td data-bbox="415 1719 626 1803">_self</td><td data-bbox="626 1719 1479 1803">Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr> <tr> <td data-bbox="415 1803 626 1887">_top</td><td data-bbox="626 1803 1479 1887">Specifies that the linked document is loaded into the topmost window.</td></tr> </tbody> </table>	Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:shape ...   href="http://www.openxmlformats.org"   target="_self" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
title (Shape Title)	<p>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
type (Shape Type Reference)	<p>Specifies a reference to a shapetype ID that describes the standard path, fill and stroke properties of a shape. Properties specified in the shape override the shapetype properties. Default is no value.</p> <p>[Example: The following example defines a shapetype that is a simple rectangle and an actual shape instance that uses it and overrides the fill color.</p> <pre>&lt;v:shapetype id="mytype" fillcolor="red" strokecolor="blue" coordorigin="0 0" coordsize="200 200" path="m 0,0 l 0,200, 200,200, 200,0 x e"/&gt; &lt;/v:shapetype&gt;  &lt;v:shape id="shape02" type="#mytype" fillcolor="green" style="position:relative;top:1;left:1;width:20;height:20"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
userdrawn (Exists In Master Slide)	<p>Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p>

Attributes	Description
<p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the <code>mso-wrap-mode</code> style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
 <choice maxOccurs="unbounded">
 <group ref="EG_ShapeElements"/>
 <element ref="o:ink"/>
 <element ref="p:iscomment"/>
 </choice>
 <attributeGroup ref="AG_AllCoreAttributes"/>
 <attributeGroup ref="AG_AllShapeAttributes"/>
 <attributeGroup ref="AG_Type"/>
 <attributeGroup ref="AG_Adj"/>
 <attributeGroup ref="AG_Path"/>
 <attribute ref="o:gfxdata"/>
 <attribute name="equationxml" type="xsd:string" use="optional"/>
</complexType>
```

### 6.1.2.20 shapetype (Shape Template)

This element defines a shape template that can be used to create other shapes. Shapetype is identical to the shape element (§6.1.2.19) except it cannot reference another shapetype element. The type attribute may not be used with shapetype. Attributes defined in the shape override any that appear in the shapetype. CSS positioning attributes (such as top, width, z-index, rotation, flip) are not passed to a shape from a shapetype. To use this element, create a shapetype with a specific id attribute. Then create a shape and reference the shapetype's id using the type attribute.

[Example:

```
<v:shapetype id="mytype" fillcolor="silver" strokecolor="blue">
 <v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"/>
 <v:fill on="true" type="gradient" color2="navy" angle="-45"/>
</v:shapetype>
<v:shape type="#mytype"
 style="position:absolute;top:10;left:10;width:50;height:50"/>
<v:shape type="#mytype" fillcolor="teal"
 style="position:absolute;top:10;left:75;width:75;height:50"/>
<v:shape type="#mytype"
 style="position:absolute;top:10;left:165;width:50;height:50">
 <v:fill type="solid"/>
</v:shape>
<v:shape type="#mytype" path="m 500,0 l 1000,1000 0,1000 x e"
 style="position:absolute;top:10;left:230;width:50;height:50"/>
```

end example]

textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

2

**Attributes****Description**

adj (Adjustment Parameters)	Specifies a comma-delimited list of parameters, or adjustment values, used to define values for a parameterized formula. Values may be omitted. There can be up to 8 adjust values. Each value is referenced using # followed by a number corresponding to the zero-based index for that value in the list of adjustment values. For example, #2 references the second value in the adj list.
-----------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Attributes	Description
	<p>[<i>Example:</i> The following shape uses formulas to define a simple rectangle. The adj values are referenced by the eqn attribute of the f element (§6.1.2.4) and in turn referenced by the path element (§6.1.2.14).</p> <pre> &lt;v:shape   coordorigin="0 0" coordsize="200 200"   style="position:relative;top:30;left:30;width:20;height:20"   adj="1, 1, 1, 200, 200, 200, 200, 1"&gt;   &lt;v:path v="m @0,@1 l @2,@3, @4,@5, @6,@7 x e"/&gt;   &lt;v:formulas&gt;     &lt;v:f eqn="val #0"/&gt;     &lt;v:f eqn="val #1"/&gt;     &lt;v:f eqn="val #2"/&gt;     &lt;v:f eqn="val #3"/&gt;     &lt;v:f eqn="val #4"/&gt;     &lt;v:f eqn="val #5"/&gt;     &lt;v:f eqn="val #6"/&gt;     &lt;v:f eqn="val #7"/&gt;   &lt;/v:formulas&gt; &lt;/v:shape&gt; </pre> <p>This is the equivalent of:</p> <pre> &lt;v:shape   coordorigin="0 0" coordsize="200 200"   style="position:relative;top:30;left:30;width:20;height:20"   path="m 1,1 l 1,200, 200,200, 200,1 x e"&gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[<i>Example:</i></p> <pre> &lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>allowoverlap (Allow Shape</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of</p>

Attributes	Description
<p>Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>alt (Alternate Text)</p>	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderbottomcolor (Bottom Border Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderleftcolor (Border Left Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre>

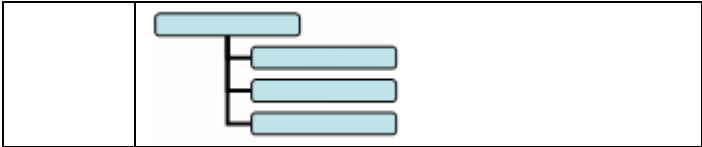

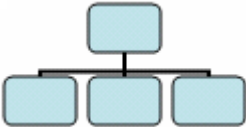

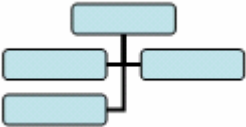

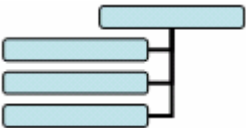

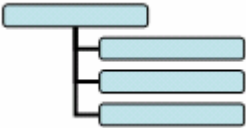

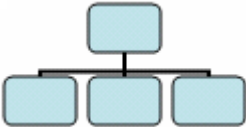

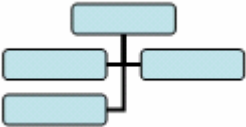

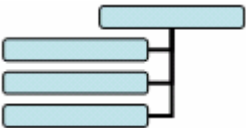

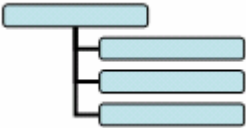

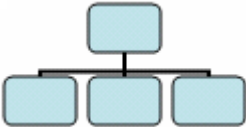

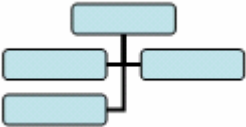

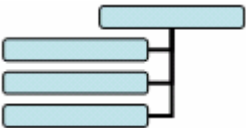

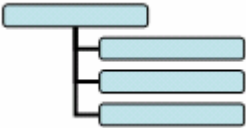

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p><b>borderrightcolor</b> (Border Right Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p><b>bordertopcolor</b> (Border Top Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p><b>bullet</b> (Graphical Bullet)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the shape is a graphical bullet. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p><b>button</b> (Button Behavior Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape will exhibit button press behavior on click. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description
<b>bwmode (Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow greyscale and pure B&amp;W might not.  <i>[Example: This shape renders in grayscale in a black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwnormal (Normal Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwpure (Pure Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in high contrast when in a pure black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>chromakey (Image)</b>	<p>Specifies a color value that will be transparent and show anything behind the shape.</p>

Attributes	Description
Transparency Color)	<p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
class (CSS Reference)	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[Example: The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
clip (Clipping Toggle)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
cliptowrap (Clip to Wrapping Polygon)	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
connectortype (Shape Connector Type)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
coordorigin (Coordinate Space Origin)	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> <div data-bbox="415 1682 516 1785" data-label="Image"> </div> <p>end example]</p>

Attributes	Description										
	The possible values for this attribute are defined by the XML Schema string datatype.										
coordsize (Coordinate Space Size)	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> <div></div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>										
dgmlayout (Diagram Node Layout Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr><tr><td>3</td><td>Hanging, left side layout.</td></tr></table>	Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 	3	Hanging, left side layout.
Value	Description										
0	Top-down, centered layout. 										
1	Hanging, both sides layout. 										
2	Hanging, right side layout. 										
3	Hanging, left side layout.										

Attributes	Description										
	<div><div></div><div><p>[Example:</p><pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre><p>end example]</p><p>The possible values for this attribute are defined by the XML Schema integer datatype.</p></div></div>										
<p>dgmlayoutmru (Diagram Node Recent Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.<div></div></td></tr><tr><td>3</td><td>Hanging, left side layout.<div></div></td></tr></table> <div><p>[Example:</p><pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre><p>end example]</p></div>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout. <div></div>	3	Hanging, left side layout. <div></div>
Value	Description										
0	Top-down, centered layout. <div></div>										
1	Hanging, both sides layout. <div></div>										
2	Hanging, right side layout. <div></div>										
3	Hanging, left side layout. <div></div>										

Attributes	Description
<p><b>dgmnodekind</b> (Diagram Node Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>The possible values for this attribute are defined by the XML Schema integer datatype.</p> <p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p><b>doubleclicknotify</b> (Double-click Notification Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p><b>fillcolor</b> (Fill Color)</p>	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p><b>filled</b> (Shape Fill)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is</p>

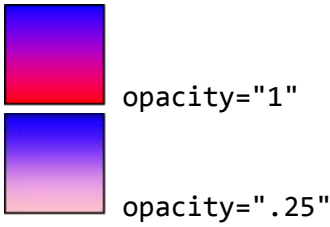

Attributes	Description
Toggle)	<p>overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
forcedash (Force Dashed Outline)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hr (Horizontal Rule Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hralign (Horizontal Rule Alignment)	<p>Specifies the alignment of a horizontal rule. Default is left.</p> <p>[Example:</p>

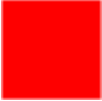

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
href (Hyperlink Target)	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hrnoshade (Horizontal Rule 3D Shading Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hrpct (Horizontal Rule Length Percentage)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
hrstd (Horizontal Rule Standard Display Toggle)  Namespace: urn:schemas-	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt;</pre>

Attributes	Description
microsoft-com:office:office	<p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
insetmode (Text Inset Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
master (Master Element Toggle)	<p>Specifies whether the shapetype is a master element. If true, it is rendered by the rendering engine. Default is false.</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	The possible values for this attribute are defined by the XML Schema string datatype.
ole (Embedded Object Toggle)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is false.  <i>[Example:</i> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is false.  <i>[Example:</i> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.  <i>[Example:</i> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.  <i>[Example: The red color is 25% opaque:</i>

Attributes	Description
	<pre>&lt;v:fill type="gradient" color="red"   color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
path (Edge Path)	<p>Specifies the line that makes up the edges of a shape. See the v attribute of the path element (§6.1.2.14) for a full description.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
print (Print Toggle)	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
regroupid (Regroup ID)	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
spid (Optional String)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional string that an application may use to Identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
spt (Optional Number)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
stroked (Shape Stroke Toggle)	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p>

Attributes	Description				
	<p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>				
<b>strokeweight</b> (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
<b>style</b> (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1577 1479 1892"> <thead> <tr> <th data-bbox="415 1577 664 1625">Property</th><th data-bbox="664 1577 1479 1625">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1625 664 1892">flip</td><td data-bbox="664 1625 1479 1892"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>
Property	Description				
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>				

Attributes	Description	
	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm,</li> </ul>

Attributes	Description	
		<p>mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</p> <ul style="list-style-type: none"> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not</p>

Attributes	Description	
		change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <code>hidden</code> - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• <code>inherit</code> - The visibility state is inherited from the parent of the shape.</li> </ul>
	<code>width</code>	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Default position of an element in the flow of the page.</li> <li>• <code>&lt;units&gt;</code>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code>- Value expressed as a percentage of the parent object's width.</li> </ul>
	<code>z-index</code>	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• <code>&lt;order&gt;</code>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	<code>direction</code>	<p>Specifies the direction of the text in the textbox. Default is <code>ltr</code>. This property is superceded by the <code>mso-direction-alt</code> property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>ltr</code> - Text is displayed left-to-right.</li> <li>• <code>rtl</code> - Text is displayed right-to-left.</li> </ul>
	<code>layout-flow</code>	<p>Determines the flow of the text layout in a textbox. Default is <code>horizontal</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>horizontal</code> - Text is displayed horizontally.</li> <li>• <code>vertical</code> - Text is displayed vertically.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>vertical-ideographic - Ideographic text is displayed vertically.</li> <li>horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>
	mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
	mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
	mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
	mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>0</li> <li>90</li> <li>180</li> <li>-90</li> </ul>
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>top</li> <li>middle</li> <li>bottom</li> <li>top-center</li> <li>middle-center</li> <li>bottom-center</li> <li>top-baseline</li> </ul>

Attributes	Description								
		<ul style="list-style-type: none"><li>bottom-baseline</li><li>top-center-baseline</li><li>bottom-center-baseline</li></ul>							
	The following properties are only used by the textpath element (§6.1.2.23):								
	Property	Description							
	font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.							
	font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.							
	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.							
	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>							
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>							
	font-weight	Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>normal</td><td rowspan="4">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200
	Value	Description							
normal	Treated as non-bold.								
lighter									
100									
200									

Attributes	Description		
		300	Treated as bold.
		400	
		bold	
		bolder	
		500	
		600	
		700	
		800	
		900	
mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.		
text-decoration	Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: <ul style="list-style-type: none"><li>• none</li><li>• underline</li><li>• overline</li><li>• line-through</li><li>• blink</li></ul>		
v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.		
v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.		
v-text-align	Specifies the alignment of text. Default is left. Allowed values are: <ul style="list-style-type: none"><li>• left</li><li>• right</li><li>• center</li><li>• justify</li><li>• letter-justify - Distributes the extra space between the letters.</li><li>• stretch-justify - Stretches the letters to fill in the space.</li></ul>		

Attributes	Description	
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode	<p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.
target (Hyperlink Display Target)	<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> <li>• height</li> <li>• left</li> <li>• margin-left</li> <li>• margin-top</li> <li>• position</li> <li>• rotation</li> <li>• top</li> <li>• visibility</li> <li>• width</li> <li>• z-index</li> </ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>	
	Value	Description

<targetname>	String containing the name of the frame or window in which to load the document.														
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.														
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.														
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.														
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.														
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).														
_top	Specifies that the linked document is loaded into the topmost window.														
title (Shape Title)	<p data-bbox="415 1234 1482 1299">Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p data-bbox="415 1339 535 1373"><i>[Example:</i></p> <pre data-bbox="451 1409 1000 1476"> &lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt; </pre> <p data-bbox="415 1514 578 1547"><i>end example]</i></p> <p data-bbox="415 1585 1430 1619">The possible values for this attribute are defined by the XML Schema string datatype.</p>														
userdrawn (Exists In Master Slide)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 1635 1482 1701">Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p> <p data-bbox="415 1738 535 1772"><i>[Example:</i></p> <pre data-bbox="451 1808 1049 1875"> &lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt; </pre>														

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is false. If true, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Shapetype">
3 <sequence>
4 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
5 <element ref="o:complex" minOccurs="0"/>
6 </sequence>
7 <attributeGroup ref="AG_AllCoreAttributes"/>
8 <attributeGroup ref="AG_AllShapeAttributes"/>
9 <attributeGroup ref="AG_Adj"/>
10 <attributeGroup ref="AG_Path"/>
11 <attribute ref="o:master"/>
12 </complexType>
```

6.1.2.21 stroke (Line Stroke Settings)

This element describes how to draw the path if something beyond solid line with a solid color is desired. The attributes of the stroke element can be used to describe a powerful set of stroke properties. Extensions to the VML stroke definition are encoded as sub-elements of stroke.

[Example:

```
<v:polyline points="0pt,0pt,50pt,0pt,50pt,35pt,15pt,35pt,
15pt,15pt,75pt,15pt">
 <v:stroke startarrow="classic" endarrow="classic"
 startarrowwidth="wide" endarrowwidth="wide" dashstyle="dashdot"
 weight="2pt" color="teal" linestyle="thinThin"/>
</v:polyline>
```

end example]

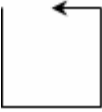

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapetype (§6.1.2.20)

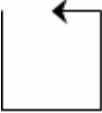

Child Elements	Subclause
bottom (Text Box Bottom Stroke)	§6.2.2.1
column (Text Box Interior Stroke)	§6.2.2.6
left (Text Box Left Stroke)	§6.2.2.15
right (Text Box Right Stroke)	§6.2.2.25
top (Text Box Top Stroke)	§6.2.2.31

Attributes	Description
althref (Alternate Image Reference)  Namespace: urn:schemas-microsoft-com:office:office	Specifies an alternate reference for an image in Macintosh PICT format.  [Example:  <v:stroke ... althref="myimage.pcz" ... > </v:stroke>  end example]

Attributes	Description
<p>color (Stroke Color)</p>	<p>The possible values for this attribute are defined by the XML Schema string datatype.</p> <p>Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is black. See the fillcolor attribute for a list of supported named colors.</p> <p><i>[Example: The shape stroke is blue:</i></p> <pre>&lt;v:shape ... strokecolor="red" ... &gt;   &lt;v:stroke color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>color2 (Stroke Alternate Pattern Color)</p>	<p>Specifies a second color for strokes, used when filltype is pattern. Default is no value.</p> <p>When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.</p> <p><i>[Example: This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.</i></p> <pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="pattern" weight="10pt"     src="myimage.gif" color2="blue"/&gt; &lt;/v:shape&gt;</pre> <div data-bbox="414 1465 594 1629" data-label="Image"> </div> <p><i>, where myimage.gif is:</i> </p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>dashstyle (Stroke Dash Pattern)</p>	<p>Specifies the dot and dash pattern for a stroke. Default is solid. Pre-defined values are:</p>

Attributes	Description
	<ul style="list-style-type: none"> <li>• solid</li> <li>• shortdash</li> <li>• shortdot</li> <li>• shortdashdot</li> <li>• shortdashdotdot</li> <li>• dot</li> <li>• dash</li> <li>• longdash</li> <li>• dashdot</li> <li>• longdashdot</li> <li>• longdashdotdot</li> </ul> <p>A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).</p> <p>[Example:</p> <pre> &lt;v:stroke dashstyle="0 2" weight="3pt"   endcap="round"&gt; &lt;/v:stroke&gt; </pre>  <pre> &lt;v:stroke dashstyle="longdashdotdot"   weight="2pt"&gt; &lt;/v:stroke&gt; </pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:

Attributes	Description
	<ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke endarrow="classic"/&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
endarrowlength (Line End Arrowhead Length)	<p>Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowlength="long" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
endarrowwidth (Line End Arrowhead Width)	<p>Specifies the width of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> </ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowwidth="wide" ... /&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
endcap (Line End Cap)	<p>Specifies the cap style for the end of a stroke. Default is flat. Allowed values are:</p> <ul style="list-style-type: none"> <li>• flat</li> <li>• square</li> <li>• round</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endcap="round" weight="10pt" ... /&gt;</pre>  <p>endcap="flat"</p> <p>endcap="square"</p> <p>endcap="round"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).</p>
filltype (Stroke Image Style)	<p>Specifies the type of fill used for the background of a stroke. Default is solid. Allowed values are:</p>

Attributes	Description
	<ul style="list-style-type: none"> <li>• <b>solid</b> - The fill pattern is solid.</li> <li>• <b>tile</b> - The fill image is tiled.</li> <li>• <b>pattern</b> - The fill image is stretched to form a pattern.</li> <li>• <b>frame</b> - The fill image becomes a border for the shape.</li> </ul> <p>[Example:</p> <pre>&lt;v:shape style="width:50;height:50"   strokecolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="frame" weight="10pt"     src="border.gif"/&gt; &lt;/v:shape&gt;</pre>   <p>, where border.gif is:</p> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>
<p><b>forcedash</b> (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is <code>false</code>.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p><b>href</b> (Original Image Reference)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre>

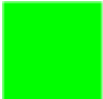

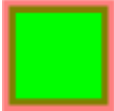

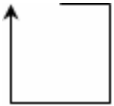

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>id (Relationship)</p> <p>Namespace: .../officeDocument /2006/relationships</p>	<p>Specifies the relationship ID of the relationship to the image used for the stroke. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>[Example: The markup specifies the associated relationship part with relationship ID rId10 contains the corresponding relationship information:</p> <pre>&lt; ... r:id="rId10" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
<p>imagealignshape (Stoke Image Alignment)</p>	<p>Specifies the alignment of the stroke image. If true, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is true.</p> <p>[Example: The top position offset shifts the image alignment relative to the containing window:</p> <pre>&lt;v:shape fillcolor="silver"   style="top:20;width:50;height:50"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke imagealignshape="false" weight="20pt"     filltype="tile" src="myimage.gif"/&gt; &lt;/v:shape&gt;</pre>

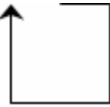

Attributes	Description								
	<div></div> <div>imagealignshape="false"</div> <div>imagealignshape="false"</div> <div>end example]</div> <div>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</div>								
imageaspect (Stroke Image Aspect Ratio)	<div>Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>ignore</td><td>Ignore aspect issues.</td></tr><tr><td>atleast</td><td>Image is at least as big as imagesize.</td></tr><tr><td>atmost</td><td>Image is no bigger than imagesize.</td></tr></table> <div>[Example:</div> <div>&lt;v:stroke filltype="frame" weight="10pt" src="border.gif" imagealignshape="true" imageaspect="atleast"&gt; &lt;/v:stroke&gt;</div> <div></div> <div>imagealignshape="ignore"</div> <div>imagealignshape="atleast"</div> <div>imagealignshape="atmost"</div> <div>end example]</div>	Value	Description	ignore	Ignore aspect issues.	atleast	Image is at least as big as imagesize.	atmost	Image is no bigger than imagesize.
Value	Description								
ignore	Ignore aspect issues.								
atleast	Image is at least as big as imagesize.								
atmost	Image is no bigger than imagesize.								

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</p>
<p>imagesize (Stroke Image Size)</p>	<p>Specifies the size of the image for the stroke. Default is the size of the image.</p> <p>[Example:</p> <pre>&lt;v:stroke ... imagesize="10pt,10pt" ... /&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>insetpen (Inset Border From Path)</p>	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>joinstyle (Line End Join Style)</p>	<p>Specifies the join style for line ends. Default is round.</p> <ul style="list-style-type: none"> <li>• round</li> <li>• bevel</li> <li>• miter</li> </ul> <p>[Example:</p> <pre>&lt;v:polyline strokeweight="10pt" strokecolor="navy"   points="10pt,10pt,50pt,50pt,90pt,10pt"&gt;   &lt;v:stroke joinstyle="bevel"/&gt; &lt;/v:polyline&gt;</pre> <div data-bbox="451 1627 683 1759">  </div> <p>joinstyle="round"</p>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).</p>
linestyle (Stroke Line Style)	<p>Specifies the line style of the stroke. Default is single.</p> <ul style="list-style-type: none"> <li>• single</li> <li>• thinThin</li> <li>• thinThick</li> <li>• thickThin</li> <li>• thickBetweenThin</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke linestyle="thickThin" weight="5pt"&gt; &lt;/v:stroke&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).</p>
miterlimit (Miter Joint Limit)	<p>Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.</p> <p>[Example:</p> <pre>&lt;v:stroke joinstyle="miter" weight="10pt"   miterlimit="2"&gt; &lt;/v:stroke&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
on (Stroke Toggle)	<p>Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50" stroked="true"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke on="false" weight="5pt"/&gt; &lt;/v:rect&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
opacity (Stroke Opacity)	<p>Specifies the amount of transparency of a stroke. Default is 1.0.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke weight="5pt" opacity="50%"/&gt; &lt;/v:rect&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
relid (Relationship to Part)  Namespace: urn:schemas-	<p>Specifies the relationship ID of the relationship to the image. The specified relationship shall be of type  <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p>

Attributes	Description
microsoft-com:office:office	<p>[<i>Example:</i> The markup specifies the associated relationship part with relationship ID rId10 contains the corresponding relationship information:</p> <pre>&lt;v:stroke ... o:relid="rId10" ...&gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§6.2.3.20).</p>
src (Stroke Image Location)	<p>Specifies the source image to load for a stroke fill. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:stroke ... src="myimage.gif" ... &gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
startarrow (Line Start Arrowhead)	<p>Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[<i>Example:</i></p> <pre>&lt;v:stroke startarrow="classic"/&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
startarrowlength (Line Start	<p>Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are:</p>

Attributes	Description
Arrowhead Length)	<ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowlength="long" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
startarrowwidth (Line Start Arrowhead Width)	<p>Specifies the width of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowwidth="wide" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
title (Stroke Title)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:title="alt text" ... &gt; &lt;/v:fill&gt;</pre>

Attributes	Description
	<i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Stroke">
 <sequence>
 <element ref="o:left" minOccurs="0"/>
 <element ref="o:top" minOccurs="0"/>
 <element ref="o:right" minOccurs="0"/>
 <element ref="o:bottom" minOccurs="0"/>
 <element ref="o:column" minOccurs="0"/>
 </sequence>
 <attributeGroup ref="AG_Id"/>
 <attributeGroup ref="AG_StrokeAttributes"/>
</complexType>
```

6.1.2.22      **textbox (Text Box)**

This element is used to define text that appears inside the shape. This text may contain rich formatting and is rendered to fit inside the textboxrect defined by the path element (§6.1.2.14).

[Example:

```
<v:shape style="width=200;height=200" coordsize="400,400"
 fillcolor="yellow" strokecolor="maroon"
 path="m 119,0 l 148,86 238,86 166,140 192,226 119,175 46,226
 72,140 0,86 90,86 x e">
 <v:textbox inset="32pt,35pt,,,">VML</v:textbox>
</v:shape>
```

*end example]*

Parent Elements

1

Parent Elements
object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapetype (§6.1.2.20)

2

Child Elements	Subclause
Any element from the empty namespace	n/a
Any element from the empty namespace	n/a
txbxContent (Rich Text Box Content Container)	§2.17.1.1

Attributes	Description
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
inset (Text Box Inset)	<p>Specifies inner margin values for textbox text. Default is "0.1in, 0.05in, 0.1in, 0.05in". Missing values are set to the default. This is used if insetmode is custom.</p> <p>The internal text margin value is specified as a string containing four values, each separated by commas or spaces. The values measure inset from the left, top, right, and bottom edges of the box specified by the textboxrect attribute of the path element (§6.1.2.14).</p> <p>[Example: The text is set toward the lower right of a small square:</p> <pre>&lt;v:textbox inset="20pt,30pt,10pt,10pt"&gt;   VML&lt;/v:textbox&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Attributes	Description						
insetmode (Text Inset Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom.</p> <p>[Example:</p> <pre>&lt;v:textbox ... o:insetmode="auto" ... &gt; &lt;/v:textbox&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>						
singleclick (Text Box Single-Click Selection Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether text is selectable with a single click. Default is false.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>						
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1188 1479 1875"> <thead> <tr> <th data-bbox="415 1188 664 1234">Property</th><th data-bbox="664 1188 1479 1234">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1234 664 1507">flip</td><td data-bbox="664 1234 1479 1507"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1507 664 1875">height</td><td data-bbox="664 1507 1479 1875"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the</li> </ul>
Property	Description						
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>						
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the</li> </ul>						

Attributes	Description	
		parent object's height.
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the</li> </ul>

Attributes	Description	
		<p>page.</p> <ul style="list-style-type: none"> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-edited	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.</p>
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is <code>static</code>. When the element is contained inside a group, this property must be <code>absolute</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>static</code> - The element is positioned according to the normal flow of the page. The <code>top</code> and <code>left</code> properties are ignored. If the object is anchored inline, this value is used.</li> <li>• <code>absolute</code> - The element is positioned relative to the parent, using the <code>top</code> and <code>left</code> properties.</li> <li>• <code>relative</code> - The element is positioned according to the normal flow of the page, but the <code>top</code> and <code>left</code> properties are used. The overlap of overlapping elements is governed by the <code>z-index</code> property.</li> </ul>
	rotation	<p>Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.</p>
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Default position of an element in the flow of the page.</li> <li>• <code>&lt;units&gt;</code> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code> - Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only <code>inherit</code> and <code>hidden</code> are used; any other values are mapped to <code>inherit</code>. Default is <code>inherit</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>hidden</code> - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• <code>inherit</code> - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• ltr - Text is displayed left-to-right.</li> <li>• rtl - Text is displayed right-to-left.</li> </ul>	
layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>• horizontal - Text is displayed horizontally.</li> <li>• vertical - Text is displayed vertically.</li> <li>• vertical-ideographic - Ideographic text is displayed vertically.</li> <li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>	
mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>	
mso-fit-shape-	<p>Specifies whether the shape stretches to fit the text in the</p>	

Attributes	Description	
	to-text	textbox. Default is false.
	mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
	mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• middle</li> <li>• bottom</li> <li>• top-center</li> <li>• middle-center</li> <li>• bottom-center</li> <li>• top-baseline</li> <li>• bottom-baseline</li> <li>• top-center-baseline</li> <li>• bottom-center-baseline</li> </ul>
The following properties are only used by the textpath element (§6.1.2.23):		
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The	

Attributes	Description														
		order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.													
	font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.													
	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.													
	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>													
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>													
	font-weight	<div>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:</div> <table><thead><tr><th>Value</th><th>Description</th></tr></thead><tbody><tr><td>normal</td><td rowspan="6">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr><tr><td>300</td></tr><tr><td>400</td></tr><tr><td>bold</td><td rowspan="4">Treated as bold.</td></tr><tr><td>bolder</td></tr><tr><td>500</td></tr><tr><td>600</td></tr></tbody></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200	300	400	bold	Treated as bold.	bolder	500
Value	Description														
normal	Treated as non-bold.														
lighter															
100															
200															
300															
400															
bold	Treated as bold.														
bolder															
500															
600															

Attributes	Description	
		<div>700</div> <div>800</div> <div>900</div>
mso-text-shadow		Specifies whether a shadow is applied to the text on a text path. Default is false.
text-decoration		<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• underline</li> <li>• overline</li> <li>• line-through</li> <li>• blink</li> </ul>
v-rotate-letters		Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
v-same-letter-heights		Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
v-text-align		<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
v-text-kern		Specifies whether kerning is turned on. Default is false.
v-text-reverse		Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
v-text-spacing-mode		Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the <code>v-text-spacing</code> property. Allowed values are:

Attributes	Description	
		<ul style="list-style-type: none"><li>tightening</li><li>tracking</li></ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.
<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"><li>top</li><li>left</li><li>width</li><li>height</li></ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"><li>flip</li><li>height</li><li>left</li><li>margin-left</li><li>margin-top</li><li>position</li><li>rotation</li><li>top</li><li>visibility</li><li>width</li><li>z-index</li></ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>		

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Textbox">
3 <choice>
4 <element ref="w:txbxContent" minOccurs="0"/>
5 <any namespace="##local" processContents="skip"/>
6 </choice>
7 <attributeGroup ref="AG_Id"/>
8 <attributeGroup ref="AG_Style"/>
9 <attribute name="inset" type="xsd:string" use="optional"/>
10 <attribute ref="o:singleclick"/>
11 <attribute ref="o:insetmode"/>
12 </complexType>
```

6.1.2.23 textpath (Text Layout Path)

This element is used to define a vector path based on the text data, font and font styles supplied. The path which results is then mapped into the region defined by the v attribute of the shape's path (§6.1.2.14).

[Example:

```
<v:curve from="50,100" to="400,100"
 control1="200,200" control2="300,200">
 <v:stroke color="blue"/>
 <v:fill color="yellow" color2="green" type="gradient"/>
 <v:path textpathok="true"/>
 <v:textpath on="true" style="font:normal normal normal 36pt Arial"
 fitpath="true" string="Hello, VML!"/>
</v:curve>
```

end example]

Parent Elements

arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes

Description

fitpath (Path Fit Toggle)  
Specifies whether the text fits the path of a shape. If true, sizes the text to fill the path it lies out on. Default is false.

[Example:

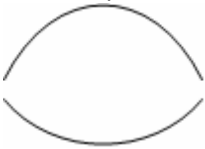

```
<v:textpath on="true" fitpath="true"
 string="VML">
</v:textpath>
```

fitpath="true"

fitpath="false"

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>fitshape (Shape Fit Toggle)</p>	<p>Specifies whether the text fits the bounding box of a shape. If true, the text is stretched out to the edges of the box that defines the entire shape. Default is false.</p> <p>[Example: When fitshape is false, the text is drawn along the first part of the path. When true, the text is stretched to fit the entire enclosed area of the shape.</p> <pre> &lt;v:shape style="width:100;height:100"   path="m 0,500 c 250,0 750,0 1000,500 e   m 0,600 c 250,900 750,900 1000,600 e"   fillcolor="yellow" strokecolor="maroon"&gt;   &lt;v:path textpathok="t"/&gt;   &lt;v:textpath on="t" fitshape="t" string="VML"/&gt; &lt;/v:shape&gt; </pre>  <p>The raw path stroke is:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre> &lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>on (Text Path</p>	<p>Specifies whether the text is displayed on the textpath. Default is false. The</p>

Attributes	Description						
Toggle)	<p>textpathok attribute of the path element (§6.1.2.14) overrides this.</p> <p>[Example:</p> <pre> &lt;v:line from="50,100" to="100,100"&gt;   &lt;v:path textpathok="false"/&gt;   &lt;v:textpath on="true" string="VML"/&gt; &lt;/v:line&gt; </pre> <hr/> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>						
string (Text Path Text)	<p>Specifies the text of the text path. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>						
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1121 1479 1843"> <thead> <tr> <th data-bbox="415 1121 664 1167">Property</th><th data-bbox="664 1121 1479 1167">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1167 664 1436">flip</td><td data-bbox="664 1167 1479 1436"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1436 664 1843">height</td><td data-bbox="664 1436 1479 1843"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
Property	Description						
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>						

Attributes	Description	
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-edited	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.</p>
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	<p>Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.</p>
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• ltr - Text is displayed left-to-right.</li> <li>• rtl - Text is displayed right-to-left.</li> </ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>• horizontal - Text is displayed horizontally.</li> <li>• vertical - Text is displayed vertically.</li> <li>• vertical-ideographic - Ideographic text is displayed vertically.</li> <li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>

Attributes	Description					
	to-text					
	mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.				
	mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.				
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.				
	mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: <ul style="list-style-type: none"><li>• 0</li><li>• 90</li><li>• 180</li><li>• -90</li></ul>				
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.				
	v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: <ul style="list-style-type: none"><li>• top</li><li>• middle</li><li>• bottom</li><li>• top-center</li><li>• middle-center</li><li>• bottom-center</li><li>• top-baseline</li><li>• bottom-baseline</li><li>• top-center-baseline</li><li>• bottom-center-baseline</li></ul>				
The following properties are only used by the textpath element (§6.1.2.23):						
<table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The</td></tr></table>			Property	Description	font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The

Attributes	Description		
		700 800 900	
mso-text-shadow			Specifies whether a shadow is applied to the text on a text path. Default is false.
text-decoration			Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: <ul style="list-style-type: none"> <li>• none</li> <li>• underline</li> <li>• overline</li> <li>• line-through</li> <li>• blink</li> </ul>
v-rotate-letters			Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
v-same-letter-heights			Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
v-text-align			Specifies the alignment of text. Default is left. Allowed values are: <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
v-text-kern			Specifies whether kerning is turned on. Default is false.
v-text-reverse			Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
v-text-spacing-mode			Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:

7 <attribute name="fitpath" type="ST_TrueFalse" use="optional"/>
8 <attribute name="trim" type="ST_TrueFalse" use="optional"/>
9 <attribute name="xscale" type="ST_TrueFalse" use="optional"/>
10 <attribute name="string" type="xsd:string" use="optional"/>
11 </complexType>
```

12 **6.1.3 Simple Types**

13 This is the complete list of simple types in the urn:schemas-microsoft-com:vml namespace.

14 **6.1.3.1 ST\_ColorType (Color Type)**

15 This simple type specifies a color. Colors are specified in one of three ways - named color, hexadecimal RGB or  
16 color palette entry. An optional index may be stored in square brackets following the color and a space.  
17 [*Rationale:* An application might store the color's index in a system color palette using this means. *end rationale*]

18 A named color is specified using the name of the color. The following named colors are supported:

- 19 • Black (#000000) ■
- 20 • Silver (#C0C0C0) ■

- 1       • Gray (#808080) 
- 2       • White (#FFFFFF) 
- 3       • Maroon (#800000) 
- 4       • Red (#FF0000) 
- 5       • Purple (#800080) 
- 6       • Fuchsia (#FF00FF) 
- 7       • Green (#008000) 
- 8       • Lime (#00FF00) 
- 9       • Olive (#808000) 
- 10      • Yellow (#FFFF00) 
- 11      • Navy (#000080) 
- 12      • Blue (#0000FF) 
- 13      • Teal (#008080) 
- 14      • Aqua (#00FFFF) 

15    [Example:

16       <... color="red" ... >

17    end example]

18    Hexadecimal RGB is specified using a hash symbol (#) followed by six hexadecimal characters, where each pair  
19    represents the red, green and blue component of the color.

20    [Example:

21       < ... color="#5f2726" ... >

22    end example]

23    A color palette entry is specified using the name of the color in the palette.

24    [Example:

25       <... color="buttonFace [67]" ... >

26    end example]

27    This simple type's contents are a restriction of the XML Schema string datatype.

### 6.1.3.2 ST\_EditAs (Shape Grouping Types)

This simple type specifies the different meanings of a group of shapes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bullseye (Bullseye Diagram)	Specifies that the group represents a bulls-eye diagram.
canvas (Shape Canvas)	Specifies that the group is a regular group and does not represent a diagram.
cycle (Cycle Diagram)	Specifies that the group represents a cycle diagram.
orgchart (Organization Chart Diagram)	Specifies that the group represents an organization chart.
radial (Radial Diagram)	Specifies that the group represents a radial diagram.
stacked (Pyramid Diagram)	Specifies that the group represents a pyramid diagram.
venn (Venn Diagram)	Specifies that the group represents a Venn diagram.

 <enumeration value="stacked"/>
 <enumeration value="venn"/>
 <enumeration value="bullseye"/>
 </restriction>
</simpleType>
```

6.1.3.3 ST\_Ext (VML Extension Handling Behaviors)

This simple type specifies VML extension handling behaviors.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
backwardCompatible (Renderable)	Specifies that the VML entity may be rendered by ignoring the extension information. If edited, the extension information must be discarded.
edit (Editable)	Specifies that the VML entity may be safely rendered and edited without invalidating the extension information.
view (Not renderable)	Specifies that the VML entity is not be renderable without understanding the extension information. If the extension information cannot be understood, the downlevel image should be used to render the object.

6.1.3.4 ST\_FillMethod (Gradient Fill Computation Type)

This simple type specifies ways in which a gradient fill is computed.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
any (Application Default Fill)	Default blend 
linear (Linear Fill)	Linear blend 
linear sigma (Linear Sigma Fill)	Linear sigma blend 
none (No Gradient Fill)	No blend 
sigma (Sigma Fill)	Sigma blend 

Referenced By
fill@method (§6.1.2.5)

The following XML Schema fragment defines the contents of this simple type:

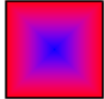

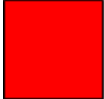

```
<simpleType name="ST_FillMethod">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="linear"/>
 <enumeration value="sigma"/>
 <enumeration value="any"/>
 <enumeration value="linear sigma"/>
 </restriction>
</simpleType>
```

### 6.1.3.5 ST\_FillType (Shape Fill Type)

This simple type specifies the types for fills applied to a shape.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
frame (Stretch Image to Fit)	The image is stretched to fill the shape. 
gradient (Linear Gradient)	The fill colors blend together in a linear gradient from bottom to top. 
gradientRadial (Radial Gradient)	The fill colors blend together in a radial gradient. 
pattern (Image Pattern)	The image is used to create a pattern using the fill colors. 
solid (Solid Fill)	The fill pattern is a solid color. 
tile (Tiled Image)	The fill image is tiled. 

Referenced By

bottom@filltype (§6.2.2.1); column@filltype (§6.2.2.6); fill@type (§6.1.2.5); left@filltype (§6.2.2.15); right@filltype (§6.2.2.25); stroke@filltype (§6.1.2.21); top@filltype (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FillType">
 <restriction base="xsd:string">
 <enumeration value="solid"/>
 <enumeration value="gradient"/>
 <enumeration value="gradientRadial"/>
 <enumeration value="tile"/>
 <enumeration value="pattern"/>
 <enumeration value="frame"/>
 </restriction>
</simpleType>
```

6.1.3.6 ST\_ImageAspect (Image Scaling Behavior)

This simple type specifies the scaling behaviors for an image applied to a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
atLeast (At Least)	Image is at least as big as imagesize. 
atMost (At Most)	Image is no bigger than imagesize. 
ignore (Ignore Aspect Ratio)	Ignore aspect issues. 

Referenced By

bottom@imageaspect (§6.2.2.1); column@imageaspect (§6.2.2.6); fill@aspect (§6.1.2.5); left@imageaspect (§6.2.2.15); right@imageaspect (§6.2.2.25); stroke@imageaspect (§6.1.2.21); top@imageaspect (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ImageAspect">
 <restriction base="xsd:string">
 <enumeration value="ignore"/>
 <enumeration value="atMost"/>
 <enumeration value="atLeast"/>
 </restriction>
</simpleType>
```

### 6.1.3.7 ST\_ShadowType (Shadow Type)

This simple type specifies the types of shadows applied to a shape.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
double (Double Shadow)	Double shadow. color2 and offset2 are used for the second shadow's color and offset.
emboss (Embossed Shadow)	The shadow has an embossed look. Similar to double.
perspective (Perspective Shadow)	Perspective shadow.
single (Single Shadow)	Single shadow.

#### Referenced By

shadow@type (§6.1.2.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ShadowType">
 <restriction base="xsd:string">
 <enumeration value="single"/>
 <enumeration value="double"/>
 <enumeration value="emboss"/>
 <enumeration value="perspective"/>
 </restriction>
</simpleType>
```

### 6.1.3.8 ST\_StrokeArrowLength (Stroke Arrowhead Length)

This simple type specifies the lengths of a stroke arrowhead.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
long (Long Arrowhead)	Long length 
medium (Medium Arrowhead)	Medium length 
short (Short Arrowhead)	Short length 

1

Referenced By
bottom@endarrowlength (§6.2.2.1); bottom@startarrowlength (§6.2.2.1); column@endarrowlength (§6.2.2.6); column@startarrowlength (§6.2.2.6); left@endarrowlength (§6.2.2.15); left@startarrowlength (§6.2.2.15); right@endarrowlength (§6.2.2.25); right@startarrowlength (§6.2.2.25); stroke@endarrowlength (§6.1.2.21); stroke@startarrowlength (§6.1.2.21); top@endarrowlength (§6.2.2.31); top@startarrowlength (§6.2.2.31)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_StrokeArrowLength">
4 <restriction base="xsd:string">
5 <enumeration value="short"/>
6 <enumeration value="medium"/>
7 <enumeration value="long"/>
8 </restriction>
9 </simpleType>

```

### 10 6.1.3.9 ST\_StrokeArrowType (Stroke Arrowhead Type)

11 This simple type specifies the types of arrowhead for a stroke.

12 This simple type's contents are a restriction of the XML Schema string datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
block (Block Arrowhead)	Block arrowhead 
classic (Classic Arrowhead)	Classic curved arrowhead 
diamond (Diamond Arrowhead)	Diamond arrowhead 
none (No Arrowhead)	No arrowhead 
open (Open Arrowhead)	Open arrowhead 
oval (Oval Arrowhead)	Round arrowhead

Enumeration Value	Description
	

1

Referenced By
bottom@endarrow (§6.2.2.1); bottom@startarrow (§6.2.2.1); column@endarrow (§6.2.2.6); column@startarrow (§6.2.2.6); left@endarrow (§6.2.2.15); left@startarrow (§6.2.2.15); right@endarrow (§6.2.2.25); right@startarrow (§6.2.2.25); stroke@endarrow (§6.1.2.21); stroke@startarrow (§6.1.2.21); top@endarrow (§6.2.2.31); top@startarrow (§6.2.2.31)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_StrokeArrowType">
4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="block"/>
7 <enumeration value="classic"/>
8 <enumeration value="oval"/>
9 <enumeration value="diamond"/>
10 <enumeration value="open"/>
11 </restriction>
12 </simpleType>
```

### 13 6.1.3.10 ST\_StrokeArrowWidth (Stroke Arrowhead Width)

14 This simple type specifies the widths of a stroke arrowhead.

15 This simple type's contents are a restriction of the XML Schema string datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
medium (Medium Arrowhead)	Medium width 
narrow (Narrow Arrowhead)	Narrow width 
wide (Wide Arrowhead)	Wide width 

17

Referenced By
bottom@endarrowwidth (§6.2.2.1); bottom@startarrowwidth (§6.2.2.1); column@endarrowwidth (§6.2.2.6); column@startarrowwidth (§6.2.2.6); left@endarrowwidth (§6.2.2.15); left@startarrowwidth (§6.2.2.15); right@endarrowwidth (§6.2.2.25); right@startarrowwidth (§6.2.2.25); stroke@endarrowwidth (§6.1.2.21); stroke@startarrowwidth (§6.1.2.21); top@endarrowwidth (§6.2.2.31); top@startarrowwidth (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeArrowWidth">
 <restriction base="xsd:string">
 <enumeration value="narrow"/>
 <enumeration value="medium"/>
 <enumeration value="wide"/>
 </restriction>
</simpleType>
```

6.1.3.11 ST\_StrokeEndCap (Stroke End Cap Type)

This simple type specifies the styles for the end of a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
flat (Flat End)	Flat end 
round (Round End)	Round end 
square (Square End)	Square end 

Referenced By

bottom@endcap (§6.2.2.1); column@endcap (§6.2.2.6); left@endcap (§6.2.2.15); right@endcap (§6.2.2.25); stroke@endcap (§6.1.2.21); top@endcap (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeEndCap">
 <restriction base="xsd:string">
 <enumeration value="flat"/>
 <enumeration value="square"/>
 <enumeration value="round"/>
 </restriction>
</simpleType>
```

### 6.1.3.12 ST\_StrokeJoinStyle (Line Join Type)

This simple type specifies the join styles for a polyline (§6.1.2.15).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bevel (Bevel Joint)	Bevel joint 
miter (Miter Joint)	Miter joint 
round (Round Joint)	Round joint 

#### Referenced By

bottom@joinstyle (§6.2.2.1); column@joinstyle (§6.2.2.6); left@joinstyle (§6.2.2.15); right@joinstyle (§6.2.2.25); stroke@joinstyle (§6.1.2.21); top@joinstyle (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeJoinStyle">
 <restriction base="xsd:string">
 <enumeration value="round"/>
 <enumeration value="bevel"/>
 <enumeration value="miter"/>
 </restriction>
</simpleType>
```

### 6.1.3.13 ST\_StrokeLineStyle (Stroke Line Style)

This simple type specifies the line styles for a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
single (Single Line)	Single line 
thickBetweenThin (Thck Line Between Thin Lines)	Thick line between thin lines 
thickThin (Thick Line Outside Thin Line)	Thick line outside thin line 
thinThick (Thin Line Outside Thick Line)	Thin line outside thick line 
thinThin (Two Thin Lines)	Two thin lines 

1

Referenced By
bottom@linestyle (§6.2.2.1); column@linestyle (§6.2.2.6); left@linestyle (§6.2.2.15); right@linestyle (§6.2.2.25); stroke@linestyle (§6.1.2.21); top@linestyle (§6.2.2.31)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_StrokeLineStyle">
4 <restriction base="xsd:string">
5 <enumeration value="single"/>
6 <enumeration value="thinThin"/>
7 <enumeration value="thinThick"/>
8 <enumeration value="thickThin"/>
9 <enumeration value="thickBetweenThin"/>
10 </restriction>
11 </simpleType>

```

#### 12 6.1.3.14 ST\_TrueFalse (Boolean Value)

13 This type specifies logical true and false.

14 This simple type's contents are a restriction of the XML Schema string datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
f (False)	Logical false.

Enumeration Value	Description
false (False)	Logical false.
t (True)	Logical true.
true (True)	Logical true.

1

Referenced By
arc@filled (§6.1.2.1); arc@insetpen (§6.1.2.1); arc@print (§6.1.2.1); arc@stroked (§6.1.2.1); background@filled (§6.1.2.2); curve@filled (§6.1.2.3); curve@insetpen (§6.1.2.3); curve@print (§6.1.2.3); curve@stroked (§6.1.2.3); fill@alignshape (§6.1.2.5); fill@on (§6.1.2.5); fill@recolor (§6.1.2.5); fill@rotate (§6.1.2.5); group@filled (§6.1.2.7); group@print (§6.1.2.7); h@invx (§6.1.2.8); h@invy (§6.1.2.8); image@bilevel (§6.1.2.10); image@filled (§6.1.2.10); image@grayscale (§6.1.2.10); image@insetpen (§6.1.2.10); image@print (§6.1.2.10); image@stroked (§6.1.2.10); imagedata@bilevel (§6.1.2.11); imagedata@grayscale (§6.1.2.11); line@filled (§6.1.2.12); line@insetpen (§6.1.2.12); line@print (§6.1.2.12); line@stroked (§6.1.2.12); oval@filled (§6.1.2.13); oval@insetpen (§6.1.2.13); oval@print (§6.1.2.13); oval@stroked (§6.1.2.13); path@arrowok (§6.1.2.14); path@fillok (§6.1.2.14); path@gradientshapeok (§6.1.2.14); path@insetpenok (§6.1.2.14); path@shadowok (§6.1.2.14); path@strokeok (§6.1.2.14); path@textpathok (§6.1.2.14); polyline@filled (§6.1.2.15); polyline@insetpen (§6.1.2.15); polyline@print (§6.1.2.15); polyline@stroked (§6.1.2.15); rect@filled (§6.1.2.16); rect@insetpen (§6.1.2.16); rect@print (§6.1.2.16); rect@stroked (§6.1.2.16); roundrect@filled (§6.1.2.17); roundrect@insetpen (§6.1.2.17); roundrect@print (§6.1.2.17); roundrect@stroked (§6.1.2.17); shadow@obscured (§6.1.2.18); shadow@on (§6.1.2.18); shape@filled (§6.1.2.19); shape@insetpen (§6.1.2.19); shape@print (§6.1.2.19); shape@stroked (§6.1.2.19); shapetype@filled (§6.1.2.20); shapetype@insetpen (§6.1.2.20); shapetype@print (§6.1.2.20); shapetype@stroked (§6.1.2.20); stroke@imagealignshape (§6.1.2.21); stroke@insetpen (§6.1.2.21); stroke@on (§6.1.2.21); textpath@fitpath (§6.1.2.23); textpath@fitshape (§6.1.2.23); textpath@on (§6.1.2.23); textpath@trim (§6.1.2.23); textpath@xscale (§6.1.2.23)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TrueFalse">
4 <restriction base="xsd:string">
5 <enumeration value="t"/>
6 <enumeration value="f"/>
7 <enumeration value="true"/>
8 <enumeration value="false"/>
9 </restriction>
10 </simpleType>

```

### 11 6.1.3.15 ST\_TrueFalseBlank (Boolean Value with Blank [False] State)

12 This simple type specifies a boolean value with a third state, using a blank attribute, which specifies that the  
 13 value be false.

14 This simple type's contents are a restriction of the XML Schema string datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
(Blank – Logical False)	Logical false.
f (Logical False)	Logical false.
false (Logical False)	Logical false.
t (Logical True)	Logical true.
true (Logical True)	Logical true.

#### Referenced By

h@switch (§6.1.2.8)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_TrueFalseBlank">
 <restriction base="xsd:string">
 <enumeration value="t"/>
 <enumeration value="f"/>
 <enumeration value="true"/>
 <enumeration value="false"/>
 <enumeration value=""/>
 </restriction>
</simpleType>

```

## 6.2 VML - Office Drawing

It is possible to include graphical VML objects in Office Open XML documents. The elements describing the core graphical objects are defined in the VML namespace. Additional elements that describe certain advanced shape effects, metadata and relationships are defined in this namespace.

[Note: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .end note]

[Example: Assume the following shape exists in a document:

The basic speech bubble shape is defined using VML. The 3-D effect is defined using the extrusion element in this namespace. The specularity attribute defines the subtle sharp reflection on the edge of the shape. The

color attribute sets the extrusion to a different color than the face of the shape. The rotationangle attribute sets the shape's rotation about the X- and Y-axes. The lightposition and lightposition2 attributes set the positions of the light sources that illuminate the shape.

```
<o:extrusion v:ext="view" specularity="80000f" color="#c4bc96 [2414]" on="t"
rotationangle="-5,15" lightposition="0,-50000" lightposition2="0,50000"
type="perspective"/>
```

This element is a child of the primary shape definition:

```
<v:shape id="_x0000_s1030" type="#_x0000_t62"
style="position:absolute;left:0;text-align:left;margin-left:35.25pt;
margin-top:60pt;width:69pt;height:57pt;z-index:251658240" adj="1675,27171"
fillcolor="#ddd8c2 [2894]">
<o:extrusion ... />
</v:shape>
```

*end example]*

Note that, throughout VML, numeric values that are allowed to take units may be specified in: cm (centimeters), mm (millimeters), in (inches), pt (points), pc (picas), px (pixels).

### 6.2.1 Table of Contents

**This subclause is informative.**

<b>6.2.2 Elements</b>	<b>4755</b>
6.2.2.1 bottom (Text Box Bottom Stroke)	4756
6.2.2.2 callout (Callout)	4768

37 **End of informative text.**

## 38 **6.2.2 Elements**

39 The following elements comprise the contents of the urn:schemas-microsoft-com:office:office namespace:

40 [Note: As the VML format is a format provided for backward compatibility, those VML elements defined in the  
 41 same urn:schemas-microsoft-com:office:office namespace will remain in that namespace as it is already used  
 42 by millions of documents already using VML. *end note*]

6.2.2.1 bottom (Text Box Bottom Stroke)

This element specifies the stroke properties for the bottom border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is false or not specified, the border is not shown.

[Example: The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
 <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
 <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
 <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
 <o:bottom v:ext="view" color="black" on="t"/>
 <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```

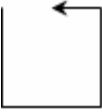

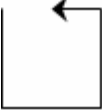

end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
alhref (Alternate Image Reference)	<p>Specifies an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p> <pre>&lt;v:stroke ... alhref="myimage.pcz" ... &gt; &lt;/v:stroke&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
color (Stroke Color)	<p>Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is black. See the fillcolor attribute for a list of supported named colors.</p> <p>[Example: The shape stroke is blue:</p>

Attributes	Description
	<pre>&lt;v:shape ... strokecolor="red" ... &gt;   &lt;v:stroke color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
<p>color2 (Stroke Alternate Pattern Color)</p>	<p>Specifies a second color for strokes, used when filltype is pattern. Default is no value.</p> <p>When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.</p> <p>[<i>Example:</i> This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.</p> <pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="pattern" weight="10pt"     src="myimage.gif" color2="blue"/&gt; &lt;/v:shape&gt;</pre> <div data-bbox="414 1241 594 1402" data-label="Image"> </div> <p>, where myimage.gif is: </p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
<p>dashstyle (Stroke Dash Pattern)</p>	<p>Specifies the dot and dash pattern for a stroke. Default is solid. Pre-defined values are:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• shortdash</li> <li>• shortdot</li> <li>• shortdashdot</li> <li>• shortdashdotdot</li> <li>• dot</li> </ul>

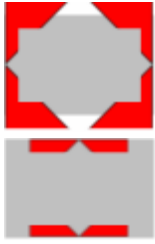

Attributes	Description
	<ul style="list-style-type: none"> <li>• dash</li> <li>• longdash</li> <li>• dashdot</li> <li>• longdashdot</li> <li>• longdashdotdot</li> </ul> <p>A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).</p> <p>[Example:</p> <pre>&lt;v:stroke dashstyle="0 2" weight="3pt"   endcap="round"&gt; &lt;/v:stroke&gt;</pre>  <pre>&lt;v:stroke dashstyle="longdashdotdot"   weight="2pt"&gt; &lt;/v:stroke&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
endarrow (Line End Arrowhead)	<p>Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p>

Attributes	Description
	<p data-bbox="451 285 935 315">&lt;v:stroke endarrow="classic"/&gt;</p>  <p data-bbox="415 499 574 529"><i>end example]</i></p> <p data-bbox="415 571 1432 638">The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
<p data-bbox="142 655 376 751">endarrowlength (Line End Arrowhead Length)</p>	<p data-bbox="415 655 1435 722">Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul data-bbox="461 764 600 856" style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p data-bbox="415 898 535 928">[Example:</p> <p data-bbox="451 970 1127 999">&lt;v:stroke ... endarrowlength="long" ... /&gt;</p>  <p data-bbox="415 1184 574 1213"><i>end example]</i></p> <p data-bbox="415 1255 1458 1323">The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p data-bbox="142 1339 376 1436">endarrowwidth (Line End Arrowhead Width)</p>	<p data-bbox="415 1339 1435 1407">Specifies the width of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul data-bbox="461 1449 600 1541" style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p data-bbox="415 1583 535 1612">[Example:</p> <p data-bbox="451 1654 1110 1684">&lt;v:stroke ... endarrowwidth="wide" ... /&gt;</p> 

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
<p>endcap (Line End Cap)</p>	<p>Specifies the cap style for the end of a stroke. Default is flat. Allowed values are:</p> <ul style="list-style-type: none"> <li>• flat</li> <li>• square</li> <li>• round</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endcap="round" weight="10pt" ... /&gt;</pre> <div style="display: flex; align-items: center; margin-top: 10px;">  <div style="margin-left: 10px;"> <p>endcap="flat"</p> <p>endcap="square"</p> <p>endcap="round"</p> </div> </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).</p>
<p>ext (VML Extension Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:vml</p>	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale]</i></p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>filltype (Stroke Image Style)</p>	<p>Specifies the type of fill used for the background of a stroke. Default is solid. Allowed values are:</p> <ul style="list-style-type: none"> <li>• solid - The fill pattern is solid.</li> <li>• tile - The fill image is tiled.</li> <li>• pattern - The fill image is stretched to form a pattern.</li> <li>• frame - The fill image becomes a border for the shape.</li> </ul>

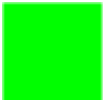

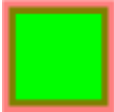

Attributes	Description
	<p>[Example:</p> <pre> &lt;v:shape style="width:50;height:50"   strokecolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="frame" weight="10pt"     src="border.gif"/&gt; &lt;/v:shape&gt; </pre> <div data-bbox="414 594 516 695"></div> <div data-bbox="516 667 764 695">, where border.gif is:</div> <div data-bbox="764 594 867 695"></div> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>
<p>forcedash (Force Dashed Outline)</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre> &lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>href (Original Image Reference)</p>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre> &lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>imagealignshape</p>	<p>Specifies the alignment of the stroke image. If true, the image is aligned with the shape.</p>

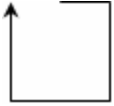

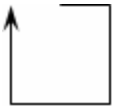

Attributes	Description								
(Stoke Image Alignment)	<p>Otherwise, it is aligned with the containing scope. Default is true.</p> <p>[Example: The top position offset shifts the image alignment relative to the containing window:</p> <pre>&lt;v:shape fillcolor="silver"   style="top:20;width:50;height:50"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke imagealignshape="false" weight="20pt"     filltype="tile" src="myimage.gif"/&gt; &lt;/v:shape&gt;</pre>  <p>imagealignshape="false"</p>  <p>imagealignshape="false"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>								
imageaspect (Stroke Image Aspect Ratio)	<p>Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are:</p> <table border="1" data-bbox="415 1318 1320 1514"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>ignore</td><td>Ignore aspect issues.</td></tr> <tr> <td>atleast</td><td>Image is at least as big as imagesize.</td></tr> <tr> <td>atmost</td><td>Image is no bigger than imagesize.</td></tr> </tbody> </table> <p>[Example:</p> <pre>&lt;v:stroke filltype="frame" weight="10pt"   src="border.gif" imagealignshape="true"   imageaspect="atleast"&gt; &lt;/v:stroke&gt;</pre>  <p>imagealignshape="ignore"</p>	Value	Description	ignore	Ignore aspect issues.	atleast	Image is at least as big as imagesize.	atmost	Image is no bigger than imagesize.
Value	Description								
ignore	Ignore aspect issues.								
atleast	Image is at least as big as imagesize.								
atmost	Image is no bigger than imagesize.								

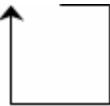

Attributes	Description
	 <p><code>imagealignshape="atleast"</code></p> <p><code>imagealignshape="atmost"</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</p>
<b>imagesize (Stroke Image Size)</b>	<p>Specifies the size of the image for the stroke. Default is the size of the image.</p> <p>[Example:</p> <pre>&lt;v:stroke ... imagesize="10pt,10pt" ... /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>insetpen (Inset Border From Path)</b>	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>joinstyle (Line End Join Style))</b>	<p>Specifies the join style for line ends. Default is round.</p> <ul style="list-style-type: none"> <li>• round</li> <li>• bevel</li> <li>• miter</li> </ul> <p>[Example:</p> <pre>&lt;v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"&gt; &lt;v:stroke joinstyle="bevel"/&gt;</pre>

Attributes	Description
	<p data-bbox="456 247 662 279">&lt;/v:polyline&gt;</p>  <p data-bbox="703 422 971 453">joinstyle="round"</p> <p data-bbox="703 554 971 585">joinstyle="bevel"</p> <p data-bbox="703 695 971 726">joinstyle="miter"</p> <p data-bbox="415 768 574 800"><i>end example]</i></p> <p data-bbox="415 842 1458 905">The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).</p>
linestyle (Stroke Line Style)	<p data-bbox="415 926 1068 957">Specifies the line style of the stroke. Default is single.</p> <ul data-bbox="461 999 743 1157" style="list-style-type: none"> <li>• single</li> <li>• thinThin</li> <li>• thinThick</li> <li>• thickThin</li> <li>• thickBetweenThin</li> </ul> <p data-bbox="415 1199 532 1230"><i>[Example:</i></p> <pre data-bbox="456 1266 1174 1329">&lt;v:stroke linestyle="thickThin" weight="5pt"&gt; &lt;/v:stroke&gt;</pre>  <p data-bbox="415 1503 574 1535"><i>end example]</i></p> <p data-bbox="415 1577 1458 1640">The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).</p>
miterlimit (Miter Joint Limit)	<p data-bbox="415 1661 1471 1755">Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.</p> <p data-bbox="415 1797 532 1829"><i>[Example:</i></p> <pre data-bbox="456 1871 1109 1902">&lt;v:stroke joinstyle="miter" weight="10pt"</pre>

Attributes	Description
	<pre>       miterlimit="2"&gt;     &lt;/v:stroke&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
on (Stroke Toggle)	<p>Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute.</p> <p>[Example:</p> <pre> &lt;v:rect style="width:50;height:50" stroked="true"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke on="false" weight="5pt"/&gt; &lt;/v:rect&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
opacity (Stroke Opacity)	<p>Specifies the amount of transparency of a stroke. Default is 1.0.</p> <p>[Example:</p> <pre> &lt;v:rect style="width:50;height:50"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke weight="5pt" opacity="50%"/&gt; &lt;/v:rect&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
src (Stroke Image Location)	<p>Specifies the source image to load for a stroke fill. Default is no value.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:stroke ... src="myimage.gif" ... &gt; &lt;/v:stroke&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>startarrow (Line Start Arrowhead)</p>	<p>Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke startarrow="classic"/&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
<p>startarrowlength (Line Start Arrowhead Length)</p>	<p>Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowlength="long" ... /&gt;</pre>  <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p>startarrowwidth (Line Start Arrowhead Width)</p>	<p>Specifies the width of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowwidth="wide" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
<p>title (Stroke Title)</p>	<p>Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:title="alt text" ... &gt; &lt;/v:fill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>weight (Stroke Weight)</p>	<p>Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

### 6.2.2.2 callout (Callout)

This element specifies the automatic behavior and layout parameters of callout shapes. Callout shapes are standard VML shapes that behave as callouts, providing an additional callout object which can be used to point at another location:

[Example: Consider the following VML shape:

If this shape is made a callout shape by adding the callout element to its shape definition, then the shape will have a callout object, for example:

1 *end example]*

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

2

Attributes	Description
accentbar (Callout accent bar toggle)	Specifies whether an accent bar will be used with the callout. Default is false.  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
angle (Callout angle)	Specifies the angle that the callout makes with respect to the bounding box of the shape. Default is no value.  The possible values for this attribute are defined by the ST_Angle simple type (§6.2.3.1).
distance (Callout drop distance)	Specifies the drop distance of a callout. The drop distance of a callout is measured from the edge of the shape where the pointer line starts and continues the absolute length of the distance value. If specified with no units, EMUs are assumed. Default is no value.  The possible values for this attribute are defined by the XML Schema string datatype.
drop (Callout drop position)	Specifies where the drop of a callout will be placed.  The possible values for this attribute are defined by the ST_CalloutDrop simple type (§6.2.3.3).
dropauto (Callout automatic drop toggle)	Specifies whether the callout has an automatic drop.  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.  [ <i>Rationale</i> : This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
gap (Callout gap)	Specifies the distance of the callout line from the bounding rectangle of the callout. Default value is one-twelfth of an inch, in EMUs (76200).  The possible values for this attribute are defined by the XML Schema string datatype.
length (Callout	Specifies the length of the first part of a multi-segmented callout line. If specified with no

Attributes	Description
length)	<p>units, EMUs are assumed. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
lengthspecified (Callout length toggle)	<p>Specifies whether the length attribute will be used for the callout. Default is <code>false</code>. If <code>true</code>, the length attribute is used. If <code>false</code>, a best fit is used.</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
minusx (Callout flip x)	<p>Specifies whether the callout flips to the other side of the drop tip along the x-axis when moved or resized. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
minusy (Callout flip y)	<p>Specifies whether the callout flips to the other side of the drop tip along the y-axis when moved or resized. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
on (Callout toggle)	<p>Specifies whether a shape is a callout. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
textborder (Callout text border toggle)	<p>Specifies whether a callout has a text border. Default is <code>true</code>.</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
type (Callout type)	<p>Specifies the type of callout. Default is <code>rectangle</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>rectangle</code></li> <li>• <code>roundedrectangle</code></li> <li>• <code>oval</code></li> <li>• <code>cloud</code></li> </ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Callout">
 <attributeGroup ref="v:AG_Ext"/>
 <attribute name="on" type="ST_TrueFalse" use="optional"/>
 <attribute name="type" type="xsd:string" use="optional"/>

 <attribute name="minusy" type="ST_TrueFalse" use="optional"/>
</complexType>
```

6.2.2.3 clippath (Shape Clipping Path)

This element specifies the path of the clipping polygon for the shape.

[Example:

```
<v:rect ... wrapcoords="-207 -433 -207 21925 21807 21925 21807 -433 -207 -433"
o:clip="t" o:cliptowrap="t">
 <o:clippath o:v="m-207,-433r,22358121807,21925r,-223581-207,-433xe"/>
</v:rect>
```

end example]

Parent Elements

arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
v (Path Definition)	<p>Specifies a string containing the commands that define the shape's path. This value consists of commands followed by zero or more parameters. Default is no value.</p> <p>The following rules apply to path strings:</p> <ul style="list-style-type: none"><li>Commas or spaces delimit parameters for each command. Both "m 0,0" and "m0 0" are acceptable.</li><li>A parameter that is omitted using commas is treated as having a value of zero. Thus, "c 10,10,0,0,25,13" and "c 10,10,,,25,13" are equivalent.</li><li>Parameterized paths are also allowed. In this case, the shape must also have a</li></ul>

Attributes	Description																																								
	<p>formulas element (§6.1.2.6) with a list of formulas that are substituted into the path using the @ symbol followed by the number of the formula. The adj property of the shape contains the input parameters for these formulas. For example, "moveto @1@4". The evaluations of the formulas are substituted into the appropriate positions. Note that @ also serves as a delimiter.</p> <p>The allowed commands are given below. An asterisk (*) indicates that the command is allowed to be repeated. For the qb command, the controlpoint parameter is also allowed to be repeated.</p> <table><tr><th>Command</th><th>Name</th><th>Parameters</th><th>Description</th></tr><tr><td>m</td><td>moveto</td><td>2</td><td>Start a new sub-path at the given (x,y) coordinate.</td></tr><tr><td>l</td><td>lineto</td><td>2*</td><td>Draw a line from the current point to the given (x,y) coordinate which becomes the new current point. Specifying a number of coordinate pairs forms a polyline.	c	curveto	6*	Draw a cubic bézier curve from the current point to the coordinate given by the final two parameters. The control points are given by the first four parameters.	x	close	0	Close the current sub-path by drawing a straight line from the current point to the original moveto point.	e	end	0	End the current set of sub-paths. A given set of sub-paths (as delimited by end) is filled. Subsequent sets of sub-paths are filled independently and superimposed on existing ones.	t	rmoveto	2*	Start a new sub-path at a coordinate relative to the current point, cp (cpx+x, cpy+y).	r	rlineto	2*	Draw a line from the current point to the given relative coordinate (cpx+x, cpy+y).	v	rcurveto	6*	Cubic bézier curve using the given coordinate relative to the current point.	nf	nofill	0	The current set of sub-paths (delimited by e) will not be filled.
Command	Name	Parameters	Description																																						
m	moveto	2	Start a new sub-path at the given (x,y) coordinate.																																						
l	lineto	2*	Draw a line from the current point to the given (x,y) coordinate which becomes the new current point. Specifying a number of coordinate pairs forms a polyline.																																						
c	curveto	6*	Draw a cubic bézier curve from the current point to the coordinate given by the final two parameters. The control points are given by the first four parameters.																																						
x	close	0	Close the current sub-path by drawing a straight line from the current point to the original moveto point.																																						
e	end	0	End the current set of sub-paths. A given set of sub-paths (as delimited by end) is filled. Subsequent sets of sub-paths are filled independently and superimposed on existing ones.																																						
t	rmoveto	2*	Start a new sub-path at a coordinate relative to the current point, cp (cpx+x, cpy+y).																																						
r	rlineto	2*	Draw a line from the current point to the given relative coordinate (cpx+x, cpy+y).																																						
v	rcurveto	6*	Cubic bézier curve using the given coordinate relative to the current point.																																						
nf	nofill	0	The current set of sub-paths (delimited by e) will not be filled.																																						

Attributes	Description			
	ns	nostroke	0	The current set of sub-paths (delimited by e) will not be stroked.
	ae	angleellipseto	6*	Draws a segment of an ellipse as described using these parameters. A straight line is drawn from the current point to the start point of the segment. The parameters are: center (x,y), size(w,h), start angle, end angle.
	al	angleellipse	6*	Same as angleellipseto except that there is an implied moveto the starting point of the segment.
	at	arcto	8*	A segment of the ellipse is drawn which starts at the angle defined by the start radius vector and ends at the angle defined by the end vector. A straight line is drawn from the current point to the start of the arc. The arc is always drawn in a counterclockwise direction. The parameters are: left, top, right, bottom, start(x,y), end(x,y). The first four values define the bounding box of an ellipse. The last four define two radial vectors.
	ar	arc	8*	Same as arcto except there is an implied moveto the start point of the arc.
	wa	clockwisearco	8*	Same as arcto but the arc is drawn in a clockwise direction.
	wr	clockwisearc	8*	Same as arc but the arc is drawn in a clockwise direction
	qx	ellipticalquadrantx	2*	A quarter ellipse is drawn from the current point to the given end point. The elliptical segment is initially tangential to a line parallel to the x-axis. (i.e. the segment starts out horizontal). The parameters are: end(x,y).
	qy	ellipticalquadranty	2*	Same as ellipticalquadrantx except that the elliptical segment is initially tangential to a line parallel to the y-axis (i.e. the segment starts out vertical).

Attributes	Description			
	qb	quadraticbezier	2+2*	Defines one or more quadratic bézier curves by means of control points and an end point. Intermediate (on-curve) points are obtained by interpolation between successive control points as in the OpenType font specification. The sub-path need not be started in which case the sub-path will be closed. In this case the last point of the sub-path defines the start point of the quadratic bézier. The parameters are: controlpoint(x,y)*, end(x,y).
	The possible values for this attribute are defined by the XML Schema string datatype.			

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ClipPath">
 <attribute name="v" type="xsd:string" use="required" form="qualified"/>
</complexType>
```

#### 6.2.2.4 colormenu (UI Default Colors)

This element determines the default colors for different types of colors that can be applied to VML shapes.

*[Rationale: An application may choose to retain default colors or the last color choices a user made and present those in parts of its user interface. end rationale]*

*[Example:*

```
<o:shapedefaults ... >
 <o:colormenu v:ext="edit" fillcolor="none" extrusioncolor="#36f"/>
</o:shapedefaults>
```

*end example]*

#### Parent Elements

shapedefaults (§6.2.2.27)

Attributes	Description
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.
Namespace: urn:schemas-	<i>[Rationale: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. end</i>

Attributes	Description
microsoft-com:vm1	<i>rationale</i>  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
extrusioncolor (Default extrusion color)	The default color associated with the 3D extrusion of a VML shape. Default is "#000000".  The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
fillcolor (Default fill color)	The default color associated with the fill of a VML shape. Default is "#0000FF".  The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
shadowcolor (Default shadow color)	The default color associated with the shadow of a VML shape. Default is "#80800C".  The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
strokecolor (Default stroke color)	The default color associated with the stroke of a VML shape. Default is "#FFFF00".  The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_ColorMenu">
3 <attributeGroup ref="v:AG_Ext"/>
4 <attribute name="strokecolor" type="ST_ColorType"/>
5 <attribute name="fillcolor" type="ST_ColorType"/>
6 <attribute name="shadowcolor" type="ST_ColorType"/>
7 <attribute name="extrusioncolor" type="ST_ColorType"/>
8 </complexType>

```

#### 9 6.2.2.5 colormru (Most Recently Used Colors)

10 This element defines a list of up to eight colors which represent the colors most recently used by the user.

11 [*Rationale*: An application may choose to retain the last color choices a user made, regardless of where on VML  
12 shapes they are used, and present those in parts of its user interface. *end rationale*]

13 [*Example*:

```

14 <o:shapedefaults ... >
15 <o:colormru v:ext="edit" colors="#a01aae,#456b69,#06f,#a1ae24,#d57811"/>
16 </o:shapedefaults>

```

17 *end example*]

Parent Elements
shapedefaults (§6.2.2.27)

1

Attributes	Description
colors (Recent colors)	<p>A comma-separated list of up to eight most recently used colors. Default is no value. Colors should be defined using hexadecimal notation - see the ST_ColorType simple type (§6.2.3.5) for a full description.</p> <p>[Example:</p> <pre>&lt;o:colormru v:ext="edit"   colors="#a01aae,#456b69,#06f,#a1ae24,#d57811"/&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vml	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[Rationale: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. end rationale]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_ColorMru">
4 <attributeGroup ref="v:AG_Ext"/>
5 <attribute name="colors" type="xsd:string"/>
6 </complexType>
```

7 6.2.2.6 column (Text Box Interior Stroke)

8 This element specifies the stroke properties for the interior border of a text box. It entirely supercedes its  
9 parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a  
10 value specified in the parent. If the on attribute is false or not specified, the border is not shown. [Note: This  
11 element is ignored if an implementation does not support multi-column text boxes. end note]

12 [Example: The text box borders are set independently. Note that the bottom border does not inherit the weight  
13 from the parent stroke element.

```
14 <v:stroke weight="2.25pt">
15 <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
16 <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
17 <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
18 <o:bottom v:ext="view" color="black" on="t"/>
19 <o:column v:ext="view" color="#f60" on="t"/>
20 </v:stroke>
```

Attributes	Description
althref (Alternate Image Reference)	<p>Specifies an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p> <pre>&lt;v:stroke ... althref="myimage.pcz" ... &gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
color (Stroke Color)	<p>Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is black. See the fillcolor attribute for a list of supported named colors.</p> <p>[Example: The shape stroke is blue:</p> <pre>&lt;v:shape ... strokecolor="red" ... &gt;   &lt;v:stroke color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
color2 (Stroke Alternate Pattern Color)	<p>Specifies a second color for strokes, used when filltype is pattern. Default is no value.</p> <p>When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.</p> <p>[Example: This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight</p>

Attributes	Description
	<p>shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.</p> <pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="pattern" weight="10pt"     src="myimage.gif" color2="blue"/&gt; &lt;/v:shape&gt;</pre>  <p>, where myimage.gif is: </p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
dashstyle (Stroke Dash Pattern)	<p>Specifies the dot and dash pattern for a stroke. Default is solid. Pre-defined values are:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• shortdash</li> <li>• shortdot</li> <li>• shortdashdot</li> <li>• shortdashdotdot</li> <li>• dot</li> <li>• dash</li> <li>• longdash</li> <li>• dashdot</li> <li>• longdashdot</li> <li>• longdashdotdot</li> </ul> <p>A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).</p> <p><i>[Example:</i></p> <pre>&lt;v:stroke dashstyle="0 2" weight="3pt"</pre>

Attributes	Description
	<pre> endcap="round"&gt; &lt;/v:stroke&gt; </pre>  <pre> &lt;v:stroke dashstyle="longdashdotdot" weight="2pt"&gt; &lt;/v:stroke&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
endarrow (Line End Arrowhead)	<p>Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre> &lt;v:stroke endarrow="classic"/&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
endarrowlength (Line End Arrowhead Length)	<p>Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:stroke ... endarrowlength="long" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p>endarrowwidth (Line End Arrowhead Width)</p>	<p>Specifies the width of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowwidth="wide" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
<p>endcap (Line End Cap)</p>	<p>Specifies the cap style for the end of a stroke. Default is flat. Allowed values are:</p> <ul style="list-style-type: none"> <li>• flat</li> <li>• square</li> <li>• round</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endcap="round" weight="10pt" ... /&gt;</pre>  <p>endcap="flat"</p>

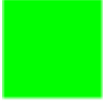

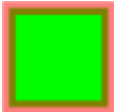

Attributes	Description
	 <p>endcap="square"</p> <p>endcap="round"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).</p>
<p>ext (VML Extension Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:vml</p>	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale]</i></p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>filltype (Stroke Image Style)</p>	<p>Specifies the type of fill used for the background of a stroke. Default is solid. Allowed values are:</p> <ul style="list-style-type: none"> <li>• solid - The fill pattern is solid.</li> <li>• tile - The fill image is tiled.</li> <li>• pattern - The fill image is stretched to form a pattern.</li> <li>• frame - The fill image becomes a border for the shape.</li> </ul> <p>[<i>Example:</i></p> <pre>&lt;v:shape style="width:50;height:50"   strokecolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="frame" weight="10pt"     src="border.gif"/&gt; &lt;/v:shape&gt;</pre>  <p>, where border.gif is:</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>

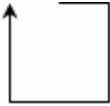

Attributes	Description
<b>forcedash (Force Dashed Outline)</b>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is <code>false</code>.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).</p>
<b>href (Original Image Reference)</b>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>imagealignshape (Stoke Image Alignment)</b>	<p>Specifies the alignment of the stroke image. If <code>true</code>, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is <code>true</code>.</p> <p>[Example: The top position offset shifts the image alignment relative to the containing window:</p> <pre>&lt;v:shape fillcolor="silver"   style="top:20;width:50;height:50"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke imagealignshape="false" weight="20pt"     filltype="tile" src="myimage.gif"/&gt; &lt;/v:shape&gt;</pre>  <p>imagealignshape="false"</p>

Attributes	Description								
	 <code>imagealignshape="false"</code>  <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).								
imageaspect (Stroke Image Aspect Ratio)	<p>Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are:</p> <table border="1" data-bbox="418 703 1318 898"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>ignore</td><td>Ignore aspect issues.</td></tr> <tr> <td>atleast</td><td>Image is at least as big as imagesize.</td></tr> <tr> <td>atmost</td><td>Image is no bigger than imagesize.</td></tr> </tbody> </table> [Example:  <pre>&lt;v:stroke filltype="frame" weight="10pt"   src="border.gif" imagealignshape="true"   imageaspect="atleast"&gt; &lt;/v:stroke&gt;</pre>  <i>end example]</i>  The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).	Value	Description	ignore	Ignore aspect issues.	atleast	Image is at least as big as imagesize.	atmost	Image is no bigger than imagesize.
Value	Description								
ignore	Ignore aspect issues.								
atleast	Image is at least as big as imagesize.								
atmost	Image is no bigger than imagesize.								
imagesize (Stroke Image Size)	<p>Specifies the size of the image for the stroke. Default is the size of the image.</p> [Example:  <pre>&lt;v:stroke ... imagesize="10pt,10pt" ... /&gt;</pre>								

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
joinstyle (Line End Join Style)	<p>Specifies the join style for line ends. Default is round.</p> <ul style="list-style-type: none"> <li>• round</li> <li>• bevel</li> <li>• miter</li> </ul> <p>[Example:</p> <pre>&lt;v:polyline strokeweight="10pt" strokecolor="navy"   points="10pt,10pt,50pt,50pt,90pt,10pt"&gt;   &lt;v:stroke joinstyle="bevel"/&gt; &lt;/v:polyline&gt;</pre> <div style="display: flex; align-items: center; margin-top: 10px;">  <div style="margin-left: 10px;"> <p>joinstyle="round"</p> <p>joinstyle="bevel"</p> <p>joinstyle="miter"</p> </div> </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type</p>

Attributes	Description
<b>linestyle (Stroke Line Style)</b>	<p>(§6.1.3.12).</p> <p>Specifies the line style of the stroke. Default is single.</p> <ul style="list-style-type: none"> <li>• single</li> <li>• thinThin</li> <li>• thinThick</li> <li>• thickThin</li> <li>• thickBetweenThin</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke linestyle="thickThin" weight="5pt"&gt; &lt;/v:stroke&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).</p>
<b>miterlimit (Miter Joint Limit)</b>	<p>Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.</p> <p>[Example:</p> <pre>&lt;v:stroke joinstyle="miter" weight="10pt"   miterlimit="2"&gt; &lt;/v:stroke&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
<b>on (Stroke Toggle)</b>	<p>Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50" stroked="true"   fillcolor="lime" strokecolor="red"&gt;</pre>

Attributes	Description
	<pre>&lt;v:stroke on="false" weight="5pt"/&gt; &lt;/v:rect&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
opacity (Stroke Opacity)	<p>Specifies the amount of transparency of a stroke. Default is 1.0.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke weight="5pt" opacity="50%"/&gt; &lt;/v:rect&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
src (Stroke Image Location)	<p>Specifies the source image to load for a stroke fill. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:stroke ... src="myimage.gif" ... &gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
startarrow (Line Start Arrowhead)	<p>Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul>

Attributes	Description
	<p>[Example:</p> <pre data-bbox="451 352 967 380">&lt;v:stroke startarrow="classic"/&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
<p>startarrowlength (Line Start Arrowhead Length)</p>	<p>Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul data-bbox="461 823 602 919" style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre data-bbox="451 1031 1159 1058">&lt;v:stroke ... startarrowlength="long" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p>startarrowwidth (Line Start Arrowhead Width)</p>	<p>Specifies the width of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul data-bbox="461 1499 602 1596" style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre data-bbox="451 1707 1143 1734">&lt;v:stroke ... startarrowwidth="wide" ... /&gt;</pre> 

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
title (Stroke Title)	<p>Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank.</p> <p>[Example:</p> <pre data-bbox="451 617 1029 680">&lt;v:fill ... o:title="alt text" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
weight (Stroke Weight)	<p>Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrokeChild">
 <attributeGroup ref="v:AG_Ext"/>

```

6.2.2.7 complex (Complex)

This element specifies that a shapetype contains fragments.

Parent Elements

background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

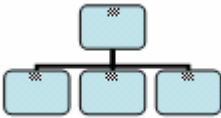

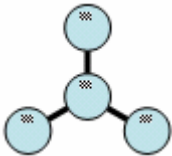

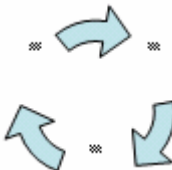

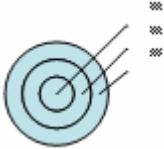

Attributes	Description
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.
Namespace: urn:schemas-microsoft-com:vmf	[ <i>Rationale</i> : This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Complex">
 <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.8 diagram (VML Diagram)

This element specifies semantic information for a limited set of structured diagrams that have VML representations. Note that diagrams should be defined using DrawingML; this representation is included for compatibility with applications that rely on VML. The following diagram types have VML representations:

Diagram Type	Example (non-normative)
Organization chart	
Radial	
Cycle	
Pyramid	
Venn	
Bulls-eye	

Each of these types of diagrams contains shapes that are positioned relative to one another. Each shape also has optional associated text.

Parent Elements
background (§2.2.1); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

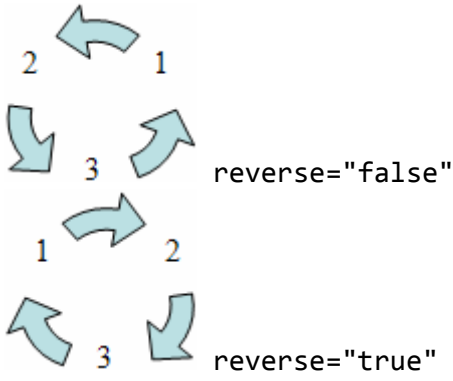

1

Child Elements	Subclause
relationtable (Diagram Relationship Table)	§6.2.2.24

2

Attributes	Description
autoformat (Diagram Automatic Format)	<p>Specifies whether the diagram is formatted automatically by the application and user overrides are locked. Default is false.</p> <p>[Example:</p> <pre>&lt;o:diagram ... autoformat="true"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
autolayout (Diagram Automatic Layout)	<p>Specifies whether the diagram elements are laid out automatically by the application and user overrides are locked. Default is true.</p> <p>[Example:</p> <pre>&lt;o:diagram ... autolayout="false"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
constrainbounds (Diagram Layout Extents)	<p>Specifies an optional, application-specific parameter related to the diagram's extents intended to be used by the application to assist laying out the diagram.</p> <p>[Example:</p> <pre>&lt;o:diagram ... constrainbounds="2910,2696,9773,9558"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
dgmbasetextscale (Diagram Base Font Size)	<p>Specifies the diagram's original font size. This is used in subsequent font size recalculations. If the most recent diagram font size is used to calculate the font size after a rescale, the font size would be wrong after non-isometric diagram rescalings.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;o:diagram ... dgmbasetextscale="12"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmfontsize</b> (Diagram Font Size)	<p>Specifies the font size for attached text when a new diagram node is added.</p> <p>[Example:</p> <pre>&lt;o:diagram ... dgmfontsize="12"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmsex</b> (Diagram Layout X Scale)	<p>Specifies an optional, application-specific parameter related to the horizontal scaling of the diagram that is intended to be used by the application to assist laying out the diagram.</p> <p>[Example:</p> <pre>&lt;o:diagram ... dgmsex="50000"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmsey</b> (Diagram Layout Y Scale)	<p>Specifies an optional, application-specific parameter related to the vertical scaling of the diagram that is intended to be used by the application to assist laying out the diagram.</p> <p>[Example:</p> <pre>&lt;o:diagram ... dgmsey="75000"&gt; &lt;/o:diagram&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmstyle</b> (Diagram Style Options)	<p>Specifies an optional, application-specific parameter related to the styling of the diagram that is intended to be used by the application to assist in formatting the diagram.</p> <p>[Example:</p>

Attributes	Description
	<pre>&lt;o:diagram ... dgmstyle="1"&gt; &lt;/o:diagram&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>ext (VML Extension Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:vml</p>	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale]</i></p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>reverse (Diagram Reverse Direction)</p>	<p>Specifies whether the order of the diagram nodes is reversed. This is only relevant to diagrams that have linear ordering.</p> <p>[<i>Example:</i></p> <pre>&lt;o:diagram ... reverse="true"&gt; &lt;/o:diagram&gt;</pre>  <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Diagram">
 <sequence>
 <element name="relationtable" type="CT_RelationTable" minOccurs="0"/>
 </sequence>
 <attributeGroup ref="v:AG_Ext"/>
 <attribute name="dgmstyle" type="xsd:integer" use="optional"/>
 <attribute name="autoformat" type="ST_TrueFalse" use="optional"/>
 <attribute name="reverse" type="ST_TrueFalse" use="optional"/>
 <attribute name="autolayout" type="ST_TrueFalse" use="optional"/>
 <attribute name="dgmsex" type="xsd:integer" use="optional"/>
 <attribute name="dgmsexey" type="xsd:integer" use="optional"/>
 <attribute name="dgmfontsize" type="xsd:integer" use="optional"/>
 <attribute name="constrainbounds" type="xsd:string" use="optional"/>
 <attribute name="dgmasetextscale" type="xsd:integer" use="optional"/>
</complexType>
```

6.2.2.9 entry (Regroup Entry)

This element specifies a single entry in a regrouptable (§6.2.2.22). Each entry is a pair mapping a current regroupid value to an old one. This is used to restore regrouping information on the regrouped object. A value of zero indicates no previous group.

[Example: The zero value of the old attribute indicates that if the shapes with regroupid 1 are regrouped, the restored group was not previously grouped with any other shapes:

```
<o:regroupable v:ext="edit">
 <o:entry new="1" old="0"/>
</o:regroupable>
```

end example]

Parent Elements

regroupable (§6.2.2.22)

Attributes

Description

new (New Group ID)

Specifies the ID of the new group. Default is 0.  
The possible values for this attribute are defined by the XML Schema int datatype.

old (Old Group ID)

Specifies the ID of the old group. Default is 0.  
The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Entry">
 <attribute name="new" type="xsd:int" use="optional"/>
 <attribute name="old" type="xsd:int" use="optional"/>
</complexType>
```

6.2.2.10 extrusion (3D Extrusion)

This element specifies a parallel or perspective extrusion of a 2-D shape, creating the appearance of a 3-D shape. Lighting is controlled via two independent point light sources. Extrusions are defined as either perspective or parallel.

[Example:

```
<v:polyline points="0pt,75pt 20pt,45pt 10pt,50pt 30pt,10pt
 50pt,50pt 40pt,45pt 60pt,75pt 0pt,75pt" fillcolor="#00a000">
 <o:extrusion on="t" backdepth="20pt"
 lightposition="30000,10000,10000"/>
</v:polyline>
```

end example]

Parent Elements

arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
autorotationcenter (Center of Rotation Toggle)	Specifies whether the center of rotation is the geometric center of the extrusion. Default is false. If true, the geometric center of an extruded shape is (0,0,0). If false, the center of rotation is determined by the rotationcenter attribute.  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
backdepth (Backward Extrusion Depth)	Specifies the amount of backward extrusion. Default is 36 pt, default units are points.  [Example:

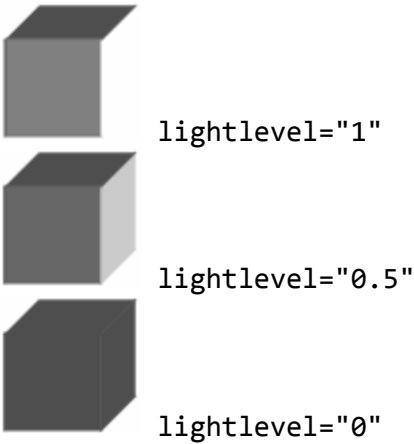

Attributes	Description
	<pre>&lt;o:extrusion on="true" backdepth="15pt"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>brightness (Brightness)</p>	<p>Specifies the overall brightness of a scene. Default is 0.3. This numeric value may also be specified in 1/65536ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies darkness and 1 implies light saturation.</p> <p>[Example:</p> <pre>&lt;o:extrusion on="true" brightness="0.4"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>color (Extrusion Color)</p>	<p>Specifies the color of the extrusion faces. This attribute is only used when colormode is custom. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as</p>

Attributes	Description
	<p>#00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre data-bbox="451 394 1015 489">&lt;o:extrusion on="true" color="lime"   colormode="custom"&gt; &lt;/o:extrusion&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
colormode (Extrusion Color Mode)	<p>Specifies whether the extrusion color is defined by the color attribute or is the same as the shape's fill color. Default is auto.</p> <p>[Example:</p> <pre data-bbox="451 1035 1015 1129">&lt;o:extrusion on="true" color="lime"   colormode="auto"&gt; &lt;/o:extrusion&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorMode simple type (§6.2.3.4).</p>
diffusivity (Diffuse Reflection)	<p>Specifies the amount of diffusion of reflected light from an extruded shape, defined as the ratio of incident light to diffused reflected light. Default is 1. Normal values range from 0 to 1. This numeric value may also be specified in 1/65536ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies all reflected light is diffuse and 1 implies no reflected light is diffuse.</p> <p>Note that specularity and diffusivity should be considered together as it is possible, though</p>

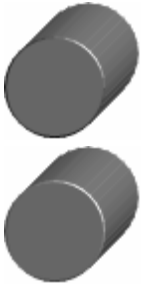

Attributes	Description
	<p>physically incorrect, to define more reflected light than incident light. This is the case if the amount of specularly reflected light and diffusely reflected light add up to more than the amount of incident light.</p> <p>[Example:</p> <pre data-bbox="451 464 1081 527">&lt;o:extrusion on="true" diffusivity=".75"&gt; &lt;/o:extrusion&gt;</pre> <div data-bbox="451 562 862 1146">  <div data-bbox="609 674 820 709">diffusivity="0"</div> <div data-bbox="609 821 852 856">diffusivity="0.5"</div> <div data-bbox="609 968 862 1003">diffusivity="0.75"</div> <div data-bbox="609 1115 820 1150">diffusivity="1"</div> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
edge (Simulated Bevel)	<p>Specifies the apparent bevel of the extrusion edges. Default is 1 point.</p> <p>[Example:</p> <pre data-bbox="451 1444 1000 1507">&lt;o:extrusion on="true" edge="2pt"&gt; &lt;/o:extrusion&gt;</pre> <div data-bbox="412 1543 553 1684">  </div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
ext (VML Extension	Specifies an optional value that indicates how applications that implement VML should

Attributes	Description
<p>Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:VML</p>	<p>interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale</i>: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i>]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>facet (Faceting Quality)</p>	<p>Specifies the quality with which the application approximates curved surfaces of an extrusion. A higher facet value produces shapes with smoother curves. A lower value reduces smoothing, resulting in curves with sharper, jagged edges. Default is 30000.</p> <p>Valid values range from 1 to 65536, where 1 implies extremely low quality curve approximation and 65536 implies extremely high quality.</p> <p>[<i>Example</i>:</p> <pre>&lt;o:extrusion on="true" facet="65536"&gt; &lt;/o:extrusion&gt;</pre>  <p>facet="65536"</p>  <p>facet="100"</p> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>foredepth (Forward Extrusion)</p>	<p>Specifies the amount of forward extrusion. Default is 0 pt, default units are points.</p> <p>[<i>Example</i>:</p> <pre>&lt;o:extrusion on="true" foredepth="25pt"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example</i>]</p>

Attributes	Description
<b>lightface</b> (Shape Face Lighting Toggle)	<p>The possible values for this attribute are defined by the XML Schema string datatype.</p> <p>Specifies whether the front face of the extrusion responds to changes in the lighting. If <code>false</code>, the front face does not respond when a lighting value changes. Default is <code>true</code>.</p> <p><i>[Example: The front face is colored as if the shape were not extruded and lit by a 3-D light source:</i></p> <pre>&lt;o:extrusion on="true" lightface="false"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>lightharsh</b> (Primary Light Harshness Toggle)	<p>Specifies whether the primary light source is harsh. If <code>false</code>, shadow boundaries are diffused. Default is <code>true</code>.</p> <p><i>[Example: The secondary light source is turned off so only the primary has an effect:</i></p> <pre>&lt;o:extrusion on="true" lightharsh="false" lightlevel2="0"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>lightharsh2</b> (Secondary Light Harshness Toggle)	<p>Specifies whether the secondary light source is harsh. If <code>false</code>, shadow boundaries defined by the secondary light source are diffused. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type</p>

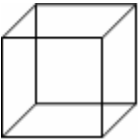

Attributes	Description
<p>lightlevel (Primary Light Intensity)</p>	<p>(§6.2.3.23).</p> <p>Specifies the intensity of the primary light source for the scene. Default is 0.6. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies no direct light and 1 implies saturated direct light.</p> <p>[Example: The secondary light source is turned off so only the primary has an effect:</p> <pre>&lt;o:extrusion on="true" lightlevel=".5"   lightlevel2="0"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>lightlevel2 (Secondary Light Intensity)</p>	<p>Specifies the intensity of the secondary light source for the scene. Default is 0.6. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies no direct light and 1 implies saturated direct light.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>lightposition (Primary Light Position)</p>	<p>Specifies the normalized X,Y,Z position of the primary light in a scene in 1/65536-ths. Default is "50000,0,10000". The use of a normalized vector from the shape origin effectively establishes the direction of the light relative to the shape. The distance of the light from the shape is irrelevant as the light source is treated as a directional light.</p>

Attributes	Description
	<p>The position "0,0,0" is at the center of the shape. Positive numbers move the light to the right, down and toward the viewer, respectively.</p> <p>[Example: The secondary light source is turned off so only the primary has an effect:</p> <pre>&lt;o:extrusion on="true" lightlevel2="0"   lightposition="7000,-13000,20000"&gt; &lt;/o:extrusion&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
lightposition2 (Secondary Light Position)	<p>Specifies the X,Y,Z position of the secondary light in a scene in 1/65536-ths. Default is "-50000,0,10000". The use of a normalized vector from the shape origin effectively establishes the direction of the light relative to the shape. The distance of the light from the shape is irrelevant as the light source is treated as a directional light.</p> <p>The position "0,0,0" is at the center of the shape. Positive numbers move the light to the right, down and toward the viewer, respectively.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
lockrotationcenter (Rotation Toggle)	<p>Specifies whether the rotation of the extruded object is specified by the rotationangle attribute. If false, the rotation is specified by the orientation attribute. Default is true.</p> <p>[Example: The following snippets are equivalent:</p> <pre>&lt;o:extrusion lockrotationcenter="false"   orientationangle="45" orientation="0,1,0"&gt; &lt;/o:extrusion&gt;</pre> <pre>&lt;o:extrusion lockrotationcenter=true   rotationangle="45"/&gt; &lt;/o:extrusion&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
metal (Metallic Surface Toggle)	<p>Specifies whether the surface of the extruded shape resembles metal. Default is false.</p>

Attributes	Description
	<p>If true, this attribute causes the specularly reflected light to be the material color instead of the light source color, making the object seem more metallic. To further approximate a metallic material requires that specularity be relatively high (about 1.2) and diffusivity be relatively low (about 0.6).</p> <p>[Example:</p> <pre>&lt;o:extrusion on="true" metal="true"   lightposition="10000,-10000,10000"   lightlevel2="0" specularity="1.2"   diffusivity="0.6"&gt; &lt;/o:extrusion&gt;</pre> <div data-bbox="451 699 812 982">  <p>metal="true"</p> <p>metal="false"</p> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
on (Extrusion Toggle)	<p>Specifies whether an extrusion is displayed. Default is false.</p> <p>[Example:</p> <pre>&lt;v:rect style="width=50;height=50"&gt;   &lt;o:extrusion /&gt; &lt;/v:rect&gt;</pre> <div data-bbox="414 1457 516 1560">  </div> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
orientation (Rotation Axis)	<p>Specifies a vector in 3D space around which the shape is rotated, as given by the orientationangle attribute. Default is "100,0,0".</p> <p>The position "0,0,0" is at the center of the shape. Positive numbers are to the right,</p>

Attributes	Description
	<p>down and toward the viewer, respectively.</p> <p>[Example:</p> <pre>&lt;o:extrusion ... orientation="200,0,0"&gt; &lt;/o:extrusion&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>orientationangle (Rotation Around Axis)</p>	<p>Specifies the angle, in degrees, that an extrusion rotates around the orientation. Default is 0.</p> <p>[Example:</p> <pre>&lt;o:extrusion ... orientationangle="30"&gt; &lt;/o:extrusion&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>plane (Extrusion Direction)</p>	<p>Specifies the plane that is at right angles to the extrusion. Default is xy. Allowed values are:</p> <ul style="list-style-type: none"> <li>• xy</li> <li>• zx</li> <li>• yz</li> </ul> <p>[Example:</p> <pre>&lt;o:extrusion on="true" plane="yz"   backdepth="100pt"&gt; &lt;/o:extrusion&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ExtrusionPlane simple type (§6.2.3.8).</p>
<p>render (Extrusion</p>	<p>Specifies the rendering mode of the extrusion. Default is solid. Allowed values are:</p>

Attributes	Description								
Render Mode)	<table border="1" data-bbox="415 281 1258 564"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>solid</td><td>Rendering displays a solid shape.</td></tr> <tr> <td>wireframe</td><td>Rendering displays a wireframe shape.</td></tr> <tr> <td>boundingcube</td><td>Rendering displays the bounding cube that contains the shape.</td></tr> </tbody> </table> <p data-bbox="415 604 535 636"><i>[Example:</i></p> <pre data-bbox="453 674 1127 737" style="background-color: #f0f0f0; padding: 5px;"> &lt;o:extrusion on="true" render="wireframe"&gt; &lt;/o:extrusion&gt; </pre>  <p data-bbox="415 951 574 982"><i>end example]</i></p> <p data-bbox="415 1022 1479 1085">The possible values for this attribute are defined by the ST_ExtrusionRender simple type (§6.2.3.9).</p>	Value	Description	solid	Rendering displays a solid shape.	wireframe	Rendering displays a wireframe shape.	boundingcube	Rendering displays the bounding cube that contains the shape.
Value	Description								
solid	Rendering displays a solid shape.								
wireframe	Rendering displays a wireframe shape.								
boundingcube	Rendering displays the bounding cube that contains the shape.								
rotationangle (X-Y Rotation Angle)	<p data-bbox="415 1106 1455 1205">Specifies the rotation of the object about the x- and y-axes, in degrees. Default is "0,0". Positive angles are measured clockwise around the axis (as if viewing from the positive axis).</p> <p data-bbox="415 1249 1463 1348">The rotation of the object is defined by a rotation angle about the y-axis followed by the rotation angle about the x-axis. The z-axis angle is controlled by the value of the CSS style attribute's rotation property.</p> <p data-bbox="415 1392 535 1423"><i>[Example:</i></p> <pre data-bbox="453 1461 1174 1560" style="background-color: #f0f0f0; padding: 5px;"> &lt;o:extrusion on="t" lockrotationcenter="true"   rotationangle="10,20"&gt; &lt;/o:extrusion&gt; </pre>  <p data-bbox="415 1764 574 1795"><i>end example]</i></p> <p data-bbox="415 1835 1430 1866">The possible values for this attribute are defined by the XML Schema string datatype.</p>								

Attributes	Description
rotationcenter (Rotation Center)	<p>Specifies the center of rotation for a shape if autorotationcenter is false. The offset of the rotation is specified in terms of fractions of the shape's size. Default is "0,0,0".</p> <p>The position "0,0,0" is at the center of the shape. Positive numbers are to the right, down and toward the viewer, respectively.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
shininess (Shininess)	<p>Specifies the concentration of the reflected light on an extrusion surface. Default is 5. The range of values should be constrained to 0-10. Reflection intensity typically grows exponentially with the shininess value.</p> <p>High values (8-10) approximate the shininess of a mirror and low values (2-3) approximate a speckled effect. Reflections do not mirror other objects; only pinpoint light sources are reflected.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
skewamt (Extrusion Skew)	<p>Specifies the amount of skew, or length, of a parallel extrusion. Default is 50%. Applies only if the extrusion type is parallel. Note that this attribute and backdepth interact to create the actual extrusion length. Valid values range from 0 (0%) to 1 (100%).</p> <p>[Example:</p> <pre data-bbox="451 1056 1063 1119">&lt;o:extrusion on="true" skewamt="100%"&gt; &lt;/o:extrusion&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
skewangle (Extrusion Skew Angle)	<p>Specifies the angle of the skew of a parallel extrusion. Default is 225 degrees. Angles are measured in degrees, counterclockwise from the negative x-axis. Applies only if the extrusion type is parallel.</p> <p>[Example:</p> <pre data-bbox="451 1701 1063 1764">&lt;o:extrusion on="true" skewangle="25"&gt; &lt;/o:extrusion&gt;</pre>

Attributes	Description				
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>				
specularity (Specularity)	<p>Specifies the specularity of an extruded shape, defined as the ratio of incident light to specularly reflected light. Default is 0. Normal values range from 0 to 1. This numeric value may also be specified in 1/65536ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>Note that specularity and diffusity should be considered together as it is possible, though physically incorrect, to define more reflected light than incident light. This is the case if the amount of specularly reflected light and diffusely reflected light add up to more than the amount of incident light.</p> <p>[Example: The secondary light source is turned off so only the primary has an effect. Although the effect is subtle, the first cylinder has a sharper specular reflection on its edge:</p> <pre data-bbox="451 1024 1063 1155">&lt;o:extrusion on="true" specularity="1"   lightposition="10000,-10000,10000"   lightlevel2="0"&gt; &lt;/o:extrusion&gt;</pre> <div data-bbox="451 1186 844 1480">  <p>specularity="1"</p>  <p>specularity="0"</p> </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
type (Extrusion Type)	<p>Specifies the way that the shape is extruded. Default is parallel. Allowed values are:</p> <table border="1" data-bbox="414 1705 1258 1869"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>parallel</td><td>Extrusion is rendered so that the center of projection is infinitely far away; that is, the extrusion lines do not converge (unlike</td></tr> </tbody> </table>	Value	Description	parallel	Extrusion is rendered so that the center of projection is infinitely far away; that is, the extrusion lines do not converge (unlike
Value	Description				
parallel	Extrusion is rendered so that the center of projection is infinitely far away; that is, the extrusion lines do not converge (unlike				

Attributes	Description				
	<table border="1" data-bbox="418 245 1260 415"> <tr> <td></td><td>perspective projections).</td></tr> <tr> <td>perspective</td><td>Extrusion is rendered to a center of projection, which is the same as the vanishing point for unrotated objects.</td></tr> </table> <p data-bbox="418 453 535 485"><i>[Example:</i></p> <pre data-bbox="456 525 1062 625">&lt;o:extrusion on="true" type="parallel"   backdepth="100pt"&gt; &lt;/o:extrusion&gt;</pre> <div data-bbox="451 657 904 1003">  <p data-bbox="665 829 904 861">type="parallel"</p> <p data-bbox="589 972 873 1003">type="perspective"</p> </div> <p data-bbox="418 1041 574 1073"><i>end example]</i></p> <p data-bbox="418 1113 1451 1182">The possible values for this attribute are defined by the ST_ExtrusionType simple type (§6.2.3.10).</p>		perspective projections).	perspective	Extrusion is rendered to a center of projection, which is the same as the vanishing point for unrotated objects.
	perspective projections).				
perspective	Extrusion is rendered to a center of projection, which is the same as the vanishing point for unrotated objects.				
viewpoint (Extrusion Viewpoint)	<p data-bbox="418 1199 1442 1268">Specifies the viewpoint of the observer in EMUs. This is effectively the end of a vector extending from the viewpointorigin.</p> <p data-bbox="418 1304 1409 1373">The position "0,0,0" is at the center of the shape. Positive numbers are to the right, down and toward the viewer, respectively.</p> <p data-bbox="418 1411 535 1442"><i>[Example:</i></p> <pre data-bbox="456 1482 1110 1583">&lt;o:extrusion on="true" type="perspective"   viewpoint="500000,-100000,100000"&gt; &lt;/o:extrusion&gt;</pre> <div data-bbox="414 1614 602 1738">  </div> <p data-bbox="418 1776 574 1808"><i>end example]</i></p> <p data-bbox="418 1848 1430 1879">The possible values for this attribute are defined by the XML Schema string datatype.</p>				

Attributes	Description
viewpointorigin (Extrusion Viewpoint Origin)	<p>Specifies the origin of the viewpoint vector for perspective extrusions. This is the origin of the vector whose opposite end is given by the viewpoint attribute. This origin is always within the bounding box of the shape. Default is "0.5,-0.5".</p> <p>The viewpoint is specified in terms of the x and y values of the original shape. The x and y values range from 0.5 to -0.5 (50% to -50% of the shape's coordinate origin). Larger numbers move the viewpoint outside the bounding box.</p> <p>[Example:</p> <pre data-bbox="451 604 1110 737">&lt;o:extrusion on="true" type="perspective"   viewpoint="500000,-100000,100000"   viewpointorigin="0,1"&gt; &lt;/o:extrusion&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

#### 6.2.2.11 FieldCodes (WordprocessingML Field Switches)

This element specifies the WordprocessingML field switches which shall be stored with an embedded object, using the set of field switches defined by the LINK field, as specified in §2.16. This element shall only be used within a WordprocessingML document, and shall specify the exact field switches for the field which represents the object..

[*Rationale:* Legacy word processors used fields to represent embedded objects – this element stores the field switches not explicitly defined using individual Office VML Drawing elements for embeddings so as not to use the fidelity of their contents. *end rationale*]

[*Example:* The following example inserts an embedded object and specifies additional properties as defined by the LINK field.

```
<o:OLEObject ...>
 <o:FieldCodes>\f 0</o:FieldCodes>
</o:OLEObject>
```

This embedded object specifies additional LINK field code values of \f 0, which specifies that the embedded object shall retain its source formatting (as defined in §2.16).

*end example]*

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
OLEObject (§6.2.2.19)

6.2.2.12 fill (Shape Fill Extended Properties)

This element specifies additional properties for fills. It is used to identify additional types of gradient fills beyond those specified in the fill element (§6.1.2.5).

Parent Elements
background (§2.2.1); fill (§6.1.2.5); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

Attributes	Description
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.
Namespace: urn:schemas-microsoft-com:vml	<p>[<i>Rationale</i>: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i>]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
type (Fill Type)	<p>Specifies the type of fill. If specified, this overrides the value of the type attribute in the parent fill element.</p> <p>[<i>Example</i>: The gradientCenter value overrides gradientRadial:</p> <pre>&lt;v:fill color2="black" focus="100%" type="gradientRadial"&gt;   &lt;o:fill v:ext="view" type="gradientCenter"/&gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.2.3.11).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fill">
 <attributeGroup ref="v:AG_Ext"/>
 <attribute name="type" type="ST_FillType"/>
</complexType>
```

6.2.2.13 idmap (Shape ID Map)

This element specifies how shape IDs in the document have been generated. This is an optional element included to allow applications a mechanism for storing information they need to persist related to generating shape IDs.

Parent Elements
shapelayout (§6.2.2.28)

Attributes	Description
data (Shape IDs)	<p>Specifies the data the application uses to generate shape IDs.</p> <p>[<i>Example:</i> An application might choose to reserve blocks of shape ID numbers for each part in the package. Each block of 1024 shape IDs could be referred to by index and this index stored in the data attribute. The data value for a given part might then be:</p> <pre>&lt;o:idmap v:ext="edit" data="1"/&gt;</pre> <p>indicating that all the IDs in block 1 are reserved by this part ( meaning shape IDs from 1 to 1024 cannot be used ). The application's internal constraint would be that each part reserve a different set of IDs. Another part, that contains more shapes, might use:</p> <pre>&lt;o:idmap v:ext="edit" data="2,3"/&gt;</pre> <p>In this case, shape IDs from 1025 to 3072 [ 3 x 1024 ] cannot be used ).</p> <p>Another implementation might choose to store more verbose information in this attribute. Yet another implementation might ignore this element completely.</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
ext (VML Extension Handling Behavior)	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p>
Namespace: urn:schemas-microsoft-com:vml	<p>[<i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale]</i></p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IdMap">
 <attributeGroup ref="v:AG_Ext"/>
 <attribute name="data" type="xsd:string" use="optional"/>
</complexType>
```

6.2.2.14 ink (Ink)

This element specifies the presence of an ink object. An ink object is a VML object which allows applications to store data for ink annotations in an application-defined format.

[Example:

```
<v:shape ... >
 <o:ink i="AMgFHQSWC+YFASAAaAwAAAAAAMA..." annotation="t"/>
</v:shape>
```

end example]

Parent Elements

background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23);  
polyline (§6.1.2.15); shape (§6.1.2.19); shapeDefaults (§2.15.1.79)

Attributes

Description

annotation (Annotation Flag)	<p>Specifies whether the ink object was created as an annotation rather than through pen input. Default is false. [Rationale This allows an application to treat annotation ink objects as any other annotation. For example, if annotations are hidden, the application can hide the ink object. An ink object that represents primary user input through a pen can be left visible. end rationale]</p> <p>[Example:</p> <pre>&lt;o:ink ... annotation="true"&gt; &lt;/o:ink&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
i (Ink Data)	<p>Specifies additional ink object information which shall be associated with the parent VML shape. The VML shape specifies the information necessary to render the ink, and this attribute may be used to store additional application-specific data about the VML shape(s) representing ink. This attribute's contents are optional and may be ignored if not recognized.</p> <p>[Example:</p>

Attributes	Description
	<pre>&lt;o:ink ... i="AMgFHQSWC+YFASAAaAwAAAAAAMA..."&gt; &lt;/o:ink&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema base64Binary datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Ink">
3 <sequence/>
4 <attribute name="i" type="xsd:base64Binary"/>
5 <attribute name="annotation" type="ST_TrueFalse"/>
6 </complexType>
```

7 **6.2.2.15 left (Text Box Left Stroke)**

8 This element specifies the stroke properties for the left border of a text box. It entirely supercedes its parent  
9 stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value  
10 specified in the parent. If the on attribute is false or not specified, the border is not shown.

11 *[Example: The text box borders are set independently. Note that the bottom border does not inherit the weight*  
12 *from the parent stroke element.*

```
13 <v:stroke weight="2.25pt">
14 <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
15 <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
16 <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
17 <o:bottom v:ext="view" color="black" on="t"/>
18 <o:column v:ext="view" color="#f60" on="t"/>
19 </v:stroke>
```

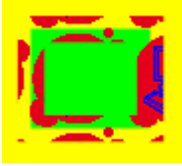

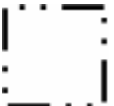

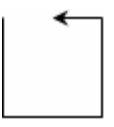

21 *end example]*

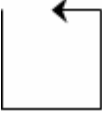

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

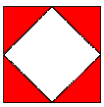

22

Attributes	Description
<b>althref</b> (Alternate Image Reference)	<p>Specifies an alternate reference for an image in Macintosh PICT format.</p> <p><i>[Example:</i></p> <pre>&lt;v:stroke ... althref="myimage.pcz" ... &gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>color</b> (Stroke Color)	<p>Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is black. See the fillcolor attribute for a list of supported named colors.</p> <p><i>[Example:</i> The shape stroke is blue:</p> <pre>&lt;v:shape ... strokecolor="red" ... &gt;   &lt;v:stroke color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
<b>color2</b> (Stroke Alternate Pattern Color)	<p>Specifies a second color for strokes, used when filltype is pattern. Default is no value.</p> <p>When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.</p> <p><i>[Example:</i> This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.</p> <pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="pattern" weight="10pt"     src="myimage.gif" color2="blue"/&gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	  <p>, where myimage.gif is:</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
dashstyle (Stroke Dash Pattern)	<p>Specifies the dot and dash pattern for a stroke. Default is solid. Pre-defined values are:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• shortdash</li> <li>• shortdot</li> <li>• shortdashdot</li> <li>• shortdashdotdot</li> <li>• dot</li> <li>• dash</li> <li>• longdash</li> <li>• dashdot</li> <li>• longdashdot</li> <li>• longdashdotdot</li> </ul> <p>A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).</p> <p><i>[Example:</i></p> <pre>&lt;v:stroke dashstyle="0 2" weight="3pt"   endcap="round"&gt; &lt;/v:stroke&gt;</pre>  <pre>&lt;v:stroke dashstyle="longdashdotdot"   weight="2pt"&gt; &lt;/v:stroke&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
endarrow (Line End Arrowhead)	<p>Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke endarrow="classic"/&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
endarrowlength (Line End Arrowhead Length)	<p>Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowlength="long" ... /&gt;</pre>  <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	<p>Specifies the width of the arrowhead at the end of a line. Default is <code>medium</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>narrow</code></li> <li>• <code>medium</code></li> <li>• <code>wide</code></li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowwidth="wide" ... /&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
endcap (Line End Cap)	<p>Specifies the cap style for the end of a stroke. Default is <code>flat</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>flat</code></li> <li>• <code>square</code></li> <li>• <code>round</code></li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endcap="round" weight="10pt" ... /&gt;</pre>  <p style="margin-left: 200px;"> <i>endcap="flat"</i>  <i>endcap="square"</i>  <i>endcap="round"</i> </p> <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vm	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale</i>: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i>]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
filltype (Stroke Image Style)	<p>Specifies the type of fill used for the background of a stroke. Default is solid. Allowed values are:</p> <ul style="list-style-type: none"> <li>• solid - The fill pattern is solid.</li> <li>• tile - The fill image is tiled.</li> <li>• pattern - The fill image is stretched to form a pattern.</li> <li>• frame - The fill image becomes a border for the shape.</li> </ul> <p>[<i>Example</i>:</p> <pre>&lt;v:shape style="width:50;height:50"   strokecolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="frame" weight="10pt"     src="border.gif"/&gt; &lt;/v:shape&gt;</pre> <div style="display: flex; align-items: center;">  <span style="margin: 0 10px;">, where border.gif is:</span>  </div> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>
forcedash (Force Dashed Outline)	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[<i>Example</i>:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre>

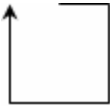

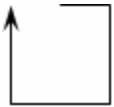

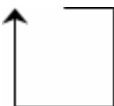

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>href (Original Image Reference)</p>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>imagealignshape (Stoke Image Alignment)</p>	<p>Specifies the alignment of the stroke image. If true, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is true.</p> <p>[Example: The top position offset shifts the image alignment relative to the containing window:</p> <pre>&lt;v:shape fillcolor="silver"   style="top:20;width:50;height:50"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke imagealignshape="false" weight="20pt"     filltype="tile" src="myimage.gif"/&gt; &lt;/v:shape&gt;</pre> <div data-bbox="451 1289 609 1444" data-label="Image"> </div> <p>imagealignshape="false"</p> <div data-bbox="451 1486 609 1642" data-label="Image"> </div> <p>imagealignshape="false"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>imageaspect</p>	<p>Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed</p>

Attributes	Description								
(Stroke Image Aspect Ratio)	<p>values are:</p> <table border="1" data-bbox="418 317 1320 512"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>ignore</td><td>Ignore aspect issues.</td></tr> <tr> <td>atleast</td><td>Image is at least as big as imagesize.</td></tr> <tr> <td>atmost</td><td>Image is no bigger than imagesize.</td></tr> </tbody> </table> <p>[Example:</p> <pre data-bbox="456 621 1109 751">&lt;v:stroke filltype="frame" weight="10pt"   src="border.gif" imagealignshape="true"   imageaspect="atleast"&gt; &lt;/v:stroke&gt;</pre> <div data-bbox="451 789 602 1136">  </div> <p style="margin-left: 350px;">imagealignshape="ignore"</p> <p style="margin-left: 350px;">imagealignshape="atleast"</p> <p style="margin-left: 350px;">imagealignshape="atmost"</p> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</p>	Value	Description	ignore	Ignore aspect issues.	atleast	Image is at least as big as imagesize.	atmost	Image is no bigger than imagesize.
Value	Description								
ignore	Ignore aspect issues.								
atleast	Image is at least as big as imagesize.								
atmost	Image is no bigger than imagesize.								
imagesize (Stroke Image Size)	<p>Specifies the size of the image for the stroke. Default is the size of the image.</p> <p>[Example:</p> <pre data-bbox="456 1482 1127 1514">&lt;v:stroke ... imagesize="10pt,10pt" ... /&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p>								

Attributes	Description
	<pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
joinstyle (Line End Join Style)	<p>Specifies the join style for line ends. Default is round.</p> <ul style="list-style-type: none"> <li>• round</li> <li>• bevel</li> <li>• miter</li> </ul> <p>[Example:</p> <pre>&lt;v:polyline strokeweight="10pt" strokecolor="navy"   points="10pt,10pt,50pt,50pt,90pt,10pt"&gt;   &lt;v:stroke joinstyle="bevel"/&gt; &lt;/v:polyline&gt;</pre> <div style="display: flex; align-items: center; margin-top: 10px;">  <div style="margin-left: 20px;"> <p>joinstyle="round"</p> <p>joinstyle="bevel"</p> <p>joinstyle="miter"</p> </div> </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).</p>
linestyle (Stroke Line Style)	<p>Specifies the line style of the stroke. Default is single.</p> <ul style="list-style-type: none"> <li>• single</li> <li>• thinThin</li> <li>• thinThick</li> <li>• thickThin</li> <li>• thickBetweenThin</li> </ul> <p>[Example:</p>

Attributes	Description
	<pre data-bbox="451 285 1177 348">&lt;v:stroke linestyle="thickThin" weight="5pt"&gt; &lt;/v:stroke&gt;</pre>  <p data-bbox="415 520 574 548"><i>end example]</i></p> <p data-bbox="415 590 1463 653">The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).</p>
<p data-bbox="142 674 354 737">miterlimit (Miter Joint Limit)</p>	<p data-bbox="415 674 1471 768">Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.</p> <p data-bbox="415 821 532 848"><i>[Example:</i></p> <pre data-bbox="451 890 1109 984">&lt;v:stroke jointstyle="miter" weight="10pt"   miterlimit="2"&gt; &lt;/v:stroke&gt;</pre>  <p data-bbox="415 1157 574 1184"><i>end example]</i></p> <p data-bbox="415 1226 1455 1253">The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
<p data-bbox="142 1272 354 1299">on (Stroke Toggle)</p>	<p data-bbox="415 1272 1442 1335">Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute.</p> <p data-bbox="415 1388 532 1415"><i>[Example:</i></p> <pre data-bbox="451 1457 1239 1583">&lt;v:rect style="width:50;height:50" stroked="true"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke on="false" weight="5pt"/&gt; &lt;/v:rect&gt;</pre>  <p data-bbox="415 1766 574 1793"><i>end example]</i></p> <p data-bbox="415 1835 1390 1898">The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description
opacity (Stroke Opacity)	<p>Specifies the amount of transparency of a stroke. Default is 1.0.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke weight="5pt" opacity="50%"/&gt; &lt;/v:rect&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
src (Stroke Image Location)	<p>Specifies the source image to load for a stroke fill. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:stroke ... src="myimage.gif" ... &gt; &lt;/v:stroke&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
startarrow (Line Start Arrowhead)	<p>Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke startarrow="classic"/&gt;</pre>  <p>end example]</p>

Attributes	Description
<p>startarrowlength (Line Start Arrowhead Length)</p>	<p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p> <p>Specifies the length of the arrowhead at the start of a line. Default is <i>medium</i>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <i>short</i></li> <li>• <i>medium</i></li> <li>• <i>long</i></li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowlength="long" ... /&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p>startarrowwidth (Line Start Arrowhead Width)</p>	<p>Specifies the width of the arrowhead at the start of a line. Default is <i>medium</i>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <i>narrow</i></li> <li>• <i>medium</i></li> <li>• <i>wide</i></li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowwidth="wide" ... /&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
<p>title (Stroke Title)</p>	<p>Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:title="alt text" ... &gt;</pre>

Attributes	Description
	<p><code>&lt;/v:fill&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
weight (Stroke Weight)	<p>Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's <code>strokeWeight</code> attribute.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

### 6.2.2.16 LinkType (Embedded Object Alternate Image Request)

This element specifies the type of image which shall be requested from an embedded object's host application when the contents of a linked image are updated within a document. When linked images are stored in documents, the only items stored in the document are an image representation and a link to the source. This element specifies the type of image which shall be requested from the source on update.

[*Note:* The formats available may vary based on the type of embedded object - this information is typically queried from the embedded object's application before it is stored. This setting may be omitted, and is usually stored for performance reasons, so it is not queried on each update of the linked object. *end note*]

The possible values for this element are defined by the ST\_OLELinkType simple type (§6.2.3.17).

Parent Elements
OLEObject (§6.2.2.19)

### 6.2.2.17 lock (Shape Protections)

This element specifies locks against actions that can be effected in the UI of an authoring application or programmatically through an object model.

[*Example:* The following snippet locks the shape's aspect ratio and text from user edits.

```
<v:shape ... >
 <o:lock v:ext="edit" aspectratio="t" text="t"/>
</v:shape>
```

*end example*]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
adjusthandles (Handles Lock)	Specifies whether the handles of a shape are locked from being edited. Default is <i>false</i> .  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
aspectratio (Aspect Ratio Lock)	Specifies whether the aspect ratio of a shape is locked from being edited. Default is <i>false</i> .  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
cropping (Cropping Lock)	Specifies whether cropping of a shape is locked from being edited. Default is <i>false</i> .  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.

Attributes	Description
Namespace: urn:schemas-microsoft-com:vm	<p>[<i>Rationale</i>: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i>]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
grouping (Grouping Lock)	<p>Specifies whether a shape is locked from being grouped. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
position (Position Lock)	<p>Specifies whether the position of a shape is locked from being edited. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
rotation (Rotation Lock)	<p>Specifies whether the rotation of a shape is locked from being edited. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
selection (Selection Lock)	<p>Specifies whether the shape is locked from being selectable in an editor. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
shapetype (AutoShape Type Lock)	<p>Specifies whether the AutoShape type is locked from being edited. Default is <code>false</code>. If <code>true</code>, the type of an AutoShape cannot be changed in a graphical editor.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
text (Text Lock)	<p>Specifies whether the text attached to a shape is locked from being edited. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
ungrouping (Ungrouping Lock)	<p>Specifies whether a grouped shape is locked from being ungrouped. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
vertices (Vertices Lock)	<p>Specifies whether the vertices of a path are locked from being edited. Default is <code>false</code>.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Lock">
 <attributeGroup ref="v:AG_Ext"/>
 <attribute name="position" type="ST_TrueFalse" use="optional"/>
 <attribute name="selection" type="ST_TrueFalse" use="optional"/>
 <attribute name="grouping" type="ST_TrueFalse" use="optional"/>
 <attribute name="ungrouping" type="ST_TrueFalse" use="optional"/>
 <attribute name="rotation" type="ST_TrueFalse" use="optional"/>
 <attribute name="cropping" type="ST_TrueFalse" use="optional"/>
 <attribute name="verticies" type="ST_TrueFalse" use="optional"/>
 <attribute name="adjusthandles" type="ST_TrueFalse" use="optional"/>
 <attribute name="text" type="ST_TrueFalse" use="optional"/>
 <attribute name="aspectratio" type="ST_TrueFalse" use="optional"/>
 <attribute name="shapetype" type="ST_TrueFalse" use="optional"/>
</complexType>
```

**6.2.2.18 LockedField (Embedded Object Cannot Be Refreshed)**

This element specifies that the embedded object's appearance is locked - that is, that the object's current representation shall be locked to prevent any user interaction or automatic application behavior from modifying its contents.

This element shall contain no content - its presence indicates that the embedded object is locked, and its omission allows the field to be updated.

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.2.3.24).

**Parent Elements**

OLEObject (§6.2.2.19)

**6.2.2.19 OLEObject (Embedded OLE Object)**

This element specifies an OLE object.

[Example: The following demonstrates a video file embedded in a WordprocessingML document:

```
<w:object ... >
 <v:shape id="_x0000_i1025" type="#_x0000_t75"
 style="width:1in;height:24pt" o:ole="">
 <v:imagedata r:id="rId4" o:title=""/>
</v:shape>
<o:OLEObject Type="Embed" ProgID="AVIFile" ShapeID="_x0000_i1025"
 DrawAspect="Content" ObjectID="_1219561732" r:id="rId5"/>
</w:object>
```

end example]

**Parent Elements**

background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23);

Parent Elements
shapeDefaults (§2.15.1.79)

1

Child Elements	Subclause
FieldCodes (WordprocessingML Field Switches)	§6.2.2.11
LinkType (Embedded Object Alternate Image Request)	§6.2.2.16
LockedField (Embedded Object Cannot Be Refreshed)	§6.2.2.18

2

Attributes	Description
DrawAspect (OLE Object Representation)	<p>Specifies how the object is represented visually in the application.</p> <p>[Example:</p> <pre>&lt;o:OLEObject ... DrawAspect="Content"&gt; &lt;/o:OLEObject&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_OLEDrawAspect simple type (§6.2.3.16).</p>
id (Relationship)	<p>Specifies the actual OLE object using a standard part relationship lookup.</p> <p>[Example:</p> <pre>&lt;o:OLEObject ... r:id="rId5"&gt; &lt;/o:OLEObject&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
ObjectID (OLE Object Unique ID)	<p>Specifies a unique ID identifying the OLE object.</p> <p>[Example:</p> <pre>&lt;o:OLEObject ... ObjectID="_1219561732"&gt; &lt;/o:OLEObject&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
ProgID (OLE Object	Specifies the OLE server application associated with the OLE object.

Attributes	Description
Application)	<p>[Example:</p> <pre>&lt;o:OLEObject ... ProgID="AVIFile"&gt; &lt;/o:OLEObject&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
ShapeID (OLE Object Shape)	<p>Specifies the shape with which the OLE object is associated. A VML shape provides the visual placeholder for an OLE object and this attribute is set to the id of the placeholder shape.</p> <p>[Example:</p> <pre>&lt;o:OLEObject ... ShapeID="_x0000_i1025"&gt; &lt;/o:OLEObject&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
Type (OLE Object Type)	<p>Specifies the type of the OLE connection.</p> <p>[Example:</p> <pre>&lt;o:OLEObject ... Type="Embed"&gt; &lt;/o:OLEObject&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OLEType simple type (§6.2.3.18).</p>
UpdateMode (OLE Update Mode)	<p>Specifies how the object is updated with new data if the Type is Link - automatically or on-demand by the user.</p> <p>[Example:</p> <pre>&lt;o:OLEObject ... UpdateMode="Always"&gt; &lt;/o:OLEObject&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OLEUpdateMode simple type (§6.2.3.19).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OLEObject">
 <sequence>
 <element name="LinkType" type="ST_OLELinkType" minOccurs="0"/>
 <element name="LockedField" type="ST_TrueFalseBlank" minOccurs="0"/>
 <element name="FieldCodes" type="xsd:string" minOccurs="0"/>
 </sequence>
 <attribute name="Type" type="ST_OLEType" use="optional"/>
 <attribute name="ProgID" type="xsd:string" use="optional"/>
 <attribute name="ShapeID" type="xsd:string" use="optional"/>
 <attribute name="DrawAspect" type="ST_OLEDrawAspect" use="optional"/>
 <attribute name="ObjectID" type="xsd:string" use="optional"/>
 <attribute ref="r:id" use="optional"/>
 <attribute name="UpdateMode" type="ST_OLEUpdateMode" use="optional"/>
</complexType>
```

6.2.2.20 proxy (Shape Reference)

This element specifies an entry in a r element rule that contains a reference to one or more shapes that are participating in the rule.

[Example: The following rule defines a connection between two shapes. The shape with id \_s1036 connects shape \_s1033 to \_s1032:

```
<o:shapelayout v:ext="edit">
 <o:rules v:ext="edit">
 <o:r id="V:Rule1" type="connector" idref="#_s1036">
 <o:proxy start="" idref="#_s1033" connectloc="0"/>
 <o:proxy end="" idref="#_s1032" connectloc="2"/>
 </o:r>
 </o:rules>
</o:shapelayout>
```

end example]

Parent Elements
r (§6.2.2.21)

Attributes	Description
connectloc (Connection Location)	Specifies the location on the shape where the connector is attached. The value is an index into the list of connection points defined in the shape - see the connectlocs attribute. Default is 0. Only used in a connector rule.  The possible values for this attribute are defined by the XML Schema int datatype.
end (End Point Connection Flag)	Specifies whether the connector's end point is connected to the shape. Default is false. Only used in a connector rule.

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
idref (Proxy Shape Reference)	<p>Specifies a reference to a shape in the current document. Default is no value. A shape name is used as the reference mechanism; this is not a relationship ID.</p> <p>This attribute indicates that the referenced shape is part of this rule. Two or more proxy elements are used for an alignment rule. A connector rule uses one or two, indicating which shapes the connector is attached to.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
start (Start Point Connection Flag)	<p>Specifies whether the connector's start point is connected to the shape. Default is false. Only used in a connector rule. If both start and end are specified the later one takes precedence.</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Proxy">
 <attribute name="start" type="ST_TrueFalseBlank" use="optional" default="false"/>
 <attribute name="end" type="ST_TrueFalseBlank" use="optional" default="false"/>
 <attribute name="idref" type="xsd:string" use="optional"/>
 <attribute name="connectloc" type="xsd:int" use="optional"/>
</complexType>

```

### 6.2.2.21 r (Rule)

This element specifies a rule entry in a rules element rule set that describes how a certain shape or set of shapes behaves during editing.

[Example: The following rule defines a connection between two shapes. The shape with id \_s1036 connects shape \_s1033 to \_s1032:

```

<o:shapelayout v:ext="edit">
 <o:rules v:ext="edit">
 <o:r id="V:Rule1" type="connector" idref="#_s1036">
 <o:proxy start="" idref="#_s1033" connectloc="0"/>
 <o:proxy end="" idref="#_s1032" connectloc="2"/>
 </o:r>
 </o:rules>
</o:shapelayout>

```

*end example]*

Parent Elements
rules (§6.2.2.26)

1

Child Elements	Subclause
proxy (Shape Reference)	§6.2.2.20

2

Attributes	Description
how (Alignment Rule Type)	<p>Specifies the type of alignment for an alignment rule. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• middle</li> <li>• bottom</li> <li>• left</li> <li>• center</li> <li>• right</li> </ul> <p>The possible values for this attribute are defined by the ST_How simple type (§6.2.3.13).</p>
id (Rule ID)	<p>Specifies an identifier for the rule. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
idref (Rule Shape Reference)	<p>Specifies a reference to a shape in the current document that is the primary shape in the rule. For example, for a connector rule, the connector.</p> <p>Default is no value. A shape name is used as the reference mechanism; this is not a relationship ID.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
type (Rule Type)	<p>Specifies the type of the rule. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• arc</li> <li>• callout</li> <li>• connector</li> <li>• align</li> </ul> <p>The possible values for this attribute are defined by the ST_RType simple type (§6.2.3.21).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_R">
 <sequence>
 <element name="proxy" type="CT_Proxy" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="id" type="xsd:string" use="required"/>
 <attribute name="type" type="ST_RType" use="optional"/>
 <attribute name="how" type="ST_How" use="optional"/>
 <attribute name="idref" type="xsd:string" use="optional"/>
</complexType>
```

### 6.2.2.22 regroupable (Shape Grouping History)

This element specifies a list of entries which describe how shapes were previously grouped so they can be regrouped. The regroupid attribute of shapes indicates which shapes belong together when a regroup is performed. The regrouptable tracks the previous regroupid that should be assigned to all shapes with the given current regroupid.

*[Example: Consider a document containing two rectangles and a circle. The rectangles are grouped together, then that group is grouped with the circle. This new group is then ungrouped, leaving the circle and grouped rectangles. The document might contain the following snippets:*

```
<v:oval ... o:regroupid="1"/>
<v:group ... o:regroupid="1"/>
 <v:rect ... />
 <v:rect ... />
</v:group>

<o:regrouptable v:ext="edit">
 <o:entry new="1" old="0"/>
</o:regrouptable>
```

The regroupid attribute indicates that the shapes with regroupid 1 were previously grouped together. The entry indicates that if those shapes are regrouped, the new group formed should not have a regroupid value as it was not previously ungrouped.

If the two rectangles are ungrouped, the document reflects that the rectangles were previously grouped and that their old group was previously grouped:

```
<v:oval ... o:regroupid="1"/>
<v:rect ... o:regroupid="2"/>
<v:rect ... o:regroupid="2"/>

<o:regrouptable v:ext="edit">
 <o:entry new="1" old="0"/>
 <o:entry new="2" old="1"/>
</o:regrouptable>
```

1 *end example]*

Child Elements	Subclause
entry (Regroup Entry)	§6.2.2.9

3

Attributes	Description
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.
Namespace: urn:schemas-microsoft-com:vmf	[ <i>Rationale</i> : This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_RegroupTable">
6 <sequence>
7 <element name="entry" type="CT_Entry" minOccurs="0" maxOccurs="unbounded"/>
8 </sequence>
9 <attributeGroup ref="v:AG_Ext"/>
10 </complexType>
```

11 **6.2.2.23 rel (Diagram Relationship)**

12 This element specifies a relationship between two diagram nodes. An optional third node that exists between  
13 the primary two may also be included. The relationship has an implicit order since it describes the source and  
14 destination nodes.

15

16 [*Example*: In the cycle diagram below, shape 1036 (the shape that is the text box for the text "2") is the first  
17 node. A relationship exists between shape 1036 and shape 1044 (the text box containing "1"). In between  
18 those shapes is shape 1038 (the yellow arrow).

```
19 <o:relationtable v:ext="edit">
20 <o:rel v:ext="edit" idsrc="#_s1036" iddest="#_s1036"/>
21 <o:rel v:ext="edit" idsrc="#_s1042" iddest="#_s1036" idcntr="#_s1043"/>
22 <o:rel v:ext="edit" idsrc="#_s1044" iddest="#_s1042" idcntr="#_s1045"/>
23 <o:rel v:ext="edit" idsrc="#_s1036" iddest="#_s1044" idcntr="#_s1038"/>
24 </o:relationtable>
```

```
1
2 <v:rect id="_s1036" ... >
3 <v:textbox ... ><...>2</...></v:textbox>
4 </v:rect>
5
6 <v:rect id="_s1044" ... >
7 <v:textbox ... ><...>1</...></v:textbox>
8 </v:rect>
9
10 <v:shape id="_s1038" ... />
```

12 *end example]*

13

Parent Elements
relationtable (§6.2.2.24)

Attributes	Description
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.  [ <i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
idcntr (Diagram Relationship Center Shape)	Specifies the optional identifier of the shape that exists between the source and destination shapes. This is omitted if the relationship does not have a shape between the source and destination shapes.  [ <i>Example:</i>  <o:rel ... idcntr="#s_1038"> </o:rel>  <i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
iddest (Diagram Relationship)	Specifies the identifier of the shape at the destination of the relationship.

Attributes	Description
Destination Shape)	<p>[Example:</p> <pre>&lt;o:rel ... iddest="#s_1044"&gt; &lt;/o:rel&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
idsrc (Diagram Relationship Source Shape)	<p>Specifies the identifier of the shape at the source of the relationship.</p> <p>[Example:</p> <pre>&lt;o:rel ... idsrc="#s_1036"&gt; &lt;/o:rel&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Relation">
3 <attributeGroup ref="v:AG_Ext"/>
4 <attribute name="idsrc" type="xsd:string" use="optional"/>
5 <attribute name="iddest" type="xsd:string" use="optional"/>
6 <attribute name="idcntr" type="xsd:string" use="optional"/>
7 </complexType>
```

#### 8 6.2.2.24 relationtable (Diagram Relationship Table)

9 This element specifies a list that describes the relationships among diagram nodes.

10 [Example: The following table describes the parent-child relationships for shapes in an organization chart. The  
 11 first entry describes the top-level shape in the diagram. The next two rows describe that the shapes are  
 12 subordinates to the first shape. Shape 1029 is a subordinate of shape 1028. Shape 1032, a connector in this  
 13 case, is in between the two.

```
14 <o:relationtable v:ext="edit">
15 <o:rel v:ext="edit" idsrc="#_s1028" iddest="#_s1028"/>
16 <o:rel v:ext="edit" idsrc="#_s1029" iddest="#_s1028" idcntr="#_s1032"/>
17 <o:rel v:ext="edit" idsrc="#_s1030" iddest="#_s1028" idcntr="#_s1033"/>
18 </o:relationtable>
```

19 end example]

Parent Elements
diagram (§6.2.2.8)

Child Elements	Subclause
rel (Diagram Relationship)	§6.2.2.23

Attributes	Description
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.  [ <i>Rationale</i> : This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelationTable">
 <sequence>
 <element name="rel" type="CT_Relation" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.25 right (Text Box Right Stroke)

This element specifies the stroke properties for the right border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is false or not specified, the border is not shown.

[*Example*: The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
 <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
 <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
 <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
 <o:bottom v:ext="view" color="black" on="t"/>
 <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```

2

Attributes	Description
althref (Alternate Image Reference)	<p>Specifies an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p> <pre>&lt;v:stroke ... althref="myimage.pcz" ... &gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
color (Stroke Color)	<p>Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is black. See the fillcolor attribute for a list of supported named colors.</p> <p>[Example: The shape stroke is blue:</p> <pre>&lt;v:shape ... strokecolor="red" ... &gt;   &lt;v:stroke color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
color2 (Stroke Alternate Pattern Color)	<p>Specifies a second color for strokes, used when filltype is pattern. Default is no value.</p> <p>When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.</p> <p>[Example: This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.</p> <pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"</pre>

Attributes	Description
	<pre> path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt; &lt;v:stroke filltype="pattern" weight="10pt"   src="myimage.gif" color2="blue"/&gt; &lt;/v:shape&gt; </pre>  , where myimage.gif is:   <i>end example]</i>  The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
dashstyle (Stroke Dash Pattern)	<p>Specifies the dot and dash pattern for a stroke. Default is solid. Pre-defined values are:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• shortdash</li> <li>• shortdot</li> <li>• shortdashdot</li> <li>• shortdashdotdot</li> <li>• dot</li> <li>• dash</li> <li>• longdash</li> <li>• dashdot</li> <li>• longdashdot</li> <li>• longdashdotdot</li> </ul> <p>A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).</p> <p>[Example:</p> <pre> &lt;v:stroke dashstyle="0 2" weight="3pt"   endcap="round"&gt; &lt;/v:stroke&gt; </pre> 

Attributes	Description
	<pre>&lt;v:stroke dashstyle="longdashdotdot"   weight="2pt"&gt; &lt;/v:stroke&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>endarrow (Line End Arrowhead)</p>	<p>Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke endarrow="classic"/&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
<p>endarrowlength (Line End Arrowhead Length)</p>	<p>Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowlength="long" ... /&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
endarrowwidth (Line End Arrowhead Width)	<p>Specifies the width of the arrowhead at the end of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endarrowwidth="wide" ... /&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
endcap (Line End Cap)	<p>Specifies the cap style for the end of a stroke. Default is flat. Allowed values are:</p> <ul style="list-style-type: none"> <li>• flat</li> <li>• square</li> <li>• round</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endcap="round" weight="10pt" ... /&gt;</pre>  <p><i>end example]</i></p>

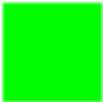

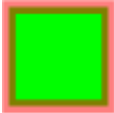

Attributes	Description
	 <p>endcap="round"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).</p>
<p>ext (VML Extension Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:vm1</p>	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale]</i></p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>filltype (Stroke Image Style)</p>	<p>Specifies the type of fill used for the background of a stroke. Default is solid. Allowed values are:</p> <ul style="list-style-type: none"> <li>• solid - The fill pattern is solid.</li> <li>• tile - The fill image is tiled.</li> <li>• pattern - The fill image is stretched to form a pattern.</li> <li>• frame - The fill image becomes a border for the shape.</li> </ul> <p>[<i>Example:</i></p> <pre>&lt;v:shape style="width:50;height:50"   strokecolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="frame" weight="10pt"     src="border.gif"/&gt; &lt;/v:shape&gt;</pre> <div style="display: flex; align-items: center;">  <span style="margin: 0 10px;">, where border.gif is:</span>  </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>
<p>forcedash (Force Dashed Outline)</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p>

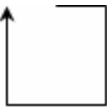

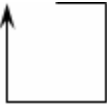

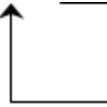

Attributes	Description
	<p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
href (Original Image Reference)	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
imagealignshape (Stoke Image Alignment)	<p>Specifies the alignment of the stroke image. If true, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is true.</p> <p>[Example: The top position offset shifts the image alignment relative to the containing window:</p> <pre>&lt;v:shape fillcolor="silver"   style="top:20;width:50;height:50"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke imagealignshape="false" weight="20pt"     filltype="tile" src="myimage.gif"/&gt; &lt;/v:shape&gt;</pre> <div data-bbox="451 1535 609 1692">  </div> <p>imagealignshape="false"</p> <div data-bbox="451 1730 609 1887">  </div> <p>imagealignshape="false"</p>

Attributes	Description								
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>								
<p>imageaspect (Stroke Image Aspect Ratio)</p>	<p>Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are:</p> <table data-bbox="418 541 1320 737"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>ignore</td><td>Ignore aspect issues.</td></tr> <tr> <td>atleast</td><td>Image is at least as big as imagesize.</td></tr> <tr> <td>atmost</td><td>Image is no bigger than imagesize.</td></tr> </table> <p>[Example:</p> <pre data-bbox="456 846 1110 978">&lt;v:stroke filltype="frame" weight="10pt"   src="border.gif" imagealignshape="true"   imageaspect="atleast"&gt; &lt;/v:stroke&gt;</pre> <div data-bbox="451 1014 604 1360">  </div> <p>imagealignshape="ignore"</p> <p>imagealignshape="atleast"</p> <p>imagealignshape="atmost"</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</p>	Value	Description	ignore	Ignore aspect issues.	atleast	Image is at least as big as imagesize.	atmost	Image is no bigger than imagesize.
Value	Description								
ignore	Ignore aspect issues.								
atleast	Image is at least as big as imagesize.								
atmost	Image is no bigger than imagesize.								
<p>imagesize (Stroke Image Size)</p>	<p>Specifies the size of the image for the stroke. Default is the size of the image.</p> <p>[Example:</p> <pre data-bbox="456 1703 1127 1734">&lt;v:stroke ... imagesize="10pt,10pt" ... /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								

Attributes	Description
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
joinstyle (Line End Join Style))	<p>Specifies the join style for line ends. Default is round.</p> <ul style="list-style-type: none"> <li>• round</li> <li>• bevel</li> <li>• miter</li> </ul> <p>[Example:</p> <pre>&lt;v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"&gt; &lt;v:stroke joinstyle="bevel"/&gt; &lt;/v:polyline&gt;</pre> <div style="display: flex; align-items: center; margin-top: 10px;">  <div style="margin-left: 10px;"> <p>joinstyle="round"</p> <p>joinstyle="bevel"</p> <p>joinstyle="miter"</p> </div> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).</p>
linestyle (Stroke Line Style)	<p>Specifies the line style of the stroke. Default is single.</p> <ul style="list-style-type: none"> <li>• single</li> </ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>• thinThin</li> <li>• thinThick</li> <li>• thickThin</li> <li>• thickBetweenThin</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke linestyle="thickThin" weight="5pt"&gt; &lt;/v:stroke&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).</p>
<b>miterlimit (Miter Joint Limit)</b>	<p>Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.</p> <p>[Example:</p> <pre>&lt;v:stroke joinstyle="miter" weight="10pt"   miterlimit="2"&gt; &lt;/v:stroke&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
<b>on (Stroke Toggle)</b>	<p>Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50" stroked="true"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke on="false" weight="5pt"/&gt; &lt;/v:rect&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
opacity (Stroke Opacity)	<p>Specifies the amount of transparency of a stroke. Default is 1.0.</p> <p>[Example:</p> <pre>&lt;v:rect style="width:50;height:50"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke weight="5pt" opacity="50%"/&gt; &lt;/v:rect&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
src (Stroke Image Location)	<p>Specifies the source image to load for a stroke fill. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:stroke ... src="myimage.gif" ... &gt; &lt;/v:stroke&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
startarrow (Line Start Arrowhead)	<p>Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p>

Attributes	Description
	<p><code>&lt;v:stroke startarrow="classic"/&gt;</code></p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
<p>startarrowlength (Line Start Arrowhead Length)</p>	<p>Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <p><code>&lt;v:stroke ... startarrowlength="long" ... /&gt;</code></p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p>startarrowwidth (Line Start Arrowhead Width)</p>	<p>Specifies the width of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <p><code>&lt;v:stroke ... startarrowwidth="wide" ... /&gt;</code></p>  <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title)	<p>Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank.</p> <p><i>[Example:</i></p> <pre>&lt;v:fill ... o:title="alt text" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
weight (Stroke Weight)	<p>Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_StrokeChild">
3 <attributeGroup ref="v:AG_Ext"/>
4 <attribute name="on" type="ST_TrueFalse" use="optional"/>

28 <attribute ref="title"/>
29 <attribute ref="forcedash"/>
30 </complexType>
```

1    6.2.2.26        rules (Rule Set)

2    This element specifies a list of rule entries which describe how a certain shape or sets of shapes should behave  
3    during editing.

4    [*Example:* The following rule defines a connection between two shapes. The shape with id \_s1036 connects  
5    shape \_s1033 to \_s1032:

```
6 <o:shapelayout v:ext="edit">
7 <o:rules v:ext="edit">
8 <o:r id="V:Rule1" type="connector" idref="#_s1036">
9 <o:proxy start="" idref="#_s1033" connectloc="0"/>
10 <o:proxy end="" idref="#_s1032" connectloc="2"/>
11 </o:r>
12 </o:rules>
13 </o:shapelayout>
```

14    *end example]*

15

Parent Elements
shapelayout (§6.2.2.28)

16

Child Elements	Subclause
r (Rule)	§6.2.2.21

Attributes	Description
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.  [ <i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

17    The following XML Schema fragment defines the contents of this element:

```
18 <complexType name="CT_Rules">
19 <sequence>
20 <element name="r" type="CT_R" minOccurs="0" maxOccurs="unbounded"/>
21 </sequence>
22 <attributeGroup ref="v:AG_Ext"/>
23 </complexType>
```

### 6.2.2.27 `shapedefaults` (New Shape Defaults)

This element specifies the defaults that are used when creating new shapes. These defaults are stored once per document.

[*Example:* Consider a case in which an application chooses to store the highest shape ID it has used in the document thus far. This could be used to support the generation of new shape IDs:

```
<o:shapedefaults v:ext="edit" spidmax="1029"/>
```

*end example]*

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

Child Elements	Subclause
callout (Callout)	§6.2.2.2
colormenu (UI Default Colors)	§6.2.2.4
colormru (Most Recently Used Colors)	§6.2.2.5
extrusion (3D Extrusion)	§6.2.2.10
fill (Shape Fill Properties)	§6.1.2.5
lock (Shape Protections)	§6.2.2.17
shadow (Shadow Effect)	§6.1.2.18
skew (Skew Transform)	§6.2.2.30
stroke (Line Stroke Settings)	§6.1.2.21
textbox (Text Box)	§6.1.2.22

Attributes	Description
allowincell (Allow in Table Cell)	Specifies whether the shape is allowed to be placed in a table cell. Default is <code>false</code> .  The possible values for this attribute are defined by the <code>ST_TrueFalse</code> simple type (§6.2.3.23).
ext (VML Extension Handling Behavior)  Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.  [ <i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i> ]  The possible values for this attribute are defined by the <code>ST_Ext</code> simple type (§6.1.3.3).

Attributes	Description
<b>fill (Shape Fill Toggle)</b>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... fill="f" fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>fillcolor (Default Fill Color)</b>	<p>Specifies the default shape fill color. Default is no value. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
<b>spidmax (Shape ID Optional Storage)</b>	<p>Specifies an optional value that allows applications a mechanism for storing information they need to persist related to shape IDs. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>stroke (Shape Stroke Toggle)</b>	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red" stroke="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description						
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>						
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1140 1479 1860"> <thead> <tr> <th data-bbox="415 1140 664 1186">Property</th><th data-bbox="664 1140 1479 1186">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1186 664 1455">flip</td><td data-bbox="664 1186 1479 1455"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1455 664 1860">height</td><td data-bbox="664 1455 1479 1860"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
Property	Description						
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>						
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>						

Attributes	Description	
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>margin</li> <li>page</li> <li>text</li> <li>line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-edited	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.</p>
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>square - Wraps text inside the shape in a square.</li> <li>none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <b>static</b> - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• <b>absolute</b> - The element is positioned relative to the parent, using the top and left properties.</li> <li>• <b>relative</b> - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <b>&lt;percentage&gt;</b>- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only <b>inherit</b> and <b>hidden</b> are used; any other values are mapped to <b>inherit</b>. Default is <b>inherit</b>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• <b>inherit</b> - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"><li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li></ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"><li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li><li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li></ul>
	The following properties are only used by the textbox element (§6.1.2.22):	
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"><li>• ltr - Test is displayed left-to-right.</li><li>• rtl - Test is displayed right-to-left.</li></ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"><li>• horizontal - Text is displayed horizontally.</li><li>• vertical - Text is displayed vertically.</li><li>• vertical-ideographic - Ideographic text is displayed vertically.</li><li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li></ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-to-text	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>
	mso-fit-text-to-shape	<p>Specifies whether the text stretches to fit the textbox. Default is false.</p>
mso-layout-flow-alt	<p>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value</p>	

Attributes	Description											
		is bottom-to-top.										
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.										
	mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: <ul style="list-style-type: none"><li>0</li><li>90</li><li>180</li><li>-90</li></ul>										
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.										
	v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: <ul style="list-style-type: none"><li>top</li><li>middle</li><li>bottom</li><li>top-center</li><li>middle-center</li><li>bottom-center</li><li>top-baseline</li><li>bottom-baseline</li><li>top-center-baseline</li><li>bottom-center-baseline</li></ul>										
The following properties are only used by the textpath element (§6.1.2.23):												
<table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr><tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr><tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr><tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property.</td></tr></table>			Property	Description	font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.	font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property.
Property	Description											
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.											
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.											
font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.											
font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property.											

Attributes	Description								
		Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>							
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>							
	font-weight	Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:							
		<table><tr><th>Value</th><th>Description</th></tr><tr><td>normal lighter 100 200 300 400</td><td>Treated as non-bold.</td></tr><tr><td>bold bolder 500 600 700 800 900</td><td>Treated as bold.</td></tr></table>		Value	Description	normal lighter 100 200 300 400	Treated as non-bold.	bold bolder 500 600 700 800 900	Treated as bold.
		Value	Description						
		normal lighter 100 200 300 400	Treated as non-bold.						
	bold bolder 500 600 700 800 900	Treated as bold.							
	mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.							
text-decoration	Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: <ul style="list-style-type: none"><li>none</li><li>underline</li><li>overline</li><li>line-through</li><li>blink</li></ul>								
v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.								
v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the								

Attributes	Description	
		height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode	<p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.
<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> <li>• height</li> <li>• left</li> <li>• margin-left</li> <li>• margin-top</li> <li>• position</li> <li>• rotation</li> <li>• top</li> </ul>		

Attributes	Description
	<ul style="list-style-type: none"><li>• visibility</li><li>• width</li><li>• z-index</li></ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Child Elements	Subclause
idmap (Shape ID Map)	§6.2.2.13
regrouptable (Shape Grouping History)	§6.2.2.22
rules (Rule Set)	§6.2.2.26

27

Attributes	Description
------------	-------------

Attributes	Description
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.
Namespace: urn:schemas-microsoft-com:vml	<i>[Rationale: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. end rationale]</i>  The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeLayout">
 <all>
 <element name="idmap" type="CT_IdMap" minOccurs="0"/>
 <element name="regrouptable" type="CT_RegroupTable" minOccurs="0"/>
 <element name="rules" type="CT_Rules" minOccurs="0"/>
 </all>
 <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.29 signatureline (Digital Signature Line)

This element specifies a signature line in a document. A signature line provides a visual representation of a signature in a document that is digitally signed. The signature line element indicates that the VML shape in which it appears acts as that visual representation. Typically, the VML shape is an image.

[Example:

```
<v:shape ... >
 <v:imagedata ... />
 <o:signatureline v:ext="edit" id="{11979195-DE54-414B-ABD6-5F63607C648B}"
 provid="{00000000-0000-0000-0000-000000000000}" o:suggestedsigner="John Doe"
 o:suggestedsigner2="Manager" o:suggestedsigneremail=johndoe@example.com
 allowcomments="t" issignatureline="t"/>
</v:shape>
```

The signature line in the document might look like this:

end example]

Attributes	Description
addlxml (Additional Signature Information)	<p>Specifies an optional string that is used to store additional information about the digital signature. Default is no value. [<i>Rationale</i>: Some digital signature software stores, for example, server and region information with the signature. <i>end rationale</i>]</p> <p>[Example:</p> <pre>&lt;o:signatureline ... o:addlxml="..."&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
allowcomments (User-specified Comments Flag)	<p>Specifies whether the user can attach comments to the signature line at signing time. Default is false.</p> <p>[Example:</p> <pre>&lt;o:signatureline ... allowcomments="true"&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
ext (VML Extension Handling Behavior)	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>Namespace: urn:schemas-microsoft-com:vml</p> <p>[<i>Rationale</i>: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i>]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
id (Unique ID)	<p>Specifies a unique ID for the signature line. Default is no value.</p> <p>[Example:</p> <pre>&lt;o:signatureline ... id="{11979195-DE54-414B-ABD6-5F63607C648B}"&gt;</pre>

Attributes	Description
	<p><code>&lt;/o:signatureline&gt;</code></p> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§6.2.3.12).</p>
<b>issignatureline</b> (Signature Line Flag)	<p>Specifies whether the image is a signature line. Default is true.</p> <p>[Example:</p> <pre> &lt;o:signatureline ... issignatureline="true"&gt; &lt;/o:signatureline&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>provid</b> (Signature Provider ID)	<p>Specifies a unique ID identifying which signature provider created the signature line. Default is no value. [<i>Guidance</i> The GUID is typically the CLSID of the provider COM add-in. <i>end guidance</i>]</p> <p>[Example:</p> <pre> &lt;o:signatureline ...   provid="{00000000-0000-0000-0000-000000000000}"&gt; &lt;/o:signatureline&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§6.2.3.12).</p>
<b>showsigndate</b> (Show Signed Date Flag)	<p>Specifies whether the signed signature line image generated should include the date of signing. Default is true.</p> <p>[Example:</p> <pre> &lt;o:signatureline ... showsigndate="false"&gt; &lt;/o:signatureline&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>signinginstructions</b> (Instructions for Signing)	<p>Specifies text shown to the user at signing time. Default is no value.</p> <p>[Example:</p>

Attributes	Description
	<pre>&lt;o:signatureline ... o:signinginstructions="Sign here"&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
signinginstructions set (Use Signing Instructions Flag)	<p>Specifies whether there is data set in the signinginstructions attribute. Default is false.</p> <p>[Example:</p> <pre>&lt;o:signatureline ... signinginstructionsset="true"&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
sigprovurl (Signature Provider Download URL)	<p>Specifies the URL for downloading the signature provider. Default is no value.</p> <p>[Example:</p> <pre>&lt;o:signatureline ... o:sigprovurl="http://www.example.com"&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
suggestedsigner (Suggested Signer Line 1)	<p>Specifies the first line of information of who should sign the signature line. Default is no value.</p> <p>[Example:</p> <pre>&lt;o:signatureline ... o:suggestedsigner="John Doe"&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
suggestedsigner2 (Suggested Signer Line 2)	<p>Specifies the second line of information of who should sign the signature line. Default is no value.</p> <p>[Example:</p> <pre>&lt;o:signatureline ... o:suggestedsigner2="Title"&gt; &lt;/o:signatureline&gt;</pre>

Attributes	Description
	<p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
suggestedsigneremail (Suggested Signer E-mail Address)	<p>Specifies the e-mail address of who should sign the signature line. Default is no value.</p> <p>[Example:</p> <pre>&lt;o:signatureline ...   o:suggestedsigneremail="johndoe@example.com"&gt; &lt;/o:signatureline&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SignatureLine">
 <attributeGroup ref="v:AG_Ext"/>

 <attribute name="addxml" type="xsd:string"/>
 <attribute name="sigprovurl" type="xsd:string"/>
</complexType>
```

### 6.2.2.30 skew (Skew Transform)

This element specifies a perspective skew effect on a shape. The skew is applied to vector graphics, not image data on the shape in picture fills or image elements. The on attribute must be true and a valid value assigned to the matrix attribute.

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
<p>ext (VML Extension Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:VML</p>	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale</i>: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale</i>]</p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>id (Skew ID)</p>	<p>Specifies a name that provides a unique identifier for a skew. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>matrix (Skew Perspective Matrix)</p>	<p>Specifies a perspective transform of a skew. Default is "1,0,0,1,0,0".</p> <p>The matrix is given in the form "<math>s_{xx}</math>, <math>s_{xy}</math>, <math>s_{yx}</math>, <math>s_{yy}</math>, <math>p_x</math>, <math>p_y</math>" where <math>s</math> = scale and <math>p</math> = perspective. If the offset attribute is in absolute units then <math>p_x</math>, <math>p_y</math> are in 1/EMU units; otherwise they are an inverse fraction of the shape size.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>offset (Skew Offset)</p>	<p>Specifies the amount of x,y offset from the shape's location. Default is "2pt,2pt". Positive values are measured from the upper left of the face of the shape.</p> <p>Values are specified as either an absolute measurement or a fractional value of the shape's dimensions (−0.5 to +0.5).</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>on (Skew Toggle)</p>	<p>Specifies whether a skew is displayed. Default is false.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>origin (Skew Origin)</p>	<p>Specifies the origin of the skew. Default is "0,0".</p> <p>Values are typically a percentage of the shape's size and range from -0.5 to +0.5. Larger values are allowed that give offsets as multiples of the shape's size.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Skew">
3 <attributeGroup ref="v:AG_Ext"/>
4 <attribute name="id" type="xsd:string" use="optional"/>
5 <attribute name="on" type="ST_TrueFalse" use="optional"/>
6 <attribute name="offset" type="xsd:string" use="optional"/>
7 <attribute name="origin" type="xsd:string" use="optional"/>
8 <attribute name="matrix" type="xsd:string" use="optional"/>
9 </complexType>
```

6.2.2.31 top (Text Box Top Stroke)

This element specifies the stroke properties for the top border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is false or not specified, the border is not shown.

[Example: The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
 <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
 <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
 <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
 <o:bottom v:ext="view" color="black" on="t"/>
 <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```

end example]

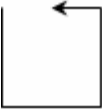

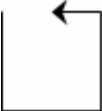

Parent Elements

background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
alhref (Alternate Image Reference)	<p>Specifies an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p> <pre>&lt;v:stroke ... alhref="myimage.pcz" ... &gt; &lt;/v:stroke&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
color (Stroke Color)	<p>Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is black. See the fillcolor attribute for a list of supported named colors.</p> <p>[Example: The shape stroke is blue:</p>

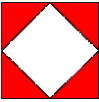

Attributes	Description
	<pre>&lt;v:shape ... strokecolor="red" ... &gt;   &lt;v:stroke color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
<p>color2 (Stroke Alternate Pattern Color)</p>	<p>Specifies a second color for strokes, used when filltype is pattern. Default is no value.</p> <p>When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.</p> <p>[<i>Example:</i> This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.</p> <pre>&lt;v:background fillcolor="yellow"/&gt; &lt;v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="pattern" weight="10pt"     src="myimage.gif" color2="blue"/&gt; &lt;/v:shape&gt;</pre> <div data-bbox="414 1241 594 1402" data-label="Image"> </div> <p>, where myimage.gif is: </p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</p>
<p>dashstyle (Stroke Dash Pattern)</p>	<p>Specifies the dot and dash pattern for a stroke. Default is solid. Pre-defined values are:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• shortdash</li> <li>• shortdot</li> <li>• shortdashdot</li> <li>• shortdashdotdot</li> <li>• dot</li> </ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>• dash</li> <li>• longdash</li> <li>• dashdot</li> <li>• longdashdot</li> <li>• longdashdotdot</li> </ul> <p>A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).</p> <p>[Example:</p> <pre>&lt;v:stroke dashstyle="0 2" weight="3pt"   endcap="round"&gt; &lt;/v:stroke&gt;</pre>  <pre>&lt;v:stroke dashstyle="longdashdotdot"   weight="2pt"&gt; &lt;/v:stroke&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
endarrow (Line End Arrowhead)	<p>Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p>

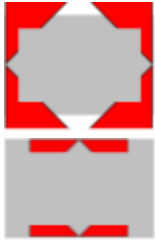

Attributes	Description

Allowed values are:</p> <ul data-bbox="464 1444 602 1539" style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p data-bbox="415 1581 537 1610">[Example:</p> <p data-bbox="456 1652 1110 1682">&lt;v:stroke ... endarrowwidth="wide" ... /&gt;</p> 

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
<p>endcap (Line End Cap)</p>	<p>Specifies the cap style for the end of a stroke. Default is flat. Allowed values are:</p> <ul style="list-style-type: none"> <li>• flat</li> <li>• square</li> <li>• round</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... endcap="round" weight="10pt" ... /&gt;</pre> <div style="display: flex; align-items: center; margin-top: 10px;">  <div style="margin-left: 10px;"> <p>endcap="flat"</p> <p>endcap="square"</p> <p>endcap="round"</p> </div> </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).</p>
<p>ext (VML Extension Handling Behavior)</p> <p>Namespace: urn:schemas-microsoft-com:vm1</p>	<p>Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.</p> <p>[<i>Rationale:</i> This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. <i>end rationale]</i></p> <p>The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).</p>
<p>filltype (Stroke Image Style)</p>	<p>Specifies the type of fill used for the background of a stroke. Default is solid. Allowed values are:</p> <ul style="list-style-type: none"> <li>• solid - The fill pattern is solid.</li> <li>• tile - The fill image is tiled.</li> <li>• pattern - The fill image is stretched to form a pattern.</li> <li>• frame - The fill image becomes a border for the shape.</li> </ul>

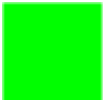

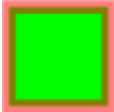

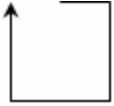

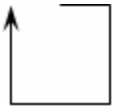

Attributes	Description
	<p>[Example:</p> <pre> &lt;v:shape style="width:50;height:50"   strokecolor="red"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke filltype="frame" weight="10pt"     src="border.gif"/&gt; &lt;/v:shape&gt; </pre>  <p>, where border.gif is: </p> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>
<p>forcedash (Force Dashed Outline)</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre> &lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>href (Original Image Reference)</p>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre> &lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>imagealignshape</p>	<p>Specifies the alignment of the stroke image. If true, the image is aligned with the shape.</p>

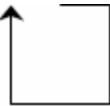

Attributes	Description								
(Stoke Image Alignment)	<p>Otherwise, it is aligned with the containing scope. Default is true.</p> <p>[Example: The top position offset shifts the image alignment relative to the containing window:</p> <pre>&lt;v:shape fillcolor="silver"   style="top:20;width:50;height:50"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e"&gt;   &lt;v:stroke imagealignshape="false" weight="20pt"     filltype="tile" src="myimage.gif"/&gt; &lt;/v:shape&gt;</pre>  <p>imagealignshape="false"</p>  <p>imagealignshape="false"</p> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>								
imageaspect (Stroke Image Aspect Ratio)	<p>Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are:</p> <table border="1" data-bbox="415 1318 1320 1514"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>ignore</td><td>Ignore aspect issues.</td></tr> <tr> <td>atleast</td><td>Image is at least as big as imagesize.</td></tr> <tr> <td>atmost</td><td>Image is no bigger than imagesize.</td></tr> </tbody> </table> <p>[Example:</p> <pre>&lt;v:stroke filltype="frame" weight="10pt"   src="border.gif" imagealignshape="true"   imageaspect="atleast"&gt; &lt;/v:stroke&gt;</pre>  <p>imagealignshape="ignore"</p>	Value	Description	ignore	Ignore aspect issues.	atleast	Image is at least as big as imagesize.	atmost	Image is no bigger than imagesize.
Value	Description								
ignore	Ignore aspect issues.								
atleast	Image is at least as big as imagesize.								
atmost	Image is no bigger than imagesize.								

Attributes	Description
	 <p><code>imagealignshape="atleast"</code></p> <p><code>imagealignshape="atmost"</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</p>
<b>imagesize (Stroke Image Size)</b>	<p>Specifies the size of the image for the stroke. Default is the size of the image.</p> <p>[Example:</p> <pre>&lt;v:stroke ... imagesize="10pt,10pt" ... /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>insetpen (Inset Border From Path)</b>	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>joinstyle (Line End Join Style))</b>	<p>Specifies the join style for line ends. Default is round.</p> <ul style="list-style-type: none"> <li>• round</li> <li>• bevel</li> <li>• miter</li> </ul> <p>[Example:</p> <pre>&lt;v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"&gt; &lt;v:stroke joinstyle="bevel"/&gt;</pre>

Attributes	Description
	<p data-bbox="456 247 662 279">&lt;/v:polyline&gt;</p>  <p data-bbox="703 422 971 453">joinstyle="round"</p> <p data-bbox="703 554 971 585">joinstyle="bevel"</p> <p data-bbox="703 695 971 726">joinstyle="miter"</p> <p data-bbox="415 768 574 800"><i>end example]</i></p> <p data-bbox="415 842 1458 905">The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).</p>
linestyle (Stroke Line Style)	<p data-bbox="415 926 1068 957">Specifies the line style of the stroke. Default is single.</p> <ul data-bbox="461 999 743 1157" style="list-style-type: none"> <li>• single</li> <li>• thinThin</li> <li>• thinThick</li> <li>• thickThin</li> <li>• thickBetweenThin</li> </ul> <p data-bbox="415 1199 532 1230"><i>[Example:</i></p> <pre data-bbox="456 1266 1174 1329">&lt;v:stroke linestyle="thickThin" weight="5pt"&gt; &lt;/v:stroke&gt;</pre>  <p data-bbox="415 1503 574 1535"><i>end example]</i></p> <p data-bbox="415 1577 1458 1640">The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).</p>
miterlimit (Miter Joint Limit)	<p data-bbox="415 1661 1471 1755">Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.</p> <p data-bbox="415 1797 532 1829"><i>[Example:</i></p> <pre data-bbox="456 1871 1109 1902">&lt;v:stroke joinstyle="miter" weight="10pt"</pre>

Attributes	Description
	<pre>       miterlimit="2"&gt;     &lt;/v:stroke&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
on (Stroke Toggle)	<p>Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute.</p> <p>[Example:</p> <pre> &lt;v:rect style="width:50;height:50" stroked="true"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke on="false" weight="5pt"/&gt; &lt;/v:rect&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
opacity (Stroke Opacity)	<p>Specifies the amount of transparency of a stroke. Default is 1.0.</p> <p>[Example:</p> <pre> &lt;v:rect style="width:50;height:50"   fillcolor="lime" strokecolor="red"&gt;   &lt;v:stroke weight="5pt" opacity="50%"/&gt; &lt;/v:rect&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
src (Stroke Image Location)	<p>Specifies the source image to load for a stroke fill. Default is no value.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:stroke ... src="myimage.gif" ... &gt; &lt;/v:stroke&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>startarrow (Line Start Arrowhead)</p>	<p>Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• block</li> <li>• classic</li> <li>• diamond</li> <li>• oval</li> <li>• open</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke startarrow="classic"/&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).</p>
<p>startarrowlength (Line Start Arrowhead Length)</p>	<p>Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• short</li> <li>• medium</li> <li>• long</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowlength="long" ... /&gt;</pre>  <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).</p>
<p>startarrowwidth (Line Start Arrowhead Width)</p>	<p>Specifies the width of the arrowhead at the start of a line. Default is medium. Allowed values are:</p> <ul style="list-style-type: none"> <li>• narrow</li> <li>• medium</li> <li>• wide</li> </ul> <p>[Example:</p> <pre>&lt;v:stroke ... startarrowwidth="wide" ... /&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).</p>
<p>title (Stroke Title)</p>	<p>Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:title="alt text" ... &gt; &lt;/v:fill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>weight (Stroke Weight)</p>	<p>Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

### 6.2.3 Simple Types

This is the complete list of simple types in the urn:schemas-microsoft-com:office:office namespace.

#### 6.2.3.1 ST\_Angle (Callout Angles)

This simple type specifies values for the angle attribute of the callout element (§6.2.2.2).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
30 (30 degrees)	30 degrees.
45 (45 degrees)	45 degrees.
60 (60 degrees)	60 degrees.
90 (90 degrees)	90 degrees.
any (Any Angle)	Unconstrained angle.

Enumeration Value	Description
auto (Automatic Angle)	The application chooses an appropriate angle.

1

Referenced By
callout@angle (§6.2.2.2)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Angle">
4 <restriction base="xsd:string">
5 <enumeration value="any"/>
6 <enumeration value="30"/>
7 <enumeration value="45"/>
8 <enumeration value="60"/>
9 <enumeration value="90"/>
10 <enumeration value="auto"/>
11 </restriction>
12 </simpleType>

```

### 13 6.2.3.2 ST\_BWMode (Black And White Modes)

14 This simple type specifies the ways in which a shape renders in a black and white context.

15 This simple type's contents are a restriction of the XML Schema string datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic)	Use the bwpure or bwnormal attributes based on the type of output being generated.
black (Black)	Use black only.
blackTextAndLines (Black Text And Lines)	Use shades of gray, except for text and lines, which are black.
color (Color)	Do not use grayscale or black and white.
grayOutline (Gray Outlines)	Use gray and white only.
grayScale (Grayscale)	Use shades of gray only.
hide (Hide Object When Displayed in Black and White)	Do not display the object when rendering in only black and white.
highContrast (Black And White)	Use black and white only, no grays.
inverseGray (Inverse Grayscale)	Use shades of gray only, but invert light and dark grays.
lightGrayscale (Light grayscale)	Use light shades of gray only.
undrawn (Do Not Show)	Do not show the object.

Enumeration Value	Description
white (White)	Use white only.

```

19 **6.2.3.3 ST\_CalloutDrop (Callout Drop Location)**

20 This simple type specifies location values for the drop attribute of the callout element (§6.2.2.2).

21 This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
callout@drop (§6.2.2.2)

22 The following XML Schema fragment defines the contents of this simple type:

23  
24  
25

```
<simpleType name="ST_CalloutDrop">
 <restriction base="xsd:string"/>
</simpleType>
```

#### 6.2.3.4 ST\_ColorMode (Extrusion Color Types)

This simple type specifies ways that the extrusion color is defined.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Use Shape Fill Color)	Specifies that the color of the extrusion is the same as the fill color of the shape.
custom (Use Custom Color)	Specifies that the extrusion is the color of the color attribute.

#### Referenced By

extrusion@colormode (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ColorMode">
 <restriction base="xsd:string">
 <enumeration value="auto"/>
 <enumeration value="custom"/>
 </restriction>
</simpleType>
```

#### 6.2.3.5 ST\_ColorType (Color Type)

This simple type specifies a color. Colors are specified in one of three ways - named color, hexadecimal RGB or color palette entry. One of two optional descriptors may follow the color and a space: a number in square brackets or a recoloring instruction. [*Rationale*: An application might store the color's index in a system color palette using the numeric storage. An application might choose to make one color dependent on another using a recoloring instruction. *end rationale*] In cases where it is appropriate for an application to indicate that no color exists, the value none may be used.

A named color is specified using the name of the color. The following named colors are supported:

- Black (#000000) 
- Silver (#C0C0C0) 
- Gray (#808080) 
- White (#FFFFFF) 
- Maroon (#800000) 
- Red (#FF0000) 
- Purple (#800080) 
- Fuchsia (#FF00FF) 
- Green (#008000) 
- Lime (#00FF00) 

- 1       • Olive (#808000) 
- 2       • Yellow (FFFF00) 
- 3       • Navy (#000080) 
- 4       • Blue (#0000FF) 
- 5       • Teal (#008080) 
- 6       • Aqua (#00FFFF) 

7    [Example:

8       <... color="red" ... >

9    end example]

10   Hexadecimal RGB is specified using a hash symbol (#) followed by six hexadecimal characters, where each pair  
11   represents the red, green and blue component of the color.

12   [Example:

13       <... color="#5f2726" ... >

14   end example]

15   Hexadecimal RGB is also optionally be specified using a hash symbol followed by three hexadecimal characters,  
16   where each character stands in for two characters in each of the red, green and blue components. For clarity,  
17   applications should use the full six character representation rather than this short form.

18   [Example: The following two representations are equivalent:

19       <... color="ff4400" ... >

20       <... color="f40" ... >

21   end example]

22   A color palette entry is specified using the name of the color in the palette.

23   [Example: This example also demonstrates the optional numeric storage:

24       <... color="buttonFace [67]" ... >

25   end example]

26   Recoloring instructions indicate that the given color is to be modified a particular amount. The instruction  
27   consists of a named instruction followed by the amount, a number in the range 0-255, in parenthesis. There are  
28   no required implementations for these recoloring instructions - applications are free to implement their own  
29   versions of each. A particular implementation should achieve the result implied by the instruction name. The  
30   instructions are:

- 31       • darken

- lighten
- add
- subtract
- reverseSubtract
- blackWhite
- invert
- invert128
- grayScale

[Example: The color is darker than the fill color by 50 units:

```
<... color="fill darken(50)">
```

end example]

This simple type's contents are a restriction of the XML Schema string datatype.

#### Referenced By

bottom@color (§6.2.2.1); bottom@color2 (§6.2.2.1); colormenu@extrusioncolor (§6.2.2.4); colormenu@fillcolor (§6.2.2.4); colormenu@shadowcolor (§6.2.2.4); colormenu@strokecolor (§6.2.2.4); column@color (§6.2.2.6); column@color2 (§6.2.2.6); extrusion@color (§6.2.2.10); left@color (§6.2.2.15); left@color2 (§6.2.2.15); right@color (§6.2.2.25); right@color2 (§6.2.2.25); shapedefaults@fillcolor (§6.2.2.27); shapedefaults@strokecolor (§6.2.2.27); top@color (§6.2.2.31); top@color2 (§6.2.2.31)

```
<simpleType name="ST_ColorType">
 <restriction base="xsd:string"/>
</simpleType>
```

#### 6.2.3.6 ST\_ConnectorType (Connector Type)

This simple type specifies types of connectors.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
curved (Curved Connector)	A curved connector.
elbow (Elbow Connector)	An elbow-shaped connector.
none (No Connector)	No connector.
straight (Straight Connector)	A straight connector.

#### Referenced By

arc@connectortype (§6.1.2.1); curve@connectortype (§6.1.2.3); image@connectortype (§6.1.2.10);

**Referenced By**

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectType">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="straight"/>
 <enumeration value="elbow"/>
 <enumeration value="curved"/>
 </restriction>
</simpleType>
```

### 6.2.3.7 ST\_ConnectType (Connection Locations Type)

This simple type specifies types of connection locations.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
custom (Custom Connections)	A custom array of connection locations.
none (No)	No connection locations.
rect (Four Connections)	Standard four connection points at midpoints of top, bottom, left, and right sides.
segments (Edit Point Connections)	The edit points of the shape are used. Edit points are the black dots in a graphical editor that are used to select parts of a shape.

**Referenced By**

path@connecttype (§6.1.2.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectType">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="rect"/>
 <enumeration value="segments"/>
 <enumeration value="custom"/>
 </restriction>
</simpleType>
```

### 6.2.3.8 ST\_ExtrusionPlane (Extrusion Planes)

This simple type specifies three axis-aligned planes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
XY (XY Plane)	The xy plane.
YZ (YZ Plane)	The yz plane.
ZX (ZX Plane)	The zx plane.

#### Referenced By

extrusion@plane (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExtrusionPlane">
 <restriction base="xsd:string">
 <enumeration value="XY"/>
 <enumeration value="ZX"/>
 <enumeration value="YZ"/>
 </restriction>
</simpleType>
```

### 6.2.3.9 ST\_ExtrusionRender (Extrusion Rendering Types)

This simple type specifies different rendering modes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
boundingCube (Bounding Cube)	Rendering displays the bounding cube that contains the shape.
solid (Solid)	Rendering displays a solid shape.
wireFrame (Wireframe)	Rendering displays a wireframe shape.

#### Referenced By

extrusion@render (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExtrusionRender">
 <restriction base="xsd:string">
 <enumeration value="solid"/>
 <enumeration value="wireFrame"/>
 <enumeration value="boundingCube"/>
 </restriction>
</simpleType>
```

### 6.2.3.10 ST\_ExtrusionType (Extrusion Type)

This simple type specifies types of extrusions.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
parallel (Parallel Projection)	Extrusion is rendered so that the center of projection is infinitely far away; the extrusion lines do not converge.
perspective (Perspective Projection)	Extrusion is rendered to a center of projection, which is the same as the vanishing point for unrotated objects.

#### Referenced By

extrusion@type (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExtrusionType">
 <restriction base="xsd:string">
 <enumeration value="perspective"/>
 <enumeration value="parallel"/>
 </restriction>
</simpleType>
```

### 6.2.3.11 ST\_FillType (Shape Fill Type)

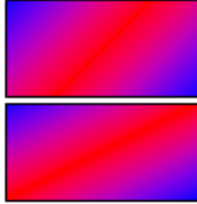

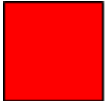

This simple type specifies the types for fills applied to a shape.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
background (Use Background Fill)	Use the fill properties of the background of the object on which the shape exists, such as the page.

Enumeration Value	Description
frame (Stretch Image to Fit)	<p>The image is stretched to fill the shape.</p> 
gradient (Linear Gradient)	<p>The fill colors blend together in a linear gradient from bottom to top.</p> 
gradientCenter (Centered Radial Gradient)	<p>This indicates that the gradient runs across the center of the shape for a gradient that is defined as gradientRadial in the parent fill element (§6.1.2.5) that is defined in the VML namespace.</p>
gradientRadial (Radial Gradient)	<p>The fill colors blend together in a radial gradient.</p> 
gradientUnscaled (Unscaled Gradient)	<p>The gradient angle is not scaled relative to the aspect ratio of the shape.</p> <p>For example, the shapes below are twice as wide as they are tall. The first shape uses an unscaled gradient and the second uses a regular scaled gradient:</p> 
pattern (Image Pattern)	<p>The image is used to create a pattern using the fill colors.</p> 
solid (Solid Fill)	<p>The fill pattern is a solid color.</p> 
tile (Tiled Image)	<p>The fill image is tiled.</p> 

Referenced By
fill@type (§6.2.2.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FillType">
 <restriction base="xsd:string">
 <enumeration value="gradientCenter"/>
 <enumeration value="solid"/>
 <enumeration value="pattern"/>
 <enumeration value="tile"/>
 <enumeration value="frame"/>
 <enumeration value="gradientUnscaled"/>
 <enumeration value="gradientRadial"/>
 <enumeration value="gradient"/>
 <enumeration value="background"/>
 </restriction>
</simpleType>
```

### 6.2.3.12 ST\_Guid (128-Bit GUID)

This simple type specifies a 128 bit GUID.

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}`.

Referenced By
signatureline@id (§6.2.2.29); signatureline@provid (§6.2.2.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
 <restriction base="xsd:token">
 <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}" />
 </restriction>
</simpleType>
```

### 6.2.3.13 ST\_How (Alignment Type)

This simple type specifies types of alignment.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottom (Bottom Alignment)	Bottom vertical alignment.

Enumeration Value	Description
center (Center Alignment)	Center horizontal alignment.
left (Left Alignment)	Left horizontal alignment.
middle (Middle Alignment)	Middle vertical alignment.
right (Right Alignment)	Right horizontal alignment.
top (Top Alignment)	Top vertical alignment.

#### Referenced By

r@how (§6.2.2.21)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_How">
 <restriction base="xsd:string">
 <enumeration value="top"/>
 <enumeration value="middle"/>
 <enumeration value="bottom"/>
 <enumeration value="left"/>
 <enumeration value="center"/>
 <enumeration value="right"/>
 </restriction>
</simpleType>

```

#### 6.2.3.14 ST\_HrAlign (Alignment Type)

This simple type specifies alignments for horizontal rules.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center Alignment)	Center aligned.
left (Left Alignment)	Left aligned.
right (Right Alignment)	Right aligned.

#### Referenced By

arc@hralign (§6.1.2.1); curve@hralign (§6.1.2.3); group@hralign (§6.1.2.7); image@hralign (§6.1.2.10); line@hralign (§6.1.2.12); oval@hralign (§6.1.2.13); polyline@hralign (§6.1.2.15); rect@hralign (§6.1.2.16); roundrect@hralign (§6.1.2.17); shape@hralign (§6.1.2.19); shapetype@hralign (§6.1.2.20)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HrAlign">
 <restriction base="xsd:string">
 <enumeration value="left"/>
 <enumeration value="right"/>
 <enumeration value="center"/>
 </restriction>
</simpleType>
```

### 6.2.3.15 ST\_InsetMode (Inset Margin Type)

This simple type specifies how inner text margins are obtained.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic Margins)	Inner text margins are calculated by the application.
custom (Custom Margins)	Inner text margins are specified by the shape.

#### Referenced By

arc@insetmode (§6.1.2.1); curve@insetmode (§6.1.2.3); group@insetmode (§6.1.2.7); image@insetmode (§6.1.2.10); line@insetmode (§6.1.2.12); oval@insetmode (§6.1.2.13); polyline@insetmode (§6.1.2.15); rect@insetmode (§6.1.2.16); roundrect@insetmode (§6.1.2.17); shape@insetmode (§6.1.2.19); shapetype@insetmode (§6.1.2.20); textbox@insetmode (§6.1.2.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_InsetMode">
 <restriction base="xsd:string">
 <enumeration value="auto"/>
 <enumeration value="custom"/>
 </restriction>
</simpleType>
```

### 6.2.3.16 ST\_OLEDrawAspect (OLE Object Representations)

This simple type specifies the ways in which OLE objects are displayed in the application.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Content (Snapshot)	The object's presentation is a picture of the contained document (provided by the OLE server application).
Icon (Icon)	The object's presentation is an icon.

1

Referenced By
OLEObject@DrawAspect (§6.2.2.19)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_OLEDrawAspect">
4 <restriction base="xsd:string">
5 <enumeration value="Content"/>
6 <enumeration value="Icon"/>
7 </restriction>
8 </simpleType>

```

### 9 6.2.3.17 ST\_OLELinkType (Embedded Object Alternate Image Request Types)

10 This simple type specifies the type of image that shall be requested from the application which hosts embedded  
 11 object data for a linked object.

12 This simple type's contents are a restriction of the XML Schema string datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
Bitmap (Bitmap Image)	Specifies that a bitmap shall be requested.
EnhancedMetaFile (Enhanced Metafile Image)	Specifies that an enhanced metafile shall be requested.
Picture (Other Image)	Specifies that any image format may be requested.

14

Referenced By
LinkType (§6.2.2.16)

### 15 6.2.3.18 ST\_OLEType (OLE Connection Type)

16 This simple type specifies whether an OLE object is included in the package (that is, embedded) or is stored  
 17 outside the package (that is, linked).

18 This simple type's contents are a restriction of the XML Schema string datatype.

19 The following are possible enumeration values for this type:

Enumeration Value	Description
Embed (Embedded Object)	Embedded object.
Link (Linked Object)	Linked object.

20

Referenced By
OLEObject@Type (§6.2.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OLEType">
 <restriction base="xsd:string">
 <enumeration value="Embed"/>
 <enumeration value="Link"/>
 </restriction>
</simpleType>
```

### 6.2.3.19 ST\_OLEUpdateMode (OLE Update Method Type)

This simple type specifies how an OLE object is updated.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Always (Server Application Update)	The object is updated whenever the OLE server application indicates there is new data available.
OnCall (User Update)	The object is updated when the user chooses to update it.

Referenced By
OLEObject@UpdateMode (§6.2.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OLEUpdateMode">
 <restriction base="xsd:string">
 <enumeration value="Always"/>
 <enumeration value="OnCall"/>
 </restriction>
</simpleType>
```

### 6.2.3.20 ST\_RelationshipId (Explicit Relationship ID)

This simple type specifies the relationship ID in a part's relationship item which is the target of an explicit relationship from the parent XML element. This simple type is an exact analog of ST\_RelationshipId defined in the <http://schemas.openxmlformats.org/officeDocument/2006/relationships> namespace

The type of relationship which shall be the target of the relationship specified shall be determined based on the context of the parent XML element.

[Example: Consider the following markup in an Office Open XML document:

<... o:relid="rId5" />

The relid attribute is of type ST\_RelationshipID, and therefore the relationship with ID rId5 shall be the target of an explicit relationship from the source part, based on the context of the parent XML element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
fill@relid (§6.1.2.5); imagedata@relid (§6.1.2.11); stroke@relid (§6.1.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelationshipId">
 <restriction base="xsd:string"/>
</simpleType>
```

### 6.2.3.21 ST\_RType (Rule Type)

This simple type specifies types of rules.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
align (Alignment Rule)	Alignment rule.
arc (Arc Rule)	Arc rule.
callout (Callout Rule)	Callout rule.
connector (Connector Rule)	Connector rule.

### Referenced By

r@type (§6.2.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RType">
 <restriction base="xsd:string">
 <enumeration value="arc"/>
 <enumeration value="callout"/>
 <enumeration value="connector"/>
 <enumeration value="align"/>
 </restriction>
</simpleType>
```

### 6.2.3.22 ST\_ScreenSize (Screen Sizes Type)

This simple type specifies screen sizes.

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
1024,768 (1024x768 pixels)	1024x768 pixels.
1152,862 (1152x862 pixels)	1152x862 pixels.
544,376 (544x376 pixels)	544x376 pixels.
640,480 (640x480 pixels)	640x480 pixels.
720,512 (720x512 pixels)	720x512 pixels.
800,600 (800x600 pixels)	800x600 pixels.

3

Referenced By
background@targetscreensize (§6.1.2.2)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_ScreenSize">
6 <restriction base="xsd:string">
7 <enumeration value="544,376"/>
8 <enumeration value="640,480"/>
9 <enumeration value="720,512"/>
10 <enumeration value="800,600"/>
11 <enumeration value="1024,768"/>
12 <enumeration value="1152,862"/>
13 </restriction>
14 </simpleType>

```

### 15 6.2.3.23 ST\_TrueFalse (Boolean Value)

16 This simple type specifies logical true and false.

17 This simple type's contents are a restriction of the XML Schema string datatype.

18 The following are possible enumeration values for this type:

Enumeration Value	Description
f (False)	Logical false.
false (False)	Logical false.
t (True)	Logical true.
true (True)	Logical true.

8 </restriction>
9 </simpleType>

```

#### 10 6.2.3.24 ST\_TrueFalseBlank (Boolean Value with Blank [False] State)

11 This simple type specifies a boolean value with a third state, using a blank attribute, which specifies that the  
12 value be false.

13 This simple type's contents are a restriction of the XML Schema string datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
(Blank – Logical False)	Logical false.

Enumeration Value	Description
f (Logical False)	Logical false.
false (Logical False)	Logical false.
t (Logical True)	Logical true.
true (Logical True)	Logical true.

## 2 6.3 VML - WordprocessingML Drawing

3 Within a WordprocessingML document, it is possible to include graphical VML objects. When these objects are  
4 present in a word processing document, it is necessary to include information about the object which is specific  
5 to their presence in a word processing document.

6 [Note: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined  
7 in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format  
8 created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be  
9 considered a deprecated format included in Office Open XML for legacy reasons only and new applications that  
10 need a file format for drawings are strongly encouraged to use preferentially DrawingML .end note]

11 The VML WordprocessingML Drawing namespace acts in this capacity, specifying all information necessary to  
12 anchor and display VML objects within a word processing document.

13 All elements defined in this subclause shall only appear in a WordprocessingML document.

14 [Example: Consider a 5-point star added to a WordprocessingML document, for example:

15 This object allows surrounding text to wrap around its top and bottom, but not to either side, so this interaction  
16 with the surrounding document text (which is specific to a word processing document) is stored in the  
17 WordprocessingML Drawing namespace as follows:

```

1 <v:shape ... >
2 ...
3 <wd:wrap wd:type="topAndBottom" />
4 </v:shape>

```

The wrap element specifies how surrounding WordprocessingML document content shall wrap around the floating VML object - in this case, by wrapping to its top and bottom extents via the type attribute value of topAndBottom. *end example*]

### 6.3.1 Table of Contents

This subclause is informative.

<b>6.3.2 Elements</b> .....	<b>4903</b>
6.3.2.1 anchorlock (Anchor Location Is Locked) .....	4903
6.3.2.2 borderbottom (Bottom Border) .....	4904
6.3.2.3 borderleft (Left Border) .....	4905
6.3.2.4 borderright (Right Border) .....	4907
6.3.2.5 bordertop (Top Border) .....	4908
6.3.2.6 wrap (Text Wrapping) .....	4910
<b>6.3.3 Simple Types</b> .....	<b>4912</b>
6.3.3.1 ST_BorderShadow (Border Shadow Type) .....	4912
6.3.3.2 ST_BorderType (Border Type) .....	4913
6.3.3.3 ST_HorizontalAnchor (Horizontal Anchor Type) .....	4916
6.3.3.4 ST_VerticalAnchor (Vertical Anchor Type) .....	4917
6.3.3.5 ST_WrapSide (Text Wrapping Side) .....	4918
6.3.3.6 ST_WrapType (Text Wrapping Type) .....	4919

End of informative text.

### 6.3.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:office:word namespace:

[*Note*: As the VML format is a format provided for backward compatibility, those VML elements defined in the same urn:schemas-microsoft-com:office:word namespace will remain in that namespace as it is already used by millions of documents already using VML. *end note*]

#### 6.3.2.1 anchorlock (Anchor Location Is Locked)

This element specifies that the anchor location for this object shall not be modified at runtime when an application edits the contents of this document. [*Guidance*: An application might have automatic behaviors which reposition the anchor for a VML object based on user interaction - for example, moving it from one page to another as needed. This element shall tell applications not to perform any such behaviors. *end guidance*]

If this element is omitted, then the anchor shall not be locked for the parent VML object.

[*Example*: Consider a floating VML object which shall have its anchor locked at the current location. This setting would be specified as follows:

```
<wd:anchorLock/>
```

The anchorLock element's presence specifies that the VML object's current anchor location shall not be changed by applications editing this content. *end example*].

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnchorLock"/>
```

### 6.3.2.2 borderbottom (Bottom Border)

This element specifies the properties for the bottom border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

10

Attributes	Description
shadow (Border shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example</i>: Consider a top border which shall appear with a shadow effect, resulting in the following content:</p> <pre>&lt;wd:bordertop wd:shadow="true" ... /&gt;</pre> <p>This element's shadow attribute is true, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).</p>
type (Border Style)	<p>Specifies the style of border used on this object.</p> <p>See the simple type definition for a description of each border style.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p> <pre>&lt;wd:borderleft wd:type="single" .../&gt;</pre> <p>This border's type is <code>single</code>, indicating that the border style is a single line. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_BorderType</code> simple type (§6.3.3.2).</p>
width (Border Width)	<p>Specifies the width of the current border.</p> <p>The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre>&lt;wd:bartop wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderleft wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderbottom wd:type="dashed" wd:width="24" .../&gt; &lt;wd:boarderright wd:type="dashed" wd:width="24" .../&gt;</pre> <p>The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema <code>positiveInteger</code> datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Border">
3 <attribute name="type" type="ST_BorderType" use="optional"/>
4 <attribute name="width" type="xsd:positiveInteger" use="optional"/>
5 <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
6 </complexType>
```

### 7 6.3.2.3 `borderleft` (Left Border)

8 This element represents the properties for the left border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

9

Attributes	Description
------------	-------------

Attributes	Description
shadow (Border shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example:</i> Consider a top border which shall appear with a shadow effect, resulting in the following content:</p> <pre data-bbox="451 638 1047 669">&lt;wd:bordertop wd:shadow="true" ... /&gt;</pre> <p>This element's shadow attribute is <code>true</code>, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).</p>
type (Border Style)	<p>Specifies the style of border used on this object.</p> <p>See the simple type definition for a description of each border style.</p> <p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p> <pre data-bbox="451 1113 1015 1144">&lt;wd:borderleft wd:type="single" .../&gt;</pre> <p>This border's type is <code>single</code>, indicating that the border style is a single line. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).</p>
width (Border Width)	<p>Specifies the width of the current border.</p> <p>The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre data-bbox="451 1659 1274 1795">&lt;wd:bordertop wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderleft wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderbottom wd:type="dashed" wd:width="24" .../&gt; &lt;wd:boarderright wd:type="dashed" wd:width="24" .../&gt;</pre> <p>The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema positiveInteger datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Border">
3 <attribute name="type" type="ST_BorderType" use="optional"/>
4 <attribute name="width" type="xsd:positiveInteger" use="optional"/>
5 <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
6 </complexType>
```

#### 7 6.3.2.4 **borderright** (Right Border)

8 This element specifies the properties for the right border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

9

Attributes	Description
shadow (Border shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example:</i> Consider a top border which shall appear with a shadow effect, resulting in the following content:</p> <pre>&lt;wd:bordertop wd:shadow="true" ... /&gt;</pre> <p>This element's shadow attribute is true, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).</p>
type (Border Style)	<p>Specifies the style of border used on this object.</p> <p>See the simple type definition for a description of each border style.</p> <p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p>

Attributes	Description
	<p><code>&lt;wd:borderleft wd:type="single" .../&gt;</code></p> <p>This border's type is single, indicating that the border style is a single line. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).</p>
width (Border Width)	<p>Specifies the width of the current border.</p> <p>The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre> &lt;wd:bordertop wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderleft wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderbottom wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderright wd:type="dashed" wd:width="24" .../&gt; </pre> <p>The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema positiveInteger datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Border">
3 <attribute name="type" type="ST_BorderType" use="optional"/>
4 <attribute name="width" type="xsd:positiveInteger" use="optional"/>
5 <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
6 </complexType>

```

### 7 6.3.2.5 **bordertop (Top Border)**

8 This element specifies the properties for the top border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

9

Attributes	Description
shadow (Border shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below</p>

Attributes	Description
	<p>and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example</i>: Consider a top border which shall appear with a shadow effect, resulting in the following content:</p> <pre data-bbox="456 533 1045 562">&lt;wd:bordertop wd:shadow="true" ... /&gt;</pre> <p>This element's shadow attribute is true, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).</p>
type (Border Style)	<p>Specifies the style of border used on this object.</p> <p>See the simple type definition for a description of each border style.</p> <p>[<i>Example</i>: Consider a left border resulting in the following WordprocessingML:</p> <pre data-bbox="456 1008 1013 1037">&lt;wd:borderleft wd:type="single" .../&gt;</pre> <p>This border's type is single, indicating that the border style is a single line. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).</p>
width (Border Width)	<p>Specifies the width of the current border.</p> <p>The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example</i>: Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre data-bbox="456 1554 1273 1688">&lt;wd:bordertop wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderleft wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderbottom wd:type="dashed" wd:width="24" .../&gt; &lt;wd:borderright wd:type="dashed" wd:width="24" .../&gt;</pre> <p>The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema positiveInteger datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
 <attribute name="type" type="ST_BorderType" use="optional"/>
 <attribute name="width" type="xsd:positiveInteger" use="optional"/>
 <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
</complexType>
```

### 6.3.2.6 wrap (Text Wrapping)

This element specifies the type of text wrapping which should be allowed around the contents of this VML object.

If this element is omitted, then no text wrapping shall be performed (i.e. the object shall be presented in line with text).

[Example: Consider the following VML object:

```
<v:shape ... >
 ...
 <wd:wrap wd:type="square" />
```

The wrap element specifies how surrounding WordprocessingML document content shall wrap around the floating VML object - in this case, by wrapping around its extents in a square via the type attribute value of square. *end example*].

#### Parent Elements

arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
anchorx (Horizontal Positioning Base)	<p>Specifies the base object from which the horizontal positioning of the object should be calculated.</p> <p>A VML object may be horizontally positioned relative to:</p> <ul style="list-style-type: none"> <li>The vertical edge of the page before any runs of text (the left edge for left-to-right paragraphs, the right edge for right-to-left paragraphs)</li> <li>The vertical edge of the text margin before any runs of text (the left edge for left-to-right paragraphs, the right edge for right-to-left paragraphs)</li> <li>The vertical edge of the text in the paragraph containing the VML object</li> <li>The position of anchor for the floating VML object in the text.</li> </ul> <p>If this attribute is omitted, then its value shall be assumed to be page.</p> <p>[Example: Consider a VML object which should be positioned relative to the page edges, which would be specified as follows:</p>

Attributes	Description
	<p><code>&lt;wd:wrap wd:anchorx="page" wd:anchory="page" /&gt;</code></p> <p>The anchorx attribute specifies that horizontal anchoring is relative to the edge of the page. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_HorizontalAnchor simple type (§6.3.3.3).</p>
anchory (Vertical Positioning Base)	<p>Specifies the base object from which the vertical positioning of the object should be calculated.</p> <p>A VML object may be vertically positioned relative to:</p> <ul style="list-style-type: none"> <li>• The horizontal top edge of the page</li> <li>• The horizontal edge of the top text margin before any runs of text</li> <li>• The horizontal top edge of line containing the VML object</li> <li>• The horizontal top edge of the paragraph containing the text.</li> </ul> <p>If this attribute is omitted, then its value shall be assumed to be page.</p> <p>[<i>Example:</i> Consider a VML object which should be positioned relative to the page edges, which would be specified as follows:</p> <p><code>&lt;wd:wrap wd:anchorx="page" wd:anchory="page" /&gt;</code></p> <p>The anchory attribute specifies that horizontal anchoring is relative to the edge of the page. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_VerticalAnchor simple type (§6.3.3.4).</p>
side (Wrapping side)	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:</p> <p><code>&lt;wd:wrap side="left" ... /&gt;</code></p> <p>The side attribute value of left specifies that text shall only wrap around the left side of the object. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapSide simple type (§6.3.3.5).</p>
type (Wrapping type)	<p>Specifies the type of wrapping - see the simple type definition for a description of each type.</p> <p>[<i>Example:</i> Consider the following VML object:</p>

Attributes	Description
	<pre>&lt;v:shape ... &gt; ... &lt;wd:wrap wd:type="topAndBottom" /&gt;</pre> <p>The wrap element specifies how surrounding WordprocessingML document content shall wrap around the floating VML object - in this case, by wrapping around its top and bottom extents via the type attribute value of topAndBottom. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapType simple type (§6.3.3.6).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Wrap">
 <attribute name="type" type="ST_WrapType" use="optional"/>
 <attribute name="side" type="ST_WrapSide" use="optional"/>
 <attribute name="anchorx" type="ST_HorizontalAnchor" use="optional"/>
 <attribute name="anchory" type="ST_VerticalAnchor" use="optional"/>
</complexType>
```

### 6.3.3 Simple Types

This is the complete list of simple types in the urn:schemas-microsoft-com:office:word namespace.

#### 6.3.3.1 ST\_BorderShadow (Border Shadow Type)

This simple type specifies logical true and false values.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
f (False)	Logical false.
false (False)	Logical false.
t (True)	Logical true.
true (True)	Logical true.

#### Referenced By

borderbottom@shadow (§6.3.2.2); borderleft@shadow (§6.3.2.3); borderright@shadow (§6.3.2.4); bordertop@shadow (§6.3.2.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderShadow">
 <restriction base="xsd:string">
 <enumeration value="t"/>
 <enumeration value="true"/>
 <enumeration value="f"/>
 <enumeration value="false"/>
 </restriction>
</simpleType>
```

### 6.3.3.2 ST\_BorderType (Border Type)

This type defines which types of borders are supported.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dash (pecifies a line border consisting of a dashed line around the parent object.)	Specifies a line border consisting of a dashed line around the parent object.
dashDotDot (Dash Dot Dot Border)	Specifies a line border consisting of a alternating dotted, dotted, dashed line around the parent object.
dashDotStroked (Stroked Dash Dot Border)	Specifies a line border consisting of a line with a series of alternating thin and thick strokes around the parent object.
dashedSmall (Small Dash Border)	Specifies a line border consisting of a dashed line with small gaps around the parent object.
dot (Dotted Border)	Specifies a line border consisting of a dotted line around the parent object.
dotDash (Dot Dash Border)	Specifies a line border consisting of a alternating dotted and dashed line around the parent object.
double (Double Line Border)	Specifies a line border consisting of a double line around the parent object.
doubleWave (Double Wavy Lines Border)	Specifies a line border consisting of a double wavy line around the parent object.
hairline (Hairline Border)	Specifies a line border consisting of a very thin line.
HTMLInset (Inset Border)	<p>Specifies a line border consisting of an inset set of lines around the parent object.</p> <p>[Example:</p>  <p>end example]</p>

Enumeration Value	Description
HTMLOutset (Outset Border)	<p>Specifies a line border consisting of an outset set of lines around the parent object.</p> <p><i>[Example:</i></p>  <p><i>end example]</i></p>
none (No Border)	Specifies that no border shall be applied to the current item.
single (Single Line Border)	Specifies a line border consisting of a single line around the parent object.
thick (Thick Line Border)	Specifies a line border consisting of a single line around the parent object.
thickBetweenThin (Thin-thick-thin Border)	Specifies a line border consisting of a thick line contained within a thin line with a medium sized intermediate gap around the parent object.
thickBetweenThinLarge (Large thin-thick-thin Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a medium sized intermediate gap around the parent object.
thickBetweenThinSmall (Small thin-thick-thin Lines Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a small intermediate gap around the parent object.
thickThin (Thick Thin Line Border)	Specifies a line border consisting of a thick line contained within a thin line with a medium sized intermediate gap around the parent object.
thickThinLarge (Thick Thin Large Gap Border)	Specifies a line border consisting of a thick line contained within a thin line with a large sized intermediate gap around the parent object.
thickThinSmall (Small thick-thin lines border)	Specifies a line border consisting of a thick line contained within a thin line with a small intermediate gap around the parent object.
thinThick (Thin Thick Line Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a medium sized intermediate gap between each around the parent object.
thinThickLarge (Thin Thick Large Gap Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a large sized intermediate gap between each around the parent object.

Enumeration Value	Description
thinThickSmall (Thin Thick Small Gap Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a small intermediate gap between each around the parent object.
threeDEmboss (3D Embossed Border)	<p>Specifies a line border consisting of three staged gradient lines around the parent object, getting darker towards the object.</p> <p>[Example:</p>  <p>end example]</p>
threeDEngrave (3D Engraved Border)	<p>Specifies a line border consisting of three staged gradient lines around the parent object, getting darker away from the object.</p> <p>[Example:</p>  <p>end example]</p>
triple (Triple Line Border)	Specifies a line border consisting of a triple line around the parent object.
wave (Wavy Border)	<p>Specifies a line border consisting of a wavy line around the parent object.</p> <p>[Example:</p>  <p>end example]</p>

1

Referenced By
borderbottom@type (§6.3.2.2); borderleft@type (§6.3.2.3); borderright@type (§6.3.2.4); bordertop@type (§6.3.2.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderType">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="single"/>
 <enumeration value="thick"/>
 <enumeration value="double"/>
 <enumeration value="hairline"/>
 <enumeration value="dot"/>
 <enumeration value="dash"/>
 <enumeration value="dotDash"/>
 <enumeration value="dashDotDot"/>
 <enumeration value="triple"/>

 <enumeration value="threeDEngrave"/>
 <enumeration value="HTMLOutset"/>
 <enumeration value="HTMLInset"/>
 </restriction>
</simpleType>
```

### 6.3.3.3 ST\_HorizontalAnchor (Horizontal Anchor Type)

This simple type specifies the horizontal position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final horizontal position of the object in the document.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
char (Character)	Specifies that the parent object shall be horizontally anchored based on the position of the anchor within the text flow.
margin (Margin)	Specifies that the parent object shall be horizontally anchored to the text margins.

Enumeration Value	Description
	This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the text margin.
page (Page)	Specifies that the parent object shall be horizontally anchored to the page edge.  This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the page.
text (Text)	Specifies that the parent object shall be horizontally anchored to the text extents.  This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the text in the anchor paragraph (including text indentations on that paragraph within the text margins).

1

Referenced By
wrap@anchorx (§6.3.2.6)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_HorizontalAnchor">
4 <restriction base="xsd:string">
5 <enumeration value="margin"/>
6 <enumeration value="page"/>
7 <enumeration value="text"/>
8 <enumeration value="char"/>
9 </restriction>
10 </simpleType>

```

#### 11 6.3.3.4 ST\_VerticalAnchor (Vertical Anchor Type)

12 This simple type specifies the vertical position to which the parent object has been anchored in the document.  
13 This anchor position shall be used as the base location to determine the final vertical position of the object in  
14 the document.

15 This simple type's contents are a restriction of the XML Schema string datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
line (Line)	Specifies that the parent object shall be vertically anchored to the line on which its anchor appears.

Enumeration Value	Description
	This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the anchor's line in the anchor paragraph.
margin (Margin)	Specifies that the parent object shall be vertically anchored to the text margins.  This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the text margin.
page (Page)	Specifies that the parent object shall be vertically anchored to the page edge.  This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the edge of the page.
text (Text)	Specifies that the parent object shall be vertically anchored to the text extents.  This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the text in the anchor paragraph.

1

Referenced By
wrap@anchory (§6.3.2.6)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_VerticalAnchor">
4 <restriction base="xsd:string">
5 <enumeration value="margin"/>
6 <enumeration value="page"/>
7 <enumeration value="text"/>
8 <enumeration value="line"/>
9 </restriction>
10 </simpleType>

```

### 11 6.3.3.5 ST\_WrapSide (Text Wrapping Side)

12 This type defines which sides text can wrap around a VML object.

13 This simple type's contents are a restriction of the XML Schema string datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
both (Both sides)	Wrap text on both sides.
largest (Largest side)	Wrap text on largest side.
left (Left side)	Wrap text on left side.
right (Right side)	Wrap text on right side.

1

Referenced By
wrap@side (§6.3.2.6)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_WrapSide">
4 <restriction base="xsd:string">
5 <enumeration value="both"/>
6 <enumeration value="left"/>
7 <enumeration value="right"/>
8 <enumeration value="largest"/>
9 </restriction>
10 </simpleType>
```

### 11 6.3.3.6 ST\_WrapType (Text Wrapping Type)

12 This simple type specifies the type of text wrapping which shall be allowed around a VML object within a  
13 document.

14 This simple type's contents are a restriction of the XML Schema string datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
none (No wrapping)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this VML object.
square (Square wrapping)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document using a rectangle touching each of the object's furthest edges.
through (Through wrapping)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document, including any holes in the object.
tight (Tight wrapping)	Specifies that text shall be allowed to tightly wrap around the remaining space on each line around this text frame in the document.
topAndBottom (Top and bottom wrapping)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around the VML

Enumeration Value	Description
	<p>object.</p> <p>Any text content shall therefore be placed on the next line following the object which does not intersect with the object's extents.</p>

1

Referenced By
wrap@type (§6.3.2.6)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_WrapType">
4 <restriction base="xsd:string">
5 <enumeration value="topAndBottom"/>
6 <enumeration value="square"/>
7 <enumeration value="none"/>
8 <enumeration value="tight"/>
9 <enumeration value="through"/>
10 </restriction>
11 </simpleType>

```

## 12 6.4 VML - SpreadsheetML Drawing

13 It is possible to attach user interface controls, such as comments, combo boxes (dropdowns) and embedded  
14 controls, to a SpreadsheetML document. VML is used to define certain aspects of the control, such as size and  
15 visual appearance. Additional information describing the control must also be included. The VML  
16 SpreadsheetML Drawing namespace provides the additional information necessary to define the type, settings  
17 and behavior of the control.

18 [Note: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined  
19 in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format  
20 created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be  
21 considered a deprecated format included in Office Open XML for legacy reasons only and new applications that  
22 need a file format for drawings are strongly encouraged to use preferentially DrawingML .end note]

23 [Example: Assume the comment below exists on a spreadsheet:

24

25 The following defines the additional information necessary to describe the comment. The ObjectType attribute  
26 describes the object as a comment. The Anchor element defines that its edges are anchored to the first and

fourth rows and the second and fourth columns. The Row and Column elements indicate that it points to the cell in the first row, first column.

```
<x:ClientData ObjectType="Note">
 <x:MoveWithCells/>
 <x:SizeWithCells/>
 <x:Anchor>1, 13, 0, 12, 2, 52, 2, 10</x:Anchor>
 <x:AutoFill>False</x:AutoFill>
 <x:Row>0</x:Row>
 <x:Column>0</x:Column>
 <x:Visible/>
</x:ClientData>
```

This additional comment data exists inside the VML shape that defines the comment object:

```
<v:shape id="_x0000_s1025" type="#_x0000_t202" style='position:absolute;margin
left:57.75pt;margin-top:9pt;width:77.25pt;height:28.5pt;z-index:1;mso-wrap-
style:tight' fillcolor="#ffffe1" o:insetmode="auto">
 <v:fill color2="#ffffe1"/>
 <v:shadow on="t" color="black" obscured="t"/>
 <v:path o:connecttype="none"/>
 <v:textbox style='mso-direction-alt:auto'>
 <div style='text-align:left'></div>
 </v:textbox>
 <x:ClientData ObjectType="Note"> ... </x:ClientData>
</v:shape>
```

*end example]*

12

13 **End of informative text.**14 **6.4.2 Elements**

15 The following elements comprise the contents of the urn:schemas-microsoft-com:office:excel namespace:

16 [Note: As the VML format is a format provided for backward compatibility, those VML elements defined in the  
 17 same urn:schemas-microsoft-com:office:excel namespace will remain in that namespace is it is already used  
 18 by millions of documents already using VML. *end note*]

19 **6.4.2.1 Accel (Primary Keyboard Accelerator)**

20 This element specifies the primary keyboard accelerator for an object. The value is the ASCII decimal number  
 21 corresponding to the accelerator key. This element is used for buttons, checkboxes, radio buttons and group  
 22 boxes.

23 [Example: The primary accelerator key is 'A' (65 is the ASCII decimal value for 'A'):

```

24 <x:ClientData ... >
25 <x:Accel>65</x:Accel>
26 </x:ClientData>

```

27 *end example]*

28 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

29 **6.4.2.2 Accel2 (Secondary Keyboard Accelerator)**

30 This element specifies the secondary keyboard accelerator for an object. The value is the ASCII decimal number  
 31 corresponding to the accelerator key. This element is used for buttons, checkboxes, radio buttons and group  
 32 boxes.

[*Example:* The secondary accelerator key is 'A' (65 is the ASCII decimal value for 'A'):

```
<x:ClientData ... >
 <x:Accel12>65</x:Accel12>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.3 Anchor (Anchor)

This element specifies the anchor location for the object. This is a general-use element.

The value is a comma-separated list of data written out as: LeftColumn, LeftOffset, TopRow, TopOffset, RightColumn, RightOffset, BottomRow, BottomOffset.

Value	Description
LeftColumn	The left anchor column of the object (left-most column is 0). [ <i>Example:</i> An object whose left anchor was off of the third column would have a LeftColumn value of 2. <i>end example]</i>
LeftOffset	The offset of the object's left edge from the left edge of the left anchor column. This value is measured in pixels.
TopRow	The top anchor row of the object (top-most column is 0). [ <i>Example:</i> An object whose top anchor was off of the fifth row would have a TopRow value of 4. <i>end example]</i>
TopOffset	The offset of the object's top edge from the top edge of the top anchor row. This value is measured in pixels.
RightColumn	The right anchor column of the object (left-most column is 0). [ <i>Example:</i> An object whose right anchor was off of the tenth column would have a RightColumn value of 9. <i>end example]</i>
RightOffset	The offset of the object's right edge from the left edge of the right anchor column. This value is measured in pixels.
BottomRow	The bottom anchor row of the object (top-most column is 0). [ <i>Example:</i> An object whose bottom anchor was off of the tenth row would have a BottomRow value of 9. <i>end example]</i>
BottomOffset	The offset of the object's bottom edge from the bottom edge of the bottom anchor row. This value is measured in pixels.

[Example: The left side of the object is 15 pixels to the right of the left edge of the second column. The top edge is 2 pixels below the upper edge of the first row. The right side is 15 pixels to the right of the left edge of the fourth column. The bottom edge is 16 pixels below the top of the fourth row.]

```
<x:ClientData ... >
 <x:Anchor>1, 15, 0, 2, 3, 15, 3, 16</x:Anchor>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.4 AutoFill (AutoFill)

This element specifies that the object is an AutoFill object. If this element is specified without a value, it is assumed to be true. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:AutoFill>False</x:AutoFill>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.5 AutoLine (AutoLine)

This element specifies that the object is an AutoLine object. If this element is specified without a value, it is assumed to be true. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:AutoLine>False</x:AutoLine>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.6 AutoPict (Automatically Size)

This element specifies whether the object's size is formatted automatically by the application. If this element is specified without a value, it is assumed to be true. This is a general-use element for objects that use an image representation, such as OLE objects, Embedded controls, cameras and signature lines.

[Example:

```
<x:ClientData ... > ...
 <x:AutoPict>True</x:AutoPict>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.7 AutoScale (Font AutoScale)

This element specifies whether the object's font is automatically scaled by the application when the object is resized. If this element is specified without a value, it is assumed to be true. This element is used for attached text.

[Example:

```
<x:ClientData ... > ...
 <x:AutoScale>True</x:AutoScale>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.8 Camera (Camera Tool)

This element specifies that the object is a camera object. A camera object shows a live view of another part of the spreadsheet. If this element is specified without a value, it is assumed to be true. This element is used for cameras.

[Example:

```

1 <x:ClientData ... > ...
2 <x:Camera>True</x:Camera>
3 </x:ClientData>

```

4 *end example]*

5 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6 6.4.2.9 Cancel (Cancel Button)

7 This element specifies that the object is a cancel button. If this element is specified without a value, it is  
8 assumed to be true. This element is used for buttons.

9 *[Example:*

```

10 <x:ClientData ... > ...
11 <x:Cancel/>
12 </x:ClientData>

```

13 *end example]*

14 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 15 6.4.2.10 CF (Clipboard Format)

16 This element specifies the clipboard format used to render the object. This is a general-use element for objects  
17 that use an image representation, such as OLE objects, embedded controls, cameras and signature lines.

18 *[Example:*

```

19 <x:ClientData ... > ...
20 <x:CF>Pict</x:CF>
21 </x:ClientData>

```

22 *end example]*

23 The possible values for this element are defined by the ST\_CF simple type (§6.4.3.1).

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.11 Checked (Checked)

This element specifies that the checkbox is checked or the radio button is selected. This element is used for checkboxes and radio buttons. Valid values are:

Value	Description
0	Unchecked / unselected
1	Checked / selected
2	Mixed selection

[Example:

```
<x:ClientData ... > ...
 <x:Checked>2</x:Checked>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.12 ClientData (Attached Object Data)

This element specifies data associated with objects attached to a spreadsheet. While this element may contain any of the child elements below, only certain combinations are meaningful. The ObjectType attribute determines the type of object the element represents and which subset of child elements is appropriate. Relevant groups are identified for each child element.

[Example: The following defines additional information for a comment. Its edges are anchored to the first and fourth rows and the second and fourth columns. It points to the cell in the first row, first column.

```
<x:ClientData ObjectType="Note">
 <x:MoveWithCells/>
 <x:SizeWithCells/>
 <x:Anchor>1, 15, 0, 2, 3, 15, 3, 16</x:Anchor>
 <x:AutoFill>False</x:AutoFill>
 <x:Row>0</x:Row>
 <x:Column>0</x:Column>
 <x:Visible/>
</x:ClientData>
```

end example]

[*Example:* The following defines additional information for a radio button. It is the first in a series of radio buttons and selected by default. The accelerator key is 'A' (65 is the ASCII decimal value for 'A') and it is linked to the cell at column A, row 1 of the first sheet.

```
<x:ClientData ObjectType=3D"Radio">
 <x:SizeWithCells/>
 <x:AutoFill>False</x:AutoFill>
 <x:AutoLine>False</x:AutoLine>
 <x:TextVAlign>Center</x:TextVAlign>
 <x:Checked>1</x:Checked>
 <x:Accel>65</x:Accel>
 <x:FmlaLink>Sheet1!A1</x:FmlaLink>
 <x:FirstButton/>
</x:ClientData>
```

*end example]*

#### Parent Elements

Attributes	Description
ObjectType (Object type)	<p>Specifies the type of the object. Different sets of child elements are appropriate for different types of objects.</p> <p>The possible values for this attribute are defined by the ST_ObjectType simple type (§6.4.3.2).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ClientData">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="MoveWithCells" type="ST_TrueFalseBlank"/>
 <element name="SizeWithCells" type="ST_TrueFalseBlank"/>
 <element name="Anchor" type="xsd:string"/>
 <element name="Locked" type="ST_TrueFalseBlank"/>
 <element name="DefaultSize" type="ST_TrueFalseBlank"/>
 <element name="PrintObject" type="ST_TrueFalseBlank"/>
 <element name="Disabled" type="ST_TrueFalseBlank"/>
 <element name="AutoFill" type="ST_TrueFalseBlank"/>
 <element name="AutoLine" type="ST_TrueFalseBlank"/>
 <element name="AutoPict" type="ST_TrueFalseBlank"/>
 <element name="FmlaMacro" type="xsd:string"/>
 <element name="TextHAlign" type="xsd:string"/>
 <element name="TextVAlign" type="xsd:string"/>
 <element name="LockText" type="ST_TrueFalseBlank"/>
 <element name="JustLastX" type="ST_TrueFalseBlank"/>
 <element name="SecretEdit" type="ST_TrueFalseBlank"/>
 <element name="Default" type="ST_TrueFalseBlank"/>
 <element name="Help" type="ST_TrueFalseBlank"/>
 <element name="Cancel" type="ST_TrueFalseBlank"/>
 <element name="Dismiss" type="ST_TrueFalseBlank"/>
 <element name="Accel" type="xsd:integer"/>
 <element name="Accel2" type="xsd:integer"/>
 <element name="Row" type="xsd:integer"/>
 <element name="Column" type="xsd:integer"/>
 <element name="Visible" type="ST_TrueFalseBlank"/>
 <element name="RowHidden" type="ST_TrueFalseBlank"/>

18 </choice>
19 <attribute name="ObjectType" type="ST_ObjectType" use="required"/>
20 </complexType>
```

#### 21 6.4.2.13 ColHidden (Comment's Column is Hidden)

22 This element specifies that the column of the cell to which this comment points is hidden. If this element is  
23 specified without a value, it is assumed to be true. This element is used for comments.

24 *[Example:*

```
25 <x:ClientData ... > ...
26 <x:ColHidden>True</x:ColHidden>
27 </x:ClientData>
```

28 *end example]*

29 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 30 6.4.2.14 Colored (Dropdown Color Toggle)

31 This element specifies that the dropdown is colored. If this element is specified without a value, it is assumed to  
32 be true. This element is used for dropdowns.

33 *[Example:*

```
34 <x:ClientData ... > ...
35 <x:Colored>True</x:Colored>
36 </x:ClientData>
```

37 *end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.15 Column (Comment Column Target)

This element specifies the column a comment points to. The column index is 0-based. This element is used for comments.

*[Example:*

```
<x:ClientData ... > ...
 <x:Column>0</x:Column>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.16 DDE (Dynamic Data Exchange)

This element specifies that the object is a DDE (Dynamic Data Exchange) link. If this element is specified without a value, it is assumed to be true. This is a general-use element.

*[Example:*

```
<x:ClientData ... > ...
 <x:DDE>True</x:DDE>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.17 Default (Default Button)

This element specifies that the object is a default (OK) button. If this element is specified without a value, it is assumed to be true. This element is used for buttons.

*[Example:*

```

1 <x:ClientData ... > ...
2 <x:Default>True</x:Default>
3 </x:ClientData>

```

4 *end example]*

5 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6 6.4.2.18 DefaultSize (Default Size Toggle)

7 This element specifies that the object is at its default size. If this element is specified without a value, it is  
8 assumed to be true. This is a general-use element.

9 *[Example:*

```

10 <x:ClientData ... > ...
11 <x:DefaultSize>True</x:DefaultSize>
12 </x:ClientData>

```

13 *end example]*

14 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 15 6.4.2.19 Disabled (Macro Disable Toggle)

16 This element specifies that the object cannot run an attached macro. If this element is specified without a value,  
17 it is assumed to be true. This is a general-use element.

18 *[Example:*

```

19 <x:ClientData ... > ...
20 <x:Disabled>True</x:Disabled>
21 </x:ClientData>

```

22 *end example]*

23 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.20 Dismiss (Dismiss Button)

This element specifies that the object is a dismiss button. If this element is specified without a value, it is assumed to be true. This element is used for buttons.

[Example:

```
<x:ClientData ... > ...
 <x:Dismiss>True</x:Dismiss>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.21 DropLines (Dropdown Maximum Lines)

This element specifies the maximum number of lines in the dropdown before scrollbars are added. This element is used for dropdowns.

If this element is omitted, one line is shown.

[Example:

```
<x:ClientData ... > ...
 <x:DropLines>8</x:DropLines>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.22 DropStyle (Dropdown Style)

This element specifies the style of the dropdown. Allowed values are:

Value	Description
Combo	Standard combo box
ComboEdit	Editable combo box
Simple	Standard combo box with only the dropdown button visible when the box is not expanded

This element is used for dropdowns.

[Example:

```
<x:ClientData ... > ...
 <x:DropStyle>Combo</x:DropStyle>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.23 Dx (Scroll Bar Width)

This element specifies the width of the scroll bar in screen pixels. This element is used for scroll bars and spinners. [Note: It is possible for other controls, such as combo boxes and list boxes, to use scroll bars and this element is valid for those controls. end note]

[Example:

```
<x:ClientData ... > ...
 <x:Dx>16</x:Dx>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.24 FirstButton (First Radio Button)

This element specifies that the object is the first radio button in a set of radio buttons. If this element is specified without a value, it is assumed to be true. This element is used for radio buttons.

[Example:

```
<x:ClientData ... > ...
 <x:FirstButton>True</x:FirstButton>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.25 FmlaGroup (Linked Formula - Group Box)

This element specifies the cell the object is linked to, using standard cell reference syntax. This element is used for group boxes. This overrides the FmlaLink for any radio buttons enclosed in the group box. The value in the linked cell and the index of the selected radio button are linked together. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[Example:

```
<x:ClientData ... > ...
 <x:FmlaGroup>A1</x:FmlaGroup>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.26 FmlaLink (Linked Formula)

This element specifies the cell the object is linked to, using standard cell reference syntax. This element is used for checkboxes, radio buttons, scroll bars, spinners, dropdowns and list boxes. The value in the linked cell and the index of the selected item in the object are linked together. This link is ignored if the control allows multiple selections. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[Example:

```
<x:ClientData ... > ...
 <x:FmlaLink>A4</x:FmlaLink>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.27 FmlaMacro (Reference to Custom Function)

This element specifies the custom function associated with the object. [Example: A macro script, add-in function, and so on. end example]

The format of this string shall be application-defined, and should be ignored if not understood.

[Example:

```
<x:ClientData ... > ...
 <x:FmlaMacro>Button1_Click()</x:FmlaMacro>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.28 FmlaPict (Camera Source Range)

This element specifies the range of source data cells visible in the camera. This element is used for cameras. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[Example:

```
<x:ClientData ... > ...
 <x:FmlaPict>A2:B4</x:FmlaPict>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.29 FmlaRange (List Items Source Range)

This element specifies the range of source data cells used to populate the list box, using standard cell reference syntax. This element is used for list boxes. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[Example:

```
<x:ClientData ... > ...
 <x:FmlaRange>A1:A15</x:FmlaRange>
</x:ClientData>
```

end example]

1 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 2 6.4.2.30 FmlaTxbx (Text Formula)

3 This element defines the formula associated with the object's text. This element is used for attached text.

4 *[Example:*

```
5 <x:ClientData ... > ...
6 <x:FmlaTxbx>D9</x:FmlaTxbx>
7 </x:ClientData>
```

8 *end example]*

9 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 10 6.4.2.31 Help (Help Button)

11 This element specifies that the object is a help button. If this element is specified without a value, it is assumed  
12 to be true. This element is used for buttons.

13 *[Example:*

```
14 <x:ClientData ... > ...
15 <x:Help>True</x:Help>
16 </x:ClientData>
```

17 *end example]*

18 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 19 6.4.2.32 Horiz (Scroll Bar Orientation)

20 This element specifies that the scroll bar is horizontal. If omitted, the scroll bar is vertical. If this element is  
21 specified without a value, it is assumed to be true. This element is used for scroll bars and spinners.

22 *[Example:*

```

1 <x:ClientData ... > ...
2 <x:Horiz>True</x:Horiz>
3 </x:ClientData>

```

4 *end example]*

5 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6 6.4.2.33 Inc (Scroll Bar Increment)

7 This element specifies the number of lines to move the scroll bar on an increment click. If omitted, the  
8 increment is 0. This element is used for scroll bars and spinners.

9 *[Example:*

```

10 <x:ClientData ... > ...
11 <x:Inc>1</x:Inc>
12 </x:ClientData>

```

13 *end example]*

14 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 15 6.4.2.34 JustLastX (Far East Alignment Toggle)

16 This element specifies that Far East alignment is set for the last line in the text. Typically, justified text in Far  
17 East environments leaves the last line unjustified. Specifying this element also justifies the last line. If this  
18 element is specified without a value, it is assumed to be true. This element is used for attached text.

19 *[Example:*

```

20 <x:ClientData ... > ...
21 <x:JustLastX>True</x:JustLastX>
22 </x:ClientData>

```

23 *end example]*

24 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.35 LCT (Callback Type)

This element specifies the list box callback type. The application should use the callback to determine how to handle user actions on the list box. The only allowed value is `Normal`. This element is used for list boxes.

[Example:

```
<x:ClientData ... > ...
 <x:LCT>Normal</x:LCT>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.36 ListItem (Non-linked List Item)

This element specifies a non-linked list item that must be persisted with the list. This element is used for list boxes. [*Rationale*: This is a place for applications to store optional information associated with the list box. For example, an item to be shown in the list box that is not linked from another set of data. *end rationale*]

[Example:

```
<x:ClientData ... > ...
 <x:ListItem>TheItem</x:ListItem>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.37 Locked (Lock Toggle)

This element specifies that the object is locked when the sheet is protected. If omitted, the object is assumed to be locked. If this element is specified without a value, it is assumed to be true. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:Locked>False</x:Locked>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.38 LockText (Text Lock)

This element specifies that the object's text is locked. If omitted, the object's text is assumed to be locked. If this element is specified without a value, it is assumed to be true. This element is used for attached text.

[Example:

```
<x:ClientData ... > ...
 <x:LockText>False</x:LockText>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.39 MapOCX (Embedded Control)

This element specifies that the object is an embedded control. If this element is specified without a value, it is assumed to be true. This element is used for all embedded controls.

[Example:

```
<x:ClientData ... >...
 <x:MapOCX>True</x:MapOCX>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.40 Max (Scroll Bar Maximum)

This element specifies the maximum scroll bar position as the index of the list item just above the item at the top of the view when the control is scrolled all the way down. The list indexes are 1-based. If omitted, the value is assumed to be that which allows the last item to be viewed when the control is scrolled all the way down.

This element is used for scroll bars and spinners.

[Example: Item 21 is the first item visible in the list when the object is scrolled all the way down.

```
<x:ClientData ... > ...
 <x:Max>20</x:Max>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.41 Min (Scroll Bar Minimum)

This element specifies the minimum scroll bar position as the index of the list item just above the item at the top of the view when the control is scrolled all the way up, typically 0. The list indexes are 1-based. If omitted, the value is assumed to be 0. This element is used for scroll bars and spinners.

[Example: The first item in the list is visible when the object is scrolled all the way up:

```
<x:ClientData ... > ...
 <x:Min>0</x:Min>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.42 MoveWithCells (Move with Cells)

This element specifies that the object moves with its underlying cells. If this element is specified without a value, it is assumed to be true. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:MoveWithCells>True</x:MoveWithCells>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
-----------------

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.43 MultiLine (Multi-line)

This element specifies that the control is multiline. If this element is specified without a value, it is assumed to be true. This element is used for edit controls.

*[Example:*

```
<x:ClientData ... > ...
 <x:Multiline>True</x:Multiline>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.44 MultiSel (Multiple Selections)

This element specifies a comma-delimited list of selected items. This element overrides the Sel element (§6.4.2.57). This element is used for list boxes that allow multiple selections. See also the SelType element (§6.4.2.58).

*[Example:*

```
<x:ClientData ... > ...
 <x:MultiSel>3, 5, 6</x:MultiSel>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.45 NoThreeD (Disable 3D)

This element specifies that 3D effects are disabled. If this element is specified without a value, it is assumed to be true. This element is used for checkboxes, radio buttons, group boxes and scroll bars.

*[Example:*

```

1 <x:ClientData ... > ...
2 <x:NoThreeD>True</x:NoThreeD>
3 </x:ClientData>

```

4 *end example]*

5 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6 6.4.2.46 NoThreeD2 (Disable 3D)

7 This element specifies that 3D effects are disabled. If this element is specified without a value, it is assumed to  
8 be true. This element is used for dropdowns and list boxes.

9 *[Example:*

```

10 <x:ClientData ... > ...
11 <x:NoThreeD2>True</x:NoThreeD2>
12 </x:ClientData>

```

13 *end example]*

14 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 15 6.4.2.47 Page (Scroll Bar Page Increment)

16 This element specifies the number of lines to move the scroll bar on a page click. This element is used for scroll  
17 bars and spinners.

18 *[Example:*

```

19 <x:ClientData ... > ...
20 <x:Page>9</x:Page>
21 </x:ClientData>

```

22 *end example]*

23 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.48 PrintObject (Print Toggle)

This element specifies that the object is printed when the document is printed. If omitted, it is assumed the object will print when the document is printed. If this element is specified without a value, it is assumed to be true. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:PrintObject>False</x:PrintObject>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.49 RecalcAlways (Recalculation Toggle)

This element defines whether the object is always included in recalculation. If this element is specified without a value, it is assumed to be true. This is used by controls that reference cells in the spreadsheet to update themselves when the spreadsheet changes.

[Example:

```
<x:ClientData ... > ...
 <x:RecalcAlways>True</x:RecalcAlways>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.50 Row (Comment Row Target)

This element specifies the row a comment points to. The row index is 0-based. This element is used for comments.

[Example:

```
<x:ClientData ... > ...
 <x:Row>0</x:Row>
</x:ClientData>
```

1 *end example]*

2 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

### 3 6.4.2.51 RowHidden (Comment's Row is Hidden)

4 This element specifies that the row of the cell to which this comment points is hidden. If this element is  
5 specified without a value, it is assumed to be true. This element is used for comments.

6 *[Example:*

```
7 <x:ClientData ... > ...
8 <x:RowHidden>True</x:RowHidden>
9 </x:ClientData>
```

10 *end example]*

11 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

### 12 6.4.2.52 ScriptExtended (HTML Script Attributes)

13 This element specifies custom extended attributes associated with the HTML script tag. The language and id are  
14 not included in the extended attributes. If the document contains no HTML script, this element should be  
15 ignored.

16 *[Example:* The extended script attribute is " src="file.js"":

```
17 <x:ClientData ... > ...
18 <x:ScriptExtended>src="file.js"</x:ScriptExtended>
19 </x:ClientData>
```

20 *end example]*

21 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

### 22 6.4.2.53 ScriptLanguage (HTML Script Language)

23 This element specifies the language of the custom function. If the document contains no HTML script, this  
24 element should be ignored. Allowed values are:

Value	Description
1	Java
2	Visual Basic
3	ASP
4	Other

1

2 *[Example:*

```

3 <x:ClientData ... > ...
4 <x:ScriptLanguage>1</x:ScriptLanguage>
5 </x:ClientData>

```

6 *end example]*

7 The possible values for this element are defined by the XML Schema nonNegativeInteger datatype.

Parent Elements
ClientData (§6.4.2.12)

8 

#### 6.4.2.54 ScriptLocation (HTML Script Location)

9 This element specifies the location of the custom function. If the document contains no HTML script, this  
10 element should be ignored. Allowed values are:

Value	Description
1	Head
2	Body

11

12 *[Example:*

```

13 <x:ClientData ... > ...
14 <x:ScriptLocation>2</x:ScriptLocation>
15 </x:ClientData>

```

16 *end example]*

17 The possible values for this element are defined by the XML Schema nonNegativeInteger datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.55 ScriptText (HTML Script Text)

This element specifies the script text (comment) associated with a block of HTML script in the document. If the document contains no HTML script, this element should be ignored.

[Example: The script text reads: "<!-- Comment -->":

```
<x:ClientData ... > ...
 <x:ScriptText><!-- Comment -->></x:ScriptText>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.56 SecretEdit (Password Edit)

This element specifies that the object represents a password edit field. If this element is specified without a value, it is assumed to be true. This element is used for attached text.

[Example:

```
<x:ClientData ... > ...
 <x:SecretEdit>True</x:SecretEdit>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.57 Sel (Selected Entry)

This element specifies the index of the selected item. The list indexes are 1-based. If omitted or set to a value of 0, no items are selected. This element is used for list boxes.

[Example:

```
<x:ClientData ... >...
 <x:Sel>1</x:Sel>
</x:ClientData>
```

*end example]*

- 1 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

## 2 6.4.2.58 SelType (Selection Type)

- 3 This element specifies the selection type for the list box. If omitted, the control is assumed to be Single.

- 4 Allowed values are:

Value	Description
Single	The listbox may only have one selected item.
Multi	The listbox may have multiple items selected by clicking on each item.
Extend	The listbox may have multiple items selected by holding a control key and clicking on each item.

5

- 6 This element is used for list boxes.

7 *[Example:*

```
8 <x:ClientData ... > ...
9 <x:SelType>Single</x:SelType>
10 </x:ClientData>
```

11 *end example]*

- 12 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

## 13 6.4.2.59 SizeWithCells (Resize with Cells)

- 14 This element specifies that the object resizes with its underlying cells. If this element is specified without a  
15 value, it is assumed to be true. This is a general-use element.

16 *[Example:*

```
17 <x:ClientData ... > ...
18 <x:SizeWithCells>True</x:SizeWithCells>
19 </x:ClientData>
```

20 *end example]*

- 21 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.60 TextHAlign (Horizontal Text Alignment)

This element specifies the horizontal text alignment for the object. Valid values are Left, Justify, Center, Right and Distributed. If omitted, the alignment is assumed to be Left. This element is used for attached text.

[Example:

```
<x:ClientData ... > ...
 <x:TextHAlign>Right</x:TextHAlign>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.61 TextVAlign (Vertical Text Alignment)

This element specifies the horizontal text alignment for the object. Valid values are Top, Justify, Center, Bottom and Distributed. If omitted, the alignment is assumed to be Top. This element is used for attached text.

[Example:

```
<x:ClientData ... > ...
 <x:TextVAlign>Center</x:TextVAlign>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6.4.2.62 UIObj (UI Object Toggle)

This element defines whether the object is a UI object. If this element is specified without a value, it is assumed to be true. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:UIObj>True</x:UIObj>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.63 Val (Scroll bar position)

This element specifies the scroll bar position as the index of the list item just above the item at the top of the view, given the current scroll position. The list indexes are 1-based. If omitted, the value is assumed to be 0.

This element is used for scroll bars and spinners.

[Example: The first list item (item 1) is just off the top of the view. The second list item is at the top of the view.

```
<x:ClientData ... > ...
 <x:Val>1</x:Val>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.64 ValidIds (Valid ID)

This element specifies that the ID of a linked object is valid. This is a general-use element.

[Example:

```
<x:ClientData ... > ...
 <x:ValidIds>True</x:ValidIds>
</x:ClientData>
```

*end example]*

The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

### 6.4.2.65 Visible (Comment Visibility Toggle)

This element specifies that a comment is visible. If omitted, the comment is assumed to be invisible. If this element is specified without a value, it is assumed to be true. This element is used for comments.

[Example:

```

1 <x:ClientData ... > ...
2 <x:Visible>True</x:Visible>
3 </x:ClientData>

```

4 *end example]*

5 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 6 6.4.2.66 VScroll (Vertical Scroll)

7 This element specifies that the object has a vertical scroll. If omitted, a vertical scroll is not used. If this element  
8 is specified without a value, it is assumed to be true. This element is used for edit controls.

9 *[Example:*

```

10 <x:ClientData ... > ...
11 <x:VScroll>True</x:VScroll>
12 </x:ClientData>

```

13 *end example]*

14 The possible values for this element are defined by the ST\_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

#### 15 6.4.2.67 VTEdit (Validation Type)

16 This element specifies the type of validation to use for data input to the control. If omitted, the value is  
17 assumed to be Text. Valid values are:

Value	Description
0	Text
1	Integer
2	Number
3	Reference
4	Formula

18

19 This element is used for edit controls.

20 *[Example:*

```

1 <x:ClientData ... > ...
2 <x:VTEdit>True</x:VTEdit>
3 </x:ClientData>

```

4 *end example]*

5 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

#### 6 6.4.2.68 WidthMin (Minimum Width)

7 This element specifies the smallest width allowed for the dropdown window in screen pixels. This element is  
8 used for list boxes and dropdowns.

9 *[Example:*

```

10 <x:ClientData ... > ...
11 <x:WidthMin>78</x:WidthMin>
12 </x:ClientData>

```

13 *end example]*

14 The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

### 15 6.4.3 Simple Types

16 This is the complete list of simple types in the urn:schemas-microsoft-com:office:excel namespace.

#### 17 6.4.3.1 ST\_CF (Clipboard Format Type)

18 This simple type specifies the allowed clipboard formats.

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
Bitmap (Bitmap)	Bitmap.
Pict (EMF)	Enhanced metafile.
PictOld (WMF)	Windows metafile.
PictPrint (Printer Picture)	An image rendered using the default printer's settings. This is typically of higher resolution and scaled

Enumeration Value	Description
	differently compared to a picture created for on-screen rendering.
PictScreen (Screen Picture EMF)	An image rendered using screen settings. This is typically lower resolution than an image created for printing.

1

Referenced By
CF (§6.4.2.10)

### 2 6.4.3.2 ST\_ObjectType (Object Type)

3 This simple type specifies the types of objects that a ClientData element can represent.

4 This simple type's contents are a restriction of the XML Schema string datatype.

5 The following are possible enumeration values for this type:

Enumeration Value	Description
Button (Pushbutton)	A pushbutton control.
Checkbox (Checkbox)	A checkbox control.
Dialog (Dialog)	A dialog.
Drop (Dropdown Box)	A dropdown (combo box) control.
Edit (Editable Text Field)	An editable text field control.
GBox (Group Box)	A group box control.
Group (Group)	A group of objects, such as a group of checkboxes.
Label (Label)	A label control.
LineA (Auditing Line)	A formula auditing arrow.
List (List Box)	A list control.
Movie (Movie)	A movie object in Mac format.
Note (Comment)	A comment.
Pict (Image)	A placeholder image.
Radio (Radio Button)	A radio button control.
Rect (Plain Rectangle)	A rectangle shape that is not a control.
RectA (Auditing Rectangle)	A formula auditing rectangle.
Scroll (Scroll Bar)	A scroll bar.
Shape (Plain Shape)	A general shape that is not a control.
Spin (Spin Button)	A spin button (spinner) control.

6

Referenced By
ClientData@ObjectType (§6.4.2.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ObjectType">
 <restriction base="xsd:string">
 <enumeration value="Button"/>
 <enumeration value="Checkbox"/>
 <enumeration value="Dialog"/>
 <enumeration value="Drop"/>
 <enumeration value="Edit"/>
 <enumeration value="GBox"/>
 <enumeration value="Label"/>
 <enumeration value="LineA"/>
 <enumeration value="List"/>
 <enumeration value="Movie"/>
 <enumeration value="Note"/>
 <enumeration value="Pict"/>
 <enumeration value="Radio"/>
 <enumeration value="RectA"/>
 <enumeration value="Scroll"/>
 <enumeration value="Spin"/>
 <enumeration value="Shape"/>
 <enumeration value="Group"/>
 <enumeration value="Rect"/>
 </restriction>
</simpleType>
```

### 6.4.3.3 ST\_TrueFalseBlank (Boolean Value with Blank State)

This element specifies logical true and false. Any string that does not evaluate to true is considered false.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
(Blank - Default Value)	Use the default true or false value as defined by the element. If an element does not define a specific value for this state, it is assumed to be true.
f (Logical False)	Logical false.
False (Logical False)	Logical false.
t (Logical True)	Logical true.
True (Logical True)	Logical true.

## 6.5 VML - PresentationML Drawing

This section describes additional information attached to VML shapes that is specific to usage with PresentationML.

[*Note:* The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example:* Assume the following annotation was drawn on a slide during a presentation and saved into the presentation:

- Bullet point

The red circle annotation is stored as a VML shape that is an ink annotation. For brevity, the specific path and ink data are omitted.

```
<v:shape id="_x0000_s1029" style='position:absolute;left:126pt;
top:327.375pt;width:27.625pt;height:24.75pt' coordorigin="4445,11549"
coordsize="973,874" path="..." filled="f" strokecolor="red"
strokeweight="1.5pt">
 <v:stroke endcap="round"/>
 <v:path shadowok="f" o:extrusionok="f" fillok="f" insetpenok="f"/>
 <o:lock v:ext="edit" rotation="t" aspectratio="t" verticies="t" text="t"
 shapetype="t"/>
 <o:ink i="..." annotation="t"/>
 <p:iscomment/>
</v:shape>
```

*end example]*

### 6.5.1 Table of Contents

This subclause is informative.

<b>6.5.2 Elements</b> .....	<b>4959</b>
6.5.2.1 iscomment (Ink Annotation Flag) .....	4959
6.5.2.2 textdata (VML Diagram Text) .....	4959

**End of informative text.**

## 6.5.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:office:powerpoint namespace:

[*Note:* As the VML format is a format provided for backward compatibility, those VML elements defined in the same urn:schemas-microsoft-com:office:powerpoint namespace will remain in that namespace as it is already used by millions of documents already using VML. *end note*]

### 6.5.2.1 iscomment (Ink Annotation Flag)

Specifies that the object was created as an ink annotation. Default is false. If this element is specified without a value, it is assumed to be true. This element is only used with PresentationML. [*Rationale* This allows an application to treat annotation ink objects as any other annotation. For example, if annotations are hidden, the application can hide the ink object. *end rationale*]

[*Example:*

```
<v:shape ... >
 <o:ink ... annotation="true"/>
 <p:iscomment/>
</v:shape>
```

• **Bullet point**

*end example]*

Parent Elements
shape (§6.1.2.19)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

### 6.5.2.2 textdata (VML Diagram Text)

This element specifies optional supplementary text information associated with a legacy VML shape that is a node in a VML diagram when it cannot otherwise be stored within the DrawingML framework.

[*Note:* An application could use this to preserve a specific diagram format for backward compatibility, but it is strongly recommended to upgrade all VML shapes to DrawingML shapes. *end note*]

1

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
id (Text Reference)	<p>Specifies the identifier that is used in conjunction with a corresponding relationship file to resolve the location of the diagram shape text.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:dgmnodekind="0" &gt;   &lt;v:textbox inset="0,0,0,0"/&gt;   &lt;p:textdata id="rId1"/&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Rel">
4 <attribute name="id" type="xsd:string"/>
5 </complexType>
```

# 7. Shared MLs Reference Material

## 7.1 Math

The following documentation describes the XML representation of equations. The outermost element is oMathPara, a paragraph of one or more equations. Each equation inside the math paragraph is represented as a single oMath. Inside each oMath is a combination of runs (r) and objects or functions (such as accents, acc, or fractions, (f).

### 7.1.1 Table of Contents

## 7.1.2 Elements

The following elements describe contents of equations.

### 7.1.2.1 acc (Accent)

This element specifies the accent function, consisting of a base and a combining diacritical mark. [Example: Example accent functions are  $\acute{a}$ ,  $\acute{a}$ , and  $\tilde{a}$ .

```

<m:acc>
 <m:accPr>
 <m:chr m:val="̃" />
 <m:ctrlPr />
 </m:accPr>
 <m:e>
 <m:r>
 <m:t>a</m:t>
 </m:r>
 </m:e>
</m:acc>

```

*end example]*

**Parent Elements**

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
accPr (Accent Properties)	§7.1.2.2
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Acc">
 <sequence>
 <element name="accPr" type="CT_AccPr" minOccurs="0"/>
 <element name="e" type="CT_OMathArg"/>
 </sequence>
</complexType>
```

### 7.1.2.2 accPr (Accent Properties)

This element specifies the properties of the Accent function. [Example:

```
<m:accPr>
 <m:chr m:val="̃" />
 <m:ctrlPr />
</m:accPr>
```

end example]

Parent Elements
acc (§7.1.2.1)

Child Elements	Subclause
chr (Accent Character)	§7.1.2.20
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AccPr">
 <sequence>
 <element name="chr" type="CT_Char" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.3 aln (Alignment)

This element specifies the alignment property on the box function. It is utilized only when the box is designated as an operator emulator. When true, this operator emulator serves as an alignment point; that is, designated alignment points in other equations can be aligned with it. *[Example:* For example, the following equation uses the operator emulator as an alignment point.  $a == b$ .

Its XML representation is as follows:

```
<m:oMath>
 <m:r>
 <m:t>a</m:t>
 </m:r>
 <m:box>
 <m:boxPr>
 <m:opEmu m:val="on"/>
 <m:aln m:val="on"/>
 <m:ctrlPr/>
 </m:boxPr>
 <m:e>
 <m:r>
 <m:t>==</m:t>
 </m:r>
 </m:e>
 </m:box>
 <m:r>
 <m:t>b</m:t>
 </m:r>
</m:oMath>
```

*end example]*

#### Parent Elements

boxPr (§7.1.2.14); rPr (§7.1.2.91)

#### Attributes

#### Description

val (value)

Specifies a binary value for the property defined by the parent XML element.

A value of `on` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of `off` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 7.1.2.4 [alnScr \(Align Scripts\)](#)

6 This element specifies the alignment of scripts in the subscript/superscript function. When on, subscripts and  
7 superscripts are aligned to each other. When off, they are kerned to the shape of the base. If this element is  
8 omitted, scripts are not aligned. [Example: Example (OFF):  $f_2^3$ ; Example (ON):  $f_2^3$ .

9 The XML representation of the second example above is:

```
10 <m:sSubSup>
11 <m:sSubSupPr>
12 <m:alnScr m:val="on"/>
13 </m:sSubSupPr>
14 <m:e>
15 <m:r>
16 <m:t>f</m:t>
17 </m:r>
18 </m:e>
19 <m:sub>
20 <m:r>
21 <m:rPr>
22 <m:scr m:val="roman"/>
23 <m:sty m:val="p"/>
24 </m:rPr>
25 <m:t>2</m:t>
26 </m:r>
27 </m:sub>
28 <m:sup>
29 <m:r>
30 <m:rPr>
31 <m:scr m:val="roman"/>
32 <m:sty m:val="p"/>
33 </m:rPr>
34 <m:t>3</m:t>
35 </m:r>
36 </m:sup>
37 </m:sSubSup>
```

1 *end example]*

Parent Elements
sSubSupPr (§7.1.2.104)

2

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_OnOff">
5 <attribute name="val" type="ST_OnOff"/>
6 </complexType>
```

#### 7 7.1.2.5 `argPr` (Argument Properties)

8 This element specifies any properties of the math argument. [*Example:* The XML below represents the `argSz`  
9 attribute on the base element `e` of a box:

```

10 <m:box>
11 <m:boxPr>
12 <m:noBreak m:val="off"/>
13 <m:ctrlPr/>
14 </m:boxPr>
15 <m:e>
16 <m:argPr>
17 <m:argSz m:val="-1"/>
18 </m:argPr>
19 <m:r>
20 <m:t>abc</m:t>
21 </m:r>
22 </m:e>
23 </m:box>
```

24 *end example]*

Parent Elements
-----------------

Parent Elements
deg (§7.1.2.26); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); lim (§7.1.2.52); num (§7.1.2.75); sub (§7.1.2.112); sup (§7.1.2.114)

1

Child Elements	Subclause
argSz (Argument Size)	§7.1.2.6

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_OMathArgPr">
4 <sequence>
5 <element name="argSz" type="CT_Integer2" minOccurs="0"/>
6 </sequence>
7 </complexType>

```

### 8 7.1.2.6 argSz (Argument Size)

9 This element specifies the size, or script level, of an argument. If the element is omitted, the default argument  
10 size is 0. [Example: The following example contains three runs: regular text in the equation, a box object with  
11 the base at script size (val=-1) and a box object with the base at script-script size (val=-2).

$$abc_{abc} abc$$

12 The XML below shows argSize used in the middle box.

```

13 <m:box>
14 <m:boxPr>
15 <m:noBreak m:val="off"/>
16 </m:boxPr>
17 <m:e>
18 <m:argPr>
19 <m:argSz m:val="-1"/>
20 </m:argPr>
21 <m:r>
22 <m:t>abc</m:t>
23 </m:t>
24 </m:e>
25 </m:box>

```

26 end example]

Parent Elements
argPr (§7.1.2.5)

27

Attributes	Description
------------	-------------

Attributes	Description																
val (Value)	<p>Specifies a value between -2 and 2 for the property defined by the parent XML element. The positive or negative sign specifies in which direction to change argument size; the absolute value specifies by how much.</p> <p>The table below represents two cases in which argument size can be changed: superscripts and boxes.</p> <p>In the superscript object <math>a^{b^c}</math>, by default the term <math>c</math> has script-script size. Should the user wish for the <math>c</math> to be shown at script size, val should be set to +1 (that is, one size larger). Should the user wish for <math>c</math> to be shown at text size, val should be set to +2 (that is, two sizes larger).</p> <table> <tr> <th>val of <math>c</math> in <math>a^{b^c}</math></th><th>Display</th></tr> <tr> <td>Default</td><td><math>a^{b^c}</math></td></tr> <tr> <td>+1</td><td><math>a^{b^c}</math></td></tr> <tr> <td>+2</td><td><math>a^{b^C}</math></td></tr> </table> <table> <tr> <th>val of <math>abc</math></th><th>Display</th></tr> <tr> <td>Default</td><td><math>abc</math></td></tr> <tr> <td>-1</td><td><math>abc</math></td></tr> <tr> <td>-2</td><td><math>abc</math></td></tr> </table> <p>The possible values for this attribute are defined by the ST_Integer2 simple type (§7.1.3.5).</p>	val of $c$ in $a^{b^c}$	Display	Default	$a^{b^c}$	+1	$a^{b^c}$	+2	$a^{b^C}$	val of $abc$	Display	Default	$abc$	-1	$abc$	-2	$abc$
val of $c$ in $a^{b^c}$	Display																
Default	$a^{b^c}$																
+1	$a^{b^c}$																
+2	$a^{b^C}$																
val of $abc$	Display																
Default	$abc$																
-1	$abc$																
-2	$abc$																

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Integer2">
3 <attribute name="val" type="ST_Integer2" use="required"/>
4 </complexType>
```

#### 5 7.1.2.7 bar (Bar)

6 This element specifies the bar function, consisting of a base argument and an overbar or underbar, as in  $\overline{a}$  and  $\underline{a}$ .

7 [Example: The XML below demonstrates the overbar in use.

```

8 <m:bar>
9 <m:barPr>
10 <m:pos m:val="top"/>
11 </m:barPr>
```

```

1 <m:e>
2 <m:r>
3 <m:t>a</m:t>
4 </m:r>
5 </m:e>
6 </m:bar>

```

7 *end example]*

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

8

Child Elements	Subclause
barPr (Bar Properties)	§7.1.2.8
e (Base (Argument))	§7.1.2.32

9 The following XML Schema fragment defines the contents of this element:

```

10 <complexType name="CT_Bar">
11 <sequence>
12 <element name="barPr" type="CT_BarPr" minOccurs="0"/>
13 <element name="e" type="CT_OMathArg"/>
14 </sequence>
15 </complexType>

```

## 16 7.1.2.8 barPr (Bar Properties)

17 This element specifies properties of the bar function. If this element is omitted, the bar assumes its default  
 18 location of top (the mathematical overbar).

Parent Elements
bar (§7.1.2.7)

19

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
pos (Position (Bar))	§7.1.2.84

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarPr">
 <sequence>
 <element name="pos" type="CT_TopBot" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.9 baseJc (Matrix Base Justification)

This element specifies the justification of the matrix. Text outside of the matrix can be aligned with the bottom, top, or center of a matrix function. If this element is omitted, the matrix assumes center justification.

[Example: This matrix has center baseJc:  $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$ ]

This matrix has top baseJc:  $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

This matrix has bottom baseJc:  $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

The XML below represents the matrix with top baseJC:

```
<m:d>
 <m:dPr>
 <m:shp m:val="match"/>
 </m:dPr>
 <m:e>
 <m:m>
 <m:mPr>
 <m:baseJc m:val="top"/>
 <m:mcs>
 <m:mc>
 <m:mcPr>
 <m:mcJc m:val="center"/>
 <m:count m:val="2"/>
 </m:mcPr>
 </m:mc>
 </m:mcs>
 </m:mPr>
 </m:m>
 </m:e>
</m:d>
```

```

1 <m:mr>
2 <m:e>
3 <m:r>
4 <m:rPr>
5 <m:scr m:val="roman"/>
6 <m:sty m:val="p"/>
7 </m:rPr>
8 <m:t>1</m:t>
9 </m:r>
10 </m:e>
11 <m:e>
12 <m:r>
13 <m:rPr>
14 <m:scr m:val="roman"/>
15 <m:sty m:val="p"/>

5 <m:sty m:val="p"/>
6 </m:rPr>
7 <m:t>5</m:t>
8 </m:r>
9 </m:e>
10 <m:e>
11 <m:r>
12 <m:rPr>
13 <m:scr m:val="roman"/>
14 <m:sty m:val="p"/>
15 </m:rPr>
16 <m:t>6</m:t>
17 </m:r>
18 </m:e>
19 </m:mr>
20 </m:m>
21 </m:e>
22 </m:d>
23 end example]
```

24

Parent Elements
eqArrPr (§7.1.2.35); mPr (§7.1.2.68)

Attributes	Description
val (Value)	<p>Specifies the vertical justification parent element respect to surrounding text. Possible values are top, bot, and center. <i>[Example: The following examples illustrate baseJc on the matrix object m.</i></p> <p>This matrix has center baseJc: <math>\begin{pmatrix} 1 &amp; 2 \\ 3 &amp; 4 \\ 5 &amp; 6 \end{pmatrix}</math></p> <p>This matrix has top baseJc: <math>\begin{pmatrix} 1 &amp; 2 \\ 3 &amp; 4 \\ 5 &amp; 6 \end{pmatrix}</math></p> <p>This matrix has bot baseJc: <math>\begin{pmatrix} 1 &amp; 2 \\ 3 &amp; 4 \\ 5 &amp; 6 \end{pmatrix}</math></p> <p>The possible values for this attribute are defined by the ST_YAlign simple type (§7.1.3.19).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_YAlign">
 <attribute name="val" type="ST_YAlign" use="required"/>
</complexType>
```

### 7.1.2.10 begChr (Delimiter Beginning Character)

This element specifies the beginning, or opening, delimiter character. Mathematical delimiters are enclosing characters such as parentheses, brackets, and braces. If this element is omitted, the default begChr is '('.

[Example: In the following example, {*a*} uses { and } as its enclosing characters:

```
<m:dPr>
 <m:begChr m:val="{"/>
 <m:endChr m:val="}"/>
</m:dPr>
```

*end example]*

#### Parent Elements

dPr (§7.1.2.31)

#### Attributes

#### Description

val (value)

Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [Example: delimiter object {*a*]:

```
<m:dPr>
 <m:begChr m:val="{"/>
 <m:endChr m:val="}"/>
</m:dPr>
```

The possible values for this attribute are defined by the ST\_Char simple type (§7.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Char">
 <attribute name="val" type="ST_Char" use="required"/>
</complexType>
```

### 7.1.2.11 borderBox (Border-Box Function)

This element specifies the Border Box function, consisting of a border drawn around an equation, as in

$a^2 + b^2 = c^2$ .

[Example: The following example shows the XML representation of the following Border Box:  $abc$ ]

```

1 <m:borderBox>
2 <m:e>
3 <m:r>
4 <m:t>abc</m:t>
5 </m:r>
6 </m:e>
7 </m:borderBox>

```

8 *end example]*

#### Parent Elements

deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

9

#### Child Elements

#### Subclause

borderBoxPr (Border Box Properties)

§7.1.2.12

e (Base (Argument))

§7.1.2.32

10 The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_BorderBox">
12 <sequence>
13 <element name="borderBoxPr" type="CT_BorderBoxPr" minOccurs="0"/>
14 <element name="e" type="CT_OMathArg"/>
15 </sequence>
16 </complexType>

```

### 17 7.1.2.12 borderBoxPr (Border Box Properties)

18 This element specifies the properties of the Border Box function, which dictate the types of lines that can be  
 19 drawn as part of the border. [Example:  (Diagonal Strikethrough from Top Left) and   
 20 (no left or right edges).

#### Parent Elements

borderBox (§7.1.2.11)

21

#### Child Elements

#### Subclause

ctrlPr (Control Properties)

§7.1.2.23

hideBot (Hide Bottom Edge)

§7.1.2.44

hideLeft (Hide Left Edge)

§7.1.2.45

hideRight (Hide Right Edge)

§7.1.2.46

Child Elements	Subclause
hideTop (Hide Top Edge)	§7.1.2.47
strikeBLTR (Border Box Strikethrough Bottom-Left to Top-Right)	§7.1.2.107
strikeH (Border Box Strikethrough Horizontal)	§7.1.2.108
strikeTLBR (Border Box Strikethrough Top-Left to Bottom-Right)	§7.1.2.109
strikeV (Border Box Strikethrough Vertical)	§7.1.2.110

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_BorderBoxPr">
 <sequence>
 <element name="hideTop" type="CT_OnOff" minOccurs="0"/>
 <element name="hideBot" type="CT_OnOff" minOccurs="0"/>
 <element name="hideLeft" type="CT_OnOff" minOccurs="0"/>
 <element name="hideRight" type="CT_OnOff" minOccurs="0"/>
 <element name="strikeH" type="CT_OnOff" minOccurs="0"/>
 <element name="strikeV" type="CT_OnOff" minOccurs="0"/>
 <element name="strikeBLTR" type="CT_OnOff" minOccurs="0"/>
 <element name="strikeTLBR" type="CT_OnOff" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>

```

### 7.1.2.13 box (Box Function)

This element specifies the box function, which is used to group components of an equation. A boxed object can (for example) serve as an operator emulator with or without an alignment point, serve as a line break point, have associated argSz, or be grouped such as not to allow line breaks within.

The equation  $a == b$  uses a box around the double equal sign.

[Example: Its XML representation is as follows:

```

<m:r>
 <m:t>a</m:t>
</m:r>
<m:box>
 <m:boxPr>
 <m:opEmu m:val="on"/>
 <m:aln/>
 </m:boxPr>
 <m:e>
 <m:r>
 <m:t>==</m:t>
 </m:r>
 </m:e>
</m:box>

```

1       <m:r>  
 2           <m:t>b</m:t>  
 3       </m:r>

4   *end example]*

deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

5

Child Elements	Subclause
boxPr (Box Properties)	§7.1.2.14
e (Base (Argument))	§7.1.2.32

6   The following XML Schema fragment defines the contents of this element:

```

7 <complexType name="CT_Box">
8 <sequence>
9 <element name="boxPr" type="CT_BoxPr" minOccurs="0"/>
10 <element name="e" type="CT_OMathArg"/>
11 </sequence>
12 </complexType>
```

### 13   7.1.2.14       boxPr (Box Properties)

14   This element specifies properties of the Box function, for example, whether the Box serves as operator emulator  
 15   with or without an alignment point, serves as a line break point, or receives the correct spacing for the  
 16   mathematical differential.

Parent Elements
box (§7.1.2.13)

17

Child Elements	Subclause
aln (Alignment)	§7.1.2.3
brk (Break)	§7.1.2.15
ctrlPr (Control Properties)	§7.1.2.23
diff (Differential)	§7.1.2.29
noBreak (No Break)	§7.1.2.73
opEmu (Operator Emulator)	§7.1.2.80

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BoxPr">
 <sequence>
 <element name="opEmu" type="CT_OnOff" minOccurs="0"/>
 <element name="noBreak" type="CT_OnOff" minOccurs="0"/>
 <element name="diff" type="CT_OnOff" minOccurs="0"/>
 <element name="brk" type="CT_ManualBreak" minOccurs="0"/>
 <element name="aln" type="CT_OnOff" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

7.1.2.15 brk (Break)

This element specifies whether there is a line break at the start of a run, or at the start of the Box function, such that the line wraps at the start of the run or function. If this element is omitted, a manual break is not inserted. The line may happen to wrap at this point if the equation exceeds the column width. [Example:The following example includes a manual line break at the operator emulator:

$$a \\ == b$$

```
<m:r>
 <m:t>a</m:t>
</m:r>
<m:box>
 <m:boxPr>
 <m:opEmu m:val="on"/>
 <m:brk/>
 </m:boxPr>
 <m:e>
 <m:r>
 <m:t>==</m:t>
 </m:r>
 </m:e>
</m:box>
<m:r>
 <m:t>b</m:t>
</m:r>
```

end example]

Parent Elements
boxPr (§7.1.2.14); rPr (§7.1.2.91)

Attributes	Description
alnAt (Index of Operator to Align To)	<p>Specifies the index of the operator on the previous line which shall be used as the alignment point for the current line. A line can be aligned to any operator on the previous line in the equation; this attribute specifies exactly which operator shall be the target of that alignment in cases where there are multiple operators.</p> <p>[Example: For example, consider the break in this equation:</p> $\begin{array}{r} a + b + c + d + e \\ + f + g \end{array}$ <p>The second line could theoretically be aligned to any of the four operators in the previous line.</p> <p>Specifying an alnAt value of 3 for the second line resolves this ambiguity; the second line is aligned to the third operator in the previous line. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Integer255 simple type (§7.1.3.6).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_ManualBreak">
3 <attribute name="alnAt" type="ST_Integer255"/>
4 </complexType>
```

5 7.1.2.16 brkBin (Break on Binary Operators)

6 This element specifies how binary operators are treated when they coincide with a line break. If this element is  
7 omitted, the line break occurs before the binary operator. That is, the binary operator is the first element on the  
8 wrapped line. [Example: For example:

$$\begin{array}{r} f(x) = a_{11} + a_{12} + \cdots \\ + a_{nn} \end{array}$$

Before

$$\begin{array}{r} f(x) = a_{11} + a_{12} + \cdots + \\ a_{nn} \end{array}$$

After

$$\begin{array}{r} f(x) = a_{11} + a_{12} + \cdots + \\ + a_{nn} \end{array}$$

Duplicate

9

10 The XML below demonstrates brkBin in use under mathPr:

```
11 <m:mathPr>
12 <m:mathFont m:val="Cambria Math"/>
13 <m:brkBin m:val="before"/>
14 <m:brkBinSub m:val="--"/>
15 <m:smallFrac m:val="off"/>
16 <m:dispDef/>
```

```

1 <m:lMargin m:val="0"/>
2 <m:rMargin m:val="0"/>
3 <m:defJc m:val="centerGroup"/>
4 <m:wrapIndent m:val="1440"/>
5 <m:intLim m:val="subSup"/>
6 <m:naryLim m:val="undOvr"/>
7 </m:mathPr>

```

8 *end example]*

Parent Elements
mathPr (§7.1.2.62)

9

Attributes	Description
val (Value)	Specifies where to break on binary operators. Possible values are before, after, and repeat.  The possible values for this attribute are defined by the ST_BreakBin simple type (§7.1.3.1).

10 The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_BreakBin">
12 <attribute name="val" type="ST_BreakBin"/>
13 </complexType>

```

#### 14 7.1.2.17 brkBinSub (Break on Binary Subtraction)

15 This element specifies how the subtraction operator is treated when it coincides with a line break, when brkBin  
16 is set to repeat. If this element is omitted, the subtraction operator is repeated before and after the break.

17 [Example: The XML below demonstrates brkBinSub in use under mathPr:

```

18 <m:mathPr>
19 <m:mathFont m:val="Cambria Math"/>
20 <m:brkBin m:val="before"/>
21 <m:brkBinSub m:val="--"/>
22 <m:smallFrac m:val="off"/>
23 <m:dispDef/>
24 <m:lMargin m:val="0"/>
25 <m:rMargin m:val="0"/>
26 <m:defJc m:val="centerGroup"/>
27 <m:wrapIndent m:val="1440"/>
28 <m:intLim m:val="subSup"/>
29 <m:naryLim m:val="undOvr"/>
30 </m:mathPr>

```

1 *end example]*

Parent Elements
mathPr (§7.1.2.62)

2

Attributes	Description
val (Value)	Specifies how the subtraction operator is treated when it coincides with a line break, when brkBin is set to repeat. Possible values are --, -+, and +-.  The possible values for this attribute are defined by the ST_BreakBinSub simple type (§7.1.3.2).

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_BreakBinSub">
5 <attribute name="val" type="ST_BreakBinSub"/>
6 </complexType>
```

## 7 7.1.2.18 cGp (Matrix Column Gap)

8 The additional (custom) column gap spacing information; the default is '0'. [Example: This matrix:  $\begin{matrix} 1 & 2 \\ 3 & 4 \end{matrix}$  has  
9 .5 ems of additional spacing between columns. The matrix properties that demonstrate this element in use are:

```
10 <m:mPr>
11 <m:cGpRule m:val="4"/>
12 <m:cGp m:val="6"/>
13 <m:mCS>
14 <m:mc>
15 <m:mcPr>
16 <m:mcJc m:val="center"/>
17 <m:count m:val="2"/>
18 </m:mcPr>
19 </m:mc>
20 </m:mCS>
21 </m:mPr>
```

22 *end example]*

Parent Elements
mPr (§7.1.2.68)

23

Attributes	Description
------------	-------------

Attributes	Description
val (Value)	<p>Specifies the amount of space between the parent element. The manner in which this value is determined depends on the setting of the rule of the parent element. If the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as lines.</p> <p>The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§7.1.3.17).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_UnSignedInteger">
3 <attribute name="val" type="ST_UnSignedInteger" use="required"/>
4 </complexType>
```

### 5 7.1.2.19 cGpRule (Matrix Column Gap Rule)

6 This element specifies the type of horizontal spacing between columns in a matrix. Type of gap (horizontal  
7 spacing) between columns of a Matrix; the default is '0'. [Example: The following matrix has double spacing  
8 between columns:

1	2
3	4

9 The XML that represents this property in use is:

```
10 <m:mPr>
11 <m:cGpRule m:val="2"/>
12 <m:mCS>
13 <m:mc>
14 <m:mcPr>
15 <m:mcJc m:val="center"/>
16 <m:count m:val="2"/>
17 </m:mcPr>
18 </m:mc>
19 </m:mCS>
20 </m:mPr>
```

21 *end example]*

Parent Elements
mPr (§7.1.2.68)

22

Attributes	Description
val (Value)	Specifies the type of spacing between rows and/or columns. Possible values are 0, 1, 2, 3, or 4, whose definitions are contained in the following table:

Attributes	Description		
	<b>Value</b>	<b>Column/Row Gap</b>	<b>Example</b>
	0	Single spacing gap	1 2
	1	1.5 spacing gap	1 2
	2	2 spacing gap	1 2
	3	Exactly (for columns, rely on value of cGp, measured in points) (for rows, rely on value of rSp, measured in points)	1 2
	4	Multiple (for columns, rely on value of cGp, measured in lines) (for rows, rely on value of rSp, measured in lines)	1 2
The possible values for this attribute are defined by the ST_SpacingRule simple type (§7.1.3.12).			

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_SpacingRule">
3 <attribute name="val" type="ST_SpacingRule" use="required"/>
4 </complexType>
```

### 5 7.1.2.20 chr (Accent Character)

6 This element specifies the type of combining diacritical mark attached to the base of the accent function. If this  
7 property is omitted, the default accent character is U+0302. [Example: Examples of accent characters are the  
8 dot, hat, and arrow in the following cases:  $\acute{a}$   $\hat{a}$   $\vec{a}$ .

9 For example, the following XML represents the acc  $\tilde{a}$ .

```
10 <m:acc>
11 <m:accPr>
12 <m:chr m:val="̃" />
13 </m:accPr>
14 <m:e>
15 <m:r>
16 <m:t>a</m:t>
17 </m:r>
18 </m:e>
19 </m:acc>
```

1 *end example]*

Parent Elements
accPr (§7.1.2.2); groupChrPr (§7.1.2.42); naryPr (§7.1.2.72)

2

Attributes	Description
val (value)	<p>Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [<i>Example:</i> delimiter object {a}:  <pre>&lt;m:dPr&gt;   &lt;m:begChr m:val="{"/&gt;   &lt;m:endChr m:val="}"/&gt; &lt;/m:dPr&gt;</pre></p> <p>The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).</p>

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_Char">
5 <attribute name="val" type="ST_Char" use="required"/>
6 </complexType>
```

#### 7 7.1.2.21 count (Matrix Column Count)

8 This element specifies the number of columns to which a property applies. [*Example:* The example below  
9 represents that two of the columns in the matrix described by the XML have the center property.

```
10 <m:mPr>
11 <m:cSp m:val="120"/>
12 <m:mcs>
13 <m:mc>
14 <m:mcPr>
15 <m:mcJc m:val="center"/>
16 <m:count m:val="2"/>
17 </m:mcPr>
18 </m:mc>
19 </m:mcs>
20 </m:mPr>
```

21 *end example]*

Parent Elements
mcPr (§7.1.2.66)

22

Attributes	Description
------------	-------------

Attributes	Description
val (Value)	<p>Specifies the number of columns to which a column attribute applies.</p> <p>[Example: A count attribute value of 3 specifies that the property applies to the first three columns of the matrix. end example]</p> <p>The possible values for this attribute are defined by the ST_Integer255 simple type (§7.1.3.6).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Integer255">
 <attribute name="val" type="ST_Integer255" use="required"/>
</complexType>
```

### 7.1.2.22 cSp (Matrix Column Spacing)

This element specifies the minimum spacing between the edge of one column and the corresponding edge of the adjacent column. Additional spacing can be added to enhance appearance. If this element is omitted, the default is column spacing is '0'. [Example: The following matrix specifies that there should never be fewer than 6 pts. between adjacent column edges:

```
1 2
3 4
```

```
<m:mPr>
 <m:cSp m:val="120"/>
 <m:mCS>
 <m:mc>
 <m:mcPr>
 <m:mcJc m:val="center"/>
 <m:count m:val="2"/>
 </m:mcPr>
 </m:mc>
 </m:mCS>
</m:mPr>
```

end example]

Parent Elements
mPr (§7.1.2.68)

Attributes	Description
val (Value)	<p>Specifies the amount of space between the parent element. The manner in which this value is determined depends on the setting of the rule of the parent element. If the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or</p>

Attributes	Description
	<p>"Multiple"), then the unit is interpreted as lines.</p> <p>The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§7.1.3.17).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnSignedInteger">
 <attribute name="val" type="ST_UnSignedInteger" use="required"/>
</complexType>
```

### 7.1.2.23 ctrlPr (Control Properties)

This element specifies properties on control characters; that is, object characters that cannot be selected. Examples of control characters are n-ary operators (excluding their limits and bases), fraction bars (excluding the numerator and denominator), and grouping characters (excluding the base). ctrlPr allows formatting properties to be stored on these control characters. The control character inherits its formatting from the paragraph formatting; ctrlPr contains the formatting differences between the control character and the paragraph formatting.

[*Example:* The example below shows that the control character is of font Cambria Math. All other formatting, such as text size and color, are the same as the paragraph.

```
<m:ctrlPr>
 <w:rPr>
 <w:rFonts w:ascii="Cambria Math" w:hAnsi="Cambria Math"/>
 </w:rPr>
</m:ctrlPr>
```

*end example]*

CtrlPr is also used to save properties on characters used in the Linear representation of an equation, that are not displayed in the Professional form. For example, the linear string  $\int_0^1$  might have color on the  $_$  or  $^$ . Though these characters are not displayed in Professional form, their formatting is stored.

Parent Elements
accPr (§7.1.2.2); barPr (§7.1.2.8); borderBoxPr (§7.1.2.12); boxPr (§7.1.2.14); deg (§7.1.2.26); den (§7.1.2.28); dPr (§7.1.2.31); e (§7.1.2.32); eqArrPr (§7.1.2.35); fNamePr (§7.1.2.37); fPr (§7.1.2.38); funcPr (§7.1.2.40); groupChrPr (§7.1.2.42); lim (§7.1.2.52); limLowPr (§7.1.2.55); limUppPr (§7.1.2.57); mPr (§7.1.2.68); naryPr (§7.1.2.72); num (§7.1.2.75); phantPr (§7.1.2.82); radPr (§7.1.2.89); sPrePr (§7.1.2.100); sSubPr (§7.1.2.102); sSubSupPr (§7.1.2.104); sSupPr (§7.1.2.106); sub (§7.1.2.112); sup (§7.1.2.114)

5 </sequence>
6 </complexType>

```

### 7 7.1.2.24 d (Delimiter Function)

8 This element specifies the delimiter function, consisting of opening and closing delimiters (such as parentheses,  
9 braces, brackets, and vertical bars), and an element contained inside. The delimiter may have more than one  
10 element, with a designated separator character between each element. *[Example:*

11 Delimiter with one base:  $(x^2)$

12 Delimiter with more than one base and separators, whose XML is shown below:  $(x^2|y^2)$

```

13 <m:d>
14 <m:e>
15 <m:sSup>
16 <m:e>
17 <m:r>
18 <m:t>x</m:t>
19 </m:r>
20 </m:e>

Child Elements	Subclause
dPr (Delimiter Properties)	§7.1.2.31
e (Base (Argument))	§7.1.2.32

22 The following XML Schema fragment defines the contents of this element:

```
23 <complexType name="CT_D">
24 <sequence>
25 <element name="dPr" type="CT_DPr" minOccurs="0"/>
26 <element name="e" type="CT_OMathArg" maxOccurs="unbounded"/>
27 </sequence>
28 </complexType>
```

29 **7.1.2.25**      **defjc (Default Justification)**

30 This element specifies the default justification of display math, at the document level. Individual equations can  
31 overrule the default setting.

Display math can be left justified, right justified, centered, or centered as a group. When display math is centered as a group, the equations are left aligned within a block, and the entire block is centered with respect to column margins. If this element is omitted, the equations are centered as a group. [Example: The XML below demonstrates defJc in use:

```
<m:mathPr>
 <m:mathFont m:val="Cambria Math"/>
 <m:brkBin m:val="before"/>
 <m:brkBinSub m:val="--"/>
 <m:smallFrac m:val="off"/>
 <m:dispDef/>
 <m:lMargin m:val="0"/>
 <m:rMargin m:val="0"/>
 <m:defJc m:val="centerGroup"/>
 <m:wrapIndent m:val="1440"/>
 <m:intLim m:val="subSup"/>
 <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the default justification of equations in the document. Possible values are center, centerGroup, left, and right.  The possible values for this attribute are defined by the ST_Jc simple type (§7.1.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathJc">
 <attribute name="val" type="ST_Jc"/>
</complexType>
```

### 7.1.2.26 deg (Degree)

This element specifies the degree in the mathematical radical, for example the 3 in  $\sqrt[3]{x}$  (XML representation is below). This element is optional. When omitted, the square root function, as in  $\sqrt{x}$ , is assumed. [Example:

```

1 <m:rad>
2 <m:deg>
3 <m:r>
4 <m:rPr>
5 <m:scr m:val="roman"/>
6 <m:sty m:val="p"/>
7 </m:rPr>
8 <m:t>3</m:t>
9 </m:r>
10 </m:deg>
11 <m:e>
12 <m:r>
13 <m:t>x</m:t>
14 </m:r>
15 </m:e>
16 </m:rad>

```

17 *end example]*

sPre (Pre-Sub-Superscript Function)	§7.1.2.99
sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
 <sequence>
 <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
 <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.27 degHide (Hide Degree)

This element specifies the per-object option to hide the degree of a radical. Every rad has a deg, but the deg can appear or not appear. When degHide is set to 'on,' the degree is not shown, as in  $\sqrt{x}$  (XML shown below). When degHide is omitted, the default is 'off'; that is, the degree is not hidden. *[Example:*

```
<m:rad>
 <m:radPr>
 <m:degHide m:val="on"/>
 </m:radPr>
 <m:deg>
 </m:deg>
 <m:e>
 <m:r>
 <m:t>x</m:t>
 </m:r>
 </m:e>
</m:rad>
```

*end example]*

#### Parent Elements

radPr (§7.1.2.89)

#### Attributes

val (value)

#### Description

Specifies a binary value for the property defined by the parent XML element.

A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

The possible values for this attribute are defined by the ST\_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 7.1.2.28 den (Denominator)

This element specifies the denominator of a fraction. [Example: For example, the  $b$  in  $\frac{a}{b}$ :

```
<m:f>
 <m:fPr>
 <m:type m:val="skw"/>
 </m:fPr>
 <m:num>
 <m:r>
 <m:t>a</m:t>
 </m:r>
 </m:num>
 <m:den>
 <m:r>
 <m:t>b</m:t>
 </m:r>
 </m:den>
</m:f>
```

*end example]*

sPre (Pre-Sub-Superscript Function)	§7.1.2.99

Child Elements	Subclause
sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_OMathArg">
3 <sequence>
4 <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
5 <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
6 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
7 </sequence>
8 </complexType>

```

### 9 7.1.2.29 diff (Differential)

10 The element specifies the differential property on box. When 'on,' the box acts as a differential (e.g.,  $dx$  in an  
 11 integrand), and receives the appropriate horizontal spacing for the mathematical differential. When this  
 12 property is omitted, the box is not treated as a differential. [Example: The following example demonstrates a  
 13 box set as differential in use, both in its proper form and in XML:

$$\int_0^1 x \, dx$$

```

14 <m:nary>
15 <m:naryPr>
16 <m:chr m:val="∫"/>
17 </m:naryPr>
18 <m:sub>
19 <m:r>
20 <m:rPr>
21 <m:scr m:val="roman"/>
22 <m:sty m:val="p"/>
23 </m:rPr>
24 <m:t>0</m:t>
25 </m:r>
26 </m:sub>

```

```

1 <m:sup>
2 <m:r>
3 <m:rPr>
4 <m:scr m:val="roman"/>
5 <m:sty m:val="p"/>
6 </m:rPr>
7 <m:t>1</m:t>
8 </m:r>
9 </m:sup>
10 <m:e>
11 <m:r>
12 <m:t>x</m:t>
13 </m:r>
14 <m:box>
15 <m:boxPr>
16 <m:diff m:val="on"/>
17 </m:boxPr>
18 <m:e>
19 <m:r>
20 <m:t>dx</m:t>
21 </m:r>
22 </m:e>
23 </m:box>
24 </m:e>
25 </m:nary>

```

*end example]*

#### Parent Elements

boxPr (§7.1.2.14)

#### Attributes

val (value)

#### Description

Specifies a binary value for the property defined by the parent XML element.

A value of `on` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of `off` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

The possible values for this attribute are defined by the `ST_OnOff` simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.30 dispDef (Use Display Math Defaults)

This element specifies the document-level property to overwrite paragraph settings for equations. When omitted, this element is set to 'on' and special math settings are applied.

[Example: The XML below demonstrates dispDef in use:

```
<m:mathPr>
 <m:mathFont m:val="Cambria Math"/>
 <m:brkBin m:val="before"/>
 <m:brkBinSub m:val="--"/>
 <m:smallFrac m:val="off"/>
 <m:dispDef/>
 <m:lMargin m:val="0"/>
 <m:rMargin m:val="0"/>
 <m:defJc m:val="centerGroup"/>
 <m:wrapIndent m:val="1440"/>
 <m:intLim m:val="subSup"/>
 <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements

mathPr (§7.1.2.62)

Attributes

val (value)

Description

Specifies a binary value for the property defined by the parent XML element.

A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

The possible values for this attribute are defined by the ST\_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 7.1.2.31 dPr (Delimiter Properties)

This element specifies the properties of d, including the enclosing and separating characters, and the properties that affect the shape of the delimiters.

Parent Elements
d (§7.1.2.24)

Child Elements	Subclause
begChr (Delimiter Beginning Character)	§7.1.2.10
ctrlPr (Control Properties)	§7.1.2.23
endChr (Delimiter Ending Character)	§7.1.2.33
grow (n-ary Grow)	§7.1.2.43
sepChr (Delimiter Separator Character)	§7.1.2.95
shp (Shape (Delimiters))	§7.1.2.97

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DPr">
 <sequence>
 <element name="begChr" type="CT_Char" minOccurs="0"/>
 <element name="sepChr" type="CT_Char" minOccurs="0"/>
 <element name="endChr" type="CT_Char" minOccurs="0"/>
 <element name="grow" type="CT_OnOff" minOccurs="0"/>
 <element name="shp" type="CT_Shp" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.32 e (Base (Argument))

This element specifies the base argument of a mathematical function.

[Example: For example, the func  $\lim_{n \rightarrow \infty} x_n$  has fName  $\lim$  and e  $x_n$ :

```
1 <m:func>
2 <m:fName>
3 <m:limLow>
4 <m:e>
5 <m:r>
6 <m:rPr>
7 <m:scr m:val="roman"/>
8 <m:sty m:val="p"/>
9 </m:rPr>
10 <m:t>lim</m:t>
11 </m:r>
12 </m:e>
13 <m:lim>
14 <m:r>
15 <m:t>n→∞</m:t>
16 </m:r>
17 </m:lim>
18 </m:limLow>
19 </m:fName>
20 <m:e>
21 <m:sSub>
22 <m:e>
23 <m:r>
24 <m:t>x</m:t>
25 </m:r>
26 </m:e>
27 <m:sub>
28 <m:r>
29 <m:t>n</m:t>
30 </m:r>
31 </m:sub>
32 </m:sSub>
33 </m:e>
34 </m:func>
```

35 *end example]*

Parent Elements
acc (§7.1.2.1); bar (§7.1.2.7); borderBox (§7.1.2.11); box (§7.1.2.13); d (§7.1.2.24); eqArr (§7.1.2.34); func (§7.1.2.39); groupChr (§7.1.2.41); limLow (§7.1.2.54); limUpp (§7.1.2.56); mr (§7.1.2.69); nary (§7.1.2.70); phant (§7.1.2.81); rad (§7.1.2.88); sPre (§7.1.2.99); sSub (§7.1.2.101); sSubSup (§7.1.2.103); sSup (§7.1.2.105)

sSup (Superscript Function)	§7.1.2.105

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_OMathArg">
3 <sequence>
4 <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
5 <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
6 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
7 </sequence>
8 </complexType>

```

### 9 7.1.2.33 endChr (Delimiter Ending Character)

10 This element specifies the ending, or closing, delimiter character. Mathematical delimiters are enclosing  
 11 characters such as parentheses, brackets, and braces. If this element is omitted, the default endChr is ')'.  
 12

[Example: In the following example, {a} uses { and } as its enclosing characters:

```

13 <m:dPr>
14 <m:begChr m:val="{"/>
15 <m:endChr m:val="}"/>
16 </m:dPr>

```

17 end example]

Parent Elements
dPr (§7.1.2.31)

18

Attributes	Description
------------	-------------

Attributes	Description
val (value)	<p>Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [Example: delimiter object {a}:</p> <pre> &lt;m:dPr&gt;   &lt;m:begChr m:val="{"/&gt;   &lt;m:endChr m:val="}"/&gt; &lt;/m:dPr&gt; </pre> <p>The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Char">
3 <attribute name="val" type="ST_Char" use="required"/>
4 </complexType>

```

### 5 7.1.2.34 eqArr (Equation-Array Function)

6 This element specifies the Equation-Array function, an object consisting of one or more equations that can be  
7 vertically justified as a unit respect to surrounding text on the line. Alignment of multiple points within each  
8 equation can occur within the equation array. [Example: An example of an equation array with alignment  
9 points is:

$$\begin{array}{rcl}
 x - y + z & = & 10 \\
 3x + y + 2z & = & 34 \\
 -5x + 2y - z & = & -14
 \end{array}$$

10 Notice that the variables, operators, and tens digits of the sums line up properly.

11 The XML of a simple eqArr  $\begin{array}{l} a = b + c \\ d + e = f \end{array}$  is:

```

12 <m:eqArr>
13 <m:e>
14 <m:r>
15 <m:t>a=b+c</m:t>
16 </m:r>
17 </m:e>
18 <m:e>
19 <m:r>
20 <m:t>d+e=f</m:t>
21 </m:r>
22 </m:e>
23 </m:eqArr>

```

24 end example]

## Parent Elements

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
eqArrPr (Equation Array Properties)	§7.1.2.35

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EqArr">
 <sequence>
 <element name="eqArrPr" type="CT_EqArrPr" minOccurs="0"/>
 <element name="e" type="CT_OMathArg" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 7.1.2.35 eqArrPr (Equation Array Properties)

This element specifies the properties of the equation array object, including the vertical justification of the object and layout inside the object.

Parent Elements
eqArr (§7.1.2.34)

Child Elements	Subclause
baseJc (Matrix Base Justification)	§7.1.2.9
ctrlPr (Control Properties)	§7.1.2.23
maxDist (Maximum Distribution)	§7.1.2.63
objDist (Object Distribution)	§7.1.2.76
rSp (Row Spacing (Equation Array))	§7.1.2.92
rSpRule (Row Spacing Rule)	§7.1.2.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EqArrPr">
 <sequence>
 <element name="baseJc" type="CT_YAlign" minOccurs="0"/>
 <element name="maxDist" type="CT_OnOff" minOccurs="0"/>
 <element name="objDist" type="CT_OnOff" minOccurs="0"/>
 <element name="rSpRule" type="CT_SpacingRule" minOccurs="0"/>
 <element name="rSp" type="CT_UnSignedInteger" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.36 f (Fraction Function)

This element specifies the fraction object, consisting of a numerator and denominator separated by a fraction bar. The fraction bar can be horizontal or diagonal, depending on the fraction properties. The fraction object is also used to represent the stack function, which places one element above another, with no fraction bar.

[*Example:* Examples of fractions are:

Stacked Fraction:  $\frac{a}{b}$

Skewed Fraction:  $\overset{a}{/}b$

Linear Fraction:  $a/b$

Stack Object (No-Bar Fraction):  $\overset{n}{k}$

The fraction  $\overset{a}{/}b$  is represented as:

```
<m:f>
 <m:fPr>
 <m:type m:val="skw"/>
 </m:fPr>
 <m:num>
 <m:r>
 <m:t>a</m:t>
 </m:r>
 </m:num>
 <m:den>
 <m:r>
 <m:t>b</m:t>
 </m:r>
 </m:den>
</m:f>
```

*end example]*

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
den (Denominator)	§7.1.2.28
fPr (Fraction Properties)	§7.1.2.38
num (Numerator)	§7.1.2.75

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_F">
 <sequence>
 <element name="fPr" type="CT_FPr" minOccurs="0"/>
 <element name="num" type="CT_OMathArg"/>
 <element name="den" type="CT_OMathArg"/>
 </sequence>
</complexType>
```

### 7.1.2.37 fName (Function Name)

This element specifies the name of the function in the Function-Apply object func. For example, function names are sin and cos.

[Example: As an example, the func  $\lim_{n \rightarrow \infty} x_n$  has fName  $\lim$  and e  $x_n$ :

```
<m:func>
 <m:fName>
 <m:limLow>
 <m:e>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>lim</m:t>

7 </sequence>
8 </complexType>
```

### 9 7.1.2.38 fPr (Fraction Properties)

10 This element specifies the properties of the fraction function f. Properties of the Fraction function include the  
 11 type or style of the fraction. The fraction bar can be horizontal or diagonal, depending on the fraction  
 12 properties. The fraction object is also used to represent the stack function, which places one element above  
 13 another, with no fraction bar. [*Example*: Examples of fractions are:

14 Stacked Fraction:  $\frac{a}{b}$

15 Skewed Fraction:  $a/b$

16 Linear Fraction:  $a/b$

17 Stack Object (No-Bar Fraction):  $\frac{n}{k}$

18 *end example*]

Parent Elements

24 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
25 </sequence>
26 </complexType>
```

### 7.1.2.39 `func` (Function Apply Function)

This element specifies the Function-Apply function, which consists of a function name and an argument acted upon. [Example: Examples of Function-Apply objects include:  $\sin x$ ,  $\tan^{-1} x^2$ , and  $\max_{0 \leq x \leq 1} x e^{-x^2}$ .

As an example, the func  $\lim_{n \rightarrow \infty} x_n$  has fName  $\lim$  and e  $x_n$ :

```

<m:func>
 <m:fName>
 <m:limLow>
 <m:e>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>

15 <sequence>
16 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
17 </sequence>
18 </complexType>

```

#### 19 7.1.2.41 groupChr (Group-Character Function)

20 This element specifies the Group-Character function, consisting of a character drawn above or below text, often  
 21 with the purpose of visually grouping items. [Example: The following example demonstrates the groupChr in  
 22 use, both in its proper form and in XML:

$$\overbrace{x+x+\cdots}$$

```

1 <m:groupChr>
2 <m:groupChrPr>
3 <m:chr m:val="⏞" />
4 <m:pos m:val="top" />
5 </m:groupChrPr>
6 <m:e>
7 <m:r>
8 <m:t>x+x+...</m:t>
9 </m:r>
10 </m:e>
11 </m:groupChr>

```

12 *end example]*

Parent Elements

13

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
groupChrPr (Group-Character Properties)	§7.1.2.42

14 The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_GroupChr">
16 <sequence>
17 <element name="groupChrPr" type="CT_GroupChrPr" minOccurs="0"/>
18 <element name="e" type="CT_OMathArg"/>
19 </sequence>
20 </complexType>

```

#### 21 7.1.2.42 groupChrPr (Group-Character Properties)

22 This element specifies the properties of the Group-Character function groupChr. These properties can be used  
 23 to specify the character placed above or below the argument, and the position of the character. When omitted,  
 24 U+23DF is used as the chr and its pos is set to bot.

Parent Elements
groupChr (§7.1.2.41)

25

Child Elements	Subclause
chr (Accent Character)	§7.1.2.20

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
pos (Position (Bar))	§7.1.2.84
vertJc (Vertical Justification)	§7.1.2.119

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GroupChrPr">
 <sequence>
 <element name="chr" type="CT_Char" minOccurs="0"/>
 <element name="pos" type="CT_TopBot" minOccurs="0"/>
 <element name="vertJc" type="CT_TopBot" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>

```

### 7.1.2.43 grow (n-ary Grow)

This element specifies the growth property of n-ary operators at the document level. When off, n-ary operators such as integrals and summations do not grow to match the size of their operand height. When on, the n-ary operator grows vertically to match its operand height. If this property is omitted, grow is set to off. [Example: The two integrals below demonstrate the difference between grow = off and grow = on.

$$\int_0^1 \frac{x^2}{x+y} dx \int_0^1 \frac{y^2}{x+y} dy$$

The XML that defines nary growth is:

```

<m:naryPr>
 <m:chr m:val="∫" />
 <m:grow m:val="on" />
</m:naryPr>

```

*end example]*

Parent Elements
dPr (§7.1.2.31); naryPr (§7.1.2.72)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p>

Attributes	Description
	<p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 7.1.2.44 `hideBot` (Hide Bottom Edge)

6 This element specifies the hidden or shown state of the bottom edge of `borderBox`. When this element is  
7 omitted, the bottom edge is shown. When on, the bottom border is hidden, as in  $\overline{abc}$ . [Example:

```
8 <m:borderBox>
9 <m:borderBoxPr>
10 <m:hideBot/>
11 </m:borderBoxPr>
12 <m:e>
13 <m:r>
14 <m:t>abc</m:t>
15 </m:r>
16 </m:e>
17 </m:borderBox>
```

18 *end example]*

Parent Elements
<code>borderBoxPr</code> (§7.1.2.12)

19

Attributes	Description
<code>val</code> (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 7.1.2.45 `hideLeft` (Hide Left Edge)

This element specifies the hidden or shown state of the left edge of `borderBox`. When this element is omitted, the edge is shown. When on, the left border is hidden, as in abc. [Example:

```
<m:borderBox>
 <m:borderBoxPr>
 <m:hideLeft/>
 </m:borderBoxPr>
 <m:e>
 <m:r>
 <m:t>abc</m:t>
 </m:r>
 </m:e>
</m:borderBox>
```

end example]

#### Parent Elements

`borderBoxPr` (§7.1.2.12)

#### Attributes

#### Description

`val` (value)

Specifies a binary value for the property defined by the parent XML element.

A value of `on` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of `off` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

The possible values for this attribute are defined by the `ST_OnOff` simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 7.1.2.46 `hideRight` (Hide Right Edge)

This element specifies the hidden or shown state of the right edge of `borderBox`. When this element is omitted, the edge is shown. When on, the right border is hidden, as in abc. [Example:

```
1 <m:borderBox>
2 <m:borderBoxPr>
3 <m:hideRight/>
4 </m:borderBoxPr>
5 <m:e>
6 <m:r>
7 <m:t>abc</m:t>
8 </m:r>
9 </m:e>
10 </m:borderBox>
```

11 *end example]*

Parent Elements
borderBoxPr (§7.1.2.12)

12

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

13 The following XML Schema fragment defines the contents of this element:

```
14 <complexType name="CT_OnOff">
15 <attribute name="val" type="ST_OnOff"/>
16 </complexType>
```

17 **7.1.2.47**      **hideTop (Hide Top Edge)**

18 This element specifies the hidden or shown state of the top edge of `borderBox`. When this element is omitted,  
19 the edge is shown.

20 When `on`, the top border is hidden, as in `|abc|`. [Example:

```
21 <m:borderBox>
22 <m:borderBoxPr>
23 <m:hideTop/>
24 </m:borderBoxPr>
```

```

1 <m:e>
2 <m:r>
3 <m:t>abc</m:t>
4 </m:r>
5 </m:e>
6 </m:boxed>

```

*end example]*

Parent Elements
boxedPr (§7.1.2.12)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```

10 <complexType name="CT_OnOff">
11 <attribute name="val" type="ST_OnOff"/>
12 </complexType>

```

### 7.1.2.48 `interSp` (Inter-Equation Spacing)

This element specifies spacing between equations within a display math paragraph, in twips.

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	<p>Specifies the value, in twips, of the parent element.</p> <p>The possible values for this attribute are defined by the <code>ST_TwipsMeasure</code> simple type (§7.1.3.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

#### 7.1.2.49 intLim (Integral Limit Locations)

This element specifies the document setting for the default placement of integral limits, when converted from a linear format to a two-dimensional output. Limits can be either centered above and below the integral, or positioned just to the right of the operator, as in:

$$\int_a^b x \, dx \quad \int_a^b x \, dx$$

When this integral object is written linearly, as  $\int_a^b$ , the placement of limits is ambiguous. intLim is a document-level property that specifies the default positioning. When this element is omitted, the default placement of integral limits is subSup (that is, the location of subscripts and superscripts, or just to the right of the base or operator).

[Example: The XML that specifies this property in use is:

```
<m:mathPr>
 <m:mathFont m:val="Cambria Math"/>
 <m:brkBin m:val="before"/>
 <m:brkBinSub m:val="--"/>
 <m:smallFrac m:val="off"/>
 <m:dispDef/>
 <m:lMargin m:val="0"/>
 <m:rMargin m:val="0"/>
 <m:defJc m:val="centerGroup"/>
 <m:wrapIndent m:val="1440"/>
 <m:intLim m:val="subSup"/>
 <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

#### Parent Elements

mathPr (§7.1.2.62)

#### Attributes

val (Value)

#### Description

Specifies the default location of limits on an integral. Possible values are subSup and undOvr.

Attributes	Description
	The possible values for this attribute are defined by the ST_LimLoc simple type (§7.1.3.8).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_LimLoc">
3 <attribute name="val" type="ST_LimLoc" use="required"/>
4 </complexType>
```

### 5 7.1.2.50 [intraSp \(Intra-Equation Spacing\)](#)

6 This element specifies the spacing between adjacent display math paragraphs, in twips.

Parent Elements
mathPr (§7.1.2.62)

7

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element.  The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_TwipsMeasure">
10 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
11 </complexType>
```

### 12 7.1.2.51 [jc \(Justification\)](#)

13 This element specifies justification of the math paragraph (a series of adjacent equations within the same  
14 paragraph). A math paragraph can be Left Justified, Right Justified, Centered, or Centered as Group. If this  
15 element is omitted, the math paragraph is Centered as Group. This means that the equations can be aligned  
16 with respect to each other, but the entire group of equations is centered as a whole. [Example: An example of  
17 Centered as Group is the following example, in which each equation is left-aligned, but the series is centered:

$$\begin{aligned}x &= x_1 + x_2 + x_3 + \cdots \\y &= y_1 + y_2 + y_3 + y_4 + \cdots \\z &= z_1 + z_2 + z_3 + z_4 + z_5 + \cdots\end{aligned}$$

18 The XML that demonstrates jc in use is:

```
19 <m:oMathParaPr>
20 <m:jc m:val="right"/>
21 </m:oMathParaPr>
```

22 *end example]*

## Parent Elements

oMathParaPr (§7.1.2.79)

## Attributes

## Description

val (Value)

Specifies the default justification of equations in the document. Possible values are center, centerGroup, left, and right.

The possible values for this attribute are defined by the ST\_Jc simple type (§7.1.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathJc">
 <attribute name="val" type="ST_Jc"/>
</complexType>
```

7.1.2.52  $\lim$  (Limit (Lower))

This element specifies the lower limit of the `limLow` function. [Example: For example, the limit of the `limLow`

$\lim_{n \rightarrow \infty}$  is  $n \rightarrow \infty$ . The XML that specifies this function is:

```
<m:limLow>
 <m:e>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>lim</m:t>
 </m:r>
 </m:e>
 <m:lim>
 <m:r>
 <m:t>n→∞</m:t>
 </m:r>
 </m:lim>
</m:limLow>
```

end example]

r (Run)	§7.1.2.87
rad (Radical Function)	§7.1.2.88
sPre (Pre-Sub-Superscript Function)	§7.1.2.99
sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_OMathArg">
3 <sequence>
4 <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
5 <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
6 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
7 </sequence>
8 </complexType>

```

### 9 7.1.2.53 limLoc (n-ary Limit Location)

10 This element specifies the location of limits in n-ary operators. Limits can be either centered above and below  
11 the n-ary operator, or positioned just to the right of the operator, as in:

$$\sum_{i=0}^n x_n \sum_{i=0}^n x_n$$

12 When this element is omitted, the default location is undOvr. [Example: The XML representing this property in  
13 use is:

```

14 <m:naryPr>
15 <m:chr m:val="∑"/>
16 <m:limLoc m:val="subSup"/>
17 <m:grow m:val="on"/>
18 </m:naryPr>

```

19 *end example]*

## Parent Elements

naryPr (§7.1.2.72)

## Attributes

## Description

val (Value)

Specifies the default location of limits on an integral. Possible values are subSup and undOvr.

The possible values for this attribute are defined by the ST\_LimLoc simple type (§7.1.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLoc">
 <attribute name="val" type="ST_LimLoc" use="required"/>
</complexType>
```

### 7.1.2.54 limLow (Lower-Limit Function)

This element specifies the Lower-Limit function, consisting of text on the baseline and reduced-size text immediately below it. Examples of limLow include  $\lim_{n \rightarrow \infty}$  and  $\max_{0 \leq x \leq 1}$ . [Example: The XML that represents  $\lim_{n \rightarrow \infty}$  is:

```
<m:limLow>
 <m:e>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>lim</m:t>
 </m:r>
 </m:e>
 <m:lim>
 <m:r>
 <m:t>n→∞</m:t>
 </m:r>
 </m:lim>
</m:limLow>
```

*end example]*

## Parent Elements

deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
lim (Limit (Lower))	§7.1.2.52
limLowPr (Lower Limit Properties)	§7.1.2.55

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLow">
 <sequence>
 <element name="limLowPr" type="CT_LimLowPr" minOccurs="0"/>
 <element name="e" type="CT_OMathArg"/>
 <element name="lim" type="CT_OMathArg"/>
 </sequence>
</complexType>
```

### 7.1.2.55 limLowPr (Lower Limit Properties)

This element specifies control properties (ctrlPr) that can be stored on the Lower Limit (limLow).

Parent Elements
limLow (§7.1.2.54)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLowPr">
 <sequence>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.56 limUpp (Upper-Limit Function)

This element specifies the Upper-Limit function, consisting of text on the baseline and reduced-size text immediately above it. [Example: Examples of limUpp include  $\overbrace{x+x+x}^{k \text{ times}}$  and  $\overset{\text{def}}{=}$ .

The XML that specifies the limUpp  $\overset{\text{def}}{=}$  is:

```
<m:limUpp>
 <m:e>
 <m:r>
 <m:t>=</m:t>
 </m:r>
 </m:e>
```

```

1 <m:lim>
2 <m:r>
3 <m:rPr>
4 <m:nor/>
5 </m:rPr>
6 <m:t>def</m:t>
7 </m:r>
8 </m:lim>
9 </m:limUpp>

```

*end example]*

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
lim (Limit (Lower))	§7.1.2.52
limUppPr (Upper Limit Properties)	§7.1.2.57

The following XML Schema fragment defines the contents of this element:

```

13 <complexType name="CT_LimUpp">
14 <sequence>
15 <element name="limUppPr" type="CT_LimUppPr" minOccurs="0"/>
16 <element name="e" type="CT_OMathArg"/>
17 <element name="lim" type="CT_OMathArg"/>
18 </sequence>
19 </complexType>

```

### 7.1.2.57 [limUppPr \(Upper Limit Properties\)](#)

This element specifies control properties (ctrlPr) that can be stored on the Upper Limit (limUpp).

Parent Elements
limUpp (§7.1.2.56)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimUpPr">
 <sequence>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.58 *lit* (Literal)

This element specifies that the characters in the run are literal; that is, they are to be interpreted literally and not take on any special mathematical meaning such as operators or characters that trigger conversion to a 2-dimensional format. [Example: In the following XML, the + operator is treated literally and does not receive proper binary spacing:

```
<m:r>a</m:r>
<m:r>
 <m:rPr>
 <m:lit/>
 </m:rPr>
 <m:t>+</m:t>
</m:r>
<m:r>
 <m:t>b</m:t>
</m:r>
```

*end example]*

#### Parent Elements

rPr (§7.1.2.91)

#### Attributes

#### Description

val (value)

Specifies a binary value for the property defined by the parent XML element.

A value of *on* specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of *off* specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

The possible values for this attribute are defined by the *ST\_OnOff* simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 7.1.2.59 $\text{lmargin}$ (Left Margin)

This element specifies the left margin for math, in twips. Math margins are added to the paragraph settings for margins. [Example: The following XML demonstrates an  $\text{lmargin}$  setting of 1".

```
<m:mathPr>
 <m:mathFont m:val="Cambria Math"/>
 <m:brkBin m:val="before"/>
 <m:brkBinSub m:val="--"/>
 <m:smallFrac m:val="off"/>
 <m:dispDef/>
 <m:lmargin m:val="1440"/>
 <m:rmargin m:val="0"/>
 <m:defJc m:val="centerGroup"/>
 <m:wrapIndent m:val="1440"/>
 <m:intLim m:val="subSup"/>
 <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

*end example]*

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element.  The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

### 7.1.2.60 $\text{m}$ (Matrix Function)

This element specifies the Matrix function, consisting of one or more elements laid out in one or more rows and one or more columns. [Example: Examples of matrices are:  $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$  and  $\begin{bmatrix} 1 & \\ & 1 \end{bmatrix}$ . Below is a 2x2 matrix, in its proper form an in XML.

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```

3 <m:mCS>
4 <m:mc>
5 <m:mcPr>
6 <m:mcJc m:val="center"/>
7 <m:count m:val="2"/>
8 </m:mcPr>
9 </m:mc>
10 </m:mCS>
11 </m:mPr>
12 <m:mr>
13 <m:e>
14 <m:r>
15 <m:rPr>
16 <m:scr m:val="roman"/>
17 <m:sty m:val="p"/>
18 </m:rPr>
19 <m:t>1</m:t>
20 </m:r >
21 </m:e>
22 <m:e>
23 <m:r>
24 <m:rPr>
25 <m:scr m:val="roman"/>
26 <m:sty m:val="p"/>
27 </m:rPr>
28 <m:t>2</m:t>
29 </m:r >
30 </m:e>
31 </m:mr>
32 <m:mr>
33 <m:e>
34 <m:r>
35 <m:rPr>
36 <m:scr m:val="roman"/>
37 <m:sty m:val="p"/>
38 </m:rPr>
39 <m:t>3</m:t>
40 </m:r >
41 </m:e>

```

```
1 <m:e>
2 <m:r>
3 <m:rPr>
4 <m:scr m:val="roman"/>
5 <m:sty m:val="p"/>
6 </m:rPr>
7 <m:t>4</m:t>
8 </m:r >
9 </m:e>
10 </m:mr>
11 </m:m>
```

12 *end example]*

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

13

Child Elements	Subclause
mPr (Matrix Properties)	§7.1.2.68
mr (Matrix Row)	§7.1.2.69

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_M">
16 <sequence>
17 <element name="mPr" type="CT_MPr" minOccurs="0"/>
18 <element name="mr" type="CT_MR" maxOccurs="unbounded"/>
19 </sequence>
20 </complexType>
```

21 **7.1.2.61 mathFont (Math Font)**

22 This element specifies the default math font to be used in the document. [*Example:* The XML containing this  
23 property is:

```
24 <m:mathPr>
25 <m:mathFont m:val="Cambria Math"/>
26 <m:brkBin m:val="before"/>
27 <m:brkBinSub m:val="--"/>
28 <m:smallFrac m:val="off"/>
29 <m:dispDef/>
```

```

1 <m:lMargin m:val="1440"/>
2 <m:rMargin m:val="0"/>
3 <m:defJc m:val="centerGroup"/>
4 <m:wrapIndent m:val="1440"/>
5 <m:intLim m:val="subSup"/>
6 <m:naryLim m:val="undOvr"/>
7 </m:mathPr>

```

8 *end example]*

Parent Elements
mathPr (§7.1.2.62)

9

Attributes	Description
val (value)	Specifies the default math font to be used in the document.  The possible values for this attribute are defined by the ST_String simple type (§7.1.3.13).

10 The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_String">
12 <attribute name="val" type="ST_String"/>
13 </complexType>

```

### 14 7.1.2.62 [mathPr \(Math Properties\)](#)

15 This element specifies the document-level properties for all math in the document.

Parent Elements
settings (§2.15.1.78)

16

Child Elements	Subclause
brkBin (Break on Binary Operators)	§7.1.2.16
brkBinSub (Break on Binary Subtraction)	§7.1.2.17
defJc (Default Justification)	§7.1.2.25
dispDef (Use Display Math Defaults)	§7.1.2.30
interSp (Inter-Equation Spacing)	§7.1.2.48
intLim (Integral Limit Locations)	§7.1.2.49
intraSp (Intra-Equation Spacing)	§7.1.2.50

 <element name="postSp" type="CT_TwipsMeasure" minOccurs="0"/>
 <element name="interSp" type="CT_TwipsMeasure" minOccurs="0"/>
 <element name="intraSp" type="CT_TwipsMeasure" minOccurs="0"/>
 <choice minOccurs="0">
 <element name="wrapIndent" type="CT_TwipsMeasure"/>
 <element name="wrapRight" type="CT_OnOff"/>
 </choice>
 <element name="intLim" type="CT_LimLoc" minOccurs="0"/>
 <element name="naryLim" type="CT_LimLoc" minOccurs="0"/>
 </sequence>
</complexType>

```

### 7.1.2.63 maxDist (Maximum Distribution)

This element specifies Equation Array Maximum Distribution. When on, the equation array is spaced to the maximum width of the containing element (page, column, cell, etc.). When this element is omitted, Equation Array Maximum Distribution is off.

Parent Elements
eqArrPr (§7.1.2.35)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **7.1.2.64 mc (Matrix Column)**

6 This element specifies a single column in a matrix *m*. [*Example: An example of this element in use is:*

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
7 <m:m>
8 <m:mPr>
9 <m:mCS>
10 <m:mc>
11 <m:mcPr>
12 <m:mcJc m:val="center"/>
13 <m:count m:val="2"/>
14 </m:mcPr>
15 </m:mc>
16 </m:mCS>
17 </m:mPr>
18 <m:mr>
19 <m:e>
20 <m:r>
21 <m:rPr>
22 <m:scr m:val="roman"/>
23 <m:sty m:val="p"/>
24 </m:rPr>
25 <m:t>1</m:t>
26 </m:r >
27 </m:e>
```

```
1 <m:e>
2 <m:r>
3 <m:rPr>
4 <m:scr m:val="roman"/>
5 <m:sty m:val="p"/>
6 </m:rPr>
7 <m:t>2</m:t>
8 </m:r >
9 </m:e>
10 </m:mr>
11 <m:mr>
12 <m:e>
13 <m:r>
14 <m:rPr>
15 <m:scr m:val="roman"/>
16 <m:sty m:val="p"/>
17 </m:rPr>
18 <m:t>3</m:t>
19 </m:r >
20 </m:e>
21 <m:e>
22 <m:r>
23 <m:rPr>
24 <m:scr m:val="roman"/>
25 <m:sty m:val="p"/>
26 </m:rPr>
27 <m:t>4</m:t>
28 </m:r >
29 </m:e>
30 </m:mr>
31 </m:m>
```

32 *end example]*

Parent Elements
mcs (§7.1.2.67)

33

Child Elements	Subclause
mcPr (Matrix Column Properties)	§7.1.2.66

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MC">
 <sequence>
 <element name="mcPr" type="CT_MCPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.65 mcJc (Matrix Column Justification)

This element specifies the justification of a matrix column (or group of matrix columns) mc. When this element is omitted, the column is centered. The matrix below has three columns. The leftmost column is left-justified,

the rightmost column is right-justified, and the center column is centered:

$$\begin{pmatrix} 1 & 1 & 1 \\ 23 & 23 & 23 \\ 456 & 456 & 456 \end{pmatrix}$$

[Example: A simple example of this property in use is a 2x2 matrix with both columns centered:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
 <m:mPr>
 <m:mCS>
 <m:mc>
 <m:mcPr>
 <m:mcJc m:val="center"/>
 <m:count m:val="2"/>
 </m:mcPr>
 </m:mc>
 </m:mCS>
 </m:mPr>
 <m:mr>
 <m:e>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>1</m:t>
 </m:r>
 </m:e>
```

```
1 <m:e>
2 <m:r>
3 <m:rPr>
4 <m:scr m:val="roman"/>
5 <m:sty m:val="p"/>
6 </m:rPr>
7 <m:t>2</m:t>
8 </m:r >
9 </m:e>
10 </m:mr>
11 <m:mr>
12 <m:e>
13 <m:r>
14 <m:rPr>
15 <m:scr m:val="roman"/>
16 <m:sty m:val="p"/>

18 <m:t>3</m:t>
19 </m:r >
20 </m:e>
21 <m:e>
22 <m:r>
23 <m:rPr>
24 <m:scr m:val="roman"/>
25 <m:sty m:val="p"/>
26 </m:rPr>
27 <m:t>4</m:t>
28 </m:r >
29 </m:e>
30 </m:mr>
31 </m:m>
```

32 *end example]*

Parent Elements
mcPr (§7.1.2.66)

33

Attributes	Description
val (Value)	Specifies the horizontal alignment of the parent element. Possible values are left, right, and center. <i>[Example:</i> <m:mcPr> <m:mcJc m:val="center"/> <m:count m:val="2"/>

Attributes	Description
	$\text{</m:mcPr>}$ The possible values for this attribute are defined by the ST_XAlign simple type (§7.1.3.18).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_XAlign">
3 <attribute name="val" type="ST_XAlign" use="required"/>
4 </complexType>
```

### 5 7.1.2.66 mcPr (Matrix Column Properties)

6 This element specifies the properties of the matrix column  $mn$ , including the number of columns and the type of  
7 justification. [Example: As an extreme example, the following matrix has two columns that are left justified

8 (count is 2) and three columns that are right justified (count is 3).  $\begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ 23 & 23 & 23 & 23 & 23 \\ 456 & 456 & 456 & 456 & 456 \end{pmatrix} \text{end}$

9 example]

Parent Elements
mc (§7.1.2.64)

10

Child Elements	Subclause
count (Matrix Column Count)	§7.1.2.21
mcJc (Matrix Column Justification)	§7.1.2.65

11 The following XML Schema fragment defines the contents of this element:

```
12 <complexType name="CT_MCPr">
13 <sequence>
14 <element name="count" type="CT_Integer255" minOccurs="0"/>
15 <element name="mcJc" type="CT_XAlign" minOccurs="0"/>
16 </sequence>
17 </complexType>
```

### 18 7.1.2.67 mcs (Matrix Columns)

19 This element specifies the collection of columns of the matrix  $m$ . [Example: An example of this element in use is:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```

1 <m:m>
2 <m:mPr>

end example]

Parent Elements
mPr (§7.1.2.68)

Child Elements	Subclause
mc (Matrix Column)	§7.1.2.64

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MCS">
 <sequence>
 <element name="mc" type="CT_MC" maxOccurs="unbounded"/>
 </sequence>
</complexType>

```

### 7.1.2.68 mPr (Matrix Properties)

This element specifies properties of the matrix *m*, including the justification of the matrix and the layout of elements within the matrix.

Parent Elements
m (§7.1.2.60)

Child Elements	Subclause
baseJc (Matrix Base Justification)	§7.1.2.9
cGp (Matrix Column Gap)	§7.1.2.18
cGpRule (Matrix Column Gap Rule)	§7.1.2.19
cSp (Matrix Column Spacing)	§7.1.2.22
ctrlPr (Control Properties)	§7.1.2.23

Child Elements	Subclause
mcs (Matrix Columns)	§7.1.2.67
plcHide (Hide Placeholders (Matrix))	§7.1.2.83
rSp (Row Spacing (Equation Array))	§7.1.2.92
rSpRule (Row Spacing Rule)	§7.1.2.93

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MPr">
 <sequence>
 <element name="baseJc" type="CT_YAlign" minOccurs="0"/>
 <element name="plcHide" type="CT_OnOff" minOccurs="0"/>
 <element name="rSpRule" type="CT_SpacingRule" minOccurs="0"/>
 <element name="cGpRule" type="CT_SpacingRule" minOccurs="0"/>
 <element name="rSp" type="CT_UnSignedInteger" minOccurs="0"/>
 <element name="cSp" type="CT_UnSignedInteger" minOccurs="0"/>
 <element name="cGp" type="CT_UnSignedInteger" minOccurs="0"/>
 <element name="mcs" type="CT_MCS" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>

```

### 7.1.2.69 mr (Matrix Row)

This element specifies a single row of the matrix m. [Example: An example of this element in use is the following example, a 2x2 matrix. There are two rows; the first contains the elements 1 and 2; the second contains 3 and 4.

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```

<m:m>
 <m:mPr>
 <m:mcs>
 <m:mc>
 <m:mcPr>
 <m:mcJc m:val="center"/>
 <m:count m:val="2"/>
 </m:mcPr>
 </m:mc>
 </m:mcs>
 </m:mPr>

```

```

1 <m:mr>
2 <m:e>
3 <m:r>
4 <m:rPr>
5 <m:scr m:val="roman"/>
6 <m:sty m:val="p"/>
7 </m:rPr>
8 <m:t>1</m:t>
9 </m:r >
10 </m:e>
11 <m:e>
12 <m:r>
13 <m:rPr>
14 <m:scr m:val="roman"/>
15 <m:sty m:val="p"/>
16 </m:rPr>
17 <m:t>2</m:t>
18 </m:r >
19 </m:e>
20 </m:mr>
21 <m:mr>
22 <m:e>
23 <m:r>
24 <m:rPr>
25 <m:scr m:val="roman"/>
26 <m:sty m:val="p"/>
27 </m:rPr>
28 <m:t>3</m:t>
29 </m:r >
30 </m:e>
31 <m:e>
32 <m:r>
33 <m:rPr>
34 <m:scr m:val="roman"/>
35 <m:sty m:val="p"/>
36 </m:rPr>
37 <m:t>4</m:t>
38 </m:r >
39 </m:e>
40 </m:mr>
41 </m:m>

```

*end example]*

Parent Elements
m (§7.1.2.60)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MR">
 <sequence>
 <element name="e" type="CT_OMathArg" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

7.1.2.70 nary (n-ary Operator Function)

This element specifies an n-ary object, consisting of an n-ary object, a base (or operand), and optional upper and lower limits. Examples of n-ary objects are:  $\int_0^1 x \, dx$ ,  $\sum_k \binom{n}{k}$ ,  $\prod_{k=1}^n A_k$ , and  $\bigcup_{n=1}^m (X_n \cap Y_n)$ . [Example: The example below demonstrates an n-ary object in its proper form and XML representation:

$$\int_0^1 x \, dx$$

```
<m:nary>
 <m:naryPr>
 <m:chr m:val="∫"/>
 </m:naryPr>
 <m:sub>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>0</m:t>
 </m:r>
 </m:sub>
 <m:sup>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>1</m:t>
 </m:r>
 </m:sup>
```

```

1 <m:e>
2 <m:r>
3 <m:t>x</m:t>
4 </m:r>
5 <m:box>
6 <m:boxPr>
7 <m:diff m:val="on"/>
8 </m:boxPr>
9 <m:e>
10 <m:r>
11 <m:t>dx</m:t>
12 </m:r>
13 </m:e>
14 </m:box>
15 </m:e>
16 </m:nary>

```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
naryPr (n-ary Properties)	§7.1.2.72
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Nary">
 <sequence>
 <element name="naryPr" type="CT_NaryPr" minOccurs="0"/>
 <element name="sub" type="CT_OMathArg"/>
 <element name="sup" type="CT_OMathArg"/>
 <element name="e" type="CT_OMathArg"/>
 </sequence>
</complexType>

```

### 7.1.2.71 naryLim (n-ary Limit Location)

This element specifies the document setting for the default placement of n-ary limits other than integrals (since integrals are most often written as subSup and other n-ary operators are most often written as undOvr), when

converted from a linear format to a two-dimensional output. Limits can be either centered above and below the n-ary operator, or positioned just to the right of the operator, as in:

$$\sum_{i=0}^n x_i \quad \sum_{i=0}^n x_i$$

When this integral object is written linearly, as  $\sum_{(i=0)}^n$ , the placement of limits is ambiguous. naryLim specifies this positioning. When this element is omitted, the default placement of n-ary limits is undOvr (that is, the location of lower and upper limits). [Example: An example XML of this element in use is:

```
<m:mathPr>
 <m:mathFont m:val="Cambria Math"/>
 <m:brkBin m:val="before"/>
 <m:brkBinSub m:val="--"/>
 <m:smallFrac m:val="off"/>
 <m:dispDef/>
 <m:lMargin m:val="0"/>
 <m:rMargin m:val="0"/>
 <m:defJc m:val="centerGroup"/>
 <m:wrapIndent m:val="1440"/>
 <m:intLim m:val="subSup"/>
 <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the default location of limits on an integral. Possible values are subSup and undOvr.  The possible values for this attribute are defined by the ST_LimLoc simple type (§7.1.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLoc">
 <attribute name="val" type="ST_LimLoc" use="required"/>
</complexType>
```

7.1.2.72 naryPr (n-ary Properties)

This element specifies the properties of the n-ary object, including the type of n-ary operator that is used, the shape and height of the operator, the location of limits, and whether limits are shown or hidden.

Parent Elements
nary (§7.1.2.70)

Child Elements	Subclause
chr (Accent Character)	§7.1.2.20
ctrlPr (Control Properties)	§7.1.2.23
grow (n-ary Grow)	§7.1.2.43
limLoc (n-ary Limit Location)	§7.1.2.53
subHide (Hide Subscript (n-ary))	§7.1.2.113
supHide (Hide Superscript (n-ary))	§7.1.2.115

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NaryPr">
 <sequence>
 <element name="chr" type="CT_Char" minOccurs="0"/>
 <element name="limLoc" type="CT_LimLoc" minOccurs="0"/>
 <element name="grow" type="CT_OnOff" minOccurs="0"/>
 <element name="subHide" type="CT_OnOff" minOccurs="0"/>
 <element name="supHide" type="CT_OnOff" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>

```

### 7.1.2.73 noBreak (No Break)

This property specifies the "unbreakable" property on the Box function box. When on, no line breaks can occur within the box. This can be important for operator emulators that consist of more than one binary operator. When this element is not specified, breaks can occur inside box. [Example: Sample XML containing this element is below. In this box, breaks are allowed.]

```

<m:boxPr>
 <m:noBreak m:val="off"/>
</m:boxPr>

```

end example]

Parent Elements
boxPr (§7.1.2.14)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 7.1.2.74 `nor` (Normal Text)

6 This element specifies that the run is normal text, i.e., math italics and math spacing are not applied. In a normal  
7 text run, no characters will trigger reformatting of a linear expression into a two-dimensional expression.

8 [Example: The example below illustrates three runs of normal text, along with the XML representation of the  
9 equation:

$$\text{rate} = \frac{\text{distance}}{\text{time}}$$

```
10 <m:r>
11 <m:rPr>
12 <m:nor/>
13 </m:rPr>
14 <m:t>rate</m:t>
15 </m:r>
16 <m:r>
17 <m:t>=</m:t>
18 </m:r>
19 <m:f>
20 <m:num>
21 <m:r>
22 <m:rPr>
23 <m:nor/>
24 </m:rPr>
25 <m:t>distance</m:t>
26 </m:r>
27 </m:num>
```

```

1 <m:den>
2 <m:r>
3 <m:rPr>
4 <m:nor/>
5 </m:rPr>
6 <m:t>time</m:t>
7 </m:r>
8 </m:den>
9 </m:f>

```

end example]

Parent Elements
rPr (§7.1.2.91)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>

```

### 7.1.2.75 num (Numerator)

This element specifies the numerator of the Fraction function  $f$ . [Example: The  $a$  in  $\frac{a}{b}$ :

```

18 <m:f>
19 <m:fPr>
20 <m:type m:val="skw"/>
21 </m:fPr>
22 <m:num>
23 <m:r>
24 <m:t>a</m:t>
25 </m:r>
26 </m:num>

```

```

1 <m:den>
2 <m:r>
3 <m:t>b</m:t>
4 </m:r>
5 </m:den>
6 </m:f>

```

7 *end example]*

6 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
7 </sequence>
8 </complexType>

```

#### 9 7.1.2.76 objDist (Object Distribution)

10 This element specifies Equation Array Object Distribution. When on, the contents of the equation array are  
11 spaced to the maximum width of the equation array object. When this element is omitted, the equation array  
12 does not receive object distribution.

Parent Elements
eqArrPr (§7.1.2.35)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).</p>

25 </complexType>
```

7.1.2.79 oMathParaPr (Office Math Paragraph Properties)

This property specifies properties of the math paragraph oMathPara, including justification jc.

Parent Elements
oMathPara (§7.1.2.78)

Child Elements	Subclause
jc (Justification)	§7.1.2.51

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathParaPr">
 <sequence>
 <element name="jc" type="CT_OMathJc" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

7.1.2.80 opEmu (Operator Emulator)

This element specifies the Operator Emulator property on box. When on, the box and its contents behave as a single operator and inherit the properties of an operator. This means, for example, that the character can serve as a point for a line break and can be aligned to other operators. Operator Emulators are often used when one or more glyphs combine to form an operator, such as  $a == b$ . The following equation uses an Operator Emulator:

$$a == b$$

[Example: Its XML representation is as follows:

```
<m:r>
 <m:t>a</m:t>
</m:r>
<m:box>
 <m:boxPr>
 <m:opEmu m:val="on"/>
 <m:aln/>
 </m:boxPr>
 <m:e>
 <m:r>
 <m:t>==</m:t>
 </m:r>
 </m:e>
</m:box>
<m:r>
 <m:t>b</m:t>
</m:r>
```

1 *end example]*

Parent Elements
boxPr (§7.1.2.14)

2

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_OnOff">
5 <attribute name="val" type="ST_OnOff"/>
6 </complexType>
```

#### 7 7.1.2.81 [phant \(Phantom Function\)](#)

8 This element specifies the phantom function. `phant` has two primary uses: adding the spacing of the phantom  
9 base  $e$  without displaying that base; and suppressing part of the glyph from spacing considerations.

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

10

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
phantPr (Phantom Properties)	§7.1.2.82

11 The following XML Schema fragment defines the contents of this element:

```
12 <complexType name="CT_Phant">
13 <sequence>
14 <element name="phantPr" type="CT_PhantPr" minOccurs="0"/>
15 <element name="e" type="CT_OMathArg"/>
16 </sequence>
17 </complexType>
```

7.1.2.82 phantPr (Phantom Properties)

This element specifies properties of the Phantom function, including whether the phantom is hidden or visible, and the amount of space that is taken into account when laying out text and objects around phantoms.

Parent Elements
phant (§7.1.2.81)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
show (Phantom Show)	§7.1.2.96
transp (Transparent (Phantom))	§7.1.2.117
zeroAsc (Phantom Zero Ascent)	§7.1.2.122
zeroDesc (Phantom Zero Descent)	§7.1.2.123
zeroWid (Phantom Zero Width)	§7.1.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhantPr">
 <sequence>
 <element name="show" type="CT_OnOff" minOccurs="0"/>
 <element name="zeroWid" type="CT_OnOff" minOccurs="0"/>
 <element name="zeroAsc" type="CT_OnOff" minOccurs="0"/>
 <element name="zeroDesc" type="CT_OnOff" minOccurs="0"/>
 <element name="transp" type="CT_OnOff" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

7.1.2.83 plcHide (Hide Placeholders (Matrix))

This element specifies the Hide Placeholders property on a matrix m. When this property is on, placeholders do not appear in the matrix. If this element is omitted, placeholders do appear such that the locations where text can be inserted are made visible. [Example: The following two examples of matrices show the hidden and visible states of placeholders:

$$\begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix} \begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix}$$

In the matrix described by the XML below, placeholders will be hidden:

```
1 <m:mPr>
2 <m:plcHide m:val="on"/>
3 <m:mCS>
4 <m:mc>
5 <m:mcPr>
6 <m:mcJc m:val="center"/>
7 <m:count m:val="3"/>
8 </m:mcPr>
9 </m:mc>
10 </m:mCS>
11 </m:mPr>
12 end example]
```

Parent Elements
mPr (§7.1.2.68)

13

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_OnOff">
16 <attribute name="val" type="ST_OnOff"/>
17 </complexType>
```

18 7.1.2.84 pos (Position (Bar))

19 This element specifies the position of the bar in the bar object; the default is 'top,' signifying the mathematical  
20 overbar. [Example: The XML representation for the mathematical overbar is:

```

1 <m:bar>
2 <m:barPr>
3 <m:pos m:val="top"/>
4 </m:barPr>
5 <m:e>
6 <m:r>
7 <m:t>a</m:t>
8 </m:r>
9 </m:e>
10 </m:bar>

```

11 *end example]*

Parent Elements
barPr (§7.1.2.8); groupChrPr (§7.1.2.42)

12

Attributes	Description
val (Value)	<p>Specifies the position of the parent element. Possible values are top and bot.</p> <p>[Example:</p> <pre>       &lt;m:barPr&gt;         &lt;m:pos    m:val="top"/&gt;       &lt;/m:barPr&gt; </pre> <p>The possible values for this attribute are defined by the ST_TopBot simple type (§7.1.3.15).</p>

13 The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_TopBot">
15 <attribute name="val" type="ST_TopBot" use="required"/>
16 </complexType>

```

### 17 7.1.2.85 [postSp \(Post-Equation Spacing\)](#)

18 This element specifies the spacing after math paragraph, in twips

Parent Elements
mathPr (§7.1.2.62)

19

Attributes	Description
val (Value)	<p>Specifies the value, in twips, of the parent element.</p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type</p>

Attributes	Description
	(§7.1.3.16).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TwipsMeasure">
3 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
4 </complexType>
```

### 5 7.1.2.86 preSp (Pre-Equation Spacing)

6 This element specifies the spacing before a math paragraph, in twips

Parent Elements
mathPr (§7.1.2.62)

7

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element.  The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_TwipsMeasure">
10 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
11 </complexType>
```

### 12 7.1.2.87 r (Run)

13 This element specifies a run of math text.

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

14

Child Elements	Subclause
annotationRef (Comment Information Block)	§2.13.4.1
br (Break)	§2.3.3.1
commentReference (Comment Content Reference Mark)	§2.13.4.5
continuationSeparator (Continuation Separator Mark)	§2.11.1
cr (Carriage Return)	§2.3.3.4
dayLong (Date Block - Long Day Format)	§2.3.3.5

Child Elements	Subclause
dayShort (Date Block - Short Day Format)	§2.3.3.6
delInstrText (Deleted Field Code)	§2.16.13
delText (Deleted Text)	§2.3.3.7
drawing (DrawingML Object)	§2.3.3.9
endnoteRef (Endnote Reference Mark)	§2.11.6
endnoteReference (Endnote Reference)	§2.11.7
fldChar (Complex Field Character)	§2.16.18
footnoteRef (Footnote Reference Mark)	§2.11.13
footnoteReference (Footnote Reference)	§2.11.14
instrText (Field Code)	§2.16.25
lastRenderedPageBreak (Position of Last Calculated Page Break)	§2.3.3.13
monthLong (Date Block - Long Month Format)	§2.3.3.15
monthShort (Date Block - Short Month Format)	§2.3.3.16
noBreakHyphen (Non Breaking Hyphen Character)	§2.3.3.18
object (Inline Embedded Object)	§2.3.3.19
pgNum (Page Number Block)	§2.3.3.20
pict (VML Object)	§2.3.3.21
ptab (Absolute Position Tab Character)	§2.3.3.22
rPr (Run Properties)	§7.1.2.91
rPr (Run Properties)	§2.3.2.25
ruby (Phonetic Guide)	§2.3.3.24
separator (Footnote/Endnote Separator Mark)	§2.11.23
softHyphen (Optional Hyphen Character)	§2.3.3.28
sym (Symbol Character)	§2.3.3.29
t (Text)	§7.1.2.116
t (Text)	§2.3.3.30
tab (Tab Character)	§2.3.3.31
yearLong (Date Block - Long Year Format)	§2.3.3.32
yearShort (Date Block - Short Year Format)	§2.3.3.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_R">
 <sequence>
 <element name="rPr" type="CT_RPR" minOccurs="0"/>
 <group ref="w:EG_RPr" minOccurs="0"/>
 <choice minOccurs="0" maxOccurs="unbounded">
 <group ref="w:EG_RunInnerContent"/>
 <element name="t" type="CT_Text" minOccurs="0"/>
 </choice>
 </sequence>
</complexType>
```

### 7.1.2.88 rad (Radical Function)

This element specifies the radical function, consisting of a radical, a base e, and an optional degree deg.

[Example: Examples of rad are  $\sqrt[3]{x}$  (XML shown below) and  $\sqrt{x}$ .

```
<m:rad>
 <m:deg>
 <m:r>
 <m:rPr>
 <m:scr m:val="roman"/>
 <m:sty m:val="p"/>
 </m:rPr>
 <m:t>3</m:t>
 </m:r>
 </m:deg>
 <m:e>
 <m:r>
 <m:t>x</m:t>
 </m:r>
 </m:e>
</m:rad>
```

*end example]*

#### Parent Elements

deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

#### Child Elements

Child Elements	Subclause
deg (Degree)	§7.1.2.26
e (Base (Argument))	§7.1.2.32
radPr (Radical Properties)	§7.1.2.89

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rad">
 <sequence>
 <element name="radPr" type="CT_RadPr" minOccurs="0"/>
 <element name="deg" type="CT_OMathArg"/>
 <element name="e" type="CT_OMathArg"/>
 </sequence>
</complexType>
```

### 7.1.2.89 radPr (Radical Properties)

This element specifies properties of the Radical function rad, including the hidden or shown state of the degree deg.

Parent Elements
rad (§7.1.2.88)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
degHide (Hide Degree)	§7.1.2.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadPr">
 <sequence>
 <element name="degHide" type="CT_OnOff" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.90 rMargin (Right Margin)

This element specifies the right margin for math, in twips. Math margins are added to the paragraph settings for margins. *[Example: The following XML demonstrates an rmargin setting of 1".*

```
<m:mathPr>
 <m:mathFont m:val="Cambria Math"/>
 <m:brkBin m:val="before"/>
 <m:brkBinSub m:val="--"/>
 <m:smallFrac m:val="off"/>
 <m:dispDef/>
```

```

1 <m:lMargin m:val="0"/>
2 <m:rMargin m:val="1440"/>
3 <m:defJc m:val="centerGroup"/>
4 <m:wrapIndent m:val="1440"/>
5 <m:intLim m:val="subSup"/>
6 <m:naryLim m:val="undOvr"/>
7 </m:mathPr>

```

8 *end example]*

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element.  The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

10 The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_TwipsMeasure">
12 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
13 </complexType>

```

### 14 7.1.2.91 rPr (Run Properties)

15 This element specifies the properties of the math run r.

Parent Elements
r (§7.1.2.87)

Child Elements	Subclause
aln (Alignment)	§7.1.2.3
brk (Break)	§7.1.2.15
lit (Literal)	§7.1.2.58
nor (Normal Text)	§7.1.2.74
scr (Script)	§7.1.2.94
sty (style)	§7.1.2.111

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RPR">
 <sequence>
 <element name="lit" minOccurs="0" type="CT_OnOff"/>
 <choice>
 <element name="nor" minOccurs="0" type="CT_OnOff"/>
 <sequence>
 <group ref="EG_ScriptStyle"/>
 </sequence>
 </choice>
 <element name="brk" minOccurs="0" type="CT_ManualBreak"/>
 <element name="aln" minOccurs="0" type="CT_OnOff"/>
 </sequence>
</complexType>
```

### 7.1.2.92 rSp (Row Spacing (Equation Array))

This element specifies spacing between rows of an equation array eqArr; it is used only when rSpRule is set to 3 (exactly; in which case the unit of measure is points) or 4 (Multiple; in which case the unit of measure is lines). If this element is omitted, single line spacing is used in the equation array, and no additional spacing is used in the layout of rows.

[Example: Below are three examples of the same equation array, with single line spacing, 1.5 line spacing, and double line spacing:

$$\begin{pmatrix} x - y + z = 10 \\ 3x + y + 2z = 34 \\ -5x + 2y - z = -14 \end{pmatrix} \begin{pmatrix} x - y + z = 10 \\ 3x + y + 2z = 34 \\ -5x + 2y - z = -14 \end{pmatrix} \begin{pmatrix} x - y + z = 10 \\ 3x + y + 2z = 34 \\ -5x + 2y - z = -14 \end{pmatrix}$$

The following eqArr  $\begin{matrix} a = b + c \\ d + e = f \end{matrix}$  has rSp of 1.6:

```
<m:eqArr>
 <m:eqArrPr>
 <m:rSpRule m:val="4"/>
 <m:rSp m:val="3"/>
 </m:eqArrPr>
 <m:e>
 <m:r>
 <m:t>a=b+c</m:t>
 </m:r>
 </m:e>
```

```

1 <m:e>
2 <m:r>
3 <m:t>d+e=f</m:t>
4 </m:r>
5 </m:e>
6 </m:eqArr>

```

7 *end example]*

#### Parent Elements

eqArrPr (§7.1.2.35); mPr (§7.1.2.68)

8

Attributes	Description
val (Value)	<p>Specifies the amount of space between the parent element. The manner in which this value is determined depends on the setting of the rule of the parent element. If the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as lines.</p> <p>The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§7.1.3.17).</p>

9 The following XML Schema fragment defines the contents of this element:

```

10 <complexType name="CT_UnSignedInteger">
11 <attribute name="val" type="ST_UnSignedInteger" use="required"/>
12 </complexType>

```

### 7.1.2.93 **rSpRule (Row Spacing Rule)**

14 This element specifies the type of vertical spacing between columns in a matrix. The following table  
15 demonstrates possible values of rSpRule along with their definitions and examples.

Value	Line spacing between rows	Example (non-normative)
0	Single line gap	$\begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array}$
1	1.5 line gap	$\begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array}$
2	2 line gap	$\begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array}$
3	Exactly (rely on value of rGp, measured in points)	$\begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array}$
4	Multiple (rely on value of rGp, measured in lines)	$\begin{array}{cc} 1 & 2 \\ 3 & 4 \end{array}$

1

Parent Elements
eqArrPr (§7.1.2.35); mPr (§7.1.2.68)

2

Attributes	Description																		
val (Value)	<p>Specifies the type of spacing between rows and/or columns. Possible values are 0, 1, 2, 3, or 4, whose definitions are contained in the following table:</p> <table><tr><th>Value</th><th>Column/Row Gap</th><th>Example</th></tr><tr><td>0</td><td>Single spacing gap</td><td>1 2</td></tr><tr><td>1</td><td>1.5 spacing gap</td><td>1 2</td></tr><tr><td>2</td><td>2 spacing gap</td><td>1 2</td></tr><tr><td>3</td><td>Exactly (for columns, rely on value of cGp, measured in points) (for rows, rely on value of rSp, measured in points)</td><td>1 2</td></tr><tr><td>4</td><td>Multiple (for columns, rely on value of cGp, measured in lines) (for rows, rely on value of rSp, measured in lines)</td><td>1 2</td></tr></table> <p>The possible values for this attribute are defined by the ST_SpacingRule simple type (§7.1.3.12).</p>	Value	Column/Row Gap	Example	0	Single spacing gap	1 2	1	1.5 spacing gap	1 2	2	2 spacing gap	1 2	3	Exactly (for columns, rely on value of cGp, measured in points) (for rows, rely on value of rSp, measured in points)	1 2	4	Multiple (for columns, rely on value of cGp, measured in lines) (for rows, rely on value of rSp, measured in lines)	1 2
Value	Column/Row Gap	Example																	
0	Single spacing gap	1 2																	
1	1.5 spacing gap	1 2																	
2	2 spacing gap	1 2																	
3	Exactly (for columns, rely on value of cGp, measured in points) (for rows, rely on value of rSp, measured in points)	1 2																	
4	Multiple (for columns, rely on value of cGp, measured in lines) (for rows, rely on value of rSp, measured in lines)	1 2																	

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_SpacingRule">
5 <attribute name="val" type="ST_SpacingRule" use="required"/>
6 </complexType>

```

7 **7.1.2.94** **scr (Script)**

8 This element describes the script applied to the characters in the run. The XML includes the ASCII value of the  
9 character along with the script of the character. The application maps the ASCII value and script type to the  
10 appropriate Unicode range. *[Example: Example: α@*

```

1 <m:r>
2 <m:rPr>
3 <m:scr m:val="fraktur"/>
4 <m:sty m:val="p"/>
5 </m:rPr>
6 <m:t>a</m:t>
7 </m:r>
8 <m:r>
9 <m:rPr>
10 <m:scr m:val="double-struck"/>
11 <m:sty m:val="p"/>
12 </m:rPr>
13 <m:t>a</m:t>
14 </m:r>
15 end example]

```

Parent Elements
rPr (§7.1.2.91)

16

Attributes	Description
val (Value)	Specifies the script type of the parent element. Possible values are: double-struck, fraktur, monospace, roman, sans-serif, and script.  The possible values for this attribute are defined by the ST_Script simple type (§7.1.3.10).

17 The following XML Schema fragment defines the contents of this element:

```

18 <complexType name="CT_Script">
19 <attribute name="val" type="ST_Script"/>
20 </complexType>

```

### 21 7.1.2.95 sepChr (Delimiter Separator Character)

22 This element specifies the character that separates base arguments e in the delimiter object d. If this element is  
 23 omitted, the default sepChr is '|'. [Example: Examples of d, each with a different sepChr, are:  
 24  $(a_1|a_2)(a_1:a_2)(a_1;a_2)$ . The following example describes a separator character if .]

```

25 <m:dPr>
26 <m:sepChr val="#0058"/>
27 </m:dPr>

```

28 end example]

Parent Elements
-----------------

## Parent Elements

dPr (§7.1.2.31)

1

Attributes	Description
val (value)	<p>Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [Example: delimiter object {a}:</p> <pre>&lt;m:dPr&gt;   &lt;m:begChr m:val="{"/&gt;   &lt;m:endChr m:val="}"/&gt; &lt;/m:dPr&gt;</pre> <p>The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Char">
4 <attribute name="val" type="ST_Char" use="required"/>
5 </complexType>
```

### 6 7.1.2.96 show (Phantom Show)

7 This element specifies the show property of the phantom phant. When off, the phant base e is hidden. If this  
8 element is omitted, the base e is shown. [Example: In the following example, there is a phantom of the fraction  
9 a/b in the second radical such that only the height is preserved. The fraction does not show.

$$\sqrt{\frac{a}{b}} = \sqrt{x}$$

```
10 <m:phantPr>
11 <m:show m:val="off"/>
12 <m:zeroDesc m:val="on"/>
13 </m:phantPr>
```

14 end example]

## Parent Elements

phantPr (§7.1.2.82)

15

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of off specifies that the property shall be explicitly turned off. This is implied</p>

Attributes	Description
	when the parent element is not present.  The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

### 5 7.1.2.97 **shp (Shape (Delimiters))**

6 This element specifies the shape of delimiters in the delimiter object d. Delimiters can be centered around the  
7 entire height of their contents, or their height can be altered to exactly match their contents' height. When this  
8 element is omitted, delimiters are 'centered'. [*Example*: In the example below, delimiters will be matched to the  
9 height of their contents:

```
10 <m:dPr>
11 <m:shp m:val="match"/>
12 </m:dPr>
```

13 *end example]*

Parent Elements
dPr (§7.1.2.31)

14

Attributes	Description
val (Value)	Specifies the shape of the parent element. Possible values are match and centered.  The possible values for this attribute are defined by the ST_Shp simple type (§7.1.3.11).

15 The following XML Schema fragment defines the contents of this element:

```
16 <complexType name="CT_Shp">
17 <attribute name="val" type="ST_Shp" use="required"/>
18 </complexType>
```

### 19 7.1.2.98 **smallFrac (Small Fraction)**

20 This element specifies a reduced fraction size display math, such that the numerator and denominator are  
21 written in script size instead of at the size of regular text. [*Example*: The XML containing this element in use is:

```
1 <m:mathPr>
2 <m:mathFont m:val="Cambria Math"/>
3 <m:brkBin m:val="before"/>
4 <m:brkBinSub m:val="--"/>
5 <m:smallFrac m:val="off"/>
6 <m:dispDef/>
7 <m:lMargin m:val="0"/>
8 <m:rMargin m:val="0"/>
9 <m:defJc m:val="centerGroup"/>
10 <m:wrapIndent m:val="1440"/>
11 <m:intLim m:val="subSup"/>
12 <m:naryLim m:val="undOvr"/>
13 </m:mathPr>
14 end example]
```

15

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

16 The following XML Schema fragment defines the contents of this element:

```
17 <complexType name="CT_OnOff">
18 <attribute name="val" type="ST_OnOff"/>
19 </complexType>
```

20 **7.1.2.99 sPre (Pre-Sub-Superscript Function)**

21 This element specifies the Pre-Sub-Superscript function, which consists of a base  $e$  and a subscript and  
22 superscript placed to the left of the base, as in  ${}_1^2A$ . [Example: The XML that specifies this function is:

```

1 <m:sPre>
2 <m:sub>
3 <m:r>
4 <m:t>1</m:t>
5 </m:r>
6 </m:sub>
7 <m:sup>
8 <m:r>
9 <m:t>2</m:t>
10 </m:r>
11 </m:sup>
12 <m:e>
13 <m:r>
14 <m:t>A</m:t>
15 </m:r>
16 </m:e>
17 </m:sPre>

```

end example]

24

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sSubPr (Subscript Properties)	§7.1.2.102
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSub">
 <sequence>
 <element name="sSubPr" type="CT_SSubPr" minOccurs="0"/>
 <element name="e" type="CT_OMathArg"/>
 <element name="sub" type="CT_OMathArg"/>
 </sequence>
</complexType>
```

7.1.2.102 sSubPr (Subscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Subscript function sSub.

Parent Elements
sSub (§7.1.2.101)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSubPr">
 <sequence>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

7.1.2.103 sSubSup (Sub-Superscript Function)

This element specifies the sub-superscript function, which consists of a base e, a reduced-size scr placed below and to the right, and a reduced-size scr placed above and to the right, as in  $x_m^n$ .

[Example: The XML that specifies this function is:

```
<m:sSubSup>
 <m:e>
 <m:r>
 <m:t>x</m:t>
 </r>
 </m:e>
 <m:sub>
 <m:r>
 <m:t>m</m:t>
 </r>
 </m:sub>
```

```

1 <m:sup>
2 <m:r>
3 <m:t>n</m:t>
4 </r>
5 </m:sup>
6 </m:sSubSup>

```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sSubSupPr (Sub-Superscript Properties)	§7.1.2.104
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SSubSup">
 <sequence>
 <element name="sSubSupPr" type="CT_SSubSupPr" minOccurs="0"/>
 <element name="e" type="CT_OMathArg"/>
 <element name="sub" type="CT_OMathArg"/>
 <element name="sup" type="CT_OMathArg"/>
 </sequence>
</complexType>

```

### 7.1.2.104 sSubSupPr (Sub-Superscript Properties)

This element specifies properties of the Sub-Superscript function, including the alignment of scripts.

Parent Elements
sSubSup (§7.1.2.103)

Child Elements	Subclause
alnScr (Align Scripts)	§7.1.2.4
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSubSupPr">
 <sequence>
 <element name="alnScr" type="CT_OnOff" minOccurs="0"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

7.1.2.105 sSup (Superscript Function)

This element specifies the subscript function sSub, which consists of a base e and a reduced-size scr placed below and to the right, as in  $x^n$ . [Example: The XML that specifies this function is:

```
<m:sSup>
 <m:e>
 <m:r>
 <m:t>x</m:t>
 </r>
 </m:e>
 <m:sup>
 <m:r>
 <m:t>n</m:t>
 </r>
 </m:sup>
</m:sSup>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sSupPr (Superscript Properties)	§7.1.2.106
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSup">
 <sequence>
 <element name="sSupPr" type="CT_SSupPr" minOccurs="0"/>
 <element name="e" type="CT_OMathArg"/>
 <element name="sup" type="CT_OMathArg"/>
 </sequence>
</complexType>
```

7.1.2.106 sSupPr (Superscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Superscript function sSup.

Parent Elements
sSup (§7.1.2.105)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSupPr">
 <sequence>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

7.1.2.107 strikeBLTR (Border Box Strikethrough Bottom-Left to Top-Right)

This element specifies the hidden or shown state of a strikethrough diagonal line from the bottom-left corner to the top-right corner of borderBox. When this element is omitted, the strikethrough is not drawn. When on, a strikethrough is drawn, as in ~~abc~~. [Example:

```
<m:borderBox>
 <m:borderBoxPr>
 <m:hideTop m:val="on"/>
 <m:hideBot m:val="on"/>
 <m:hideLeft m:val="on"/>
 <m:hideRight m:val="on"/>
 <m:strikeBLTR m:val="on"/>
 </m:borderBoxPr>
 <m:e>
 <m:r>
 <m:t>abc</m:t>
 </m:r>
 </m:e>
</m:borderBox>
```

1 *end example]*

Parent Elements
borderBoxPr (§7.1.2.12)

2

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_OnOff">
5 <attribute name="val" type="ST_OnOff"/>
6 </complexType>
```

#### 7 7.1.2.108 `strikeH` (Border Box Strikethrough Horizontal)

8 This element specifies the hidden or shown state of a strikethrough horizontal line in `borderBox`. When this  
 9 element is omitted, the strikethrough is not drawn. When `on`, a horizontal strikethrough is drawn, as in *abc*.  
 10 [Example:

```
11 <m:borderBox>
12 <m:borderBoxPr>
13 <m:hideTop m:val="on"/>
14 <m:hideBot m:val="on"/>
15 <m:hideLeft m:val="on"/>
16 <m:hideRight m:val="on"/>
17 <m:strikeH m:val="on"/>
18 </m:borderBoxPr>
19 <m:e>
20 <m:r>
21 <m:t>abc</m:t>
22 </m:r>
23 </m:e>
24 </m:borderBox>
```

25 *end example]*

Parent Elements
-----------------

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 7.1.2.109 strikeTLBR (Border Box Strikethrough Top-Left to Bottom-Right)

This element specifies the hidden or shown state of a strikethrough diagonal line from the top-left corner to the bottom-right corner of `borderBox`. When this element is omitted, the strikethrough is not drawn. When `on`, a strikethrough is drawn, as in ~~abc~~. [Example:

```
<m:borderBox>
 <m:borderBoxPr>
 <m:hideTop m:val="on"/>
 <m:hideBot m:val="on"/>
 <m:hideLeft m:val="on"/>
 <m:hideRight m:val="on"/>
 <m:strikeTLBR m:val="on"/>
 </m:borderBoxPr>
 <m:e>
 <m:r>
 <m:t>abc</m:t>
 </m:r>
 </m:e>
</m:borderBox>
```

*end example]*

Parent Elements
borderBoxPr (§7.1.2.12)

1

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>

```

### 6 7.1.2.110 `strikeV` (Border Box Strikethrough Vertical)

7 This element specifies the hidden or shown state of a strikethrough vertical line in `borderBox`. When this  
8 element is omitted, the strikethrough is not drawn. When on, a strikethrough is drawn, as in . [Example:

```

9 <m:borderBox>
10 <m:borderBoxPr>
11 <m:strikeV m:val="on"/>
12 </m:borderBoxPr>
13 <m:e>
14 <m:r>
15 <m:t>abc</m:t>
16 </m:r>
17 </m:e>
18 </m:borderBox>

```

19 *end example]*

Parent Elements
<code>borderBoxPr</code> (§7.1.2.12)

20

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p>

Attributes	Description
	A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.
	The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 7.1.2.111 `sty` (style)

6 This element describes the script applied to the characters in the run. The XML includes the ASCII value of the  
7 character along with the style of the character. The application maps the ASCII value and style to the  
8 appropriate Unicode range. [Example: Example: ***abc***

```
9 <m:oMath>
10 <m:r>
11 <m:rPr>
12 <m:scr m:val="roman"/>
13 <m:sty m:val="b"/>
14 </m:rPr>
15 <m:t>abc</m:t>
16 </m:r>
17 </m:oMath>
```

18 *end example]*

Parent Elements
rPr (§7.1.2.91)

19

Attributes	Description
val (Value)	Specifies the style of the parent element. Possible values are <code>b</code> (bold), <code>i</code> (italic), <code>bi</code> (bold-italic), and <code>p</code> (plain).
	The possible values for this attribute are defined by the <code>ST_Style</code> simple type (§7.1.3.14).

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_Style">
22 <attribute name="val" type="ST_Style"/>
23 </complexType>
```

### 7.1.2.112 `sub` (Subscript (Pre-Sub-Superscript))

This element specifies the subscript of the Pre-Sub-Superscript function `sPre`. [*Example*: For example, the `sub` in the object  ${}_1^2A$  is 1. An example of this element in use is:

```
<m:sPre>
 <m:sub>
 <m:r>
 <m:t>1</m:t>
 </m:r>
 </m:sub>
 <m:sup>
 <m:r>
 <m:t>2</m:t>
 </m:r>
 </m:sup>
 <m:e>
 <m:r>
 <m:t>A</m:t>
 </m:r>
 </m:e>
</m:sPre>
```

*end example*

Parent Elements

6 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
7 </sequence>
8 </complexType>

```

### 9 7.1.2.113 subHide (Hide Subscript (n-ary))

10 This element specifies the n-ary Hide Subscript property. When on, the lower limit does not appear, as in

11  $\int^{\infty} \frac{x}{x+1} dx$ . If this element is omitted, the lower limit appears. [Example: An example of this element in use is:

```

12 <m:naryPr>
13 <m:chr m:val="∫" />
14 <m:subHide m:val="on" />
15 </m:naryPr>

```

16 *end example]*

Parent Elements
naryPr (§7.1.2.72)

17

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).</p>

18 The following XML Schema fragment defines the contents of this element:

```

19 <complexType name="CT_OnOff">
20 <attribute name="val" type="ST_OnOff"/>
21 </complexType>

```

### 7.1.2.114 `sup` (Superscript (Superscript function))

This element specifies the superscript of the superscript function `sSup`. For example, the `sup` in the superscript object  $x^n$  is  $n$ . [Example: An example of this element in use is:

```
<m:sSup>
 <m:e>
 <m:r>
 <m:t>x</m:t>
 </m:r>
 </m:e>
 <m:sup>
 <m:r>
 <m:t>n</m:t>
 </m:r>
 </m:sup>
</m:sSup>
```

*end example]*

oMath (Office Math)	§7.1.2.77
oMathPara (Math Paragraph)	§7.1.2.78
permEnd (Range Permission End)	§2.13.7.1
permStart (Range Permission Start)	§2.13.7.2
phant (Phantom Function)	§7.1.2.81
proofErr (Proofing Error Anchor)	§2.13.8.1
r (Run)	§7.1.2.87
rad (Radical Function)	§7.1.2.88
sPre (Pre-Sub-Superscript Function)	§7.1.2.99
sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
 <sequence>
 <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
 <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
 <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
 </sequence>
</complexType>
```

### 7.1.2.115 **supHide** (Hide Superscript (n-ary))

This element specifies the n-ary Hide Superscript property. When on, the upper limit does not appear, as in

$\int_0^x \frac{x}{x+1} dx$ . If this element is omitted, the lower limit appears. [Example: An example of this element in use is:

```
<m:naryPr>
 <m:chr m:val="∫" />
 <m:supHide m:val="on" />
</m:naryPr>
```

*end example]*

#### Parent Elements

naryPr (§7.1.2.72)

#### Attributes

val (value)

#### Description

Specifies a binary value for the property defined by the parent XML element.

A value of `on` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

A value of `off` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

The possible values for this attribute are defined by the `ST_OnOff` simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 7.1.2.116 **t** (Text)

This element specifies the text in a math run r.

#### Parent Elements

r (§7.1.2.87)

1

Attributes	Description
space (Content Contains Significant Whitespace)  Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. [<i>Example</i>: Consider the following run contained within a WordprocessingML document:</p> <pre>&lt;w:r&gt;   &lt;w:t&gt;significant whitespace  &lt;/w:t&gt; &lt;/w:r&gt;</pre> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>type</code> in the <code>namespace</code>.</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Text">
4 <simpleContent>
5 <extension base="ST_String">
6 <attribute ref="xml:space" use="optional"/>
7 </extension>
8 </simpleContent>
9 </complexType>
```

10 7.1.2.117 `transp` (Transparent (Phantom))

11 This element specifies that the phantom is transparent for spacing. This means that if the contents of the  
12 phantom are belonging to a special spacing class (such as binary operators, relational operators, differentials,  
13 etc.), the contents of that phantom are taken into consideration when laying out text. If transparency is off, then  
14 the contents of the phantom are ignored during layout. When this element is omitted, transparency is 'off'. In  
15 the following example, transparency is off on the phantom around the differential term.  
16  $\int x dx$ . The spacing is incorrect. In the following integral, the only difference is that transparency is on:  
17  $\int x \, dx$ . Now the spacing is correct.

18 [*Example*: An example of this element in XML is:

```
19 <m:phantPr>
20 <m:zeroAsc m:val="on"/>
21 <m:zeroDesc m:val="on"/>
22 <m:transp m:val="on"/>
23 </m:phantPr>
```

24 *end example*]

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 7.1.2.118 type (Fraction type)

This element specifies the type of fraction  $f$ ; the default is 'bar'. Fractions types are:

Stacked Fraction:  $\frac{a}{b}$

Skewed Fraction:  $a/b$

Linear Fraction:  $a/b$

Stack Object (No-Bar Fraction):  $\frac{n}{k}$

Parent Elements
fPr (§7.1.2.38)

Attributes	Description
val (Value)	<p>Specifies the type of fraction. Possible values are <code>bar</code> (Bar Fraction), <code>lin</code> (Linear Fraction), <code>noBar</code> (No-Bar Fraction (Stack)), and <code>skw</code> (Skewed).</p> <p>The possible values for this attribute are defined by the <code>ST_FType</code> simple type (§7.1.3.4).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FType">
 <attribute name="val" type="ST_FType" use="required"/>
</complexType>
```

### 7.1.2.119 `vertJc` (Vertical Justification)

This element, combined with `pos` of `groupChrPr`, specifies the vertical layout of the `groupChr` object. Where `pos` specifies the position of the grouping character, `vertJc` specifies the alignment of the object with respect to the baseline. For example, when the group character is above the object, `vertJc` of `top` signifies that the top of the object falls on the baseline; when `vertJc` is set to `bot`, the bottom of the object is on the baseline. The table below demonstrates the four possible combinations of `groupChr` layout:

Pos	vertJc	Layout
top	top	$a \overleftarrow{\quad} e$ $\quad bcd$
top	bot	$a \overbrace{\quad} bcd e$
bot	top	$a \underbrace{\quad} bcd e$
bot	bot	$a \xrightarrow{\text{yields}} b$

#### Parent Elements

`groupChrPr` (§7.1.2.42)

#### Attributes

#### Description

`val` (Value)

Specifies the position of the parent element. Possible values are `top` and `bot`.

[Example:

```
<m:barPr>
 <m:pos m:val="top"/>
</m:barPr>
```

The possible values for this attribute are defined by the `ST_TopBot` simple type (§7.1.3.15).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TopBot">
 <attribute name="val" type="ST_TopBot" use="required"/>
</complexType>
```

### 7.1.2.120 `wrapIndent` (Wrap Indent)

This element specifies the indent of the wrapped line of an equation. The line or lines of a wrapped equation after the line break can either be indented by a specified amount from the left margin, or right aligned. The default indent is 1".

[Example: The XML below demonstrates `wrapIndent` in use:

```

1 <m:mathPr>
2 <m:mathFont m:val="Cambria Math"/>
3 <m:brkBin m:val="before"/>
4 <m:brkBinSub m:val="--"/>
5 <m:smallFrac m:val="off"/>
6 <m:dispDef/>
7 <m:lMargin m:val="0"/>
8 <m:rMargin m:val="0"/>
9 <m:defJc m:val="centerGroup"/>
10 <m:wrapIndent m:val="1440"/>
11 <m:intLim m:val="subSup"/>
12 <m:naryLim m:val="undOvr"/>
13 </m:mathPr>
14 end example]

```

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element.  The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```

17 <complexType name="CT_TwipsMeasure">
18 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
19 </complexType>

```

### 7.1.2.121 wrapRight (Wrap Right)

This element specifies the right justification of the wrapped line of an equation. The line or lines of a wrapped equation after the line break can either be indented by a specified amount from the left margin, or right aligned. If this element is present, the continuation is right aligned. *[Example: An example of this element in use is:*

```

24 <m:mathPr>
25 <m:mathFont m:val="Cambria Math"/>
26 <m:brkBin m:val="before"/>
27 <m:brkBinSub m:val="--"/>
28 <m:smallFrac m:val="off"/>
29 <m:dispDef/>

```

```

1 <m:lMargin m:val="0"/>
2 <m:rMargin m:val="0"/>
3 <m:defJc m:val="centerGroup"/>
4 <m:wrapRight/>
5 <m:intLim m:val="subSup"/>
6 <m:naryLim m:val="undOvr"/>
7 </m:mathPr>

```

8 *end example]*

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

10 The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_OnOff">
12 <attribute name="val" type="ST_OnOff"/>
13 </complexType>

```

### 14 7.1.2.122 zeroAsc (Phantom Zero Ascent)

15 This element specifies that the phantom has zero ascent. The ascent of the contents of the phantom is not taken  
 16 into account during layout. When this property is omitted, the phantom does have ascent (zero ascent is off). In  
 17 the following example, the differential term is contained in a phantom that zero ascent. As a result, spacing is  
 18 reduced between the tip of the "d" and the radical bar:  $\sqrt{x}dx$ . [Example:

```

19 <m:phantPr>
20 <m:zeroAsc m:val="on"/>
21 </m:phantPr>

```

22 *end example]*

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

### 5 7.1.2.123 zeroDesc (Phantom Zero Descent)

6 This element specifies that the phantom has zero descent. The descent of the contents of the phantom is not  
7 taken into account during layout. When this property is omitted, the phantom does have descent (zero descent  
8 is off). [Example: In the following two examples, only the second has zero descent around the "y". Note that the  
9 radical is smaller than in the first case.  $\sqrt{y}\sqrt{y}$ ]

```
10 <m:phantPr>
11 <m:zeroDesc m:val="on"/>
12 </m:phantPr>
```

13 *end example]*

Parent Elements
phantPr (§7.1.2.82)

14

Attributes	Description
val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of <code>off</code> specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§7.1.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.124 zeroWid (Phantom Zero Width)

This element specifies that the phantom has zero width. The width of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have width (zero width is off).

[Example: In the following example, the second radical contains a phantom of the fraction  $a/b$ . The phantom has

zero width, such that only the height grows to accommodate the hidden fraction:  $\sqrt{\frac{a}{b}} = \sqrt{x}$

```
<m:phantPr>
 <m:show m:val="off"/>
 <m:zeroDesc m:val="on"/>
</m:phantPr>
```

end example]

Parent Elements

phantPr (§7.1.2.82)

Attributes

Description

val (value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.</p> <p>A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).</p>
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.3 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/officeDocument/2006/math> namespace.

### 7.1.3.1 ST\_BreakBin (Break Binary Operators)

This defines how to represent binary operators with respect to a line-wrapping break. The line can wrap before the operator or after the operator; alternately, the operator can appear both at the end of the first line and the beginning of the second.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
after (After)	When line-wrapping breaks occur on binary operators, the binary operator appears after the break (at the start of the next line).
before (Before)	When line-wrapping breaks occur on binary operators, the binary operator appears before the break (at the end of the first line).
repeat (Repeat)	When line-wrapping breaks occur on binary operators, the binary operator appears on both sides of the break (at the end of the first line and the start of the next line).

#### Referenced By

brkBin@val (§7.1.2.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BreakBin">
 <restriction base="xsd:string">
 <enumeration value="before"/>
 <enumeration value="after"/>
 <enumeration value="repeat"/>
 </restriction>
</simpleType>
```

### 7.1.3.2 ST\_BreakBinSub (Break on Binary Subtraction)

This simple type specifies how to represent subtraction on both sides of a line-wrapping break, when the Break Binary Operators option is set to repeat. The first character represents the sign at the end of the line with the break; the second represents the sign at the start of the wrapped line. Options are --, -+, and +-.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-- (Minus Minus)	Repetition of subtraction sign after a line-wrapping

Enumeration Value	Description
	break is minus on the first and second lines.
-- (Minus Plus)	Repetition of subtraction sign after a line-wrapping break is minus on the first line and plus on the second line.
+- (Plus Minus)	Repetition of subtraction sign after a line-wrapping break is plus on the first line and minus on the second line.

1

Referenced By
brkBinSub@val (§7.1.2.17)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_BreakBinSub">
4 <restriction base="xsd:string">
5 <enumeration value="--"/>
6 <enumeration value="--+"/>
7 <enumeration value="+-"/>
8 </restriction>
9 </simpleType>
```

### 10 7.1.3.3 ST\_Char (Character)

11 This Simple Type specifies the single character used by the parent element.

12 [Example: In the following example, {*a*} uses { and } as its enclosing characters, instead of the default ( and ).

```

13 <m:dPr>
14 <m:begChr m:val="{"/>
15 <m:endChr m:val="}"/>
16 </m:dPr>
```

17 *end example]*

18 This simple type's contents are a restriction of the XML Schema string datatype.

19 This simple type also specifies the following restrictions:

- 20 • This simple type's contents have a maximum length of 1 characters.

Referenced By
begChr@val (§7.1.2.10); chr@val (§7.1.2.20); endChr@val (§7.1.2.33); sepChr@val (§7.1.2.95)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Char">
 <restriction base="xsd:string">
 <maxLength value="1"/>
 </restriction>
</simpleType>
```

#### 7.1.3.4 ST\_FType (Fraction Type)

Fractions can be of type bar (horizontal fraction bar), skewed ("skw" - diagonal fraction bar with kerned and vertically adjusted numerator and denominator), linear ("lin" - diagonal fraction bar, takes up exactly one line of space), and the "stack" object ("noBar").

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bar (Bar Fraction)	Fraction with a horizontal fraction bar.
lin (Linear Fraction)	Fraction with slanted fraction bar, that takes up no additional vertical space.
noBar (No-Bar Fraction (Stack))	Stack object, which looks like a fraction with no fraction bar.
skw (Skewed)	Fraction with diagonal fraction bar.

#### Referenced By

type@val (§7.1.2.118)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FType">
 <restriction base="xsd:string">
 <enumeration value="bar"/>
 <enumeration value="skw"/>
 <enumeration value="lin"/>
 <enumeration value="noBar"/>
 </restriction>
</simpleType>
```

#### 7.1.3.5 ST\_Integer2 (Integer value (-2 to 2))

This simple type contains a value from (-2,+2) which specifies the size of the argument. The effects of each value are described by the referencing element.

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -2.
- This simple type has a maximum value of less than or equal to 2.

Referenced By
argSz@val (§7.1.2.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Integer2">
 <restriction base="xsd:integer">
 <minInclusive value="-2"/>
 <maxInclusive value="2"/>
 </restriction>
</simpleType>
```

### 7.1.3.6 ST\_Integer255 (Integer value (1 to 255))

This simple type specifies an integer value. The semantics of each value are discussed by the referencing element.

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 255.

Referenced By
brk@alnAt (§7.1.2.15); count@val (§7.1.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Integer255">
 <restriction base="xsd:integer">
 <minInclusive value="1"/>
 <maxInclusive value="255"/>
 </restriction>
</simpleType>
```

### 7.1.3.7 ST\_Jc (Justification)

This Simple Type specifies the justification of Math Paragraphs. Justification of the Math Paragraph can be Left, Right, Centered, or Centered as Group.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center (Equation))	Centers each equation individually with respect to

Enumeration Value	Description
	margins.
centerGroup (Centered as Group (Equations))	Justifies equations with respect to each other, and centers the group of equations (the Math Paragraph) with respect to the page.
left (Left Justification)	Left justification of Math Paragraph
right (Right)	Right Justification of Math Paragraph

1

Referenced By
defJc@val (§7.1.2.25); jc@val (§7.1.2.51)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Jc">
4 <restriction base="xsd:string">
5 <enumeration value="left"/>
6 <enumeration value="right"/>
7 <enumeration value="center"/>
8 <enumeration value="centerGroup"/>
9 </restriction>
10 </simpleType>

```

### 11 7.1.3.8 ST\_LimLoc (Limit Location)

12 Limits can be in one of two positions: Under-Over (undOvr - above and below the base), and Subscript-  
 13 Superscript (subSup - positioned to the side of the base, in the position of subscripts and superscripts).

14 This simple type's contents are a restriction of the XML Schema string datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
subSup (Subscript-Superscript location)	Limits placed to the side of the base, as opposed to directly over and under.
undOvr (Under-Over location)	Limits placed to the directly above and below the base, as opposed to on the side.

16

Referenced By
intLim@val (§7.1.2.49); limLoc@val (§7.1.2.53); naryLim@val (§7.1.2.71)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LimLoc">
 <restriction base="xsd:string">
 <enumeration value="undOvr"/>
 <enumeration value="subSup"/>
 </restriction>
</simpleType>
```

### 7.1.3.9 ST\_OnOff (On Off)

The boolean value of either on or off.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
off (Off)	Off
on (On)	On

#### Referenced By

aln@val (§7.1.2.3); alnScr@val (§7.1.2.4); degHide@val (§7.1.2.27); diff@val (§7.1.2.29); dispDef@val (§7.1.2.30); grow@val (§7.1.2.43); hideBot@val (§7.1.2.44); hideLeft@val (§7.1.2.45); hideRight@val (§7.1.2.46); hideTop@val (§7.1.2.47); lit@val (§7.1.2.58); maxDist@val (§7.1.2.63); noBreak@val (§7.1.2.73); nor@val (§7.1.2.74); objDist@val (§7.1.2.76); opEmu@val (§7.1.2.80); plcHide@val (§7.1.2.83); show@val (§7.1.2.96); smallFrac@val (§7.1.2.98); strikeBLTR@val (§7.1.2.107); strikeH@val (§7.1.2.108); strikeTLBR@val (§7.1.2.109); strikeV@val (§7.1.2.110); subHide@val (§7.1.2.113); supHide@val (§7.1.2.115); transp@val (§7.1.2.117); wrapRight@val (§7.1.2.121); zeroAsc@val (§7.1.2.122); zeroDesc@val (§7.1.2.123); zeroWid@val (§7.1.2.124)

```
<simpleType name="ST_OnOff">
 <restriction base="xsd:string">
 <enumeration value="on"/>
 <enumeration value="off"/>
 </restriction>
</simpleType>
```

### 7.1.3.10 ST\_Script (Script)

Script can be of type Roman, Script, Fraktur, Double-Struck, Sans-Serif, or Monospace.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
double-struck (double-struck)	Double-Struck Script Type
fraktur (Fraktur)	Fraktur Script Type
monospace (Monospace)	Monospace Script Type
roman (Roman)	Roman Script Type
sans-serif (Sans-Serif)	Sans-Serif Script Type
script (Script)	Script Type

1

Referenced By
scr@val (§7.1.2.94)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Script">
4 <restriction base="xsd:string">
5 <enumeration value="roman"/>
6 <enumeration value="script"/>
7 <enumeration value="fraktur"/>
8 <enumeration value="double-struck"/>
9 <enumeration value="sans-serif"/>
10 <enumeration value="monospace"/>
11 </restriction>
12 </simpleType>

```

### 13 7.1.3.11 ST\_Shp (Shape (Delimiters))

14 Delimiters shape can be centered around the argument, or matched to the shape of the argument.

15 This simple type's contents are a restriction of the XML Schema string datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
centered (Centered (Delimiters))	Delimiters are centered around their argument.
match (Match)	Match shape of contents of delimiters.

17

Referenced By
shp@val (§7.1.2.97)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Shp">
 <restriction base="xsd:string">
 <enumeration value="centered"/>
 <enumeration value="match"/>
 </restriction>
</simpleType>
```

### 7.1.3.12 ST\_SpacingRule (Spacing Rule)

Integer value (0 to 4), representing the type of spacing between rows.

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 4.

#### Referenced By

cGpRule@val (§7.1.2.19); rSpRule@val (§7.1.2.93)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SpacingRule">
 <restriction base="xsd:integer">
 <minInclusive value="0"/>
 <maxInclusive value="4"/>
 </restriction>
</simpleType>
```

### 7.1.3.13 ST\_String (String)

String

This simple type's contents are a restriction of the XML Schema string datatype.

#### Referenced By

mathFont@val (§7.1.2.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_String">
 <restriction base="xsd:string"/>
</simpleType>
```

### 7.1.3.14 ST\_Style (Style)

Style of math can be plain, bold, italic, or bold-italic (p, bi, i, or bi).

This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bold)	Bold
bi (Bold-Italic)	Bold-Italic
i (Italic)	Italic
p (Plain)	Plain

2

Referenced By
sty@val (§7.1.2.111)

- 3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_Style">
5 <restriction base="xsd:string">
6 <enumeration value="p"/>
7 <enumeration value="b"/>
8 <enumeration value="i"/>
9 <enumeration value="bi"/>
10 </restriction>
11 </simpleType>

```

### 12 7.1.3.15 ST\_TopBot (Top-Bottom)

- 13 Possible values are top and bot.

- 14 This simple type's contents are a restriction of the XML Schema string datatype.

- 15 The following are possible enumeration values for this type:

Enumeration Value	Description
bot (Bottom Alignment)	Aligns the bottom of the function to the baseline of the surrounding text.
top (Top)	Aligns the top row of the function to the baseline of the surrounding text.

16

Referenced By
pos@val (§7.1.2.84); vertJc@val (§7.1.2.119)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TopBot">
 <restriction base="xsd:string">
 <enumeration value="top"/>
 <enumeration value="bot"/>
 </restriction>
</simpleType>
```

#### 7.1.3.16 ST\_TwipsMeasure (Twips measurement)

Positive measurement in twips (twentieths of a point, 1/1440 of an inch).

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

##### Referenced By

interSp@val (§7.1.2.48); intraSp@val (§7.1.2.50); lMargin@val (§7.1.2.59); postSp@val (§7.1.2.85); preSp@val (§7.1.2.86); rMargin@val (§7.1.2.90); wrapIndent@val (§7.1.2.120)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TwipsMeasure">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

#### 7.1.3.17 ST\_UnSignedInteger (Unsigned integer.)

Unsigned Integer

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

##### Referenced By

cGp@val (§7.1.2.18); cSp@val (§7.1.2.22); rSp@val (§7.1.2.92)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnSignedInteger">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

#### 7.1.3.18 ST\_XAlign (Horizontal Alignment)

Possible values are left, center, and right.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center)	Centers the argument in the containing function.
left (Left Justification)	Aligns the argument to the left of the containing

Enumeration Value	Description
	function.
right (Right)	Aligns the argument to the right of the containing function.

1

Referenced By
mcJc@val (§7.1.2.65)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_XAlign">
4 <restriction base="xsd:string">
5 <enumeration value="left"/>
6 <enumeration value="center"/>
7 <enumeration value="right"/>
8 </restriction>
9 </simpleType>
```

### 10 7.1.3.19 ST\_YAlign (Vertical Alignment)

11 Possible values are bot, center, and top.

12 This simple type's contents are a restriction of the XML Schema string datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
bot (Bottom Alignment)	Aligns the bottom of the function to the baseline of the surrounding text.
center (Center (Function))	Centers the argument in the containing function.
top (Top)	Aligns the top row of the function to the baseline of the surrounding text.

14

Referenced By
baseJc@val (§7.1.2.9)

15 The following XML Schema fragment defines the contents of this simple type:

```

16 <simpleType name="ST_YAlign">
17 <restriction base="xsd:string">
18 <enumeration value="top"/>
19 <enumeration value="center"/>
20 <enumeration value="bot"/>
21 </restriction>
22 </simpleType>
```

## 7.2 Extended Properties

Extended properties are a predefined set of metadata properties that are applicable to Office Open XML documents. These properties extend the set of core properties defined in Part 2: "Open Packaging Conventions" which are common to all packages.

Extended properties are stored within an Extended File Properties part with:

- Source Relationship:  
<http://schemas.openxmlformats.org/officeDocument/2006/relationships/extended-properties>
- Content Type: application/vnd.openxmlformats-officedocument.extended-properties+xml

Each extended property is represented as an element in the extended properties part. Extended properties elements are non-repeatable and may be empty or omitted. If all extended property elements are omitted then the extended properties part may be excluded from a document.

[*Example:* A sample extended file properties part:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Properties xmlns="http://.../extended-properties"
 xmlns:vt="http://.../docPropsVTypes">
 ..<Template>Sales Report.dotm</Template>
 ..<TotalTime>0</TotalTime>
 ..<Pages>1</Pages>
 ..<Words>166</Words>
 ..<Characters>948</Characters>
 ..<Application>Microsoft Office Word</Application>
 ..<DocSecurity>0</DocSecurity>
 ..<Lines>7</Lines>
 ..<Paragraphs>2</Paragraphs>
 ..<ScaleCrop>>false</ScaleCrop>
 ..<Company>Northwind Traders</Company>
 ..<LinksUpToDate>>false</LinksUpToDate>
 ..<CharactersWithSpaces>1112</CharactersWithSpaces>
 ..<SharedDoc>>false</SharedDoc>
 ..<HyperlinksChanged>>false</HyperlinksChanged>
 ..<AppVersion>12.0000</AppVersion>
</Properties>
```

*end example]*

29

30 **End of informative text.**31 **7.2.2 Elements**

32 The following elements specify the contents of this namespace:

33 **7.2.2.1 Application (Application Name)**

34 This element specifies the name of the application that created this document.

35 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

36 **7.2.2.2 AppVersion (Application Version)**

37 This element specifies the version of the application which produced this document.

The content of this element shall be of the form XX.YYYY where X and Y represent numerical values, or the document shall be considered non-conformant.

[Note: The contents of this element do not represent absolute values, but rather qualify the contents of the Application element to differentiate between different versions of the same producer. Applications should use this information in an informative manner only (as document metadata). *end note*]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.3 Characters (Total Number of Characters)

This element specifies the total number of characters in a document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.4 CharactersWithSpaces (Number of Characters (With Spaces))

This element specifies the last count of the number of characters (including spaces) in this document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.5 Company (Name of Company)

This element specifies the name of a company associated with the document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.6 DigSig (Digital Signature)

This element contains the signature of a digitally signed document.

[Note: This property is a mechanism used by legacy documents to store the digital signature of its binary representation, and should be considered deprecated in favor of the well-defined mechanism defined in Part 2. Any use of this property should be for legacy compatibility only, and is application-defined. *end note*]

Parent Elements
-----------------

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
blob (Binary Blob)	§7.4.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DigSigBlob">
 <sequence minOccurs="1" maxOccurs="1">
 <element ref="vt:blob"/>
 </sequence>
</complexType>
```

### 7.2.2.7 DocSecurity (Document Security)

This metadata element specifies the security level of a document as a numeric value. Document security is defined as:

DocSecurity	Security Level
1	Document is password protected.
2	Document is recommended to be opened as read-only.
4	Document is enforced to be opened as read-only.
8	Document is locked for annotation.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

### 7.2.2.8 HeadingPairs (Heading Pairs)

Heading pairs indicates the grouping of document parts and the number of parts in each group. These parts are not document parts but conceptual representations of document sections.

[Example: A presentation composing of three slides with an applied theme may have the following HeadingPairs representation:

```
<HeadingPairs>
 <vt:vector size="4" baseType="variant">
 <vt:variant>
 <vt:lpstr>Theme</vt:lpstr>
 </vt:variant>
```

```

1 <vt:variant>
2 <vt:i4>1</vt:i4>
3 </vt:variant>
4 <vt:variant>
5 <vt:lpstr>Slide Titles</vt:lpstr>
6 </vt:variant>
7 <vt:variant>
8 <vt:i4>3</vt:i4>
9 </vt:variant>
10 </vt:vector>
11 </HeadingPairs>

```

end example]

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
vector (Vector)	§7.4.2.34

The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_VectorVariant">
16 <sequence minOccurs="1" maxOccurs="1">
17 <element ref="vt:vector"/>
18 </sequence>
19 </complexType>

```

### 7.2.2.9 HiddenSlides (Number of Hidden Slides)

This element specifies the number of hidden slides in a presentation document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

### 7.2.2.10 HLinks (Hyperlink List)

This element specifies the set of hyperlinks that were in this document when last saved.

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
vector (Vector)	§7.4.2.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VectorVariant">
 <sequence minOccurs="1" maxOccurs="1">
 <element ref="vt:vector"/>
 </sequence>
</complexType>
```

#### 7.2.2.11 HyperlinkBase (Relative Hyperlink Base)

This element specifies the base string used for evaluating relative hyperlinks in this document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.12 HyperlinksChanged (Hyperlinks Changed)

This element specifies that one or more hyperlinks in this part were updated exclusively in this part by a producer. The next producer to open this document shall update the hyperlink relationships with the new hyperlinks specified in this part.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.13 Lines (Number of Lines)

This element specifies the total number of lines in a document when last saved by a conforming producer if applicable.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

#### 7.2.2.14 LinksUpToDate (Links Up-to-Date)

This element indicates whether hyperlinks in a document are up-to-date. Set this element to TRUE to indicate that hyperlinks are updated. Set this element to FALSE to indicate that hyperlinks are outdated.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
-----------------

**Parent Elements**

Properties (§7.2.2.21)

1    **7.2.2.15      Manager (Name of Manager)**

2    This element specifies the name of a supervisor associated with the document.

3    The possible values for this element are defined by the XML Schema string datatype.

**Parent Elements**

Properties (§7.2.2.21)

4    **7.2.2.16      MMClips (Total Number of Multimedia Clips)**

5    This element specifies the total number of sound or video clips that are present in the document.

6    The possible values for this element are defined by the XML Schema int datatype.

**Parent Elements**

Properties (§7.2.2.21)

7    **7.2.2.17      Notes (Number of Slides Containing Notes)**

8    This element specifies the number of slides in a presentation containing notes.

9    The possible values for this element are defined by the XML Schema int datatype.

**Parent Elements**

Properties (§7.2.2.21)

10   **7.2.2.18      Pages (Total Number of Pages)**

11   This element specifies the total number of pages of a document if applicable.

12   The possible values for this element are defined by the XML Schema int datatype.

**Parent Elements**

Properties (§7.2.2.21)

13   **7.2.2.19      Paragraphs (Total Number of Paragraphs)**

14   This element specifies the total number of paragraphs found in a document if applicable.

15   The possible values for this element are defined by the XML Schema int datatype.

**Parent Elements**

Properties (§7.2.2.21)

### 7.2.2.20 PresentationFormat (Intended Format of Presentation)

This element specifies the intended format for a presentation document. For example, a presentation intended to be shown on video will have PresentationFormat "Video".

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

### 7.2.2.21 Properties (Application Specific File Properties)

This element specifies the application properties of a document. For properties of type string, NCR escape format (\_xHHHH\_) is used for any invalid XML characters.

Parent Elements
Root element of Shared Extended File Properties part

Child Elements	Subclause
Application (Application Name)	§7.2.2.1
AppVersion (Application Version)	§7.2.2.2
Characters (Total Number of Characters)	§7.2.2.3
CharactersWithSpaces (Number of Characters (With Spaces))	§7.2.2.4
Company (Name of Company)	§7.2.2.5
DigSig (Digital Signature)	§7.2.2.6
DocSecurity (Document Security)	§7.2.2.7
HeadingPairs (Heading Pairs)	§7.2.2.8
HiddenSlides (Number of Hidden Slides)	§7.2.2.9
HLinks (Hyperlink List)	§7.2.2.10
HyperlinkBase (Relative Hyperlink Base)	§7.2.2.11
HyperlinksChanged (Hyperlinks Changed)	§7.2.2.12
Lines (Number of Lines)	§7.2.2.13
LinksUpToDate (Links Up-to-Date)	§7.2.2.14
Manager (Name of Manager)	§7.2.2.15
MMClips (Total Number of Multimedia Clips)	§7.2.2.16
Notes (Number of Slides Containing Notes)	§7.2.2.17
Pages (Total Number of Pages)	§7.2.2.18
Paragraphs (Total Number of Paragraphs)	§7.2.2.19
PresentationFormat (Intended Format of Presentation)	§7.2.2.20

Child Elements	Subclause
ScaleCrop (Thumbnail Display Mode)	§7.2.2.22
SharedDoc (Shared Document)	§7.2.2.23
Slides (Slides Metadata Element)	§7.2.2.24
Template (Name of Document Template)	§7.2.2.25
TitlesOfParts (Part Titles)	§7.2.2.26
TotalTime (Total Edit Time Metadata Element)	§7.2.2.27
Words (Word Count)	§7.2.2.28

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Properties">
 <all>
 <element name="Template" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="Manager" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="Company" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="Pages" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="Words" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="Characters" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="PresentationFormat" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="Lines" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="Paragraphs" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="Slides" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="Notes" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="TotalTime" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="HiddenSlides" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="MMClips" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="ScaleCrop" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
 <element name="HeadingPairs" minOccurs="0" maxOccurs="1" type="CT_VectorVariant"/>
 <element name="TitlesOfParts" minOccurs="0" maxOccurs="1" type="CT_VectorLpstr"/>
 <element name="LinksUpToDate" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
 <element name="CharactersWithSpaces" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 <element name="SharedDoc" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
 <element name="HyperlinkBase" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="HLinks" minOccurs="0" maxOccurs="1" type="CT_VectorVariant"/>
 <element name="HyperlinksChanged" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
 <element name="DigSig" minOccurs="0" maxOccurs="1" type="CT_DigSigBlob"/>
 <element name="Application" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="AppVersion" minOccurs="0" maxOccurs="1" type="xsd:string"/>
 <element name="DocSecurity" minOccurs="0" maxOccurs="1" type="xsd:int"/>
 </all>
</complexType>

```

### 7.2.2.22 ScaleCrop (Thumbnail Display Mode)

This element indicates the display mode of the document thumbnail. Set this element to TRUE to enable scaling of the document thumbnail to the display. Set this element to FALSE to enable cropping of the document thumbnail to show only sections that will fit the display.

- 1 The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
Properties (§7.2.2.21)

2 **7.2.2.23 SharedDoc (Shared Document)**

- 3 This element indicates if this document is currently shared between multiple producers. If this element is set to  
4 TRUE, producers should take care when updating the document.

- 5 The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
Properties (§7.2.2.21)

6 **7.2.2.24 Slides (Slides Metadata Element)**

- 7 This element specifies the total number of slides in a presentation document.

- 8 The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

9 **7.2.2.25 Template (Name of Document Template)**

- 10 This element specifies the name of an external document template containing format and style information  
11 used to create the current document.

- 12 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

13 **7.2.2.26 TitlesOfParts (Part Titles)**

- 14 This element specifies the title of each document. These parts are not document parts but conceptual  
15 representations of document sections.

- 16 *[Example: A presentation composing of three slides with an applied theme "Currency" may have the following*  
17 *TitlesofParts representation:*

```
<TitlesofParts>
 <vt:vector size="4" baseType="lpstr">
 <vt:lpstr>Currency</vt:lpstr>
 <vt:lpstr>Slide 1</vt:lpstr>
 <vt:lpstr>Slide 2</vt:lpstr>
 <vt:lpstr>Slide 3</vt:lpstr>
 </vt:vector>
</TitlesofParts>
```

*end example]*

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
vector (Vector)	§7.4.2.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VectorLpstr">
 <sequence minOccurs="1" maxOccurs="1">
 <element ref="vt:vector"/>
 </sequence>
</complexType>
```

### 7.2.2.27 TotalTime (Total Edit Time Metadata Element)

Total time that a document has been edited. The default time unit is minutes.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

### 7.2.2.28 Words (Word Count)

This element specifies the total number of words contained in a document when last saved.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

## 7.3 Custom Properties

Custom properties enable users to define custom metadata properties through a set of well-defined data types.

Custom properties are represented by property elements (§7.3.2.2) stored in the Custom File Properties part with:

- Source Relationship:  
<http://schemas.openxmlformats.org/officeDocument/2006/relationships/custom-properties>
- Content Type: application/vnd.openxmlformats-officedocument.custom-properties+xml

Custom property elements are non-repeatable and may be empty or omitted. If all custom property elements are omitted then the custom properties part may be excluded from a document.

The type and value of custom properties are specified by child XML elements in the File Properties Variant Types namespace (discussed in detail in §7.4). User defined properties are uniquely identified through the name attribute of the property element. Custom properties can be associated with OLE document properties through the fmtid and pid attributes.

[Example: A custom OLE Editor property of type string can be defined as follows:

```
<property fmtid="{D5CDD505-2E9C-101B-9397-08002B2CF9AE}" pid="2"
 name="Editor">
 <vt:lpwstr>John Smith</vt:lpwstr>
</property>
```

end example]

### 7.3.1 Table of Contents

This subclause is informative.

<b>7.3.2 Elements</b> .....	<b>5114</b>
7.3.2.1 Properties (Custom File Properties) .....	5114
7.3.2.2 property (Custom File Property) .....	5115

End of informative text.

### 7.3.2 Elements

This subclause specifies the set of elements that define this namespace:

#### 7.3.2.1 Properties (Custom File Properties)

Parent element for the custom file properties part.

Parent Elements
Root element of Shared Custom File Properties part

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
property (Custom File Property)	§7.3.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Properties">
 <sequence>
 <element name="property" minOccurs="0" maxOccurs="unbounded" type="CT_Property"/>
 </sequence>
</complexType>
```

### 7.3.2.2 property (Custom File Property)

This element specifies a single custom file property. Custom file property type is defined through child elements in the File Properties Variant Type namespace. Custom file property value can be set by setting the appropriate Variant Type child element value.

Parent Elements
Properties (§7.3.2.1)

Child Elements	Subclause
array (Array)	§7.4.2.1
blob (Binary Blob)	§7.4.2.2

7.4.3.1 ST_ArrayBaseType (Array Base Type Simple Type)	5134
7.4.3.2 ST_Clsid (Class ID Simple Type)	5136
7.4.3.3 ST_Cy (Currency Simple Type)	5136
7.4.3.4 ST_Error (Error Status Code Simple Type)	5137
7.4.3.5 ST_Format (Format Simple Type)	5137
7.4.3.6 ST_VectorBaseType (Vector Base Type Simple Type)	5137

**End of informative text.**

## 7.4.2 Elements

The following elements define the contents of this namespace:

### 7.4.2.1 array (Array)

The array element defines the array variant type. Array contents must be of uniform type as specified by the `baseType` attribute. The contents of an array are defined using repeated child elements of the appropriate variant type.

Multi-dimensional arrays can be defined by specifying the length of each dimension in the `lBound` and `uBound` attributes through the use of the "," delimiter. Child elements of multi-dimensional arrays are indexed along each dimension in the order the dimensions are declared.

In other words, the array shall be filled as follows:

- The first index shall be incremented to its maximum value [*Example: [0,0,0] to [max,0,0] end example*]
- The second index shall be incremented to its maximum value [*Example: [0,1,0] to [0,max,0] end example*]
- Subsequent indices shall be filled until all provided values have been added
- All other values shall have null values within the array (i.e. no default value shall be assumed).

[*Example: A 2x3 variant type array of type "i4" is specified as follows:*

```
<vt:array lBounds="0,0" uBounds="1,2" baseType="i4">
 <vt:i4>0</vt:i4>
 <vt:i4>1</vt:i4>
 <vt:i4>2</vt:i4>
 <vt:i4>3</vt:i4>
 <vt:i4>4</vt:i4>
</vt:array>
```

The resulting array: [0,0] = 0, [1,0] = 1, [0,1] = 2, [1,1] = 3, [0,2] = 4. *end example*]

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

Child Elements	Subclause
bool (Boolean)	§7.4.2.3
bstr (Basic String)	§7.4.2.4
cy (Currency)	§7.4.2.7
date (Date and Time)	§7.4.2.8
decimal (Decimal)	§7.4.2.9

Child Elements	Subclause
error (Error Status Code)	§7.4.2.11
i1 (1-Byte Signed Integer)	§7.4.2.13
i2 (2-Byte Signed Integer)	§7.4.2.14
i4 (4-Byte Signed Integer)	§7.4.2.15
int (Integer)	§7.4.2.17
r4 (4-Byte Real Number)	§7.4.2.24
r8 (8-Byte Real Number)	§7.4.2.25
ui1 (1-Byte Unsigned Integer)	§7.4.2.28
ui2 (2-Byte Unsigned Integer)	§7.4.2.29
ui4 (4-Byte Unsigned Integer)	§7.4.2.30
uint (Unsigned Integer)	§7.4.2.32
variant (Variant)	§7.4.2.33

1

Attributes	Description
baseType (Array Base Type)	<p>The baseType attribute specifies the base variant type of an array.</p> <p>The allowed values are: variant, i1, i2, i4, int, ui1, ui2, ui4, uint, r4, r8, decimal, bstr, date, bool, cy, and error.</p> <p>The possible values for this attribute are defined by the ST_ArrayBaseType simple type (§7.4.3.1).</p>
lBounds (Array Lower Bounds Attribute)	<p>The lBounds attribute specifies the lower bound of an array in the format: #, #, # ... # where each # represents an integer.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
uBounds (Array Upper Bounds Attribute)	<p>The uBounds attribute specifies the upper bound of an array in the format: #, #, # ... # where each # represents an integer.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Array">
 <choice minOccurs="1" maxOccurs="unbounded">
 <element ref="variant"/>
 <element ref="i1"/>
 <element ref="i2"/>
 <element ref="i4"/>
 <element ref="int"/>
 <element ref="ui1"/>
 <element ref="ui2"/>
 <element ref="ui4"/>
 <element ref="uint"/>
 <element ref="r4"/>
 <element ref="r8"/>
 <element ref="decimal"/>
 <element ref="bstr"/>
 <element ref="date"/>
 <element ref="bool"/>
 <element ref="error"/>
 <element ref="cy"/>
 </choice>
 <attribute name="lBounds" type="xsd:int" use="required"/>
 <attribute name="uBounds" type="xsd:int" use="required"/>
 <attribute name="baseType" type="ST_ArrayBaseType" use="required"/>
</complexType>
```

#### 7.4.2.2 blob (Binary Blob)

This element specifies a base64 binary blob variant type.

This type is defined as follows: a DWORD count of bytes, followed by that many bytes of data. The byte count does not include the four bytes for the length of the count itself; an empty blob member would have a count of zero, followed by zero bytes.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
DigSig (§7.2.2.6); property (§7.3.2.2); variant (§7.4.2.33)

#### 7.4.2.3 bool (Boolean)

This element specifies a Boolean variant type.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

#### 7.4.2.4 **bstr** (Basic String)

This element defines a binary basic string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format `_xHHHH_`, where H represents a hexadecimal character in the character's value. *[Example: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as `_x0008_`. end example]*

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

#### 7.4.2.5 **cf** (Clipboard Data)

This element specifies base64-encoded binary clipboard data.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

10

Attributes	Description												
format (Format Attribute)	<p>Specifies the format of the clipboard data and must be: -3, -2, -1, 0, or any positive integer.</p> <table> <tr> <th>Format Value</th><th>Clipboard Data</th></tr> <tr> <td>0</td><td>No data.</td></tr> <tr> <td>-1</td><td>A long that contains a built-in Windows clipboard format value.</td></tr> <tr> <td>-2</td><td>A long that contains a Macintosh clipboard format value.</td></tr> <tr> <td>-3</td><td>A GUID that contains a format identifier (FMTID).</td></tr> <tr> <td>any positive value</td><td>A null-terminated string that contains a clipboard format name to be registered. The Format value indicates the string length, including the null byte at the end.</td></tr> </table> <p>The possible values for this attribute are defined by the ST_Format simple type (§7.4.3.5).</p>	Format Value	Clipboard Data	0	No data.	-1	A long that contains a built-in Windows clipboard format value.	-2	A long that contains a Macintosh clipboard format value.	-3	A GUID that contains a format identifier (FMTID).	any positive value	A null-terminated string that contains a clipboard format name to be registered. The Format value indicates the string length, including the null byte at the end.
Format Value	Clipboard Data												
0	No data.												
-1	A long that contains a built-in Windows clipboard format value.												
-2	A long that contains a Macintosh clipboard format value.												
-3	A GUID that contains a format identifier (FMTID).												
any positive value	A null-terminated string that contains a clipboard format name to be registered. The Format value indicates the string length, including the null byte at the end.												

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cf">
 <simpleContent>
 <extension base="xsd:base64Binary">
 <attribute name="format" type="ST_Format"/>
 </extension>
 </simpleContent>
</complexType>
```

#### 7.4.2.6 clsid (Class ID)

This element specifies a class ID variant type. The value must be a Globally Unique Identifier with format: {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}.

The possible values for this element are defined by the ST\_Clsid simple type (§7.4.3.2).

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

#### 7.4.2.7 cy (Currency)

This element specifies a currency variant type with exactly four digits after the decimal point.

The possible values for this element are defined by the ST\_Cy simple type (§7.4.3.3).

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

#### 7.4.2.8 date (Date and Time)

This element specifies a date variant type of type date-time as defined in RFC 3339.

The possible values for this element are defined by the XML Schema dateTime datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

#### 7.4.2.9 decimal (Decimal)

This element specifies a decimal variant type.

The possible values for this element are defined by the XML Schema decimal datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33)

#### 7.4.2.10 empty (Empty)

This element specifies an empty variant type. No values or child elements are allowed.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

1 The following XML Schema fragment defines the contents of this element:

2 `<complexType name="CT_Empty"/>`

### 3 7.4.2.11 error (Error Status Code)

4 The error element specifies a 32-bit error status code variant type of the form 0xHHHHHHHH. Each H represents  
5 a hexadecimal digit.

6 The possible values for this element are defined by the ST\_Error simple type (§7.4.3.4).

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

### 7 7.4.2.12 filetime (File Time)

8 This element specifies a file-time variant type of type date-time as defined in RFC 3339.

9 The possible values for this element are defined by the XML Schema dateTime datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

### 10 7.4.2.13 i1 (1-Byte Signed Integer)

11 This element specifies a 1-byte signed integer variant type.

12 The possible values for this element are defined by the XML Schema byte datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

### 13 7.4.2.14 i2 (2-Byte Signed Integer)

14 This element specifies a 2-byte signed integer variant type.

15 The possible values for this element are defined by the XML Schema short datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

### 16 7.4.2.15 i4 (4-Byte Signed Integer)

17 This element specifies a 4-byte signed integer variant type.

18 The possible values for this element are defined by the XML Schema int datatype.

**Parent Elements**

array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.16 i8 (8-Byte Signed Integer)**

This element specifies a 8-byte signed integer variant type.

The possible values for this element are defined by the XML Schema long datatype.

**Parent Elements**

property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.17 int (Integer)**

This element specifies an integer variant type.

The possible values for this element are defined by the XML Schema int datatype.

**Parent Elements**

array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.18 lpstr (LPSTR)**

This element specifies a string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format `_xHHHH_`, where H represents a hexadecimal character in the character's value.

*[Example: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as `_x0008_`. end example]*

The possible values for this element are defined by the XML Schema string datatype.

**Parent Elements**

property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.19 lpwstr (LPWSTR)**

This element specifies a string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format `_xHHHH_`, where H represents a hexadecimal character in the character's value.

*[Example: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as `_x0008_`. end example]*

The possible values for this element are defined by the XML Schema string datatype.

**Parent Elements**

property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.20 null (Null)**

This element specifies a null variant type.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Null"/>
```

**7.4.2.21 oblob (Binary Blob Object)**

This element specifies a base64 binary blob object variant type.

This type is defined as follows: A blob member that contains a serialized object in the same representation that would appear in the ostream element. That is, a DWORD byte count (where the byte count does not include the size of itself) which is in the format of a class identifier followed by initialization data for that class.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.22 ostorage (Binary Storage Object)**

This element specifies a base64 binary storage object variant type.

This type is defined as follows: Identical to the storage element, but indicates that the designated storage shall contain a loadable object.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.23 ostream (Binary Stream Object)**

This element specifies a binary stream object variant type.

This type is defined as follows: Identical to the definition of the stream element, but indicates that the stream contains a serialized object, which is a CLSID – see the ST\_Clsid simple type (§7.4.3.2) – followed by initialization data for the specified class.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.24 r4 (4-Byte Real Number)**

This element specifies a 4-byte real number variant type.

The possible values for this element are defined by the XML Schema float datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.25 r8 (8-Byte Real Number)**

This element specifies a 8-byte real number variant type.

The possible values for this element are defined by the XML Schema double datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.26 storage (Binary Storage)**

This element specifies a binary storage variant type.

This type is defined as follows: Contains the base64-encoded data for a structured storage.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.27 stream (Binary Stream)**

This element specifies a binary stream variant type.

This type is defined as follows: Contains the base64-encoded data for a structured storage stream.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.28 ui1 (1-Byte Unsigned Integer)**

This element specifies a 1-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedByte datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.29 ui2 (2-Byte Unsigned Integer)**

This element specifies a 2-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedShort datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.30 ui4 (4-Byte Unsigned Integer)**

This element specifies a 4-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedInt datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.31 ui8 (8-Byte Unsigned Integer)**

This element specifies a 8-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedLong datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

**7.4.2.32 uint (Unsigned Integer)**

This element specifies an unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedInt datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33)

**7.4.2.33 variant (Variant)**

This element can contain exactly 1 child element of any variant type. This element is only valid as a child element of a vector or array variant type.

[Example: A vector of variant types:

```
<vt:vector baseType="variant">
 <vt:variant>
 <vt:i4>12</vt:i4>
 </vt:variant>
 <vt:variant>
 <vt:lpstr>WorkSheets</vt:lpstr>
```

1       </vt:variant>  
 2       </vt:vector>  
 3       *end example]*

Parent Elements
array (§7.4.2.1); variant (§7.4.2.33); vector (§7.4.2.34)

4

Child Elements	Subclause
array (Array)	§7.4.2.1
blob (Binary Blob)	§7.4.2.2
bool (Boolean)	§7.4.2.3
bstr (Basic String)	§7.4.2.4
cf (Clipboard Data)	§7.4.2.5
clsid (Class ID)	§7.4.2.6
cy (Currency)	§7.4.2.7
date (Date and Time)	§7.4.2.8
decimal (Decimal)	§7.4.2.9
empty (Empty)	§7.4.2.10
error (Error Status Code)	§7.4.2.11
filetime (File Time)	§7.4.2.12
i1 (1-Byte Signed Integer)	§7.4.2.13
i2 (2-Byte Signed Integer)	§7.4.2.14
i4 (4-Byte Signed Integer)	§7.4.2.15
i8 (8-Byte Signed Integer)	§7.4.2.16
int (Integer)	§7.4.2.17
lpstr (LPSTR)	§7.4.2.18
lpwstr (LPWSTR)	§7.4.2.19
null (Null)	§7.4.2.20
oblob (Binary Blob Object)	§7.4.2.21
ostorage (Binary Storage Object)	§7.4.2.22
ostream (Binary Stream Object)	§7.4.2.23
r4 (4-Byte Real Number)	§7.4.2.24
r8 (8-Byte Real Number)	§7.4.2.25

ui1 (1-Byte Unsigned Integer)	§7.4.2.28
ui2 (2-Byte Unsigned Integer)	§7.4.2.29
ui4 (4-Byte Unsigned Integer)	§7.4.2.30
ui8 (8-Byte Unsigned Integer)	§7.4.2.31
uint (Unsigned Integer)	§7.4.2.32
variant (Variant)	§7.4.2.33
vector (Vector)	§7.4.2.34
vstream (Binary Versioned Stream)	§7.4.2.35

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Variant">
 <choice minOccurs="1" maxOccurs="1">
 <element ref="variant"/>
 <element ref="vector"/>
 <element ref="array"/>
 <element ref="blob"/>
 <element ref="oblob"/>
 <element ref="empty"/>
 <element ref="null"/>
 <element ref="i1"/>
 <element ref="i2"/>
 <element ref="i4"/>
 <element ref="i8"/>
 <element ref="int"/>
 <element ref="ui1"/>
 <element ref="ui2"/>
 <element ref="ui4"/>
 <element ref="ui8"/>
 <element ref="uint"/>
 <element ref="r4"/>
 <element ref="r8"/>
 <element ref="decimal"/>
 <element ref="lpstr"/>
 <element ref="lpwstr"/>
 <element ref="bstr"/>
 <element ref="date"/>
 <element ref="filetime"/>
 <element ref="bool"/>
 <element ref="cy"/>
 <element ref="error"/>
 <element ref="stream"/>
 <element ref="ostream"/>
 <element ref="storage"/>
 <element ref="ostorage"/>
 <element ref="vstream"/>
 <element ref="clsid"/>
 <element ref="cf"/>
 </choice>
</complexType>

```

#### 7.4.2.34 vector (Vector)

This element defines the vector variant type. Vector contents must be of uniform type as specified by the `baseType` attribute. The contents of a vector are defined using repeated child elements of the appropriate variant type.

[Example: A vector of `lpstr` variant types:

```

1 <vt:vector baseType="lpstr">
2 <vt:lpstr>One</vt:lpstr>
3 <vt:lpstr>Two</vt:lpstr>
4 <vt:lpstr>Three</vt:lpstr>
5 </vt:vector>

```

6 *end example]*

7

Parent Elements

8

Attributes	Description
baseType (Vector)	The baseType attribute specifies the base variant type of a vector.

Attributes	Description
Base Type)	<p>The allowed values are: variant, i1, i2, i4, i8, ui1, ui2, ui4, ui8, r4, r8, lpstr, lpwstr, bstr, date, filetime, bool, cy, error, clsid, and cf.</p> <p>The possible values for this attribute are defined by the ST_VectorBaseType simple type (§7.4.3.6).</p>
size (Vector Size)	<p>Specifies the number of elements in the vector.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Vector">
 <choice minOccurs="1" maxOccurs="unbounded">
 <element ref="variant"/>
 <element ref="i1"/>
 <element ref="i2"/>
 <element ref="i4"/>
 <element ref="i8"/>
 <element ref="ui1"/>
 <element ref="ui2"/>
 <element ref="ui4"/>
 <element ref="ui8"/>
 <element ref="r4"/>
 <element ref="r8"/>
 <element ref="lpstr"/>
 <element ref="lpwstr"/>
 <element ref="bstr"/>
 <element ref="date"/>
 <element ref="filetime"/>
 <element ref="bool"/>
 <element ref="cy"/>
 <element ref="error"/>
 <element ref="clsid"/>
 <element ref="cf"/>
 </choice>
 <attribute name="baseType" type="ST_VectorBaseType" use="required"/>
 <attribute name="size" type="xsd:unsignedInt" use="required"/>
</complexType>

```

#### 7.4.2.35 vstream (Binary Versioned Stream)

This element specifies a binary versioned stream variant type.

This type is defined as follows: A stream element's content with a GUID version (the version attribute).

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

1

Attributes	Description
version (VSTREAM Version Attribute)	The version attribute of the vstream element specifies the version as a Globally Unique Identifiers with format: {HHHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}.  The possible values for this attribute are defined by the ST_Clsid simple type (§7.4.3.2).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Vstream">
4 <simpleContent>
5 <extension base="xsd:base64Binary">
6 <attribute name="version" type="ST_Clsid"/>
7 </extension>
8 </simpleContent>
9 </complexType>

```

### 10 7.4.3 Simple Types

11 This is the complete list of simple types in the  
12 <http://schemas.openxmlformats.org/officeDocument/2006/docPropsVTypes> namespace.

#### 13 7.4.3.1 ST\_ArrayBaseType (Array Base Type Simple Type)

14 The ST\_ArrayBaseType simple type defines the allowed values for an array's baseType attribute as: variant, i1,  
15 i2, i4, int, ui1, ui2, ui4, uint, r4, r8, decimal, bstr, date, bool, cy, and error.

16 This simple type's contents are a restriction of the XML Schema string datatype.

17 The following are possible enumeration values for this type:

Enumeration Value	Description
bool (Boolean Base Type)	Specifies that the variant type for the contents of a array shall be bool.
bstr (Basic String Base Type)	Specifies that the variant type for the contents of a array shall be bstr.
cy (Curency Base Type)	Specifies that the variant type for the contents of a array shall be cy.
date (Date and Time Base Type)	Specifies that the variant type for the contents of a array shall be date.
decimal (Decimal Base Type)	Specifies that the variant type for the contents of a array shall be decimal.
error (Error Status Code Base Type)	Specifies that the variant type for the contents of a array shall be error.
i1 (1-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be i1.

Enumeration Value	Description
i2 (2-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be i2.
i4 (4-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be i4.
int (Integer Base Type)	Specifies that the variant type for the contents of a array shall be int.
r4 (4-Byte Real Number Base Type)	Specifies that the variant type for the contents of a array shall be r4.
r8 (8-Byte Real Number Base Type)	Specifies that the variant type for the contents of a array shall be r8.
ui1 (1-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be ui1.
ui2 (2-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be ui2.
ui4 (4-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be ui4.
uint (Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be uint.
variant (Variant Base Type)	Specifies that the variant type for the contents of a array shall be variant.

1

Referenced By
array@baseType (§7.4.2.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ArrayBaseType">
 <restriction base="xsd:string">
 <enumeration value="variant"/>
 <enumeration value="i1"/>
 <enumeration value="i2"/>
 <enumeration value="i4"/>
 <enumeration value="int"/>
 <enumeration value="ui1"/>
 <enumeration value="ui2"/>
 <enumeration value="ui4"/>
 <enumeration value="uint"/>
 <enumeration value="r4"/>
 <enumeration value="r8"/>
 <enumeration value="decimal"/>
 <enumeration value="bstr"/>
 <enumeration value="date"/>
 <enumeration value="bool"/>
 <enumeration value="cy"/>
 <enumeration value="error"/>
 </restriction>
</simpleType>
```

#### 7.4.3.2 ST\_Clsid (Class ID Simple Type)

The ST\_Clsid simple type specifies the type for the clsid element. The allowed values must be Globally Unique Identifiers with format: {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\s*\{[a-fA-F0-9]{8}-[a-fA-F0-9]{4}-[a-fA-F0-9]{4}-[a-fA-F0-9]{4}-[a-fA-F0-9]{12}\}\s*`.

#### Referenced By

clsid (§7.4.2.6); property@fmtid (§7.3.2.2)

#### 7.4.3.3 ST\_Cy (Currency Simple Type)

The ST\_Cy simple type defines the cy element as a currency variant type with exactly four digits after the decimal point.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\s*[0-9]*\.[0-9]{4}\s*`.

#### Referenced By

Referenced By
cy (§7.4.2.7)

#### 7.4.3.4 ST\_Error (Error Status Code Simple Type)

The ST\_Error simple type defines a 32-bit error status code variant type of the form 0xHHHHHHHH. Each H represents a hexadecimal.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\s*0x[0-9A-Za-z]{8}\s*`.

Referenced By
error (§7.4.2.11)

#### 7.4.3.5 ST\_Format (Format Simple Type)

The ST\_Format simple type defines the format attribute of the cf element. The format attribute can be the following values: -3, -2, 1, 0, and any positive integer.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\-1`.
- This simple type's contents must match the following regular expression pattern: `\-2`.
- This simple type's contents must match the following regular expression pattern: `\-3`.
- This simple type's contents must match the following regular expression pattern: `[1-9]+`.
- This simple type's contents must match the following regular expression pattern: `0`.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Format">
 <restriction base="xsd:string">
 <pattern value="\-1"/>
 <pattern value="\-2"/>
 <pattern value="\-3"/>
 <pattern value="[1-9]+"/>
 <pattern value="0"/>
 </restriction>
</simpleType>
```

#### 7.4.3.6 ST\_VectorBaseType (Vector Base Type Simple Type)

The ST\_VectorBaseType simple type defines the allowed values for a vector's baseType attribute as: variant, i1, i2, i4, i8, ui1, ui2, ui4, ui8, r4, r8, lpstr, lpwstr, bstr, date, filetime, bool, cy, error, clsid, and cf.

This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
bool (Boolean Base Type)	Specifies that the variant type for the contents of a vector shall be bool.
bstr (Basic String Base Type)	Specifies that the variant type for the contents of a vector shall be bstr.
cf (Clipboard Data Base Type)	Specifies that the variant type for the contents of a vector shall be cf.
clsid (Class ID Base Type)	Specifies that the variant type for the contents of a vector shall be clsid.
cy (Currency Base Type)	Specifies that the variant type for the contents of a vector shall be cy.
date (Date and Time Base Type)	Specifies that the variant type for the contents of a vector shall be date.
error (Error Status Code Base Type)	Specifies that the variant type for the contents of a vector shall be error.
filetime (File Time Base Type)	Specifies that the variant type for the contents of a vector shall be filetime.
i1 (Vector Base Type Enumeration Value)	Specifies that the variant type for the contents of a vector shall be i1.
i2 (2-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be i2.
i4 (4-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be i4.
i8 (8-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be i8.
lpstr (LPSTR Base Type)	Specifies that the variant type for the contents of a vector shall be lpstr.
lpwstr (LPWSTR Base Type)	Specifies that the variant type for the contents of a vector shall be lpwstr.
r4 (4-Byte Real Number Base Type)	Specifies that the variant type for the contents of a vector shall be r4.
r8 (8-Byte Real Number Base Type)	Specifies that the variant type for the contents of a vector shall be r8.
ui1 (1-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be ui1.
ui2 (2-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be ui2.
ui4 (4-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be ui4.

Enumeration Value	Description
ui8 (8-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be ui8.
variant (Variant Base Type)	Specifies that the variant type for the contents of a vector shall be variant.

1

Referenced By
vector@baseType (§7.4.2.34)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_VectorBaseType">
4 <restriction base="xsd:string">
5 <enumeration value="variant"/>
6 <enumeration value="i1"/>
7 <enumeration value="i2"/>
8 <enumeration value="i4"/>
9 <enumeration value="i8"/>
10 <enumeration value="ui1"/>
11 <enumeration value="ui2"/>
12 <enumeration value="ui4"/>
13 <enumeration value="ui8"/>
14 <enumeration value="r4"/>
15 <enumeration value="r8"/>
16 <enumeration value="lpstr"/>
17 <enumeration value="lpwstr"/>
18 <enumeration value="bstr"/>
19 <enumeration value="date"/>
20 <enumeration value="filetime"/>
21 <enumeration value="bool"/>
22 <enumeration value="cy"/>
23 <enumeration value="error"/>
24 <enumeration value="clsid"/>
25 <enumeration value="cf"/>
26 </restriction>
27 </simpleType>

```

## 28 7.5 Custom XML Data Properties

29 This namespace defines the set of properties that may be associated with one or more custom XML parts within  
30 an Office Open XML document. A *custom XML part* is a part within an Office Open XML document, that contains  
31 arbitrary custom XML markup not necessarily defined by this Office Open XML Standard, and which is kept  
32 independent from the presentation-specific markup within the package.

33 [*Rationale:* It is often necessary to include custom XML semantics with an Office Open XML document, to store a  
34 complex set of properties (e.g., a document management system's metadata) along with the file. This  
35 mechanism allows this custom XML to be stored in the document in a way that is independent of the type of

document and separate from the presentation markup—only the custom XML is stored in this part. *end rationale]*

The properties that can be applied to a custom XML part are:

- A part ID
- (optionally) One or more associated custom XML schemas

## 7.5.1 Table of Contents

7.5.3.1 ST_Guid (128-Bit GUID Value) .....	5143

**End of informative text.**

## 7.5.2 Elements

The following information describes the elements in this namespace:

### 7.5.2.1 dataStoreItem (Custom XML Data Properties)

This element specifies the properties for a single custom XML part inside of an Office Open XML document. The set of properties specified within this element are attached to the custom XML part that specifies a relationship to this part.

[*Example:* Consider the following content for a custom XML part properties part:

```
<w:dataStoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
 <w:schemaRefs>
 <w:schemaRef w:uri="http://www.contoso.com/exampleSchema" />
 </w:schemaRefs>
</w:dataStoreItem>
```

The dataStoreItem element contains the properties for the custom XML part that referenced it; specifically, a part ID of A67AC88A-A164-4ADE-8889-8826CE44DE6E, and a single XML Schema reference to a schema with a target namespace of http://www.contoso.com/exampleSchema. *end example]*

Parent Elements
Root element of Shared Custom XML Data Storage Properties part

Child Elements	Subclause
schemaRefs (Set of Associated XML Schemas)	§7.5.2.3

1

Attributes	Description
itemID (Custom XML Data ID)	<p>Specifies a globally unique identifier (GUID) that uniquely identifies a single custom XML part within an Office Open XML document.</p> <p>Each itemID value shall be unique among all custom XML data parts in this document. If a document contains duplicate itemID values, then the first value should be persisted, and subsequent values should be reassigned.</p> <p>[Example: Consider the following content for a custom XML part properties part:</p> <pre>&lt;w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}"&gt; ... &lt;/w:datastoreItem&gt;</pre> <p>The itemID attribute specifies that the ID associated with the parent custom XML part is A67AC88A-A164-4ADE-8889-8826CE44DE6E. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§7.5.3.1).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_DatastoreItem">
4 <sequence>
5 <element name="schemaRefs" type="CT_DatastoreSchemaRefs" minOccurs="0"/>
6 </sequence>
7 <attribute name="itemID" type="ST_Guid" use="required"/>
8 </complexType>
```

### 9 7.5.2.2 schemaRef (Associated XML Schema)

10 This element specifies a single XML schema that is associated with the custom XML data part. This XML schema  
 11 is identified using its target namespace, and may be located via any means available to an application processing  
 12 the contents of this file.

13 If the custom XML part cannot be validated using the specified XML schema when it is opened, then this  
 14 reference may be omitted when the file is subsequently saved.

15 [Example: Consider the following content for a custom XML part properties part:

```

1 <w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
2 <w:schemaRefs>
3 <w:schemaRef w:uri="http://www.contoso.com/exampleSchema" />
4 </w:schemaRefs>
5 </w:datastoreItem>

```

The schemaRef element contains a single XML Schema reference to a schema with a target namespace of `http://www.contoso.com/exampleSchema`. Applications may then locate and utilize a schema for this namespace using any means available. *end example*

Parent Elements
schemaRefs (§7.5.2.3)

Attributes	Description
uri (Target Namespace of Associated XML Schema)	<p>Specifies the target namespace for the XML Schema associated with this schema reference.</p> <p>[Example: Consider the following content for a custom XML part properties part:</p> <pre> ... &lt;w:schemaRef w:uri="http://www.contoso.com/schema1" /&gt; &lt;w:schemaRef w:uri="http://www.contoso.com/schema2" /&gt; ... </pre> <p>The uri attribute specifies the target namespace of each XML schema reference:</p> <ul style="list-style-type: none"> <li>http://www.contoso.com/schema1</li> <li>http://www.contoso.com/schema2</li> </ul> <p>Applications may then locate and utilize a schema for these namespaces using any means available. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

- http://www.contoso.com/schema1
- http://www.contoso.com/schema2

The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_DatastoreSchemaRef">
12 <attribute name="uri" type="xsd:string" use="required"/>
13 </complexType>

```

### 7.5.2.3 schemaRefs (Set of Associated XML Schemas)

This element specifies the set of XML schemas that are associated with the parent custom XML part. Any number of XML schemas may be referenced, and this collection of schemas shall then be used to validate the contents of the corresponding custom XML part. If this element is present, then the set of XML schemas provided within should be used to validate the contents of the corresponding custom XML part (including the

explicit presence of no child elements to specify that no custom XML schemas should be used even if one is present).

If this element is omitted, then applications may determine the set of XML schemas to be used to validate the contents of this part using any desired means.

[Example: Consider the following content for a custom XML part properties part:

```
<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
 <w:schemaRefs>
 <w:schemaRef w:uri="http://www.contoso.com/exampleSchema" />
 </w:schemaRefs>
</w:datastoreItem>
```

The schemaRefs element contains the set of XML Schema references that may be used to validate the contents of this part. *end example*]

Parent Elements
datastoreItem (§7.5.2.1)

Child Elements	Subclause
schemaRef (Associated XML Schema)	§7.5.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DatastoreSchemaRefs">
 <sequence>
 <element name="schemaRef" type="CT_DatastoreSchemaRef" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 7.5.3 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/officeDocument/2006/customXml> namespace.

#### 7.5.3.1 ST\_Guid (128-Bit GUID Value)

This simple type specifies that its values shall be a 128-bit globally unique identifier (GUID) value.

[Example: Consider the following content for a custom XML part properties part:

```
<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
 ...
</w:datastoreItem>
```

The itemID attribute specifies that the ID associated with the parent custom XML part is A67AC88A-A164-4ADE-8889-8826CE44DE6E. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}`.

Referenced By
datastoreItem@itemID (§7.5.2.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
 <restriction base="xsd:token">
 <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}" />
 </restriction>
</simpleType>
```

## Bibliography

Within an Office Open XML document, it is possible to store an arbitrary amount of bibliographic data, the use of which can be determined by the application reading the content. This subclause defines the format and structure of that bibliographic data.

The outermost element of bibliographic data is Sources, which represents the collection of individual reference materials (Source) in the document.

### 7.6.1 Table of Contents

This subclause is informative.

<b>7.6.2 Elements</b>	<b>5146</b>
7.6.2.1 AbbreviatedCaseNumber (Abbreviated Case Number)	5146

18

19 **End of informative text.**20 **7.6.2 Elements**

21 The following elements define the contents of the Bibliography schema:

22 **7.6.2.1 AbbreviatedCaseNumber (Abbreviated Case Number)**

23 This element describes the abbreviated form of a case number. Typically, this field is used in the Case source  
 24 type.

25 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

26 **7.6.2.2 AlbumTitle (Album Title)**

27 This element specifies the title of an album. Typically, this field is used in the Sound recording source type.

28 *[Example:*

```

1 <b:Source>
2 <b:Tag>Bon96</b:Tag>
3 <b:SourceType>SoundRecording</b:SourceType>
4 <b:Author>
5 <b:Performer>
6 <b:NameList>
7 <b:Person>
8 <b:Last>Villaron</b:Last>
9 <b:First>Shawn</b:First>
10 <b:Middle>Alan</b:Middle>
11 </b:Person>
12 </b:NameList>
13 </b:Performer>
14 </b:Author>
15 Title>TitleTitle>
16 <b:Year>2004</b:Year>
17 <b:City>London</b:City>
18 <b:AlbumTitle>Album Title</b:AlbumTitle>
19 <b:RefOrder>15</b:RefOrder>
20 <b:Guid>{17722923-790D-47E7-BB5D-C5DC67FA83D6}</b:Guid>
21 <b:LCID>0</b:LCID>
22 <b:Comments>Comments</b:Comments>
23 </b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.3 Artist (Artist)

This element specifies the artist of the source. Typically, this field is used in the Art and Sound Recording source types. *[Example:*

```

1 <b:Author>
2 <b:Artist>
3 <b:NameList>
4 <b:Person>
5 <b:Last>Jones</b:Last>
6 <b:First>Brian</b:First>
7 </b:Person>
8 </b:NameList>
9 </b:Artist>
10 </b:Author>

```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_NameType">
15 <sequence>
16 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
17 </sequence>
18 </complexType>

```

#### 7.6.2.4 Author (Author)

This element specifies the author of the source. *[Example:*

```

21 <b:Author>
22 <b:Author>
23 <b:NameList>
24 <b:Person>
25 <b:Last>Jones</b:Last>
26 <b:First>Brian</b:First>
27 </b:Person>
28 </b:NameList>
29 </b:Author>
30 </b:Author>

```

*end example]*

Parent Elements
-----------------

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
Corporate (Corporate Author)	§7.6.2.18
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameOrCorporateType">
 <sequence>
 <choice minOccurs="0" maxOccurs="1">
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 <element name="Corporate" minOccurs="1" maxOccurs="1" type="ST_String255"/>
 </choice>
 </sequence>
</complexType>
```

### 7.6.2.5 Author (Contributors List)

This element specifies the contributors to the source. [Example:

```
<b:Author>
 <b:Author>
 <b:NameList>
 <b:Person>
 <b:Last>Rothschiller</b:Last>
 <b:First>Chad</b:First>
 </b:Person>
 </b:NameList>
 </b:Author>
 <b:Editor>
 <b:NameList>
 <b:Person>
 <b:Last>Jaeschke</b:Last>
 <b:First>Rex</b:First>
 </b:Person>
 </b:NameList>
 </b:Editor>
```

```

1 <b:Translator>
2 <b:NameList>
3 <b:Person>
4 <b:Last>Davis</b:Last>
5 <b:First>Tristan</b:First>
6 </b:Person>
7 </b:NameList>
8 </b:Translator>
9 </b:Author>

```

end example]

Parent Elements
Source (§7.6.2.59)

Child Elements	Subclause
Artist (Artist)	§7.6.2.3
Author (Author)	§7.6.2.4
BookAuthor (Book Author)	§7.6.2.6
Compiler (Compiler)	§7.6.2.14
Composer (Composer)	§7.6.2.15
Conductor (Conductor)	§7.6.2.16
Counsel (Counsel)	§7.6.2.19
Director (Director)	§7.6.2.25
Editor (Editor)	§7.6.2.28
Interviewee (Interviewee)	§7.6.2.33
Interviewer (Interviewer)	§7.6.2.34
Inventor (Inventor)	§7.6.2.35
Performer (Performer)	§7.6.2.48
ProducerName (Producer Name)	§7.6.2.51
Translator (Translator)	§7.6.2.69
Writer (Writer)	§7.6.2.74

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AuthorType">
 <sequence>
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="Artist" type="CT_NameType"/>
 <element name="Author" type="CT_NameOrCorporateType"/>
 <element name="BookAuthor" type="CT_NameType"/>
 <element name="Compiler" type="CT_NameType"/>
 <element name="Composer" type="CT_NameType"/>
 <element name="Conductor" type="CT_NameType"/>
 <element name="Counsel" type="CT_NameType"/>
 <element name="Director" type="CT_NameType"/>
 <element name="Editor" type="CT_NameType"/>
 <element name="Interviewee" type="CT_NameType"/>
 <element name="Interviewer" type="CT_NameType"/>
 <element name="Inventor" type="CT_NameType"/>
 <element name="Performer" type="CT_NameOrCorporateType"/>
 <element name="ProducerName" type="CT_NameType"/>
 <element name="Translator" type="CT_NameType"/>
 <element name="Writer" type="CT_NameType"/>
 </choice>
 </sequence>
</complexType>
```

7.6.2.6 BookAuthor (Book Author)

This element specifies the author of a book, when the primary author has authored the book section. For example, if person X writes a chapter in a book by person Y, person X is the Author and person Y is the BookAuthor. [Example:

```
<b:Author>
 <b:BookAuthor>
 <b:NameList>
 <b:Person>
 <b:Last>Rothschiller</b:Last>
 <b:First>Chad</b:First>
 </b:Person>
 </b:NameList>
 </b:BookAuthor>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 7.6.2.7 BookTitle (Book Title)

This element specifies the title of a book, when the source is a book section. In this case, the title of the book section is the primary title. For example, if X is the title of a chapter in a book entitled , X is the Title and Y is the BookTitle. [Example:

```
...
<b:Year>1992</b:Year>
<b:City>Paris</b:City>
<b:Publisher>Publisher</b:Publisher>
<b:Pages>51-84</b:Pages>
<b:Comments>Comments</b:Comments>
<b:BookTitle>Book Title</b:BookTitle>
</b:Source>
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.8 Broadcaster (Broadcaster)

This element specifies the broadcaster of a source. Typically, this field is used in the Interview source type. [Example:

```
...
<b:ProgramTitle>Program Title</b:ProgramTitle>
<b:Broadcaster>Broadcaster</b:Broadcaster>
<b:Station>Station</b:Station>
<b:RefOrder>1</b:RefOrder>
Title>Title (Interview)Title>
BroadcastTitle>Broadcast TitleBroadcastTitle>
<b:StateProvince>State or Province</b:StateProvince>
<b:CountryRegion>Country or Region</b:CountryRegion>
</b:Source>
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.9 BroadcastTitle (Broadcast Title)

This element specifies the broadcast title of a source. Typically, this field is used in the Interview source type.

*[Example:*

...

```
<b:ProgramTitle>Program Title</b:ProgramTitle>
<b:Broadcaster>Broadcaster</b:Broadcaster>
<b:Station>Station</b:Station>
<b:RefOrder>1</b:RefOrder>
Title>Title (Interview)Title>
<b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
<b:StateProvince>State/Province</b:StateProvince>
<b:CountryRegion>Country/Region</b:CountryRegion>
</b:Source>
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.10 CaseNumber (Case Number)

This element specifies the case number of a source. Typically, this field is used in the Case source type.

*[Example:*

...

```
Title>Title (Case)Title>
<b:Year>Year</b:Year>
<b:City>Place Published</b:City>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:CaseNumber>Case Number</b:CaseNumber>
<b:Court>Court</b:Court>
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 1 7.6.2.11 ChapterNumber (Chapter Number)

2 This element specifies the number or index of the chapter being referenced. [Example:

3 ...  
 4 <b:BookTitle>Title</b:BookTitle>  
 5 <b:Pages>23-65</b:Pages>  
 6 <b:Comments>Comments</b:Comments>  
 7 <b:ChapterNumber>6</b:ChapterNumber>  
 8 <b:RefOrder>1</b:RefOrder>  
 9 ...

10 *end example]*

11 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 12 7.6.2.12 City (City)

13 This element specifies the city in which the source was published, printed, or manufactured. [Example:

14 ...  
 15 <b>Title>Title</b>Title>  
 16 <b:Year>1997</b:Year>  
 17 <b:City>London</b:City>  
 18 <b:Publisher>Publihser</b:Publisher>  
 19 ...

20 *end example]*

21 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 22 7.6.2.13 Comments (Comments)

23 This element specifies any additional comments about the source. The documentation style determines whether  
 24 the comments appear in the bibliography. [Example:

```

...
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Comments>Comments</b:Comments>
<b:RefOrder>2</b:RefOrder>
...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.14 Compiler (Compiler)

This element specifies the person who compiled the information in a source. [*Example:*

```

<b:Author>
 <b:Compiler>
 <b:NameList>
 <b:Person>
 <b:Last>Jones</b:Last>
 <b:First>Brian</b:First>
 </b:Person>
 </b:NameList>
 </b:Compiler>
</b:Author>

```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 7.6.2.15 Composer (Composer)

This element specifies the composer of a sound recording. [*Example:*

```

1 <b:Author>
2 <b:Composer>
3 <b:NameList>
4 <b:Person>
5 <b:Last>Davis</b:Last>
6 <b:First>Tristan</b:First>
7 </b:Person>
8 </b:NameList>
9 </b:Composer>
10 </b:Author>

```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_NameType">
15 <sequence>
16 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
17 </sequence>
18 </complexType>

```

### 7.6.2.16 Conductor (Conductor)

This element specifies the conductor of a source. Typically, this field is used in the sound recording source type.

*[Example:*

```

22 <b:Author>
23 <b:Conductor>
24 <b:NameList>
25 <b:Person>
26 <b:Last>Jones</b:Last>
27 <b:First>Brian</b:First>
28 </b:Person>
29 </b:NameList>
30 </b:Conductor>
31 </b:Author>

```

*end example]*

Parent Elements
-----------------

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 7.6.2.17 ConferenceName (Conference or Proceedings Name)

This element specifies the title of the proceedings from a conference. [Example:

```
...
<b:Comments>Comments</b:Comments>
<b:ConferenceName>Conference Name</b:ConferenceName>
<b:RefOrder>9</b:RefOrder>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.18 Corporate (Corporate Author)

This element specifies the corporate author, performer, or any field that can be a name. The element is used when an organization, rather than a person, is used. [Example:

```
<b:Author>
 <b:Author>
 <b:Corporate>Corporate Author</b:Corporate>
 </b:Author>
</b:Author>
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
-----------------

Parent Elements
Author (§7.6.2.4); Performer (§7.6.2.48)

### 7.6.2.19 Counsel (Counsel)

This element specifies the counsel, attorney, or attorneys in a case.

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 7.6.2.20 CountryRegion (Country or Region)

This element specifies the country or region of a source. [Example:

...

```
<b:ProgramTitle>Program Title</b:ProgramTitle>
<b:Broadcaster>Broadcaster</b:Broadcaster>
<b:Station>Station</b:Station>
<b:RefOrder>1</b:RefOrder>
Title>Title (Interview)Title>
<b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
<b:StateProvince>State or Province</b:StateProvince>
<b:CountryRegion>Country or Region</b:CountryRegion>
</b:Source>
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.21 Court (Court)

This element specifies the court in which the case was presented. [Example:

1 ...  
 2 <b:Year>1972</b:Year>  
 3 <b:CaseNumber>339 1018</b:CaseNumber>  
 4 <b:Court>Supreme Court</b:Court>  
 5 ...

6 *end example]*

7 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 8 7.6.2.22 Day (Day)

9 This element specifies the day on which a source was created or published. [*Example:*

10 ...  
 11 <b:PeriodicalTitle>Periodical Title</b:PeriodicalTitle>  
 12 <b:Month>November</b:Month>  
 13 <b:Day>10</b:Day>  
 14 ...

15 *end example]*

16 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 17 7.6.2.23 DayAccessed (Day Accessed)

18 This element specifies the day of the month a source was accessed. [*Example:*

19 <b:MonthAccessed>October</b:MonthAccessed>  
 20 <b:DayAccessed>5</b:DayAccessed>  
 21 <b:YearAccessed>2000</b:YearAccessed>

22 *end example]*

23 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.24 Department (Department)

This element specifies the department in which a source originated, or to which a source was submitted. Typically, this field is used in the Report source type, which includes theses and dissertations. [Example:

```
...
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Doctoral Dissertation</b:ThesisType>
<b:Department>Department of Mathematics</b:Department>
...
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.25 Director (Director)

This element specifies the director of a source. Typically, this field is used in the Film source type. [Example:

```
<b:Author>
 <b:Director>
 <b:NameList>
 <b:Person>
 Last>JonesLast>
 <b:First>Brian</b:First>
 </b:Person>
 </b:NameList>
 </b:Director>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 7.6.2.26 Distributor (Distributor)

This element specifies the distributor of a source. Typically, this field is used in the Performance and Film source types. [Example:

```
...
<b:Distributor>Distributor</b:Distributor>
<b:Country>United States</b:Country>
<b:RefOrder>19</b:RefOrder>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.27 Edition (Editor)

This element specifies the edition of a source. [Example:

```
...
<b:Pages>1-34</b:Pages>
<b:Edition>Edition</b:Edition>
<b:Issue>Issue</b:Issue>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.28 Editor (Editor)

This element specifies the editor of a source. [Example:

```
1 <b:Author>
2 <b:Editor>
3 <b:NameList>
4 <b:Person>
5 <b:Last>Jaeschke</b:Last>
6 <b:First>Rex</b:First>
7 </b:Person>
8 </b:NameList>
9 </b:Editor>
10 </b:Author>
```

11 *end example]*

Parent Elements
Author (§7.6.2.5)

12

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

13 The following XML Schema fragment defines the contents of this element:

```
14 <complexType name="CT_NameType">
15 <sequence>
16 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
17 </sequence>
18 </complexType>
```

19 **7.6.2.29 First (Person's First, or Given, Name)**

20 This element specifies a person's first name. [*Example:*

```
21 <b:Author>
22 <b:Editor>
23 <b:NameList>
24 <b:Person>
25 <b:Last>Jaeschke</b:Last>
26 <b:First>Rex</b:First>
27 </b:Person>
28 </b:NameList>
29 </b:Editor>
30 </b:Author>
```

31 *end example]*

32 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Person (§7.6.2.50)

### 7.6.2.30 Guid (GUID)

This element specifies the GUID of a source. [Example:

...

```
<b:RefOrder>2</b:RefOrder>
<b:Guid>{EE06CBFE-1989-4533-A274-D81DFA436D79}</b:Guid>
<b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.31 Institution (Institution)

This element specifies the institution of the source. Typically, this field is used in the Report source type, where it signifies the university or institute, and in the Art source type, where it signifies the museum or institution where the art is housed. [Example:

...

```
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Dissertation</b:ThesisType>
<b:RefOrder>12</b:RefOrder>
<b:Guid>{6CB80970-81D3-476D-90D5-5C9D64E77FAF}</b:Guid>
<b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.32 InternetSiteTitle (Internet Site Title)

This element specifies the title of an internet site. Typically, this field is used in the Internet Site and Document from Internet Site source types. [Example:

```

1 ...
2 Title>TitleTitle>
3 <b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
4 <b:Month>July</b:Month>
5 <b:Day>1</b:Day>
6 <b:Year>2001</b:Year>
7 <b:MonthAccessed>Sept.</b:MonthAccessed>
8 <b:DayAccessed>22</b:DayAccessed>
9 <b:YearAccessed>1999</b:YearAccessed>
10 ...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.33 Interviewee (Interviewee)

This element specifies the person being interviewed. Typically, this field is used in the Interview source type.

[*Example:*

```

16 <b:Interviewee>
17 <b:NameList>
18 <b:Person>
19 Last>RothschillerLast>
20 <b:First>Chad</b:First>
21 </b:Person>
22 </b:NameList>
23 </b:Interviewee>

```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 7.6.2.34 Interviewer (Interviewer)

This element specifies the person conducting an interview. Typically, this field is used in the Interview source type. [Example:

```
<b:Interviewer>
 <b:NameList>
 <b:Person>
 <b:Last>Davis</b:Last>
 <b:First>Tristan</b:First>
 </b:Person>
 </b:NameList>
</b:Interviewer>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 7.6.2.35 Inventor (Inventor)

This element specifies the inventor of a source. Typically, this field is used in the Patent source type. [Example:

```

1 <b:Author>
2 <b:Inventor>
3 <b:NameList>
4 <b:Person>
5 <b:Last>Jones</b:Last>
6 <b:First>Brian</b:First>
7 </b:Person>
8 </b:NameList>
9 </b:Inventor>
10 </b:Author>

```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_NameType">
15 <sequence>
16 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
17 </sequence>
18 </complexType>

```

### 7.6.2.36 Issue (Issue)

This element specifies the issue of a source. Typically, this field is used in the Journal Article and Article in Periodical source types. *[Example:*

```

22 ...
23 <b:Edition>Edition</b:Edition>
24 <b:Issue>Issue</b:Issue>
25 <b:RefOrder>28</b:RefOrder>
26 </b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.37 JournalName (Journal Name)

This element specifies the name of the journal. Typically, this field is used in the Journal Article source type.

[Example:

```
...
Title>Article TitleTitle>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
...
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.38 Last (Person's Last, or Family, Name)

This element specifies a person's last name. [Example:

```
<b:Author>
 <b:Editor>
 <b:NameList>
 <b:Person>
 Last>JaeschkeLast>
 <b:First>Tristan</b:First>
 </b:Person>
 </b:NameList>
 </b:Editor>
</b:Author>
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Person (§7.6.2.50)

### 7.6.2.39 LCID (Locale ID)

This element specifies the locale ID of a source, representing the source's language. The set of locale IDs shall be as specified in §2.18.52. [*Example:*

```

...
<b:RefOrder>2</b:RefOrder>
<b:Guid>{EE06CBFE-1989-4533-A274-D81DFA436D79}</b:Guid>
<b:LCID>0</b:LCID>
</b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.40 Medium (Medium)

This element specifies the medium on or in which a source was created. Typically, this field is used in the Electronic source, sound recording, and film source types. [*Example:*

```

<b:Source>
...
<b:LCID>0</b:LCID>
<b:Medium>DVD</b:Medium>
</b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.41 Middle (Person's Middle, or Other, Name)

This element specifies a person's middle name. [*Example:*

```

1 <b:Author>
2 <b:Editor>
3 <b:NameList>
4 <b:Person>
5 <b:Last>Villaron</b:Last>
6 <b:First>Shawn</b:First>
7 <b:Middle>Alan</b:Middle>
8 </b:Person>
9 </b:NameList>
10 </b:Editor>
11 </b:Author>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Person (§7.6.2.50)

#### 7.6.2.42 Month (Month)

This element specifies the month in which a source was created or published. [*Example:*

```

16 ...
17 <b:PeriodicalTitle>Time</b:PeriodicalTitle>
18 <b:Month>November</b:Month>
19 <b:Day>10</b:Day>
20 ...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.43 MonthAccessed (Month Accessed)

This element specifies the month during which the source was accessed. [*Example:*

```

25 ...
26 <b:MonthAccessed>October</b:MonthAccessed>
27 <b:DayAccessed>5</b:DayAccessed>
28 <b:YearAccessed>2000</b:YearAccessed>
29 ...

```

*end example]*

1 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 2 7.6.2.44 NameList (Name List)

3 This element specifies a list containing one or more names of a type of contributor to a source, such as a list of  
4 authors, editors, or translators. *[Example:*

```

5 <b:Author>
6 <b:Author>
7 <b:NameList>
8 <b:Person>
9 <b:Last>Davis</b:Last>
10 <b:First>Tristan</b:First>
11 </b:Person>
12 </b:NameList>
13 </b:Author>
14 </b:Author>

```

15 *end example]*

Parent Elements
Artist (§7.6.2.3); Author (§7.6.2.4); BookAuthor (§7.6.2.6); Compiler (§7.6.2.14); Composer (§7.6.2.15); Conductor (§7.6.2.16); Counsel (§7.6.2.19); Director (§7.6.2.25); Editor (§7.6.2.28); Interviewee (§7.6.2.33); Interviewer (§7.6.2.34); Inventor (§7.6.2.35); Performer (§7.6.2.48); ProducerName (§7.6.2.51); Translator (§7.6.2.69); Writer (§7.6.2.74)

16

Child Elements	Subclause
Person (Person)	§7.6.2.50

17 The following XML Schema fragment defines the contents of this element:

```

18 <complexType name="CT_NameListType">
19 <sequence>
20 <element name="Person" type="CT_PersonType" minOccurs="1" maxOccurs="unbounded"/>
21 </sequence>
22 </complexType>

```

#### 23 7.6.2.45 NumberVolumes (Number of Volumes)

24 This element specifies the number of volumes a source contains. *[Example:*

1       ...

2       <b:NumberVolumes>10</b:NumberVolumes>

3       <b:Comments>Comments</b:Comments>

4       </b:Source>

5       *end example]*

6       The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7 7.6.2.46       Pages (Pages)

8       This element specifies the page range being cited in a source. [*Example:*

9       ...

10       <b>Title>Article Title</b>Title>

11       <b:Year>2000</b:Year>

12       <b:ShortTitle>Short Title</b:ShortTitle>

13       <b:Volume>100</b:Volume>

14       <b:Comments>Comments</b:Comments>

15       <b:JournalName>Journal Name</b:JournalName>

16       <b:Pages>91-160</b:Pages>

17       ...

18       *end example]*

19       The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 20 7.6.2.47       PatentNumber (Patent Number)

21       This element specifies the patent number of a source. Typically, this field is used in the Patent source type.

22       [*Example:*

23       <b:Source>

24       ...

25       <b:PatentNumber>1,000,000</b:PatentNumber>

26       <b:RefOrder>26</b:RefOrder>

27       <b:Guid>{8295ABC5-2DFD-4FA7-A2A7-A748917C1755}</b:Guid>

28       <b:LCID>0</b:LCID>

29       </b:Source>

30       *end example]*

1 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

## 2 7.6.2.48 Performer (Performer)

3 This element specifies the performer. Typically, this field is used in the sound recording, performance, and film  
4 source types. [Example:

```

5 <b:Performer>
6 <b:NameList>
7 <b:Person>
8 <b:Last>Rothschiller</b:Last>
9 <b:First>Chad</b:First>
10 </b:Person>
11 </b:NameList>
12 </b:Performer>

```

13 end example]

Parent Elements
Author (§7.6.2.5)

14

Child Elements	Subclause
Corporate (Corporate Author)	§7.6.2.18
NameList (Name List)	§7.6.2.44

15 The following XML Schema fragment defines the contents of this element:

```

16 <complexType name="CT_NameOrCorporateType">
17 <sequence>
18 <choice minOccurs="0" maxOccurs="1">
19 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
20 <element name="Corporate" minOccurs="1" maxOccurs="1" type="ST_String255"/>
21 </choice>
22 </sequence>
23 </complexType>

```

## 24 7.6.2.49 PeriodicalTitle (Periodical Title)

25 This element specifies the title of a periodical. [Example:

```

1 ...
2 <b:PeriodicalTitle>Periodical Title</b:PeriodicalTitle>
3 <b:Month>July</b:Month>
4 <b:Day>1</b:Day>
5 ...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.50 Person (Person)

This element specifies a person who contributed to a source. [*Example:*

```

10 <b:Author>
11 <b:NameList>
12 <b:Person>
13 <b:Last>Villaron</b:Last>
14 <b:First>Shawn</b:First>
15 <b:Middle>Alan</b:Middle>
16 </b:Person>
17 </b:NameList>
18 </b:Author>

```

*end example]*

Parent Elements
NameList (§7.6.2.44)

Child Elements	Subclause
First (Person's First, or Given, Name)	§7.6.2.29
Last (Person's Last, or Family, Name)	§7.6.2.38
Middle (Person's Middle, or Other, Name)	§7.6.2.41

The following XML Schema fragment defines the contents of this element:

```

22 <complexType name="CT_PersonType">
23 <sequence>
24 <element name="Last" type="ST_String255" minOccurs="0" maxOccurs="unbounded"/>
25 <element name="First" type="ST_String255" minOccurs="0" maxOccurs="unbounded"/>
26 <element name="Middle" type="ST_String255" minOccurs="0" maxOccurs="unbounded"/>
27 </sequence>
28 </complexType>

```

### 7.6.2.51 ProducerName (Producer Name)

This element specifies the person who produced a source. Typically, this field is used in the Internet site, Doc from internet site, Electronic source, Sound recording, Performance, and Film source types. [Example:

```
<b:ProducerName>
 <b:NameList>
 <b:Person>
 <b:Last>Rothschiller</b:Last>
 <b:First>Chad</b:First>
 </b:Person>
 </b:NameList>
</b:ProducerName>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 7.6.2.52 ProductionCompany (Production Company)

This element specifies the company that produced a source. Typically, this field is used in the Internet site, Document from internet site, Electronic source, Sound recording, Performance, and Film source types. [Example:

```
...
 <b:City>Chicago</b:City>
 <b:ProductionCompany>Production Company</b:ProductionCompany>
 <b:Medium>CD</b:Medium>
 <b:RefOrder>16</b:RefOrder>
</b:Source>
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
-----------------

Parent Elements
Source (§7.6.2.59)

### 7.6.2.53 PublicationTitle (Publication Title)

This element specifies the title of the publication that contains the source. Typically, this field is used in the Electronic Source source type. *[Example:*

```
...
<b:Volume>Volume</b:Volume>
<b:PublicationTitle>Publication Title</b:PublicationTitle>
<b:Month>June</b:Month>
<b:Day>2</b:Day>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.54 Publisher (Publisher)

This element specifies the publisher of a source.

```
...
<b:City>London</b:City>
<b:Publisher>Publisher</b:Publisher>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>Volume</b:Volume>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.55 RecordingNumber (Recording Number)

This element specifies the recording number of a source. Typically, this field is used in the sound recording source type.

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
-----------------

Parent Elements
Source (§7.6.2.59)

#### 1 7.6.2.56 RefOrder (Reference Order)

2 This element specifies the reference order of a source. [Example:

3 ...

4 <b:City>Chicago</b:City>

5 <b:ProductionCompany>Production Company</b:ProductionCompany>

6 <b:Medium>CD</b:Medium>

7 <b:RefOrder>16</b:RefOrder>

8 </b:Source>

9 end example]

10 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 11 7.6.2.57 Reporter (Reporter)

12 This element specifies the reporter of a source. Typically, this field is used in the Case source type. [Example:

13 ...

14 <b:Reporter>Reporter</b:Reporter>

15 <b:RefOrder>27</b:RefOrder>

16 <b:Guid>{CE314AB7-E824-4D10-B295-044C68EBED27}</b:Guid>

17 <b:LCID>0</b:LCID>

18 </b:Source>

19 end example]

20 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 21 7.6.2.58 ShortTitle (Short Title)

22 This element specifies the short title of a source. [Example:

1 ...  
 2 <b:City>London</b:City>  
 3 <b:Publisher>Publisher</b:Publisher>  
 4 <b:ShortTitle>Short Title</b:ShortTitle>  
 5 <b:Volume>Volume</b:Volume>  
 6 ...

7 *end example]*

8 The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 9 7.6.2.59 Source (Source)

10 This element specifies the bibliography entry for a source or reference work. [*Example:*

11 ...  
 12 <b:NumberVolumes>10</b:NumberVolumes>  
 13 <b:Comments>Comments</b:Comments>  
 14 </b:Source>

15 *end example]*

### 7.6.2.60 Sources (Sources)

This element specifies the sources in a collection.

#### Parent Elements

Root element of Shared Bibliography part

#### Child Elements

#### Subclause

Source (Source)

§7.6.2.59

#### Attributes

#### Description

SelectedStyle  
(Selected Style)

Specifies the filename of a file which may be used to format the bibliographies and citations within this document.

If this file is of an unknown form or cannot be located, then the other attributes on this element may be used to determine the format to use.

[Example:

```
<b:Sources SelectedStyle="\APA.XSL" StyleName="APA"
 URI="http://schemas.openxmlformats.org/bibliographicStyle/APA">
```

end example]

The possible values for this attribute are defined by the ST\_String255 simple type (§7.6.3.2).

StyleName  
(Documentation  
Style Name)

Specifies the name of the documentation style in which the bibliography and citations are formatted.

The following values shall be well-defined:

Attributes	Description
	The possible values for this attribute are defined by the ST_String255 simple type (§7.6.3.2).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Sources">
 <sequence>
 <element name="Source" type="CT_SourceType" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="SelectedStyle" type="ST_String255"/>
 <attribute name="StyleName" type="ST_String255"/>
 <attribute name="URI" type="ST_String255"/>
</complexType>

```

#### 7.6.2.61 SourceType (Source Type)

This element specifies the type of source being cited.

The possible values for this element are defined by the ST\_SourceType simple type (§7.6.3.1).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.62 StandardNumber (Standard Number)

This element specifies the standard number, such as ISBN or ISSN, of a source. *[Example:*

```

...
 <b:NumberVolumes>10</b:NumberVolumes>
 <b:StandardNumber>ISBN or ISSN</b:StandardNumber>
 <b:Comments>Comments</b:Comments>
</b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.63 StateProvince (State or Province)

This element specifies the state or province in which a source was created or published. *[Example:*

```

...
 <b:ProgramTitle>Program Title</b:ProgramTitle>
 <b:Broadcaster>Broadcaster</b:Broadcaster>
 <b:Station>Station</b:Station>
 <b:RefOrder>1</b:RefOrder>

```

```

1 <b:Title>Title (Interview)</b:Title>
2 <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
3 <b:StateProvince>State/Province</b:StateProvince>
4 <b:CountryRegion>Country/Region</b:CountryRegion>
5 </b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.64 Station (Station)

This element specifies the station on which an interview was broadcasted. Typically, this field is used in the Interview source type. *[Example:*

```

11 ...
12 <b:Month>November</b:Month>
13 <b:Day>18</b:Day>
14 <b:Broadcaster>ABC</b:Broadcaster>
15 <b:Station>WABC</b:Station>
16 ...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.65 Tag (Tag)

This element specifies the tag name of a source. *[Example:*

```

21 <b:Source>
22 <b:Tag>New01</b:Tag>
23 ...
24 </b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

**7.6.2.66 Theater (Theater)**

This element specifies the theater in which a source was performed or viewed. Typically, this field is used in the Performer source type. [Example:

```
...
<b:Theater>Theater Name</b:Theater>
<b:Month>October</b:Month>
<b:Day>25</b:Day>
<b:RefOrder>19</b:RefOrder>
...
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

**7.6.2.67 ThesisType (Thesis Type)**

This element specifies the type of report being cited, such as Thesis, Dissertation, or Book Report. Typically, this field is used in the Report source type. [Example:

```
...
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Doctoral Dissertation</b:ThesisType>
<b:Department>Department of Mathematics</b:Department>
...
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

**7.6.2.68 Title (Title)**

This element specifies the title of a source. [Example:

```
...
</b:Author>
Title>TitleTitle>
<b:Year>2005</b:Year>
<b:City>Seattle</b:City>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.69 Translator (Translator)

This element specifies the translator of a source. [*Example:*

```

<b:Author>
 <b:Translator>
 <b:NameList>
 <b:Person>
 <b:Last>Davis</b:Last>
 <b:First>Tristan</b:First>
 </b:Person>
 </b:NameList>
 </b:Translator>
</b:Author>

```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 7.6.2.70 Type (Type)

This element specifies the type of patent. Typically, this field is used in the Patent source type.

[*Example:*

```

1 <b:Type>Patent Type</b:Type>
2 <b:Guid>{8295ABC5-2DFD-4FA7-A2A7-A748917C1755}</b:Guid>
3 <b:LCID>0</b:LCID>
4 </Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.71 URL (URL)

This element specifies the URL of the source. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example:*

```

10 ...
11 <b:MonthAccessed>September</b:MonthAccessed>
12 <b:DayAccessed>1</b:DayAccessed>
13 <b:YearAccessed>1998</b:YearAccessed>
14 <b:URL>URL</b:URL>
15 <b:RefOrder>29</b:RefOrder>
16 ...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.72 Version (Version)

This element specifies the version of the source. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example:*

```

22 ...
23 <b:Version>3.0</b:Version>
24 <b:RefOrder>31</b:RefOrder>
25 <b:Guid>{F06D8D48-7FD7-4515-88E9-EC70AB9BE792}</b:Guid>
26 <b:LCID>0</b:LCID>
27 </b:Source>

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.73 Volume (Volume)

This element specifies the volume of the source. [*Example:*

```

...
Title>Article TitleTitle>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
...
```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.2.74 Writer (Writer)

This element specifies the writer of the source. Typically, this field is used in the Performance and Film source types. [*Example:*

```

<b:Author>
 <b:Writer>
 <b:NameList>
 <b:Person>
 Last>JonesLast>
 <b:First>Brian</b:First>
 </b:Person>
 </b:NameList>
 </b:Writer>
</b:Author>
```

*end example]*

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
 <sequence>
 <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 7.6.2.75 Year (Year)

This element specifies the year in which a source was created or published.

[Example:

```
...
Title>TitleTitle>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
...
```

end example]

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

#### 7.6.2.76 YearAccessed (Year Accessed)

This element specifies the month during which the source was accessed. [Example:

```

1 ...
2 <b:Title>Title</b:Title>
3 <b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
4 <b:Month>July</b:Month>
5 <b:Day>1</b:Day>
6 <b:Year>2001</b:Year>
7 <b:MonthAccessed>Sept.</b:MonthAccessed>
8 <b:DayAccessed>22</b:DayAccessed>
9 <b:YearAccessed>1999</b:YearAccessed>
10 ...

```

*end example]*

The possible values for this element are defined by the ST\_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

### 7.6.3 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/officeDocument/2006/bibliography> namespace.

#### 7.6.3.1 ST\_SourceType (Bibliographic Data Source Types)

This simple type specifies the possible types of sources that may be used within bibliographic data in an Office Open XML document.

[*Note:* The Office Open XML formats support a collection of predefined source types based on the categories most commonly used in various citation and bibliography style guidelines . The set of predefined source types can be extended as needed. The recommended approach for extending this set is to use the Misc type, and then leverage the methods described in Part 5 of this standard for extending the format with new attributes or elements. *end note.*]

This simple type's contents are a restriction of the ST\_String255 simple type (§7.6.3.2).

The following are possible enumeration values for this type:

Enumeration Value	Description
Art (Art)	Art
ArticleInAPeriodical (Article in a Periodical)	Article in a Periodical
Book (Book)	Book
BookSection (Book Section)	Book Section
Case (Case)	Case
ConferenceProceedings (Conference Proceedings)	Conference Proceedings

Enumeration Value	Description
DocumentFromInternetSite (Document from Internet Site)	Document from Internet Site
ElectronicSource (Electronic Source)	Electronic Source
Film (Film)	Film
InternetSite (Internet Site)	Internet Site
Interview (Interview)	Interview
JournalArticle (Journal Article)	Journal Article
Misc (Miscellaneous)	Miscellaneous
Patent (Patent)	Patent
Performance (Performance)	Performance
Report (Reporter)	Report
SoundRecording (Sound Recording)	Sound Recording

1

Referenced By
SourceType (§7.6.2.61)

### 2 7.6.3.2 ST\_String255 (String Value)

3 String whose maximum length is 255 characters.

4 This simple type's contents are a restriction of the XML Schema string datatype.

5 This simple type also specifies the following restrictions:

- 6 • This simple type's contents have a minimum length of 0 characters.
- 7 • This simple type's contents have a maximum length of 255 characters.

Referenced By
AbbreviatedCaseNumber (§7.6.2.1); AlbumTitle (§7.6.2.2); BookTitle (§7.6.2.7); Broadcaster (§7.6.2.8); BroadcastTitle (§7.6.2.9); CaseNumber (§7.6.2.10); ChapterNumber (§7.6.2.11); City (§7.6.2.12); Comments (§7.6.2.13); ConferenceName (§7.6.2.17); Corporate (§7.6.2.18); CountryRegion (§7.6.2.20); Court (§7.6.2.21); Day (§7.6.2.22); DayAccessed (§7.6.2.23); Department (§7.6.2.24); Distributor (§7.6.2.26); Edition (§7.6.2.27); First (§7.6.2.29); Guid (§7.6.2.30); Institution (§7.6.2.31); InternetSiteTitle (§7.6.2.32); Issue (§7.6.2.36); JournalName (§7.6.2.37); Last (§7.6.2.38); LCID (§7.6.2.39); Medium (§7.6.2.40); Middle (§7.6.2.41); Month (§7.6.2.42); MonthAccessed (§7.6.2.43); NumberVolumes (§7.6.2.45); Pages (§7.6.2.46); PatentNumber (§7.6.2.47); PeriodicalTitle (§7.6.2.49); ProductionCompany (§7.6.2.52); PublicationTitle (§7.6.2.53); Publisher (§7.6.2.54); RecordingNumber (§7.6.2.55); RefOrder (§7.6.2.56); Reporter (§7.6.2.57); ShortTitle (§7.6.2.58); Sources@SelectedStyle (§7.6.2.60); Sources@StyleName (§7.6.2.60); Sources@URI (§7.6.2.60); ST_SourceType (§7.6.3.1); StandardNumber (§7.6.2.62); StateProvince (§7.6.2.63); Station (§7.6.2.64); Tag (§7.6.2.65); Theater (§7.6.2.66); ThesisType (§7.6.2.67); Title (§7.6.2.68); Type (§7.6.2.70); URL (§7.6.2.71); Version (§7.6.2.72); Volume (§7.6.2.73); Year (§7.6.2.75); YearAccessed (§7.6.2.76)

## 7.7 Additional Characteristics

In order to allow producers of Office Open XML to describe specific contextual conditions under which the document was created, additional characteristics can be provided within the Additional Characteristics part using the syntax defined below.

The set of additional characteristics is designed to be an extensible list, and can provide a consumer with more information on how to interpret the file. This Standard defines one set of characteristics; however, additional grammars can be created and associated with a unique URI via the vocabulary attribute.

### 7.7.1 Table of Contents

**This subclause is informative.**

7.7.2.1 additionalCharacteristics (Set of Additional Characteristics) .....	5192
7.7.2.2 characteristic (Single Characteristic) .....	5193
<b>7.7.3 Simple Types</b> .....	<b>5195</b>
7.7.3.1 ST_Relation (Characteristic Relationship Types) .....	5195

**End of informative text.**

### 7.7.2 Elements

The following elements define the contents of the Additional Characteristics schema:

#### 7.7.2.1 additionalCharacteristics (Set of Additional Characteristics)

This element is the root element of the Additional Characteristics part and contains the list of additional characteristics for an Office Open XML document.

*[Example: The following content in an Additional Characteristics part would specify that the producing spreadsheet application supports from 0 to 10,000 columns, and that column ranges should be interpreted accordingly:*

```
<additionalCharacteristics>
 <characteristic name="numColumns" relation="le" val="10000"/>
 <characteristic name="numColumns" relation="ge" val="0"/>
</additionalCharacteristics>
```

*end example]*

Parent Elements
Root element of Shared Additional Characteristics part

Child Elements	Subclause
characteristic (Single Characteristic)	§7.7.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdditionalCharacteristics">
 <sequence>
 <element name="characteristic" type="CT_Characteristic" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 7.7.2.2 characteristic (Single Characteristic)

This element specifies a single characteristic. The type of characteristic is defined by the name attribute.

[Example: A producer can inform the consumer that the computations used to calculate the stored numbers in the formulas belong to a value space expressed by ranges of the binary mantissa and exponent. A consumer can optionally check those characteristics to determine whether, for example, the values should be recalculated.

The XML for this would be:

```
<additionalCharacteristics>
 <characteristic name='precisionMantissa' relation='gt'
 val='-9007199254740992' />
 <characteristic name='precisionMantissa' relation='lt'
 val='9007199254740992' />
 <characteristic name='precisionExponent' relation='ge' val='-1075' />
 <characteristic name='precisionExponent' relation='le' val='970' />
</additionalCharacteristics>
```

*end example]*

Parent Elements
additionalCharacteristics (§7.7.2.1)

Attributes	Description				
name (Name of Characteristic)	<p>Specifies the name of the characteristic. There are no constraints on the value of the name attribute, but each name shall be associated with a specific vocabulary via the vocabulary attribute.</p> <p>The values defined by this Standard shall be associated with a null vocabulary value, and are as follows:</p> <table> <tr> <th>Name Value</th><th>Property Specified</th></tr> <tr> <td>numColumns</td><td>Number of Columns supported by the spreadsheet producer.</td></tr> </table>	Name Value	Property Specified	numColumns	Number of Columns supported by the spreadsheet producer.
Name Value	Property Specified				
numColumns	Number of Columns supported by the spreadsheet producer.				

Attributes	Description	
	numRows	Number of Rows supported by the spreadsheet producer.
	functionVersion	Version of the function specification used
	precisionMantissa	Allowed values of the mantissa of numbers within spreadsheet cells/formulas when expressed in base 2.
	precisionExponent	Allowed values of the exponent of numbers within spreadsheet cells/formulas when expressed in base 2.
	numWorkbookColors	Number of Workbook colors
	numConditionalFormatConditions	Number of condition format conditions on a workbook cell
	nummaxSortLevels	Number of level of sorting on a range or table
	numAutoFilterItems	Number of items shown in the Auto-filter dropdown
	numDisplayCellChars	Number of characters that can display in a cell
	numPrintCellChars	Number of characters per cell that Excel can print
	numUniqueCellStyles	Number of unique cell styles in a workbook (combinations of all cell formatting)
	numFormulaLengthChars	Length of formulas in characters
	numFormulaNestingLevel	Number of levels of formula nesting
	numFunctionArguments	Number of arguments to a function
	numPivotTableRows	Number of rows in a pivot table
	numPivotTableColumns	Number of columns in a pivot table
	numUniquePivotFieldItems	Number of unique items in a pivot field
	numPivotTableMDXNameChars	Number of characters in a MDX name for a pivot table item
	numPivotTableRelationshipChars	String length for a relationship pivot table
	numPivotTableFieldLabelChars	Length of field labels in PivotTable including caption length limitations
	numPivotTableFields	Number of fields in a pivot table
	numSheetXRefArrayFormulas	The number of array formulas in a worksheet that can refer to another (given) worksheet
relation (Relationship of Value to Name)	The possible values for this attribute are defined by the XML Schema string datatype.	
	Specifies how the contents of the value attribute should be interpreted in the context of this characteristic.	

Attributes	Description
	<p>[<i>Example:</i> The following would specify that the application supports from 0 to 10,000 columns, and that column ranges should be interpreted accordingly:</p> <pre>&lt;additionalCharacteristics&gt;   &lt;characteristic name="numColumns" relation="le" val="10000"/&gt;   &lt;characteristic name="numColumns" relation="ge" val="0"/&gt; &lt;/additionalCharacteristics&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Relation simple type (§7.7.3.1).</p>
val (Characteristic Value)	<p>Specifies the value of the characteristic.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
vocabulary (Characteristic Grammar)	<p>Specifies a URI defining the characteristic grammar with which the name attribute value shall be interpreted.</p> <p>If this attribute is omitted, then the default grammar (as defined above) shall be used.</p> <p>The possible values for this attribute are defined by the XML Schema anyURI datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Characteristic">
3 <attribute name="name" type="xsd:string" use="required"/>
4 <attribute name="relation" type="ST_Relation" use="required"/>
5 <attribute name="val" type="xsd:string" use="required"/>
6 <attribute name="vocabulary" type="xsd:anyURI" use="optional"/>
7 </complexType>
```

## 8 7.7.3 Simple Types

9 This is the complete list of simple types in the  
10 <http://schemas.openxmlformats.org/officeDocument/2006/characteristics namespace>.

### 11 7.7.3.1 ST\_Relation (Characteristic Relationship Types)

12 This simple type specifies the possible relationships between a characteristic's name and value attributes.

13 This simple type's contents are a restriction of the XML Schema string datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
eq (Equal To)	Equal to.
ge (Greater Than or Equal to)	Greater than or equal to.

Enumeration Value	Description
gt (Greater Than)	Greater than.
le (Less Than or Equal To)	Less than or equal to.
lt (Less Than)	Less than.

Referenced By
characteristic@relation (§7.7.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Relation">
 <restriction base="xsd:string">
 <enumeration value="ge"/>
 <enumeration value="le"/>
 <enumeration value="gt"/>
 <enumeration value="lt"/>
 <enumeration value="eq"/>
 </restriction>
</simpleType>
```

7.8 Office Document Relationships

Within an Office Open XML document, it is necessary to be able to explicitly reference one part within the package from another [Example: A PresentationML Slide needs to be able to explicitly reference each picture within it to know where each one is anchored. end example]

In order to ensure that all such explicit relationship references are easily identifiable within a document, all such relationships are included within attributes in this namespace. This namespace therefore only serves to define attributes used throughout Office Open XML to create explicit relationships, and a single simple type for such attributes.

7.8.1 Table of Contents

This subclause is informative.

7.8.2 Simple Types .....	5196
7.8.2.1 ST_RelationshipId (Explicit Relationship ID) .....	5197

End of informative text.

7.8.2 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/officeDocument/2006/relationships> namespace.

### 7.8.2.1 ST\_RelationshipId (Explicit Relationship ID)

This simple type specifies the relationship ID in a part's relationship item which is the target of an explicit relationship from the parent XML element.

The type of relationship which shall be the target of the relationship specified shall be determined based on the context of the parent XML element.

[*Example*: Consider the following markup in an Office Open XML document:

```
<... r:id="rId5" />
```

The id attribute is of type ST\_RelationshipID, and therefore the relationship with ID rId5 shall be the target of an explicit relationship from the source part, based on the context of the parent XML element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

#### Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelationshipId">
 <restriction base="xsd:string"/>
</simpleType>
```

## 8. Custom XML Schema References

This namespace defines the set of properties which define the location and properties associated with one or more custom XML schemas which have been stored within the contents of a Office Open XML document. Collectively, the set of schemas associated with a document's custom XML markup are referred to as that document's *schema library*. The schema library then stores the set of unique XML namespaces used within the document's custom XML markup, and allows applications to 'tag' these namespaces with appropriate metadata.

### 8.1 Table of Contents

This subclause is informative.

<b>8.2 Elements .....</b>	<b>5199</b>
8.2.1 schema (Custom XML Schema Reference).....	5199
8.2.2 schemaLibrary (Embedded Custom XML Schema Supplementary Data) .....	5201

End of informative text.

### 8.2 Elements

The following information describes the elements in this namespace:

#### 8.2.1 schema (Custom XML Schema Reference)

This element specifies the properties associated with a single XML namespace, for which all known XML schemas shall be loaded in order to validate the custom XML markup stored within this document. These properties may be used appropriately to locate custom XML schema(s) for use with the document.

[*Example:* Consider a WordprocessingML document which contains custom XML markup in the `http://www.contoso.com` namespace. The following content would be displayed in the document's schema library data:

```
<w:schemaLibrary>
 <w:schema w:uri="http://www.contoso.com" w:schemaLocation="c:\contoso.xsd" />
</w:schemaLibrary>
```

The schema element contains the properties for this one XML namespace: in this case, a namespace URI of `http://www.contoso.com` and a file location of `c:\contoso.xsd`. *end example*

Parent Elements
schemaLibrary (§8.2.2)

Attributes	Description
<b>manifestLocation</b> (Resource File Location)	<p>Specifies the location of a resource file which should be downloaded and parsed when this document is loaded. The format and contents of this resource file are application-defined.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which contains custom XML markup in the <code>http://www.contoso.com</code> namespace, which is associated with a resource file located at <code>http://www.contoso.com/resource.xml</code>. The following content would be displayed in the document's schema library data:</p> <pre>&lt;w:schemaLibrary&gt;   &lt;w:schema w:uri="http://www.contoso.com" w:manifestLocation= "http://www.contoso.com/resource.xml" /&gt; &lt;/w:schemaLibrary&gt;</pre> <p>The <code>manifestLocation</code> attribute contains <code>http://www.contoso.com/manifest.xml</code> which is the location of a resource file that may be downloaded for use when this namespace is used. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>schemaLocation</b> (Custom XML Schema Location)	<p>Specifies the location of the XML schema file which should be downloaded and parsed when this document is loaded.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which contains custom XML markup in the <code>http://www.contoso.com</code> namespace, which is defined by an XML schema located at <code>c:\contoso.xsd</code>. The following content would be displayed in the document's schema library data:</p> <pre>&lt;w:schemaLibrary&gt;   &lt;w:schema w:uri="http://www.contoso.com" w:schemaLocation= "c:\contoso.xsd" /&gt; &lt;/w:schemaLibrary&gt;</pre> <p>The <code>schemaLocation</code> attribute contains <code>c:\contoso.xsd</code> which is the location of the XML schema file used when this namespace is used. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>uri</b> (Custom XML Schema Namespace)	<p>Specifies the target namespace for the XML Schema associated with this schema reference.</p> <p>[<i>Example:</i> Consider the following content for custom XML namespace data:</p> <pre>... &lt;w:schema w:uri="http://www.contoso.com/schema1" /&gt; &lt;w:schema w:uri="http://www.contoso.com/schema2" /&gt; ...</pre>

Attributes	Description
	<p>The uri attribute specifies the target namespace of each XML schema reference:</p> <ul style="list-style-type: none"> <li>http://www.contoso.com/schema1</li> <li>http://www.contoso.com/schema2</li> </ul> <p>Applications may then locate and utilize a schema for these namespaces using any means available. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Schema">
 <attribute name="uri" type="xsd:string" default=""/>
 <attribute name="manifestLocation" type="xsd:string"/>
 <attribute name="schemaLocation" type="xsd:string"/>
</complexType>
```

## 8.2.2 schemaLibrary (Embedded Custom XML Schema Supplementary Data)

This element specifies the set of XML namespaces which have been associated with the contents of the custom XML markup within the current Office Open XML document. Each unique namespace which is referenced within the document may be referenced within this element by a single schema element, regardless of the number of constituent XML schemas which comprise that namespace.

[*Example:* Consider a WordprocessingML document which contains custom XML markup in two distinct namespaces: the http://www.contoso.com namespace and the http://www.woodgroveBank.com namespace. If the first namespace is defined by a single XML schema, and the second is defined by five XML schemas (which are cross-referenced using the appropriate XML Schema syntax), the following content would be displayed in the document's schema library XML:

```
<w:schemaLibrary>
 <w:schema ... />
 <w:schema ... />
</w:schemaLibrary>
```

The schemaLibrary element contains only two schema elements even though there are six XML schemas in use, as there are only two distinct namespaces for which data is stored. *end example*

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
schema (Custom XML Schema Reference)	§8.2.1

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_SchemaLibrary">
3 <sequence>
4 <element name="schema" type="CT_Schema" minOccurs="0" maxOccurs="unbounded"/>
5 </sequence>
6 </complexType>
```

# 1 **Annex A. Office Schemas – XML Schema**

2 This Office Open XML specification includes a family of schemas defined using the XML Schema 1.0 syntax. The  
3 normative definitions of these schemas reside in an accompanying file named OfficeOpenXML-XMLSchema.zip,  
4 which is distributed in electronic form only.

5 If discrepancies exist between the electronic version of a schema and its corresponding representation as  
6 published in this part, Part 4, the electronic version is the definitive version.

# 1    **Annex B. Schemas – RELAX NG**

2    **This clause is informative.**

3    This Office Open XML specification includes a family of schemas defined using the RELAX NG syntax. The  
4    definitions of these schemas reside in an accompanying file named OfficeOpenXML-RELAXNG.zip, which is  
5    distributed in electronic form only.

6    If discrepancies exist between the RELAX NG version of a schema and its corresponding XML Schema, the XML  
7    Schema is the definitive version.

8    **End of informative text.**

# Annex C. Additional Syntax Constraints

## This clause is informative.

Although the set of XML Schemas included in Annex A specifies a majority of the requirements needed to ensure document conformance, there also exists a set of constraints that cannot easily be expressed in the XML Schema syntax (otherwise referred to as *additional syntax constraints*). These additional constraints can be deduced from the normative content of this Part, and are included in the requirements for document conformance.

The following is a sample of such constraints specified in this Part:

Subclause	Constraint
WordprocessingML Paragraphs	The caps element shall not be present with the smallCaps element on the same run, since they are mutually exclusive in terms of appearance.
WordprocessingML Headers and Footers	If the relationship type of the relationship specified by this element shall be present, have a TargetMode attribute value of Internal, and a Type attribute value of <a href="http://schemas.openxmlformats.org/officeDocument/2006/header">http://schemas.openxmlformats.org/officeDocument/2006/header</a> .
WordprocessingML Annotations	Each "cross-structure" annotation shall have a start element whose id attribute value matches the id attribute value of the corresponding end element.
SpreadsheetML Formulas	The syntax of the value of a formula shall conform to the structure of a formula as defined in the Formulas subclause.
SpreadsheetML Styles	The xfId attribute on the cellStyles element shall specify an xf record which is present in the cellStyleXfs collection.
PresentationML Slides	Each sldId attribute in a sldLst shall have a unique value for its id attribute (within the scope of the collection).
PresentationML Slides	A customShow element specifies a range of slides (a start and end slide) in PresentationML to define the set of slides that define a slide show. There shall be slides in the presentation that have slide IDs referenced in these attributes and the start slide shall be before the end slide.
DrawingML Main	The id attribute on the stCxn and endCxn elements specifies the start and end shapes to be connected. Shapes with matching id attribute values shall exist elsewhere in the spTree.

**End of informative text.**

# 1 **Annex D. Predefined SpreadsheetML Style**

## 2 **Definitions**

3 This Office Open XML specification includes the definitions of all predefined SpreadsheetML styles that are  
4 referenced by the following elements:

- 5 • cellStyle (§3.8.7)
- 6 • tableStyle (§3.8.40)

7 The normative SpreadsheetML markup defining these styles resides in an accompanying file named  
8 OfficeOpenXML-SpreadsheetMLStyles.zip, which is distributed in electronic form only.

# 1 Annex E. Example Predefined DrawingML 2 Shape and Text Geometries

3 **This clause is informative.**

4 This Office Open XML specification includes an example definition for all predefined DrawingML shape  
5 geometries that are referenced by the following elements:

- 6 • prstGeom@prst (§5.1.11.18)
- 7 • prstTxWarp@prst (§5.1.11.19)

8 The informative sample DrawingML markup defining these shape and text geometries resides in an  
9 accompanying file named OfficeOpenXML-DrawingMLGeometries.zip, which is distributed in electronic form  
10 only.

11 **End of informative text.**

# Annex F. Root Element Locations

**This clause is informative.**

This clause provides the location of each part's root element (as identified in §1) within the set of normative XML Schema files provided in Annex A, based on both its part name and its XML Schema:
