firstCol (First Column)	§5.1.4.2.11
firstRow (First Row)	§5.1.4.2.12
lastCol (Last Column)	§5.1.4.2.16
lastRow (Last Row)	§5.1.4.2.17
neCell (Northeast Cell)	§5.1.4.2.20

Child Elements	Subclause
nwCell (Northwest Cell)	§5.1.4.2.21
seCell (Southeast Cell)	§5.1.4.2.23
swCell (Southwest Cell)	§5.1.4.2.24
tblBg (Table Background)	§5.1.4.2.25
wholeTbl (Whole Table)	§5.1.4.2.34

1

Attributes	Description
styleId (Style ID)	Specifies a GUID identifying the table style in a unique manner.  The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).
styleName (Name)	Specifies the name of the table style which can show up in the user interface identifying the style to a user.  The possible values for this attribute are defined by the XML Schema string datatype.

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TableStyle">
4 <sequence>
5 <element name="tblBg" type="CT_TableBackgroundStyle" minOccurs="0" maxOccurs="1"/>
6 <element name="wholeTbl" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
7 <element name="band1H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
8 <element name="band2H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
9 <element name="band1V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
10 <element name="band2V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
11 <element name="lastCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
12 <element name="firstCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
13 <element name="lastRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
14 <element name="seCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
15 <element name="swCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
16 <element name="firstRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
17 <element name="neCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
18 <element name="nwCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
19 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
20 </sequence>
21 <attribute name="styleId" type="ST_Guid" use="required"/>
22 <attribute name="styleName" type="xsd:string" use="required"/>
23 </complexType>
```

24 5.1.4.2.27 tblStyleLst (Table Style List)

25 This element is simply a list of table styles which are used within a document.

26 [Example: Consider the following example of a table style list within DrawingML:

```
1 <tblStyleLst def="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}">
2 <tblStyle styleId="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}"
3 styleName="Medium Style 2 - Accent 1">
4 ...
5 </tblStyle>
6 <tblStyle styleId="{3C2FFA5D-87B4-456A-9821-1D502468CF0F}"
7 styleName="Themed Style 1 - Accent 1">
8 ...
9 </tblStyle>
10 </tblStyleLst>
```

11 In this example, we see two table styles defined along with the default being specified. *end example*]

Parent Elements
Root element of DrawingML Table Styles part

12

Child Elements	Subclause
tblStyle (Table Style)	§5.1.4.2.26

13

Attributes	Description
def (Default)	The GUID corresponding to the default table style in the list of table styles. This default can be used when a table is initially inserted into a document.  The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_TableStyleList">
16 <sequence>
17 <element name="tblStyle" type="CT_TableStyle" minOccurs="0" maxOccurs="unbounded"/>
18 </sequence>
19 <attribute name="def" type="ST_Guid" use="required"/>
20 </complexType>
```

21 **5.1.4.2.28**      **tcBdr (Table Cell Borders)**

22 This element defines the borders for the cells within a table.

23 *[Example: Consider the following example of table cell borders being used within DrawingML:*

```
1 <tcBdr>
2 <left>
3 <lnRef idx="1">
4 <schemeClr val="accent1"/>
5 </lnRef>
6 </left>
7 <right>
8 <lnRef idx="1">
9 <schemeClr val="accent1"/>
10 </lnRef>
11 </right>
12 <top>
13 <lnRef idx="1">
14 <schemeClr val="accent1"/>
15 </lnRef>
16 </top>
17 <bottom>
18 <lnRef idx="2">
19 <schemeClr val="lt1"/>
20 </lnRef>
21 </bottom>
22 <insideH>
23 <ln>
24 <noFill/>
25 </ln>
26 </insideH>
27 <insideV>
28 <ln>
29 <noFill/>
30 </ln>
31 </insideV>
32 </tcBdr>
```

33 In this example, we define borders for the bottom, top, right, and left borders of the table cells. *end example*]

Parent Elements
tcStyle (§5.1.4.2.29)

34

Child Elements	Subclause
bottom (Bottom Border)	§5.1.4.2.6
extLst (Extension List)	§5.1.2.1.15
insideH (Inside Horizontal Border)	§5.1.4.2.14

Child Elements	Subclause
insideV (Inside Vertical Border)	§5.1.4.2.15
left (Left Border)	§5.1.4.2.18
right (Right Border)	§5.1.4.2.22
tl2br (Top Left to Bottom Right Border)	§5.1.4.2.31
top (Top Border)	§5.1.4.2.32
tr2bl (Top Right to Bottom Left Border)	§5.1.4.2.33

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TableCellStyle">
 <sequence>
 <element name="left" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="right" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="top" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="bottom" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="insideH" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="insideV" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tl2br" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tr2bl" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.4.2.29 tcStyle (Table Cell Style)

This element defines the style for a give cell in a table.

[*Example:* Consider the following example of a table cell style in use within DrawingML:

```

<tcStyle>
 <tcBdr>
 ...
 </tcBdr>
 <fill>
 ...
 </fill>
</tcStyle>

```

In this example, we see that a set of borders for the cell along with a cell fill are being defined. *end example]*

Parent Elements
band1H (§5.1.4.2.1); band1V (§5.1.4.2.2); band2H (§5.1.4.2.3); band2V (§5.1.4.2.4); firstCol (§5.1.4.2.11); firstRow (§5.1.4.2.12); lastCol (§5.1.4.2.16); lastRow (§5.1.4.2.17); neCell (§5.1.4.2.20); nwCell (§5.1.4.2.21); seCell (§5.1.4.2.23); swCell (§5.1.4.2.24); wholeTbl (§5.1.4.2.34)

Child Elements	Subclause
cell3D (Cell 3-D)	§5.1.6.1
fill (Fill)	§5.1.4.2.9
fillRef (Fill Reference)	§5.1.4.2.10
tcBdr (Table Cell Borders)	§5.1.4.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCellStyle">
 <sequence>
 <element name="tcBdr" type="CT_TableCellBorderStyle" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_ThemeableFillStyle" minOccurs="0" maxOccurs="1"/>
 <element name="cell3D" type="CT_Cell3D" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.4.2.30 tcTxStyle (Table Cell Text Style)

This element defines the text properties associated with the text contained within a table cell.

[*Example:* Consider the following example of a table cell text style in use within DrawingML:

```
<tcTxStyle b="on">
 <fontRef idx="minor">
 <scrgbClr r="0" g="0" b="0"/>
 </fontRef>
 <schemeClr val="lt1"/>
</tcTxStyle>
```

In this example, we define the text within the cell to be bold and reference the themed minor font and to also be the light 1 color. *end example*

Parent Elements
band1H (§5.1.4.2.1); band1V (§5.1.4.2.2); band2H (§5.1.4.2.3); band2V (§5.1.4.2.4); firstCol (§5.1.4.2.11); firstRow (§5.1.4.2.12); lastCol (§5.1.4.2.16); lastRow (§5.1.4.2.17); neCell (§5.1.4.2.20); nwCell (§5.1.4.2.21); seCell (§5.1.4.2.23); swCell (§5.1.4.2.24); wholeTbl (§5.1.4.2.34)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.2.13
fontRef (Font Reference)	§5.1.4.1.17
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29

Child Elements	Subclause
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

1

Attributes	Description
b (Bold)	Specifies if the text is to be bolded.  The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§5.1.12.36).
i (Italic)	Specifies if the text is to be italicized.  The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§5.1.12.36).

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TableStyleTextStyle">
4 <sequence>
5 <group ref="EG_ThemeableFontStyles" minOccurs="0" maxOccurs="1"/>
6 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
7 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 <attribute name="b" type="ST_OnOffStyleType" use="optional" default="def"/>
10 <attribute name="i" type="ST_OnOffStyleType" use="optional" default="def"/>
11 </complexType>
```

12 5.1.4.2.31 **tl2br (Top Left to Bottom Right Border)**

13 This element defines the line properties associated with the border which goes from the top-left to the bottom-  
14 right corner in a table cell.

15 [Example: Consider the following example of the top border in use within DrawingML:

```
16 <tl2br>
17 <ln w="12700" cmpd="sng">
18 <solidFill>
19 <schemeClr val="accent1"/>
20 </solidFill>
21 </ln>
22 </tl2br>
```

23 In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

1

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ThemeableLineStyle">
4 <choice>
5 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
6 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
7 </choice>
8 </complexType>

```

### 9 5.1.4.2.32 top (Top Border)

10 This element defines the line properties associated with the top border in a table cell.

11 *[Example: Consider the following example of the top border in use within DrawingML:*

```

12 <top>
13 <ln w="12700" cmpd="sng">
14 <solidFill>
15 <schemeClr val="accent1"/>
16 </solidFill>
17 </ln>
18 </top>

```

19 In this example, we see the top border on a table cell to be a single 1pt line which is colored accent 1. *end*  
20 *example]*

Parent Elements
tcBdr (§5.1.4.2.28)

21

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

22 The following XML Schema fragment defines the contents of this element:

```

23 <complexType name="CT_ThemeableLineStyle">
24 <choice>
25 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
26 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
27 </choice>
28 </complexType>

```

5.1.4.2.33 **tr2bl** (Top Right to Bottom Left Border)

This element defines the line properties associated with the border which goes from the top-right to the bottom-left corner in a table cell.

[Example: Consider the following example of the top border in use within DrawingML:

```
<tr2bl>
 <ln w="12700" cmpd="sng">
 <solidFill>
 <schemeClr val="accent1"/>
 </solidFill>
 </ln>
</tr2bl>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example]*

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
 <choice>
 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 </choice>
</complexType>
```

5.1.4.2.34 **wholeTbl** (Whole Table)

This element contains formatting options which are applied to the table as a whole when it is in its default state with no formatting options (first row, last row, etc) enabled.

[Example: Consider the following example of whole table being used within DrawingML:

```
<wholeTbl>
 <tcTxStyle>
 ...
 </tcTxStyle>
 <tcStyle>
 ...
 </tcStyle>
</wholeTbl>
```

In this example, we see definitions for the text and the cells within the table. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.5 Paragraphs and Rich Formatting

The Paragraphs and Rich Formatting portion of the DrawingML framework stores text and related formatting information for a text body contained within a shape. Formatting for text within a shape can be broken down into three levels of precision, namely body, paragraph, and run formatting properties.

5.1.5.1 Body Formatting

Being the highest level of formatting available within a shape, the body properties allow for the manipulation of the text area as a whole. This means that all paragraphs and runs of text for the shape in question would be encompassed within here and, therefore, follow the text body style defined here.

[Example: Consider a shape that has three paragraphs within it, each with a different sized text. If this shape is resized to be smaller, then the text will no longer fit the same way within the shape. Thus, we see that to maintain visual quality the size must be changed.

Rather than try to change each of the paragraphs to a smaller font size to fit in the shape, just use a body-level format property such as the normAutofit. This will apply to all text within the shape and scale the text by a certain percentage in order to fit within the shape.

```
1 <p:txBody>
2 <a:bodyPr>
3 <a:normAutofit fontScale="20000" lnSpcReduction="20000"/>
4 </a:bodyPr>
5 ...
6 <a:p>
7 ...
8 </a:p>
9 <a:p>
10 ...
11 </a:p>
12 <a:p>
13 ...
14 </a:p>
15 </p:txBody>
```

16 *end example]*

17 **5.1.5.1.1 bodyPr (Body Properties)**

18 This element defines the body properties for the text body within a shape.

19 *[Example:* Consider a shape with a text body that has some formatting properties associated with it. For the  
20 formatting of text body properties, the bodyPr element should be used as follows:

```
21 <p:sp>
22 ...
23 <p:txBody>
24 <a:bodyPr>
25 (text body properties)
26 </a:bodyPr>
27 ...
28 </p:txBody>
29 </p:sp>
```

30 *end example]*

31

Parent Elements
lnDef (§5.1.4.1.20); rich (§5.7.2.157); spDef (§5.1.4.1.27); t (§5.9.3.8); txBody (§5.8.2.26); txBody (§5.1.2.1.40); txBody (§5.6.2.33); txBody (§4.4.1.47); txDef (§5.1.4.1.28); txPr (§5.7.2.217)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
flatTx (No text in 3D scene)	§5.1.7.8

Child Elements	Subclause
noAutofit (No AutoFit)	§5.1.5.1.2
normAutofit (Normal AutoFit)	§5.1.5.1.3
prstTxWarp (Preset Text Warp)	§5.1.11.19
scene3d (3D Scene Properties)	§5.1.4.1.26
sp3d (Apply 3D shape properties)	§5.1.7.12
spAutoFit (Shape AutoFit)	§5.1.5.1.4

1

Attributes	Description
anchor (Anchor)	<p>Specifies the anchoring position of the txBody within the shape. If this attribute is omitted, then a value of t, or top is implied.</p> <p>[Example: Consider the following DrawingML:</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr anchor="ctr" ... /&gt;   ... &lt;/p:txBody&gt;</pre> <p>Here the text is vertically aligned in the center of the shape within which it is contained. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§5.1.12.60).</p>
anchorCtr (Anchor Center)	<p>Specifies the centering of the text box. The way it works fundamentally is to determine the smallest possible "bounds box" for the text and then to center that "bounds box" accordingly. Note that this is different than paragraph alignment, which aligns the text within the "bounds box" for the text. This flag is compatible with all of the different types of anchoring. If this attribute is omitted, then a value of 0, or off is implied.</p> <p>[Example: The text within this shape has been both vertically centered with the anchor attribute and horizontally centered with the anchorCtr attribute.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr anchor="ctr" anchorCtr="1" ... /&gt;   ... &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bIns (Bottom Inset)	<p>Specifies the bottom inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, a value of 45720 or 0.05 inches is implied.</p>

Attributes	Description
	<p>[Example: Consider the following DrawingML:</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr lIns="91440" tIns="91440"     rIns="91440" bIns="91440" ... /&gt;   ... &lt;/p:txBody&gt;</pre> <p>The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
compatLnSpc (Compatible Line Spacing)	<p>Specifies that the line spacing for this text body will be decided in a simplistic manner using the font scene. If this attribute is omitted, a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
forceAA (Force Anti-Alias)	<p>Forces the text to be rendered anti-aliased regardless of the font size. Certain fonts may appear grainy around their edges unless they are anti-aliased. Therefore this attribute allows for the specifying of which bodies of text should always be anti-aliased and which ones should not. If this attribute is omitted, then a value of 0, or off is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fromWordArt (From WordArt)	<p>Specifies that text within this textbox is converted text from a WordArt object. This is more of a backwards compatibility attribute that is useful to the application from a tracking perspective. WordArt was the former way to apply text effects and therefore this attribute is useful in document conversion scenarios. If this attribute is omitted, then a value of 0, or off is implied.</p> <p>[Example: Consider the following DrawingML:</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr wrap="none" fromWordArt="1" ...   /&gt;   ... &lt;/p:txBody&gt;</pre> <p><i>end example</i>]</p> <p>Because of the presence of the fromWordArt attribute the text within this shape can be mapped back to the corresponding WordArt during document conversion. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
horzOverflow (Text Horizontal Overflow)	<p>Determines whether the text can flow out of the bounding box horizontally. This is used to determine what will happen in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where we have multiply paragraphs within a shape and the second is greater in length and causes text to flow outside the shape. By applying the clip value of the horzOverflow attribute as a body property this overflowing text will now be cut off instead of extending beyond the bounds of the shape.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr horzOverflow="clip" ... /&gt;   ...   &lt;a:p&gt;     ...     (Some text)   ... &lt;/a:p&gt; &lt;a:p&gt;   ...   (Some more text)   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§5.1.12.69).</p>
lIns (Left Inset)	<p>Specifies the left inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.</p> <p>[<i>Example</i>: Consider the following DrawingML:</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr lIns="91440" tIns="91440" rIns="91440"     bIns="91440" ... /&gt;   ... &lt;/p:txBody&gt; </pre> <p>The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
numCol (Number of Columns)	<p>Specifies the number of columns of text in the bounding rectangle. When applied to a text run this property takes the width of the bounding box for the text and divides it by the number of columns specified. These columns are then treated as overflow containers in that when the previous column has been filled with text the next column will act as the repository for additional text. When all columns have been filled and text still remains</p>

Attributes	Description
	<p>then the overflow properties set for this text body will be used and the text will be reflowed to make room for additional text. If this attribute is omitted, then a value of 1 is implied.</p> <p>[<i>Example:</i> Consider the case where a text area would need to be split up into four separate columns. Then simply specifying one paragraph with one run of text is enough to describe four columns of text here.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="4" ... /&gt;   &lt;a:p&gt;     &lt;a:r&gt;       ...       (Some text)       ...     &lt;/a:r&gt;   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextColumnCount simple type (§5.1.12.65).</p>
rIns (Right Inset)	<p>Specifies the right inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.</p> <p>[<i>Example:</i> Consider the following DrawingML:</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr lIns="91440" tIns="91440"     rIns="91440" bIns="91440" ... /&gt;   ... &lt;/p:txBody&gt; </pre> <p>The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
rot (Rotation)	<p>Specifies the rotation that is being applied to the text within the bounding box. If it not specified, the rotation of the accompanying shape is used. If it is specified, then this is applied independently from the shape. That is the shape can have a rotation applied in addition to the text itself having a rotation applied to it. If this attribute is omitted, then a value of 0, is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where a shape has a rotation of 5400000, or 90 degrees clockwise applied to it. In addition to this, the text body itself has a rotation of -5400000, or 90 degrees counter-clockwise applied to it. Then the resulting shape would appear to be rotated but the text within it would appear as though it had not been rotated at all. The DrawingML specifying this would look like the following:</p> <pre> &lt;p:sp&gt;   &lt;p:spPr&gt;     &lt;a:xfrm rot="5400000"&gt;       ...     &lt;/a:xfrm&gt;   &lt;/p:spPr&gt;   ...   &lt;p:txBody&gt;     &lt;a:bodyPr rot="-5400000" ... /&gt;     ...     (Some text)     ...   &lt;/p:txBody&gt; &lt;/p:sp&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>
rtlCol (Columns Right-To-Left)	<p>Specifies whether columns are used in a right-to-left or left-to-right order. The usage of this attribute only sets the column order that is used to determine which column overflow text should go to next. If this attribute is omitted, then a value of 0, or off is implied in which case text will start in the leftmost column and flow to the right.</p> <p>[<i>Note</i>: This attribute in no way determines the direction of text but merely the direction in which multiple columns are used. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
spcCol (Space Between Columns)	<p>Specifies the space between text columns in the text area. This should only apply when there is more than 1 column present. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).</p>
spcFirstLastPara (Paragraph Spacing)	<p>Specifies whether the before and after paragraph spacing defined by the user is to be respected. While the spacing between paragraphs is helpful, it is additionally useful to be able to set a flag as to whether this spacing is to be followed at the edges of the text body, in other words the first and last paragraphs in the text body. More precisely since this is a text body level property it should only effect the before paragraph spacing of the first paragraph and the after paragraph spacing of the last paragraph for a given text body. If this attribute is omitted, then a value of 0, or false is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where spacing has been defined between multiple paragraphs within a text body using the spcBef and spcAft paragraph spacing attributes. For this text body however the user would like to not have this followed for the edge paragraphs and thus we have the following DrawingML.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr spcFirstLastPara="0" ... /&gt;   ...   &lt;a:p&gt;     &lt;a:pPr&gt;       &lt;a:spcBef&gt;         &lt;a:spcPts val="1800"/&gt;       &lt;/a:spcBef&gt;       &lt;a:spcAft&gt;         &lt;a:spcPts val="600"/&gt;       &lt;/a:spcAft&gt;     &lt;/a:pPr&gt;     ...     (Some text)     ...   &lt;/a:p&gt;   &lt;a:p&gt;     &lt;a:pPr&gt;       &lt;a:spcBef&gt;         &lt;a:spcPts val="1800"/&gt;       &lt;/a:spcBef&gt;       &lt;a:spcAft&gt;         &lt;a:spcPts val="600"/&gt;       &lt;/a:spcAft&gt;     &lt;/a:pPr&gt;     ...     (Some text)     ...   &lt;/a:p&gt;   ... &lt;/p:txBody&gt; end example] </pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
tIns (Top Inset)	<p>Specifies the top inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 45720 or 0.05 inches is implied.</p> <p>[<i>Example</i>: Consider the following DrawingML:</p> <pre> &lt;p:txBody&gt; </pre>

Attributes	Description
	<pre>&lt;a:bodyPr lIns="91440" tIns="91440" rIns="91440" bIns="91440" ... /&gt; ... &lt;/p:txBody&gt;</pre> <p>The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
upright (Text Upright)	<p>Specifies whether text should remain upright, regardless of the transform applied to it and the accompanying shape transform. If this attribute is omitted, then a value of 0, or false will be implied.</p> <p>[<i>Example:</i> Consider text that has been rotated within the text body but has the upright flag set.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr upright="1" rot="5400000" .../&gt;   ...   (Some text)   ... &lt;/p:txBody&gt;</pre> <p>This text will appear as though no transform has been applied to it. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
vert (Vertical Text)	<p>Determines if the text within the given text body should be displayed vertically. If this attribute is omitted, then a value of horz, or no vertical text is implied.</p> <p>[<i>Example:</i> Consider the case where the user needs to display text that appears vertical and has a right to left flow with respect to its columns.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr vert="wordArtVertRtl" ... /&gt;   ...   &lt;a:p&gt;     ...     &lt;a:t&gt;This is&lt;/a:t&gt;     ...   &lt;/a:p&gt;   &lt;a:p&gt;     ...     &lt;a:t&gt;some text.&lt;/a:t&gt;     ...   &lt;/a:p&gt;</pre>

Attributes	Description
	<p data-bbox="451 247 630 279">&lt;/p:txBody&gt;</p> <p data-bbox="414 317 1471 491">In the above sample DrawingML there are two paragraphs denoting a separation between the text otherwise which are known as either a line or paragraph break. Because wordArtVertRtl is used here this text will not only be displayed in a stacked manner flowing from top to bottom but also have the first paragraph be displayed to the right of the second. This is because it is both vertical text and right to left. <i>end example</i>]</p> <p data-bbox="414 529 1422 596">The possible values for this attribute are defined by the ST_TextVerticalType simple type (§5.1.12.83).</p>
vertOverflow (Text Vertical Overflow)	<p data-bbox="414 615 1463 751">Determines whether the text can flow out of the bounding box vertically. This is used to determine what will happen in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied.</p> <p data-bbox="414 789 1458 926"><i>[Example: Consider the case where we have multiply paragraphs within a shape and the second causes text to flow outside the shape. By applying the clip value of the vertOverflow attribute as a body property this overflowing text will now be cut off instead of extending beyond the bounds of the shape.</i></p> <pre data-bbox="451 968 1029 1444"> &lt;p:txBody&gt;   &lt;a:bodyPr vertOverflow="clip" ... /&gt;   ...   &lt;a:p&gt;     ...     (Some text)     ...   &lt;/a:p&gt;   &lt;a:p&gt;     ...     (Some longer text)     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p data-bbox="414 1482 574 1514"><i>end example]</i></p> <p data-bbox="414 1551 1406 1619">The possible values for this attribute are defined by the ST_TextVertOverflowType simple type (§5.1.12.84).</p>
wrap (Text Wrapping Type)	<p data-bbox="414 1644 1446 1711">Specifies the wrapping options to be used for this text body. If this attribute is omitted, then a value of square is implied which will wrap the text using the bounding text box.</p> <p data-bbox="414 1749 1446 1816">The possible values for this attribute are defined by the ST_TextWrappingType simple type (§5.1.12.85).</p>

The following XML Schema fragment defines the contents of this element:

```

#### 5.1.5.1.2 noAutofit (No AutoFit)

This element specifies that text within the text body should not be auto-fit to the bounding box. Auto-fitting is when text within a text box is scaled in order to remain inside the text box. If this element is omitted, then noAutofit or auto-fit off is implied.

[Example: Consider a text box where the user wishes to have the text extend outside the bounding box. The following DrawingML would describe this.

```
<p:txBody>
 <a:bodyPr wrap="none" rtlCol="0">
 <a:noAutofit/>
 </a:bodyPr>
 <a:p>
 ...
 <a:t>Some text</a:t>
 ...
 </a:p>
</p:txBody>
```

1 *end example]*

Parent Elements
bodyPr (§5.1.5.1.1)

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TextNoAutofit"/>
```

4 **5.1.5.1.3 normAutofit (Normal AutoFit)**

5 This element specifies that text within the text body should be normally auto-fit to the bounding box. Auto-  
6 fitting is when text within a text box is scaled in order to remain inside the text box. If this element is omitted,  
7 then noAutofit or auto-fit off is implied.

8 *[Example:* Consider the situation where a user is building a diagram and needs to have the text for each shape  
9 that they are using stay within the bounds of the shape. An easy way this might be done is by using  
10 normAutofit. The following DrawingML will illustrate how this might be accomplished.

```
11 <p:sp>
12 <p:txBody>
13 <a:bodyPr rtlCol="0" anchor="ctr">
14 <a:normAutofit fontScale="92000" lnSpcReduction="20000"/>
15 </a:bodyPr>
16 ...
17 <a:p>
18 ...
19 <a:t>Diagram Object 1</a:t>
20 ...
21 </a:p>
22 </p:txBody>
23 </p:sp>
24 <p:sp>
25 <p:txBody>
26 <a:bodyPr rtlCol="0" anchor="ctr">
27 <a:normAutofit fontScale="92000" lnSpcReduction="20000"/>
28 </a:bodyPr>
29 ...
30 <a:p>
31 ...
32 <a:t>Diagram Object 2</a:t>
33 ...
34 </a:p>
35 </p:txBody>
36 </p:sp>
```

In the above example there are two shapes that have normAutofit turned on so that when the user types more text within the shape that the text will actually resize to accommodate the new data. For the application to know how and to what degree the text should be resized two attributes are set for the auto-fit resize logic. *end example*]

#### Parent Elements

bodyPr (§5.1.5.1.1)

#### Attributes

#### Description

fontScale (Font Scale)

Specifies the percentage of the original font size to which each run in the text body is scaled. In order to auto-fit text within a bounding box it is sometimes necessary to decrease the font size by a certain percentage. Using this attribute the font within a text box can be scaled based on the value provided. A value of 100000 is treated as 100% while a value of 1000 is consequently 1%. If this attribute is omitted, then a value of 100000 or 100% is implied.

The possible values for this attribute are defined by the ST\_TextFontScalePercent simple type (§5.1.12.67).

lnSpcReduction (Line Space Reduction)

Specifies the percentage amount by which the line spacing of each paragraph in the text body is reduced. The reduction is applied by subtracting it from the original line spacing value. Using this attribute the vertical spacing between the lines of text can be scaled by a percent amount. A value of 100000 is treated as 100% while a value of 1000 is consequently 1%. If this attribute is omitted, then a value of 0 or 0% is implied.

[*Note*: This attribute applies only to paragraphs with percentage line spacing. *end note*]

The possible values for this attribute are defined by the ST\_TextSpacingPercent simple type (§5.1.12.77).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextNormalAutofit">
 <attribute name="fontScale" type="ST_TextFontScalePercent" use="optional" default="100000"/>
 <attribute name="lnSpcReduction" type="ST_TextSpacingPercent" use="optional" default="0"/>
</complexType>
```

#### 5.1.5.1.4 spAutoFit (Shape AutoFit)

This element specifies that a shape should be auto-fit to fully contain the text described within it. Auto-fitting is when text within a shape is scaled in order to contain all the text inside. If this element is omitted, then noAutofit or auto-fit off is implied.

[*Example*: Consider the situation where a user is building a diagram and needs to have the text for each shape that they are using stay within the bounds of the shape. An easy way this might be done is by using spAutofit. The following DrawingML will illustrate how this might be accomplished.

```
1 <p:sp>
2 <p:txBody>
3 <a:bodyPr rtlCol="0" anchor="ctr">
4 <a:spAutoFit/>
5 </a:bodyPr>
6 ...
7 <a:p>
8 ...
9 <a:t>Diagram Object 1</a:t>
10 ...
11 </a:p>
12 </p:txBody>
13 </p:sp>
14 <p:sp>
15 <p:txBody>
16 <a:bodyPr rtlCol="0" anchor="ctr">
17 <a:spAutoFit/>
18 </a:bodyPr>
19 ...
20 <a:p>
21 ...
22 <a:t>Diagram Object 2</a:t>
23 ...
24 </a:p>
25 </p:txBody>
26 </p:sp>
```

27 In the above example there are two shapes that have spAutoFit turned on so that when the user types more  
28 text within the shape that the shape will actually resize to accommodate the new data. *end example]*

Parent Elements
bodyPr (§5.1.5.1.1)

29 The following XML Schema fragment defines the contents of this element:

```
30 <complexType name="CT_TextShapeAutofit"/>
```

31 **5.1.5.2 Paragraph Formatting**

32 This level of formatting allows for more granular control of text within a shape. Properties here apply to all text  
33 residing within the corresponding paragraph. This intermediate property level allows freedom to assign what  
34 would seem like lower level properties to a larger group of text. Along with this the paragraph property level  
35 also allows what would seem like larger group properties to a more granular set of text. This makes for a  
36 property level that is quite versatile in its ability to define formatting on text within a shape.

[*Example:* For instance consider the case where a paragraph of text would need to have bullets applied to it. At first one might think that this formatting must be done at the text run level as it may seem run specific. Much to the contrary this is a paragraph level property and is applied to multiple runs of text. As an example we have once again our three paragraphs with the second having bullets applied to it.

```

<a:p>
...
</a:p>
<a:p>
 <a:pPr>
 <a:buFont typeface="Wingdings"/>
 <a:buChar typeface="ü"/>
 <a:pPr>
 <a:r>
 <a:rPr lang="en-US" dirty="0" smtClean="0"/>
 <a:t>This Paragraph of Text Will Have a Bullet.</a:t>
 </a:r>
 </a:p>
<a:p>
...
</a:p>

```

Here we see that the paragraph will be formatted to have character bullets for each new line of text that is encountered. In particular this paragraph will have the "ü" character applied which in the "Wingdings" font is the checkmark character. The other paragraphs will not be effected by this paragraph's bullet formatting and should have their text remain unformatted.

*end example]*

#### 5.1.5.2.1 br (Text Line Break)

This element specifies the existence of a vertical line break between two runs of text within a paragraph. In addition to specifying a vertical space between two runs of text, this element may also have run properties specified via the rPr child element. This sets the formatting of text for the line break so that if text is later inserted there that a new run can be generated with the correct formatting.

[*Example:* Consider the DrawingML shown below.

```
1 <p:txBody>
2 ...
3 <a:p>
4 <a:r>
5 ...
6 <a:t>Text Run 1.</a:t>
7 ...
8 </a:r>
9 <a:br/>
10 <a:r>
11 ...
12 <a:t>Text Run 2.</a:t>
13 ...
14 </a:r>
15 </a:p>
16 </p:txBody>
```

17 This paragraph will have two runs of text laid out in a vertical fashion with a line break in between them. This  
18 line break acts much like a carriage return would within a normal run of text. *end example*]

Parent Elements
p (§5.1.5.2.6)

19

Child Elements	Subclause
rPr (Text Run Properties)	§5.1.5.3.9

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_TextLineBreak">
22 <sequence>
23 <element name="rPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
24 </sequence>
25 </complexType>
```

26 **5.1.5.2.2**      **defPPr (Default Paragraph Style)**

27 This element specifies the paragraph properties that are to be applied when no other paragraph properties have  
28 been specified. If this attribute is omitted, then it is left to the application to decide the set of default paragraph  
29 properties that should be applied.

30 [*Example*: Consider the DrawingML shown below.]

1 <p:txBody>  
2 ...  
3 <a:lstStyle>  
4 <a:defPPr>  
5 <a:buNone/>  
6 </a:defPPr>  
7 </a:lstStyle>  
8 <a:p>  
9 ...  
10 <a:t>Sample Text</a:t>  
11 ...  
12 </a:p>  
13 </p:txBody>

14 The above paragraph will follow the properties described in defPPr if no overriding properties are specified  
15 within the pPr element. *end example*]

16

tabLst (Tab List)	§5.1.5.2.13

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;   &lt;a:normAutofit/&gt;   &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).</p>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr defTabSz="376300" .../&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticexpialidocious</p>

Attributes	Description
	<p>Sample text Sample text Sample text supercalifragilisticexpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="t"</p></div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="ctr"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="base"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="b"</p></div></div> <pre>&lt;a:txtBody&gt; ... &lt;a:pPr fontAlgn="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt;</pre>

Attributes	Description
	<p>... &lt;/p:txBody&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div><div>Here is some text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div></div> <p>[Example: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;   ...</pre>

Attributes	Description
	<pre>       &lt;a:t&gt;Here is some...&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>     &lt;p:txBody&gt;       ...     &lt;a:p&gt;       &lt;a:pPr latinLnBrk="0" .../&gt;       ...       &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine</p>

Attributes	Description
	<p>separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre data-bbox="456 426 886 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr rtl="1" .../&gt; ...   &lt;a:t&gt;Sample text...&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

### 5.1.5.2.3 endParaRPr (End Paragraph Run Properties)

This element specifies the text run properties that are to be used if another run is inserted after the last run specified. This effectively saves the run property state so that it may be applied when the user enters additional text. If this element is omitted, then the application may determine which default properties to apply. It is recommended that this element be specified at the end of the list of text runs within the paragraph so that an orderly list is maintained.

Attributes	Description
altLang (Alternative Language)	Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute will be used

Attributes	Description
	<p>here.</p> <p>The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).</p>
b (Bold)	<p>Specifies whether a run of text will be formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.  [Example: Consider the DrawingML shown below.</p> <pre> &lt;a:p&gt; ... &lt;a:rPr b="1"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted as bold text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
baseline (Baseline)	<p>Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal to 100 percent font of the font size.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
bmk (Bookmark Link Target)	<p>Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
cap (Capitalization)	<p>Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed.</p> <p>The possible values for this attribute are defined by the ST_TextCapsType simple type (§5.1.12.64).</p>
dirty (Dirty)	<p>Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that must be checked again by the generating application for mistakes such as spelling, grammar, etc.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
err (Spelling Error)	<p>Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
i (Italics)	<p>Specifies whether a run of text will be formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[<i>Example</i>: Consider the DrawingML shown below.</p> <pre> &lt;a:p&gt; ...   &lt;a:rPr i="1"/&gt; ...   &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted as italic text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
kern (Kerning)	<p>Specifies the minimum font size at which character kerning will occur for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning will occur for all font sizes down to a 0 point font.</p> <p>The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§5.1.12.74).</p>
kumimoji (Kumimoji)	<p>Specifies whether the numbers contained within vertical text will continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lang (Language ID)	<p>Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application may select a language of its choice.</p> <p>The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).</p>
noProof (No Proofing)	<p>Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
normalizeH (Normalize Heights)	<p>Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This</p>

Attributes	Description
	<p>attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false will be assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
smtClean (SmartTag Clean)	<p>Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
smtId (SmartTag ID)	<p>Specifies the reference id for the smart tag. This id corresponds to a link within this slides relationship file. The following of this link within the relationship file will result in the actual smart tag information for this piece of text.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spc (Spacing)	<p>Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed.</p> <p>The possible values for this attribute are defined by the ST_TextPoint simple type (§5.1.12.75).</p>
strike (Strikethrough)	<p>Specifies whether a run of text will be formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre data-bbox="451 1402 922 1644"> &lt;a:p&gt; ...   &lt;a:rPr strike="sngStrike"/&gt; ...   &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted as single strikethrough text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextStrikeType simple type (§5.1.12.79).</p>
sz (Font Size)	<p>Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be</p>

Attributes	Description
	<p>1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre data-bbox="456 428 808 659">&lt;a:p&gt; ... &lt;a:rPr sz="1200"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted with a 12 point text size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).</p>
u (Underline)	<p>Specifies whether a run of text will be formatted as underlined text. If this attribute is omitted, than no underline is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre data-bbox="456 1035 808 1266">&lt;a:p&gt; ... &lt;a:rPr u="sng"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted as single underline text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§5.1.12.82).</p>

#### 5.1.5.2.4 fld (Text Field)

This element specifies a text field which contains generated text that the application should update periodically. Each piece of text when it is generated is given a unique identification number that is used to refer to a specific field. At the time of creation the text field is also specified to be of a certain type which indicates the type of text that should be used to update this field. This update type is used so that all applications that did not create this text field may still know what type of text it should be updated with. Thus the new application can then attach an update type to the text field id for continual updating.

[Example: Consider a slide within a presentation that needs to have the slide number placed on the slide. The following DrawingML may be used to describe such a situation.

```
1 <p:txBody>
2 <a:bodyPr/>
3 <a:lstStyle/>
4 <a:p>
5 <a:fld id="{424CEEAC-8F67-4238-9622-1B74DC6E8318}" type="slidenum">
6 <a:rPr lang="en-US" smtClean="0"/>
7 <a:pPr/>
8 <a:t>3</a:t>
9 </a:fld>
10 <a:endParaRPr lang="en-US"/>
11 </a:p>
12 </p:txBody>
```

13 *end example]*

14

Parent Elements
p (§5.1.5.2.6)

15

Child Elements	Subclause
pPr (Text Paragraph Properties)	§5.1.5.2.7
rPr (Text Run Properties)	§5.1.5.3.9
t (Text String)	§5.1.5.3.11

Attributes	Description
id (Field ID)	<p>Specifies the unique to this document, host specified token that is used to identify the field. This token is generated when the text field is created and persists in the file as the same token until the text field is removed. Any application should check the document for conflicting tokens before assigning a new token to a text field.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).</p>
type (Field Type)	<p>Specifies the type of update text that should be used within this text field. This is needed in addition to the text field id because a new application that did not create this document must be able to know what update should be assigned to a specific text field id.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextField">
 <sequence>
 <element name="rPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
 <element name="pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="t" type="xsd:string" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="ST_Guid" use="required"/>
 <attribute name="type" type="xsd:string" use="optional"/>
</complexType>
```

5.1.5.2.5      **lnSpc (Line Spacing)**

This element specifies the vertical line spacing that is to be used within a paragraph. This may be specified in two different ways, percentage spacing and font point spacing. If this element is omitted then the spacing between two lines of text should be determined by the point size of the largest piece of text within a line.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 <a:p>
 <a:pPr>
 <a:lnSpc>
 <a:spcPct val="200000"/>
 </a:lnSpc>
 </a:pPr>
 <a:r>
 <a:rPr lang="en-US" dirty="0" smtClean="0"/>
 <a:t>Some</a:t>
 </a:r>
 <a:br>
 <a:rPr lang="en-US" smtClean="0"/>
 </a:br>
 <a:r>
 <a:rPr lang="en-US" dirty="0" smtClean="0"/>
 <a:t>Text</a:t>
 </a:r>
 </a:p>
</p:txBody>
```

This paragraph will have two lines of text that will have percentage based vertical spacing. This kind of spacing should change based on the size of the text involved as its size is calculated as a percentage of this. *end example]*

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16);

Parent Elements
lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

1

Child Elements	Subclause
spcPct (Spacing Percent)	§5.1.5.2.10
spcPts (Spacing Points)	§5.1.5.2.11

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TextSpacing">
4 <choice>
5 <element name="spcPct" type="CT_TextSpacingPercent"/>
6 <element name="spcPts" type="CT_TextSpacingPoint"/>
7 </choice>
8 </complexType>
```

9 5.1.5.2.6 p (Text Paragraphs)

10 This element specifies the presence of a paragraph of text within the containing text body. The paragraph is the  
11 highest level text separation mechanism within a text body. A paragraph may contain text paragraph properties  
12 associated with the paragraph. If no properties are listed then properties specified in the defPPr element are  
13 used.

14 [Example: Consider the case where the user would like to describe a text body that will contain two paragraphs.  
15 The requirement for these paragraphs is that one be right aligned and the other left aligned. The following  
16 DrawingML would specify a text body such as this.

```
17 <p:txBody>
18 ...
19 <a:p>
20 <a:pPr algn="r">
21 </a:pPr>
22 ...
23 <a:t>Some text</a:t>
24 ...
25 </a:p>
26 <a:p>
27 <a:pPr algn="l">
28 </a:pPr>
29 ...
30 <a:t>Some text</a:t>
31 ...
32 </a:p>
33 </p:txBody>
```

1 *end example]*

Parent Elements
rich (§5.7.2.157); t (§5.9.3.8); txBody (§5.8.2.26); txBody (§5.1.2.1.40); txBody (§5.6.2.33); txBody (§4.4.1.47); txPr (§5.7.2.217)

2

Child Elements	Subclause
br (Text Line Break)	§5.1.5.2.1
endParaRPr (End Paragraph Run Properties)	§5.1.5.2.3
fld (Text Field)	§5.1.5.2.4
pPr (Text Paragraph Properties)	§5.1.5.2.7
r (Text Run)	§5.1.5.3.8

3 The following XML Schema fragment defines the contents of this element:

4 <complexType name="CT_TextParagraph">
5 <sequence>
6 <element name="pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_TextRun" minOccurs="0" maxOccurs="unbounded"/>
8 <element name="endParaRPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
9 </sequence>
10 </complexType>

11 5.1.5.2.7 pPr (Text Paragraph Properties)

12 This element contains all paragraph level text properties for the containing paragraph. These paragraph  
13 properties should override any and all conflicting properties that are associated with the paragraph in question.

14 [Example: Consider the DrawingML shown below.

```
15 <a:p>
16 <a:pPr marL="0" algn="ctr">
17 <a:buNone/>
18 </a:pPr>
19 ...
20 <a:t>Some Text</a:t>
21 ...
22 </a:p>
```

23 The paragraph described above will be formatting with a left margin of 0 and will have all of text runs contained  
24 within it centered about the horizontal median of the bounding box for the text body. *end example]*

25 [Note: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be  
26 examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to  
27 the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr

- 1 elements then the pPr property should take precedence because in the property hierarchy it is closer to the  
 2 actual text being represented. *end note*]

3

defTabSz (Default Tab Size)	<p data-bbox="415 1545 1458 1684">Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p data-bbox="415 1726 1461 1793"><i>[Example:</i> Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre data-bbox="451 1831 613 1890"> &lt;p:txBody&gt;   ... </pre>																								

Attributes	Description
	<pre> &lt;a:p&gt;   &lt;a:pPr defTabSz="376300" .../&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; end example] </pre> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr eaLnBrk="0" .../&gt;     ...     &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlgn="t"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlgn="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlgn="base"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlgn="b"</p> </div> </div> <pre> &lt;a:txtBody&gt; ... &lt;a:pPr fontAlgn="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt; ... &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>

Attributes	Description
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div data-bbox="446 730 976 1104"> <pre> Here is some text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample </pre> </div> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Here is some...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr latinLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; </pre>

Attributes	Description
	<pre> ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example:</i> Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt; </pre>

Attributes	Description
	<pre>&lt;a:pPr rtl="1" .../&gt; ... &lt;a:t&gt;Sample text...&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt;  end example]</pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">
 <sequence>

 <attribute name="hangingPunct" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.5.2.8 spcAft (Space After)

This element specifies the amount of vertical white space that will be present after a paragraph. This space is specified in either percentage or points via the child elements spcPct and spcPts.

[Example: Consider the DrawingML shown below.

```
1 <p:txBody>
2 ...
3 <a:p>
4 <a:pPr ...>
5 <a:spcBef>
6 <a:spcPts val="1800"/>
7 </a:spcBef>
8 <a:spcAft>
9 <a:spcPts val="600"/>
10 </a:spcAft>
11 </a:pPr>
12 ...
13 <a:t>Sample Text</a:t>
14 ...
15 </a:p>
16 ...
17 </p:txBody>
```

18 The above paragraph of text will be formatted to have a spacing both before and after the paragraph text. The  
19 spacing before will be a size of 18 points, or value=1800 and the spacing after will be a size of 6 points, or  
20 value=600. *end example*]

21

Child Elements	Subclause
spcPct (Spacing Percent)	§5.1.5.2.10
spcPts (Spacing Points)	§5.1.5.2.11

22 The following XML Schema fragment defines the contents of this element:

```
23 <complexType name="CT_TextSpacing">
24 <choice>
25 <element name="spcPct" type="CT_TextSpacingPercent"/>
26 <element name="spcPts" type="CT_TextSpacingPoint"/>
27 </choice>
28 </complexType>
```

29 **5.1.5.2.9 spcBef (Space Before)**

30 This element specifies the amount of vertical white space that will be present before a paragraph. This space is  
31 specified in either percentage or points via the child elements spcPct and spcPts.

1 [Example: Consider the DrawingML shown below.

```
2 <p:txBody>
3 ...
4 <a:p>
5 <a:pPr ...>
6 <a:spcBef>
7 <a:spcPts val="1800"/>
8 </a:spcBef>
9 <a:spcAft>
10 <a:spcPts val="600"/>
11 </a:spcAft>
12 </a:pPr>
13 ...
14 <a:t>Sample Text</a:t>
15 ...
16 </a:p>
17 ...
18 </p:txBody>
```

19 The above paragraph of text will be formatted to have a spacing both before and after the paragraph text. The  
20 spacing before will be a size of 18 points, or value=1800 and the spacing after will be a size of 6 points, or  
21 value=600. *end example*

22

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
spcPct (Spacing Percent)	§5.1.5.2.10
spcPts (Spacing Points)	§5.1.5.2.11

23 The following XML Schema fragment defines the contents of this element:

```
24 <complexType name="CT_TextSpacing">
25 <choice>
26 <element name="spcPct" type="CT_TextSpacingPercent"/>
27 <element name="spcPts" type="CT_TextSpacingPoint"/>
28 </choice>
29 </complexType>
```

5.1.5.2.10 spcPct (Spacing Percent)

This element specifies the amount of white space that is to be used between lines and paragraphs in the form of a percentage of the text size. The text size that is used to calculate the spacing here is the text for each run, with the largest text size having precedence. That is if there is a run of text with 10 point font and within the same paragraph on the same line there is a run of text with a 12 point font size then the 12 point should be used to calculate the spacing to be used.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:pPr ...>
 <a:spcBef>
 <a:spcPct val="200000"/>
 </a:spcBef>
 </a:pPr>
 ...
 <a:t>Sample Text</a:t>
 ...
</a:p>
...
</p:txBody>
```

The above paragraph of text will be formatted to have a spacing before the paragraph text. This spacing will be 200% of the size of the largest text on each line. *end example]*

Parent Elements
InSpc (§5.1.5.2.5); spcAft (§5.1.5.2.8); spcBef (§5.1.5.2.9)

Attributes	Description
val (Value)	<p>Specifies the percentage of the size that the white space should be. It is specified here in terms of 100% being equal to 100000 and 1% being specified in increments of 1000.</p> <p>The possible values for this attribute are defined by the ST_TextSpacingPercent simple type (§5.1.12.77).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacingPercent">
 <attribute name="val" type="ST_TextSpacingPercent" use="required"/>
</complexType>
```

5.1.5.2.11 spcPts (Spacing Points)

This element specifies the amount of white space that is to be used between lines and paragraphs in the form of a text point size. The size is specified using points where 100 is equal to 1 point font and 1200 is equal to 12 point.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:pPr ...>
 <a:spcBef>
 <a:spcPts val="1400"/>
 </a:spcBef>
 </a:pPr>
 ...
 <a:t>Sample Text</a:t>
 ...
</a:p>
...
</p:txBody>
```

The above paragraph of text will be formatted to have a spacing before the paragraph text. This spacing will be a size of 14 points due to val="1400". end example]

Parent Elements
InSpc (§5.1.5.2.5); spcAft (§5.1.5.2.8); spcBef (§5.1.5.2.9)

Attributes	Description
val (Value)	<p>Specifies the size of the white space in point size. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250.</p> <p>The possible values for this attribute are defined by the ST_TextSpacingPoint simple type (§5.1.12.78).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacingPoint">
 <attribute name="val" type="ST_TextSpacingPoint" use="required"/>
</complexType>
```

5.1.5.2.12 tab (Tab Stop)

This element specifies a single tab stop to be used on a line of text when there are one or more tab characters present within the text. When there is more than one present than they should be utilized in increasing position order which is specified via the pos attribute.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:pPr ...>
 <a:tabLst>
 <a:tab pos="2292350" algn="l"/>
 <a:tab pos="2627313" algn="l"/>
 <a:tab pos="2743200" algn="l"/>
 <a:tab pos="2974975" algn="l"/>
 </a:tabLst>
 </a:pPr>
 ...
 <a:t>Sample Text</a:t>
 ...
</a:p>
...
</p:txBody>
```

The paragraph within which this <a:tab> information resides will have a total of 4 unique tab stops that should be listed in order of increasing position. Along with specifying the tab position each tab allows for the specifying of an alignment. *end example*]

Parent Elements
tabLst (§5.1.5.2.13)

Attributes	Description
algn (Tab Alignment)	Specifies the alignment that is to be applied to text using this tab stop. If this attribute is omitted then the application default for the generating application.  The possible values for this attribute are defined by the ST_TextTabAlignType simple type (§5.1.12.80).
pos (Tab Position)	Specifies the position of the tab stop relative to the left margin. If this attribute is omitted then the application default for tab stops will be used.  The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextTabStop">
 <attribute name="pos" type="ST_Coordinate32" use="optional"/>
 <attribute name="align" type="ST_TextTabAlignType" use="optional"/>
</complexType>
```

5.1.5.2.13 tabLst (Tab List)

This element specifies the list of all tab stops that are to be used within a paragraph. These tabs should be used when describing any custom tab stops within the document. If these are not specified then the default tab stops of the generating application should be used.

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
tab (Tab Stop)	§5.1.5.2.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextTabStopList">
 <sequence>
 <element name="tab" type="CT_TextTabStop" minOccurs="0" maxOccurs="32"/>
 </sequence>
</complexType>
```

5.1.5.3 Run Formatting

Run level formatting is the most granular property level and allows for the specifying of all low level text properties. The text run is what all paragraphs are derived from and thus specifying various properties per run will allow for a diversely formatted text paragraph.

[Example: Consider the case where have multiple runs within a paragraph and you wish to apply bold to only one of them without having to split up the text into higher level XML groups. To do this we would simply apply the bold run property to the text run that we wish to format as shown below.

```
<a:r>
...
</a:r>
<a:r>
 <a:rPr lang="en-US" b="1" dirty="0" smtClean="0"/>
 <a:t>This text will be bold</a:t>
</a:r>
```

1       <a:r>  
2       ...  
3       </a:r>

4   *end example]*

5   5.1.5.3.1       cs (Complex Script Font)

6   This element specifies that a complex script font be used for a specific run of text. This font will be specified with  
7   a typeface attribute much like the others but will specifically be classified as a complex script font.

8   *[Example: Consider the DrawingML shown below.*

9       <a:r>  
10        <a:rPr ...>  
11         <a:cs typeface="Sample Font"/>  
12       </a:rPr>  
13       <a:t>Sample Text</a:t>  
14       </a:r>

15   The above run of text will be rendered using the complex script font "Sample Font". *end example]*

16

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); rPr (§5.1.5.3.9)

Attributes	Description
charset (Similar Character Set)	<p>Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.</p> <p>The possible values for this attribute are defined by the XML Schema byte datatype.</p>
panose (Panose Setting)	<p>Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method.</p> <p>The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).</p>
pitchFamily (Similar Font Family)	<p>Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.</p> <p>The possible values for this attribute are defined by the XML Schema byte datatype.</p>
typeface (Text Typeface)	<p>Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
 <attribute name="typeface" type="ST_TextTypeface"/>
 <attribute name="panose" type="ST_Panose" use="optional"/>
 <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
 <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

#### 5.1.5.3.2 defRPr (Default Text Run Properties)

This element contains all default run level text properties for the text runs within a containing paragraph. These properties are to be used when overriding properties have not been defined within the rPr element.

[*Example:* Consider the DrawingML shown below.

```
<a:p>
 ...
 <a:rPr u="sng"/>
 ...
 <a:t>Some Text</a:t>
 ...
</a:p>
```

The run of text described above will be formatting with a single underline of text matching color. *end example]*

#### Parent Elements

1

Attributes	Description
altLang (Alternative Language)	<p>Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute will be used here.</p> <p>The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).</p>
b (Bold)	<p>Specifies whether a run of text will be formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre>&lt;a:p&gt; ... &lt;a:rPr b="1"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted as bold text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
baseline (Baseline)	<p>Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal to 100 percent font of the font size.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
bmk (Bookmark Link Target)	<p>Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
cap (Capitalization)	<p>Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed.</p> <p>The possible values for this attribute are defined by the ST_TextCapsType simple type (§5.1.12.64).</p>
dirty (Dirty)	<p>Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that must be checked again by the generating application for mistakes such as spelling, grammar, etc.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
err (Spelling Error)	<p>Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
i (Italics)	<p>Specifies whether a run of text will be formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre data-bbox="451 1150 808 1388"> &lt;a:p&gt; ...   &lt;a:rPr i="1"/&gt; ...   &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted as italic text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
kern (Kerning)	<p>Specifies the minimum font size at which character kerning will occur for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning will occur for all font sizes down to a 0 point font.</p> <p>The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§5.1.12.74).</p>
kumimoji	Specifies whether the numbers contained within vertical text will continue vertically with

Attributes	Description
(Kumimoji)	<p>the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lang (Language ID)	<p>Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application may select a language of its choice.</p> <p>The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).</p>
noProof (No Proofing)	<p>Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
normalizeH (Normalize Heights)	<p>Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false will be assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
smtClean (SmartTag Clean)	<p>Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
smtId (SmartTag ID)	<p>Specifies the reference id for the smart tag. This id corresponds to a link within this slides relationship file. The following of this link within the relationship file will result in the actual smart tag information for this piece of text.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spc (Spacing)	<p>Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed.</p> <p>The possible values for this attribute are defined by the ST_TextPoint simple type (§5.1.12.75).</p>

Attributes	Description
<p>strike (Strikethrough)</p>	<p>Specifies whether a run of text will be formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre>&lt;a:p&gt; ... &lt;a:rPr strike="sngStrike"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted as single strikethrough text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextStrikeType simple type (§5.1.12.79).</p>
<p>sz (Font Size)</p>	<p>Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre>&lt;a:p&gt; ... &lt;a:rPr sz="1200"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted with a 12 point text size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).</p>
<p>u (Underline)</p>	<p>Specifies whether a run of text will be formatted as underlined text. If this attribute is omitted, than no underline is assumed.</p> <p>[<i>Example:</i> Consider the DrawingML shown below.</p> <pre>&lt;a:p&gt; ... &lt;a:rPr u="sng"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt;</pre>

Attributes	Description
	<p>...</p> <p><code>&lt;/a:p&gt;</code></p> <p>The above run of text will be formatted as single underline text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§5.1.12.82).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TextCharacterProperties">
 <sequence>
 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>

 <attribute name="smtId" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="bmk" type="xsd:string" use="optional"/>
</complexType>

```

#### 5.1.5.3.3 ea (East Asian Font)

This element specifies that an East Asian font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as an East Asian font.

1 [Example: Consider the DrawingML shown below.

```
2 <a:r>
3 <a:rPr ...>
4 <a:ea typeface="Sample Font"/>
5 </a:rPr>
6 <a:t>Sample Text</a:t>
7 </a:r>
```

8 The above run of text will be rendered using the East Asian font "Sample Font". *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); rPr (§5.1.5.3.9)

9

Attributes	Description
charset (Similar Character Set)	<p>Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.</p> <p>The possible values for this attribute are defined by the XML Schema byte datatype.</p>
panose (Panose Setting)	<p>Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method.</p> <p>The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).</p>
pitchFamily (Similar Font Family)	<p>Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.</p> <p>The possible values for this attribute are defined by the XML Schema byte datatype.</p>
typeface (Text Typeface)	<p>Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application.</p> <p>The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).</p>

10 The following XML Schema fragment defines the contents of this element:

```
11 <complexType name="CT_TextFont">
12 <attribute name="typeface" type="ST_TextTypeface"/>
13 <attribute name="panose" type="ST_Panose" use="optional"/>
14 <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
15 <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
16 </complexType>
```

5.1.5.3.4 highlight (Highlight Color)

This element specifies the highlight color that will be present for a run of text.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 ...
 <a:p>
 <a:r>
 <a:rPr ...>
 <a:highlight>
 <a:srgbClr val="FFFF00"/>
 </a:highlight>
 </a:rPr>
 ...
 <a:t>Sample Text</a:t>
 ...
</a:r>
</a:p>
...
</p:txBody>
```

The above run of text will have a yellow highlight color as specified by the srgbClr child element. end example]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

### 5.1.5.3.5 hlinkClick (Click Hyperlink)

Specifies the on-click hyperlink information to be applied to a run of text. When the hyperlink text is clicked the link will be fetched.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:r>
 <a:rPr ...>
 <a:hlinkClick r:id="rId2" tooltip="Some Sample Text"/>
 </a:rPr>
 ...
 <a:t>Sample Text</a:t>
 ...
</a:r>
</a:p>
...
</p:txBody>
```

The above run of text will be a hyperlink that points to the resource pointed at by rId2 within this slides relationship file. Additionally this text should display a tooltip when the mouse is hovered over the run of text.  
*end example]*

Parent Elements
cNvPr (§5.2.2.3); cNvPr (§5.8.2.7); cNvPr (§4.4.1.12); cNvPr (§5.6.2.8); cNvPr (§5.1.2.1.8); defRPr (§5.1.5.3.2); docPr (§5.5.2.5); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
snd (Hyperlink Sound)	§5.1.2.1.32

Attributes	Description
action (Action Setting)	Specifies an action that is to be taken when this hyperlink is activated. This may be used to specify a slide to be navigated to or a script of code to be run.  The possible values for this attribute are defined by the XML Schema string datatype.
endSnd (End Sounds)	Specifies if the URL in question should stop all sounds that are playing when it is clicked.  The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
highlightClick (Highlight Click)	<p>Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application may determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
history (Add Hyperlink to Page History)	<p>Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1, or true is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
id (Drawing Object Hyperlink Target)  Namespace: .../officeDocument /2006/relationships	<p>Specifies the relationship id that when looked up in this slides relationship file will contain the target of this hyperlink. This attribute cannot be omitted.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
invalidUrl (Invalid URL)	<p>Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application may still store the URL but it is known that this URL is not correct.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
tgtFrame (Target Frame)	<p>Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute will be used to determine if a new window must be launched for viewing or if an existing one may be used. If this attribute is omitted, than a new window will be opened.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
tooltip (Hyperlink Tooltip)	<p>Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, than the hyperlink text itself may be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
 <sequence>
 <element name="snd" type="CT_EmbeddedWAVAudioFile" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="optional"/>
 <attribute name="invalidUrl" type="xsd:string" use="optional" default=""/>
 <attribute name="action" type="xsd:string" use="optional" default=""/>
 <attribute name="tgtFrame" type="xsd:string" use="optional" default=""/>
 <attribute name="tooltip" type="xsd:string" use="optional" default=""/>
 <attribute name="history" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="highlightClick" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="endSnd" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.5.3.6 hlinkMouseOver (Mouse-Over Hyperlink)

Specifies the mouse-over hyperlink information to be applied to a run of text. When the mouse is hovered over this hyperlink text the link will be fetched.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 ...
 <a:p>
 <a:r>
 <a:rPr ...>
 <a:hlinkMouseOver r:id="rId2" tooltip="Some Sample Text"/>
 </a:rPr>
 ...
 <a:t>Sample Text</a:t>
 </a:r>
 </a:p>
 ...
</p:txBody>
```

The above run of text will be a hyperlink that points to the resource pointed at by rId2 within this slides relationship file. Additionally this text should display a tooltip when the mouse is hovered over the run of text.  
*end example]*

tooltip (Hyperlink Tooltip)	<p>Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, then the hyperlink text itself may be</p>

Attributes	Description
	displayed.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Hyperlink">
 <sequence>
 <element name="snd" type="CT_EmbeddedWAVAudioFile" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="optional"/>
 <attribute name="invalidUrl" type="xsd:string" use="optional" default=""/>
 <attribute name="action" type="xsd:string" use="optional" default=""/>
 <attribute name="tgtFrame" type="xsd:string" use="optional" default=""/>
 <attribute name="tooltip" type="xsd:string" use="optional" default=""/>
 <attribute name="history" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="highlightClick" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="endSnd" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

#### 5.1.5.3.7 latin (Latin Font)

This element specifies that a Latin font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as a Latin font.

[Example: Consider the DrawingML shown below.

```

<a:r>
 <a:rPr ...>
 <a:latin typeface="Sample Font"/>
 </a:rPr>
 <a:t>Sample Text</a:t>
</a:r>

```

The above run of text will be rendered using the Latin font "Sample Font". *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); rPr (§5.1.5.3.9)

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.

Attributes	Description
panose (Panose Setting)	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method.  The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application.  The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
 <attribute name="typeface" type="ST_TextTypeface"/>
 <attribute name="panose" type="ST_Panose" use="optional"/>
 <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
 <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

#### 5.1.5.3.8 r (Text Run)

This element specifies the presence of a run of text within the containing text body. The run element is the lowest level text separation mechanism within a text body. A text run may contain text run properties associated with the run. If no properties are listed then properties specified in the defRPr element are used.

[Example: Consider the case where the user would like to describe a text body that will contain two runs of text and would like one to be bold and the other not. The following DrawingML would specify such a text body.

```
<p:txBody>
 ...
 <a:r>
 <a:rPr b="1">
 </a:rPr>
 <a:t>Some text</a:t>
 </a:r>
 ...
 <a:r>
 <a:rPr/>
 <a:t>Some text</a:t>
 </a:r>
</p:txBody>
```

1 The above text body will have the first run be formatted bold and the second normally. *end example]*

Parent Elements
p (§5.1.5.2.6)

2

Child Elements	Subclause
rPr (Text Run Properties)	§5.1.5.3.9
t (Text String)	§5.1.5.3.11

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_RegularTextRun">
5 <sequence>
6 <element name="rPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
7 <element name="t" type="xsd:string" minOccurs="1" maxOccurs="1"/>
8 </sequence>
9 </complexType>

```

#### 10 5.1.5.3.9 rPr (Text Run Properties)

11 This element contains all run level text properties for the text runs within a containing paragraph.

12 *[Example: Consider the DrawingML shown below.*

```

13 <a:p>
14 ...
15 <a:rPr u="sng"/>
16 ...
17 <a:t>Some Text</a:t>
18 ...
19 </a:p>

```

20 The run of text described above will be formatting with a single underline of text matching color. *end example]*

1

Attributes	Description
altLang (Alternative Language)	<p>Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute will be used here.</p> <p>The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).</p>
b (Bold)	<p>Specifies whether a run of text will be formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre>&lt;a:p&gt; ... &lt;a:rPr b="1"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted as bold text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
baseline (Baseline)	<p>Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal</p>

Attributes	Description
	<p>to 100 percent font of the font size.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
bmk (Bookmark Link Target)	<p>Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
cap (Capitalization)	<p>Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed.</p> <p>The possible values for this attribute are defined by the ST_TextCapsType simple type (§5.1.12.64).</p>
dirty (Dirty)	<p>Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that must be checked again by the generating application for mistakes such as spelling, grammar, etc.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
err (Spelling Error)	<p>Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
i (Italics)	<p>Specifies whether a run of text will be formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 1413 808 1654"> &lt;a:p&gt; ... &lt;a:rPr i="1"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted as italic text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
kern (Kerning)	<p>Specifies the minimum font size at which character kerning will occur for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1.</p>

Attributes	Description
	<p>For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning will occur for all font sizes down to a 0 point font.</p> <p>The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§5.1.12.74).</p>
kumimoji (Kumimoji)	<p>Specifies whether the numbers contained within vertical text will continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lang (Language ID)	<p>Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application may select a language of its choice.</p> <p>The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).</p>
noProof (No Proofing)	<p>Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
normalizeH (Normalize Heights)	<p>Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false will be assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
smtClean (SmartTag Clean)	<p>Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
smtId (SmartTag ID)	<p>Specifies the reference id for the smart tag. This id corresponds to a link within this slides relationship file. The following of this link within the relationship file will result in the actual smart tag information for this piece of text.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spc (Spacing)	<p>Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the</p>

Attributes	Description
	<p>generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed.</p> <p>The possible values for this attribute are defined by the ST_TextPoint simple type (§5.1.12.75).</p>
<p>strike (Strikethrough)</p>	<p>Specifies whether a run of text will be formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 688 922 924"> &lt;a:p&gt; ... &lt;a:rPr strike="sngStrike"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted as single strikethrough text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextStrikeType simple type (§5.1.12.79).</p>
<p>sz (Font Size)</p>	<p>Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.</p> <p>[Example: Consider the DrawingML shown below.</p> <pre data-bbox="451 1365 808 1600"> &lt;a:p&gt; ... &lt;a:rPr sz="1200"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt; </pre> <p>The above run of text will be formatted with a 12 point text size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).</p>
<p>u (Underline)</p>	<p>Specifies whether a run of text will be formatted as underlined text. If this attribute is omitted, than no underline is assumed.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the DrawingML shown below.</p> <pre>&lt;a:p&gt; ... &lt;a:rPr u="sng"/&gt; ... &lt;a:t&gt;Some Text&lt;/a:t&gt; ... &lt;/a:p&gt;</pre> <p>The above run of text will be formatted as single underline text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§5.1.12.82).</p>

The following XML Schema fragment defines the contents of this element:

</complexType>
```

#### 5.1.5.3.10 sym (Symbol Font)

This element specifies that a symbol font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as a symbol font.

[Example: Consider the DrawingML shown below.

```
<a:r>
 <a:rPr ...>
 <a:sym typeface="Sample Font"/>
 </a:rPr>
 <a:t>Sample Text</a:t>
</a:r>
```

1 The above run of text will be rendered using the symbol font "Sample Font". *end example]*

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

2

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose Setting)	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method.  The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application.  The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

3 The following XML Schema fragment defines the contents of this element:

<pre> 4 &lt;complexType name="CT_TextFont"&gt; 5   &lt;attribute name="typeface" type="ST_TextTypeface"/&gt; 6   &lt;attribute name="panose" type="ST_Panose" use="optional"/&gt; 7   &lt;attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/&gt; 8   &lt;attribute name="charset" type="xsd:byte" use="optional" default="1"/&gt; 9 &lt;/complexType&gt; </pre>
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### 10 5.1.5.3.11 t (Text String)

11 This element specifies the actual text for this text run. This is the text that will be formatted using all specified  
12 body, paragraph and run properties. This element must be present within a run of text.

13 [Example: Consider the DrawingML shown below.

```
1 <p:txBody>
2 ...
3 <a:p>
4 ...
5 <a:r>
6 ...
7 <a:t>Sample Text</a:t>
8 ...
9 </a:r>
10 ...
11 </a:p>
12 ...
13 </p:txBody>
```

14 The above DrawingML specifies a text body containing a single paragraph, containing a single run which contains  
15 the actual text specified with the <a:t> element.

16 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
fld (§5.1.5.2.4); r (§5.1.5.3.8)

17 **5.1.5.3.12**      **uFill (Underline Fill)**

18 This element specifies the fill color of an underline for a run of text.

19 *[Example: Consider the DrawingML shown below.*

```
20 <p:txBody>
21 ...
22 <a:p>
23 <a:r>
24 <a:rPr ...>
25 <a:uFill>
26 <a:solidFill>
27 <a:srgbClr val="FFFF00"/>
28 </a:solidFill>
29 </a:uFill>
30 </a:rPr>
```

```
1 ...
2 <a:t>Sample Text</a:t>
3 ...
4 </a:r>
5 </a:p>
6 ...
7 </p:txBody>
```

The underline color of the above text will be yellow specified by the `srgbClr` child element. *end example*

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextUnderlineFillGroupWrapper">
 <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
</complexType>
```

**5.1.5.3.13 uFillTx (Underline Fill Properties Follow Text)**

This element specifies that the fill color of an underline for a run of text should be of the same color as the text run within which it is contained.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 ...
 <a:p>
 <a:r>
 <a:rPr ...>
 <a:uFillTx>
 </a:rPr>
 ...
```

```
<a:t>Sample Text</a:t>
...
</a:r>
</a:p>
...
</p:txBody>
```

The underline color of the above text will follow the color of the text run within which it resides. *end example]*

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextUnderlineFillFollowText"/>
```

5.1.5.3.14 uLn (Underline Stroke)

This element specifies the properties for the stroke of the underline that will be present within a run of text.

[*Example:* Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:r>
 <a:rPr ...>
 <a:uLn align="r">
 </a:rPr>
 ...
 <a:t>Sample Text</a:t>
 ...
 </a:r>
</a:p>
...
</p:txBody>
```

The underline alignment of the above text will be right aligned. *end example]*

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48

Attributes	Description
align (Stroke Alignment)	<p>Specifies the alignment to be used for the underline stroke.</p> <p>The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).</p>
cap (Line Ending Cap Type)	<p>Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, then a value of square is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).</p>
cmpd (Compound Line Type)	<p>Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.</p> <p>The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).</p>
w (Line Width)	<p>Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
 <sequence>
 <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
 <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="w" type="ST_LineWidth" use="optional"/>
 <attribute name="cap" type="ST_LineCap" use="optional"/>
 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
 <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.5.3.15 uLnTx (Underline Follows Text)

This element specifies that the stroke style of an underline for a run of text should be of the same as the text run within which it is contained.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 ...
 <a:p>
 <a:r>
 <a:rPr ...>
 <a:uLnTx>
 </a:rPr>
 ...
 <a:t>Sample Text</a:t>
 ...
</a:r>
</a:p>
...
</p:txBody>
```

The underline stroke of the above text will follow the stroke of the run text within which it resides. *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextUnderlineLineFollowText"/>
```

#### 5.1.5.4 Bullets and Numbering

In addition to the above body, paragraph and text run properties there can also be a structure of bullets and numbering that can be defined by utilizing a few of these layers. Since Bullet and Numbering does span multiple formatting levels it will be described on it's own in the following section.

##### 5.1.5.4.1 buAutoNum (Auto-Numbered Bullet)

This element specifies that automatic numbered bullet points should be applied to a paragraph. These are not just numbers used as bullet points but instead automatically assigned numbers that are based on both buAutoNum attributes and paragraph level.

*[Example: Consider the DrawingML content shown below.]*

1. Bullet 1
  1. Bullet 2
2. Bullet 3

```
<p:txBody>
...
<a:p>
 <a:pPr ...>
 <a:buAutoNum type="arabicPeriod"/>
 </a:pPr>
 ...
 <a:t>Bullet 1</a:t>
 ...
</a:p>
<a:p>
 <a:pPr lvl="1"...>
 <a:buAutoNum type="arabicPeriod"/>
 </a:pPr>
 ...
 <a:t>Bullet 2</a:t>
 ...
</a:p>
```

```
1 <a:p>
2 <a:pPr ...>
3 <a:buAutoNum type="arabicPeriod"/>
4 </a:pPr>
5 ...
6 <a:t>Bullet 3</a:t>
7 ...
8 </a:p>
9 ...
10 </p:txBody>
```

11 For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Due to  
12 this breakdown of levels, the numbering sequence that should be automatically applied will be 1, 1, 2 as is  
13 shown in the picture above. *end example]*

14

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
startAt (Start Numbering At)	<p>Specifies the number that will start number for a given sequence of automatically numbered bullets. When the numbering is alphabetical, the number should map to the appropriate letter. For instance 1 will map to 'a', 2 to 'b' and so on. If the numbers are larger than 26, then multiple letters should be used. For instance 27 should be represented as 'aa' and similarly 53 should be 'aaa'.</p> <p>The possible values for this attribute are defined by the ST_TextBulletStartAtNum simple type (§5.1.12.63).</p>
type (Bullet Autonumbering Type)	<p>Specifies the numbering scheme that is to be used. This allows for the describing of formats other than strictly numbers. For instance a set of bullets may need to be represented by a series of Roman numerals instead of the standard 1,2,3,etc. number set.</p> <p>The possible values for this attribute are defined by the ST_TextAutonumberScheme simple type (§5.1.12.61).</p>

15 The following XML Schema fragment defines the contents of this element:

```
16 <complexType name="CT_TextAutonumberBullet">
17 <attribute name="type" type="ST_TextAutonumberScheme" use="required"/>
18 <attribute name="startAt" type="ST_TextBulletStartAtNum" use="optional" default="1"/>
19 </complexType>
```

#### 5.1.5.4.2 buBlip (Picture Bullet)

This element specifies that a picture be applied to a set of bullets. This element allows for any standard picture format graphic to be used instead of the typical bullet characters. This opens up the possibility for bullets to be anything the generating application would seek to apply.

*[Example: Consider the DrawingML shown below.]*

 Bullet 1

 Bullet 2

 Bullet 3

```
<p:txBody>
 ...
 <a:p>
 <a:pPr ...>
 <a:buBlip>
 <a:blip r:embed="rId2"/>
 </a:buBlip>
 </a:pPr>
 ...
 <a:t>Bullet 1</a:t>
 ...
 </a:p>
 <a:p>
 <a:pPr lvl="1" ...>
 <a:buBlip>
 <a:blip r:embed="rId2"/>
 </a:buBlip>
 </a:pPr>
 ...
 <a:t>Bullet 2</a:t>
 ...
 </a:p>
```

```
1 <a:p>
2 <a:pPr ...>
3 <a:buBlip>
4 <a:blip r:embed="rId2"/>
5 </a:buBlip>
6 </a:pPr>
7 ...
8 <a:t>Bullet 3</a:t>
9 ...
10 </a:p>
11 ...
12 </p:txBody>
```

13 For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1".  
14 Because the same picture is specified for each bullet the levels do not stand out here. The only difference is the  
15 indentation as shown in the picture above. *end example]*

16

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
blip (Blip)	§5.1.10.13

17 The following XML Schema fragment defines the contents of this element:

```
18 <complexType name="CT_TextBlipBullet">
19 <sequence>
20 <element name="blip" type="CT_Blip" minOccurs="1" maxOccurs="1"/>
21 </sequence>
22 </complexType>
```

23 5.1.5.4.3 buChar (Character Bullet)

24 This element specifies that a character be applied to a set of bullets. These bullets are allowed to be any  
25 character in any font that the system is able to support. If no bullet font is specified along with this element then  
26 the paragraph font will be used.

27 [Example: Consider the DrawingML shown below.

g    Bullet 1  
    g    Bullet 2  
g    Bullet 3

```
1
2 <p:txBody>
3 ...
4 <a:p>
5 <a:pPr ...>
6 <a:buFont typeface="Calibri"/>
7 <a:buChar char="g"/>
8 </a:pPr>
9 ...
10 <a:t>Bullet 1</a:t>
11 ...
12 </a:p>
13 <a:p>
14 <a:pPr lvl="1"...>
15 <a:buFont typeface="Calibri"/>
16 <a:buChar char="g"/>
17 </a:pPr>
18 ...
19 <a:t>Bullet 2</a:t>
20 ...
21 </a:p>
22 <a:p>
23 <a:pPr ...>
24 <a:buFont typeface="Calibri"/>
25 <a:buChar char="g"/>
26 </a:pPr>
27 ...
28 <a:t>Bullet 3</a:t>
29 ...
30 </a:p>
31 ...
32 </p:txBody>
```

For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Because the same character is specified for each bullet the levels do not stand out here. The only difference is the indentation as shown in the picture above. *end example]*

Parent Elements

Parent Elements

defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes

Description

char (Bullet Character)  
Specifies the character to be used in place of the standard bullet point. This character may be any character for the specified font that will be supported by the system upon which this document is being viewed.

The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextCharBullet">
 <attribute name="char" type="xsd:string" use="required"/>
</complexType>
```

5.1.5.4.4 buClr (Color Specified)

This element specifies the color to be used on bullet characters within a given paragraph. The color is specified using the numerical RGB color format.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:pPr ...>
 <a:buClr>
 <a:srgbClr val="FFFF00"/>
 </a:buClr>
 </a:pPr>
 ...
 <a:t>Bullet 1</a:t>
 ...
</a:p>
...
</p:txBody>
```

The color of the above bullet will not follow the text color but instead will have a yellow color specified by val="FFFF00". This color should only apply to the actual bullet character and not to the text within the bullet.  
end example]

Parent Elements

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 5.1.5.4.5 buClrTx (Follow Text)

This element specifies that the color of the bullets for a paragraph should be of the same color as the text run within which each bullet is contained.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 ...
 <a:p>
 <a:pPr ...>
 <a:buClrTx>
 </a:pPr>
 ...
 <a:t>Bullet 1</a:t>
 ...
 </a:p>
 ...
</p:txBody>
```

The color of the above bullet will follow the default text color of the text for the run of text shown above since no specific text color was specified. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

1 The following XML Schema fragment defines the contents of this element:

2 `<complexType name="CT_TextBulletColorFollowText"/>`

### 3 5.1.5.4.6 buFont (Specified)

4 This element specifies the font to be used on bullet characters within a given paragraph. The font is specified  
5 using the typeface that it is registered as within the generating application.

6 *[Example: Consider the DrawingML shown below.*

```

7 <p:txBody>
8 ...
9 <a:p>
10 <a:pPr ...>
11 <a:buFont typeface="Arial"/>
12 <a:buChar char="g"/>
13 </a:pPr>
14 ...
15 <a:t>Bullet 1</a:t>
16 ...
17 </a:p>
18 ...
19 </p:txBody>
```

20 The font of the above bullet will not follow the text font but instead will have Arial font specified by  
21 typeface="Arial". This font should only apply to the actual bullet character and not to the text within the bullet.  
22 *end example]*

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

23

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose)	Specifies the panose standard setting that will be used to determine the closest matching

Attributes	Description
Setting)	font by any generating application that employs this method.  The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application.  The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
 <attribute name="typeface" type="ST_TextTypeface"/>
 <attribute name="panose" type="ST_Panose" use="optional"/>
 <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
 <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

#### 5.1.5.4.7 buFontTx (Follow text)

This element specifies that the font of the bullets for a paragraph should be of the same font as the text run within which each bullet is contained.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
 ...
 <a:p>
 <a:pPr ...>
 <a:buFontTx>
 </a:pPr>
 ...
 <a:t>Bullet 1</a:t>
 ...
 </a:p>
 ...
</p:txBody>
```

The font of the above bullet will follow the default text font of the text for the run of text shown above since no specific text font was specified. *end example*]

Parent Elements

defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16);  
lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21);  
pPr (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBulletTypefaceFollowText"/>
```

5.1.5.4.8 buNone (No Bullet)

This element specifies that the paragraph within which it is applied is to have no bullet formatting applied to it. That is to say that there should be no bulleting found within the paragraph where this element is specified.

[Example: Consider the DrawingML shown below.

```
<p:txBody>
...
<a:p>
 <a:pPr ...>
 <a:buNone/>
 </a:pPr>
 ...
 <a:t>Bullet 1</a:t>
 ...
</a:p>
...
</p:txBody>
```

The above paragraph will be formatted with no bullets. *end example*]

Parent Elements

defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16);  
lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21);  
pPr (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextNoBullet"/>
```

5.1.5.4.9 buSzPct (Bullet Size Percentage)

This element specifies the size in percentage of the surrounding text to be used on bullet characters within a given paragraph. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal to 100 percent font of the font size.

[Example: Consider the DrawingML shown below.

```
1 <p:txBody>
2 ...
3 <a:p>
4 <a:pPr ...>
5 <a:buSzPct val="111000"/>
6 </a:pPr>
7 ...
8 <a:t>Bullet 1</a:t>
9 ...
10 </a:p>
11 ...
12 </p:txBody>
```

13 The size of the above bullet will follow the text size in that it will always be rendered at 111% the size of the text  
14 within the given text run. This is specified by val="111000", with a restriction on the values not being less than  
15 25% or more than 400%. A value of 100000 is equal to 100%, similarly a value of 1000 is equal to 1%. This  
16 percentage size should only apply to the actual bullet character and not to the text within the bullet. *end*  
17 *example]*

18

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
val (Value)	<p>Specifies the percentage of the text size that this bullet should be. It is specified here in terms of 100% being equal to 100000 and 1% being specified in increments of 1000. This attribute should not be lower than 25%, or 25000 and not be higher than 400%, or 400000.</p> <p>The possible values for this attribute are defined by the ST_TextBulletSizePercent simple type (§5.1.12.62).</p>

19 The following XML Schema fragment defines the contents of this element:

```
20 <complexType name="CT_TextBulletSizePercent">
21 <attribute name="val" type="ST_TextBulletSizePercent"/>
22 </complexType>
```

23 **5.1.5.4.10 buSzPts (Bullet Size Points)**

24 This element specifies the size in points to be used on bullet characters within a given paragraph. The size is  
25 specified using the points where 100 is equal to 1 point font and 1200 is equal to 12 point font.

26 *[Example: Consider the DrawingML shown below.*

```
1 <p:txBody>
2 ...
3 <a:p>
4 <a:pPr ...>
5 <a:buSzPts val="1400"/>
6 </a:pPr>
7 ...
8 <a:t>Bullet 1</a:t>
9 ...
10 </a:p>
11 ...
12 </p:txBody>
```

13 The size of the above bullet will not follow the text size of the text within the given text run. The bullets size is  
14 specified by val="1400", which corresponds to a point size of 14. This bullet size should only apply to the actual  
15 bullet character and not to the text within the bullet. *end example]*

16

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
val (Value)	Specifies the size of the bullets in point size. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250.  The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).

17 The following XML Schema fragment defines the contents of this element:

```
18 <complexType name="CT_TextBulletSizePoint">
19 <attribute name="val" type="ST_TextFontSize"/>
20 </complexType>
```

21 5.1.5.4.11 buSzTx (Bullet Size Follows Text)

22 This element specifies that the size of the bullets for a paragraph should be of the same point size as the text run  
23 within which each bullet is contained.

24 [Example: Consider the DrawingML shown below.

```
1 <p:txBody>
2 ...
3 <a:p>
4 <a:pPr ...>
5 <a:buSzTx>
6 </a:pPr>
7 ...
8 <a:t>Bullet 1</a:t>
9 ...
10 </a:p>
11 ...
12 </p:txBody>
```

13 The size of the above bullet will follow the default text size of the text for the run of text shown above since no  
14 specific text size was specified. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

 </sequence>
</complexType>
```

5.1.5.4.13 lvl1pPr (List Level 1 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="0". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl1pPr and thus create a paragraph of text that has no bullets and is right aligned.

```

1 <p:txBody>
2 ...
3 <a:lstStyle>
4 <a:lvl1pPr align="r">
5 <a:buNone/>
6 </a:lvl1pPr>
7 </a:lstStyle>
8 <a:p>
9 <a:pPr lvl="0">
10 </a:pPr>
11 ...
12 <a:t>Some text</a:t>
13 ...
14 </a:p>
15 </p:txBody>

```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
algn (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400" .../&gt;   &lt;a:normAutofit/&gt;   &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).</p>
<p>defTabSz (Default Tab Size)</p>	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[<i>Example:</i> Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre data-bbox="454 724 966 1018">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr defTabSz="376300" .../&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
<p>eaLnBrk (East Asian Line Break)</p>	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre data-bbox="454 1753 868 1879">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;</pre>

Attributes	Description
	<pre> ... &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticexpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticexpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[<i>Example:</i> Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlgn="t"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlgn="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlgn="base"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlgn="b"</p> </div> </div> <pre> &lt;a:txtBody&gt; ... &lt;a:pPr fontAlgn="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; </pre>

Attributes	Description
	<pre>&lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;0&lt;/a:t&gt; &lt;/a:r&gt; ... &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div><div>Here is some Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample</div><div>text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre>&lt;p:txBody&gt;</pre>

Attributes	Description
	<pre> &lt;a:bodyPr numCol="2" spcCol="914400" .../&gt;   &lt;a:normAutofit/&gt;   &lt;/a:bodyPr&gt;  ... &lt;a:p&gt;   &lt;a:pPr marL="0" indent="571500" algn="just"&gt;     &lt;a:buNone/&gt;   &lt;/a:pPr&gt;   ...   &lt;a:t&gt;Here is some...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr latinLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p>

Attributes	Description
	<p>Sample text Sample text Sample text supercalifragilisticexpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt; ...   &lt;a:t&gt;Sample text&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR</p>

Attributes	Description
	<p>attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre data-bbox="451 724 889 1029"> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr rtl="1" .../&gt;     ...     &lt;a:t&gt;Sample text...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

</complexType>
```

#### 5.1.5.4.14 lvl2pPr (List Level 2 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="1"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

*[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl2pPr` and thus create a paragraph of text that has no bullets and is right aligned.]*

```
<p:txBody>
 ...
 <a:lstStyle>
 <a:lvl2pPr algn="r">
 <a:buNone/>
 </a:lvl2pPr>
 </a:lstStyle>
```

```

1 <a:p>
2 <a:pPr lvl="1">
3 </a:pPr>
4 ...
5 <a:t>Some text</a:t>
6 ...
7 </a:p>
8 </p:txBody>

```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;   &lt;a:normAutofit/&gt;   &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).</p>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre>&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr defTabSz="376300" .../&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p>

Attributes	Description
	<p>Sample text Sample text Sample text supercalifragilisticexpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="t"</p></div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="ctr"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="base"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="b"</p></div></div> <pre>&lt;a:txtBody&gt; ... &lt;a:pPr fontAlgn="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt;</pre>

Attributes	Description
	<p>...</p> <p>&lt;/p:txBody&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div><div>Here is some text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div></div> <p>[Example: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;   ...</pre>

Attributes	Description
	<pre>       &lt;a:t&gt;Here is some...&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>     &lt;p:txBody&gt;       ...     &lt;a:p&gt;       &lt;a:pPr latinLnBrk="0" .../&gt;       ...       &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine</p>

Attributes	Description
	<p>separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt; ...   &lt;a:t&gt;Sample text&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre data-bbox="454 428 889 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr rtl="1" .../&gt; ...   &lt;a:t&gt;Sample text...&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

5.1.5.4.15      **lvl3pPr (List Level 3 Text Style)**

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="2"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example:* Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl3pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
...
<a:l1stStyle>
 <a:lvl3pPr algn="r">
 <a:buNone/>
 </a:lvl3pPr>
</a:l1stStyle>
<a:p>
 <a:pPr lvl="2">
 </a:pPr>
 ...
 <a:t>Some text</a:t>
 ...
</a:p>
</p:txBody>
```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the `pPr` element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the `pPr` and `lvl1pPr` elements then the `pPr` property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

#### 5.1.5.4.16 lvl4pPr (List Level 4 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="3"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

*[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl4pPr` and thus create a paragraph of text that has no bullets and is right aligned.]*

```
<p:txBody>
 ...
 <a:lstStyle>
 <a:lvl4pPr algn="r">
 <a:buNone/>
 </a:lvl4pPr>
 </a:lstStyle>
```

```

1 <a:p>
2 <a:pPr lvl="3">
3 </a:pPr>
4 ...
5 <a:t>Some text</a:t>
6 ...
7 </a:p>
8 </p:txBody>

```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;   &lt;a:normAutofit/&gt;   &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).</p>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr defTabSz="376300" .../&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticexpialidocious</p>

Attributes	Description
	<p>Sample text Sample text Sample text supercalifragilisticexpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="t"</p></div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="ctr"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="base"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="b"</p></div></div> <pre>&lt;a:txtBody&gt; ... &lt;a:pPr fontAlgn="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt;</pre>

Attributes	Description																								
	<p>...</p> <p>&lt;/p:txBody&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>																								
<p>hangingPunct (Hanging Punctuation)</p>	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																								
<p>indent (Indent)</p>	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div data-bbox="446 987 976 1360"> <table> <tr> <td>Here is some</td> <td>text Sample text</td> </tr> <tr> <td>Sample text Sample</td> <td>Sample text Sample</td> </tr> <tr> <td>text Sample text</td> <td>text Sample text</td> </tr> <tr> <td>Sample text Sample</td> <td>Sample text Sample</td> </tr> <tr> <td>text Sample text</td> <td>text Sample text</td> </tr> <tr> <td>Sample text Sample</td> <td>Sample text</td> </tr> <tr> <td>text Sample text</td> <td></td> </tr> <tr> <td>Sample text Sample</td> <td></td> </tr> <tr> <td>text Sample text</td> <td></td> </tr> <tr> <td>Sample text Sample</td> <td></td> </tr> <tr> <td>text Sample text</td> <td></td> </tr> <tr> <td>Sample text Sample</td> <td></td> </tr> </table> </div> <p>[Example: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;   ... </pre>	Here is some	text Sample text	Sample text Sample	Sample text Sample	text Sample text	text Sample text	Sample text Sample	Sample text Sample	text Sample text	text Sample text	Sample text Sample	Sample text	text Sample text		Sample text Sample		text Sample text		Sample text Sample		text Sample text		Sample text Sample

Attributes	Description
	<pre>       &lt;a:t&gt;Here is some...&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>     &lt;p:txBody&gt;       ...     &lt;a:p&gt;       &lt;a:pPr latinLnBrk="0" .../&gt;       ...       &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine</p>

Attributes	Description
	<p>separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre data-bbox="451 426 889 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr rtl="1" .../&gt; ...   &lt;a:t&gt;Sample text...&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

5.1.5.4.17      **lvl5pPr (List Level 5 Text Style)**

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="4"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example:* Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl5pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
...
<a:lstStyle>
 <a:lvl5pPr algn="r">
 <a:buNone/>
 </a:lvl5pPr>
</a:lstStyle>
<a:p>
 <a:pPr lvl="4">
 </a:pPr>
 ...
 <a:t>Some text</a:t>
 ...
</a:p>
</p:txBody>
```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the `pPr` element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the `pPr` and `lvl1pPr` elements then the `pPr` property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[<i>Example</i>: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p>

Attributes	Description
	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlign="t"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlign="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlign="base"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlign="b"</p> </div> </div> <pre> &lt;a:txtBody&gt; ... &lt;a:pPr fontAlign="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt; ... &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p>

Attributes	Description
	<p>Here is some text Sample text  Sample text Sample text Sample  text Sample text text Sample text  Sample text Sample text Sample  text Sample text text Sample text  Sample text Sample text  text Sample text  Sample text Sample  text Sample text  Sample text Sample  text Sample text  Sample text Sample</p> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400" .../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Here is some...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it</p>

Attributes	Description
	<p>may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre data-bbox="451 426 1063 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr latinLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[Example: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre data-bbox="451 1444 868 1749">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>[Note: To resolve conflicting paragraph properties the linear hierarchy of paragraph</p>

Attributes	Description
	<p>properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr rtl="1" .../&gt;     ...     &lt;a:t&gt;Sample text...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

#### 5.1.5.4.18 lvl6pPr (List Level 6 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="5"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example:* Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl6pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
 ...
 <a:lstStyle>
 <a:lvl6pPr algn="r">
 <a:buNone/>
 </a:lvl6pPr>
 </a:lstStyle>
```

```

1 <a:p>
2 <a:pPr lvl="5">
3 </a:pPr>
4 ...
5 <a:t>Some text</a:t>
6 ...
7 </a:p>
8 </p:txBody>

```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
align (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div><div>Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text</div></div> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;   &lt;a:normAutofit/&gt;   &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).</p>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr defTabSz="376300" .../&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticexpialidocious</p>

Attributes	Description
	<p>Sample text Sample text Sample text supercalifragilisticexpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[Example: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p> <div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="t"</p></div><div><math display="block">\text{H}^2\text{O}</math><p>fontAlgn="ctr"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="base"</p></div><div><math display="block">\text{H}_2\text{O}</math><p>fontAlgn="b"</p></div></div> <pre>&lt;a:txtBody&gt; ... &lt;a:pPr fontAlgn="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt;</pre>

Attributes	Description
	<p>...</p> <p>&lt;/p:txBody&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div><div>Here is some text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div><div>Sample text Sample text Sample text</div></div> <p>[Example: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;   ...</pre>

Attributes	Description
	<pre>       &lt;a:t&gt;Here is some...&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>     &lt;p:txBody&gt;       ...     &lt;a:p&gt;       &lt;a:pPr latinLnBrk="0" .../&gt;       ...       &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine</p>

Attributes	Description
	<p>separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre data-bbox="451 426 889 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr rtl="1" .../&gt; ...   &lt;a:t&gt;Sample text...&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

5.1.5.4.19      **lvl7pPr (List Level 7 Text Style)**

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="6"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example:* Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl7pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
...
<a:lstStyle>
 <a:lvl7pPr algn="r">
 <a:buNone/>
 </a:lvl7pPr>
</a:lstStyle>
<a:p>
 <a:pPr lvl="6">
 </a:pPr>
 ...
 <a:t>Some text</a:t>
 ...
</a:p>
</p:txBody>
```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the `pPr` element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the `pPr` and `lvl1pPr` elements then the `pPr` property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
algn (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;</pre>

Attributes	Description
	<pre> &lt;a:normAutofit/&gt; &lt;/a:bodyPr&gt;  ... &lt;a:p&gt;   &lt;a:pPr marL="0" algn="just"&gt;     &lt;a:buNone/&gt;   &lt;/a:pPr&gt;   ...   &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; end example]  The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59). </pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[Example: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr defTabSz="376300" .../&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; end example]  The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17). </pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[<i>Example</i>: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p>

Attributes	Description
	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlign="t"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlign="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlign="base"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlign="b"</p> </div> </div> <pre> &lt;a:txtBody&gt; ... &lt;a:pPr fontAlign="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;0&lt;/a:t&gt; &lt;/a:r&gt; ... &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p>

Attributes	Description
	<p>Here is some text Sample text  Sample text Sample text Sample  text Sample text text Sample text  Sample text Sample text Sample  text Sample text text Sample text  Sample text Sample text  text Sample text  Sample text Sample  text Sample text  Sample text Sample  text Sample text  Sample text Sample</p> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400" .../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Here is some...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it</p>

Attributes	Description
	<p>may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre data-bbox="451 426 1063 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr latinLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre data-bbox="451 1444 873 1749">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph</p>

Attributes	Description
	<p>properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example:</i> Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr rtl="1" .../&gt;     ...     &lt;a:t&gt;Sample text...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

#### 5.1.5.4.20 lvl8pPr (List Level 8 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="7"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lvl2pPr` should come before `lvl3pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

*[Example: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lvl8pPr` and thus create a paragraph of text that has no bullets and is right aligned.]*

```
<p:txBody>
 ...
 <a:lstStyle>
 <a:lvl8pPr algn="r">
 <a:buNone/>
 </a:lvl8pPr>
 </a:lstStyle>
 <a:p>
 <a:pPr lvl="7">
 </a:pPr>
 ...
```

```
<a:t>Some text</a:t>
...
</a:p>
</p:txBody>
```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
	<p>...</p> <p>&lt;/p:txBody&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p> <div data-bbox="446 987 976 1360"> <pre> Here is some text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample text Sample text text Sample text Sample text Sample text Sample </pre> </div> <p>[Example: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" algn="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;   ... </pre>

Attributes	Description
	<pre>       &lt;a:t&gt;Here is some...&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre>     &lt;p:txBody&gt;       ...     &lt;a:p&gt;       &lt;a:pPr latinLnBrk="0" .../&gt;       ...       &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;       ...     &lt;/a:p&gt;   &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine</p>

Attributes	Description
	<p>separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr rtl="1" .../&gt; ...   &lt;a:t&gt;Sample text...&lt;/a:t&gt; ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

26 </complexType>

```

5.1.5.4.21 **lv19pPr (List Level 9 Text Style)**

This element specifies all paragraph level text properties for all elements that have the attribute `lvl="8"`. There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is `lv12pPr` should come before `lv13pPr`. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example:* Consider the following DrawingML code that would specify a paragraph to follow the level style defined in `lv19pPr` and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
...
<a:lstStyle>
 <a:lv19pPr algn="r">
 <a:buNone/>
 </a:lv19pPr>
</a:lstStyle>
<a:p>
 <a:pPr lvl="8">
 </a:pPr>
 ...
 <a:t>Some text</a:t>
 ...
</a:p>
</p:txBody>
```

*end example]*

[*Note:* To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the `pPr` element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the `pPr` and `lv11pPr` elements then the `pPr` property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note]*

Attributes	Description
algn (Alignment)	<p>Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.</p> <div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div><div>Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample Sample text text Sample</div></div> <hr/> <p>[<i>Example:</i> Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.</p> <pre>&lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400".../&gt;</pre>

Attributes	Description
	<pre>       &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;      ...     &lt;a:p&gt;       &lt;a:pPr marL="0" algn="just"&gt;         &lt;a:buNone/&gt;       &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;  end example]  The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59). </pre>
defTabSz (Default Tab Size)	<p>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</p> <p>[Example: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.</p> <pre> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr defTabSz="376300" .../&gt;     ...     &lt;a:t&gt;Sample Text ...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt;  end example]  The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17). </pre>
eaLnBrk (East Asian Line Break)	<p>Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre> &lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr eaLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fontAlgn (Font Alignment)	<p>Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.</p> <p>[<i>Example</i>: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.</p>

Attributes	Description
	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlign="t"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}^2\text{O}</math> <p>fontAlign="ctr"</p> </div> </div> <div style="display: flex; justify-content: space-around; align-items: flex-start; margin-top: 20px;"> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlign="base"</p> </div> <div style="text-align: center;"> <math display="block">\text{H}_2\text{O}</math> <p>fontAlign="b"</p> </div> </div> <pre> &lt;a:txtBody&gt; ... &lt;a:pPr fontAlign="b" .../&gt; ... &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;H &lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr sz="1200" .../&gt;   &lt;a:t&gt;2&lt;/a:t&gt; &lt;/a:r&gt; &lt;a:r&gt;   &lt;a:rPr .../&gt;   &lt;a:t&gt;O&lt;/a:t&gt; &lt;/a:r&gt; ... &lt;/p:txBody&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).</p>
hangingPunct (Hanging Punctuation)	<p>Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indent)	<p>Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.</p>

Attributes	Description
	<p>Here is some text Sample text  Sample text Sample text Sample  text Sample text text Sample text  Sample text Sample text Sample  text Sample text text Sample text  Sample text Sample text  text Sample text  Sample text Sample text  text Sample text  Sample text Sample</p> <p>[<i>Example:</i> Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.</p> <pre> &lt;p:txBody&gt;   &lt;a:bodyPr numCol="2" spcCol="914400" .../&gt;     &lt;a:normAutofit/&gt;     &lt;/a:bodyPr&gt;   ...   &lt;a:p&gt;     &lt;a:pPr marL="0" indent="571500" align="just"&gt;       &lt;a:buNone/&gt;     &lt;/a:pPr&gt;     ...     &lt;a:t&gt;Here is some...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p>By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).</p>
latinLnBrk (Latin Line Break)	<p>Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.</p> <p>[<i>Example:</i> Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it</p>

Attributes	Description
	<p>may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.</p> <pre data-bbox="451 426 1063 730">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr latinLnBrk="0" .../&gt;   ...   &lt;a:t&gt;Sample text (Long word)&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p>Sample text Sample text Sample text supercalifr agilisticxpialidocious</p> <p>Sample text Sample text Sample text supercalifragilisticxpialidocious</p> <p style="text-align: right;"><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lvl (Level)	<p>Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.</p> <p>[<i>Example:</i> Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.</p> <pre data-bbox="451 1444 873 1749">&lt;p:txBody&gt; ... &lt;a:p&gt;   &lt;a:pPr lvl="1" .../&gt;   ...   &lt;a:t&gt;Sample text&lt;/a:t&gt;   ... &lt;/a:p&gt; &lt;/p:txBody&gt;</pre> <p><i>end example]</i></p> <p>[<i>Note:</i> To resolve conflicting paragraph properties the linear hierarchy of paragraph</p>

Attributes	Description
	<p>properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).</p>
marL (Left Margin)	<p>Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
marR (Right Margin)	<p>Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied.</p> <p>The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).</p>
rtl (Right To Left)	<p>Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.</p> <p>[<i>Example</i>: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.</p> <pre> &lt;p:txBody&gt;   ...   &lt;a:p&gt;     &lt;a:pPr rtl="1" .../&gt;     ...     &lt;a:t&gt;Sample text...&lt;/a:t&gt;     ...   &lt;/a:p&gt; &lt;/p:txBody&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

### 5.1.6 Tables

This section contains information regarding the definition of a table within DrawingML. The following image is an example table within DrawingML.

text	text	text	text	text
text	text	text	text	text
text	text	text	text	text
text	text	text	text	text
text	text	text	text	text

### 5.1.6.1 cell3D (Cell 3-D)

This element specifies a set of properties which dictate the 3-D appearance of a given cell in a table. Collectively, these properties are referred to as a cell 3-D. The application of these properties occurs on a per-cell basis in the table.

Parent Elements
tcPr (§5.1.6.15); tcStyle (§5.1.4.2.29)

Child Elements	Subclause
bevel (Bevel)	§5.1.4.2.5
extLst (Extension List)	§5.1.2.1.15
lightRig (Light Rig)	§5.1.7.9

Attributes	Description
prstMaterial (Preset Material)	Specifies a material type which will be used to define the material characteristics of the cell. The material properties, combined with the lighting characteristics of the scene in define the final look and feel of the 3-D appearance of the cell.  The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§5.1.12.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell3D">
 <sequence>
 <element name="bevel" type="CT_Bevel" minOccurs="1" maxOccurs="1"/>
 <element name="lightRig" type="CT_LightRig" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="prstMaterial" type="ST_PresetMaterialType" use="optional" default="plastic"/>
</complexType>
```

### 5.1.6.2 gridCol (Table Grid Column)

This element specifies the width of a given column within a table. For each column in a table, there will be an associated table grid column defining the width of the column.

[*Example:* Consider the following example of a table grid containing widths defined for three table grid columns:

```
<a:tblGrid>
 <a:gridCol w="1117600"/>
 <a:gridCol w="1117600"/>
```

1     <a:gridCol w="1117600"/>  
2     </a:tblGrid>

3     *end example]*

4

Parent Elements
tblGrid (§5.1.6.12)

5

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

6

Attributes	Description
w (Width)	The width of the column in EMUs.  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

7     The following XML Schema fragment defines the contents of this element:

8     <complexType name="CT_TableCol"> 9         <sequence> 10             <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/> 11         </sequence> 12         <attribute name="w" type="ST_Coordinate" use="required"/> 13     </complexType>
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

14     5.1.6.3         lnB (Bottom Border Line Properties)

15     This element defines the line properties associated with the bottom border of a given cell.

16     [Example: Consider the following example of a bottom border line properties element within DrawingML:

17     <a:lnB w="38100" cap="flat" cmpd="sng" algn="ctr">  
18         <a:solidFill>  
19             <a:schemeClr val="accent2"/>  
20         </a:solidFill>  
21         <a:prstDash val="solid"/>  
22         <a:round/>  
23         <a:headEnd type="none" w="med" len="med"/>  
24         <a:tailEnd type="none" w="med" len="med"/>  
25     </a:lnB>

- 1 In this example, one can see that the bottom border line style defined with certain properties, such as a flat end  
 2 line cap, a given width, head and tail end, color, etc. *end example*]

3

Parent Elements
tcPr (§5.1.6.15)

4

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48
round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke.  The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed.  The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.  The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.  The possible values for this attribute are defined by the ST_LineWidth simple type

Attributes	Description
	(§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_LineProperties">
 <sequence>
 <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
 <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="w" type="ST_LineWidth" use="optional"/>
 <attribute name="cap" type="ST_LineCap" use="optional"/>
 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
 <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>

```

#### 5.1.6.4 lnBlToTr (Bottom-Left to Top-Right Border Line Properties)

This element defines the line properties associated with the diagonal line from the bottom left corner of the cell to the top right corner.

[Example: Consider the following example of a lnBlToTr within DrawingML:

```

<a:lnBlToTr w="38100" cap="flat" cmpd="sng" algn="ctr">
 <a:solidFill>
 <a:schemeClr val="accent2"/>
 </a:solidFill>
 <a:prstDash val="solid"/>
 <a:round/>
 <a:headEnd type="none" w="med" len="med"/>
 <a:tailEnd type="none" w="med" len="med"/>
</a:lnBlToTr >

```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Parent Elements
tcPr (§5.1.6.15)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21

Attributes	Description
align (Stroke Alignment)	<p>Specifies the alignment to be used for the underline stroke.</p> <p>The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).</p>
cap (Line Ending Cap Type)	<p>Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, then a value of square is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).</p>
cmpd (Compound Line Type)	<p>Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.</p> <p>The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).</p>
w (Line Width)	<p>Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.</p> <p>The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
 <sequence>
 <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
 <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="w" type="ST_LineWidth" use="optional"/>
 <attribute name="cap" type="ST_LineCap" use="optional"/>
 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
 <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

### 5.1.6.5 lnL (Left Border Line Properties)

This element defines the line properties associated with the left border of a cell

[Example: Consider the following example of a lnL within DrawingML:

```
<a:lnL w="38100" cap="flat" cmpd="sng" algn="ctr">
 <a:solidFill>
 <a:schemeClr val="accent2"/>
 </a:solidFill>
 <a:prstDash val="solid"/>
 <a:round/>
 <a:headEnd type="none" w="med" len="med"/>
 <a:tailEnd type="none" w="med" len="med"/>
</a:lnL >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example]*

tailEnd (Tail line end style)	§5.1.10.57

1

Attributes	Description
align (Stroke Alignment)	Specifies the alignment to be used for the underline stroke.  The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, then a value of square is assumed.  The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.  The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.  The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_LineProperties">
4 <sequence>
5 <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
6 <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
8 <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
9 <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
10 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
11 </sequence>
12 <attribute name="w" type="ST_LineWidth" use="optional"/>
13 <attribute name="cap" type="ST_LineCap" use="optional"/>
14 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
15 <attribute name="align" type="ST_PenAlignment" use="optional"/>
16 </complexType>

```

### 5.1.6.6 lnR (Right Border Line Properties)

This element defines the line properties associated with right border of a cell.

[Example: Consider the following example of a lnR within DrawingML:

```
<a:lnR w="38100" cap="flat" cmpd="sng" algn="ctr">
 <a:solidFill>
 <a:schemeClr val="accent2"/>
 </a:solidFill>
 <a:prstDash val="solid"/>
 <a:round/>
 <a:headEnd type="none" w="med" len="med"/>
 <a:tailEnd type="none" w="med" len="med"/>
</a:lnR >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*

Parent Elements
tcPr (§5.1.6.15)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9

 </sequence>
 <attribute name="w" type="ST_LineWidth" use="optional"/>
 <attribute name="cap" type="ST_LineCap" use="optional"/>
 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
 <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>

```

#### 5.1.6.8 lnTlToBr (Top-Left to Bottom-Right Border Line Properties)

This element defines the line properties associated with the diagonal line from the top left corner of the cell to the bottom right corner.

[Example: Consider the following example of a lnTlToBr within DrawingML:

```

<a:lnTlToBr w="38100" cap="flat" cmpd="sng" algn="ctr">
 <a:solidFill>
 <a:schemeClr val="accent2"/>
 </a:solidFill>
 <a:prstDash val="solid"/>
 <a:round/>
 <a:headEnd type="none" w="med" len="med"/>
 <a:tailEnd type="none" w="med" len="med"/>
</a:lnTlToBr>

```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example]*

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
 <sequence>
 <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
 <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="w" type="ST_LineWidth" use="optional"/>
 <attribute name="cap" type="ST_LineCap" use="optional"/>
 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
 <attribute name="align" type="ST_PenAlignment" use="optional"/>
</complexType>
```

### 5.1.6.9 tableStyle (Table Style)

This element specifies a particular table style. Fourteen elements make up the styling information of a given table style. These fourteen elements work together to provide visual formatting options for on/off states of the following toggles:

- First row on/off - Associated element: firstRow
- Last row on/off - Associated element: lastRow
- First column on/off - Associated element: firstCol
- Last column on/off - Associated element: lastCol
- Row banding on/off - Associated elements: band1H, band2H
- Column banding on/off - Associated elements: band1V, band2V

The formatting associated with the wholeTbl element defines the table formatting when all options are off. When an option is turned on, the formatting for that particular option is applied to the table. The four cell specific formatting options are enabled when overlapping options are toggled on. For example, when the first row, and first column formatting options are enabled, any formatting within the northwest cell will also be applied since that is the overlapping table cell when both first column and first row formatting options are on.

[Example: Consider the following partial example of a tblStyle within DrawingML:

```
<a:tblStyle styleId="{5940675A-B579-460E-94D1-54222C63F5DA}"
 styleName="No Style, Table Grid">
 <a:wholeTbl>
 <a:tcTxStyle>
 <a:fontRef idx="minor">
 <a:scrgbClr r="0" g="0" b="0"/>
 </a:fontRef>
```

```
1 <a:schemeClr val="tx1"/>
2 </a:tcTxStyle>
3 <a:tcStyle>
4 <a:tcBdr>
5 <a:left>
6 <a:ln w="12700" cmpd="sng">
7 <a:solidFill>
8 <a:schemeClr val="tx1"/>
9 </a:solidFill>
10 </a:ln>
11 </a:left>
```

12 ...right, top, bottom, insideH, insideV border information is defined just as the 'left' tag...

```
13 </a:tcBdr>
14 <a:fill>
15 <a:noFill/>
16 </a:fill>
17 </a:tcStyle>
18 </a:wholeTbl>
19 <a:band1H>
20 <a:tcStyle>
21 <a:tcBdr/>
22 </a:tcStyle>
23 </a:band1H>
```

24 ...band2H, band1V, band2V, firstCol, firstRow, lastCol, lastRow, neCell, nwCell, seCell, swCell tags are all defined  
25 just as the 'band1H' tag

26 </a:tblStyle>

27 In this example, one can get an idea for the definition of a table style in its entirety. The above defined table  
28 style will create a style with only 1pt line formatting applied to all of the cells in a table. Notice that the on/off  
29 toggle formatting (band1H, band2H, firstCol, etc) do not define any formatting and therefore have no effect to  
30 the table when toggled. *end example*]

31

Attributes	Description
styleId (Style ID)	<p>Specifies a GUID identifying the table style in a unique manner.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).</p>
styleName (Name)	<p>Specifies the name of the table style which can show up in the user interface identifying the style to a user.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyle">
 <sequence>
 <element name="tblBg" type="CT_TableBackgroundStyle" minOccurs="0" maxOccurs="1"/>
 <element name="wholeTbl" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="band1H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="band2H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="band1V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="band2V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="lastCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="firstCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="lastRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="seCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="swCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="firstRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="neCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="nwCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="styleId" type="ST_Guid" use="required"/>
 <attribute name="styleName" type="xsd:string" use="required"/>
</complexType>
```

5.1.6.10 tableStyleId (Table Style ID)

This element defines the table style which is currently applied to the table by referencing the styleId attribute of the tableStyle element.

[Example: Consider the following example of a tableStyleId within DrawingML:

```
<a:tblPr firstRow="1" bandRow="1">
 <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId>
</a:tblPr>
```

In this example, we see a reference to a table style being specified in the tableStyleId element. *end example]*

The possible values for this element are defined by the ST\_Guid simple type (§5.1.12.27).

Parent Elements
tblPr (§5.1.6.13)

5.1.6.11 tbl (Table)

This element is the root element for a table. Within this element is contained everything that one would need to define a table within DrawingML.

[Example: Consider the following example of a tbl within DrawingML:

```
1 <a:tbl>
2 <a:tblPr firstRow="1" bandRow="1">
3 ...
4 <a:tblPr>
5 <a:tblGrid>
6 ...
7 </a:tblGrid>
8 <a:tr h="419100">
9 ...
10 </a:tr>
11 </a:tbl>
```

12 In this example, we see can see the definition of a table within DrawingML. *end example*]

Child Elements	Subclause
tblGrid (Table Grid)	§5.1.6.12
tblPr (Table Properties)	§5.1.6.13
tr (Table Row)	§5.1.6.16

13 The following XML Schema fragment defines the contents of this element:

```
14 <complexType name="CT_Table">
15 <sequence>
16 <element name="tblPr" type="CT_TableProperties" minOccurs="0" maxOccurs="1"/>
17 <element name="tblGrid" type="CT_TableGrid" minOccurs="1" maxOccurs="1"/>
18 <element name="tr" type="CT_TableRow" minOccurs="0" maxOccurs="unbounded"/>
19 </sequence>
20 </complexType>
```

21 [5.1.6.12](#)      [tblGrid \(Table Grid\)](#)

22 This element defines a list of table column (§5.1.6.2) elements. There should be a table column (§5.1.6.2)  
23 element for every column held within the table.

24 [*Example:* Consider the following example of a tblGrid within DrawingML:

```
25 <a:tblGrid>
26 <a:gridCol w="1117600"/>
27 <a:gridCol w="1117600"/>
28 <a:gridCol w="1117600"/>
29 </a:tblGrid>
```

30 In this example, we have a tblGrid defined that holds three columns, therefore the table will have three  
31 columns. *end example*]

Parent Elements
tbl (§5.1.6.11)

1

Child Elements	Subclause
gridCol (Table Grid Column)	§5.1.6.2

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TableGrid">
4 <sequence>
5 <element name="gridCol" type="CT_TableCol" minOccurs="0" maxOccurs="unbounded"/>
6 </sequence>
7 </complexType>

```

### 8 5.1.6.13 tblPr (Table Properties)

9 This element defines the properties of a table on the whole. Within this element are many visual modifications  
10 that can be applied to the table.

11 [Example: Consider the following example of a tblPr within DrawingML:

```

12 <a:tblPr firstRow="1" bandRow="1">
13 <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId>
14 </a:tblPr>

```

15 In this example, we see that there is a link to a table style id (§5.1.6.10) which is defined elsewhere and that the  
16 first column formatting and banded row formatting has been enabled. The table style defines the formatting  
17 applied with the two formatting options enabled. *end example*

Parent Elements
tbl (§5.1.6.11)

18

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14

solidFill (Solid Fill)	§5.1.10.54
tableStyle (Table Style)	§5.1.6.9
tableStyleId (Table Style ID)	§5.1.6.10

Attributes	Description
bandCol (Banded Columns)	<p>Enables or disables the banded column formatting for a table style. A value of on, 1 or true will enable the banded column formatting defined in the table style. The attribute will default to off if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre>&lt;a:tblPr bandCol="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt; &lt;/a:tblPr&gt;</pre> <p>In this example, we can see the banded column formatting is enabled for the table. When applied, the linked table style defines the formatting for banded columns. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bandRow (Banded Rows)	<p>Enables or disables the banded row formatting for a table style. A value of on, 1 or true will enable the banded row formatting defined in the table style. The attribute will default to off if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre>&lt;a:tblPr bandRow="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt; &lt;/a:tblPr&gt;</pre> <p>In this example, we can see the banded row formatting is enabled for the table. When applied, the linked table style defines the formatting for banded rows. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
firstCol (First Column)	<p>Enables or disables the first column formatting for a table style. A value of on, 1 or true will enable the first column formatting defined in the table style. The attribute will default to off if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre>&lt;a:tblPr firstCol="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt; &lt;/a:tblPr&gt;</pre> <p>In this example, we can see the first column formatting is enabled for the table. When</p>

Attributes	Description
	<p>applied, the linked table style defines the formatting for the first column. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
firstRow (First Row)	<p>Enables or disables the first row formatting for a table style. A value of on, 1 or true will enable the first row formatting defined in the table style. The attribute will default to off if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre data-bbox="456 617 1143 747">&lt;a:tblPr firstRow="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt; &lt;/a:tblPr&gt;</pre> <p>In this example, we can see the first row formatting is enabled for the table. When applied, the linked table style defines the formatting for the first row. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lastCol (Last Column)	<p>Enables or disables the last column formatting for a table style. A value of on, 1 or true will enable the last column formatting defined in the table style. The attribute will default to off if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre data-bbox="456 1192 1143 1323">&lt;a:tblPr lastCol="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt; &lt;/a:tblPr&gt;</pre> <p>In this example, we can see the last column formatting is enabled for the table. When applied, the linked table style defines the formatting for the last column. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lastRow (Last Row)	<p>Enables or disables the last row formatting for a table style. A value of on, 1 or true will enable the last row formatting defined in the table style. The attribute will default to off if it is not specified.</p> <p>[Example: Consider the following run:</p> <pre data-bbox="456 1770 1143 1866">&lt;a:tblPr lastRow="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt;</pre>

Attributes	Description
	<p><code>&lt;/a:tblPr&gt;</code></p> <p>In this example, we can see the last row formatting is enabled for the table. When applied, the linked table style defines the formatting for the last row. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rtl (Right-to-Left)	<p>Defines enables the right-to-left settings of a table. If the value of rtl is on, 1 or true, then the table will be laid out from the right-to-left rather than the default left-to-right.</p> <p>[Example: Consider the following run:</p> <pre>&lt;a:tblPr rtl="1"&gt;   &lt;a:tableStyleId&gt;{5940675A-B579-460E-94D1-54222C63F5DA}&lt;/a:tableStyleId&gt; &lt;/a:tblPr&gt;</pre> <p>In this example, we can see that the table is to be created in a right-to-left direction. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TableProperties">
3 <sequence>
4 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
5 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
6 <choice minOccurs="0" maxOccurs="1">
7 <element name="tableStyle" type="CT_TableStyle"/>
8 <element name="tableStyleId" type="ST_Guid"/>
9 </choice>
10 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
11 </sequence>
12 <attribute name="rtl" type="xsd:boolean" use="optional" default="false"/>
13 <attribute name="firstRow" type="xsd:boolean" use="optional" default="false"/>
14 <attribute name="firstCol" type="xsd:boolean" use="optional" default="false"/>
15 <attribute name="lastRow" type="xsd:boolean" use="optional" default="false"/>
16 <attribute name="lastCol" type="xsd:boolean" use="optional" default="false"/>
17 <attribute name="bandRow" type="xsd:boolean" use="optional" default="false"/>
18 <attribute name="bandCol" type="xsd:boolean" use="optional" default="false"/>
19 </complexType>
```

20 5.1.6.14 tc (Table Cell)

21 This element defines a cell within the table. The table cell holds a text body that actually contains the data held  
22 within the cell along with the properties of the table cell which hold formatting options associated with the cell.

23 [Example: Consider the following example of a tc within DrawingML:

```
1 <a:tc>
2 <a:txBody>
3 <a:bodyPr/>
4 <a:lstStyle/>
5 <a:p>
6 <a:pPr marL="0" align="ctr" rtl="0"/>
7 <a:r>
8 <a:rPr lang="en-US" dirty="0" smtClean="0"/>
9 <a:t>data</a:t>
10 </a:r>
11 <a:endParaRPr lang="en-US" dirty="0"/>
12 </a:p>
13 </a:txBody>
14 <a:tcPr/>
15 </a:tc>
```

16 In this example, we see a single cell in a table being defined with the default cell properties and a text body  
17 which contains the word "data". The text "data" will be the only text in the cell. *end example*

18

Parent Elements
tr (§5.1.6.16)

19

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
tcPr (Table Cell Properties)	§5.1.6.15
txBody (Shape Text Body)	§5.1.2.1.40

20

Attributes	Description
gridSpan (Grid Span)	<p>Specifies the number of columns that a merged cell spans. This is used in combination with the hMerge attribute on other cells in order to specify the beginning cell of a horizontal merge.</p> <p>[Example: Consider the following example:</p> <pre>&lt;a:tc gridSpan="3"&gt; ... /a:tc&gt; &lt;a:tc hMerge="1"&gt; ... /a:tc&gt;</pre>

Attributes	Description
	<pre>&lt;a:tc hMerge="1"&gt; ... /a:tc&gt;</pre> <p>In this example, we can define what looks like a single cell in the table as a group of three cells merged together. The merged cell spans three columns of the table. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
hMerge (Horizontal Merge)	<p>When this attribute is set to on, 1 or true, then this table cell is to be merged with the previous horizontal table cell when the table is created.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre>&lt;a:tc hMerge="1"&gt; ... &lt;/a:tc&gt;</pre> <p>In this example, we see the hMerge attribute set to on which signifies that this cell is to be merged with the previous horizontal cell in the table. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rowSpan (Row Span)	<p>Specifies the number of rows that a merged cell spans. This is used in combination with the vMerge attribute on other cells in order to specify the beginning cell of a horizontal merge.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre>&lt;a:tc rowspan="3"&gt; ... /a:tc&gt; &lt;a:tc vMerge="1"&gt; ... /a:tc&gt; &lt;a:tc vMerge="1"&gt; ... /a:tc&gt;</pre> <p>In this example, we can define what looks like a single cell in the table as a group of three cells merged together. The merged cell spans three rows of the table. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
vMerge (Vertical Merge)	<p>When this attribute is set to on, 1 or true, then this table cell is to be merged with the previous vertical table cell when the table is created.</p> <p>[<i>Example:</i> Consider the following example:</p>

Attributes	Description
	<pre>&lt;a:tc vMerge="1"&gt; ... /a:tc&gt;</pre> <p>In this example, we see the vMerge attribute set to on which signifies that this cell is to be merged with the previous vertical cell in the table. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCell">
 <sequence>
 <element name="txBody" type="CT_TextBody" minOccurs="0" maxOccurs="1"/>
 <element name="tcPr" type="CT_TableCellProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="rowSpan" type="xsd:int" use="optional" default="1"/>
 <attribute name="gridSpan" type="xsd:int" use="optional" default="1"/>
 <attribute name="hMerge" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="vMerge" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.1.6.15 tcPr (Table Cell Properties)

This element defines the formatting properties associated with a cell. The formatting options which are available to be adjusted range from the line types used for the borders to the cell fill to the margins associated with the layout of the text in the cell.

[Example: Consider the following example of a tcPr within DrawingML:

```
<a:tcPr marL="45720" marR="45720">
 <a:lnL w="38100" cap="flat" cmpd="sng" algn="ctr">
 <a:solidFill>
 <a:schemeClr val="accent2"/>
 </a:solidFill>
 <a:prstDash val="solid"/>
 <a:round/>
 <a:headEnd type="none" w="med" len="med"/>
 <a:tailEnd type="none" w="med" len="med"/>
 </a:lnL>
</a:tcPr>
```

In this example, we have a solid line defined as the left border of the cell along with left and right margin adjustments being made from the default margins. *end example]*

Parent Elements
tc (§5.1.6.14)

1

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
cell3D (Cell 3-D)	§5.1.6.1

pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

2

Attributes	Description
anchor (Anchor)	<p>Defines the alignment of the text vertically within the cell.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre>&lt;a:tcPr marL="45720" anchor="ctr"/&gt;</pre> <p>In this example, the text in the cell will be anchored to the center of the cell vertically. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§5.1.12.60).</p>
anchorCtr (Anchor Center)	<p>When this attribute is on, 1 or true, it modifies the anchor attribute. This attribute will center align the text box itself which will allow for text to be left aligned along the center of the cell for example.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
horzOverflow (Horizontal)	<p>Specifies the clipping behavior of the cell. The two options here allow for the text to be clipped and out of view when outside of the bounds of the cell, or for the text to remain</p>

Attributes	Description
Overflow)	<p>visible and overflow outside of the cell.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre>&lt;a:tcPr horzOverflow="overflow"&gt; ... &lt;/a:tcPr&gt;</pre> <p>In this example, the text in the cell will freely overflow outside of the cell boundaries and will always remain visible. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§5.1.12.69).</p>
marB (Bottom Margin)	<p>Specifies the bottom margin of the cell. The value specified in this attribute is the distance to offset from the bottom of the cell.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre>&lt;a:tcPr marB="45720" anchor="ctr"&gt; ... &lt;/a:tcPr&gt;</pre> <p>In this example, we have specified a value for the margin on the bottom of the cell. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
marL (Left Margin)	<p>This attribute specifies the left margin of the cell. The value specified in this attribute is the distance to offset from the left of the cell in EMU's.</p> <p>[<i>Example:</i> Consider the following example:</p> <pre>&lt;a:tcPr marL="45720" anchor="ctr"&gt; ... &lt;/a:tcPr&gt;</pre> <p>In this example, we have specified a value for the margin on the left of the cell. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
marR (Right Margin)	<p>This attribute specifies the right margin of the cell. The value specified in this attribute is the distance to offset from the right of the cell in EMU's.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider the following example:</p> <pre>&lt;a:tcPr marR="45720" anchor="ctr"&gt; ... &lt;/a:tcPr&gt;</pre> <p>In this example, we have specified a value for the margin on the right of the cell. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
marT (Top Margin)	<p>This attribute specifies the top margin of the cell. The value specified in this attribute is the distance to offset from the top of the cell in EMU's.</p> <p>[<i>Example</i>: Consider the following example:</p> <pre>&lt;a:tcPr marT="45720" anchor="ctr"&gt; ... &lt;/a:tcPr&gt;</pre> <p>In this example, we have specified a value for the margin on the top of the cell. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>
vert (Text Direction)	<p>Defines the text direction within the cell.</p> <p>[<i>Example</i>: Consider the following example:</p> <pre>&lt;a:tcPr vert="vert270"&gt; ... &lt;/a:tcPr&gt;</pre> <p>In this example, we have rotated the layout of the text 270 degrees so that it starts at the bottom of the cell and goes upward toward the top of the cell. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TextVerticalType simple type (§5.1.12.83).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCellProperties">
 <sequence>
 <element name="lnL" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lnR" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lnT" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lnB" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lnTlToBr" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lnBlToTr" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <element name="cell3D" type="CT_Cell3D" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="marL" type="ST_Coordinate32" use="optional" default="91440"/>
 <attribute name="marR" type="ST_Coordinate32" use="optional" default="91440"/>
 <attribute name="marT" type="ST_Coordinate32" use="optional" default="45720"/>
 <attribute name="marB" type="ST_Coordinate32" use="optional" default="45720"/>
 <attribute name="vert" type="ST_TextVerticalType" use="optional" default="horz"/>
 <attribute name="anchor" type="ST_TextAnchoringType" use="optional" default="t"/>
 <attribute name="anchorCtr" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="horzOverflow" type="ST_TextHorzOverflowType" use="optional" default="clip"/>
</complexType>
```

#### 5.1.6.16 tr (Table Row)

This element defines a row in a table. A row as defined in a table is simply a listing of table cells (§5.1.6.14). There will be a table row element defined for every row in the table.

[Example: Consider the following example of a tr within DrawingML:

```
<a:tr h="774700">
 <a:tc>
 <a:txBody>
 <a:bodyPr/>
 <a:lstStyle/>
 <a:p>
 <a:endParaRPr lang="en-US" dirty="0"/>
 </a:p>
 </a:txBody>
 <a:tcPr/>
</a:tc>
...
</a:tr>
```

In this example, we see a table row defined with an example table cell (§5.1.6.14) defined within it. The height of the row has been specified and in real use, there will be a table cell defined in this row for each grid column (§5.1.6.2) defined in the table. *end example*]

#### Parent Elements

**Parent Elements**

tbl (§5.1.6.11)

**Child Elements****Subclause**

extLst (Extension List)

§5.1.2.1.15

tc (Table Cell)

§5.1.6.14

**Attributes****Description**

h (Height)

Defines the height of the row in the table.

The possible values for this attribute are defined by the ST\_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableRow">
 <sequence>
 <element name="tc" type="CT_TableCell" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="h" type="ST_Coordinate" use="required"/>
</complexType>
```

**5.1.7 3D**

The 3D portion of the DrawingML framework allows for the describing of a 3D scene to be placed within a document. This 3D scene can be described using text and shape objects along with various lighting, material and camera settings.

**5.1.7.1 anchor (Anchor Point)**

This element specifies a point in 3D space. This point is the point in space that anchors the backdrop plane.

Please see the example in the backdrop (§5.1.7.2) definition for an in depth explanation of this element.

**Parent Elements**

backdrop (§5.1.7.2)

**Attributes****Description**

x (X-Coordinate in 3D)

X-Coordinate in 3D space.

The possible values for this attribute are defined by the ST\_Coordinate simple type (§5.1.12.16).

y (Y-Coordinate in 3D)

Y-Coordinate in 3D space.

Attributes	Description
3D)	The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
z (Z-Coordinate in 3D)	Z-Coordinate in 3D space.  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point3D">
 <attribute name="x" type="ST_Coordinate" use="required"/>
 <attribute name="y" type="ST_Coordinate" use="required"/>
 <attribute name="z" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.7.2 backdrop (Backdrop Plane)

This element defines a plane in which effects, such as glow and shadow, are applied in relation to the shape they are being applied to. The points and vectors contained within the backdrop define a plane in 3D space.

[Example: Consider the following image as an explanation of the backdrop plane definition:

In this image we see a plane being defined by an anchor point, the vector normal to the face of the plane and a vector pointing up in relation to the plane. end example]

Parent Elements
scene3d (§5.1.4.1.26); scene3d (§5.9.5.5)

Child Elements	Subclause
anchor (Anchor Point)	§5.1.7.1
extLst (Extension List)	§5.1.2.1.15
norm (Normal)	§5.1.7.10
up (Up Vector)	§5.1.7.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Backdrop">
 <sequence>
 <element name="anchor" type="CT_Point3D" minOccurs="1" maxOccurs="1"/>
 <element name="norm" type="CT_Vector3D" minOccurs="1" maxOccurs="1"/>
 <element name="up" type="CT_Vector3D" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.7.3 bevelB (Bottom Bevel)

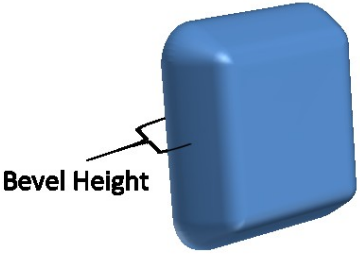

This element holds the properties associated with defining a bevel on the bottom or back face of a shape.

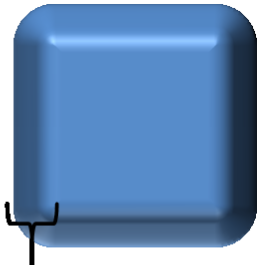

[Example: Consider the following example of an sp3d containing a bottom bevel.

```
<a:sp3d>
 <a:bevelB w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a bottom bevel being defined with a preset bevel type along with a custom width and height. *end example*]

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

Attributes	Description
h (Height)	<p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[Example: Consider the following example bevel</p>  <p>Bevel Height</p>

Attributes	Description
	<p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
prst (Preset Bevel)	<p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§5.1.12.9).</p>
w (Width)	<p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="477 732 732 995"></div> <p><b>Bevel Width</b></p> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Bevel">
3 <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="76200"/>
4 <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="76200"/>
5 <attribute name="prst" type="ST_BevelPresetType" use="optional" default="circle"/>
6 </complexType>
```

7 **5.1.7.4 bevelT (Top Bevel)**

8 This element holds the properties associated with defining a bevel on the top or front face of a shape.

9 [Example: Consider the following example of an sp3d containing a top bevel.

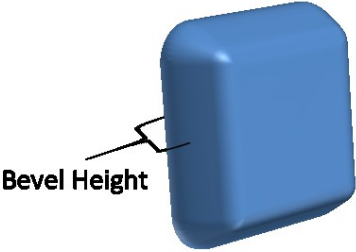

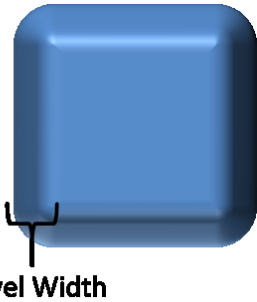

```
10 <a:sp3d>
11 <a:bevelT w="139700" h="127000" prst="coolSlant"/>
12 </a:sp3d>
```

13 In this example, we see a top bevel being defined with a preset bevel type along with a custom width and  
14 height. *end example*]

Parent Elements

sp3d (§5.1.7.12); sp3d (§5.9.5.6)

1

Attributes	Description
h (Height)	<p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="431 558 784 808" data-label="Image"></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
prst (Preset Bevel)	<p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§5.1.12.9).</p>
w (Width)	<p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="477 1310 732 1610" data-label="Image"></div> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Bevel">
 <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="76200"/>
 <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="76200"/>
 <attribute name="prst" type="ST_BevelPresetType" use="optional" default="circle"/>
</complexType>
```

### 5.1.7.5 camera (Camera)

This element defines the placement and properties of the camera in the 3D scene. The camera position and properties modify the view of the scene.

[Example: Consider the following example of a camera in DrawingML:

```
<a:camera prst="orthographicFront">
 <a:rot lat="19902513" lon="17826689" rev="1362739"/>
</a:camera>
```

In this example, we see a preset camera being defined along with a rotation containing latitude, longitude, and revolution overrides provided that further rotate the camera around the scene. The effect of this camera can be seen on the following shape:

end example]

Parent Elements
scene3d (§5.1.4.1.26); scene3d (§5.9.5.5)

Child Elements	Subclause
rot (Rotation)	§5.1.7.11

Attributes	Description
fov (Field of View)	Provides an override for the default field of view for the camera. Different perspectives can be obtained by modifying this attribute.  [Example: Consider the following example of a fov in DrawingML:

Attributes	Description
	<pre data-bbox="456 285 1304 415">&lt;a:camera prst="perspectiveContrastingRightFacing"   fov="6900000"&gt;   &lt;a:rot lat="1200000" lon="18000000" rev="1200000"/&gt; &lt;/a:camera&gt;</pre> <p data-bbox="415 457 1468 520">In this example, we see a fov being defined which modifies the default fov for the preset camera. <i>end example</i>]</p> <p data-bbox="415 562 1386 625">The possible values for this attribute are defined by the ST_FOVAngle simple type (§5.1.12.24).</p>
prst (Preset Camera Type)	<p data-bbox="415 646 1468 709">Defines the preset camera that is being used by the camera element. The preset camera defines a starting point for common preset rotations in space.</p> <p data-bbox="415 751 1203 783">[<i>Example</i>: Consider the following example of a prst in DrawingML:</p> <pre data-bbox="456 825 1304 955">&lt;a:camera prst="perspectiveContrastingRightFacing"   fov="6900000"&gt;   &lt;a:rot lat="1200000" lon="18000000" rev="1200000"/&gt; &lt;/a:camera&gt;</pre> <p data-bbox="415 997 1468 1060">In this example, we see a prst being defined as perspectiveContrastingRightFacing. <i>end example</i>]</p> <p data-bbox="415 1102 1446 1165">The possible values for this attribute are defined by the ST_PresetCameraType simple type (§5.1.12.47).</p>
zoom (Zoom)	<p data-bbox="415 1186 1443 1249">Defines the zoom factor of a given camera element. The zoom modifies the scene as a whole and zooms in or out accordingly.</p> <p data-bbox="415 1291 1219 1323">[<i>Example</i>: Consider the following example of a zoom in DrawingML:</p> <pre data-bbox="456 1365 1304 1495">&lt;a:camera prst="perspectiveContrastingRightFacing"   fov="6900000" zoom="200000"&gt;   &lt;a:rot lat="1200000" lon="18000000" rev="1200000"/&gt; /a:camera&gt;</pre> <p data-bbox="415 1537 1414 1600">In this example, we see a zoom being used which will zoom the scene by 200%. <i>end example</i>]</p> <p data-bbox="415 1642 1446 1705">The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Camera">
 <sequence>
 <element name="rot" type="CT_SphereCoords" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="prst" type="ST_PresetCameraType" use="required"/>
 <attribute name="fov" type="ST_FOVAngle" use="optional"/>
 <attribute name="zoom" type="ST_PositivePercentage" use="optional" default="100000"/>
</complexType>
```

5.1.7.6 contourClr (Contour Color)

This element defines the color for the contour on a shape. The contour of a shape is a solid filled line which surrounds the outer edges of the shape.

[Example: Consider the following example of a contour defined on a shape which includes a contourClr. Lighting characteristics applied to the shape are ignored when it comes to the contour on the shape.

```
<a:sp3d contourW="101600" prstMaterial="plastic">
 <a:bevelT w="254000" h="254000"/>
 <a:bevelB w="254000" h="254000"/>
 <a:contourClr>
 <a:schemeClr val="bg1"/>
 </a:contourClr>
</a:sp3d>
```

In this example, we see a contour defined on a shape with a top and bottom bevel defined. In the image below, the contour is the white ring around the shape.

end example]

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

1

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Color">
4 <sequence>
5 <group ref="EG_ColorChoice"/>
6 </sequence>
7 </complexType>
```

8 **5.1.7.7 extrusionClr (Extrusion Color)**

9 This element defines the color of the extrusion applied to a shape. The extrusion on a shape is an artificial  
10 height applied to the geometry.

11 *[Example: Consider the following example of an extrusion which takes advantage of the extrusionClr. Lighting*  
12 *characteristics that are applied to the shape are also applied to the extrusion on the shape.*

```
13 <a:sp3d extrusionH="139700" prstMaterial="plastic">
14 <a:bevelT w="254000" h="254000"/>
15 <a:bevelB w="254000" h="254000"/>
16 <a:extrusionClr>
17 <a:srgbClr val="FF0000"/>
18 </a:extrusionClr>
19 </a:sp3d>
```

20 In this example, we see the extrusion color defined as red which can also be shown applied to the shape in the  
21 following image:

*end example]*

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

### 5.1.7.8 flatTx (No text in 3D scene)

Keep text out of 3D scene entirely.

Parent Elements
bodyPr (§5.1.5.1.1); txPr (§5.9.5.12)

Attributes	Description
z (Z Coordinate)	Specifies the Z coordinate to be used in positioning the flat text within the 3D scene.  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_FlatText">
3 <attribute name="z" type="ST_Coordinate" use="optional" default="0"/>
4 </complexType>
```

#### 5 5.1.7.9 lightRig (Light Rig)

6 This element defines the light rig associated with the table. The light rig comes into play when there is a 3D  
7 bevel applied to a cell. When 3D is used, the light rig defines the lighting properties associated with the scene.

Parent Elements
cell3D (§5.1.6.1); scene3d (§5.1.4.1.26); scene3d (§5.9.5.5)

8

Child Elements	Subclause
rot (Rotation)	§5.1.7.11

9

Attributes	Description
dir (Direction)	Defines the direction from which the light rig is oriented in relation to the scene.  [Example: Consider the following example of dir being used in a light rig:  <a:lightRig rig="threePt" dir="t"/>  In this example, we define the direction to be top. <i>end example</i> ]  The possible values for this attribute are defined by the ST_LightRigDirection simple type (§5.1.12.29).
rig (Rig Preset)	Defines the preset type of light rig which is to be applied to the scene.  [Example: Consider the following example of rig being used in a light rig:  <a:lightRig rig="threePt" dir="t"/>  In this example, we define the rig to be a threePt rig. <i>end example</i> ]  The possible values for this attribute are defined by the ST_LightRigType simple type (§5.1.12.30).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LightRig">
 <sequence>
 <element name="rot" type="CT_SphereCoords" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="rig" type="ST_LightRigType" use="required"/>
 <attribute name="dir" type="ST_LightRigDirection" use="required"/>
</complexType>
```

5.1.7.10 norm (Normal)

This element defines a normal vector. To be more precise, this attribute defines a vector normal to the face of the backdrop plane.

[Example: Consider the following image as an example of what a normal vector is in relation to the backdrop plane:

end example]

Parent Elements
backdrop (§5.1.7.2)

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D

Attributes	Description
	The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Vector3D">
 <attribute name="dx" type="ST_Coordinate" use="required"/>
 <attribute name="dy" type="ST_Coordinate" use="required"/>
 <attribute name="dz" type="ST_Coordinate" use="required"/>
</complexType>
```

#### 5.1.7.11 rot (Rotation)

This element defines a rotation in 3D space. A rotation in DrawingML is defined through the use of a latitude coordinate, a longitude coordinate, and a revolution about the axis as the latitude and longitude coordinates.

[Example: Consider the following example of a rotation defined by the rot elements being used in a lightRig in DrawingML:

```
<a:lightRig rig="twoPt" dir="t">
 <a:rot lat="0" lon="0" rev="6000000"/>
</a:lightRig>
```

In this example, we have only a revolution applied to the light rig rich rotates it around it's center axis. *end example]*

Parent Elements
camera (§5.1.7.5); lightRig (§5.1.7.9)

Attributes	Description
lat (Latitude)	Defines the latitude value of the rotation.  [Example: Consider the following example of a rot in DrawingML:  <a:rot lat="0" lon="0" rev="6000000"/>  In this example, we set the lat to be equal to 0. <i>end example]</i>  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
lon (Longitude)	Defines the longitude value of the rotation.

Attributes	Description
	<p>[<i>Example:</i> Consider the following example of a rot in DrawingML:</p> <pre data-bbox="456 352 1062 384">&lt;a:rot lat="0" lon="0" rev="6000000"/&gt;</pre> <p>In this example, we set the lon to be equal to 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).</p>
rev (Revolution)	<p>This attributes defines the revolution around the central axis in the rotation.</p> <p>[<i>Example:</i> Consider the following example of a rot in DrawingML:</p> <pre data-bbox="456 720 1062 751">&lt;a:rot lat="0" lon="0" rev="6000000"/&gt;</pre> <p>In this example, we set the rev to be equal to 6000000. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_SphereCoords">
3 <attribute name="lat" type="ST_PositiveFixedAngle" use="required"/>
4 <attribute name="lon" type="ST_PositiveFixedAngle" use="required"/>
5 <attribute name="rev" type="ST_PositiveFixedAngle" use="required"/>
6 </complexType>
```

### 7 5.1.7.12 sp3d (Apply 3D shape properties)

8 This element defines the 3D properties associated with a particular shape in DrawingML. The 3D properties  
9 which can be applied to a shape are top and bottom bevels, a contour and an extrusion.

10 [*Example:* Consider the following example of an sp3d in DrawingML:

```

11 <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic">
12 <a:bevelT w="254000" h="254000"/>
13 <a:bevelB w="254000" h="254000"/>
14 <a:extrusionClr>
15 <a:srgbClr val="FF0000"/>
16 </a:extrusionClr>
17 <a:contourClr>
18 <a:schemeClr val="accent3"/>
19 </a:contourClr>
20 </a:sp3d>
```

1 In this example, we see an sp3d defined which contains information defining both a top and bottom bevel,  
2 along with an extrusion and contour on the shape. The following image illustrates a shape with the applied  
3 sp3d:

4  
5 *end example]*

Parent Elements
bodyPr (§5.1.5.1.1); effectStyle (§5.1.4.1.11); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); txPr (§5.9.5.12)

6

Child Elements	Subclause
bevelB (Bottom Bevel)	§5.1.7.3
bevelT (Top Bevel)	§5.1.7.4
contourClr (Contour Color)	§5.1.7.6
extLst (Extension List)	§5.1.2.1.15
extrusionClr (Extrusion Color)	§5.1.7.7

7

Attributes	Description
contourW (Contour Width)	<p>Defines the width of the contour on the shape.</p> <p>[Example: Consider the following example of a contourW in use within the sp3d element:</p> <pre>&lt;a:sp3d extrusionH="165100" contourW="50800"   prstMaterial="plastic"&gt;   &lt;a:bevelT w="254000" h="254000"/&gt;   &lt;a:bevelB w="254000" h="254000"/&gt;   &lt;a:extrusionClr&gt;     &lt;a:srgbClr val="FF0000"/&gt;   &lt;/a:extrusionClr&gt;</pre>

Attributes	Description
	<pre> &lt;a:contourClr&gt;   &lt;a:schemeClr val="accent3"/&gt; &lt;/a:contourClr&gt; &gt;/a:sp3d&gt; </pre> <p>In this example, we see a countourW defined as 50800. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
extrusionH (Extrusion Height)	<p>Defines the height of the extrusion applied to the shape.</p> <p>[<i>Example:</i> Consider the following example of an extrusionH in use within the sp3d element:</p> <pre> &lt;a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"&gt;   &lt;     &lt;a:bevelT w="254000" h="254000"/&gt;     &lt;a:bevelB w="254000" h="254000"/&gt;     &lt;a:extrusionClr&gt;       &lt;a:srgbClr val="FF0000"/&gt;     &lt;/a:extrusionClr&gt;     &lt;a:contourClr&gt;       &lt;a:schemeClr val="accent3"/&gt;     &lt;/a:contourClr&gt;   &lt;/a:sp3d&gt; </pre> <p>In this example, we see a extrusionH defined as 165100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
prstMaterial (Preset Material Type)	<p>Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape.</p> <p>[<i>Example:</i> Consider the following example of a prstMaterial in use within the sp3d element:</p> <pre> &lt;a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"&gt;   &lt;a:bevelT w="254000" h="254000"/&gt;   &lt;a:bevelB w="254000" h="254000"/&gt;   &lt;a:extrusionClr&gt;     &lt;a:srgbClr val="FF0000"/&gt;   &lt;/a:extrusionClr&gt;   &lt;a:contourClr&gt;     &lt;a:schemeClr val="accent3"/&gt;   &lt;/a:contourClr&gt; </pre>

Attributes	Description
	<p><code>&lt;/a:sp3d&gt;</code></p> <p>In this example, we see a <code>prstMaterial</code> defined as <code>plastic</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_PresetMaterialType</code> simple type (§5.1.12.50).</p>
z (Shape Depth)	<p>Defines the z coordinate for the 3D shape.</p> <p>The possible values for this attribute are defined by the <code>ST_Coordinate</code> simple type (§5.1.12.16).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Shape3D">
3 <sequence>
4 <element name="bevelT" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
5 <element name="bevelB" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
6 <element name="extrusionClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
7 <element name="contourClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
8 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
9 </sequence>
10 <attribute name="z" type="ST_Coordinate" use="optional" default="0"/>
11 <attribute name="extrusionH" type="ST_PositiveCoordinate" use="optional" default="0"/>
12 <attribute name="contourW" type="ST_PositiveCoordinate" use="optional" default="0"/>
13 <attribute name="prstMaterial" type="ST_PresetMaterialType" use="optional" default="warmMatte"/>
14 </complexType>
```

15 **5.1.7.13 up (Up Vector)**

16 This element defines a vector representing up. To be more precise, this attribute defines a vector representing  
17 up in relation to the face of the backdrop plane.

18 *[Example:* Consider the following image as an example of what an up vector is in relation to the backdrop plane:

end example]

Parent Elements
backdrop (§5.1.7.2)

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Vector3D">
 <attribute name="dx" type="ST_Coordinate" use="required"/>
 <attribute name="dy" type="ST_Coordinate" use="required"/>
 <attribute name="dz" type="ST_Coordinate" use="required"/>
</complexType>
```

## 5.1.8 Shared Style Sheet

The shared style sheet aspects contained within DrawingML are responsible for containing formatting options and styles which can be used by applications to define a certain look or feel to documents. The shared style sheet can be used by any document type (for example, a presentation) to pull visual information from which formats the document in a certain way, or theme. The shared style sheet contains information that is not document type specific.

### 5.1.8.1 clrMap (Color Map)

This element specifies the color mapping layer which allows a user to define colors for background and text. This allows for swapping out of light/dark colors for backgrounds and the text on top of the background in order to maintain readability of the text. On a deeper level, this specifies exactly which colors the first 12 values refer to in the color scheme.

[*Example:* Consider the following example of a color map in use:

```
<clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
 accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
 accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

In this example, we see that bg1 is mapped to lt1, tx1 is mapped to dk1, and so on. *end example*]

Parent Elements
extraClrScheme (§5.1.8.4)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color.

Attributes	Description
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5)	<p>Specifies a color defined which is associated as the accent 5 color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
accent6 (Accent 6)	<p>Specifies a color defined which is associated as the accent 6 color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
bg1 (Background 1)	<p>A color defined which is associated as the first background color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
bg2 (Background 2)	<p>Specifies a color defined which is associated as the second background color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
folHlink (Followed Hyperlink)	<p>Specifies a color defined which is associated as the color for a followed hyperlink.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
hlink (Hyperlink)	<p>Specifies a color defined which is associated as the color for a hyperlink.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
tx1 (Text 1)	<p>Specifies a color defined which is associated as the first text color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>
tx2 (Text 2)	<p>Specifies a color defined which is associated as the second text color.</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMapping">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>
```

#### 5.1.8.2 clrScheme (Color Scheme)

This element defines a set of colors which are referred to as a color scheme. The color scheme is responsible for defining a list of twelve colors. The twelve colors consist of six accent colors, two dark colors, two light colors and a color for each of a hyperlink and followed hyperlink.

[Example: Consider the following example of a color scheme defined in DrawingML:

```
<clrScheme name="sample">
 <dk1>
 <sysClr val="windowText"/>
 </dk1>
 <lt1>
 <sysClr val="window"/>
 </lt1>
 <dk2>
 <srgbClr val="04617B"/>
 </dk2>
 <lt2>
 <srgbClr val="DBF5F9"/>
 </lt2>
 <accent1>
 <srgbClr val="0F6FC6"/>
 </accent1>
 <accent2>
 <srgbClr val="009DD9"/>
 </accent2>
```

```
1 <accent3>
2 <srgbClr val="0BD0D9"/>
3 </accent3>
4 <accent4>
5 <srgbClr val="10CF9B"/>
6 </accent4>
7 <accent5>
8 <srgbClr val="7CCA62"/>
9 </accent5>
10 <accent6>
11 <srgbClr val="A5C249"/>
12 </accent6>
13 <hlink>
14 <srgbClr val="FF9800"/>
15 </hlink>
16 <folHlink>
17 <srgbClr val="F45511"/>
18 </folHlink>
19 </clrScheme>
```

20 In this example, are defined the 12 theme colors in the sample color scheme. *end example*]

21

Parent Elements
extraClrScheme (§5.1.8.4); themeElements (§5.1.8.10); themeOverride (§5.1.8.12)

Child Elements	Subclause
accent1 (Accent 1)	§5.1.4.1.1
accent2 (Accent 2)	§5.1.4.1.2
accent3 (Accent 3)	§5.1.4.1.3
accent4 (Accent 4)	§5.1.4.1.4
accent5 (Accent 5)	§5.1.4.1.5
accent6 (Accent 6)	§5.1.4.1.6
dk1 (Dark 1)	§5.1.4.1.9
dk2 (Dark 2)	§5.1.4.1.10
extLst (Extension List)	§5.1.2.1.15
folHlink (Followed Hyperlink)	§5.1.4.1.15
hlink (Hyperlink)	§5.1.4.1.19
lt1 (Light 1)	§5.1.4.1.22
lt2 (Light 2)	§5.1.4.1.23

1

Attributes	Description
name (Name)	The common name for this color scheme. This name can show up in the user interface in a list of color schemes.  The possible values for this attribute are defined by the XML Schema string datatype.

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_ColorScheme">
4 <sequence>
5 <element name="dk1" type="CT_Color" minOccurs="1" maxOccurs="1"/>
6 <element name="lt1" type="CT_Color" minOccurs="1" maxOccurs="1"/>
7 <element name="dk2" type="CT_Color" minOccurs="1" maxOccurs="1"/>
8 <element name="lt2" type="CT_Color" minOccurs="1" maxOccurs="1"/>
9 <element name="accent1" type="CT_Color" minOccurs="1" maxOccurs="1"/>
10 <element name="accent2" type="CT_Color" minOccurs="1" maxOccurs="1"/>
11 <element name="accent3" type="CT_Color" minOccurs="1" maxOccurs="1"/>
12 <element name="accent4" type="CT_Color" minOccurs="1" maxOccurs="1"/>
13 <element name="accent5" type="CT_Color" minOccurs="1" maxOccurs="1"/>
14 <element name="accent6" type="CT_Color" minOccurs="1" maxOccurs="1"/>
15 <element name="hlink" type="CT_Color" minOccurs="1" maxOccurs="1"/>
16 <element name="folHlink" type="CT_Color" minOccurs="1" maxOccurs="1"/>
17 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
18 </sequence>
19 <attribute name="name" type="xsd:string" use="required"/>
20 </complexType>
```

21 **5.1.8.3 custClrLst (Custom Color List)**

22 This element allows for a custom color palette to be created and which shows up alongside other color schemes.  
23 This can be very useful, for example, when someone would like to maintain a corporate color palette.

Parent Elements
theme (§5.1.8.9)

24

Child Elements	Subclause
custClr (Custom color)	§5.1.4.1.8

25 The following XML Schema fragment defines the contents of this element:

```
26 <complexType name="CT_CustomColorList">
27 <sequence>
28 <element name="custClr" type="CT_CustomColor" minOccurs="0" maxOccurs="unbounded"/>
29 </sequence>
30 </complexType>
```

#### 5.1.8.4 `extraClrScheme` (Extra Color Scheme)

This element defines an auxiliary color scheme, which includes both a color scheme and color mapping. This is mainly used for backward compatibility concerns and roundtrips information required by earlier versions.

[*Example:* Consider the following example of an extra color scheme in use in DrawingML:

```
<extraClrScheme>
 <clrScheme name="extraColorSchemeSample">
 <dk1>
 <sysClr val="windowText"/>
 </dk1>
 <lt1>
 <sysClr val="window"/>
 </lt1>
 <dk2>
 <srgbClr val="04617B"/>
 </dk2>
 <lt2>
 <srgbClr val="DBF5F9"/>
 </lt2>
 <accent1>
 <srgbClr val="0F6FC6"/>
 </accent1>
 <accent2>
 <srgbClr val="009DD9"/>
 </accent2>
 <accent3>
 <srgbClr val="0BD0D9"/>
 </accent3>
 <accent4>
 <srgbClr val="10CF9B"/>
 </accent4>
 <accent5>
 <srgbClr val="7CCA62"/>
 </accent5>
 <accent6>
 <srgbClr val="A5C249"/>
 </accent6>
 <hlink>
 <srgbClr val="FF9800"/>
 </hlink>
 <folHlink>
 <srgbClr val="F45511"/>
 </folHlink>
```

```
1 </clrScheme>
2 <clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
3 accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
4 accent6="accent6" hlink="hlink" folHlink="folHlink"/>
5 </extraClrScheme>
```

In this example, the extra color scheme contains a color scheme and a color map for that color scheme. *end example]*

Parent Elements
extraClrSchemeLst (§5.1.8.5)

Child Elements	Subclause
clrMap (Color Map)	§5.1.8.1
clrScheme (Color Scheme)	§5.1.8.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorSchemeAndMapping">
 <sequence>
 <element name="clrScheme" type="CT_ColorScheme" minOccurs="1" maxOccurs="1"/>
 <element name="clrMap" type="CT_ColorMapping" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.8.5 extraClrSchemeLst (Extra Color Scheme List)

This element is a container for the list of extra color schemes present in a document.

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
extraClrScheme (Extra Color Scheme)	§5.1.8.4

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorSchemeList">
 <sequence>
 <element name="extraClrScheme" type="CT_ColorSchemeAndMapping" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.1.8.6 masterClrMapping (Master Color Mapping)

This element is a part of a choice for which color mapping is used within the document. There is also defined an overrideClrMapping (§1.1.8) element which, when specified, the override is used rather than the color mapping defined in the master. If this element is specified, then we specifically use the color mapping defined in the master.

Parent Elements
clrMapOvr (§4.4.1.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmptyElement"/>
```

### 5.1.8.7 objectDefaults (Object Defaults)

This element allows for the definition of default shape, line, and textbox formatting properties. An application can use this information to format a shape (or text) initially on insertion into a document.

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
lnDef (Line Default)	§5.1.4.1.20
spDef (Shape Default)	§5.1.4.1.27
txDef (Text Default)	§5.1.4.1.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ObjectStyleDefaults">
 <sequence>
 <element name="spDef" type="CT_DefaultShapeDefinition" minOccurs="0" maxOccurs="1"/>
 <element name="lnDef" type="CT_DefaultShapeDefinition" minOccurs="0" maxOccurs="1"/>
 <element name="txDef" type="CT_DefaultShapeDefinition" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.8.8 overrideClrMapping (Override Color Mapping)

This element provides an override for the color mapping in a document. When defined, this color mapping is used in place of the already defined color mapping, or master color mapping. This color mapping is defined in the same manner as the other mappings within this document.

[Example: Consider the following example of an override color mapping in DrawingML:

```

<overrideClrMapping bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
 accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
 accent6="accent6" hlink="hlink" folHlink="folHlink"/>

```

*end example]*

Parent Elements
clrMapOvr (§4.4.1.7)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5)	Specifies a color defined which is associated as the accent 5 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6)	Specifies a color defined which is associated as the accent 6 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg1 (Background 1)	A color defined which is associated as the first background color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

Attributes	Description
bg2 (Background 2)	Specifies a color defined which is associated as the second background color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink)	Specifies a color defined which is associated as the color for a followed hyperlink.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink)	Specifies a color defined which is associated as the color for a hyperlink.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1)	Specifies a color defined which is associated as the first text color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

The following XML Schema fragment defines the contents of this element:

```

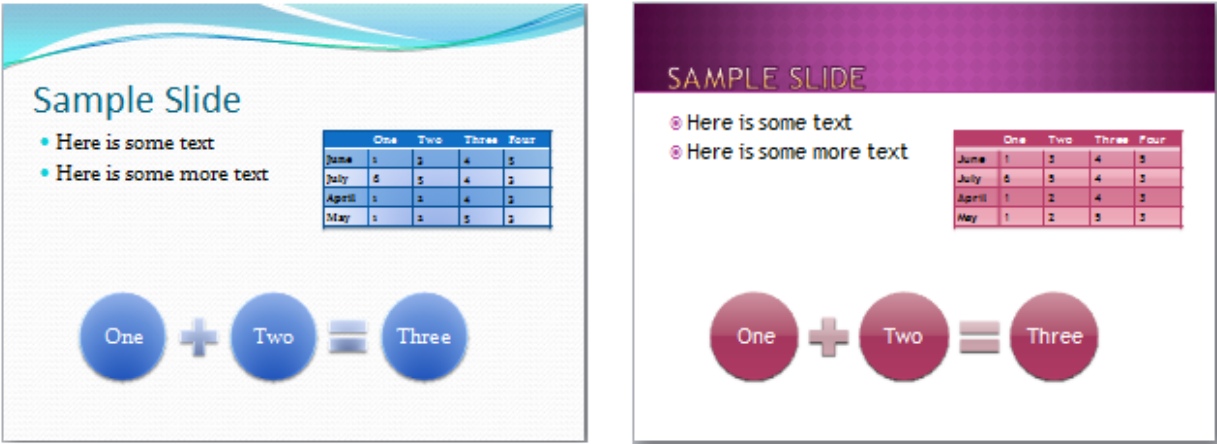

<complexType name="CT_ColorMapping">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>

```

### 5.1.8.9 theme (Theme)

This element defines the root level complex type associated with a shared style sheet (or theme). This element holds all the different formatting options available to a document through a theme and defines the overall look and feel of the document when themed objects are used within the document.

[Example: Consider the following image as an example of different themes in use applied to a presentation:

1

2 In this example, we see how a theme can affect font, colors, backgrounds, fills, and effects for different objects

3 in a presentation. *end example*]

Parent Elements
Root element of DrawingML Theme part

4

Child Elements	Subclause
custClrLst (Custom Color List)	§5.1.8.3
extLst (Extension List)	§5.1.2.1.15
extraClrSchemeLst (Extra Color Scheme List)	§5.1.8.5
objectDefaults (Object Defaults)	§5.1.8.7
themeElements (Theme Elements)	§5.1.8.10

5

Attributes	Description
name (Name)	Specifies the name given to the theme.  The possible values for this attribute are defined by the XML Schema string datatype.

6 The following XML Schema fragment defines the contents of this element:

```
7 <complexType name="CT_OfficeStyleSheet">
8 <sequence>
9 <element name="themeElements" type="CT_BaseStyles" minOccurs="1" maxOccurs="1"/>
10 <element name="objectDefaults" type="CT_ObjectStyleDefaults" minOccurs="0" maxOccurs="1"/>
11 <element name="extraClrSchemeLst" type="CT_ColorSchemeList" minOccurs="0" maxOccurs="1"/>
12 <element name="custClrLst" type="CT_CustomColorList" minOccurs="0" maxOccurs="1"/>
13 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
14 </sequence>
15 <attribute name="name" type="xsd:string" use="optional" default=""/>
16 </complexType>
```

5.1.8.10 themeElements (Theme Elements)

This element defines the theme formatting options for the theme and is the workhorse of the theme. This is where the bulk of the shared theme information is contained and used by a document. This element contains the color scheme, font scheme, and format scheme elements which define the different formatting aspects of what a theme defines.

[Example: Consider the following example of a theme elements defined in DrawingML:

```
<themeElements>
 <clrScheme name="sample">
 ...
</clrScheme>
 <fontScheme name="sample">
 ...
</fontScheme>
 <fmtScheme name="sample">
 <fillStyleLst>
 ...
 </fillStyleLst>
 <lnStyleLst>
 ...
 </lnStyleLst>
 <effectStyleLst>
 ...
 </effectStyleLst>
 <bgFillStyleLst>
 ...
 </bgFillStyleLst>
 </fmtScheme>
</themeElements>
```

In this example, we see the basic structure of how a theme elements is defined and have left out the true guts of each individual piece to save room. Each part (color scheme, font scheme, format scheme) is defined elsewhere within DrawingML. end example]

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
clrScheme (Color Scheme)	§5.1.8.2
extLst (Extension List)	§5.1.2.1.15
fmtScheme (Format Scheme)	§5.1.4.1.14

Child Elements	Subclause
fontScheme (Font Scheme)	§5.1.4.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BaseStyles">
 <sequence>
 <element name="clrScheme" type="CT_ColorScheme" minOccurs="1" maxOccurs="1"/>
 <element name="fontScheme" type="CT_FontScheme" minOccurs="1" maxOccurs="1"/>
 <element name="fmtScheme" type="CT_StyleMatrix" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.8.11 themeManager (Theme Manager)

The starting part for a theme file.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmptyElement"/>
```

#### 5.1.8.12 themeOverride (Theme Override)

This element allows for an override which changes just the colors, fonts, or effects of a single object, like a table for example. Currently it is used only to control overrides on the non-top-level masters within a presentation.

Parent Elements
Root element of DrawingML Theme Override part

Child Elements	Subclause
clrScheme (Color Scheme)	§5.1.8.2
fmtScheme (Format Scheme)	§5.1.4.1.14
fontScheme (Font Scheme)	§5.1.4.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BaseStylesOverride">
 <sequence>
 <element name="clrScheme" type="CT_ColorScheme" minOccurs="0" maxOccurs="1"/>
 <element name="fontScheme" type="CT_FontScheme" minOccurs="0" maxOccurs="1"/>
 <element name="fmtScheme" type="CT_StyleMatrix" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.9 Coordinate Systems and Transformations

The following elements are used to reflect dimensions, scaling, location, rotation, and flip information on groups and individual shapes respectively.

5.1.9.1 chExt (Child Extents)

This element specifies the size dimensions of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Parent Elements
xfrm (§5.1.9.5)

Attributes	Description
cx (Extent Length)	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
cy (Extent Width)	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

The following XML Schema fragment defines the contents of this element:

<pre>&lt;complexType name="CT_PositiveSize2D"&gt;   &lt;attribute name="cx" type="ST_PositiveCoordinate" use="required"/&gt;   &lt;attribute name="cy" type="ST_PositiveCoordinate" use="required"/&gt; &lt;/complexType&gt;</pre>
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

5.1.9.2 chOff (Child Offset)

This element specifies the location of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Parent Elements
-----------------

Parent Elements
xfrm (§5.1.9.5)

1

Attributes	Description
x (X-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
y (Y-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Point2D">
4 <attribute name="x" type="ST_Coordinate" use="required"/>
5 <attribute name="y" type="ST_Coordinate" use="required"/>
6 </complexType>

```

7 

### 5.1.9.3 ext (Extents)

8 This element specifies the size of the bounding box enclosing the referenced object.

Parent Elements
xfrm (§4.4.1.49); xfrm (§5.1.9.6); xfrm (§5.6.2.35); xfrm (§5.8.2.28); xfrm (§5.1.9.5)

9

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size

Attributes	Description
	<p>of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
cy (Extent Width)	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_PositiveSize2D">
3 <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
4 <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
5 </complexType>
```

#### 6 5.1.9.4 off (Offset)

7 This element specifies the location of the bounding box of an object. Effects on an object are not included in this  
8 bounding box.

Parent Elements
xfrm (§4.4.1.49); xfrm (§5.1.9.6); xfrm (§5.6.2.35); xfrm (§5.8.2.28); xfrm (§5.1.9.5)

9

Attributes	Description
x (X-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p>

Attributes	Description
	<p><code>&lt;wp:... x="0" y="100" /&gt;</code></p> <p>The x attribute defines an x-coordinate of 0. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
y (Y-Axis Coordinate)	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <p><code>&lt;wp:... x="0" y="100" /&gt;</code></p> <p>The y attribute defines a y-coordinate of 100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

1 The following XML Schema fragment defines the contents of this element:

2	<code>&lt;complexType name="CT_Point2D"&gt;</code>
3	<code>  &lt;attribute name="x" type="ST_Coordinate" use="required"/&gt;</code>
4	<code>  &lt;attribute name="y" type="ST_Coordinate" use="required"/&gt;</code>
5	<code>&lt;/complexType&gt;</code>

6 **5.1.9.5 xfrm (2D Transform for Grouped Objects)**

7 This element is nearly identical to the representation of 2-D transforms for ordinary shapes (§5.1.9.6). The only  
8 addition is a member to represent the Child offset and the Child extents.

Parent Elements
grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17)

9

Child Elements	Subclause
chExt (Child Extents)	§5.1.9.1
chOff (Child Offset)	§5.1.9.2
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

10

Attributes	Description
------------	-------------

Attributes	Description
flipH (Horizontal Flip)	<p>Horizontal flip. When true, this attribute defines that the group will be flipped horizontally about the center of its bounding box.</p> <p>[Example -- The following illustrates the effect of a horizontal flip.</p>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
flipV (Vertical Flip)	<p>Vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box.</p> <p>[Example -- The following illustrates the effect of a vertical flip.</p>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rot (Rotation)	<p>Rotation. Specifies the clockwise rotation of a group in 1/64000 of a degree.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_GroupTransform2D">
3 <sequence>
4 <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
5 <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>

 <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.1.10 Shape Fills, Effects, and Line Properties

This portion of the DrawingML framework describes effects defining the visual appearance of shapes and lines. Shapes may be filled in a variety of ways, with images, solid colors, gradients, or pattern fills. In addition, several visual effects may alter the appearance of a shape, and multiple effects may be combined together. Lines also may have special properties defining how they are rendered, including a dashed appearance or decorations at the line ends. This section documents the elements that define these properties and effects for shapes and lines.

#### 5.1.10.1 alphaBiLevel (Alpha Bi-Level Effect)

This element represents an Alpha Bi-Level Effect.

Alpha (Opacity) values less than the threshold are changed to 0 (fully transparent) and alpha values greater than or equal to the threshold are changed to 100% (fully opaque).

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
thresh (Threshold)	Specifies the threshold value for the alpha bi-level effect.  The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaBiLevelEffect">
 <attribute name="thresh" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

#### 5.1.10.2 alphaCeiling (Alpha Ceiling Effect)

This element represents an alpha ceiling effect.

Alpha (opacity) values greater than zero are changed to 100%. In other words, anything partially opaque becomes fully opaque.

**Parent Elements**

blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaCeilingEffect"/>
```

### 5.1.10.3 alphaFloor (Alpha Floor Effect)

This element represents an alpha floor effect.

Alpha (opacity) values less than 100% are changed to zero. In other words, anything partially transparent becomes fully transparent.

**Parent Elements**

blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaFloorEffect"/>
```

### 5.1.10.4 alphaInv (Alpha Inverse Effect)

This element represents an alpha inverse effect.

Alpha (opacity) values are inverted by subtracting from 100%.

**Parent Elements**

blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

**Child Elements****Subclause**

hslClr (Hue, Saturation, Luminance Color Model)

§5.1.2.2.13

prstClr (Preset Color)

§5.1.2.2.22

schemeClr (Scheme Color)

§5.1.2.2.29

scrgbClr (RGB Color Model - Percentage Variant)

§5.1.2.2.30

srgbClr (RGB Color Model - Hex Variant)

§5.1.2.2.32

sysClr (System Color)

§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaInverseEffect">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.10.5 [alphaMod \(Alpha Modulate Effect\)](#)

This element represents an alpha modulate effect.

Effect alpha (opacity) values are multiplied by a fixed percentage. The effect container specifies an effect containing alpha values to modulate.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
cont (Effect Container)	§5.1.10.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaModulateEffect">
 <sequence>
 <element name="cont" type="CT_EffectContainer" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.10.6 [alphaModFix \(Alpha Modulate Fixed Effect\)](#)

This element represents an alpha modulate fixed effect.

Effect alpha (opacity) values are multiplied by a fixed percentage.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
amt (Amount)	Specifies the percentage amount to scale the alpha.  The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaModulateFixedEffect">
 <attribute name="amt" type="ST_PositivePercentage" use="optional" default="100000"/>
</complexType>
```

### 5.1.10.7 [alphaOutset \(Alpha Inset/Outset Effect\)](#)

This element specifies an alpha outset/inset effect.

- 1 This is equivalent to an alpha ceiling, followed by alpha blur, followed by either an alpha ceiling (positive radius)  
 2 or alpha floor (negative radius).

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

3

Attributes	Description
rad (Radius)	Specifies the radius of outset/inset.  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

- 4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_AlphaOutsetEffect">
6 <attribute name="rad" type="ST_Coordinate" use="optional" default="0"/>
7 </complexType>
```

#### 8 5.1.10.8 alphaRepl (Alpha Replace Effect)

- 9 This element specifies an alpha replace effect.

- 10 Effect alpha (opacity) values are replaced by a fixed alpha.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

11

Attributes	Description
a (Alpha)	Specifies the new opacity value.  The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

- 12 The following XML Schema fragment defines the contents of this element:

```
13 <complexType name="CT_AlphaReplaceEffect">
14 <attribute name="a" type="ST_PositiveFixedPercentage" use="required"/>
15 </complexType>
```

#### 16 5.1.10.9 bevel (Line Join Bevel)

- 17 This element specifies a Bevel Line Join.

- 18 A bevel joint specifies that an angle joint is used to connect lines.

**Parent Elements**

ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineJoinBevel"/>
```

**5.1.10.10 bgClr (Background color)**

This element specifies the background color of a Pattern fill.

**Parent Elements**

pattFill (§5.1.10.47)

**Child Elements**

**Subclause**

hslClr (Hue, Saturation, Luminance Color Model)

§5.1.2.2.13

prstClr (Preset Color)

§5.1.2.2.22

schemeClr (Scheme Color)

§5.1.2.2.29

scrgbClr (RGB Color Model - Percentage Variant)

§5.1.2.2.30

srgbClr (RGB Color Model - Hex Variant)

§5.1.2.2.32

sysClr (System Color)

§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

**5.1.10.11 biLevel (Bi-Level (Black/White) Effect)**

This element specifies a bi-level (black/white) effect. Input colors whose luminance is less than the specified threshold value are changed to black. Input colors whose luminance are greater than or equal the specified value are set to white. The alpha effect values are unaffected by this effect.

**Parent Elements**

blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
thresh (Threshold)	Specifies the luminance threshold for the Bi-Level effect. Values greater than or equal to the threshold are set to white. Values lesser than the threshold are set to black.  The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BiLevelEffect">
 <attribute name="thresh" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

#### 5.1.10.12 blend (Blend Effect)

This element specifies a blend of several effects. The container specifies the raw effects to blend while the blend mode specifies how the effects are to be blended.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
cont (Effect Container)	§5.1.10.20

Attributes	Description
blend (Blend Mode)	Specifies how to blend the two effects.  The possible values for this attribute are defined by the ST_BlendMode simple type (§5.1.12.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlendEffect">
 <sequence>
 <element name="cont" type="CT_EffectContainer" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="blend" type="ST_BlendMode" use="required"/>
</complexType>
```

#### 5.1.10.13 blip (Blip)

This element specifies the existence of an image (binary large image or picture) and contains a reference to the image data.

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4); buBlip

2

Attributes	Description
cstate (Compression State)	Specifies the compression state with which the picture is stored. This allows the application to specify the amount of compression that has been applied to a picture.  The possible values for this attribute are defined by the ST_BlipCompression simple type (§5.1.12.12).
embed (Embedded Picture Reference)  Namespace: .../officeDocument /2006/relationships	Specifies the identification information for an embedded picture. This attribute is used to specify an image that resides locally within the file.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
link (Linked Picture)	Specifies the identification information for a linked picture. This attribute is used to

Attributes	Description
Reference)	specify an image that does not reside within this file.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```

</complexType>

```

#### 5.1.10.14 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

*[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.]*

```

1 <p:pic>
2 ...
3 <p:blipFill>
4 <a:blip r:embed="rId2"/>
5 <a:stretch>
6 <a:fillRect/>
7 </a:stretch>
8 </p:blipFill>
9 ...
10 </p:pic>

```

11

12 The above picture object is shown as an example of this fill type. *end example*]

13 [Example: Consider now the same picture object but with an additional gradient fill applied within the shape

14 properties portion of the picture.

```

15 <p:pic>
16 ...
17 <p:blipFill>
18 <a:blip r:embed="rId2"/>
19 <a:stretch>
20 <a:fillRect/>
21 </a:stretch>
22 </p:blipFill>
23 <p:spPr>
24 <a:gradFill>
25 <a:gsLst>
26 <a:gs pos="0">
27 <a:schemeClr val="tx2">
28 <a:shade val="50000"/>
29 </a:schemeClr>
30 </a:gs>

```

```
1 <a:gs pos="39999">
2 <a:schemeClr val="tx2">
3 <a:tint val="20000"/>
4 </a:schemeClr>
5 </a:gs>
6 <a:gs pos="70000">
7 <a:srgbClr val="C4D6EB"/>
8 </a:gs>
9 <a:gs pos="100000">
10 <a:schemeClr val="bg1"/>
11 </a:gs>
12 </a:gsLst>
13 </a:gradFill>
14 </p:spPr>
15 ...
16 </p:pic>
```

17

18 The above picture object is shown as an example of this double fill type. *end example*]

Attributes	Description
dpi (DPI Setting)	<p>Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.</p> <p>[<i>Note:</i> This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rotWithShape (Rotate With Shape)	<p>Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_BlipFillProperties">
4 <sequence>
5 <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
6 <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
10 <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
11 </complexType>

```

#### 12 5.1.10.15 blur (Blur Effect)

13 This element specifies a blur effect that is applied to the entire shape, including its fill. All color channels,  
14 including alpha, are affected.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

15

Attributes	Description
grow (Grow Bounds)	<p>Specifies whether the bounds of the object should be grown as a result of the blurring. True indicates the bounds are grown while false indicates that they are not.</p> <p>[<i>Example:</i></p>

Attributes	Description
	<p>With grow set to false, the blur effect does not extend beyond the original bounds of the object:</p>  <p>With grow set to true, the blur effect may extend beyond the original bounds of the object:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rad (Radius)	<p>Specifies the radius of blur.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_BlurEffect">
3 <attribute name="rad" type="ST_PositiveCoordinate" use="optional" default="0"/>
4 <attribute name="grow" type="xsd:boolean" use="optional" default="true"/>
5 </complexType>
```

6 **5.1.10.16**      **clrChange (Color Change Effect)**

7 This element specifies a Color Change Effect. Instances of clrFrom are replaced with instances of clrTo.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

8

Child Elements	Subclause
clrFrom (Change Color From)	§5.1.10.17

Child Elements	Subclause
clrTo (Change Color To)	§5.1.10.19

1

Attributes	Description
useA (Consider Alpha Values)	Specifies whether alpha values are considered for the effect. Effect alpha values are considered if useA is true, else they are ignored.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ColorChangeEffect">
4 <sequence>
5 <element name="clrFrom" type="CT_Color" minOccurs="1" maxOccurs="1"/>
6 <element name="clrTo" type="CT_Color" minOccurs="1" maxOccurs="1"/>
7 </sequence>
8 <attribute name="useA" type="xsd:boolean" use="optional" default="true"/>
9 </complexType>
```

### 10 5.1.10.17 clrFrom (Change Color From)

11 This element specifies a color getting removed in a color change effect. It is the "from" or source input color.

Parent Elements
clrChange (§5.1.10.16)

12

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

13 The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_Color">
15 <sequence>
16 <group ref="EG_ColorChoice"/>
17 </sequence>
18 </complexType>
```

### 5.1.10.18 **clrRepl** (Solid Color Replacement)

This element specifies a solid color replacement value. All effect colors are changed to a fixed color. Alpha values are unaffected.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorReplaceEffect">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.10.19 **clrTo** (Change Color To)

This element specifies the color which replaces the clrFrom in a clrChange effect. This is the "target" or "to" color in the color change effect.

Parent Elements
clrChange (§5.1.10.16)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 5.1.10.20 cont (Effect Container)

This element specifies an Effect Container. It is a list of effects.

##### Parent Elements

alphaMod (§5.1.10.5); blend (§5.1.10.12); cont (§5.1.10.20); effectDag (§5.1.10.25)

##### Child Elements

##### Subclause

alphaBiLevel (Alpha Bi-Level Effect)	§5.1.10.1
alphaCeiling (Alpha Ceiling Effect)	§5.1.10.2
alphaFloor (Alpha Floor Effect)	§5.1.10.3
alphaInv (Alpha Inverse Effect)	§5.1.10.4
alphaMod (Alpha Modulate Effect)	§5.1.10.5
alphaModFix (Alpha Modulate Fixed Effect)	§5.1.10.6
alphaOutset (Alpha Inset/Outset Effect)	§5.1.10.7
alphaRepl (Alpha Replace Effect)	§5.1.10.8
biLevel (Bi-Level (Black/White) Effect)	§5.1.10.11
blend (Blend Effect)	§5.1.10.12
blur (Blur Effect)	§5.1.10.15
clrChange (Color Change Effect)	§5.1.10.16
clrRepl (Solid Color Replacement)	§5.1.10.18
cont (Effect Container)	§5.1.10.20
duotone (Duotone Effect)	§5.1.10.23
effect (Effect)	§5.1.10.24
fill (Fill)	§5.1.10.28
fillOverlay (Fill Overlay Effect)	§5.1.10.29
glow (Glow Effect)	§5.1.10.32
grayscale (Gray Scale Effect)	§5.1.10.34
hsl (Hue Saturation Luminance Effect)	§5.1.10.39
innerShdw (Inner Shadow Effect)	§5.1.10.40
lum (Luminance Effect)	§5.1.10.42

Child Elements	Subclause
outerShdw (Outer Shadow Effect)	§5.1.10.45
prstShdw (Preset Shadow)	§5.1.10.49
reflection (Reflection Effect)	§5.1.10.50
relOff (Relative Offset Effect)	§5.1.10.51
softEdge (Soft Edge Effect)	§5.1.10.53
tint (Tint Effect)	§5.1.10.60
xfrm (Transform Effect)	§5.1.10.61

1

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Must be unique across all effect trees and effect containers.  The possible values for this attribute are defined by the XML Schema token datatype.
type (Effect Container Type)	Specifies the type of container, either sibling or tree.  The possible values for this attribute are defined by the ST_EffectContainerType simple type (§5.1.12.20).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_EffectContainer">
4 <group ref="EG_Effect" minOccurs="0" maxOccurs="unbounded"/>
5 <attribute name="type" type="ST_EffectContainerType" use="optional" default="sib"/>
6 <attribute name="name" type="xsd:token" use="optional"/>
7 </complexType>

```

### 8 5.1.10.21 custDash (Custom Dash)

9 This element specifies a custom dashing scheme. It is a list of dash stop elements which represent building block  
10 atoms upon which the custom dashing scheme is built.

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

11

Child Elements	Subclause
ds (Dash Stop)	§5.1.10.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DashStopList">
 <sequence>
 <element name="ds" type="CT_DashStop" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.1.10.22 ds (Dash Stop)

This element specifies a dash stop primitive. Dashing schemes are built by specifying an ordered list of dash stop primitive. A dash stop primitive consists of a dash and a space.

Parent Elements
custDash (§5.1.10.21)

Attributes	Description
d (Dash Length)	Specifies the length of the dash relative to the line width.  The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).
sp (Space Length)	Specifies the length of the space relative to the line width.  The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DashStop">
 <attribute name="d" type="ST_PositivePercentage" use="required"/>
 <attribute name="sp" type="ST_PositivePercentage" use="required"/>
</complexType>
```

#### 5.1.10.23 duotone (Duotone Effect)

This element specifies a duotone effect.

For each pixel, combines clr1 and clr2 through a linear interpolation to determine the new color for that pixel.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22

Child Elements	Subclause
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DuotoneEffect">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="2" maxOccurs="2"/>
 </sequence>
</complexType>
```

#### 5.1.10.24 effect (Effect)

This element specifies a reference to an existing effect container.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
ref (Reference)	<p>Specifies the reference. Its value may be the name of an effect container, or one of four special references:</p> <ul style="list-style-type: none"> <li>fill - refers to the fill effect</li> <li>line - refers to the line effect</li> <li>fillLine - refers to the combined fill and line effects</li> <li>children - refers to the combined effects from logical child shapes or text</li> </ul> <p>The possible values for this attribute are defined by the XML Schema token datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectReference">
 <attribute name="ref" type="xsd:token"/>
</complexType>
```

#### 5.1.10.25 effectDag (Effect Container)

This element specifies a list of effects. Effects are applied in the order specified by the container type (sibling or tree).

[Note: An effectDag element may contain multiple effect containers as child elements. Effect containers with different types may be combined in an effectDag to define a directed acyclic graph (DAG) that specifies the order in which all effects are applied. *end note*]

1

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Must be unique across all effect trees and effect containers.  The possible values for this attribute are defined by the XML Schema token datatype.
type (Effect Container Type)	Specifies the type of container, either sibling or tree.  The possible values for this attribute are defined by the ST_EffectContainerType simple type (§5.1.12.20).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_EffectContainer">
4 <group ref="EG_Effect" minOccurs="0" maxOccurs="unbounded"/>
5 <attribute name="type" type="ST_EffectContainerType" use="optional" default="sib"/>
6 <attribute name="name" type="xsd:token" use="optional"/>
7 </complexType>

```

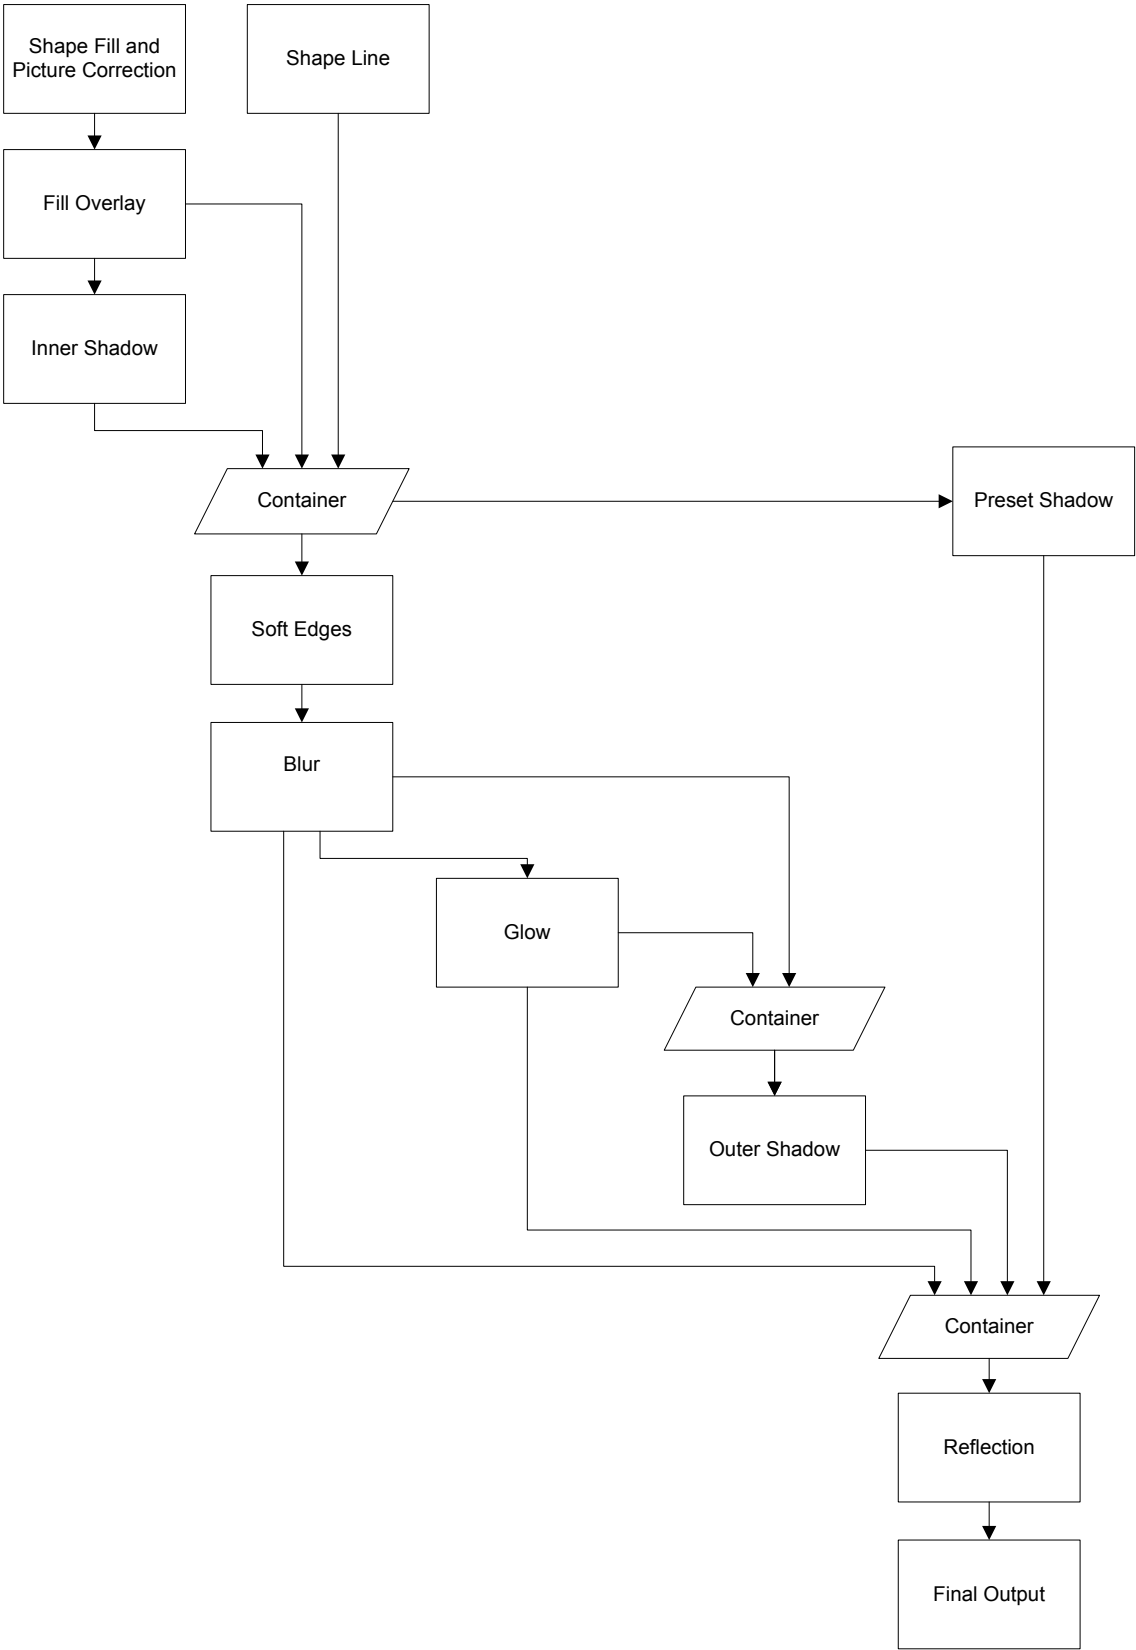

8 **5.1.10.26 effectLst (Effect Container)**

9 This element specifies a list of effects. Effects in an effectLst are applied in the default order by the rendering  
10 engine. The following diagrams illustrate the order in which effects are to be applied, both for shapes and for  
11 group shapes.

12 [*Note:* The output of many effects does not include the input shape. For effects that should be applied to the  
13 result of previous effects as well as the original shape, a container is used to group the inputs together. *end*  
14 *note*]

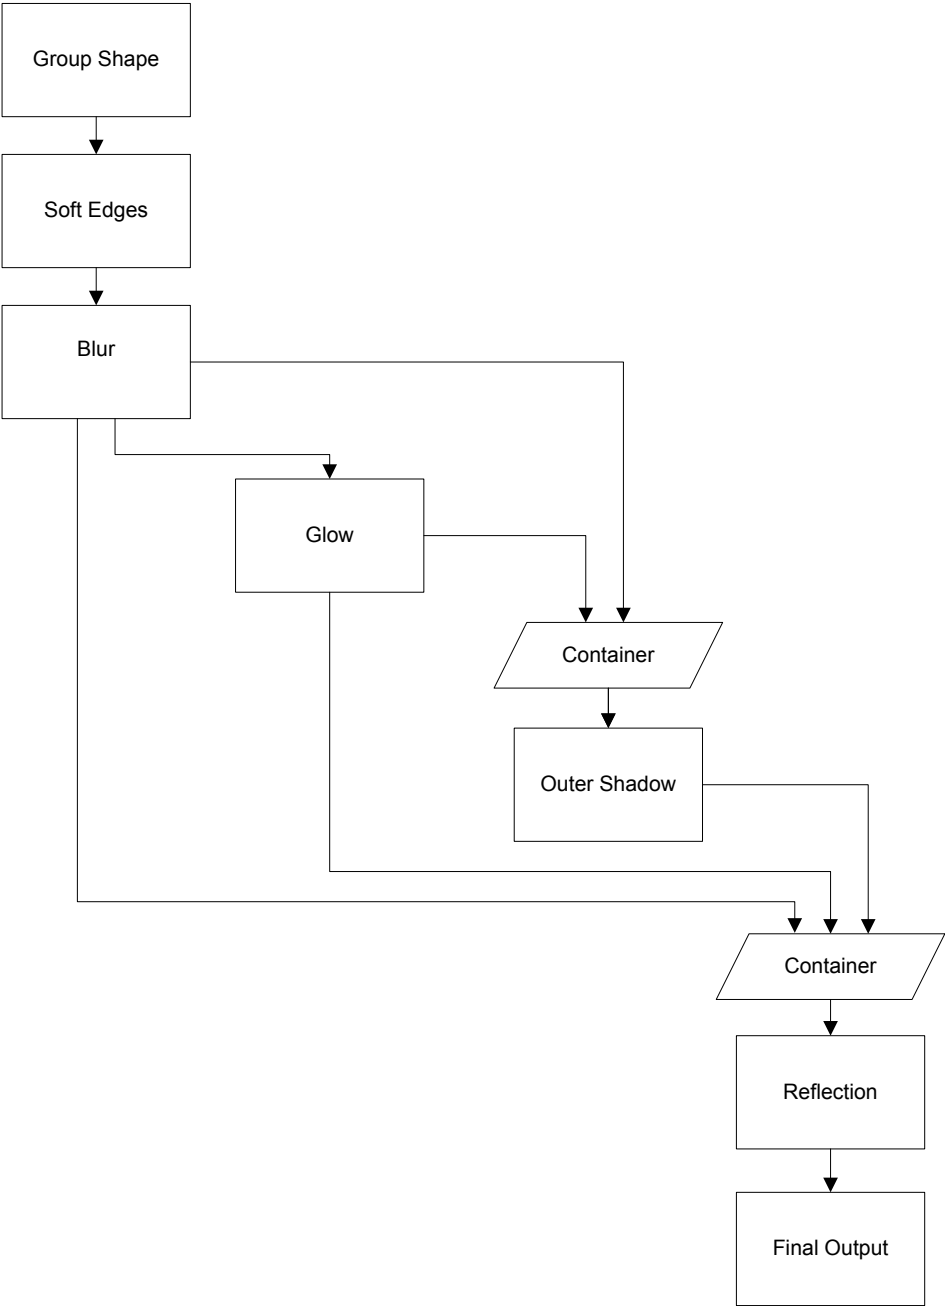

15 [*Example:* Outer Shadow is applied both to the original shape and the original shape's glow. The result of blur  
16 contains the original shape, while the result of glow contains only the added glow. Therefore, a container that  
17 groups the blur result with the glow result is used as the input to Outer Shadow. *end example*]

**effectLst Processing for Shapes**

13 </sequence>
14 </complexType>

```

### 15 5.1.10.27 fgClr (Foreground color)

16 This element specifies the foreground color of a pattern fill.

Parent Elements
pattFill (§5.1.10.47)

17

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 5.1.10.28 fill (Fill)

This element specifies a fill which is one of blipFill, gradFill, grpFill, noFill, pattFill or solidFill.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FillEffect">
 <sequence>
 <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.10.29 fillOverlay (Fill Overlay Effect)

This element specifies a fill overlay effect. A fill overlay may be used to specify an additional fill for an object and blend the two fills together.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44

Child Elements	Subclause
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

Attributes	Description
blend (Blend)	<p>Specifies how to blend the fill with the base effect.</p> <p>The possible values for this attribute are defined by the ST_BlendMode simple type (§5.1.12.11).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FillOverlayEffect">
 <sequence>
 <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="blend" type="ST_BlendMode" use="required"/>
</complexType>
```

### 5.1.10.30 fillRect (Fill Rectangle)

This element specifies a fill rectangle. When stretching of an image is specified, a source rectangle, srcRect, is scaled to fit the specified fill rectangle.

Each edge of the fill rectangle is defined by a percentage offset from the corresponding edge of the shape's bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the fill rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width.

[Example:

```
<a:blipFill>
 <a:blip r:embed="rId2"/>
 <a:stretch>
 <a:fillRect b="10000" r="25000"/>
 </a:stretch>
</a:blipFill>
```

The above image is stretched to fill the entire rectangle except for the bottom 10% and rightmost 25%.

1 *end example]*

Parent Elements
stretch (§5.1.10.56)

2

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

3 The following XML Schema fragment defines the contents of this element:

4	<code>&lt;complexType name="CT_RelativeRect"&gt;</code>
5	<code>  &lt;attribute name="l" type="ST_Percentage" use="optional" default="0"/&gt;</code>
6	<code>  &lt;attribute name="t" type="ST_Percentage" use="optional" default="0"/&gt;</code>
7	<code>  &lt;attribute name="r" type="ST_Percentage" use="optional" default="0"/&gt;</code>
8	<code>  &lt;attribute name="b" type="ST_Percentage" use="optional" default="0"/&gt;</code>
9	<code>&lt;/complexType&gt;</code>

### 10 5.1.10.31 fillToRect (Fill To Rectangle)

11 This element defines the "focus" rectangle for the center shade, specified relative to the fill tile rectangle. The  
12 center shade fills the entire tile except the margins specified by each attribute.

13 Each edge of the center shade rectangle is defined by a percentage offset from the corresponding edge of the  
14 tile rectangle. A positive percentage specifies an inset, while a negative percentage specifies an outset. For  
15 example, a left offset of 25% specifies that the left edge of the center shade rectangle is located to the right of  
16 the tile rectangle's left edge by an amount equal to 25% of the tile rectangle's width.

17 [Example:

```
<a:path path="rect">
 <a:fillToRect l="50000" r="50000" t="50000" b="50000"/>
</a:path>
```

In the above shape, the rectangle defined by fillToRect is a single point in the center of the shape. This creates the effect of the center shade focusing at a point in the center of the region.

*end example]*

[*Example:*

```
<a:path path="rect">
 <a:fillToRect l="25000" t="25000" r="25000" b="0"/>
</a:path>
```

The center shade occupies the rectangle defined by excluding the topmost, leftmost, and rightmost 25% of the region. Therefore, the gradient fills the remaining leftmost 25%, topmost 25%, and rightmost 25% of the region.

*end example]*

Parent Elements
path (§5.1.10.46)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle.

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeRect">
 <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

### 5.1.10.32 glow (Glow Effect)

This element specifies a glow effect, in which a color blurred outline is added outside the edges of the object.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
rad (Radius)	Specifies the radius of the glow.  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GlowEffect">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="rad" type="ST_PositiveCoordinate" use="optional" default="0"/>
</complexType>
```

### 5.1.10.33 `gradFill` (Gradient Fill)

This element defines a gradient fill.

A gradient fill is a fill which is characterized by a smooth gradual transition from one color to the next. At its simplest, it is a fill which transitions between two colors; or more generally, it may be a transition of any number of colors.

The desired transition colors and locations are defined in the gradient stop list (`gsLst`) child element.

The other child element defines the properties of the gradient fill (there are two styles-- a linear shade style as well as a path shade style)

*[Example:*

The following is a sample gradient fill, varying from blue to white:

*end example]*

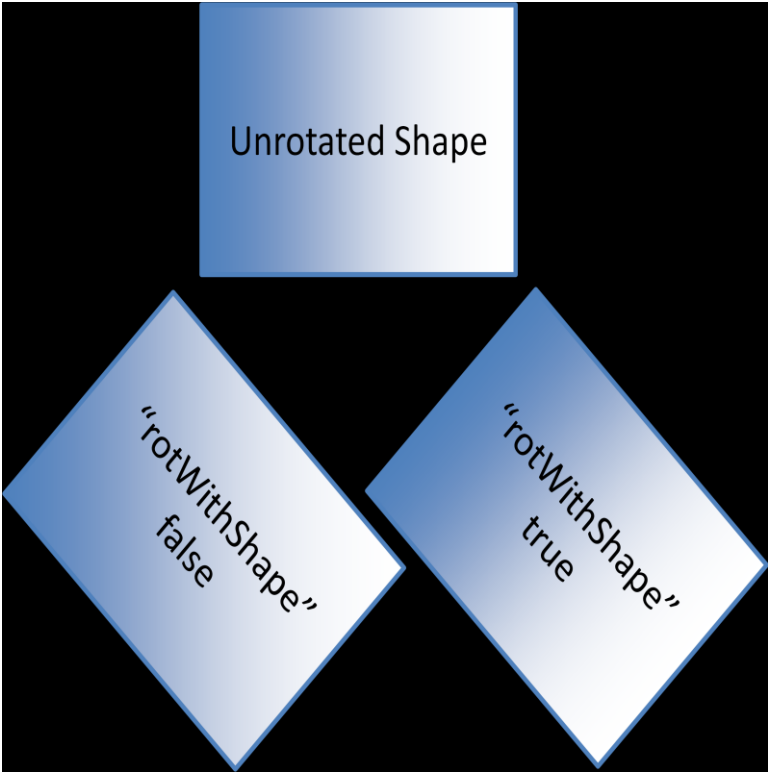

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

Child Elements	Subclause
gsLst (Gradient Stop List)	§5.1.10.37
lin (Linear Gradient Fill)	§5.1.10.41
path (Path Gradient)	§5.1.10.46

Child Elements	Subclause
tileRect (Tile Rectangle)	§5.1.10.59

1

Attributes	Description
flip (Tile Flip)	<p>Specifies the direction(s) in which to flip the gradient while tiling.</p> <p>Normally a gradient fill encompasses the entire bounding box of the shape which contains the fill. However, with the tileRect element, it is possible to define a "tile" rectangle which is smaller than the bounding box. In this situation, the gradient fill is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.</p> <p>The possible values for this attribute are defined by the ST_TileFlipMode simple type (§5.1.12.86).</p>
rotWithShape (Rotate With Shape)	<p>Specifies if a fill will rotate along with a shape when the shape is rotated.</p> <p><i>[Example:</i></p> <p>The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.</p>

Attributes	Description
	<div></div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_GradientFillProperties">
3 <sequence>
4 <element name="gsLst" type="CT_GradientStopList" minOccurs="0" maxOccurs="1"/>
5 <group ref="EG_ShadeProperties" minOccurs="0" maxOccurs="1"/>
6 <element name="tileRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="flip" type="ST_TileFlipMode" use="optional"/>
9 <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
10 </complexType>
```

### 5.1.10.34 grayscl (Gray Scale Effect)

This element specifies a gray scale effect. Converts all effect color values to a shade of gray, corresponding to their luminance. Effect alpha (opacity) values are unaffected.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GrayscaleEffect"/>
```

### 5.1.10.35 grpFill (Group Fill)

This element specifies a group fill. When specified, this setting indicates that the parent element is part of a group and should inherit the fill properties of the group.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupFillProperties"/>
```

### 5.1.10.36 gs (Gradient stops)

This element defines a gradient stop. A gradient stop consists of a position where the stop appears in the color band.

Parent Elements
gsLst (§5.1.10.37)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
pos (Position)	<p>Specifies where this gradient stop should appear in the color band. This position is specified in the range [0%, 100%], which corresponds to the beginning and the end of the color band respectively.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_GradientStop">
3 <sequence>
4 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
5 </sequence>
6 <attribute name="pos" type="ST_PositiveFixedPercentage" use="required"/>
7 </complexType>
```

8 [5.1.10.37](#)      [gsLst \(Gradient Stop List\)](#)

9 The list of gradient stops that specifies the gradient colors and their relative positions in the color band.

Parent Elements
gradFill (§5.1.10.33)

10

Child Elements	Subclause
gs (Gradient stops)	§5.1.10.36

11 The following XML Schema fragment defines the contents of this element:

```
12 <complexType name="CT_GradientStopList">
13 <sequence>
14 <element name="gs" type="CT_GradientStop" minOccurs="2" maxOccurs="unbounded"/>
15 </sequence>
16 </complexType>
```

17 [5.1.10.38](#)      [headEnd \(Line Head/End Style\)](#)

18 This element specifies decorations which can be added to the head of a line.

19

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

20

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width.  The possible values for this attribute are defined by the ST_LineEndLength simple type (§5.1.12.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead.  The possible values for this attribute are defined by the ST_LineEndType simple type (§5.1.12.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width.  The possible values for this attribute are defined by the ST_LineEndWidth simple type (§5.1.12.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineEndProperties">
 <attribute name="type" type="ST_LineEndType" use="optional"/>
 <attribute name="w" type="ST_LineEndWidth" use="optional"/>
 <attribute name="len" type="ST_LineEndLength" use="optional"/>
</complexType>
```

### 5.1.10.39 hsl (Hue Saturation Luminance Effect)

This element specifies a hue/saturation/luminance effect. The hue, saturation, and luminance may each be adjusted relative to its current value.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
hue (Hue)	Specifies the number of degrees by which the hue is adjusted.  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
lum (Luminance)	Specifies the percentage by which the luminance is adjusted.  The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
sat (Saturation)	Specifies the percentage by which the saturation is adjusted.  The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HSLEffect">
 <attribute name="hue" type="ST_PositiveFixedAngle" use="optional" default="0"/>
 <attribute name="sat" type="ST_FixedPercentage" use="optional" default="0"/>
 <attribute name="lum" type="ST_FixedPercentage" use="optional" default="0"/>
</complexType>
```

#### 5.1.10.40 innerShdw (Inner Shadow Effect)

This element specifies an inner shadow effect. A shadow is applied within the edges of the object according to the parameters given by the attributes.

#### Parent Elements

cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

#### Child Elements

#### Subclause

hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

#### Attributes

#### Description

blurRad (Blur Radius)	Specifies the blur radius.  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
dir (Direction)	Specifies the direction to offset the shadow.  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Distance)	Specifies how far to offset the shadow.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_InnerShadowEffect">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="blurRad" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
</complexType>

```

#### 5.1.10.41 [lin](#) (Linear Gradient Fill)

This element specifies a linear gradient.

Parent Elements
gradFill (§5.1.10.33)

Attributes	Description
ang (Angle)	<p>Specifies the direction of color change for the gradient. To define this angle, let its value be <math>x</math> measured clockwise. Then <math>(-\sin x, \cos x)</math> is a vector parallel to the line of constant color in the gradient fill.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).</p>
scaled (Scaled)	<p>Whether the gradient angle scales with the fill region. Mathematically, if this flag is true, then we scale the gradient vector <math>(\cos x, \sin x)</math> by the width (<math>w</math>) and height (<math>h</math>) of the fill region, so that the vector becomes <math>(w \cos x, h \sin x)</math> (before normalization). Observe that now if the gradient angle is 45 degrees, the gradient vector is <math>(w, h)</math>, which goes from top-left to bottom-right of the fill region. If this flag is false, the gradient angle is independent of the fill region and will not be scaled using the manipulation described above. So a 45-degree gradient angle always give a gradient band whose line of constant color is parallel to the vector <math>(1, -1)</math>.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_LinearShadeProperties">
 <attribute name="ang" type="ST_PositiveFixedAngle" use="optional"/>
 <attribute name="scaled" type="xsd:boolean" use="optional"/>
</complexType>

```

#### 5.1.10.42 lum (Luminance Effect)

This element specifies a luminance effect. Brightness linearly shifts all colors closer to white or black. Contrast scales all colors to be either closer or further apart.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
bright (Brightness)	Specifies the percent to change the brightness.  The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
contrast (Contrast)	Specifies the percent to change the contrast.  The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LuminanceEffect">
 <attribute name="bright" type="ST_FixedPercentage" use="optional" default="0"/>
 <attribute name="contrast" type="ST_FixedPercentage" use="optional" default="0"/>
</complexType>
```

#### 5.1.10.43 miter (Miter Line Join)

This element specifies that a line join shall be mitered.

[Example: The following sample illustrated two lines which are joined using a mitered style

end example]

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
lim (Miter Join Limit)	Specifies the amount by which lines will be extended to form a miter join - otherwise miter joins can extend infinitely far (for lines which are almost parallel).

Attributes	Description
	The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_LineJoinMiterProperties">
3 <attribute name="lim" type="ST_PositivePercentage" use="optional"/>
4 </complexType>
```

#### 5 5.1.10.44 noFill (No Fill)

6 This element specifies that no fill will be applied to the parent element.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

7 The following XML Schema fragment defines the contents of this element:

```
8 <complexType name="CT_NoFillProperties"/>
```

#### 9 5.1.10.45 outerShdw (Outer Shadow Effect)

10 This element specifies an Outer Shadow Effect.

11 [Example: The following is an example of an outer shadow effect.

12

13 end example]

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

14

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13

Child Elements	Subclause
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

1

Attributes	Description
align (Shadow Alignment)	Specifies shadow alignment; alignment happens first, effectively setting the origin for scale, skew, and offset.  The possible values for this attribute are defined by the ST_RectAlignment simple type (§5.1.12.53).
blurRad (Blur Radius)	Specifies the blur radius of the shadow.  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
dir (Shadow Direction)	Specifies the direction to offset the shadow.  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Shadow Offset Distance)	Specifies the how far to offset the shadow.  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
kx (Horizontal Skew)	Specifies the horizontal skew angle.  The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
ky (Vertical Skew)	Specifies the vertical skew angle.  The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
rotWithShape (Rotate With Shape)	Specifies whether the shadow should rotate with the shape if the shape is rotated.  The possible values for this attribute are defined by the XML Schema boolean datatype.
sx (Horizontal Scaling Factor)	Specifies the horizontal scaling factor; negative scaling causes a flip.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
sy (Vertical Scaling)	Specifies the vertical scaling factor; negative scaling causes a flip.

Attributes	Description
Factor)	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OuterShadowEffect">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="blurRad" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
 <attribute name="sx" type="ST_Percentage" use="optional" default="100000"/>
 <attribute name="sy" type="ST_Percentage" use="optional" default="100000"/>
 <attribute name="kx" type="ST_FixedAngle" use="optional" default="0"/>
 <attribute name="ky" type="ST_FixedAngle" use="optional" default="0"/>
 <attribute name="align" type="ST_RectAlignment" use="optional" default="b"/>
 <attribute name="rotWithShape" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.10.46 path (Path Gradient)

This element defines that a gradient fill will follow a path vs. a linear line.

[Example:

The examples above illustrate gradient fills following a circular, rectangular or shape path.

*end example]*

Parent Elements
gradFill (§5.1.10.33)

Child Elements	Subclause
fillToRect (Fill To Rectangle)	§5.1.10.31

Attributes	Description
path (Gradient Fill Path)	Specifies the shape of the path to follow.  The possible values for this attribute are defined by the ST_PathShadeType simple type (§5.1.12.39).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PathShadeProperties">
 <sequence>
 <element name="fillToRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="path" type="ST_PathShadeType" use="optional"/>
</complexType>
```

#### 5.1.10.47 pattFill (Pattern Fill)

This element specifies a pattern fill. A repeated pattern is used to fill the object.

##### Parent Elements

bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

##### Child Elements

##### Subclause

bgClr (Background color)

§5.1.10.10

fgClr (Foreground color)

§5.1.10.27

##### Attributes

##### Description

prst (Preset Pattern)

Specifies one of a set of preset patterns to fill the object.

The possible values for this attribute are defined by the ST\_PresetPatternVal simple type (§5.1.12.51).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PatternFillProperties">
 <sequence>
 <element name="fgClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="bgClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="prst" type="ST_PresetPatternVal" use="optional"/>
</complexType>
```

#### 5.1.10.48 prstDash (Preset Dash)

This element specifies that a preset line dashing scheme should be used.

##### Parent Elements

ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr

Parent Elements
(§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
val (Value)	Specifies which preset dashing scheme is to be used.  The possible values for this attribute are defined by the ST_PresetLineDashVal simple type (§5.1.12.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresetLineDashProperties">
 <attribute name="val" type="ST_PresetLineDashVal" use="optional"/>
</complexType>
```

#### 5.1.10.49 prstShdw (Preset Shadow)

This element specifies that a preset shadow is to be used. Each preset shadow is equivalent to a specific outer shadow effect. For each preset shadow, the color element, direction attribute, and distance attribute represent the color, direction, and distance parameters of the corresponding outer shadow. Additionally, the rotateWithShape attribute of corresponding outer shadow is always false. Other non-default parameters of the outer shadow are dependent on the prst attribute.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29

sysClr (System Color)	§5.1.2.2.33

Attributes	Description
dir (Direction)	Specifies the direction to offset the shadow.  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Distance)	Specifies how far to offset the shadow.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prst (Preset Shadow)	Specifies which preset shadow to use.  The possible values for this attribute are defined by the ST_PresetShadowVal simple type (§5.1.12.52).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_PresetShadowEffect">
3 <sequence>
4 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
5 </sequence>
6 <attribute name="prst" type="ST_PresetShadowVal" use="required"/>
7 <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
8 <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
9 </complexType>
```

10 **5.1.10.50 reflection (Reflection Effect)**

11 This element specifies a reflection effect.

12 *[Example:*

13 *end example]*

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

14

Attributes	Description
algn (Shadow Alignment)	Specifies shadow alignment.  The possible values for this attribute are defined by the ST_RectAlignment simple type

Attributes	Description
	(§5.1.12.53).
blurRad (Blur Radius)	<p>Specifies the blur radius.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
dir (Direction)	<p>Specifies the direction of the alpha gradient ramp relative to the shape itself.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).</p>
dist (Distance)	<p>Specifies how far to distance the shadow.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
endA (End Alpha)	<p>Specifies the ending reflection opacity.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>
endPos (End Position)	<p>Specifies the end position (along the alpha gradient ramp) of the end alpha value.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>
fadeDir (Fade Direction)	<p>Specifies the direction to offset the reflection.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).</p>
kx (Horizontal Skew)	<p>Specifies the horizontal skew angle.</p> <p>The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).</p>
ky (Vertical Skew)	<p>Specifies the vertical skew angle.</p> <p>The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).</p>
rotWithShape (Rotate With Shape)	<p>Specifies if the reflection should rotate with the shape.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
stA (Start Opacity)	<p>starting reflection opacity.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>
stPos (Start Position)	<p>Specifies the start position (along the alpha gradient ramp) of the start alpha value.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).
sx (Horizontal Ratio)	Specifies the horizontal scaling factor.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
sy (Vertical Ratio)	Specifies the vertical scaling factor.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ReflectionEffect">

 <attribute name="rotWithShape" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

#### 5.1.10.51 relOff (Relative Offset Effect)

This element specifies a relative offset effect. Sets up a new origin by offsetting relative to the size of the previous effect.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
tx (Offset X)	Specifies the X offset.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
ty (Offset Y)	Specifies the Y offset.  The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeOffsetEffect">
 <attribute name="tx" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="ty" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

#### 5.1.10.52 round (Round Line Join)

This element specifies that lines joined together will have a round join.

[Example:

end example]

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineJoinRound"/>
```

#### 5.1.10.53 softEdge (Soft Edge Effect)

This element specifies a soft edge effect. The edges of the shape are blurred, while the fill is not affected.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Attributes	Description
rad (Radius)	Specifies the radius of blur to apply to the edges.  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SoftEdgesEffect">
 <attribute name="rad" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

### 5.1.10.54 **solidFill** (Solid Fill)

This element specifies a solid color fill. The shape is filled entirely with the specified color.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SolidColorFillProperties">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.10.55 **srcRect** (Source Rectangle)

This element specifies the portion of the blip used for the fill.

Each edge of the source rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the source rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width.

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeRect">
 <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
 <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

#### 5.1.10.56 stretch (Stretch)

This element specifies that a BLIP should be stretched to fill the target rectangle. The other option is a tile where a BLIP is tiled to fill the available area.

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4)

Child Elements	Subclause
fillRect (Fill Rectangle)	§5.1.10.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StretchInfoProperties">
 <sequence>
 <element name="fillRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.10.57 tailEnd (Tail line end style)

This element specifies decorations which can be added to the tail of a line.

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width.  The possible values for this attribute are defined by the ST_LineEndLength simple type (§5.1.12.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead.  The possible values for this attribute are defined by the ST_LineEndType simple type (§5.1.12.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width.  The possible values for this attribute are defined by the ST_LineEndWidth simple type (§5.1.12.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineEndProperties">
 <attribute name="type" type="ST_LineEndType" use="optional"/>
 <attribute name="w" type="ST_LineEndWidth" use="optional"/>
 <attribute name="len" type="ST_LineEndLength" use="optional"/>
</complexType>
```

### 5.1.10.58 tile (Tile)

This element specifies that a BLIP should be tiled to fill the available space. This element defines a "tile" rectangle within the bounding box. The image is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.

[Example:

The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

1

2 *end example]*

3

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4)

Attributes	Description
align (Alignment)	<p>Specifies where to align the first tile with respect to the shape. Alignment happens after the scaling, but before the additional offset.</p> <p>The possible values for this attribute are defined by the ST_RectAlignment simple type (§5.1.12.53).</p>
flip (Tile Flipping)	<p>Specifies the direction(s) in which to flip the source image while tiling. Images may be flipped horizontally, vertically, or in both directions to fill the entire region.</p> <p>The possible values for this attribute are defined by the ST_TileFlipMode simple type (§5.1.12.86).</p>
sx (Horizontal Ratio)	<p>Specifies the amount to horizontally scale the srcRect.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
sy (Vertical Ratio)	<p>Specifies the amount to vertically scale the srcRect.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
tx (Horizontal Offset)	<p>Specifies additional horizontal offset after alignment.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
ty (Vertical Offset)	<p>Specifies additional vertical offset after alignment.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TileInfoProperties">
 <attribute name="tx" type="ST_Coordinate" use="optional"/>
 <attribute name="ty" type="ST_Coordinate" use="optional"/>
 <attribute name="sx" type="ST_Percentage" use="optional"/>
 <attribute name="sy" type="ST_Percentage" use="optional"/>
 <attribute name="flip" type="ST_TileFlipMode" use="optional"/>
 <attribute name="align" type="ST_RectAlignment" use="optional"/>
</complexType>
```

#### 5.1.10.59 tileRect (Tile Rectangle)

This element specifies a rectangular region of the shape to which the gradient is applied. This region is then tiled across the remaining area of the shape to complete the fill. The tile rectangle is defined by percentage offsets from the sides of the shape's bounding box.

Each edge of the tile rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the tile rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width.

*[Example:*

The image above depicts a horizontal gradient with no tileRect element.

The image above depicts the same gradient with a tileRect element specifying l="50000" (50%). The right half of the shape is the tile to which the gradient is applied, and the left half of the shape contains a tiled copy of that gradient fill.

The image above depicts the same gradient with a tileRect element specifying l="75000" (75%). The rightmost 25% of the shape contains the tile rectangle to which the gradient is applied. This gradient is tiled three times to

1 cover the leftmost 75% of the shape. Note that the tile rectangle is flipped horizontally when covering the  
 2 shape.

3 *end example]*

Parent Elements
gradFill (§5.1.10.33)

4

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

5 The following XML Schema fragment defines the contents of this element:

```

6 <complexType name="CT_RelativeRect">
7 <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
8 <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
9 <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
10 <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
11 </complexType>

```

## 12 5.1.10.60 tint (Tint Effect)

13 This element specifies a tint effect. Shifts effect color values towards/away from hue by the specified amount.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

14

Attributes	Description
amt (Amount)	Specifies by how much the color value is shifted.

Attributes	Description
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
hue (Hue)	Specifies the hue towards which to tint.  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TintEffect">
3 <attribute name="hue" type="ST_PositiveFixedAngle" use="optional" default="0"/>
4 <attribute name="amt" type="ST_FixedPercentage" use="optional" default="0"/>
5 </complexType>
```

#### 6 5.1.10.61 xfrm (Transform Effect)

7 This element specifies a transform effect. The transform is applied to each point in the shape's geometry using  
8 the following matrix:

$$\begin{bmatrix} sx & \tan(kx) & tx \\ \tan(ky) & sy & ty \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

9

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

10

Attributes	Description
kx (Horizontal Skew)	Specifies the horizontal skew angle, defined as the angle between the top-left corner and bottom-left corner of the object's original bounding box. If positive, the bottom edge of the shape will be positioned to the right relative to the top edge.  The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
ky (Vertical Skew)	Specifies the vertical skew angle, defined as the angle between the top-left corner and top-right corner of the object's original bounding box. If positive, the right edge of the object will be positioned lower relative to the left edge.  The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
sx (Horizontal Ratio)	Specifies a percentage by which to horizontally scale the object.  The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).
sy (Vertical Ratio)	Specifies a percentage by which to vertically scale the object.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
tx (Horizontal Shift)	Specifies an amount by which to shift the object along the x-axis.  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
ty (Vertical Shift)	Specifies an amount by which to shift the object along the y-axis.  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TransformEffect">
 <attribute name="sx" type="ST_Percentage" use="optional" default="100000"/>
 <attribute name="sy" type="ST_Percentage" use="optional" default="100000"/>
 <attribute name="kx" type="ST_FixedAngle" use="optional" default="0"/>
 <attribute name="ky" type="ST_FixedAngle" use="optional" default="0"/>
 <attribute name="tx" type="ST_Coordinate" use="optional" default="0"/>
 <attribute name="ty" type="ST_Coordinate" use="optional" default="0"/>
</complexType>

```

### 5.1.11 Shape Definitions and Attributes

The Shape Definitions and Attributes portion of the DrawingML framework deals with all geometric properties for shapes within a document. This includes both preset geometries that publicly are interpreted by the generating application and custom geometries that have their points and curves explicitly specified. In addition to the underlying geometry of the shape there are also other coordinate-based properties for each shape that this framework describes.

#### 5.1.11.1 ahLst (List of Shape Adjust Handles)

This element specifies the adjust handles that will be applied to a custom geometry. These adjust handles will specify points within the geometric shape that can be used to perform certain transform operations on the shape.

*[Example:* Consider the scenario where a custom geometry, an arrow in this case, has been drawn and adjust handles have been placed at the top left corner of both the arrow head and arrow body. The user interface can then be made to transform only certain parts of the shape by using the corresponding adjust handle.

For instance if the user wished to change only the width of the arrow head then they would use the adjust handle located on the top left of the arrow head. The result of adjusting this will transform the shape as shown below.

*end example]*

Parent Elements
custGeom (§5.1.11.8)

Child Elements	Subclause
ahPolar (Polar Adjust Handle)	§5.1.11.2
ahXY (XY Adjust Handle)	§5.1.11.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdjustHandleList">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="ahXY" type="CT_XYAdjustHandle" minOccurs="1" maxOccurs="1"/>
 <element name="ahPolar" type="CT_PolarAdjustHandle" minOccurs="1" maxOccurs="1"/>
 </choice>
</complexType>
```

5.1.11.2 ahPolar (Polar Adjust Handle)

This element specifies a polar adjust handle for a custom shape. The position of this adjust handle will be specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max type attributes. Based on the adjustment of this adjust handle certain corresponding guides will be updated to contain these values.

gdRefY (Vertical Adjustment Guide)	<p>Specifies the name of the guide that will be updated with the adjustment y position from this adjust handle.</p> <p>The possible values for this attribute are defined by the ST_GeomGuideName simple type (§5.1.12.26).</p>
maxX (Maximum Horizontal Adjustment)	<p>Specifies the maximum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move in the x direction. That is the maxX and minX will be equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).</p>
maxY (Maximum	Specifies the maximum vertical position that is allowed for this adjustment handle. If this

Attributes	Description
Vertical Adjustment)	<p>attribute is omitted, then it will be assumed that this adjust handle cannot move in the y direction. That is the maxY and minY will be equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).</p>
minX (Minimum Horizontal Adjustment)	<p>Specifies the minimum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move in the x direction. That is the maxX and minX will be equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).</p>
minY (Minimum Vertical Adjustment)	<p>Specifies the minimum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move in the y direction. That is the maxY and minY will be equal.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_XYAdjustHandle">
 <sequence>
 <element name="pos" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="gdRefX" type="ST_GeomGuideName" use="optional"/>
 <attribute name="minX" type="ST_AdjCoordinate" use="optional"/>
 <attribute name="maxX" type="ST_AdjCoordinate" use="optional"/>
 <attribute name="gdRefY" type="ST_GeomGuideName" use="optional"/>
 <attribute name="minY" type="ST_AdjCoordinate" use="optional"/>
 <attribute name="maxY" type="ST_AdjCoordinate" use="optional"/>
</complexType>

```

#### 5.1.11.4 arcTo (Draw Arc To)

This element specifies the existence of an arc within a shape path. It draws an arc with the specified parameters from the current pen position to the new point specified. An arc is a line that is bent based on the shape of a supposed circle. The length of this arc is determined by specifying both a start angle and an ending angle that act together to effectively specify an end point for the arc.

*[Example:* The diagram shown below represents a single arc that has a start angle of 300 degrees and a swing angle of 150 degrees. This arc will be drawn using the supposed circle that is described using the hR and wR attributes as shown below. The degrees by which the stAng must abide is shown along the circumference of the circle. These degrees are to be specified in 60,000ths of a degree. If this arc were part of a shape the start angle point along the circle would be the starting point along the path and the ending point would be the ending of the angle swing along this supposed circle. That is any shape geometry coming before this arc in the shape path

- 1
- would be joined with the upper point of this arc and consequently any geometry coming after this arc in the
- 2
- path would be joined with the lower point of this arc.

- 3
- 4
- end example]

Parent Elements
path (§5.1.11.15)

5

Attributes	Description
hR (Shape Arc Height Radius)	<p>This attribute will specify the height radius of the supposed circle being used to draw the arc. This will give the circle a total height of (2 * hR). This total height could also be called it's vertical diameter as it is the diameter for the y axis only.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).</p>
stAng (Shape Arc Start Angle)	<p>Specifies the start angle for an arc. This angle will specify what angle along the supposed circle path will be used as the start position for drawing the arc. This start angle will be locked to the last known pen position in the shape path. Thus guaranteeing a continuos shape path.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).</p>
swAng (Shape Arc Swing Angle)	<p>Specifies the swing angle for an arc. This angle will specify how far angle-wise along the supposed cicle path the arc will be extended. The extension from the start angle will always be in the clockwise direction around the supposed circle.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).</p>
wR (Shape Arc Width Radius)	<p>This attribute will specify the width radius of the supposed circle being used to draw the arc. This will give the circle a total width of (2 * wR). This total width could also be called it's horizontal diameter as it is the diameter for the x axis only.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type</p>

Attributes	Description
	(§5.1.12.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DArcTo">
 <attribute name="wR" type="ST_AdjCoordinate" use="required"/>
 <attribute name="hR" type="ST_AdjCoordinate" use="required"/>
 <attribute name="stAng" type="ST_AdjAngle" use="required"/>
 <attribute name="swAng" type="ST_AdjAngle" use="required"/>
</complexType>
```

5.1.11.5 avLst (List of Shape Adjust Values)

This element specifies the adjust values that will be applied to the specified shape. An adjust value is simply a guide that has a value based formula specified. That is, no calculation takes place for an adjust value guide. Instead, this guide specifies a parameter value that is used for calculations within the shape guides.

[Example: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an adjust value. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the height, namely 2. Thus we see in the figure below that the bottom of the triangle matches the bottom of the shape bounding box.

```
<a:xfrm>
 <a:off x="3200400" y="1600200"/>
 <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
 <a:avLst>
 <a:gd name="myGuide" fmla="val 2"/>
 </a:avLst>
 <a:gdLst/>
 <a:ahLst/>
 <a:cxnLst/>
 <a:rect l="0" t="0" r="0" b="0"/>
 <a:pathLst>
 <a:path w="2" h="2">
 <a:moveTo>
 <a:pt x="0" y="myGuide"/>
 </a:moveTo>
```

```
1 <a:lnTo>
2 <a:pt x="2" y="myGuide"/>
3 </a:lnTo>
4 <a:lnTo>
5 <a:pt x="1" y="0"/>
6 </a:lnTo>
7 <a:close/>
8 </a:path>
9 </a:pathLst>
10 </a:custGeom>
```

11 If however we change the adjust value to half that, namely 1. Then we see the entire bottom edge of the  
12 triangle move to now be placed along the vertical midpoint within the shape bounding box. This is because both  
13 of the bottom points in this triangle depend on this adjust value for their coordinate positions. The triangle and  
14 corresponding DrawingML shown below illustrate this point.

```
15
16 <a:avLst>
17 <a:gd name="myGuide" fmla="val 1"/>
18 </a:avLst>
```

19 *end example]*

Parent Elements
custGeom (§5.1.11.8); prstGeom (§5.1.11.18); prstTxWarp (§5.1.11.19)

Child Elements	Subclause
gd (Shape Guide)	§5.1.11.11

21 The following XML Schema fragment defines the contents of this element:

```
22 <complexType name="CT_GeomGuideList">
23 <sequence>
24 <element name="gd" type="CT_GeomGuide" minOccurs="0" maxOccurs="unbounded"/>
25 </sequence>
26 </complexType>
```

5.1.11.6 close (Close Shape Path)

This element specifies the ending of a series of lines and curves in the creation path of a custom geometric shape. When this element is encountered, the generating application should consider the corresponding path closed. That is, any further lines or curves that follow this element should be ignored.

[Note: It is valid to have a path be specified and not closed. A path such as this cannot however have any fill associated with it as it has not been considered a closed geometric path.

[Example: Consider the following DrawingML.

```
<a:custGeom>
 <a:pathLst>
 <a:path w="2824222" h="590309">
 <a:moveTo>
 <a:pt x="0" y="428263"/>
 </a:moveTo>
 <a:lnTo>
 <a:pt x="1620455" y="590309"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="2824222" y="173620"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="1562582" y="0"/>
 </a:lnTo>
 <a:close/>
 </a:path>
 </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*

[Note: When the last point in the creation path does not meet with the first point in the creation path the generating application should connect the last point with the first via a straight line, thus creating a closed shape geometry. *end note*

Parent Elements
path (§5.1.11.15)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DClose"/>
```

5.1.11.7 cubicBezTo (Draw Cubic Bezier Curve To)

This element specifies to draw a cubic bezier curve along the specified points. To specify a cubic bezier curve there needs to be 3 points specified. The first two are control points used in the cubic bezier calculation and the last is the ending point for the curve. The coordinate system used for this type of curve is the path coordinate system as this element is path specific.

Parent Elements
path (§5.1.11.15)

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DCubicBezierTo">
 <sequence>
 <element name="pt" type="CT_AdjPoint2D" minOccurs="3" maxOccurs="3"/>
 </sequence>
</complexType>
```

5.1.11.8 custGeom (Custom Geometry)

This element specifies the existence of a custom geometric shape. This shape will consist of a series of lines and curves described within a creation path. In addition to this there may also be adjust values, guides, adjust handles, connection sites and an inscribed rectangle specified for this custom geometric shape.

[Example: Consider the scenario when a preset geometry does not accurately depict what must be displayed in the document. For this a custom geometry can be used to define most any 2-dimensional geometric shape. Shown below is an example of such a custom geometry.

```
<a:custGeom>
 <a:avLst/>
 <a:gdLst/>
 <a:ahLst/>
 <a:cxnLst/>
 <a:rect l="0" t="0" r="0" b="0"/>
 <a:pathLst>
 <a:path w="2650602" h="1261641">
 <a:moveTo>
 <a:pt x="0" y="1261641"/>
 </a:moveTo>
 <a:lnTo>
 <a:pt x="2650602" y="1261641"/>
 </a:lnTo>
```

```
1 <a:lnTo>
2 <a:pt x="1226916" y="0"/>
3 </a:lnTo>
4 <a:close/>
5 </a:path>
6 </a:pathLst>
7 </a:custGeom>
```

The custom geometry above is drawn by first moving to a specific starting point with the moveTo element. Then a series of lnTo elements in the creation path specify the lines that make up the borders of the shape and finally a close element is used to specify the end of the creation path. The resulting shape is shown above. *end example]*

Parent Elements
spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6)

Child Elements	Subclause

 <element name="pathLst" type="CT_Path2DList" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.11.9 cxn (Shape Connection Site)

This element specifies the existence of a connection site on a custom shape. A connection site allows a cxnSp to be attached to this shape. This connection will be maintained when the shape is repositioned within the document. It should be noted that this connection is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[Note: The transform coordinate system is different from a path coordinate system as it is per shape instead of per path within the shape. *end note*]

[Example: Consider the following custom geometry that has two connection sites specified. One connection is located at the bottom left of the shape and the other at the bottom right. The following DrawingML would describe such a custom geometry.

```
<a:xfrm>
 <a:off x="3200400" y="1600200"/>
 <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
 <a:avLst/>
 <a:gdLst/>
 <a:ahLst/>
 <a:cxnLst>
 <a:cxn ang="0">
 <a:pos x="0" y="679622"/>
 </a:cxn>
```

```
<a:cxn ang="0">
 <a:pos x="1705233" y="679622"/>
</a:cxn>
</a:cxnLst>
<a:rect l="0" t="0" r="0" b="0"/>
<a:pathLst>
 <a:path w="2" h="2">
 <a:moveTo>
 <a:pt x="0" y="2"/>
 </a:moveTo>
 <a:lnTo>
 <a:pt x="2" y="2"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="1" y="0"/>
 </a:lnTo>
 <a:close/>
 </a:path>
</a:pathLst>
</a:custGeom>
```

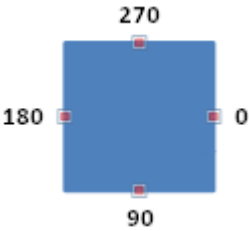

*end example]*

cxnLst (§5.1.11.10)

Child Elements	Subclause
pos (Shape Position Coordinate)	§5.1.11.17

Attributes	Description
ang (Connection Site Angle)	<p>Specifies the incoming connector angle. This angle is the angle around the connection site that an incoming connector will try to be routed to. This allows connectors to know where the shape is in relation to the connection site and route connectors so as to avoid any overlap with the shape.</p> <p>[<i>Example:</i> Consider a simple square. In order to not have any connectors routed over the shape, the collowing angles would be specified for their respective connection sites.</p>

Attributes	Description
	<div><p><i>end example]</i></p><p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).</p></div>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_ConnectionSite">
3 <sequence>
4 <element name="pos" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
5 </sequence>
6 <attribute name="ang" type="ST_AdjAngle" use="required"/>
7 </complexType>
```

8 **5.1.11.10 cxnLst (List of Shape Connection Sites)**

9 This element specifies all the connection sites that will be used for this shape. A connection site is specified by  
10 defining a point within the shape bounding box that can have a cxnSp element attached to it. These connection  
11 sites are specified using the shape coordinate system that is specified within the ext transform element.

Parent Elements
custGeom (§5.1.11.8)

12

Child Elements	Subclause
cxn (Shape Connection Site)	§5.1.11.9

13 The following XML Schema fragment defines the contents of this element:

```
14 <complexType name="CT_ConnectionSiteList">
15 <sequence>
16 <element name="cxn" type="CT_ConnectionSite" minOccurs="0" maxOccurs="unbounded"/>
17 </sequence>
18 </complexType>
```

19 **5.1.11.11 gd (Shape Guide)**

20 This element specifies the precense of a shape guide that will be used to govern the geometry of the specified  
21 shape. A shape guide consists of a formula and a name that the result of the formula is assigned to. Recognized  
22 formulas are listed with the fmla attribute documentation for this element.

[*Note:* The order in which guides are specified determines the order in which their values will be calculated. For instance it is not possible to specify a guide that uses another guides result when that guide has not yet been calculated. *end note*]

[*Example:* Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an guide. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the  $\frac{2}{3}$  the value of the shape height. Thus we see in the figure below that the triangle appears to occupy  $\frac{2}{3}$  of the vertical space within the shape bounding box.

```

<a:xfrm>
 <a:off x="3200400" y="1600200"/>
 <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
 <a:avLst/>
 <a:gdLst>
 <a:gd name="myGuide" fmla="*/ h 2 3"/>
 </a:gdLst>
 <a:ahLst/>
 <a:cxnLst/>
 <a:rect l="0" t="0" r="0" b="0"/>
 <a:pathLst>
 <a:path w="1705233" h="679622">
 <a:moveTo>
 <a:pt x="0" y="myGuide"/>
 </a:moveTo>
 <a:lnTo>
 <a:pt x="1705233" y="myGuide"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="852616" y="0"/>
 </a:lnTo>
 <a:close/>
 </a:path>
 </a:pathLst>
</a:custGeom>

```

1 If however we change the guide to half that, namely 1/3. Then we see the entire bottom edge of the triangle  
2 move to now only occupy 1/3 of the total space within the shape bounding box. This is because both of the  
3 bottom points in this triangle depend on this guide for their coordinate positions. The triangle and  
4 corresponding DrawingML shown below illustrate this point.

5  
6 `<a:gdLst>`  
7 `<a:gd name="myGuide" fmla="*/ h 1 3"/>`  
8 `</a:gdLst>`  
9 *end example]*

10

Attributes	Description
fmla (Shape Guide Formula)	<p>Specifies the formula that will be used to calculate the value for a guide. Each formula has a certain number of arguments and a specific set of operations to perform on these arguments in order to generate a value for a guide. There are a total of 17 different formulas available. These are shown below with the usage for each defined.</p> <p><b>('*/') - Multiply Divide Formula</b> Arguments: 3 (fmla="*/ x y z") Usage: "*/ x y z" = ((x * y) / z) = value of this guide</p> <p><b>('+-') - Add Subtract Formula</b> Arguments: 3 (fmla="+- x y z") Usage: "+- x y z" = ((x + y) - z) = value of this guide</p> <p><b>('+/' ) - Add Divide Formula</b> Arguments: 3 (fmla="+/ x y z") Usage: "+/ x y z" = ((x + y) / z) = value of this guide</p> <p><b>('?:') - If Else Formula</b> Arguments: 3 (fmla="?: x y z") Usage: "?: x y z" = if (x &gt; 0), then y = value of this guide, else z = value of this guide</p> <p><b>('abs') - Absolute Value Formula</b> Arguments: 1 (fmla="abs x") Usage: "abs x" = if (x &lt; 0), then (-1) * x = value of this guide else x = value of this guide</p>

Attributes	Description
	<p><b>('at2') - ArcTan Formula</b>  Arguments: 2 (fmla="at2 x y")  Usage: "at2 x y" = <math>\arctan(y / x)</math> = value of this guide</p> <p><b>('cat2') - Cosine ArcTan Formula</b>  Arguments: 3 (fmla="cat2 x y z")  Usage: "cat2 x y z" = <math>(x * (\cos(\arctan(z / y))))</math> = value of this guide</p> <p><b>('cos') - Cosine Formula</b>  Arguments: 2 (fmla="cos x y")  Usage: "cos x y" = <math>(x * \cos(y))</math> = value of this guide</p> <p><b>('max') - Maximum Value Formula</b>  Arguments: 2 (fmla="max x y")  Usage: "max x y" = if <math>(x &gt; y)</math>, then <math>x</math> = value of this guide  else <math>y</math> = value of this guide</p> <p><b>('min') - Minimum Value Formula</b>  Arguments: 2 (fmla="min x y")  Usage: "min x y" = if <math>(x &lt; y)</math>, then <math>x</math> = value of this guide  else <math>y</math> = value of this guide</p> <p><b>('mod') - Modulo Formula</b>  Arguments: 3 (fmla="mod x y z")  Usage: "mod x y z" = <math>\sqrt{x^2 + b^2 + c^2}</math> = value of this guide</p> <p><b>('pin') - Pin To Formula</b>  Arguments: 3 (fmla="pin x y z")  Usage: "pin x y z" = if <math>(y &lt; x)</math>, then <math>x</math> = value of this guide  else if <math>(y &gt; z)</math>, then <math>z</math> = value of this guide  else <math>y</math> = value of this guide</p> <p><b>('sat2') - Sine ArcTan Formula</b>  Arguments: 3 (fmla="sat2 x y z")  Usage: "sat2 x y z" = <math>(x * \sin(\arctan(z / y)))</math> = value of this guide</p> <p><b>('sin') - Sine Formula</b>  Arguments: 2 (fmla="sin x y")  Usage: "sin x y" = <math>(x * \sin(y))</math> = value of this guide</p> <p><b>('sqrt') - Square Root Formula</b>  Arguments: 1 (fmla="sqrt x")  Usage: "sqrt x" = <math>\sqrt{x}</math> = value of this guide</p> <p><b>('tan') - Tangent Formula</b>  Arguments: 2 (fmla="tan x y")  Usage: "tan x y" = <math>(x * \tan(y))</math> = value of this guide</p> <p><b>('val') - Literal Value Formula</b>  Arguments: 1 (fmla="val x")  Usage: "val x" = <math>x</math> = value of this guide</p>

Attributes	Description
	<p>[<i>Note</i>: Guides that have a literal value formula specified via <code>fmla="val x"</code> above should only be used within the <code>avLst</code> as an adjust value for the shape. This however is not strictly enforced. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_GeomGuideFormula</code> simple type (§5.1.12.25).</p>
name (Shape Guide Name)	<p>Specifies the name that will be used to reference to this guide. This name may be used just as a variable would within an equation. That is this name may be substituted for literal values within other guides or the specification of the shape path.</p> <p>The possible values for this attribute are defined by the <code>ST_GeomGuideName</code> simple type (§5.1.12.26).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_GeomGuide">
3 <attribute name="name" type="ST_GeomGuideName" use="required"/>
4 <attribute name="fmla" type="ST_GeomGuideFormula" use="required"/>
5 </complexType>
```

#### 6 5.1.11.12 [gdLst \(List of Shape Guides\)](#)

7 This element specifies all the guides that will be used for this shape. A guide is specified by the `gd` element and  
8 defines a calculated value that may be used for the construction of the corresponding shape.

9 [*Note*: Guides that have a literal value formula specified via `fmla="val x"` above should only be used within the  
10 `avLst` as an adjust value for the shape. This however is not strictly enforced. *end note*]

Parent Elements
custGeom (§5.1.11.8)

11

Child Elements	Subclause
gd (Shape Guide)	§5.1.11.11

12 The following XML Schema fragment defines the contents of this element:

```
13 <complexType name="CT_GeomGuideList">
14 <sequence>
15 <element name="gd" type="CT_GeomGuide" minOccurs="0" maxOccurs="unbounded"/>
16 </sequence>
17 </complexType>
```

#### 18 5.1.11.13 [lnTo \(Draw Line To\)](#)

19 This element specifies the drawing of a straight line from the current pen position to the new point specified.  
20 This line becomes part of the shape geometry, representing a side of the shape. The coordinate system used  
21 when specifying this line is the path coordinate system.

Parent Elements
path (§5.1.11.15)

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DLineTo">
 <sequence>
 <element name="pt" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.11.14 moveTo (Move Path To)

This element specifies a set of new coordinates to move the shape cursor to. This element is only used for drawing a custom geometry. When this element is utilized the pt element is used to specify a new set of shape coordinates that the shape cursor should be moved to. This will not draw a line or curve to this new position from the old position but simply move the cursor to a new starting position. It is only when a path drawing element such as lnTo is used that a portion of the path will be drawn.

[Example: Consider the case where a user wishes to begin drawing a custom geometry not at the default starting coordinates of x=0 , y=0 but at coordinates further inset into the shape coordinate space. The following DrawingML would specify such a case.

```
<a:custGeom>
 <a:pathLst>
 <a:path w="2824222" h="590309">
 <a:moveTo>
 <a:pt x="0" y="428263"/>
 </a:moveTo>
 <a:lnTo>
 <a:pt x="1620455" y="590309"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="2824222" y="173620"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="1562582" y="0"/>
 </a:lnTo>
 <a:close/>
 </a:path>
 </a:pathLst>
</a:custGeom>
```

1 Notice the moveTo element advances the y coordinates before any actual lines are drawn. *end example*

Parent Elements
path (§5.1.11.15)

2

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_Path2DMoveTo">
5 <sequence>
6 <element name="pt" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
7 </sequence>
8 </complexType>
```

9 **5.1.11.15 path (Shape Path)**

10 This element specifies a creation path consisting of a series of moves, lines and curves that when combined will  
11 form a geometric shape. This element will only be utilized if a custom geometry is specified.

12 [Note: Since multiple paths are allowed the rules for drawing are that the path specified later in the pathLst will  
13 be drawn on top of all previous paths. *end note*]

14 [Example: Consider the following DrawingML.

```
15 <a:custGeom>
16 <a:pathLst>
17 <a:path w="2824222" h="590309">
18 <a:moveTo>
19 <a:pt x="0" y="428263"/>
20 </a:moveTo>
21 <a:lnTo>
22 <a:pt x="1620455" y="590309"/>
23 </a:lnTo>
24 <a:lnTo>
25 <a:pt x="2824222" y="173620"/>
26 </a:lnTo>
27 <a:lnTo>
28 <a:pt x="1562582" y="0"/>
29 </a:lnTo>
30 <a:close/>
31 </a:path>
32 </a:pathLst>
33 </a:custGeom>
```

- 1 In the above example there is specified a four sided geometric shape that has all straight sides. While we only  
 2 see three lines being drawn via the `lnTo` element there are actually four sides because the last point of  
 3 (`x=1562585, y=0`) is connected to the first point in the creation path via a `lnTo` element. *end example*]

Parent Elements
pathLst (§5.1.11.16)

moveTo (Move Path To)	§5.1.11.14
quadBezTo (Draw Quadratic Bezier Curve To)	§5.1.11.21

5

Attributes	Description
extrusionOk (3D Extrusion Allowed)	Specifies that the use of 3D extrusions are possible on this path. This allows the generating application to know whether 3D extrusion can be applied in any form. If this attribute is omitted then a value of 0, or false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
fill (Path Fill)	Specifies how the corresponding path should be filled. If this attribute is omitted, a value of "norm" is assumed.  The possible values for this attribute are defined by the ST_PathFillMode simple type (§5.1.12.38).
h (Path Height)	Specifies the height, or maximum y coordinate that should be used for within the path coordinate system. This value determines the vertical placement of all points within the corresponding path as they will all be calculated using this height attribute as the max y coordinate.  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
stroke (Path Stroke)	Specifies if the corresponding path should have a path stroke shown. This is a boolean value that will effect on the outline of the path. If this attribute is omitted, a value of true is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
w (Path Width)	Specifies the width, or maximum x coordinate that should be used for within the path coordinate system. This value determines the horizontal placement of all points within

Attributes	Description
	<p>the corresponding path as they will all be calculated using this width attribute as the max x coordinate.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Path2D">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="close" type="CT_Path2DClose" minOccurs="1" maxOccurs="1"/>
 <element name="moveTo" type="CT_Path2DMoveTo" minOccurs="1" maxOccurs="1"/>
 <element name="lnTo" type="CT_Path2DLineTo" minOccurs="1" maxOccurs="1"/>
 <element name="arcTo" type="CT_Path2DArcTo" minOccurs="1" maxOccurs="1"/>
 <element name="quadBezTo" type="CT_Path2DQuadBezierTo" minOccurs="1" maxOccurs="1"/>
 <element name="cubicBezTo" type="CT_Path2DCubicBezierTo" minOccurs="1" maxOccurs="1"/>
 </choice>
 <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="fill" type="ST_PathFillMode" use="optional" default="norm"/>
 <attribute name="stroke" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="extrusionOk" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

#### 5.1.11.16 pathLst (List of Shape Paths)

This element specifies the entire path that is to make up a single geometric shape. The pathLst can consist of many individual paths within it.

[Example: Consider the following DrawingML.

```

<a:custGeom>
 <a:pathLst>
 <a:path w="2824222" h="590309">
 <a:moveTo>
 <a:pt x="0" y="428263"/>
 </a:moveTo>
 <a:lnTo>
 <a:pt x="1620455" y="590309"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="2824222" y="173620"/>
 </a:lnTo>
 <a:lnTo>
 <a:pt x="1562582" y="0"/>
 </a:lnTo>
 </a:path>
 </a:pathLst>
</a:custGeom>

```

```
<a:close/>
</a:path>
</a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the `lnTo` element there are actually four sides because the last point of (`x=1562585, y=0`) is connected to the first point in the creation path via a `lnTo` element. *end example*]

[*Note*: A geometry with multiple paths within it should be treated visually as if each path were a distinct shape. That is each creation path will have its first point and last point joined to form a closed shape. However, the generating application should then connect the last point to the first point of the new shape. If a `close` element is encountered at the end of the previous creation path then this joining line should not be rendered by the generating application. The rendering should resume with the first line or curve on the new creation path. *end note*]

Parent Elements
<code>custGeom</code> (§5.1.11.8)

Child Elements	Subclause
<code>path</code> (Shape Path)	§5.1.11.15

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DList">
 <sequence>
 <element name="path" type="CT_Path2D" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.1.11.17 `pos` (Shape Position Coordinate)

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the `ext transform` element.

[*Note*: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is `x=0, y=0` and the coordinate points for `x` grow to the right and for `y` grow down. This is illustrated in the diagram below.

*end note]*

[*Example:* To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system will specify a y coordinate of 679622 within the shape coordinate system for this particular case.

```
<a:xfrm>
 <a:off x="3200400" y="1600200"/>
 <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>

```

19 <complexType name="CT_AdjPoint2D">
20 <attribute name="x" type="ST_AdjCoordinate" use="required"/>
21 <attribute name="y" type="ST_AdjCoordinate" use="required"/>
22 </complexType>

```

5.1.11.18 prstGeom (Preset geometry)

This element specifies when a preset geometric shape should be used instead of a custom geometric shape. The generating application should be able to render all preset geometries enumerated in the ST\_ShapeType list.

[Example: Consider the scenario when a user does not wish to specify all the lines and curves that make up the desired shape but instead chooses to use a preset geometry. The following DrawingML would specify such a case.

```
<p:sp>
 <p:nvSpPr>
 <p:cNvPr id="4" name="My Preset Shape"/>
 <p:cNvSpPr/>
 <p:nvPr/>
 </p:nvSpPr>
 <p:spPr>
 <a:xfrm>
 <a:off x="1981200" y="533400"/>
 <a:ext cx="1143000" cy="1066800"/>
 </a:xfrm>
 <a:prstGeom prst="heart">
 </a:prstGeom>
 </p:spPr>
</p:sp>
```

The output shape rendered by this DrawingML is shown above. *end example*]

prst (Preset Shape)	Specifies the preset geometry that will be used for this shape. This preset can have any of

Attributes	Description
	<p>the values in the enumerated list for ST_ShapeType. This attribute is required in order for a preset geometry to be rendered.</p> <p>[Example: Consider the sample DrawingML below.</p> <pre> &lt;p:sp&gt;   &lt;p:nvSpPr&gt;     &lt;p:cNvPr id="4" name="Sun 3"/&gt;     &lt;p:cNvSpPr/&gt;     &lt;p:nvPr/&gt;   &lt;/p:nvSpPr&gt;   &lt;p:spPr&gt;     &lt;a:xfrm&gt;       &lt;a:off x="1981200" y="533400"/&gt;       &lt;a:ext cx="1143000" cy="1066800"/&gt;     &lt;/a:xfrm&gt;     &lt;a:prstGeom prst="sun"&gt;       &lt;/a:prstGeom&gt;     &lt;/p:spPr&gt;   &lt;/p:sp&gt; </pre> <p>In the above example a preset geometry has been used to define a shape. The shape utilized here is the sun shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ShapeType simple type (§5.1.12.56).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_PresetGeometry2D">
3 <sequence>
4 <element name="avLst" type="CT_GeomGuideList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="prst" type="ST_ShapeType" use="required"/>
7 </complexType>

```

#### 8 5.1.11.19 prstTxWarp (Preset Text Warp)

9 This element specifies when a preset geometric shape should be used to transform a piece of text. This  
10 operation is known formally as a text warp. The generating application should be able to render all preset  
11 geometries enumerated in the ST\_TextShapeType list.

12 [Example: Consider the case where the user wishes to accent a piece of text by warping it's shape. For this to  
13 occur a preset shape will be chosen from the ST\_TextShapeType list and applied to the entire body of text.

```

1 <p:sp>
2 <p:txBody>
3 <a:bodyPr wrap="none" rtlCol="0">
4 <a:prstTxWarp prst="textInflate">
5 </a:prstTxWarp>
6 <a:spAutoFit/>
7 </a:bodyPr>
8 <a:lstStyle/>
9 <a:p>
10 ...
11 <a:t>Sample Text</a:t>
12 ...
13 </a:p>
14 </p:txBody>
15 </p:sp>

```

No Warp:    Sample Text

Inflate Warp:    Sample Text

16

17 The resulting text that has now had the Inflate text warp applied to it is shown above. *end example]*

18 Using any of the presets listed under the ST\_TextShapeType list below it is possible to apply a text warp to a run  
19 of DrawingML text via the following steps.

20 If you look at any of the text warps in the file format you will notice that each consists of two paths. This  
21 corresponds to a top path (first one specified) and a bottom path (second one specified). Now the top path and  
22 the bottom path represent the top line and base line that the text needs to be warped to. How this is done is in  
23 the following way.

- 24     22. Compute the rectangle that the unwarped text resides in. (tightest possible rectangle around text, no  
25       white space except for "space characters")
- 26     23. Take each of the quadratic and cubic Bezier curves that are used to calculate the original character and  
27       change their end points and control points by the following method...
- 28     24. Move a vertical line horizontally along the original text rectangle and find the horizontal percentage that  
29       a given end point or control point lives at. (.5 for the middle for instance)
- 30     25. Now do the same thing for this point vertically. Find the vertical percentage that this point lives at with  
31       the top and bottom of this text rectangle being the respective top and bottom bounds. (0.0 and 1.0  
32       respectively)
- 33     26. Now that we have the percentages for a given point in a Bezier equation we can map that to the new  
34       point in the warped text environment.

27. Going back to the top and bottom paths specified in the file format we can take these and flatten them out to a straight arc (top and bottom might be different lengths)
28. After they are straight we can measure them both horizontally to find the same percentage point that we found within the original text rectangle. (0.5 let's say)
29. So then we measure 50% along the top path and 50% along the bottom path, putting the paths back to their original curvy shapes.
30. Once we have these two points we can draw a line between them that will serve as our vertical line in the original text rectangle (note: this might not be truly vertical as 50% on the top does not always line up with 50% on the bottom)
31. Taking this new line we then follow it from top to bottom the vertical percentage amount that we got from step 4.
32. This is then the new point that should be used in place of the old point in the original text rectangle.
33. We will then continue doing these same steps for each of the end points and control points within the body of text. (is applied to a whole body of text only)

[Note: Horizxontal percentages begin at 0.0 and continue to 1.0, left to right. Vertical percentages begin at 0.0 and continue to 1.0, top to bottom. *end note*]

[Note: Since this is a shape it does have both a shape coordinate system and a path coordinate system. *end note*]

Parent Elements

6 <attribute name="prst" type="ST_TextShapeType" use="required"/>
7 </complexType>
```

8 **5.1.11.20 pt (Shape Path Point)**

9 This element specifies an x-y coordinate within the path coordinate space. This coordinate space is determined  
10 by the width and height attributes defined within the path element. A point is utilized by one of it's parent  
11 elements to specify the next point of interest in custom geometry shape. Depending on the parent element used  
12 the point may either have a line drawn to it or the cursor may simply be moved to this new location.

13 [Note: When specifying a point coordinate in path coordinate space it should be noted that the top left of the  
14 coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is  
15 illustrated in the diagram below.

*end note]*

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Example:* To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system will specify a y coordinate of 679622 within the shape coordinate system for this particular case.

```
<a:xfrm>
 <a:off x="3200400" y="1600200"/>
 <a:ext cx="1705233" cy="679622"/>
</a:xfrm>

</complexType>
```

## 5.1.12 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/drawingml/2006/main> namespace.

### 5.1.12.1 ST\_AdjAngle (Adjustable Angle Methods)

This simple type is an adjustable angle, either an absolute angle or a reference to a geometry guide. The units for an adjustable angle are 60,000ths of a degree.

This simple type is defined as a union of the following types:

- TheST\_Angle simple type (§5.1.12.3).
- TheST\_GeomGuideName simple type (§5.1.12.26).

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AdjAngle">
 <union memberTypes="ST_Angle ST_GeomGuideName"/>
</simpleType>
```

### 5.1.12.2 ST\_AdjCoordinate (Adjustable Coordinate Methods)

This simple type is an adjustable coordinate is either an absolute coordinate position or a reference to a geometry guide.

This simple type is defined as a union of the following types:

- TheST\_Coordinate simple type (§5.1.12.16).
- TheST\_GeomGuideName simple type (§5.1.12.26).

Referenced By
---------------

ahPolar@maxR (§5.1.11.2); ahPolar@minR (§5.1.11.2); ahXY@maxX (§5.1.11.3); ahXY@maxY (§5.1.11.3); ahXY@minX (§5.1.11.3); ahXY@minY (§5.1.11.3); arcTo@hR (§5.1.11.4); arcTo@wR (§5.1.11.4); pos@x (§5.1.11.17); pos@y (§5.1.11.17); pt@x (§5.1.11.20); pt@y (§5.1.11.20); rect@b (§5.1.11.22); rect@l (§5.1.11.22); rect@r (§5.1.11.22); rect@t (§5.1.11.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AdjCoordinate">
 <union memberTypes="ST_Coordinate ST_GeomGuideName"/>
</simpleType>
```

### 5.1.12.3 ST\_Angle (Angle)

This simple type represents an angle in 60,000ths of a degree. Positive angles are clockwise (i.e., towards the positive y axis); negative angles are counter-clockwise (i.e., towards the negative y axis).

This simple type's contents are a restriction of the XML Schema int datatype.

<simpleType name="ST_Angle">
 <restriction base="xsd:int"/>
</simpleType>
```

### 5.1.12.4 ST\_AnimationBuildType (Animation Build Type)

This simple type specifies the ways that an animation can be built, or animated.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (Animate At Once)	Animate all objects as one.

Referenced By
---------------

ST_AnimationChartBuildType (§5.1.12.5); ST_AnimationDgmBuildType (§5.1.12.7)
------------------------------------------------------------------------------

The following XML Schema fragment defines the contents of this simple type:

<simpleType name="ST_AnimationBuildType">
 <restriction base="xsd:token">
 <enumeration value="allAtOnce"/>
 </restriction>
</simpleType>
```

### 5.1.12.5 ST\_AnimationChartBuildType (Chart Animation Build Type)

This simple type specifies the ways that a chart animation can be built. That is, it specifies the way in which the objects within the chart should be animated.

This simple type is defined as a union of the following types:

- TheST\_AnimationBuildType simple type (§5.1.12.4).
- TheST\_AnimationChartOnlyBuildType simple type (§5.1.12.6).

#### Referenced By

bldChart@bld (§5.1.2.1.1)

```
<simpleType name="ST_AnimationChartBuildType">
 <union memberTypes="ST_AnimationBuildType ST_AnimationChartOnlyBuildType"/>
</simpleType>
```

### 5.1.12.6 ST\_AnimationChartOnlyBuildType (Chart only Animation Types)

This simple type specifies the build options available only for animating a chart. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
category (Catefory)	Animate by each category
categoryEl (Category Element)	Animate by each element within the category
series (Series)	Animate by each series.
seriesEl (Series Element)	Animate by each element within the series

#### Referenced By

ST\_AnimationChartBuildType (§5.1.12.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationChartOnlyBuildType">
 <restriction base="xsd:token">
 <enumeration value="series"/>
 <enumeration value="category"/>
 <enumeration value="seriesEl"/>
 <enumeration value="categoryEl"/>
 </restriction>
</simpleType>
```

### 5.1.12.7 ST\_AnimationDgmBuildType (Diagram Animation Build Type)

This simple type specifies the ways that a diagram animation can be built. That is, it specifies the way in which the objects within the diagram graphical object should be animated.

This simple type is defined as a union of the following types:

- TheST\_AnimationBuildType simple type (§5.1.12.4).
- TheST\_AnimationDgmOnlyBuildType simple type (§5.1.12.8).

Referenced By
bldDgm@bld (§5.1.2.1.2)

```
<simpleType name="ST_AnimationDgmBuildType">
 <union memberTypes="ST_AnimationBuildType ST_AnimationDgmOnlyBuildType"/>
</simpleType>
```

### 5.1.12.8 ST\_AnimationDgmOnlyBuildType (Diagram only Animation Types)

This simple type specifies the build options available only for animating a diagram. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
lvlAtOnce (Each Level at Once)	Animate the diagram one level at a time, animating the whole level as one object
lvlOne (Level One-by-One)	Animate the diagram by the elements within a level, animating them one level element at a time.
one (Elements One-by-One)	Animate the diagram by elements. For a tree diagram the animation will occur by branch within the diagram tree.

Referenced By
ST_AnimationDgmBuildType (§5.1.12.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationDgmOnlyBuildType">
 <restriction base="xsd:token">
 <enumeration value="one"/>
 <enumeration value="lvlOne"/>
 <enumeration value="lvlAtOnce"/>
 </restriction>
</simpleType>
```

**5.1.12.9 ST\_BevelPresetType (Bevel Presets)**

Represents a preset for a type of bevel which can be applied to a shape in 3D. The bevel properties are applied differently depending on the type of bevel defined for a shape.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
angle (Angle)	<p>[Example: Consider the following example of an angle bevel type applied to a shape:</p>  <p>end example]</p>
artDeco (Art Deco)	<p>[Example: Consider the following example of an artDeco bevel type applied to a shape:</p>

Enumeration Value	Description
	 <i>end example]</i>
circle (Circle)	<p>[Example: Consider the following example of an circle bevel type applied to a shape:</p>  <i>end example]</i>
convex (Convex)	<p>[Example: Consider the following example of an convex bevel type applied to a shape:</p>  <i>end example]</i>
coolSlant (Cool Slant)	<p>[Example: Consider the following example of an coolSlant bevel type applied to a shape:</p>

Enumeration Value	Description
	 <i>end example]</i>
cross (Cross)	<p>[Example: Consider the following example of an cross bevel type applied to a shape:</p>  <i>end example]</i>
divot (Divot)	<p>[Example: Consider the following example of an divot bevel type applied to a shape:</p>  <i>end example]</i>
hardEdge (Hard Edge)	<p>[Example: Consider the following example of an hardEdge bevel type applied to a shape:</p>

Enumeration Value	Description
	 <p><i>end example]</i></p>
relaxedInset (Relaxed Inset)	<p>[Example: Consider the following example of an relaxedInset bevel type applied to a shape:</p>  <p><i>end example]</i></p>
riblet (Riblet)	<p>[Example: Consider the following example of an riblet bevel type applied to a shape:</p>  <p><i>end example]</i></p>
slope (Slope)	<p>[Example: Consider the following example of an</p>

Enumeration Value	Description
	<p>slope bevel type applied to a shape:</p>  <p><i>end example]</i></p>
softRound (Soft Round)	<p>[<i>Example:</i> Consider the following example of an softRound bevel type applied to a shape:</p>  <p><i>end example]</i></p>

 </restriction>
</simpleType>
```

#### 5.1.12.10 ST\_BlackWhiteMode (Black and White Mode)

This simple type specifies how an object should be rendered when specified to be in black and white mode.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic)	Object rendered with automatic coloring
black (Black)	Object rendered with black-only coloring
blackGray (Black and Gray)	Object rendered with black and gray coloring
blackWhite (Black and White)	Object rendered within black and white coloring
clr (Color)	Object rendered with normal coloring
gray (Gray)	Object rendered with gray coloring
grayWhite (Gray and White)	Object rendered within gray and white coloring
hidden (Hidden)	Object rendered with hidden coloring
invGray (Inverse Gray)	Object rendered with inverse gray coloring
ltGray (Light Gray)	Object rendered with light gray coloring
white (White)	Object rendered within white coloring

#### Referenced By

 <enumeration value="hidden"/>
 </restriction>
</simpleType>
```

#### 5.1.12.11 ST\_BlendMode (Blend Mode)

This simple type describes how to render effects one on top of another.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
darken (Darken)	Darken
lighten (Lighten)	Lighten
mult (Multiply)	Multiply
over (Overlay)	Overlay
screen (Screen)	Screen

#### Referenced By

blend@blend (§5.1.10.12); fillOverlay@blend (§5.1.10.29)

 <enumeration value="over"/>
 <enumeration value="mult"/>
 <enumeration value="screen"/>
 <enumeration value="darken"/>
 <enumeration value="lighten"/>
 </restriction>
</simpleType>
```

### 5.1.12.12 ST\_BlipCompression (Blip Compression Type)

This type specifies the amount of compression that has been used for a particular binary large image or picture (blip).

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
email (Email Compression)	Compression size suitable for inclusion with email
hqprint (High Quality Printing Compression)	Compression size suitable for high quality printing
none (No Compression)	No compression was used
print (Printing Compression)	Compression size suitable for printing
screen (Screen Viewing Compression)	Compression size suitable for viewing on screen

#### Referenced By

blip@cstate (§5.1.10.13)

The following XML Schema fragment defines the contents of this simple type:

 <enumeration value="screen"/>
 <enumeration value="print"/>
 <enumeration value="hqprint"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

### 5.1.12.13 ST\_ChartBuildStep (Chart Animation Build Step)

This simple type specifies an animation build step within a chart animation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allPts (All Points)	Animate all points within the chart for this animation build step
category (Category)	Animate a chart category for this animation build step
gridLegend (Grid and Legend)	Animate the chart grid and legend for this animation build step

Enumeration Value	Description
ptInCategory (Category Points)	Animate a point in a chart category for this animation build step
ptInSeries (Series Points)	Animate a point in a chart series for this animation build step
series (Series)	Animate a chart series for this animation build step

#### Referenced By

chart@bldStep (§5.1.2.1.3)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_ChartBuildStep">
 <restriction base="xsd:token">
 <enumeration value="category"/>
 <enumeration value="ptInCategory"/>
 <enumeration value="series"/>
 <enumeration value="ptInSeries"/>
 <enumeration value="allPts"/>
 <enumeration value="gridLegend"/>
 </restriction>
</simpleType>

```

#### 5.1.12.14 ST\_ColorSchemeIndex (Theme Color Reference)

A reference to a color in the color scheme.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent 1)	Represents the accent 1 color.
accent2 (Accent 2)	Represents the accent 2 color.
accent3 (Accent 3)	Represents the accent 3 color.
accent4 (Accent 4)	Represents the accent 4 color.
accent5 (Accent 5)	Represents the accent 5 color.
accent6 (Accent 6)	Represents the accent 6 color.
dk1 (Dark 1)	Represents the first dark color.
dk2 (Dark 2)	Represents the second dark color.
folHlink (Followed Hyperlink)	Represents the followed hyperlink color.
hlink (Hyperlink)	Represents the hyperlink color.
lt1 (Light 1)	Represents the first light color.

Enumeration Value	Description
lt2 (Light 2)	Represents the second light color.

17 </restriction>
18 </simpleType>

```

### 19 5.1.12.15 ST\_CompoundLine (Compound Line Type)

20 This type specifies the compound line type that is to be used for lines with text such as underlines.

21 This simple type's contents are a restriction of the XML Schema token datatype.

22 The following are possible enumeration values for this type:

Enumeration Value	Description
dbl (Double Lines)	Double lines of equal width
sng (Single Line)	Single line: one normal width
thickThin (Thick Thin Double Lines)	Double lines: one thick, one thin
thinThick (Thin Thick Double Lines)	Double lines: one thin, one thick
tri (Thin Thick Thin Triple Lines)	Three lines: thin, thick, thin

#### Referenced By

 <enumeration value="tri"/>
 </restriction>
</simpleType>
```

#### 5.1.12.16 ST\_Coordinate (Coordinate)

This simple type represents a one dimensional position or length in EMUs. EMUs (English Metric Units) are a high precision coordinate space (914400 dpi / 360000 dpc).

This simple type's contents are a restriction of the XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -27273042329600.
- This simple type has a maximum value of less than or equal to 27273042316900.

#### Referenced By

 </restriction>
</simpleType>
```

#### 5.1.12.17 ST\_Coordinate32 (Coordinate Point)

This type specifies a coordinate within the document. This may be used for measurements or spacing with the maximum size requirement being a 32 bit integer.

NOTE: The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the XML Schema int datatype.

```

#### 5.1.12.18 ST\_DgmBuildStep (Diagram Animation Build Steps)

This simple type specifies an animation build step within a diagram animation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bg (Background)	Animate the diagram background for this animation build step
sp (Shape)	Animate a diagram shape for this animation build step

#### Referenced By

dgm@bldStep (§5.1.2.1.12)

```
<simpleType name="ST_DrawingElementId">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

#### 5.1.12.20 ST\_EffectContainerType (Effect Container Type)

This simple type determines the relationship between effects in a container, either sibling or tree.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
sib (Sibling)	Each effect is separately applied to the parent object.  <i>[Example: If the parent element contains an outer shadow and a reflection, the resulting effect will be a shadow around the parent object and a reflection of the object. The reflection will not have a shadow. end example]</i>
tree (Tree)	Each effect is applied to the result of the previous effect.  <i>[Example: If the parent element contains an outer shadow followed by a glow, the shadow will first be applied to the parent object. Then, the glow will be applied to the shadow (rather than the original object). The resulting effect would be a glowing shadow. end example]</i>

8 </simpleType>
```

9 **5.1.12.21 ST\_FixedAngle (Fixed Angle)**

10 This simple type represents a fixed range angle in 60000ths of a degree. Range from (-90, 90 degrees).

11 This simple type's contents are a restriction of the ST\_Angle simple type (§5.1.12.3).

12 This simple type also specifies the following restrictions:

- 13 • This simple type has a minimum value of greater than -5400000.
- 14 • This simple type has a maximum value of less than 5400000.

Referenced By
outerShdw@kx (§5.1.10.45); outerShdw@ky (§5.1.10.45); reflection@kx (§5.1.10.50); reflection@ky (§5.1.10.50); xfrm@kx (§5.1.10.61); xfrm@ky (§5.1.10.61)

```
16 <simpleType name="ST_FixedAngle">
17 <restriction base="ST_Angle">
18 <minExclusive value="-5400000"/>
19 <maxExclusive value="5400000"/>
20 </restriction>
21 </simpleType>
```

22 **5.1.12.22 ST\_FixedPercentage (Fixed Percentage)**

23 This simple type represents a fixed percentage in 1000ths of a percent. Range from [-100%, 100%].

24 This simple type's contents are a restriction of the ST\_Percentage simple type (§5.1.12.41).

25 This simple type also specifies the following restrictions:

- 26 • This simple type has a minimum value of greater than or equal to -100000.
- 27 • This simple type has a maximum value of less than or equal to 100000.

### 5.1.12.23 ST\_FontCollectionIndex (Font Collection Index)

This simple type represents one of the fonts associated with the style.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
major (Major Font)	The major font of the style's font scheme.
minor (Minor Font)	The minor font of the style's font scheme.
none (None)	No font reference.

Referenced By
fontRef@idx (§5.1.4.1.17)

 <enumeration value="minor"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

### 5.1.12.24 ST\_FOVAngle (Field of View Angle)

Represents a positive angle in 60000ths of a degree. Range from [0, 180] degrees.

This simple type's contents are a restriction of the ST\_Angle simple type (§5.1.12.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

- This simple type has a maximum value of less than or equal to 10800000.

Referenced By
camera@fov (§5.1.7.5)

```
<simpleType name="ST_GeomGuideName">
 <restriction base="xsd:token"/>
</simpleType>
```

#### 5.1.12.27 ST\_Guid (GUID Method)

This type specifies a 128 bit GUID

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}`.

**5.1.12.28 ST\_HexBinary3 (Hex Binary of Length 3)**

This simple type specifies a hex representation of a binary number whose length is 3 characters.

This simple type's contents are a restriction of the XML Schema `hexBinary` datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 3 characters.

**Referenced By**

srgbClr@val (§5.1.2.2.32); sysClr@lastClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexBinary3">
 <restriction base="xsd:hexBinary">
 <length value="3"/>
 </restriction>
</simpleType>
```

**5.1.12.29 ST\_LightRigDirection (Light Rig Direction)**

Represents the direction from which the light rig is positioned relative to the scene. The light rig, itself, can be made up of multiple lights in any orientation around a given shape. This simple type defines the orientation of the light rig as a whole, and not the individual lights within the rig. This means that because the direction of the light rig is left, that does not guarantee the light will be coming from the left side of the shape, but rather the orientation of the rig as a whole is rotated to the left.

*[Example:* Consider the following example as a visual representation of a light rig oriented from the top of the shape in the center:

In this example we see that the light rig defines three lights (all in a single plane as represented by the black circular line). The lights defined in this representation can all have different intensities, which means, for this example, Light 3 and Light 2 look to have a more intense effect (or could even be a different color) than Light 1. One can image rotating this rig to the so that Light 1 is to the right of the shape when the light rig direction is defined to be right. *end example*]

The following properties were used to define the shape used in the image examples below:

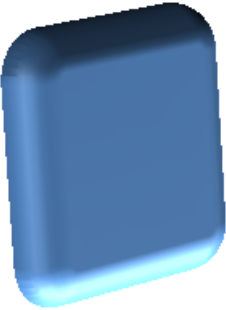

- Rounded rectangle shape
- Three Point light rig type
- Circle bevel type
- Plastic material type
- Camera type defined by the orthographicFront preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	[Example: Consider the following example of a light direction from the bottom:

Enumeration Value	Description
	 <i>end example]</i>
bl (Bottom Left)	<p>[<i>Example:</i> Consider the following example of a light direction from the bottom left:</p>  <i>end example]</i>
br (Bottom Right)	<p>[<i>Example:</i> Consider the following example of a light direction from the bottom right:</p>  <i>end example]</i>
l (Left)	<p>[<i>Example:</i> Consider the following example of a light direction from the left:</p>

Enumeration Value	Description
	 <i>end example]</i>
r (Right)	<p>[Example: Consider the following example of a light direction from the right:</p>  <i>end example]</i>
t (Top)	<p>[Example: Consider the following example of a light direction from the top:</p>  <i>end example]</i>
tl (Top Left)	<p>[Example: Consider the following example of a light</p>

Enumeration Value	Description
	<p>direction from the top left:</p>  <p><i>end example]</i></p>
tr (Top Right)	<p>[<i>Example:</i> Consider the following example of a light direction from the top right:</p>  <p><i>end example]</i></p>

 </restriction>
</simpleType>
```

### 5.1.12.30 ST\_LightRigType (Light Rig Type)

Represents a preset light right that can be applied to a shape. The light rig represents a group of lights oriented in a specific way relative to a 3D scene. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Circle bevel type
- Warm Matte material type
- Camera type defined by the perspectiveContrastingRightFacing preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
balanced (Light Rig Enum ( Balanced ))	Balanced
brightRoom (Bright Room)	<p>[Example: Consider the following example of the brightRoom light rig applied to a basic shape:</p> 

Enumeration Value	Description
	<i>end example]</i>
chilly (Chilly)	<p>[<i>Example:</i> Consider the following example of the chilly light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
contrasting (Contrasting)	<p>[<i>Example:</i> Consider the following example of the contrasting light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
flat (Flat)	<p>[<i>Example:</i> Consider the following example of the flat light rig applied to a basic shape:</p> 

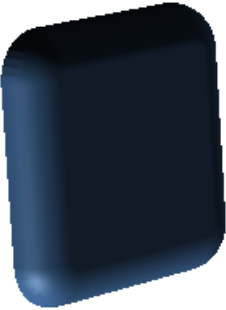

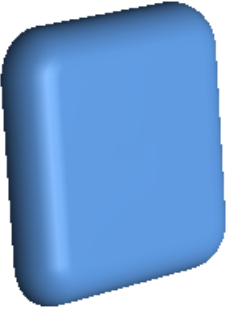

Enumeration Value	Description
	<i>end example]</i>
flood (Flood)	<p>[<i>Example:</i> Consider the following example of the flood light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
freezing (Freezing)	<p>[<i>Example:</i> Consider the following example of the freezing light rig applied to a basic shape:</p>  <p><i>end example]</i></p>
glow (Glow)	<p>[<i>Example:</i> Consider the following example of the glow light rig applied to a basic shape:</p>

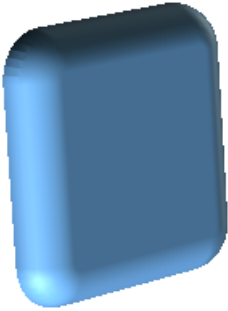

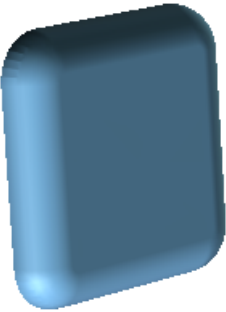

Enumeration Value	Description
	 <i>end example]</i>
harsh (Harsh)	<p>[Example: Consider the following example of the harsh light rig applied to a basic shape:</p>  <i>end example]</i>
legacyFlat1 (Legacy Flat 1)	<p>[Example: Consider the following example of the legacyFlat1 light rig applied to a basic shape:</p>  <i>end example]</i>
legacyFlat2 (Legacy Flat 2)	<p>[Example: Consider the following example of the legacyFlat2 light rig applied to a basic shape:</p>

Enumeration Value	Description
	 <i>end example]</i>
legacyFlat3 (Legacy Flat 3)	<p>[Example: Consider the following example of the legacyFlat3 light rig applied to a basic shape:</p>  <i>end example]</i>
legacyFlat4 (Legacy Flat 4)	<p>[Example: Consider the following example of the legacyFlat4 light rig applied to a basic shape:</p>  <i>end example]</i>
legacyHarsh1 (Legacy Harsh 1)	<p>[Example: Consider the following example of the legacyHarsh1 light rig applied to a basic shape:</p>

Enumeration Value	Description
	 <i>end example]</i>
legacyHarsh2 (Legacy Harsh 2)	<p>[Example: Consider the following example of the legacyHarsh2 light rig applied to a basic shape:</p>  <i>end example]</i>
legacyHarsh3 (Legacy Harsh 3)	<p>[Example: Consider the following example of the legacyHarsh3 light rig applied to a basic shape:</p>  <i>end example]</i>
legacyHarsh4 (Legacy Harsh 4)	<p>[Example: Consider the following example of the</p>

```

5.1.12.31 ST\_LineCap (End Line Cap)

This type specifies how to cap the ends of lines. This also affects the ends of line segments for dashed lines.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
flat (Flat Line Cap)	Line ends at end point.
round (Round Line Cap)	Rounded ends. Semi-circle protrudes by half line width.
square (Square Line Cap)	Square protrudes by half line width.

Referenced By

### 5.1.12.32 ST\_LineEndLength (Line End Length)

This simple type represents the length of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[Example: See the example images below. These samples have an arrow line end type and medium line end width. end example]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
lg (Large)	➤ Large
med (Medium)	➔ Medium
sm (Small)	➔ Small

Referenced By
headEnd@len (§5.1.10.38); tailEnd@len (§5.1.10.57)

 <enumeration value="lg"/>
 </restriction>
</simpleType>
```

### 5.1.12.33 ST\_LineEndType (Line End Type)

This simple type represents the shape decoration that appears at the ends of lines. For example, one choice is an arrow head.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
arrow (Arrow Head)	 Line arrow head
diamond (Diamond)	 Diamond
none (None)	 No end
oval (Oval)	 Oval
stealth (Stealth Arrow)	 Stealth arrow head
triangle (Triangle Arrow Head)	 Triangle arrow head

#### Referenced By

headEnd@type (§5.1.10.38); tailEnd@type (§5.1.10.57)

8 </restriction>
9 </simpleType>
```

### 10 5.1.12.35 ST\_LineWidth (Line Width)

11 This type specifies the width of a line in EMUs. 1 pt = 12700 EMUs.

12 This simple type's contents are a restriction of the ST\_Coordinate32 simple type (§5.1.12.17).

13 This simple type also specifies the following restrictions:

- 14 • This simple type has a minimum value of greater than or equal to 0.
- 15 • This simple type has a maximum value of less than or equal to 20116800.

Referenced By
ln@w (§5.1.2.1.24); lnB@w (§5.1.6.3); lnBlToTr@w (§5.1.6.4); lnL@w (§5.1.6.5); lnR@w (§5.1.6.6); lnT@w (§5.1.6.7); lnTlToBr@w (§5.1.6.8); uLn@w (§5.1.5.3.14)

20 <maxInclusive value="20116800"/>
21 </restriction>
22 </simpleType>
```

### 23 5.1.12.36 ST\_OnOffStyleType (On/Off Style Type)

24 This simple type represents whether a style property should be applied.

25 This simple type's contents are a restriction of the XML Schema token datatype.

1 The following are possible enumeration values for this type:

Enumeration Value	Description
def (Default)	Follow parent settings. For a themed property, follow the theme settings. For an unthemed property, follow the parent setting in the property inheritance chain.
off (Off)	Property is off.
on (On)	Property is on.

2

8 <enumeration value="def"/>
9 </restriction>
10 </simpleType>

```

11 [5.1.12.37](#)      [ST\\_Panose \(Panose Type\)](#)

12 This type specifies the Panose setting for this font so that generating applications using this Office Open XML  
13 Standard may determine the closest font type if necessary.

14 This simple type's contents are a restriction of the XML Schema hexBinary datatype.

15 This simple type also specifies the following restrictions:

- 16     • This simple type's contents must have a length of exactly 10 characters.

Referenced By
buFont@panose (§5.1.5.4.6); cs@panose (§5.1.5.3.1); ea@panose (§5.1.5.3.3); font@panose (§4.3.1.10); latin@panose (§5.1.5.3.7); sym@panose (§5.1.5.3.10)

20 <length value="10"/>
21 </restriction>
22 </simpleType>

```

### 5.1.12.38 ST\_PathFillMode (Path Fill Mode)

This simple type specifies the manner in which a path should be filled. The lightening and darkening of a path allow for certain parts of the shape to be colored lighter or darker depending on user preference.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
darken (Darken Path Fill)	This specifies that the corresponding path should have a darker shaded color applied to its fill.
darkenLess (Darken Path Fill Less)	This specifies that the corresponding path should have a slightly darker shaded color applied to its fill.
lighten (Lighten Path Fill)	This specifies that the corresponding path should have a lightly shaded color applied to its fill.
lightenLess (Lighten Path Fill Less)	This specifies that the corresponding path should have a slightly lighter shaded color applied to its fill.
none (No Path Fill)	This specifies that the corresponding path should have no fill.
norm (Normal Path Fill)	This specifies that the corresponding path should have a normally shaded color applied to its fill.

#### Referenced By

path@fill (§5.1.11.15)

 <enumeration value="lighten"/>
 <enumeration value="lightenLess"/>
 <enumeration value="darken"/>
 <enumeration value="darkenLess"/>
 </restriction>
</simpleType>

```

### 5.1.12.39 ST\_PathShadeType (Path Shade Type)

This simple type describes the shape of path to follow for a path gradient shade.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
circle (Circle)	Gradient follows a circular path
rect (Rectangle)	Gradient follows a rectangular path
shape (Shape)	Gradient follows the shape

1

Referenced By
path@path (§5.1.10.46)

6 <enumeration value="circle"/>
7 <enumeration value="rect"/>
8 </restriction>
9 </simpleType>
```

#### 10 5.1.12.40 ST\_PenAlignment (Alignment Type)

11 This type specifies the Pen Alignment type for use within a text body.

12 This simple type's contents are a restriction of the XML Schema token datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center Alignment)	Center pen (line drawn at center of path stroke).
in (Inset Alignment)	Inset pen (the pen is aligned on the inside of the edge of the path).

14

Referenced By
ln@aln (§5.1.2.1.24); lnB@aln (§5.1.6.3); lnBlToTr@aln (§5.1.6.4); lnL@aln (§5.1.6.5); lnR@aln (§5.1.6.6); lnT@aln (§5.1.6.7); lnTlToBr@aln (§5.1.6.8); uLn@aln (§5.1.5.3.14)

18 <enumeration value="ctr"/>
19 <enumeration value="in"/>
20 </restriction>
21 </simpleType>
```

#### 5.1.12.41 ST\_Percentage (Percentage)

This simple type represents a percentage in 1000ths of a percent, e.g., a value of 1 represents 0.001% == 0.00001; a value of 100000 is equal to 100%. Percentages have no intrinsic units, but are used to scale other values with units.

This simple type's contents are a restriction of the XML Schema int datatype.

```

#### 5.1.12.42 ST\_PositiveCoordinate (Positive Coordinate)

This simple type represents a positive position or length in EMUs.

This simple type's contents are a restriction of the XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 27273042316900.

#### 5.1.12.43 ST\_PositiveCoordinate32 (Positive Coordinate Point)

This type specifies the a positive coordinate point that has a maximum size of 32 bits.

NOTE: The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the ST\_Coordinate32 simple type (§5.1.12.17).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

#### 5.1.12.45 ST\_PositiveFixedPercentage (Positive Fixed Percentage)

This simple type represents a positive fixed percentage in 1000ths of a percent. Range from [0%, 100%].

This simple type's contents are a restriction of the ST\_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 100000.

**5.1.12.47 ST\_PresetCameraType (Preset Camera Type)**

These enumeration values represent different algorithmic methods for setting all camera properties, including position. The following example images below are all based off the following shape:

In this image, we can see the shape has a camera pointing directly at the front face.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
isometricBottomDown (Isometric Bottom Down)	<p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p>
isometricBottomUp (Isometric Bottom Up)	<p>[<i>Example:</i> Consider the following example of the</p>

Enumeration Value	Description
	<p>camera preset type:</p>  <p><i>end example]</i></p>
isometricLeftDown (Isometric Left Down)	<p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p>
isometricLeftUp (Isometric Left Up)	<p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
isometricOffAxis1Left (Isometric Off Axis 1 Left)	<p data-bbox="824 296 1409 363"><i>[Example: Consider the following example of the camera preset type:</i></p>  <p data-bbox="824 800 987 829"><i>end example]</i></p>
isometricOffAxis1Right (Isometric Off Axis 1 Right)	<p data-bbox="824 884 1409 951"><i>[Example: Consider the following example of the camera preset type:</i></p>  <p data-bbox="824 1352 987 1381"><i>end example]</i></p>

#### 5.1.12.48 ST\_PresetColorVal (Preset Color Value)

This simple type represents a preset color value.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aliceBlue (Alice Blue Preset Color)	Specifies a color with RGB value (240,248,255)
antiqueWhite (Antique White Preset Color)	Specifies a color with RGB value (250,235,215)
aqua (Aqua Preset Color)	Specifies a color with RGB value (0,255,255)
aquamarine (Aquamarine Preset Color)	Specifies a color with RGB value (127,255,212)
azure (Azure Preset Color)	Specifies a color with RGB value (240,255,255)
beige (Beige Preset Color)	Specifies a color with RGB value (245,245,220)
bisque (Bisque Preset Color)	Specifies a color with RGB value (255,228,196)
black (Black Preset Color)	Specifies a color with RGB value (0,0,0)
blanchedAlmond (Blanched Almond Preset Color)	Specifies a color with RGB value (255,235,205)
blue (Blue Preset Color)	Specifies a color with RGB value (0,0,255)
blueViolet (Blue Violet Preset Color)	Specifies a color with RGB value (138,43,226)
brown (Brown Preset Color)	Specifies a color with RGB value (165,42,42)
burlyWood (Burly Wood Preset Color)	Specifies a color with RGB value (222,184,135)
cadetBlue (Cadet Blue Preset Color)	Specifies a color with RGB value (95,158,160)
chartreuse (Chartreuse Preset Color)	Specifies a color with RGB value (127,255,0)
chocolate (Chocolate Preset Color)	Specifies a color with RGB value (210,105,30)
coral (Coral Preset Color)	Specifies a color with RGB value (255,127,80)
cornflowerBlue (Cornflower Blue Preset Color)	Specifies a color with RGB value (100,149,237)
cornsilk (Cornsilk Preset Color)	Specifies a color with RGB value (255,248,220)

Enumeration Value	Description
crimson (Crimson Preset Color)	Specifies a color with RGB value (220,20,60)
cyan (Cyan Preset Color)	Specifies a color with RGB value (0,255,255)
deepPink (Deep Pink Preset Color)	Specifies a color with RGB value (255,20,147)
deepSkyBlue (Deep Sky Blue Preset Color)	Specifies a color with RGB value (0,191,255)
dimGray (Dim Gray Preset Color)	Specifies a color with RGB value (105,105,105)
dkBlue (Dark Blue Preset Color)	Specifies a color with RGB value (0,0,139)
dkCyan (Dark Cyan Preset Color)	Specifies a color with RGB value (0,139,139)
dkGoldenrod (Dark Goldenrod Preset Color)	Specifies a color with RGB value (184,134,11)
dkGray (Dark Gray Preset Color)	Specifies a color with RGB value (169,169,169)
dkGreen (Dark Green Preset Color)	Specifies a color with RGB value (0,100,0)

#### 5.1.12.49 ST\_PresetLineDashVal (Preset Line Dash Value)

This simple type represents preset line dash values. The description for each style shows an illustration of the line style. Each style also contains a precise binary representation of the repeating dash style. Each 1 corresponds to a line segment of the same length as the line width, and each 0 corresponds to a space of the same length as the line width.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
dash (Dash)	 1111000
dashDot (Dash Dot)	 11110001000
dot (Dot)	 1000
lgDash (Large Dash)	 11111111000
lgDashDot (Large Dash Dot)	 111111110001000
lgDashDotDot (Large Dash Dot Dot)	 1111111100010001000
solid (Solid)	 1
sysDash (System Dash)	 1110
sysDashDot (System Dash Dot)	 111010
sysDashDotDot (System Dash Dot Dot)	 11101010
sysDot (System Dot)	 10

 </restriction>
</simpleType>
```

5.1.12.50 ST\_PresetMaterialType (Preset Material Type)

Describes surface appearance of a shape. The material type combines with lighting characteristics to create the final look and feel of a shape. The following properties were used to define the shape used in the image examples below:

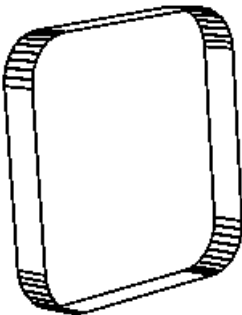

- Rounded rectangle shape
- Circle bevel type
- Three Point light rig type
- Camera type defined by the perspectiveContrastingRightFacing preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the XML Schema token datatype.

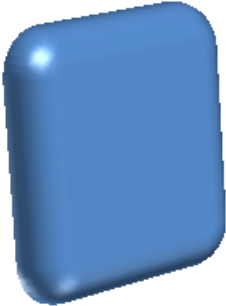

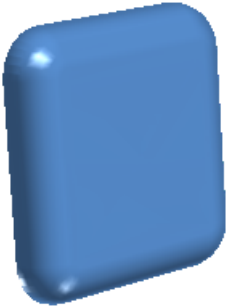

The following are possible enumeration values for this type:

Enumeration Value	Description
clear (Clear)	<p>[<i>Example:</i> Consider the following example of the clear material type:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
dkEdge (Dark Edge)	<p>[<i>Example:</i> Consider the following example of the dkEdge material type:</p>  <p><i>end example]</i></p>
flat (Flat)	<p>[<i>Example:</i> Consider the following example of the flat material type:</p>  <p><i>end example]</i></p>
legacyMatte (Legacy Matte)	<p>[<i>Example:</i> Consider the following example of the legacyMatte material type:</p>  <p></p>

Enumeration Value	Description
	<i>end example]</i>
legacyMetal (Legacy Metal)	<p>[<i>Example:</i> Consider the following example of the legacyMetal material type:</p>  <p><i>end example]</i></p>
legacyPlastic (Legacy Plastic)	<p>[<i>Example:</i> Consider the following example of the legacyPlastic material type:</p>  <p><i>end example]</i></p>
legacyWireframe (Legacy Wireframe)	<p>[<i>Example:</i> Consider the following example of the legacyWireframe material type:</p>  <p></p>

Enumeration Value	Description
	<i>end example]</i>
matte (Matte)	<p>[<i>Example:</i> Consider the following example of the matte material type:</p>  <p><i>end example]</i></p>
metal (Metal)	<p>[<i>Example:</i> Consider the following example of the warmMatte material type:</p>  <p><i>end example]</i></p>

### 5.1.12.51 ST\_PresetPatternVal (Preset Pattern Value)

This simple type indicates a preset type of pattern fill. The description of each value contains an illustration of the fill type.

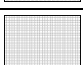

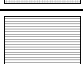

[Note: These presets correspond to members of the HatchStyle enumeration in the Microsoft .NET Framework. A reference for this type may be found at <http://msdn2.microsoft.com/en-us/library/system.drawing.drawing2d.hatchstyle.aspx>. end note]

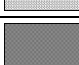

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cross (Cross)	
dashDnDiag (Dashed Downward Diagonal)	
dashHorz (Dashed Horizontal)	
dashUpDiag (Dashed Upward Diagonal)	
dashVert (Dashed Vertical)	

Enumeration Value	Description
diagBrick (Diagonal Brick)	
diagCross (Diagonal Cross)	
divot (Divot)

### 5.1.12.52 ST\_PresetShadowVal (Preset Shadow Type)

This simple type indicates one of 20 preset shadow types. Each enumeration value description illustrates the type of shadow represented by the value. Each description contains the parameters to the outer shadow effect represented by the preset, in addition to those attributes common to all prstShdw effects.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
shdw1 (Top Left Drop Shadow)	 No additional attributes specified.
shdw10 (Top Left Large Drop Shadow)	 align = "br" sx = 125% sy = 125%
shdw11 (Back Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = 50%
shdw12 (Back Right Long Perspective Shadow)	 align = "b" kx = -40.89° sy = 50%
shdw13 (Top Left Double Drop Shadow)	 Equivalent to two outer shadow effects.  Shadow 1: No additional attributes specified.  Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dist = 2 * shadow 1's distance
shdw14 (Bottom Right Small Drop Shadow)	

Enumeration Value	Description
	No additional attributes specified.
shdw15 (Front Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw16 (Front Right LongPerspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw17 (3D Outer Box Shadow)	 Equivalent to two outer shadow effects.  Shadow 1: No additional attributes specified.  Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°
shdw18 (3D Inner Box Shadow)	 Equivalent to two outer shadow effects.  Shadow 1: No additional attributes specified.  Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°
shdw19 (Back Center Perspective Shadow)	 align = "b" sy = 50°
shdw2 (Top Right Drop Shadow)	 No additional attributes specified.
shdw20 (Front Bottom Shadow)	 align = "b"

Enumeration Value	Description
	sy = -100°
shdw3 (Back Left Perspective Shadow)	 align = "b" ky = 40.89° sy = 50%
shdw4 (Back Right Perspective Shadow)	 align = "b" kx = -40.89° sy = 50%
shdw5 (Bottom Left Drop Shadow)	 No additional attributes specified.
shdw6 (Bottom Right Drop Shadow)	 No additional attributes specified.
shdw7 (Front Left Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw8 (Front Right Perspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw9 (Top Left Small Drop Shadow)	 align = "tl" sx = 75% sy = 75%

5.1.12.53 ST\_RectAlignment (Rectangle Alignments)

This simple type describes how to position two rectangles relative to each other.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Rectangle Alignment Enum ( Bottom ))	Bottom
bl (Rectangle Alignment Enum ( Bottom Left ))	Bottom Left
br (Rectangle Alignment Enum ( Bottom Right ))	Bottom Right
ctr (Rectangle Alignment Enum ( Center ))	Center
l (Rectangle Alignment Enum ( Left ))	Left
r (Rectangle Alignment Enum ( Right ))	Right
t (Rectangle Alignment Enum ( Top ))	Top
tl (Rectangle Alignment Enum ( Top Left ))	Top Left
tr (Rectangle Alignment Enum ( Top Right ))	Top Right

#### 5.1.12.54 ST\_SchemeColorVal (Scheme Color)

This simple type represents a scheme color value.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent Color 1)	Extra scheme color 1
accent2 (Accent Color 2)	Extra scheme color 2
accent3 (Accent Color 3)	Extra scheme color 3
accent4 (Accent Color 4)	Extra scheme color 4
accent5 (Accent Color 5)	Extra scheme color 5
accent6 (Accent Color 6)	Extra scheme color 6
bg1 (Background Color 1)	Semantic background color
bg2 (Background Color 2)	Semantic additional background color
dk1 (Dark Color 1)	Main dark color 1
dk2 (Dark Color 2)	Main dark color 2
folHlink (Followed Hyperlink Color)	Followed Hyperlink Color
hlink (Hyperlink Color)	Regular Hyperlink Color
lt1 (Light Color 1)	Main Light Color 1
lt2 (Light Color 2)	Main Light Color 2
phClr (Style Color)	A color used in theme definitions which means to use the color of the style.

Enumeration Value	Description
tx1 (Text Color 1)	Semantic text color
tx2 (Text Color 2)	Semantic additional text color

```

### 5.1.12.56 ST\_ShapeType (Preset Shape Types)

This simple type specifies the preset shape geometry that is to be used for a shape. An enumeration of this type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset shapes there are predefined guides that the generating application must maintain for calculation purposes at all times. The necessary guides should have the following values.

#### **3/4 of a Circle ('3cd4') - Constant value of "16200000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

#### **3/8 of a Circle ('3cd8') - Constant value of "8100000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

#### **5/8 of a Circle ('5cd8') - Constant value of "13500000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

#### **7/8 of a Circle ('7cd8') - Constant value of "18900000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

#### **Shape Bottom Edge ('b') - Constant value of "h"**

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

#### **1/2 of a Circle ('cd2') - Constant value of "10800000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

#### **1/4 of a Circle ('cd4') - Constant value of "5400000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

#### **1/8 of a Circle ('cd8') - Constant value of "2700000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

#### **Shape Height ('h')**

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

#### **Horizontal Center ('hc') - Calculated value of "\*" / w 1.0 2.0"**

This is the horizontal center of the shape which is just the width divided by 2.

#### **1/2 of Shape Height ('hd2') - Calculated value of "\*" / h 1.0 2.0"**

This is 1/2 the shape height.

#### **1/4 of Shape Height ('hd4') - Calculated value of "\*" / h 1.0 4.0"**

This is 1/4 the shape height.

#### **1/5 of Shape Height ('hd5') - Calculated value of "\*" / h 1.0 5.0"**

This is 1/5 the shape height.

#### **1/6 of Shape Height ('hd6') - Calculated value of "\*" / h 1.0 6.0"**

This is 1/6 the shape height.

**1/8 of Shape Height ('hd8') - Calculated value of  $"/ h 1.0 8.0$ "**

This is 1/8 the shape height.

**Shape Left Edge ('l') - Constant value of "0"**

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

**Longest Side of Shape ('ls') - Calculated value of  $"/ \max w h$ "**

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

**Shape Right Edge ('r') - Constant value of "w"**

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

**Shortest Side of Shape ('ss') - Calculated value of  $"/ \min w h$ "**

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

**1/2 Shortest Side of Shape ('ssd2') - Calculated value of  $"/ ss 1.0 2.0$ "**

This is 1/2 the shortest side of the shape.

**1/4 Shortest Side of Shape ('ssd4') - Calculated value of  $"/ ss 1.0 4.0$ "**

This is 1/4 the shortest side of the shape.

**1/6 Shortest Side of Shape ('ssd6') - Calculated value of  $"/ ss 1.0 6.0$ "**

This is 1/6 the shortest side of the shape.

**1/8 Shortest Side of Shape ('ssd8') - Calculated value of  $"/ ss 1.0 8.0$ "**

This is 1/8 the shortest side of the shape.

**Shape Top Edge ('t') - Constant value of "0"**

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

**Vertical Center of Shape ('vc') - Calculated value of  $"/ h 1.0 2.0$ "**

This is the vertical center of the shape which is just the height divided by 2.

**Shape Width ('w')**

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

**1/2 of Shape Width ('wd2') - Calculated value of  $"/ w 1.0 2.0$ "**

This is 1/2 the shape width.

**1/4 of Shape Width ('wd4') - Calculated value of  $"/ w 1.0 4.0$ "**

This is 1/4 the shape width.

**1/5 of Shape Width ('wd5') - Calculated value of  $"/ w 1.0 5.0$ "**

This is 1/5 the shape width.

**1/6 of Shape Width ('wd6') - Calculated value of  $"/ w 1.0 6.0$ "**

This is 1/6 the shape width.

**1/8 of Shape Width ('wd8') - Calculated value of  $"/ w 1.0 8.0$ "**

This is 1/8 the shape width.

**1/10 of Shape Width ('wd10') - Calculated value of  $"/ w 1.0 10.0$ "**

- 1      This is 1/10 the shape width.

Enumeration Value	Description
bracePair (Brace Pair Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the bracePair element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
bracketPair (Bracket Pair Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the bracketPair element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
callout1 (Callout 1 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the callout1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
callout2 (Callout 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the callout2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
callout3 (Callout 3 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the callout3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
can (Can Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the can element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
chartPlus (Chart Plus Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the chartPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
chartStar (Chart Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the chartStar element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
chartX (Chart X Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the chartX element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
chevron (Chevron Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the chevron element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
chord (Chord Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the chord element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
circularArrow (Circular Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the circularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
cloud (Cloud Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the cloud element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
cloudCallout (Callout Cloud Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the cloudCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
corner (Corner Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the corner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
cornerTabs (Corner Tabs Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the cornerTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
cube (Cube Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the cube element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedConnector2 (Curved Connector 2 Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedConnector3 (Curved Connector 3 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedConnector4 (Curved Connector 4 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
curvedConnector5 (Curved Connector 5 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedDownArrow (Curved Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedDownArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedLeftArrow (Curved Left Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedLeftArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
curvedRightArrow (Curved Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
curvedUpArrow (Curved Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
decagon (Decagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used</p>

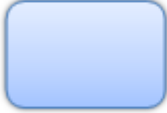

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the decagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
diagStripe (Diagonal Stripe Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the diagStripe element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
diamond (Diamond Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the diamond element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
dodecagon (Dodecagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the dodecagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
donut (Donut Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the donut element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
doubleWave (Double Wave Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the doubleWave element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
downArrow (Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the downArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
downArrowCallout (Callout Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the downArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ellipse (Ellipse Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the ellipse element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ellipseRibbon (Ellipse Ribbon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the ellipseRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ellipseRibbon2 (Ellipse Ribbon 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the ellipseRibbon2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartAlternateProcess (Alternate Process Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartAlternateProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartCollate (Collate Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartCollate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartConnector (Connector Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartDecision (Decision Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartDecision element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartDelay (Delay Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartDelay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartDisplay (Display Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartDisplay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartDocument (Document Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used</p>

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the flowChartDocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartExtract (Extract Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartExtract element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartInputOutput (Input Output Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartInputOutput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartInternalStorage (Internal Storage Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used</p>

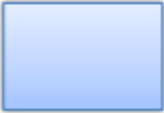

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the flowChartInternalStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartMagneticDisk (Magnetic Disk Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartMagneticDisk element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartMagneticDrum (Magnetic Drum Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartMagneticDrum element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartMagneticTape (Magnetic Tape Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used</p>

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the flowChartMagneticTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartManualInput (Manual Input Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartManualInput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartManualOperation (Manual Operation Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartManualOperation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartMerge (Merge Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the flowChartMerge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
<p>flowChartMultidocument (Multi-Document Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartMultidocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartOfflineStorage (Offline Storage Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartOfflineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
<p>flowChartOffpageConnector (Off-Page Connector Flow Shape)</p>	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used</p>

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the flowChartOffpageConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartOnlineStorage (Online Storage Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartOnlineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartOr (Or Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartOr element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartPredefinedProcess (Predefined Process Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used</p>

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the flowChartPredefinedProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartPreparation (Preparation Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartPreparation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartProcess (Process Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartPunchedCard (Punched Card Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used</p>

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the flowChartPunchedCard element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartPunchedTape (Punched Tape Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartPunchedTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartSort (Sort Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartSort element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartSummingJunction (Summing Junction Flow	Specifies a preset shape geometry. This geometry shall

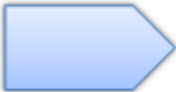

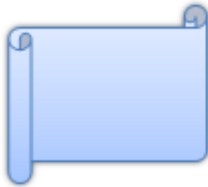

Enumeration Value	Description
Shape)	<p>be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartSummingJunction element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
flowChartTerminator (Terminator Flow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartTerminator element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
foldedCorner (Folded Corner Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the foldedCorner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
frame (Frame Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the frame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
funnel (Funnel Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the funnel element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
gear6 (Gear 6 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the gear6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
gear9 (Gear 9 Shape)	<p>Specifies a preset shape geometry. This geometry shall</p>

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the gear9 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
halfFrame (Half Frame Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the halfFrame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
heart (Heart Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the heart element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

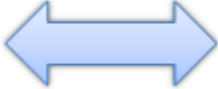

Enumeration Value	Description
	
heptagon (Heptagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the heptagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
hexagon (Hexagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the hexagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
homePlate (Home Plate Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the homePlate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
horizontalScroll (Horizontal Scroll Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the horizontalScroll element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
irregularSeal1 (Irregular Seal 1 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the irregularSeal1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
irregularSeal2 (Irregular Seal 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

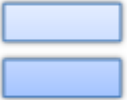

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the irregularSeal2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftArrow (Left Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftArrowCallout (Callout Left Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftBrace (Left Brace Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftBrace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftBracket (Left Bracket Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftBracket element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftCircularArrow (Left Circular Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftCircularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftRightArrow (Left Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall</p>

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftRightArrowCallout (Callout Left Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftRightCircularArrow (Left Right Circular Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightCircularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftRightRibbon (Left Right Ribbon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which may be used</p>

Enumeration Value	Description
	<p>to generate this preset shape definition is contained in the leftRightRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftRightUpArrow (Left Right Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
leftUpArrow (Left Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the leftUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
lightningBolt (Lightning Bolt Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the lightningBolt element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
line (Line Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the line element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
lineInv (Line Inverse Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the lineInv element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 

Enumeration Value	Description
mathDivide (Divide Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the mathDivide element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathEqual (Equal Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the mathEqual element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathMinus (Minus Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the mathMinus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathMultiply (Multiply Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

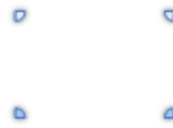

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathMultiply element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathNotEqual (Not Equal Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathNotEqual element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
mathPlus (Plus Math Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
moon (Moon Shape)	<p>Specifies a preset shape geometry. This geometry shall</p>

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the moon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
nonIsoscelesTrapezoid (Non-Isosceles Trapezoid Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the nonIsoscelesTrapezoid element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
noSmoking (No Smoking Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the noSmoking element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
notchedRightArrow (Notched Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the notchedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
octagon (Octagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the octagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
parallelogram (Parallelogram Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the parallelogram element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are</p>

Enumeration Value	Description
	<p>described in further detail above. <i>end note</i>]</p> 
pentagon (Pentagon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the pentagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
pie (Pie Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the pie element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
pieWedge (Pie Wedge Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

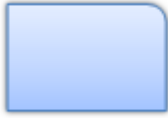

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the pieWedge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
plaque (Plaque Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the plaque element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
plaqueTabs (Plaque Tabs Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the plaqueTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
plus (Plus Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

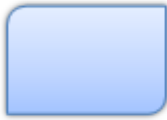

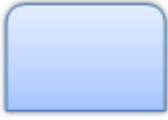

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the plus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
quadArrow (Quad-Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the quadArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
quadArrowCallout (Callout Quad-Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the quadArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
rect (Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ribbon (Ribbon Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the ribbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
ribbon2 (Ribbon 2 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the ribbon2 element in the preset shape geometries</p>

Enumeration Value	Description
	<p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
rightArrow (Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the rightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rightArrowCallout (Callout Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the rightArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rightBrace (Right Brace Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the rightBrace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
rightBracket (Right Bracket Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the rightBracket element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
round1Rect (One Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the round1Rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
round2DiagRect (Two Diagonal Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the round2DiagRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
round2SameRect (Two Same-side Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the round2SameRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
roundRect (Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the roundRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
rtTriangle (Right Triangle Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the <code>rtTriangle</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
smileyFace (Smiley Face Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the <code>smileyFace</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
snip1Rect (One Snip Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the <code>snip1Rect</code> element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
snip2DiagRect (Two Diagonal Snip Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the snip2DiagRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
snip2SameRect (Two Same-side Snip Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the snip2SameRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
snipRoundRect (One Snip One Round Corner Rectangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the snipRoundRect element in the preset shape geometries electronic addenda of Annex D. The</p>

Enumeration Value	Description
	<p>constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
squareTabs (Square Tabs Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the squareTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star10 (Ten Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the star10 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star12 (Twelve Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the star12 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
star16 (Sixteen Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the star16 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star24 (Twenty Four Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the star24 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star32 (Thirty Two Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the star32 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star4 (Four Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the star4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star5 (Five Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the star5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
star6 (Six Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the star6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star7 (Seven Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the star7 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
star8 (Eight Pointed Star Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the star8 element in the preset shape geometries electronic addenda of Annex D. The constants used in</p>

Enumeration Value	Description
	<p>that markup are guides that are described in further detail above. <i>end note</i>]</p> 
straightConnector1 (Straight Connector 1 Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the straightConnector1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
stripedRightArrow (Striped Right Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the stripedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
sun (Sun Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the sun element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
swooshArrow (Swoosh Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the swooshArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
teardrop (Teardrop Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the teardrop element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
trapezoid (Trapezoid Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the trapezoid element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
triangle (Triangle Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the triangle element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upArrow (Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the upArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
	
upArrowCallout (Callout Up Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the upArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upDownArrow (Up Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the upDownArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
upDownArrowCallout (Callout Up Down Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in</p>

Enumeration Value	Description
	<p>the upDownArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p> 
uturnArrow (U-Turn Arrow Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the uturnArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
verticalScroll (Vertical Scroll Shape)	<p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which may be used to generate this preset shape definition is contained in the verticalScroll element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
wave (Wave Shape)	<p>Specifies a preset shape geometry. This geometry shall</p>

Enumeration Value	Description
	<p>be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which may be used to generate this preset shape definition is contained in the wave element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> 
wedgeEllipseCallout (Callout Wedge Ellipse Shape)	<p>Specifies a preset shape geometry. ```

39 <simpleType name="ST_StyleMatrixColumnIndex">
40 <restriction base="xsd:unsignedInt"/>
41 </simpleType>

```

### 5.1.12.58 ST\_SystemColorVal (System Color Value)

This simple type specifies a system color value. This color is based upon the value that this color currently has within the system on which the document is being viewed.

Applications shall use the lastClr attribute to determine the absolute value of the last color used if system colors are not supported.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
3dDkShadow (3D Dark System Color)	Specifies a Dark shadow color for three-dimensional display elements.
3dLight (3D Light System Color)	Specifies a Light color for three-dimensional display elements (for edges facing the light source).
activeBorder (Active Border System Color)	Specifies an Active Window Border Color.
activeCaption (Active Caption System Color)	Specifies the active window title bar color. In particular the left side color in the color gradient of an active window's title bar if the gradient effect is enabled.
appWorkspace (Application Workspace System Color)	Specifies the Background color of multiple document interface (MDI) applications.
background (Background System Color)	Specifies the desktop background color.
btnFace (Button Face System Color)	Specifies the face color for three-dimensional display elements and for dialog box backgrounds.
btnHighlight (Button Highlight System Color)	Specifies the highlight color for three-dimensional display elements (for edges facing the light source).
btnShadow (Button Shadow System Color)	Specifies the shadow color for three-dimensional display elements (for edges facing away from the light source).
btnText (Button Text System Color)	Specifies the color of text on push buttons.
captionText (Caption Text System Color)	Specifies the color of text in the caption, size box, and scroll bar arrow box.
gradientActiveCaption (Gradient Active Caption System Color)	Specifies the right side color in the color gradient of an active window's title bar.
gradientInactiveCaption (Gradient Inactive Caption System Color)	Specifies the right side color in the color gradient of an inactive window's title bar.
grayText (Gray Text System Color)	Specifies a grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
highlight (Highlight System Color)	Specifies the color of Item(s) selected in a control.

Enumeration Value	Description
highlightText (Highlight Text System Color)	Specifies the text color of item(s) selected in a control.
hotLight (Hot Light System Color)	Specifies the color for a hyperlink or hot-tracked item.
inactiveBorder (Inactive Border System Color)	Specifies the color of the Inactive window border.
inactiveCaption (Inactive Caption System Color)	Specifies the color of the Inactive window caption. Specifies the left side color in the color gradient of an inactive window's title bar if the gradient effect is enabled.
inactiveCaptionText (Inactive Caption Text System Color)	Specifies the color of text in an inactive caption.
infoBk (Info Back System Color)	Specifies the background color for tooltip controls.
infoText (Info Text System Color)	Specifies the text color for tooltip controls.
menu (Menu System Color)	Specifies the menu background color.
menuBar (Menu Bar System Color)	Specifies the background color for the menu bar when menus appear as flat menus.
menuHighlight (Menu Highlight System Color)	Specifies the color used to highlight menu items when the menu appears as a flat menu.
menuText (Menu Text System Color)	Specifies the color of Text in menus.
scrollBar (Scroll Bar System Color)	Specifies the scroll bar gray area color.
window (Window System Color)	Specifies window background color.
windowFrame (Window Frame System Color)	Specifies the window frame color.
windowText (Window Text System Color)	Specifies the color of text in windows.

#### 5.1.12.59 ST\_TextAlignType (Text Alignment Types)

This type specifies the text alignment types

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Text Alignment Enum ( Center ))	Align text in the center.
dist (Text Alignment Enum ( Distributed ))	Distributes the text words across an entire text line.
just (Text Alignment Enum ( Justified ))	Align text so that it is justified across the whole line. It is smart in the sense that it will not justify sentences which are short.

Enumeration Value	Description
justLow (Text Alignment Enum ( Justified Low ))	Aligns the text with an adjusted kashida length for Arabic text.
l (Text Alignment Enum ( Left ))	Align text to the left margin.
r (Text Alignment Enum ( Right ))	Align text to the right margin.
thaiDist (Text Alignment Enum ( Thai Distributed ))	Distributes Thai text specially, because each character is treated as a word.

13 </simpleType>

```

#### 14 5.1.12.60 ST\_TextAnchoringType (Text Anchoring Types)

15 This type specifies a list of available anchoring types for text.

16 This simple type's contents are a restriction of the XML Schema token datatype.

17 The following are possible enumeration values for this type:

Enumeration Value	Description
b (Text Anchor Enum ( Bottom ))	Anchor the text at the bottom of the bounding rectangle.
ctr (Text Anchor Enum ( Center ))	Anchor the text at the middle of the bounding rectangle.
dist (Text Anchor Enum ( Distributed ))	Anchor the text so that it is distributed vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to anchorJustified (special case: if only 1 line, then anchored in middle). When text is vertical, then it distributes the letters vertically. This is different than

Enumeration Value	Description
	anchorJustified, because it always forces distribution of the words, even if there are only one or two words in a line.
just (Text Anchor Enum ( Justified ))	Anchor the text so that it is justified vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to 'distrib' (special case: if only 1 line, then anchored at top). When text is vertical, then it justifies the letters vertically. This is different than anchorDistributed, because in some cases such as very little text in a line, it will not justify.
t (Text Anchoring Type Enum ( Top ))	Anchor the text at the top of the bounding rectangle.

### 12 5.1.12.61 ST\_TextAutonumberScheme (Text Auto-number Schemes)

13 This type specifies a list of automatic numbering schemes.

14 This simple type's contents are a restriction of the XML Schema token datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
alphaLcParenBoth (Autonumber Enum ( alphaLcParenBoth ))	(a), (b), (c), ...
alphaLcParenR (Autonumbering Enum ( alphaLcParenR ))	a), b), c), ...
alphaLcPeriod (Autonumbering Enum ( alphaLcPeriod ))	a., b., c., ...
alphaUcParenBoth (Autonumbering Enum (	(A), (B), (C), ...

Enumeration Value	Description
alphaUcParenBoth ))	
alphaUcParenR (Autonumbering Enum ( alphaUcParenR ))	A), B), C), ...
alphaUcPeriod (Autonumbering Enum ( alphaUcPeriod ))	A., B., C., ...
arabic1Minus (Autonumbering Enum ( arabic1Minus ))	Bidi Arabic 1 (AraAlpha) with ANSI minus symbol
arabic2Minus (Autonumbering Enum ( arabic2Minus ))	Bidi Arabic 2 (AraAbjad) with ANSI minus symbol
arabicDbPeriod (Autonumbering Enum ( arabicDbPeriod ))	Dbl-byte Arabic numbers w/ double-byte period
arabicDbPlain (Autonumbering Enum ( arabicDbPlain ))	Dbl-byte Arabic numbers
arabicParenBoth (Autonumbering Enum ( arabicParenBoth ))	(1), (2), (3), ...
arabicParenR (Autonumbering Enum ( arabicParenR ))	1), 2), 3), ...
arabicPeriod (Autonumbering Enum ( arabicPeriod ))	1., 2., 3., ...
arabicPlain (Autonumbering Enum ( arabicPlain ))	1, 2, 3, ...
circleNumDbPlain (Autonumbering Enum ( circleNumDbPlain ))	Dbl-byte circle numbers (1-10 circle[0x2460-], 11- arabic numbers)
circleNumWdBlackPlain (Autonumbering Enum ( circleNumWdBlackPlain ))	Wingdings black circle numbers
circleNumWdWhitePlain (Autonumbering Enum ( circleNumWdWhitePlain ))	Wingdings white circle numbers (0-10 circle[0x0080-], 11- arabic numbers)
ea1ChsPeriod (Autonumbering Enum ( ea1ChsPeriod ))	EA: Simplified Chinese w/ single-byte period
ea1ChsPlain (Autonumbering Enum ( ea1ChsPlain ))	EA: Simplified Chinese (TypeA 1-99, TypeC 100-)
ea1ChtPeriod (Autonumbering Enum ( ea1ChtPeriod ))	EA: Traditional Chinese w/ single-byte period
ea1ChtPlain (Autonumbering Enum ( ea1ChtPlain ))	EA: Traditional Chinese (TypeA 1-19, TypeC 20-)
ea1JpnChsDbPeriod (Autonumbering Enum ( ea1JpnChsDbPeriod ))	EA: Japanese w/ double-byte period
ea1JpnKorPeriod (Autonumbering Enum ( ea1JpnKorPeriod ))	EA: Japanese/Korean w/ single-byte period
ea1JpnKorPlain (Autonumbering Enum ( ea1JpnKorPlain ))	EA: Japanese/Korean (TypeC 1-)
hebrew2Minus (Autonumbering Enum ( hebrew2Minus ))	Bidi Hebrew 2 with ANSI minus symbol

Enumeration Value	Description
hindiAlpha1Period (Autonumbering Enum ( hindiAlpha1Period ))	Hindi alphabet period - consonants
hindiAlphaPeriod (Autonumbering Enum ( hindiAlphaPeriod ))	Hindi alphabet period - vowels
hindiNumParenR (Autonumbering Enum ( hindiNumParenR ))	Hindi numerical parentheses - right
hindiNumPeriod (Autonumbering Enum ( hindiNumPeriod ))	Hindi numerical period
romanLcParenBoth (Autonumbering Enum ( romanLcParenBoth ))	(i), (ii), (iii), ...
romanLcParenR (Autonumbering Enum ( romanLcParenR ))	i), ii), iii), ...
romanLcPeriod (Autonumbering Enum ( romanLcPeriod ))	i., ii., iii., ...

#### 5.1.12.62 ST\_TextBulletSizePercent (Bullet Size Percentage)

This type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it. 25000 = 25 % 400000 = 400 %

This simple type's contents are a restriction of the ST\_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 25000.
- This simple type has a maximum value of less than or equal to 400000.

#### Referenced By

buSzPct@val (§5.1.5.4.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextBulletSizePercent">
 <restriction base="ST_Percentage">
 <minInclusive value="25000"/>
 <maxInclusive value="400000"/>
 </restriction>
</simpleType>
```

#### 5.1.12.63 ST\_TextBulletStartAtNum (Start Bullet At Number)

This type specifies the range that the start at number for a bullet's auto-numbering sequence can begin at. When the numbering is alphabetical, then the numbers map to the appropriate letter. 1->a, 2->b, etc. If the numbers go above 26, then the numbers begin to double up. For example, 27->aa and 53->aaa.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 32767.

#### Referenced By

buAutoNum@startAt (§5.1.5.4.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextBulletStartAtNum">
 <restriction base="xsd:int">
 <minInclusive value="1"/>
 <maxInclusive value="32767"/>
 </restriction>
</simpleType>
```

#### 5.1.12.64 ST\_TextCapsType (Text Cap Types)

This type specifies the cap types of the text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (Text Caps Enum ( All ))	Apply all caps on the text. All lower case letters are converted to upper case even though they are stored differently in the backing store.
none (Text Caps Enum ( None ))	The reason we cannot implicitly have noCaps be the scenario where capitalization is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not have a capitalization scheme even though the style says otherwise.
small (Text Caps Enum ( Small ))	Apply small caps to the text. All letters are converted to lower case.

1

```

### 5.1.12.66 ST\_TextFontAlignType (Font Alignment Types)

This type specifies the different types of font alignment.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Font Alignment Enum ( Automatic ))	When the text flow is horizontal or simple vertical same as fontBaseline but for other vertical modes same as fontCenter.
b (Font Alignment Enum ( Bottom ))	The letters are anchored to the very bottom of a single line. This is different than the bottom baseline because of letters such as "g," "q," "y," etc.
base (Font Alignment Enum ( Baseline ))	The letters are anchored to the bottom baseline of a single line.
ctr (Font Alignment Enum ( Center ))	The letters are anchored between the two baselines of a single line.
t (Font Alignment Enum ( Top ))	The letters are anchored to the top baseline of a single line.

 </restriction>
</simpleType>
```

### 5.1.12.67 ST\_TextFontScalePercent (Text Font Scale Percentage)

This type specifies the percentage range text can be scaled to in order to fit.

This simple type's contents are a restriction of the ST\_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1000.
- This simple type has a maximum value of less than or equal to 100000.

Referenced By
normAutofit@fontScale (§5.1.5.1.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextFontScalePercent">
 <restriction base="ST_Percentage">
 <minInclusive value="1000"/>
 <maxInclusive value="100000"/>
 </restriction>
</simpleType>
```

#### 5.1.12.68 ST\_TextFontSize (Text Font Size)

This type specifies the size of any text in hundredths of a point. Must be at least 1 point.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 100.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By
buSzPts@val (§5.1.5.4.10); defRPr@sz (§5.1.5.3.2); endParaRPr@sz (§5.1.5.2.3); rPr@sz (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextFontSize">
 <restriction base="xsd:int">
 <minInclusive value="100"/>
 <maxInclusive value="400000"/>
 </restriction>
</simpleType>
```

#### 5.1.12.69 ST\_TextHorzOverflowType (Text Horizontal Overflow Types)

This type specifies the text horizontal overflow types

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clip (Text Horizontal Overflow Enum ( Clip ))	When a big character does not fit into a line, clip it at the proper horizontal overflow.
overflow (Text Horizontal Overflow Enum ( Overflow	When a big character does not fit into a line, allow a

Enumeration Value	Description
))	horizontal overflow.

4 <restriction base="xsd:token">
5 <enumeration value="overflow"/>
6 <enumeration value="clip"/>
7 </restriction>
8 </simpleType>
```

### 9 5.1.12.70 ST\_TextIndent (Text Indentation)

10 This type specifies the text indentation amount to be used.

11 NOTE: The units of measurement used here are EMUs (English Metric Units).

12 This simple type's contents are a restriction of the ST\_Coordinate32 simple type (§5.1.12.17).

13 This simple type also specifies the following restrictions:

- 14 • This simple type has a minimum value of greater than or equal to -51206400.
- 15 • This simple type has a maximum value of less than or equal to 51206400.

Referenced By

20 <maxInclusive value="51206400"/>
21 </restriction>
22 </simpleType>
```

### 23 5.1.12.71 ST\_TextIndentLevelType (Text Indent Level Type)

24 This type specifies the indent level type. We support list level 0 to 8, and we use -1 and -2 for outline mode  
25 levels that should only exist in memory.

26 This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 8.

**Referenced By**

defPPr@lvl (§5.1.5.2.2); lvl1pPr@lvl (§5.1.5.4.13); lvl2pPr@lvl (§5.1.5.4.14); lvl3pPr@lvl (§5.1.5.4.15);

</simpleType>
```

**5.1.12.73 ST\_TextMargin (Text Margin)**

This type specifies the margin that will be used and its corresponding size.

This simple type's contents are a restriction of the ST\_Coordinate32 simple type (§5.1.12.17).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 51206400.

 <maxInclusive value="51206400"/>
 </restriction>
</simpleType>
```

**5.1.12.74 ST\_TextNonNegativePoint (Text Non-Negative Point)**

This type specifies a non-negative font size in hundredths of a point. This is restricted to the range [0, 400000].

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 400000.

**Referenced By**

 <maxInclusive value="400000"/>
 </restriction>
</simpleType>
```

**5.1.12.75 ST\_TextPoint (Text Point)**

This type specifies a font size in hundredths of a point. This is restricted to the range [-400000, 400000], i.e from -4000 pt to 4000 pt.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -400000.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By

 <minInclusive value="-400000"/>
 <maxInclusive value="400000"/>
 </restriction>
</simpleType>
```

#### 5.1.12.76 ST\_TextShapeType (Preset Text Shape Types)

This simple type specifies the preset text shape geometry that is to be used for a shape. An enumeration of this type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset text shapes there are predefined guides that the generating application must maintain for calculation purposes at all times. The necessary guides should have the following values.

##### **3/4 of a Circle ('3cd4') - Constant value of "16200000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

##### **3/8 of a Circle ('3cd8') - Constant value of "8100000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

##### **5/8 of a Circle ('5cd8') - Constant value of "13500000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

##### **7/8 of a Circle ('7cd8') - Constant value of "18900000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

##### **Shape Bottom Edge ('b') - Constant value of "h"**

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

##### **1/2 of a Circle ('cd2') - Constant value of "10800000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

##### **1/4 of a Circle ('cd4') - Constant value of "5400000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

##### **1/8 of a Circle ('cd8') - Constant value of "2700000.0"**

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

##### **Shape Height ('h')**

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

##### **Horizontal Center ('hc') - Calculated value of "\*" / w 1.0 2.0"**

This is the horizontal center of the shape which is just the width divided by 2.

**1/2 of Shape Height ('hd2') - Calculated value of  $h / 2$** 

This is 1/2 the shape height.

**1/4 of Shape Height ('hd4') - Calculated value of  $h / 4$** 

This is 1/4 the shape height.

**1/5 of Shape Height ('hd5') - Calculated value of  $h / 5$** 

This is 1/5 the shape height.

**1/6 of Shape Height ('hd6') - Calculated value of  $h / 6$** 

This is 1/6 the shape height.

**1/8 of Shape Height ('hd8') - Calculated value of  $h / 8$** 

This is 1/8 the shape height.

**Shape Left Edge ('l') - Constant value of "0"**

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

**Longest Side of Shape ('ls') - Calculated value of  $\max(w, h)$** 

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

**Shape Right Edge ('r') - Constant value of "w"**

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

**Shortest Side of Shape ('ss') - Calculated value of  $\min(w, h)$** 

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

**1/2 Shortest Side of Shape ('ssd2') - Calculated value of  $ss / 2$** 

This is 1/2 the shortest side of the shape.

**1/4 Shortest Side of Shape ('ssd4') - Calculated value of  $ss / 4$** 

This is 1/4 the shortest side of the shape.

**1/6 Shortest Side of Shape ('ssd6') - Calculated value of  $ss / 6$** 

This is 1/6 the shortest side of the shape.

**1/8 Shortest Side of Shape ('ssd8') - Calculated value of  $ss / 8$** 

This is 1/8 the shortest side of the shape.

**Shape Top Edge ('t') - Constant value of "0"**

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

**Vertical Center of Shape ('vc') - Calculated value of  $h / 2$** 

This is the vertical center of the shape which is just the height divided by 2.

**Shape Width ('w')**

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

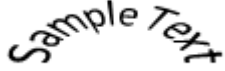

**1/2 of Shape Width ('wd2') - Calculated value of  $w / 2$** 

This is 1/2 the shape width.

**1/4 of Shape Width ('wd4') - Calculated value of  $w / 4$**

- 1        This is 1/4 the shape width.
- 2        **1/5 of Shape Width ('wd5') - Calculated value of "\*" / w 1.0 5.0"**
- 3        This is 1/5 the shape width.
- 4        **1/6 of Shape Width ('wd6') - Calculated value of "\*" / w 1.0 6.0"**
- 5        This is 1/6 the shape width.
- 6        **1/8 of Shape Width ('wd8') - Calculated value of "\*" / w 1.0 8.0"**
- 7        This is 1/8 the shape width.
- 8        **1/10 of Shape Width ('wd10') - Calculated value of "\*" / w 1.0 10.0"**
- 9        This is 1/10 the shape width.
- 10
- 11      This simple type's contents are a restriction of the XML Schema token datatype.
- 12      The following are possible enumeration values for this type:

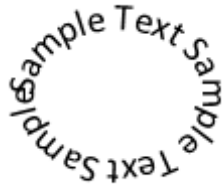

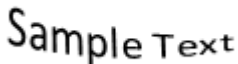

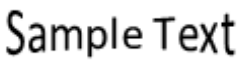

Enumeration Value	Description
textArchDown (Downward Arch Text Shape)	 <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textArchDown element in the preset text warp electronic addenda of Annex D. Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeLeft element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textFadeRight (Right Fade Text Shape)	<p><b>Sample Text</b></p> <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[<i>Note</i>: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeRight element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textFadeUp (Upward Fade Text Shape)	<p></p> <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[<i>Note</i>: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeUp element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textInflate (Inflate Text Shape)	<p><b>Sample Text</b></p> <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[<i>Note</i>: An example of DrawingML markup which may be used to achieve this effect is contained in the textInflate element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>

Enumeration Value	Description
textInflateBottom (Bottom Inflate Text Shape)	<p data-bbox="850 268 1078 331">Sample Text</p> <p data-bbox="824 361 1455 424">Specifies a text shape that shall match the normative shape shown above.</p> <p data-bbox="824 466 1464 674"><i>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textInflateBottom element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. end note]</i></p>
textInflateTop (Top Inflate Text Shape)	<p data-bbox="850 714 1078 777">Sample Text</p> <p data-bbox="824 806 1455 869">Specifies a text shape that shall match the normative shape shown above.</p> <p data-bbox="824 911 1464 1119"><i>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textInflateTop element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. end note]</i></p>
textNoShape (No Text Shape)	<p data-bbox="824 1138 1445 1274">Specifies that the text will have no associated shape with it and thus the text should not be warped but instead be constrained by the normal text bounding box.</p>
textPlain (Plain Text Shape)	<p data-bbox="850 1314 1078 1377">Sample Text</p> <p data-bbox="824 1428 1455 1491">Specifies a text shape that shall match the normative shape shown above.</p> <p data-bbox="824 1533 1464 1740"><i>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textPlain element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. end note]</i></p>
textRingInside (Inside Ring Text Shape)	<p data-bbox="850 1780 1078 1843">Sample Text</p>

Enumeration Value	Description
	<p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textRingInside element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textRingOutside (Outside Ring Text Shape)	 <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textRingOutside element in the preset text warp electronic addenda of Annex D.</p> <p>The constants used in that markup are guides that are described in further detail above</p>
textSlantDown (Downward Slant Text Shape)	 <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textSlantDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textSlantUp (Upward Slant Text Shape)	 <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textSlantUp element in the preset text warp electronic addenda of Annex D. The constants used in that</p>

Enumeration Value	Description
	markup are guides that are described in further detail above. <i>end note</i> ]
textStop (Stop Sign Text Shape)	<p data-bbox="849 352 1078 411">sample Text</p> <p data-bbox="824 436 1455 504">Specifies a text shape that shall match the normative shape shown above.</p> <p data-bbox="824 541 1463 751">[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textStop element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textTriangle (Triangle Text Shape)	<p data-bbox="849 789 1078 848">sample Text</p> <p data-bbox="824 873 1455 940">Specifies a text shape that shall match the normative shape shown above.</p> <p data-bbox="824 978 1463 1188">[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textTriangle element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textTriangleInverted (Inverted Triangle Text Shape)	<p data-bbox="849 1234 1078 1293">Sample Text</p> <p data-bbox="824 1318 1455 1386">Specifies a text shape that shall match the normative shape shown above.</p> <p data-bbox="824 1423 1463 1633">[Note: An example of DrawingML markup which may be used to achieve this effect is contained in the textTriangleInverted element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textWave1 (Wave 1 Text Shape)	<p data-bbox="849 1688 1078 1747">Sample Text</p> <p data-bbox="824 1772 1455 1839">Specifies a text shape that shall match the normative shape shown above.</p>

Enumeration Value	Description
	<p>[<i>Note</i>: An example of DrawingML markup which may be used to achieve this effect is contained in the textWave1 element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>
textWave2 (Wave 2 Text Shape)	<p><b>Sample Text</b></p> <p>Specifies a text shape that shall match the normative shape shown above.</p> <p>[<i>Note</i>: An example of DrawingML markup which may be used to achieve this effect is contained in the textWave2 element in the preset text warp electronic addenda of Annex D. #### 5.1.12.77 ST\_TextSpacingPercent (Text Spacing Percent)

This type specifies the range that the spacing percent, in terms of a line. Represented in the file format from 0-1000 line hundredths, maps to 0.00-10.00 lines.

This simple type's contents are a restriction of the ST\_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 13200000.

Referenced By
normAutofit@lnSpcReduction (§5.1.5.1.3); spcPct@val (§5.1.5.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextSpacingPercent">
 <restriction base="ST_Percentage">
 <minInclusive value="0"/>
 <maxInclusive value="13200000"/>
 </restriction>
</simpleType>
```

### 5.1.12.78 ST\_TextSpacingPoint (Text Spacing Point)

This type specifies the Text Spacing that will be used in terms of font point size.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 158400.

Referenced By
spcPts@val (§5.1.5.2.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextSpacingPoint">
 <restriction base="xsd:int">
 <minInclusive value="0"/>
 <maxInclusive value="158400"/>
 </restriction>
</simpleType>
```

### 5.1.12.79 ST\_TextStrikeType (Text Strike Type)

This type specifies the strike type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
dblStrike (Text Strike Enum ( Double Strike ))	A double strikethrough applied on the text
noStrike (Text Strike Enum ( No Strike ))	No strike is applied to the text
sngStrike (Text Strike Enum ( Single Strike ))	A single strikethrough is applied to the text

1

Referenced By
defRPr@strike (§5.1.5.3.2); endParaRPr@strike (§5.1.5.2.3); rPr@strike (§5.1.5.3.9)

6 <enumeration value="sngStrike"/>
7 <enumeration value="dblStrike"/>
8 </restriction>
9 </simpleType>
```

#### 10 5.1.12.80 ST\_TextTabAlignType (Text Tab Alignment Types)

11 This type specifies the text tab alignment types.

12 This simple type's contents are a restriction of the XML Schema token datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Text Tab Alignment Enum ( Center ))	The text at this tab stop is center aligned.
dec (Text Tab Alignment Enum ( Decimal ))	At this tab stop, the decimals are lined up. From a user's point of view, the text here behaves as right aligned until the decimal, and then as left aligned after the decimal.
l (Text Tab Alignment Enum ( Left ))	The text at this tab stop is left aligned.
r (Text Tab Alignment Enum ( Right ))	The text at this tab stop is right aligned.

14

Referenced By

 <enumeration value="ctr"/>
 <enumeration value="r"/>
 <enumeration value="dec"/>
 </restriction>
</simpleType>
```

#### 5.1.12.81 ST\_TextTypeface (Text Typeface)

This type specifies the way we represent a font typeface.

This simple type's contents are a restriction of the XML Schema string datatype.

##### Referenced By

buFont@typeface (§5.1.5.4.6); cs@typeface (§5.1.5.3.1); ea@typeface (§5.1.5.3.3); font@typeface (§4.3.1.10); font@typeface (§5.1.4.1.16); latin@typeface (§5.1.5.3.7); sym@typeface (§5.1.5.3.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextTypeface">
 <restriction base="xsd:string"/>
</simpleType>
```

#### 5.1.12.82 ST\_TextUnderlineType (Text Underline Types)

This type specifies the text underline types that will be used.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dash (Text Underline Enum ( Dashed ))	Underline the text with a single, dashed line of normal thickness.
dashHeavy (Text Underline Enum ( Heavy Dashed ))	Underline the text with a single, dashed, thick line.
dashLong (Text Underline Enum ( Long Dashed ))	Underline the text with a single line consisting of long dashes of normal thickness.
dashLongHeavy (Text Underline Enum ( Heavy Long Dashed ))	Underline the text with a single line consisting of long, thick dashes.
dbl (Text Underline Enum ( Double ))	Underline the text with two lines of normal thickness.
dotDash (Text Underline Enum ( Dot Dash ))	Underline the text with a single line of normal thickness consisting of repeating dots and dashes.
dotDashHeavy (Text Underline Enum ( Heavy Dot Dash ))	Underline the text with a single, thick line consisting of repeating dots and dashes.

Enumeration Value	Description
dotDotDash (Text Underline Enum ( Dot Dot Dash ))	Underline the text with a single line of normal thickness consisting of repeating two dots and dashes.
dotDotDashHeavy (Text Underline Enum ( Heavy Dot Dot Dash ))	Underline the text with a single, thick line consisting of repeating two dots and dashes.
dotted (Text Underline Enum ( Dotted ))	Underline the text with a single, dotted line of normal thickness.
dottedHeavy (Text Underline Enum ( Heavy Dotted ))	Underline the text with a single, thick, dotted line.
heavy (Text Underline Enum ( Heavy ))	Underline the text with a single, thick line.
none (Text Underline Enum ( None ))	The reason we cannot implicitly have noUnderline be the scenario where underline is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not be underlined even though the style says otherwise.
sng (Text Underline Enum ( Single ))	Underline the text with a single line of normal thickness.
wavy (Text Underline Enum ( Wavy ))	Underline the text with a single wavy line of normal thickness.
wavyDbl (Text Underline Enum ( Double Wavy ))	Underline the text with two wavy lines of normal thickness.
wavyHeavy (Text Underline Enum ( Heavy Wavy ))	Underline the text with a single, thick wavy line.
words (Text Underline Enum ( Words ))	Underline just the words and not the spaces between them.

1

Referenced By
defRPr@u (§5.1.5.3.2); endParaRPr@u (§5.1.5.2.3); rPr@u (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextUnderlineType">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="words"/>
 <enumeration value="sng"/>
 <enumeration value="dbl"/>
 <enumeration value="heavy"/>
 <enumeration value="dotted"/>
 <enumeration value="dottedHeavy"/>

 <enumeration value="wavyHeavy"/>
 <enumeration value="wavyDb1"/>
 </restriction>
</simpleType>
```

#### 5.1.12.83 ST\_TextVerticalType (Vertical Text Types)

If there is vertical text, determines what type of vertical text is going to be used.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
eaVert (Vertical Text Type Enum ( East Asian Vertical ))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical.
horz (Vertical Text Type Enum ( Horizontal ))	Horizontal text. This should be default.
mongolianVert (Vertical Text Type Enum ( Mongolian Vertical ))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical. The difference between this and the eastAsianVertical is the text flows top down then LEFT RIGHT, instead of RIGHT LEFT
vert (Vertical Text Type Enum ( Vertical ))	Determines if all of the text is vertical orientation (each line is 90 degrees rotated clockwise, so it goes from top to bottom; each next line is to the left from the previous one).
vert270 (Vertical Text Type Enum ( Vertical 270 ))	Determines if all of the text is vertical orientation

Enumeration Value	Description
	(each line is 270 degrees rotated clockwise, so it goes from bottom to top; each next line is to the right from the previous one).
wordArtVert (Vertical Text Type Enum ( WordArt Vertical ))	Determines if all of the text is vertical ("one letter on top of another").
wordArtVertRtl (Vertical WordArt Right to Left)	Specifies that vertical WordArt should be shown from right to left rather than left to right.

1

Referenced By
bodyPr@vert (§5.1.5.1.1); tcPr@vert (§5.1.6.15)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TextVerticalType">
4 <restriction base="xsd:token">
5 <enumeration value="horz"/>
6 <enumeration value="vert"/>
7 <enumeration value="vert270"/>
8 <enumeration value="wordArtVert"/>
9 <enumeration value="eaVert"/>
10 <enumeration value="mongolianVert"/>
11 <enumeration value="wordArtVertRtl"/>
12 </restriction>
13 </simpleType>
```

#### 14 5.1.12.84 ST\_TextVertOverflowType (Text Vertical Overflow)

15 This type specifies the text vertical overflow.

16 This simple type's contents are a restriction of the XML Schema token datatype.

17 The following are possible enumeration values for this type:

Enumeration Value	Description
clip (Text Overflow Enum ( Clip ))	Pay attention to top and bottom barriers. Provide no indication that there is text which is not visible.
ellipsis (Text Overflow Enum ( Ellipsis ))	Pay attention to top and bottom barriers. Use an ellipsis to denote that there is text which is not visible.
overflow (Text Overflow Enum ( Overflow ))	Overflow the text and pay no attention to top and bottom barriers.

18

Referenced By
bodyPr@vertOverflow (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextVertOverflowType">
 <restriction base="xsd:token">

 <enumeration value="ellipsis"/>
 <enumeration value="clip"/>
 </restriction>
</simpleType>
```

#### 5.1.12.85 ST\_TextWrappingType (Text Wrapping Types)

##### Text Wrapping Types

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (Text Wrapping Type Enum ( None ))	No wrapping will occur on this text body. Words will spill out without paying attention to the bounding rectangle boundaries.
square (Text Wrapping Type Enum ( Square ))	Determines whether we wrap words within the bounding rectangle.

#### Referenced By

bodyPr@wrap (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextWrappingType">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="square"/>
 </restriction>
</simpleType>
```

#### 5.1.12.86 ST\_TileFlipMode (Tile Flip Mode)

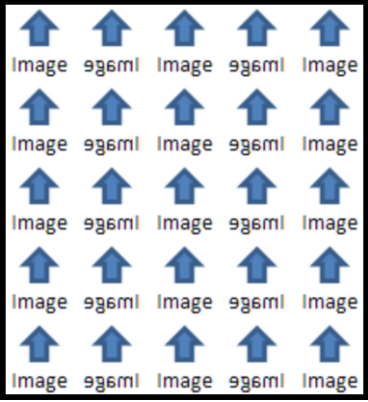

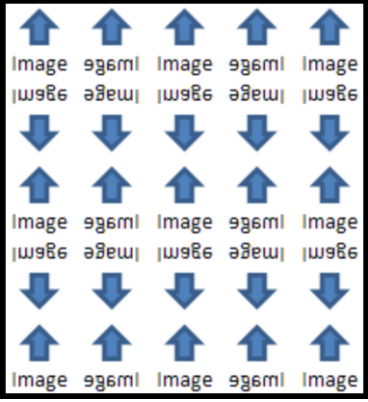

This simple type indicates whether/how to flip the contents of a tile region when using it to fill a larger fill region.

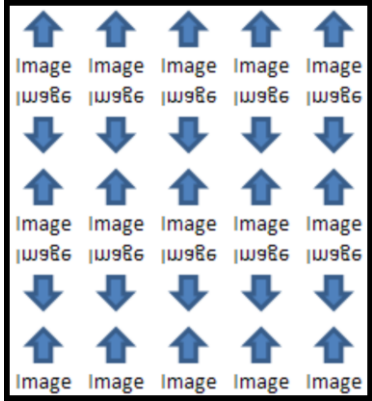

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
none (None)	<div><p>Tiles are not flipped.</p></div>
x (Horizontal)	<div><p>Tiles are flipped horizontally.</p></div>
xy (Horizontal and Vertical)	<div><p>Tiles are flipped both horizontally and vertically.</p></div>

Enumeration Value	Description
y (Vertical)	<div></div> <p>Tiles are flipped vertically.</p>

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TileFlipMode">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="x"/>
 <enumeration value="y"/>
 <enumeration value="xy"/>
 </restriction>
</simpleType>
```

5.2 DrawingML - Picture

These elements encompass the definition of pictures within the DrawingML framework. While pictures are in many ways very similar to shapes they have specific properties that are unique in order to optimize for picture-specific scenarios. Some of these properties include Fill behavior, Border behavior and Resize behavior.

5.2.1 Table of Contents

This subclause is informative.

<b>5.2.2 Elements</b> .....	<b>3886</b>

**End of informative text.**

## 5.2.2 Elements

The following section defines the Picture portion of the DrawingML framework.

### 5.2.2.1 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

*[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.]*

```

<p:pic>
 ..
 <p:blipFill>
 <a:blip r:embed="rId2"/>
 <a:stretch>
 <a:fillRect/>
 </a:stretch>
 </p:blipFill>
 ..
</p:pic>

```

1 The above picture object is shown as an example of this fill type. *end example*]

2 [*Example:* Consider now the same picture object but with an additional gradient fill applied within the shape  
3 properties portion of the picture.

```

4 <p:pic>
5 ..
6 <p:blipFill>
7 <a:blip r:embed="rId2"/>
8 <a:stretch>
9 <a:fillRect/>
10 </a:stretch>
11 </p:blipFill>
12 <p:spPr>
13 <a:gradFill>
14 <a:gsLst>
15 <a:gs pos="0">
16 <a:schemeClr val="tx2">
17 <a:shade val="50000"/>
18 </a:schemeClr>
19 </a:gs>
20 <a:gs pos="39999">
21 <a:schemeClr val="tx2">
22 <a:tint val="20000"/>
23 </a:schemeClr>
24 </a:gs>
25 <a:gs pos="70000">
26 <a:srgbClr val="C4D6EB"/>
27 </a:gs>
28 <a:gs pos="100000">
29 <a:schemeClr val="bg1"/>
30 </a:gs>
31 </a:gsLst>
32 </a:gradFill>
33 </p:spPr>
34 ..
35 </p:pic>

```

1

2 The above picture object is shown as an example of this double fill type. *end example*]

3

Parent Elements
pic (§5.2.2.5)

4

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting)  Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.  [Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i> ]  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape)  Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
 <sequence>
 <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
 <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
 <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

### 5.2.2.2 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[Example: Consider the following DrawingML.

```
<p:pic>
 ..
 <p:nvPicPr>
 <p:cNvPr id="4" name="Lilly.jpg"/>
 <p:cNvPicPr>
 <a:picLocks noChangeAspect="1"/>
 </p:cNvPicPr>
 <p:nvPr/>
 </p:nvPicPr>
 ..
</p:pic>
```

end example]

#### Parent Elements

nvPicPr (§5.2.2.4)

#### Child Elements

extLst (Extension List)

picLocks (Picture Locks)

#### Subclause

§5.1.2.1.15

§5.1.2.1.31

#### Attributes

#### Description

preferRelativeResi  
ze (Relative Resize  
Preferred)

Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size.

Attributes	Description
Namespace: .../drawingml/2006/main	<p>[<i>Example</i>: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NonVisualPictureProperties">
 <sequence>
 <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

### 5.2.2.3 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```

<p:pic>
 ..
 <p:nvPicPr>
 <p:cNvPr id="4" name="Lilly.jpg"/>
 </p:nvPicPr>
 ..
</p:pic>

```

*end example*]

Parent Elements
nvPicPr (§5.2.2.4)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text which may be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [<i>Note</i>: An application may have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name)  Namespace: .../drawingml/2006/main	<p>Specifies the name of the object. [<i>Note:</i> Typically, this will be used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example:</i> Consider a DrawingML object defined as follows:</p> <pre>&lt; ... name="foo.jpg" &gt;</pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
 <sequence>
 <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
 <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="ST_DrawingElementId" use="required"/>
 <attribute name="name" type="xsd:string" use="required"/>
 <attribute name="descr" type="xsd:string" use="optional" default=""/>
 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 5.2.2.4 nvPicPr (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example:* Consider the following DrawingML.

```
<p:pic>
 ..
 <p:nvPicPr>
 ..
 </p:nvPicPr>
 ..
</p:pic>
```

*end example*]

Parent Elements
pic (§5.2.2.5)

1

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.2.2.2
cNvPr (Non-Visual Drawing Properties)	§5.2.2.3

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_PictureNonVisual">
4 <sequence>
5 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
6 <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
7 </sequence>
8 </complexType>

```

### 9 5.2.2.5 pic (Picture)

10 This element specifies the existence of a picture object within the document.

11 *[Example: Consider the following DrawingML that specifies the existence of a picture within a document. This*  
 12 *picture can have non-visual properties, a picture fill as well as shape properties attached to it.*

```

13 <p:pic>
14 <p:nvPicPr>
15 <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
16 <p:cNvPicPr>
17 <a:picLocks noChangeAspect="1"/>
18 </p:cNvPicPr>
19 </p:nvPicPr>
20 </p:pic>
21 <p:blipFill>
22 ...
23 </p:blipFill>
24 <p:spPr>
25 ...
26 </p:spPr>
27 </p:pic>

```

28 *end example]*

Child Elements	Subclause
blipFill (Picture Fill)	§5.2.2.1
nvpicPr (Non-Visual Picture Properties)	§5.2.2.4
spPr (Shape Properties)	§5.2.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Picture">
 <sequence minOccurs="1" maxOccurs="1">
 <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.2.2.6 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe the visual appearance of a picture within a document. This allows for a picture to have both the properties of a shape as well as picture specific properties that are allowed under the pic element.

 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

### 5.3 DrawingML - Legacy Compatibility

Within the context of DrawingML, it must be possible (for considerations to legacy compatibility) to be able to include explicit references to specific shapes within VML Drawing parts.

[*Example*: A VML Drawing part is used to define ink on a PresentationML slide, but the resulting ink is referenced from the slide by its shape ID using the elements of this namespace. *end example*]

#### 5.3.1 Table of Contents

This subclause is informative.

5.3.2 Basics.....	3895
5.3.2.1 legacyDrawing (Legacy Drawing Object) .....	3896

End of informative text.

#### 5.3.2 Basics

Legacy Compatibility is part of the shape definitions and properties of the DrawingML framework.

5.3.2.1 legacyDrawing (Legacy Drawing Object)

This element specifies the shape ID for a legacy drawing object. These legacy drawing objects all have a shape ID associated with them that is unique across the entire document. In order to store these legacy shape IDs as well as new shape IDs this legacyDrawing element should be used.

Attributes	Description
spid (Shape ID)	<p>Legacy Shape ID that is unique throughout the entire document. Legacy shape IDs should be assigned based on which portion of the document the drawing resides on. The assignment of these ids is broken down into clusters of 1024 values. The first cluster is 1-1024, the second 1025-2048 and so on.</p> <p>[Example: Within a word processing application the spid should be assigned based on the page that the drawing resides on. If the drawing resides on the second page then the assigned spid should be a value between 1025 and 2048. end example]</p> <p>[Example: Within a spreadsheet application the spid should be assigned based on the sheet that the drawing resides on. If the drawing resides on the second sheet then the assigned spid should be a value between 1025 and 2048. end example]</p> <p>[Example: Within a presentation application the spid should be assigned based on the slide that the drawing resides on. If the drawing resides on the second slide then the assigned spid should be a value between 1025 and 2048. end example]</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Compat">
 <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

5.4 DrawingML - Locked Canvas

Within a DrawingML object, a *locked canvas* allows DrawingML objects to be placed in a format where they can be viewed but not edited by the hosting application. This allows DrawingML objects not supported by an application to be included and viewed in applications where they cannot be edited.

5.4.1 Table of Contents

This subclause is informative.

5.4.2 Basics.....3897

5.4.2.1 lockedCanvas (Locked Canvas Container) ..... 3897

End of informative text.

## 5.4.2 Basics

This section specifies a locked canvas within the basic DrawingML framework.

### 5.4.2.1 lockedCanvas (Locked Canvas Container)

The locked canvas element acts as a container for more advanced drawing objects. The notion of a locked canvas comes from the fact that the generating application opening the file cannot create this object and can thus not perform edits either. Thus the drawing object is locked from all UI adjustments that would normally take place.

Child Elements	Subclause
cxnSp (Connection Shape)	§5.1.2.1.10
extLst (Extension List)	§5.1.2.1.15
graphicFrame (Graphic Frame)	§5.1.2.1.18
grpSp (Group shape)	§5.1.2.1.20
grpSpPr (Visual Group Shape Properties)	§5.1.2.1.22
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§5.1.2.1.27
pic (Picture)	§5.1.2.1.30
sp (Shape)	§5.1.2.1.33
txSp (Text Shape)	§5.1.2.1.41

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GvmlGroupShape">
 <sequence>
 <element name="nvGrpSpPr" type="CT_GvmlGroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="grpSpPr" type="CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="txSp" type="CT_GvmlTextShape"/>
 <element name="sp" type="CT_GvmlShape"/>
 <element name="cxnSp" type="CT_GvmlConnector"/>
 <element name="pic" type="CT_GvmlPicture"/>
 <element name="graphicFrame" type="CT_GvmlGraphicalObjectFrame"/>
 <element name="grpSp" type="CT_GvmlGroupShape"/>
 </choice>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

## 5.5 DrawingML - WordprocessingML Drawing

Within a WordprocessingML document, it is possible to include graphical DrawingML objects:

- Pictures (§5.2)
- Locked Canvases (§5.4)
- Diagrams (§5.9)

• Charts (§5.7)

When these objects are present in a word processing document, it is necessary to include information which specifies how the objects shall be positioned relative to the paginated document. [Example: Whether the object is displayed in line with text. end example]

The WordprocessingML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a word processing document.

[Example: Consider a DrawingML picture which shall be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<w:r>
 <w:drawing>
 <wp:anchor relativeHeight="10" allowOverlap="true">
 <wp:positionH relativeFrom="margin">
 <wp:align>center</wp:align>
 </wp:positionH>
 <wp:positionV relativeFrom="margin">
 <wp:align>center</wp:align>
 </wp:positionV>
 <wp:extent cx="2441542" cy="1828800"/>
 <wp:wrapSquare wrapText="bothSides"/>
 <a:graphic>
 ...
 </a:graphic>
 </wp:anchor>
 </w:drawing>
</w:r>
```

The anchor element (§5.5.2.3) specifies that this object is not positioned in line with text, and its child elements specify that the object is centered on the page horizontally and vertically (§5.5.2.10; §5.5.2.11), and that text can wrap around it in a square (§5.5.2.17). end example]

5.5.1 Table of Contents

23 **End of informative text.**

## 24 **5.5.2 Elements**

25 The following elements define the contents of the WordprocessingML Drawing namespace:

### 26 **5.5.2.1 align (Relative Horizontal Alignment)**

27 This element specifies how a DrawingML object shall be horizontally aligned relative to the horizontal alignment  
 28 base defined by the parent element. Once an alignment base is defined, this element shall determine how the  
 29 DrawingML object shall be aligned relative to that location.

30 *[Example: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of*  
 31 *the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified*  
 32 *as follows:*

```

33 <wp:anchor ... >
34 <wp:positionH relativeFrom="page">
35 <wp:align>left</wp:align>
36 </wp:positionH>
37 ...
38 </wp:anchor>

```

The align element with a value of left specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the left edge of the page. *end example*

The possible values for this element are defined by the ST\_AlignH simple type (§5.5.3.1).

Parent Elements
positionH (§5.5.2.10)

### 5.5.2.2 align (Relative Vertical Alignment)

This element specifies how a DrawingML object shall be vertically aligned relative to the vertical alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example:* Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor ... >
 <wp:positionV relativeFrom="page">
 <wp:align>top</wp:align>
 </wp:positionH>
 ...
</wp:anchor>
```

The align element with a value of top specifies that for the vertical positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the top edge of the page. *end example*

The possible values for this element are defined by the ST\_AlignV simple type (§5.5.3.2).

Parent Elements
positionV (§5.5.2.11)

### 5.5.2.3 anchor (Anchor for Floating DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is a floating object. Within a WordprocessingML document, drawing objects can exist in two states:

- Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).
- Floating* - The drawing object is anchored within the text, but may be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object as a floating object on the page.

[*Example:* Consider a WordprocessingML document where the anchor for a floating DrawingML object shall be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```
<w:p>
 <w:r>
 <w:drawing>
 <wp:anchor ... >
 ...
 </wp:anchor>
 </w:drawing>
 </w:r>
</w:p>
```

The anchor element, when present as the child element of the drawing element, specifies that this DrawingML object shall be positioned as a floating object based on the values of its child elements. *end example]*

#### Attributes

#### Description

allowOverlap

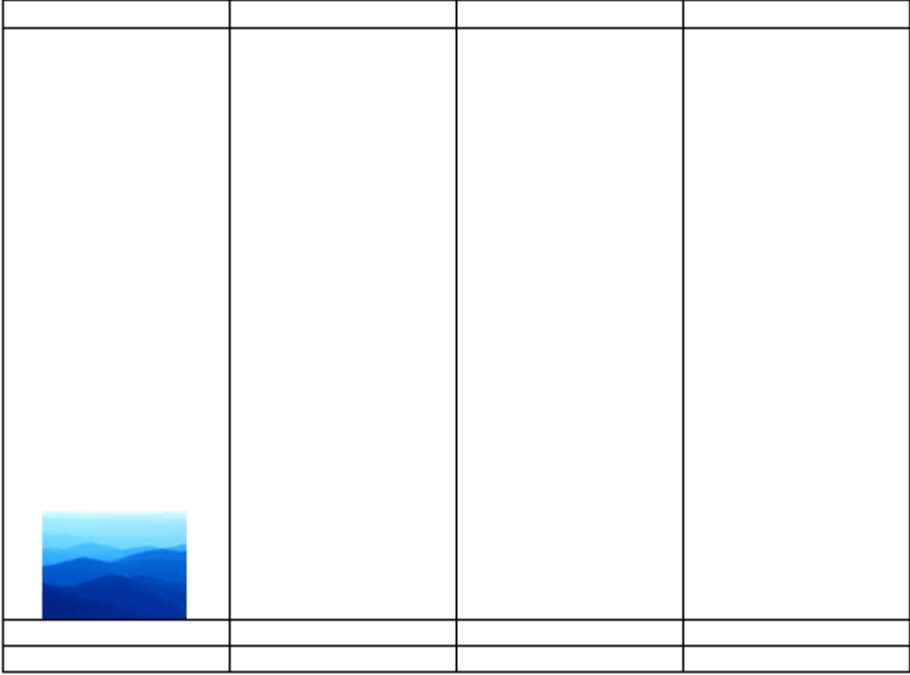

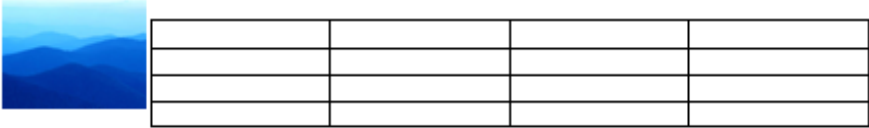

Specifies whether a DrawingML object which intersects another DrawingML object at

Attributes	Description
(Allow Objects to Overlap)	<p>display time shall be allowed to overlap the contents of the other DrawingML object. If a DrawingML object cannot overlap other DrawingML object, it shall be repositioned when displayed to prevent this overlap as needed.</p> <p>If this element is omitted on a given DrawingML object, then overlap shall not be allowed between a DrawingML object which intersects another DrawingML object displayed at the same location.</p> <p>[<i>Example:</i> Consider a document with two DrawingML objects which are allowed to overlap each other. This would be specified as follows within each object's anchor markup:</p> <pre>&lt;wp:anchor allowOverlap="true" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The allowOverlap attribute has a value of true, which specifies that this object shall be allowed to overlap other objects when it is displayed on the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
behindDoc (Display Behind Document Text)	<p>Specifies whether this floating DrawingML object shall be displayed behind the text of the document when the document is displayed. When a DrawingML object is displayed within a WordprocessingML document, that object may intersect with text in the document. This attribute shall determine whether the text or the object shall be rendered on top in case of overlapping.</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed in front of the text content of the document in cases of overlapping.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall be displayed above any text which it intersects within the document's content. This setting would be specified as follows:</p> <pre>&lt;wp:anchor behindDoc="false" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The behindDoc attribute has a value of false, which specifies that the DrawingML object is displayed above the text of the document in z-order. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
distB (Distance From Text on Bottom Edge)	<p>Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p>

Attributes	Description
	<p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element <i>[Example: wrapThrough or wrapSquare end example]</i> present as a child element also has a distance from text, then this value shall be ignored.</p> <p><i>[Example: Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:</i></p> <pre>&lt;wp:anchor distB="457200" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element <i>[Example: wrapThrough or wrapSquare end example]</i> present as a child element also has a distance from text, then this value shall be ignored.</p> <p><i>[Example: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</i></p> <pre>&lt;wp:anchor distL="228600" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distL attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distR (Distance	Specifies the minimum distance which shall be maintained between the right edge of this

Attributes	Description
From Text on Right Edge)	<p>drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</i></p> <pre data-bbox="451 783 919 884">&lt;wp:anchor distR="228600" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distR attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distT (Distance From Text on Top Edge)	<p>Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [<i>Example: wrapThrough or wrapSquare end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[<i>Example: Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</i></p> <pre data-bbox="451 1682 919 1782">&lt;wp:anchor distT="457200" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p>

Attributes	Description
hidden (Hidden)	<p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p> <p>Specifies whether this floating DrawingML object shall be displayed. When a DrawingML object is displayed within a WordprocessingML document, that object may be hidden (i.e. present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [Note: An application may have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e. not hidden).</p> <p>[Example: Consider a floating DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;wp:anchor hidden="true" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
layoutInCell (Layout In Table Cell)	<p>Specifies how this DrawingML object shall behave when its anchor is located in a table cell; and its specified position would cause it to intersect with a table cell displayed in the document. That behavior shall be as follows:</p> <ul style="list-style-type: none"> <li>• When this attribute has a value of true, then the object shall be positioned within the existing table cell, causing the cell to be resized as needed. This means that all positioning shall be relative to the cell and not the line on which the table appears.</li> <li>• When this attribute has a value of false, then the object shall be positioned as specified, but the table shall be resized and/or relocated within the document as needed to accommodate the object. This means that all positioning shall be relative to the line on which the table appears and not the cell in which the anchor is present.</li> </ul> <p>If this attribute is omitted, then its default value shall be considered to be false.</p> <p>[Example: Consider a DrawingML picture which shall be displayed in the center of the document. If the object is contained within a table and is defined as follows:</p> <pre>&lt;wp:anchor layoutInCell="true" ... &gt; ... &lt;/wp:anchor&gt;</pre>

Attributes	Description
	<p>The <code>layoutInCell</code> attribute has a value of <code>true</code>, which specifies that the object can be placed within the cell if needed, for example:</p>  <p>If the <code>layoutInCell</code> attribute was now set to <code>false</code>, the object shall be laid out outside of the cell, causing the table to be repositioned:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
locked (Lock Anchor)	<p>Specifies that the anchor location for this object shall not be modified at runtime when an application edits the contents of this document. <i>[Guidance: An application might have automatic behaviors which reposition the anchor for a DrawingML object based on user interaction - for example, moving it from one page to another as needed. This element shall tell applications not to perform any such behaviors. end guidance]</i></p> <p>If this attribute is omitted, then the anchor shall not be locked for the parent DrawingML object (i.e. a default value of <code>false</code>).</p> <p><i>[Example: Consider a floating DrawingML object which shall have its anchor locked at the current location. This setting would be specified as follows:</i></p>

Attributes	Description
	<pre data-bbox="451 285 906 384">&lt;wp:anchor locked="true" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p data-bbox="414 422 1430 527">The locked attribute has a value of true, which specifies that the DrawingML object's current anchor location shall not be changed by applications editing this content. <i>end example</i></p> <p data-bbox="414 564 1458 596">The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
relativeHeight (Relative Z-Ordering Position)	<p data-bbox="414 615 1471 751">Specifies the relative Z-ordering of all DrawingML objects in this document. Each floating DrawingML object shall have a Z-ordering value, which determines which object is displayed when any two objects intersect. Higher values shall indicate higher Z-order; lower values shall indicate lower Z-order.</p> <p data-bbox="414 789 1398 894">This attribute shall only indicate the Z-order with respect to other objects in the document which have an identical behindDoc attribute value. All objects with a behindDoc value of false shall be displayed above elements with a value of true.</p> <p data-bbox="414 932 1162 963"><i>[Example: Consider two floating DrawingML objects as follows:</i></p> <pre data-bbox="451 1001 984 1310">&lt;wp:anchor relativeHeight="5" ... &gt; ... &lt;/wp:anchor&gt;  ...  &lt;wp:anchor relativeHeight="8" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p data-bbox="414 1348 1438 1453">The relativeHeight attribute of the second object is 8, which specifies that the second DrawingML object shall be at a higher Z-order than the first and shall be displayed whenever the two overlap. <i>end example</i></p> <p data-bbox="414 1491 1390 1554">The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
simplePos (Page Positioning)	<p data-bbox="414 1575 1446 1711">Specifies that this object shall be positioned using the positioning information in the simplePos child element (§5.5.2.13). This positioning, when specified, will position the object on the page by placing its top left point at the x-y coordinates specified by that element.</p> <p data-bbox="414 1749 1341 1822">If this element is omitted, then this object shall not use the simple positioning information in the simplePos element, even when present.</p> <p data-bbox="414 1822 1463 1892"><i>[Example: Consider a floating DrawingML object which shall be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:</i></p>

Attributes	Description
	<pre data-bbox="454 283 950 420">&lt;wp:anchor simplePos="true" ... &gt;   &lt;wp:simplePos x="0" y="0" /&gt;   ... &lt;/wp:anchor&gt;</pre> <p data-bbox="414 457 1485 556">The simplePos attribute has a value of true, which specifies that the DrawingML object's current position shall be dictated by the simplePos element, and hence placed at 0,0. <i>end example]</i></p> <p data-bbox="414 598 1461 630">The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Anchor">
 <sequence>

```

#### 5.5.2.4 cNvGraphicFramePr (Common DrawingML Non-Visual Properties)

This element specifies common non-visual DrawingML object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[Example: Consider a DrawingML object in a WordprocessingML document defined as follows:

```

1 <wp:inline>
2 ...
3 <wp:cNvGraphicFramePr>
4 <a:graphicFrameLocks ... />
5 </wp:cNvGraphicFramePr>
6 </wp:inline>

```

The cNvGraphicFramePr element contains a set of common non-visual properties as defined by DrawingML.  
*end example]*

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_NonVisualGraphicFrameProperties">
12 <sequence>
13 <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
14 maxOccurs="1"/>
15 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
16 </sequence>
17 </complexType>

```

### 5.5.2.5 docPr (Drawing Object Non-Visual Properties)

This element specifies non-visual object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[*Example:* Consider a DrawingML object in a WordprocessingML document defined as follows:

```

22 <wp:inline>
23 ...
24 <wp:docPr id="1" name="Example Object">
25 <a:hlinkClick ... />
26 <a:hlinkHover ... />
27 </wp:docPr>
28 </wp:inline>

```

The docPr element contains a set of common non-visual properties for this object. *end example]*

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8)

1

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

2

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text which may be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [<i>Note</i>: An application may have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 352 678 384">&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).</p>
<p>name (Name)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies the name of the object. [<i>Note</i>: Typically, this will be used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 793 776 825">&lt; ... name="foo.jpg" &gt;</pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_NonVisualDrawingProps">
3 <sequence>
4 <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
5 <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="id" type="ST_DrawingElementId" use="required"/>
9 <attribute name="name" type="xsd:string" use="required"/>
10 <attribute name="descr" type="xsd:string" use="optional" default=""/>
11 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
12 </complexType>

```

13 **5.5.2.6 effectExtent (Object Extents Including Effects)**

14 This element specifies the additional extent which shall be added to each edge of the image (top, bottom, left,  
15 right) in order to compensate for any drawing effects applied to the DrawingML object.

16 The extent element (§5.5.2.7) specifies the size of the actual DrawingML object; however, an object may have  
17 effects applied which change its overall size [*Example*: A reflection and/or shadow effect. *end example*]. The  
18 additional size for each edge of the shape shall be stored on this element, and used to calculate the appropriate  
19 wrapping for wrap types without a wrapping polygon and the appropriate line height for inline objects.

20 [*Example*: Consider the following DrawingML image:

1  
2 This object has no effects, and hence would have the following effect extents:

3 `<wp:effectExtents b="0" t="0" l="0" r="0" />`

4 However, if a shadow effect was applied which added effects to the right of the image:

5  
6 Then the additional extent the right side would be specified in the r attribute on this element:

7 `<wp:effectExtents b="0" t="0" l="0" r="695325" />`

8 The r attribute has a value of 695325, specifying that that 695325 EMUs shall be added to the right side of the  
9 image. *end example*

Parent Elements

anchor (§5.5.2.3); inline (§5.5.2.8); wrapSquare (§5.5.2.17); wrapTopAndBottom (§5.5.2.20)

Attributes

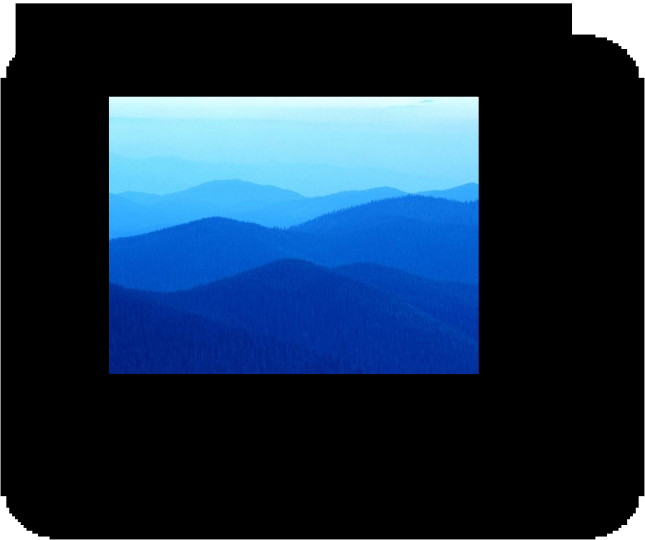

Description

b (Additional Extent on Bottom Edge)

Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.

[Example: Consider the following DrawingML image:

Attributes	Description
	 <p>This image has an effect on all four sides, resulting in the following markup:</p> <pre>&lt;wp:effectExtent l="504825" t="447675" r="771525" b="809625" /&gt;</pre> <p>The b attribute value of 809625 specifies that 809625 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
I (Additional Extent on Left Edge)	<p>Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p>[Example: Consider the following DrawingML image:</p>  <p>This image has an effect on all four sides, resulting in the following markup:</p>

Attributes	Description
	<p><code>&lt;wp:effectExtent l="504825" t="447675" r="771525" b="809625" /&gt;</code></p> <p>The l attribute value of 504825 specifies that 504825 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
r (Additional Extent on Right Edge)	<p>Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p>[Example: Consider the following DrawingML image:</p>  <p>This image has an effect on all four sides, resulting in the following markup:</p> <p><code>&lt;wp:effectExtent l="504825" t="447675" r="771525" b="809625" /&gt;</code></p> <p>The r attribute value of 771525 specifies that 771525 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
t (Additional Extent on Top Edge)	<p>Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects.</p> <p>[Example: Consider the following DrawingML image:</p>

Attributes	Description
	<div></div> <p>This image has an effect on all four sides, resulting in the following markup:</p> <pre>&lt;wp:effectExtent l="504825" t="447675" r="771525" b="809625" /&gt;</pre> <p>The t attribute value of 447675 specifies that 447675 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_EffectExtent">
3 <attribute name="l" type="a:ST_Coordinate" use="required"/>
4 <attribute name="t" type="a:ST_Coordinate" use="required"/>
5 <attribute name="r" type="a:ST_Coordinate" use="required"/>
6 <attribute name="b" type="a:ST_Coordinate" use="required"/>
7 </complexType>
```

8 **5.5.2.7 extent (Drawing Object Size)**

9 This element specifies the extents of the parent DrawingML object within the document (i.e. its final height and  
10 width).

11 *[Example: Consider a DrawingML picture which is present in a WordprocessingML document and has an equal*  
12 *height and width. This object would be specified as follows:*

```
13 <wp:anchor relativeHeight="10" allowOverlap="true">
14 ...
15 <wp:extent cx="1828800" cy="1828800"/>
16 ...
17 </wp:anchor>
```

- 1 The extent element specifies via its attributes that this object has a height and width of 1828800 EMUs (English  
2 Metric Units). *end example*]

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8)

3

Attributes	Description
cx (Extent Length)  Namespace: .../drawingml/2006/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
cy (Extent Width)  Namespace: .../drawingml/2006/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

- 4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_PositiveSize2D">
6 <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
7 <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
8 </complexType>
```

### 9 5.5.2.8 inline (Inline DrawingML Object)

- 10 This element specifies that the DrawingML object located at this position in the document is an inline object.  
11 Within a WordprocessingML document, drawing objects can exist in two states:

- 12 • *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a  
13 character glyph of similar size).

- *Floating* - The drawing object is anchored within the text, but may be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object in line with text.

[*Example*: Consider a WordprocessingML document where an inline DrawingML object shall be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```
<w:p>
 <w:r>
 <w:drawing>
 <wp:inline>
 ...
 </wp:inline>
 </w:drawing>
 </w:r>
</w:p>
```

The inline element, when present as the child element of the drawing element, specifies that this DrawingML object shall be positioned in line with the text of this paragraph, modifying line heights, etc. as necessary. *end example*

#### Attributes

#### Description

distB (Distance From Text on Bottom Edge)

Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.

The distance shall be measured in EMUs (English Metric Units).

If this object is an inline object (i.e. has a parent element of inline), then this value shall

Attributes	Description
	<p>not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [Example: wrapThrough or wrapSquare <i>end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[Example: Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:</p> <pre>&lt;wp:anchor distB="457200" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [Example: wrapThrough or wrapSquare <i>end example</i>] present as a child element also has a distance from text, then this value shall be ignored.</p> <p>[Example: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre>&lt;wp:anchor distL="228600" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distL attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distR (Distance From Text on Right Edge)	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p>

Attributes	Description
	<p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element <i>[Example: wrapThrough or wrapSquare end example]</i> present as a child element also has a distance from text, then this value shall be ignored.</p> <p><i>[Example: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</i></p> <pre>&lt;wp:anchor distR="228600" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distR attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distT (Distance From Text on Top Edge)	<p>Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element <i>[Example: wrapThrough or wrapSquare end example]</i> present as a child element also has a distance from text, then this value shall be ignored.</p> <p><i>[Example: Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</i></p> <pre>&lt;wp:anchor distT="457200" ... &gt; ... &lt;/wp:anchor&gt;</pre> <p>The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type</p>

Attributes	Description
	(§5.5.3.6).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Inline">
 <sequence>
 <element name="extent" type="a:CT_PositiveSize2D"/>
 <element name="effectExtent" type="CT_EffectExtent" minOccurs="0"/>
 <element name="docPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="0"
 maxOccurs="1"/>
 <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="distT" type="ST_WrapDistance" use="optional"/>
 <attribute name="distB" type="ST_WrapDistance" use="optional"/>
 <attribute name="distL" type="ST_WrapDistance" use="optional"/>
 <attribute name="distR" type="ST_WrapDistance" use="optional"/>
</complexType>

```

### 5.5.2.9 lineTo (Wrapping Polygon Line End Position)

This element specifies a single point on the wrapping polygon for a DrawingML object. This point shall be the termination of the edge of the wrapping polygon started by the previous start or lineTo element in document order, and shall be the origin of the next edge on the same polygon.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[Example: Consider the following basic wrapping polygon for a DrawingML object:

```

<wp:wrapPolygon>
 <wp:start x="0" y="0" />
 <wp:lineTo x="0" y="100" />
 <wp:lineTo x="100" y="100" />
 <wp:lineTo x="100" y="0" />
 <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>

```

The lineTo element defines each point of the wrapping polygon (in this case, the four points of the wrapping square). *end example*]

Parent Elements
wrapPolygon (§5.5.2.16)

Attributes	Description
x (X-Axis	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified

Attributes	Description
Coordinate)  Namespace: .../drawingml/2006/main	by the parent XML element.  [ <i>Example</i> : Consider the following point on a basic wrapping polygon for a DrawingML object:  <pre>&lt;wp:... x="0" y="100" /&gt;</pre> The x attribute defines an x-coordinate of 0. <i>end example</i>  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate)  Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.  [ <i>Example</i> : Consider the following point on a basic wrapping polygon for a DrawingML object:  <pre>&lt;wp:... x="0" y="100" /&gt;</pre> The y attribute defines a y-coordinate of 100. <i>end example</i>  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
 <attribute name="x" type="ST_Coordinate" use="required"/>
 <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

#### 5.5.2.10 positionH (Horizontal Positioning)

This element specifies the horizontal positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example*: Consider a DrawingML picture which shall be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```

1 <wp:anchor ... >
2 <wp:positionH relativeFrom="margin">
3 <wp:align>center</wp:align>
4 </wp:positionH>
5 <wp:positionV relativeFrom="margin">
6 <wp:align>center</wp:align>
7 </wp:positionV>
8 </wp:anchor>

```

The positionH element specifies that the object is horizontally positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example]*

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
align (Relative Horizontal Alignment)	§5.5.2.1
posOffset (Absolute Position Offset)	§5.5.2.12

Attributes	Description
relativeFrom (Horizontal Position Relative Base)	<p>Specifies the base to which the relative horizontal positioning of this object shall be calculated.</p> <p>[<i>Example:</i> Consider a DrawingML picture which shall be displayed at the bottom center of the page. This object would be specified as follows:</p> <pre> &lt;wp:anchor ... &gt;   &lt;wp:positionH relativeFrom="page"&gt;     &lt;wp:align&gt;center&lt;/wp:align&gt;   &lt;/wp:positionH&gt;   ... &lt;/wp:anchor&gt; </pre> <p>The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelFromH simple type (§5.5.3.4).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PosH">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="align" type="ST_AlignH" minOccurs="1" maxOccurs="1"/>
 <element name="posOffset" type="ST_PositionOffset" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
 <attribute name="relativeFrom" type="ST_RelFromH" use="required"/>
</complexType>
```

### 5.5.2.11 positionV (Vertical Positioning)

This element specifies the vertical positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example:* Consider a DrawingML picture which shall be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor ... >
 <wp:positionH relativeFrom="margin">
 <wp:align>center</wp:align>
 </wp:positionH>
 <wp:positionV relativeFrom="margin">
 <wp:align>center</wp:align>
 </wp:positionV>
</wp:anchor>
```

The positionV element specifies that the object is vertically positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example]*

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
align (Relative Vertical Alignment)	§5.5.2.2
posOffset (Absolute Position Offset)	§5.5.2.12

Attributes	Description
relativeFrom (Vertical Position Relative Base)	<p>Specifies the base to which the relative vertical positioning of this object shall be calculated.</p> <p>[<i>Example:</i> Consider a DrawingML picture which shall be displayed at the bottom center of the page margins. This object would be specified as follows:</p> <pre data-bbox="451 464 1065 663">&lt;wp:anchor ... &gt; ... &lt;wp:positionV relativeFrom="margin"&gt;   &lt;wp:align&gt;bottom&lt;/wp:align&gt; &lt;/wp:positionV&gt; &lt;/wp:anchor&gt;</pre> <p>The relativeFrom attribute specifies that the object is horizontally positioned relative to the margin. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelFromV simple type (§5.5.3.5).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PosV">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="align" type="ST_AlignV" minOccurs="1" maxOccurs="1"/>
 <element name="posOffset" type="ST_PositionOffset" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
 <attribute name="relativeFrom" type="ST_RelFromV" use="required"/>
</complexType>
```

### 5.5.2.12 posOffset (Absolute Position Offset)

This element specifies an absolute measurement for the positioning of a floating DrawingML object within a WordprocessingML document. This measurement shall be calculated relative to the top left edge of the positioning base specified by the parent element's relativeFrom attribute.

[*Example:* Consider a DrawingML picture which shall be displayed one inch from the top of the page, and one-half of an inch from the left edge of the page. This object would be specified as follows:

```
<wp:anchor ... >
 <wp:positionH relativeFrom="page">
 <wp:posOffset>914400</wp:posOffset>
 </wp:positionH>
 <wp:positionV relativeFrom="page">
 <wp:posOffset>457200</wp:posOffset>
 </wp:positionV>
</wp:anchor>
```

1 The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page  
 2 in EMUs. *end example*]

3 The possible values for this element are defined by the ST\_PositionOffset simple type (§5.5.3.3).

Parent Elements	
positionH (§5.5.2.10); positionV (§5.5.2.11)	

#### 4 5.5.2.13 simplePos (Simple Positioning Coordinates)

5 This element specifies the coordinates at which a DrawingML object shall be positioned relative to the top-left  
 6 edge of its page, when the simplePos attribute is specified on the anchor element (§5.5.2.3).

7 [Example: Consider a floating DrawingML object which shall be positioned at the top left corner of the page  
 8 using simple positioning. This setting would be specified as follows:

```

9 <wp:anchor simplePos="true" ... >
10 <wp:simplePos x="0" y="0" />
11 ...
12 </wp:anchor>
```

13 The simplePos attribute has a value of true, which specifies that the DrawingML object's current position shall  
 14 be dictated by the simplePos element, and hence placed at 0,0. *end example*]

Parent Elements	
anchor (§5.5.2.3)	

15

Attributes	Description
x (X-Axis Coordinate)  Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.  [Example: Consider the following point on a basic wrapping polygon for a DrawingML object: <pre>&lt;wp:... x="0" y="100" /&gt;</pre> The x attribute defines an x-coordinate of 0. <i>end example</i> ]  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate)  Namespace: .../drawingml/2006/main	Specifies a coordinate on the y-axis. The origin point for this coordinate shall be specified by the parent XML element.  [Example: Consider the following point on a basic wrapping polygon for a DrawingML object: <pre>&lt;wp:... x="0" y="100" /&gt;</pre> The y attribute defines a y-coordinate of 100. <i>end example</i> ]  The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

Attributes	Description
6/main	<p><code>&lt;wp:... x="0" y="100" /&gt;</code></p> <p>The y attribute defines a y-coordinate of 100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
 <attribute name="x" type="ST_Coordinate" use="required"/>
 <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

#### 5.5.2.14 start (Wrapping Polygon Start)

This element specifies the starting point on the wrapping polygon for a DrawingML object. This point shall be the start and termination of the wrapping polygon for the parent object.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example:* Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
 <wp:start x="0" y="0" />
 <wp:lineTo x="0" y="100" />
 <wp:lineTo x="100" y="100" />
 <wp:lineTo x="100" y="0" />
 <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The start element defines the start and end of the wrapping polygon (in this case, the four points of the wrapping square). *end example*

Parent Elements
wrapPolygon (§5.5.2.16)

Attributes	Description
x (X-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.
Namespace: .../drawingml/200	[ <i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:

Attributes	Description
6/main	<p><code>&lt;wp:... x="0" y="100" /&gt;</code></p> <p>The x attribute defines an x-coordinate of 0. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
y (Y-Axis Coordinate)  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <p><code>&lt;wp:... x="0" y="100" /&gt;</code></p> <p>The y attribute defines a y-coordinate of 100. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Point2D">
3 <attribute name="x" type="ST_Coordinate" use="required"/>
4 <attribute name="y" type="ST_Coordinate" use="required"/>
5 </complexType>

```

#### 6 5.5.2.15 wrapNone (No Text Wrapping)

7 This element specifies that the parent DrawingML object shall not cause any text wrapping within the contents  
8 of the host WordprocessingML document based on its display location. In effect, this setting shall place the  
9 object in one of two locations:

- 10 • If the behindDoc attribute on the parent element is true, then the object shall be positioned behind the  
11 text as it is normally displayed.
- 12 • If the behindDoc attribute on the parent element is false, then the object shall be positioned in front  
13 of the text as it is normally displayed.

14 [*Example:* Consider a DrawingML picture which shall be displayed in front of any text on the page. This object  
15 would be specified as follows:

```

16 <wp:anchor relativeHeight="10" behindDoc="false">
17 ...
18 <wp:wrapNone/>
19 </wp:anchor>

```

The wrapNone element specifies that the DrawingML object shall not cause any text wrapping, and since the behindDoc attribute is false, the object shall be displayed in front of the text of the document. *end example]*

Parent Elements
anchor (§5.5.2.3)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapNone"/>
```

### 5.5.2.16 wrapPolygon (Wrapping Polygon)

This element specifies the wrapping polygon which shall be used to determine the extents to which text may wrap around the specified object in the document. This polygon shall be defined by the following:

- The start element defines the coordinates of the origin of the wrap polygon
- Two or more lineTo elements define the point of the wrap polygon

If the set of child elements does not result in a closed polygon (the last lineTo element does not return to the position specified by the start element), then a single additional line shall be inferred as needed to close the wrapping polygon.

[Example: Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
 <wp:start x="0" y="0" />
 <wp:lineTo x="0" y="100" />
 <wp:lineTo x="100" y="100" />
 <wp:lineTo x="100" y="0" />
 <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The wrapPolygon element defines the object's text wrapping polygon (in this case, the four points of a square). *end example]*

Parent Elements
wrapThrough (§5.5.2.18); wrapTight (§5.5.2.19)

Child Elements	Subclause
lineTo (Wrapping Polygon Line End Position)	§5.5.2.9
start (Wrapping Polygon Start)	§5.5.2.14

Attributes	Description
------------	-------------

Attributes	Description
edited (Wrapping Points Modified)	<p>Specifies that the wrap points for the wrapping polygon have been edited, and the resulting extents shall be recalculated to compensate when the document is next opened.</p> <p>[<i>Example:</i> Consider the following basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:wrapPolygon edited="true"&gt;   &lt;wp:start x="0" y="0" /&gt;   &lt;wp:lineTo x="0" y="100" /&gt;   &lt;wp:lineTo x="50" y="50" /&gt;   &lt;wp:lineTo x="0" y="0" /&gt; &lt;/wp:wrapPolygon&gt;</pre> <p>The edited attribute specifies that these wrap points have been changed since the document was last rendered. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_WrapPath">
3 <sequence>
4 <element name="start" type="a:CT_Point2D" minOccurs="1" maxOccurs="1"/>
5 <element name="lineTo" type="a:CT_Point2D" minOccurs="2" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="edited" type="xsd:boolean" use="optional"/>
8 </complexType>
```

9 **5.5.2.17**      **wrapSquare (Square Wrapping)**

10 This element specifies that text shall wrap around a virtual rectangle bounding this object. The bounds of the  
11 wrapping rectangle shall be dictated by the extents including the addition of the effectExtent element as a child  
12 of this element (if present) or the effectExtent present on the parent element.

13 [*Example:* Consider a DrawingML object using square wrapping and defined as follows:

```
14 <wp:anchor ... >
15 ...
16 <wp:wrapSquare wrapText="bothSides" />
17 </wp:anchor>
```

18 The wrapSquare element specifies that text shall wrap around both sides of a rectangle around this object  
19 which includes its effect extents. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
effectExtent (Object Extents Including Effects)	§5.5.2.6

1

Attributes	Description
distB (Distance From Text on Bottom Edge)	<p>Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:</p> <pre>&lt;wp:anchor ... &gt; ...   &lt;wp:wrapSquare distB="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre>&lt;wp:anchor ... &gt; ...   &lt;wp:wrapSquare distL="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distR (Distance	Specifies the minimum distance which shall be maintained between the right edge of this

Attributes	Description
From Text on Right Edge)	<p>drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="456 569 1029 701">&lt;wp:anchor ... &gt; ... &lt;wp:wrapSquare distR="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distR attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distT (Distance From Text (Top))	<p>Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="456 1289 1029 1421">&lt;wp:anchor ... &gt; ... &lt;wp:wrapSquare distT="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
wrapText (Text Wrapping Location)	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:</p> <pre data-bbox="456 1829 678 1894">&lt;wp:anchor ... &gt; ...</pre>

Attributes	Description
	<pre>&lt;wp:wrapSquare wrapText="left" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The wrapText attribute value of left specifies that text shall only wrap around the left side of the object. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapText simple type (§5.5.3.7).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_WrapSquare">
3 <sequence>
4 <element name="effectExtent" type="CT_EffectExtent" minOccurs="0"/>
5 </sequence>
6 <attribute name="wrapText" type="ST_WrapText" use="required"/>
7 <attribute name="distT" type="ST_WrapDistance" use="optional"/>
8 <attribute name="distB" type="ST_WrapDistance" use="optional"/>
9 <attribute name="distL" type="ST_WrapDistance" use="optional"/>
10 <attribute name="distR" type="ST_WrapDistance" use="optional"/>
11 </complexType>
```

12 **5.5.2.18 wrapThrough (Through Wrapping)**

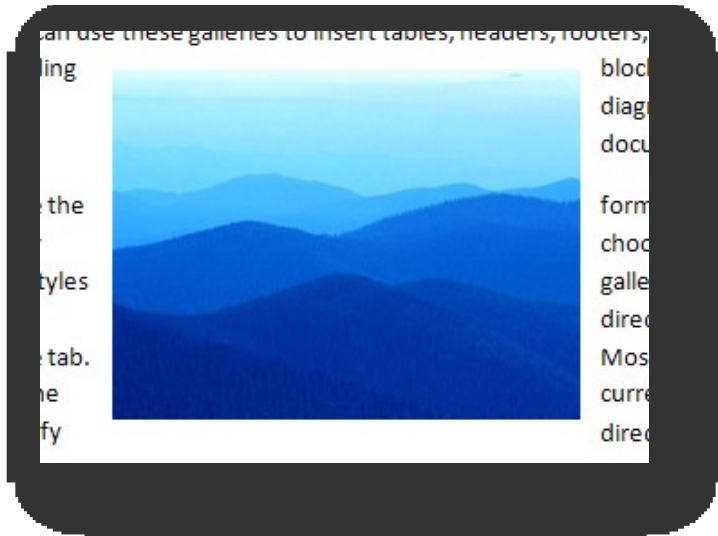

13 This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the  
14 child wrapPolygon element. When this element specifies a wrapping polygon, it shall allow text to wrap within  
15 the object's maximum left and right extents.

16 [Example: Consider an object with the following wrap points:

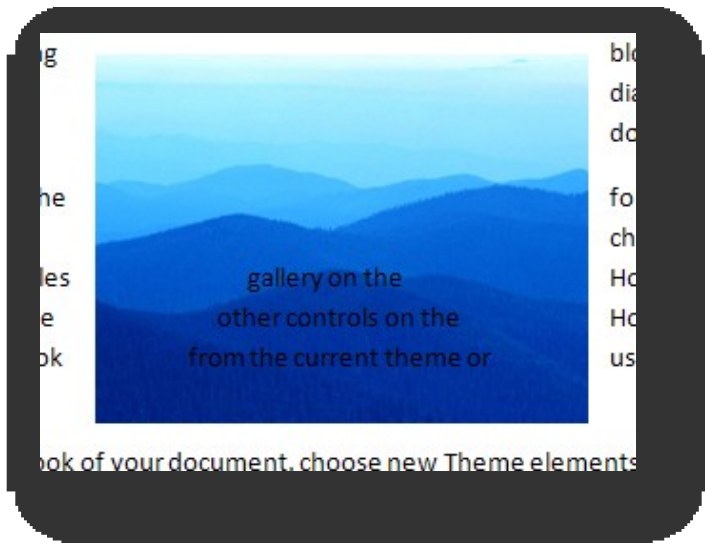

17  
18 If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the  
19 wrap polygon at any location:

20

1

2 However, with through wrapping:

3

4 *end example]*

5 [Example: Consider a DrawingML object using through wrapping and defined as follows:

```

6 <wp:anchor ... >
7 ...
8 <wp:wrapThrough wrapText="bothSides">
9 ...
10 </wp:wrapThrough>
11 </wp:anchor>

```

12 The wrapThrough element specifies that text shall wrap through this object as defined by its wrap polygon. *end*  
13 *example]*

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
wrapPolygon (Wrapping Polygon)	§5.5.2.16

Attributes	Description
distL (Distance From Text on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre>&lt;wp:anchor ... &gt; ... &lt;wp:wrapThrough distL="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distR (Distance From Text on Right Edge)	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</p> <pre>&lt;wp:anchor ... &gt; ... &lt;wp:wrapThrough distR="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distR attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).
wrapText (Text Wrapping Location)	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:</p> <pre data-bbox="451 548 1065 680">&lt;wp:anchor ... &gt;   ...   &lt;wp:wrapThrough wrapText="left" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The wrapText attribute value of left specifies that text shall only wrap around the left side of the object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_WrapText simple type (§5.5.3.7).</p>

1 The following XML Schema fragment defines the contents of this element:

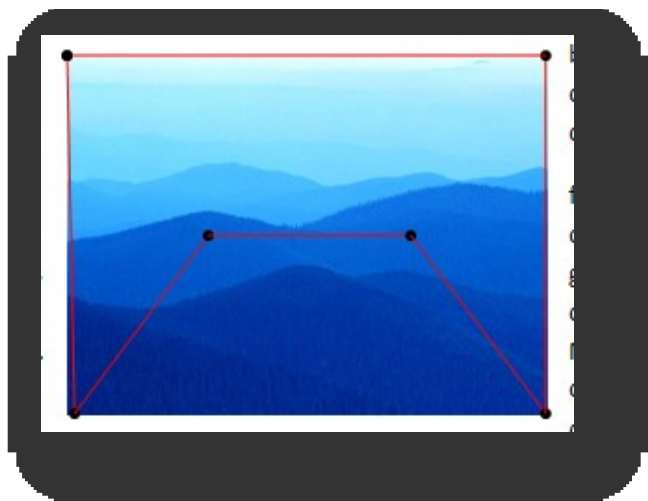

```

2 <complexType name="CT_WrapThrough">
3 <sequence>
4 <element name="wrapPolygon" type="CT_WrapPath" minOccurs="1" maxOccurs="1"/>
5 </sequence>
6 <attribute name="wrapText" type="ST_WrapText" use="required"/>
7 <attribute name="distL" type="ST_WrapDistance" use="optional"/>
8 <attribute name="distR" type="ST_WrapDistance" use="optional"/>
9 </complexType>
```

#### 10 5.5.2.19 wrapTight (Tight Wrapping)

11 This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the  
12 child wrapPolygon element. When this element specifies a wrapping polygon, it shall not allow text to wrap  
13 within the object's maximum left and right extents.

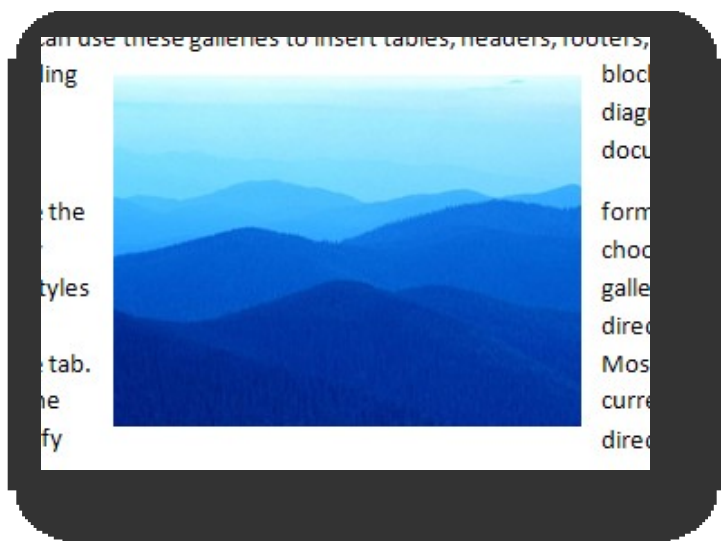

14 [*Example:* Consider an object with the following wrap points:

1

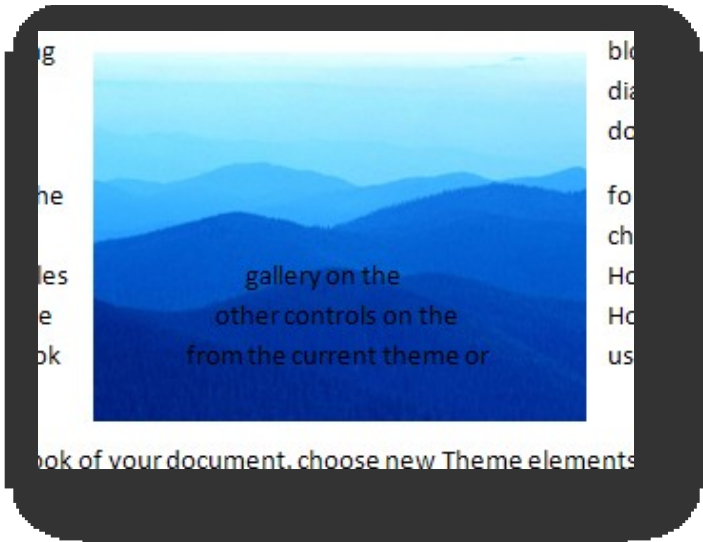

2 If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the  
3 wrap polygon at any location:

4

5

6 However, with through wrapping:

*end example]*

[Example: Consider a DrawingML object using tight wrapping and defined as follows:

```
<wp:anchor ... >
...
 <wp:wrapTight wrapText="bothSides">
 ...
 </wp:wrapTight>
</wp:anchor>
```

The wrapTight element specifies that text shall wrap through this object as defined by its wrap polygon. *end example]*

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
wrapPolygon (Wrapping Polygon)	§5.5.2.16

Attributes	Description
distL (Distance From Test on Left Edge)	<p>Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of</p>

Attributes	Description
	<p>padding between its left edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="451 359 1016 489">&lt;wp:anchor ... &gt; ...   &lt;wp:wrapTight distL="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
distR (Distance From Text on Right Edge)	<p>Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.</p> <p>The distance shall be measured in EMUs (English Metric Units).</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:</p> <pre data-bbox="451 1077 1016 1207">&lt;wp:anchor ... &gt; ...   &lt;wp:wrapTight distR="457200" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The distR attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).</p>
wrapText (Text Wrapping Location)	<p>Specifies how text shall wrap around the object's left and right sides.</p> <p>[<i>Example:</i> Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:</p> <pre data-bbox="451 1619 1032 1749">&lt;wp:anchor ... &gt; ...   &lt;wp:wrapTight wrapText="left" ... /&gt; &lt;/wp:anchor&gt;</pre> <p>The wrapText attribute value of left specifies that text shall only wrap around the left side of the object. <i>end example</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapText simple type (§5.5.3.7).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_WrapTight">
 <sequence>
 <element name="wrapPolygon" type="CT_WrapPath" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="wrapText" type="ST_WrapText" use="required"/>
 <attribute name="distL" type="ST_WrapDistance" use="optional"/>
 <attribute name="distR" type="ST_WrapDistance" use="optional"/>
</complexType>

```

### 5.5.2.20 wrapTopAndBottom (Top and Bottom Wrapping)

This element specifies that text shall wrap around the top and bottom of this object, but not its left or right edges.

[*Example:* Consider a DrawingML object using top and bottom wrapping and defined as follows:

```

<wp:anchor ... >
 ...
 <wp:wrapTopAndBottom />
</wp:anchor>

```

The wrapTopAndBottom element specifies that text shall wrap around neither side of this object. *end example]*

Parent Elements

5 <attribute name="distT" type="ST_WrapDistance" use="optional"/>
6 <attribute name="distB" type="ST_WrapDistance" use="optional"/>
7 </complexType>
```

### 9 5.5.3 Simple Types

10 This is the complete list of simple types in the

11 <http://schemas.openxmlformats.org/drawingml/2006/wordprocessingDrawing namespace>.

### 5.5.3.1 ST\_AlignH (Relative Horizontal Alignment Positions)

This simple type contains the possible settings specifying how a DrawingML object may be horizontally aligned relative to the horizontal alignment base defined by the parent element.

*[Example: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:*

```
<wp:anchor ... >
 <wp:positionH relativeFrom="page">
 <wp:align>left</wp:align>
 </wp:positionH>
 ...
</wp:anchor>
```

The align element with a value of left specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the left edge of the page. *end example]*

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center Alignment)	Specifies that the object shall be centered with respect to the horizontal alignment base. <i>[Example: Centered on the page. end example]</i>
inside (Inside)	Specifies that the object shall be inside of the horizontal alignment base. <i>[Example: Inside the outside margin. end example]</i>
left (Left Alignment)	Specifies that the object shall be left aligned to the horizontal alignment base. <i>[Example: Left aligned relative to the margins. end example]</i>
outside (Outside)	Specifies that the object shall be outside of the horizontal alignment base. <i>[Example: Outside the left margin. end example]</i>
right (Right Alignment)	Specifies that the object shall be right aligned to the horizontal alignment base.

Enumeration Value	Description
	<i>[Example: Right aligned relative to the margins. end example]</i>

1

Referenced By
align (§5.5.2.1)

### 2 5.5.3.2 ST\_AlignV (Vertical Alignment Definition)

3 This simple type contains the possible settings specifying how a DrawingML object may be vertically aligned  
4 relative to the vertical alignment base defined by the parent element.

5 *[Example: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of*  
6 *the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified*  
7 *as follows:*

```
8 <wp:anchor ... >
9 <wp:positionV relativeFrom="page">
10 <wp:align>top</wp:align>
11 </wp:positionH>
12 ...
13 </wp:anchor>
```

14 The align element with a value of top specifies that for the vertical positioning defined by the parent element  
15 (in this case, positioning relative to the page), the picture shall be aligned to the top edge of the page. *end*  
16 *example]*

17 This simple type's contents are a restriction of the XML Schema token datatype.

18 The following are possible enumeration values for this type:

Enumeration Value	Description
bottom (Bottom)	Specifies that the object shall be at the bottom of the vertical alignment base.  <i>[Example: Bottom of the page. end example]</i>
center (Center Alignment)	Specifies that the object shall be centered with respect to the vertical alignment base.  <i>[Example: Centered on the page. end example]</i>
inside (Inside)	Specifies that the object shall be inside of the horizontal alignment base.  <i>[Example: Inside the top margin. end example]</i>

Enumeration Value	Description
outside (Outside)	Specifies that the object shall be outside of the vertical alignment base. <i>[Example: Outside the top margin. end example]</i>
top (Top)	Specifies that the object shall be at the top of the vertical alignment base. <i>[Example: Top of the page. end example]</i>

1

Referenced By
align (§5.5.2.2)

### 2 5.5.3.3 ST\_PositionOffset (Absolute Position Offset Value)

3 This simple type represents a one dimensional distance which shall be used to offset an object from its base  
4 positioning location stored in EMUs.

5 *[Example: Consider a DrawingML picture which shall be displayed one inch from the top of the page, and one-  
6 half of an inch from the left edge of the page. This object would be specified as follows:*

```

7 <wp:anchor ... >
8 <wp:positionH relativeFrom="page">
9 <wp:posOffset>914400</wp:posOffset>
10 </wp:positionH>
11 <wp:positionV relativeFrom="page">
12 <wp:posOffset>457200</wp:posOffset>
13 </wp:positionV>
14 </wp:anchor>

```

15 The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page  
16 in EMUs. *end example]*

17 This simple type's contents are a restriction of the XML Schema int datatype.

Referenced By
posOffset (§5.5.2.12)

### 18 5.5.3.4 ST\_RelFromH (Horizontal Relative Positioning)

19 This simple type specifies the possible values for the base from which the relative horizontal positioning of an  
20 object shall be calculated.

21 *[Example: Consider a DrawingML picture which shall be displayed at the bottom center of the page. This object  
22 would be specified as follows:*

```

1 <wp:anchor ... >
2 <wp:positionH relativeFrom="page">
3 <wp:align>center</wp:align>
4 </wp:positionH>
5 ...
6 </wp:anchor>

```

The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example]*

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
character (Character)	Specifies that the horizontal positioning shall be relative to the position of the anchor within its run content.
column (Column)	Specifies that the horizontal positioning shall be relative to the extents of the column which contains its anchor.
insideMargin (Inside Margin)	Specifies that the horizontal positioning shall be relative to the inside margin of the current page (the left margin on odd pages, right on even pages).
leftMargin (Left Margin)	Specifies that the horizontal positioning shall be relative to the left margin of the page.
margin (Page Margin)	Specifies that the horizontal positioning shall be relative to the page margins.
outsideMargin (Outside Margin)	Specifies that the horizontal positioning shall be relative to the outside margin of the current page (the right margin on odd pages, left on even pages).
page (Page Edge)	Specifies that the horizontal positioning shall be relative to the edge of the page.
rightMargin (Right Margin)	Specifies that the horizontal positioning shall be relative to the right margin of the page.

#### Referenced By

positionH@relativeFrom (§5.5.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelFromH">
 <restriction base="xsd:token">
 <enumeration value="margin"/>
 <enumeration value="page"/>
 <enumeration value="column"/>
 <enumeration value="character"/>
 <enumeration value="leftMargin"/>
 <enumeration value="rightMargin"/>
 <enumeration value="insideMargin"/>
 <enumeration value="outsideMargin"/>
 </restriction>
</simpleType>
```

### 5.5.3.5 ST\_RelFromV (Vertical Relative Positioning)

This simple type specifies the possible values for the base from which the relative vertical positioning of an object shall be calculated.

[*Example:* Consider a DrawingML picture which shall be displayed at the bottom center of the page. This object would be specified as follows:

```
<wp:anchor ... >
 <wp:positionV relativeFrom="page">
 <wp:align>bottom</wp:align>
 </wp:positionV>
 ...
</wp:anchor>
```

The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example]*

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottomMargin (Bottom Margin)	Specifies that the vertical positioning shall be relative to the bottom margin of the current page.
insideMargin (Inside Margin)	Specifies that the vertical positioning shall be relative to the inside margin of the current page.
line (Line)	Specifies that the vertical positioning shall be relative to the line containing the anchor character.
margin (Page Margin)	Specifies that the vertical positioning shall be relative to the page margins.
outsideMargin (Outside Margin)	Specifies that the vertical positioning shall be relative to the outside margin of the current page.

Enumeration Value	Description
page (Page Edge)	Specifies that the vertical positioning shall be relative to the edge of the page.
paragraph (Paragraph)	Specifies that the vertical positioning shall be relative to the paragraph which contains the drawing anchor.
topMargin (Top Margin)	Specifies that the vertical positioning shall be relative to the top margin of the current page.

Referenced By
positionV@relativeFrom (§5.5.2.11)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_RelFromV">
4 <restriction base="xsd:token">
5 <enumeration value="margin"/>
6 <enumeration value="page"/>
7 <enumeration value="paragraph"/>
8 <enumeration value="line"/>
9 <enumeration value="topMargin"/>
10 <enumeration value="bottomMargin"/>
11 <enumeration value="insideMargin"/>
12 <enumeration value="outsideMargin"/>
13 </restriction>
14 </simpleType>
```

### 15 5.5.3.6 ST\_WrapDistance (Distance from Text)

16 This simple type represents a one dimensional distance which shall be used to offset an object from text, stored  
17 in EMUs.

18 [Example: Consider a floating DrawingML object which shall have one-half of an inch of padding between its left  
19 edge and the nearest text. This setting would be specified as follows:

```

20 <wp:anchor ... >
21 ...
22 <wp:wrapThrough distL="457200" ... />
23 </wp:anchor>
```

24 The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end*  
25 *example]*

26 This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
anchor@distB (§5.5.2.3); anchor@distL (§5.5.2.3); anchor@distR (§5.5.2.3); anchor@distT (§5.5.2.3);

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WrapDistance">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

### 5.5.3.7 ST\_WrapText (Text Wrapping Location)

This simple type specifies the possible settings for how text may wrap around the object's left and right sides.

[*Example:* Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:

```
<wp:anchor ... >
 ...
 <wp:wrapTight wrapText="left" ... />
</wp:anchor>
```

The wrapText attribute value of left specifies that text shall only wrap around the left side of the object. *end example]*

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bothSides (Both Sides)	Specifies that text shall wrap around both sides of the object.
largest (Largest Side Only)	<p>Specifies that text shall only wrap around the largest side of the object.</p> <p>If the object is positioned in the exact center of the page, the text shall wrap around the side on which text is first encountered:</p> <ul style="list-style-type: none"> <li>If the first line of text intersecting the object is using left-to-right reading order, the text shall wrap to the object's left.</li> <li>If the first line of text intersecting the object is using right-to-left reading order, the text shall wrap to the object's right.</li> </ul>

Enumeration Value	Description
left (Left Side Only)	Specifies that text shall only wrap around the left side of the object.
right (Right Side Only)	Specifies that text shall only wrap around the right side of the object.

```

3 <simpleType name="ST_WrapText">
4 <restriction base="xsd:token">
5 <enumeration value="bothSides"/>
6 <enumeration value="left"/>
7 <enumeration value="right"/>
8 <enumeration value="largest"/>
9 </restriction>
10 </simpleType>
```

## 11 5.6 DrawingML - SpreadsheetML Drawing

12 Within a SpreadsheetML document, it is possible to include graphical DrawingML objects:

- 13 • Pictures (§5.2)
- 14 • Locked Canvases (§5.4)
- 15 • Diagrams (§5.9)
- 16 • Charts (§5.7)

17 When these objects are present in a spreadsheet document, it is necessary to include information which  
18 specifies how the objects shall be positioned relative to the parent worksheet. [*Example: Whether the object is*  
19 *anchored to a specific row, whether it resizes with cells, and so on. end example*]

20 The SpreadsheetML Drawing namespace acts in this capacity, specifying all information necessary to anchor and  
21 display DrawingML objects within a spreadsheet document.

22 [*Example: Consider a DrawingML picture which shall be anchored to a specific cell for its top left and bottom*  
23 *right corners, resizing as those cells are relocated. This object would be specified as follows:*

```

24 <xdr:twoCellAnchor>
25 <xdr:from>
26 ...
27 </xdr:from>
28 <xdr:to>
29 ...
30 </xdr:to>
```

```
1 <xdr:graphicFrame>
2 ...
3 <a:graphic>
4 <a:graphicData
5 uri="http://schemas.openxmlformats.org/drawingml/2006/diagram">
6 <dgm:relIds xmlns:dgm="..." xmlns:r="..." r:dm="rId1" r:lo="rId2"
7 r:qs="rId3" r:cs="rId4" />
8 </a:graphicData>
9 </a:graphic>
10 </xdr:graphicFrame>
11 </xdr:twoCellAnchor>
```

12 The twoCellAnchor element (§5.6.2.32) specifies that this object anchored to the cells specified by the to  
13 (§5.6.2.31) and from (§5.6.2.14) elements. *end example*

13

14 **End of informative text.**15 **5.6.2 Elements**

16 The following elements define the contents of the Spreadsheet Drawing namespace:

17 **5.6.2.1 absoluteAnchor (Absolute Anchor Shape Size)**

18 This element is used as an anchor placeholder for a shape or group of shapes. It will anchor the object in the  
 19 same position relative to sheet position and its extents are in EMU unit.

20

Parent Elements
wsDr (§5.6.2.34)

Child Elements	Subclause
clientData (Client Data)	§5.6.2.3
cxnSp (Connection Shape)	§5.6.2.12
ext (Shape Extent)	§5.6.2.13
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
pic (Picture)	§5.6.2.24
pos (Position)	§5.6.2.25
sp (Shape)	§5.6.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AbsoluteAnchor">
 <sequence>
 <element name="pos" type="a:CT_Point2D"/>
 <element name="ext" type="a:CT_PositiveSize2D"/>
 <group ref="EG_ObjectChoices"/>
 <element name="clientData" type="CT_AnchorClientData" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.6.2.2 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<xdr:pic>
 ..
 <xdr:blipFill>
 <a:blip r:embed="rId2"/>
 <a:stretch>
 <a:fillRect/>
 </a:stretch>
 </xdr:blipFill>
 ..
</xdr:pic>
```

The above picture object is shown as an example of this fill type. End example]

[Example: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```

1 <xdr:pic>
2 ..
3 <xdr:blipFill>
4 <a:blip r:embed="rId2"/>
5 <a:stretch>
6 <a:fillRect/>
7 </a:stretch>
8 </xdr:blipFill>
9 <xdr:spPr>
10 <a:gradFill>
11 <a:gsLst>
12 <a:gs pos="0">
13 <a:schemeClr val="tx2">
14 <a:shade val="50000"/>
15 </a:schemeClr>
16 </a:gs>
17 <a:gs pos="39999">
18 <a:schemeClr val="tx2">
19 <a:tint val="20000"/>
20 </a:schemeClr>
21 </a:gs>
22 <a:gs pos="70000">
23 <a:srgbClr val="C4D6EB"/>
24 </a:gs>
25 <a:gs pos="100000">
26 <a:schemeClr val="bg1"/>
27 </a:gs>
28 </a:gsLst>
29 </a:gradFill>
30 </xdr:spPr>
31 ..
32 </xdr:pic>

```

1

2 The above picture object is shown as an example of this double fill type. End example]

3

Parent Elements
pic (§5.6.2.24)

4

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting)  Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.  <i>[Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. end note]</i>  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape)  Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
 <sequence>
 <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
 <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
 <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

### 5.6.2.3 clientData (Client Data)

This element is used to set certain properties related to a drawing element on the client spreadsheet application.

#### Parent Elements

absoluteAnchor (§5.6.2.1); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

#### Attributes

#### Description

fLocksWithSheet  
(Locks With Sheet  
Flag)

This attribute indicates whether to disable selection on drawing elements when the sheet is protected.

The possible values for this attribute are defined by the XML Schema boolean datatype.

fPrintsWithSheet  
(Prints With Sheet  
Flag)

This attribute indicates whether to print drawing elements when printing the sheet.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnchorClientData">
 <attribute name="fLocksWithSheet" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="fPrintsWithSheet" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.6.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual properties for a connector shape. These are the set of properties on a shape which do not affect its display within a spreadsheet.

#### Parent Elements

nvCxnSpPr (§5.6.2.18)

#### Child Elements

#### Subclause

cxnSpLocks (Connection Shape Locks)

§5.1.2.1.11

Child Elements	Subclause
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NonVisualConnectorProperties">
 <sequence>
 <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
 <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.6.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual properties for a single graphical object frame within a spreadsheet. These are the set of properties of a frame which do not affect its display within a spreadsheet.

Parent Elements
nvGraphicFramePr (§5.6.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NonVisualGraphicFrameProperties">
 <sequence>
 <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
 maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.6.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual properties of a hierarchical grouping of shapes, graphical object frames, and child groups. These are the set of properties of a group which do not affect its display within a spreadsheet.

Parent Elements
nvGrpSpPr (§5.6.2.20)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
 <sequence>
 <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.6.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element describes the non-visual properties of a picture within a spreadsheet. These are the set of properties of a picture which do not affect its display within a spreadsheet.

[Example: Consider the following SpreadsheetDrawingML.

```
<xdr:pic>
 ..
 <xdr:nvPicPr>
 <xdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
 <xdr:cNvPicPr>
 <a:picLocks noChangeAspect="1"/>
 </xdr:cNvPicPr>
 <xdr:nvPr/>
 </xdr:nvPicPr>
 ..
</xdr:pic>
```

The above example defines some non-visual picture drawing properties for the inserted picture. End example]

Parent Elements
nvPicPr (§5.6.2.21)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResize (Relative Resize)	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be

Attributes	Description
Preferred)  Namespace: .../drawingml/2006/main	<p>relative to the original picture size as opposed to the current picture size.</p> <p>[<i>Example</i>: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
 <sequence>
 <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

#### 5.6.2.8 cNvPr (Non-Visual Drawing Properties)

This element specifies the set of non-visual properties for the parent element. These properties specify all the data about the parent which does not affect its display within the spreadsheet.

[Example: Consider the following SpreadSheetDrawingML.

```
<xdr:pic>
 ..
 <xdr:nvPicPr>
 <xdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
 </xdr:nvPicPr>
 ..
</xdr:pic>
```

The above example defines some non-visual drawing properties for the inserted picture. End example]

Parent Elements
nvCxnSpPr (§5.6.2.18); nvGraphicFramePr (§5.6.2.19); nvGrpSpPr (§5.6.2.20); nvPicPr (§5.6.2.21); nvSpPr (§5.6.2.22)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

1

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text which may be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [<i>Note</i>: An application may have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p>

Attributes	Description
	<p><code>&lt;... id="10" ... &gt;</code></p> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).</p>
name (Name)  Namespace: .../drawingml/2006/main	<p>Specifies the name of the object. [<i>Note:</i> Typically, this will be used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example:</i> Consider a DrawingML object defined as follows:</p> <p><code>&lt; ... name="foo.jpg" &gt;</code></p> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_NonVisualDrawingProps">
3 <sequence>
4 <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
5 <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="id" type="ST_DrawingElementId" use="required"/>
9 <attribute name="name" type="xsd:string" use="required"/>
10 <attribute name="descr" type="xsd:string" use="optional" default=""/>
11 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
12 </complexType>

```

### 13 5.6.2.9 cNvSpPr (Connection Non-Visual Shape Properties)

14 This element specifies the set of non-visual properties for a connection shape. These properties specify all data  
15 about the connection shape which do not affect its display within a spreadsheet.

16 [Example: Consider the shape that has a shape lock applied to it.

```

17 <xdr:sp>
18 <xdr:nvSpPr>
19 <xdr:cNvPr id="2" name="Rectangle 1"/>
20 <xdr:cNvSpPr>
21 <a:spLocks noGrp="1"/>
22 </xdr:cNvSpPr>
23 </xdr:nvSpPr>

```

..  
</xdr:sp>

This shape lock is stored within the non-visual drawing properties for this shape. End example]

Parent Elements
nvSpPr (§5.6.2.22)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
spLocks (Shape Locks)	§5.1.2.1.34

Attributes	Description
<b>txBox (Text Box)</b>  Namespace: .../drawingml/2006/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.  <i>[Note: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. end note]</i>  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
 <sequence>
 <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 5.6.2.10 col (Column))

This element specifies the column that will be used within the from and to elements to specify anchoring information for a shape within a spreadsheet

The possible values for this element are defined by the ST\_ColID simple type (§5.6.3.1).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

### 5.6.2.11 colOff (Column Offset)

This element is used to specify the column offset within a cell. The units for which this attribute is specified in reside within the simple type definition referenced below.

The possible values for this element are defined by the ST\_Coordinate simple type (§5.1.12.16).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

### 5.6.2.12 cxnSp (Connection Shape)

This element specifies the properties for a connection shape drawing element. A connection shape is a line, etc. that connects two other shapes in this drawing.

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
nvCxnSpPr (Non-Visual Properties for a Connection Shape)	§5.6.2.18
spPr (Shape Properties)	§5.6.2.29
style (Shape Style)	§5.6.2.30

Attributes	Description
fPublished (Publish to Server Flag)	<p>This attribute indicates whether the shape shall be published with the worksheet when sent to the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the object. <i>[Example: A macro script, add-in function, and so on. end example]</i></p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p><i>[Example:</i></p> <pre>&lt; ... macro="DoWork()" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connector">
 <sequence>
 <element name="nvCxnSpPr" type="CT_ConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional"/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.6.2.13 ext (Shape Extent)

This element describes the length and width properties for how far a drawing element should extend for.

#### Parent Elements

absoluteAnchor (§5.6.2.1); oneCellAnchor (§5.6.2.23)

Attributes	Description
cx (Extent Length)  Namespace: .../drawingml/2006/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
cy (Extent Width)  Namespace: .../drawingml/2006/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
 <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
 <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.6.2.14 from (Starting Anchor Point)

This element specifies the first anchor point for the drawing element. This will be used to anchor the top and left sides of the shape within the spreadsheet. That is when the cell that is specified in the from element is adjusted, the shape will also be adjusted.

[Example: Consider the following SpreadsheetDrawingML

```
<xdr:twoCellAnchor>
 <xdr:from>
 <xdr:col>3</xdr:col>
 <xdr:colOff>447675</xdr:colOff>
 <xdr:row>8</xdr:row>
 <xdr:rowOff>28575</xdr:rowOff>
 </xdr:from>
 <xdr:to>
 <xdr:col>5</xdr:col>
 <xdr:colOff>466725</xdr:colOff>
 <xdr:row>14</xdr:row>
 <xdr:rowOff>9525</xdr:rowOff>
 </xdr:to>
 <xdr:sp macro="" textlink="">
 ...
 </xdr:sp>
 <xdr:clientData/>
</xdr:twoCellAnchor>
```

The above example shows the first anchor point being specified via the from element. End example]

Parent Elements
oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
col (Column))	§5.6.2.10
colOff (Column Offset)	§5.6.2.11
row (Row)	§5.6.2.26
rowOff (Row Offset)	§5.6.2.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
 <sequence>
 <element name="col" type="ST_ColID"/>
 <element name="colOff" type="a:ST_Coordinate"/>
 <element name="row" type="ST_RowID"/>
 <element name="rowOff" type="a:ST_Coordinate"/>
 </sequence>
</complexType>
```

### 5.6.2.15 graphicFrame (Graphic Frame)

This element describes a single graphical object frame for a spreadsheet which contains a graphical object.

#### Parent Elements

absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

#### Child Elements

#### Subclause

graphic (Graphic Object)

§5.1.2.1.16

nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

§5.6.2.19

xfrm (2D Transform for Graphic Frames)

§5.6.2.35

#### Attributes

#### Description

fPublished (Publish to Server Flag)

This attribute indicates whether the shape shall be published with the worksheet when sent to the server.

The possible values for this attribute are defined by the XML Schema boolean datatype.

macro (Reference To Custom Function)

This element specifies the custom function associated with the object. *[Example: A macro script, add-in function, and so on. end example]*

The format of this string shall be application-defined, and should be ignored if not understood.

*[Example:*

```
< ... macro="DoWork()" />
```

*end example]*

The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrame">
 <sequence>
 <element name="nvGraphicFramePr" type="CT_GraphicalObjectFrameNonVisual" minOccurs="1"
 maxOccurs="1"/>
 <element name="xfrm" type="a:CT_Transform2D" minOccurs="1" maxOccurs="1"/>
 <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional"/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.6.2.16 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<xdr:grpSp>
 <xdr:nvGrpSpPr>
 <xdr:cNvPr id="10" name="Group 9"/>
 <xdr:cNvGrpSpPr/>
 <xdr:nvPr/>
 </xdr:nvGrpSpPr>
 <xdr:grpSpPr>
 <a:xfrm>
 <a:off x="838200" y="990600"/>
 <a:ext cx="2426208" cy="978408"/>
 <a:chOff x="838200" y="990600"/>
 <a:chExt cx="2426208" cy="978408"/>
 </a:xfrm>
 </xdr:grpSpPr>
 <xdr:sp>
 ..
 </xdr:sp>
 <xdr:sp>
 ..
 </xdr:sp>
 <xdr:sp>
 ..
 </xdr:sp>
</xdr:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. End example]

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

4

Child Elements	Subclause
cxnSp (Connection Shape)	§5.6.2.12
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
grpSpPr (Group Shape Properties)	§5.6.2.17
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§5.6.2.20
pic (Picture)	§5.6.2.24
sp (Shape)	§5.6.2.28

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GroupShape">
 <sequence>
 <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
 <choice minOccurs="0" maxOccurs="unbounded">

 <element name="pic" type="CT_Picture"/>
 </choice>
 </sequence>
</complexType>

```

### 5.6.2.17 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§5.6.2.16)

8 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
9 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
10 </sequence>
11 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
12 </complexType>

```

### 13 5.6.2.18 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

14 This element specifies all non-visual properties for a connection shape. This element is a container for the non-  
 15 visual identification properties, shape properties and application properties that are to be associated with a

connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§5.6.2.12)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	§5.6.2.4
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvCxnSpPr" type="a:CT_NonVisualConnectorProperties" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.6.2.19 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§5.6.2.15)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§5.6.2.5
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrameNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.6.2.20 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§5.6.2.16)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§5.6.2.6
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGrpSpPr" type="a:CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.6.2.21 nvPicPr (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following SpreadsheetDrawingML.

```
<xdr:pic>
 ..
 <xdr:nvPicPr>
 ..
 </xdr:nvPicPr>
 ..
</xdr:pic>
```

The above example shows the defining of non-visual picture properties. End example]

Parent Elements
pic (§5.6.2.24)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.6.2.7
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.6.2.22 nvSpPr (Non-Visual Properties for a Shape)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements
sp (§5.6.2.28)

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8
cNvSpPr (Connection Non-Visual Shape Properties)	§5.6.2.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvSpPr" type="a:CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.6.2.23 oneCellAnchor (One Cell Anchor Shape Size)

This element specifies a one cell anchor placeholder for a group, a shape, or a drawing element. It moves with the cell and its extents is in EMU units.

Parent Elements
wsDr (§5.6.2.34)

Child Elements	Subclause
clientData (Client Data)	§5.6.2.3

Child Elements	Subclause
cxnSp (Connection Shape)	§5.6.2.12
ext (Shape Extent)	§5.6.2.13
from (Starting Anchor Point)	§5.6.2.14
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
pic (Picture)	§5.6.2.24
sp (Shape)	§5.6.2.28

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_OneCellAnchor">
 <sequence>
 <element name="from" type="CT_Marker"/>
 <element name="ext" type="a:CT_PositiveSize2D"/>
 <group ref="EG_ObjectChoices"/>
 <element name="clientData" type="CT_AnchorClientData" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.6.2.24 pic (Picture)

This element specifies the existence of a picture object within the spreadsheet.

[Example: Consider the following SpreadsheetDrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```

<xdr:pic>
 <xdr:nvPicPr>
 <xdr:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
 <xdr:cNvPicPr>
 <a:picLocks noChangeAspect="1"/>
 </xdr:cNvPicPr>
 <xdr:nvPr/>
 </xdr:nvPicPr>
 <xdr:blipFill>
 ...
 </xdr:blipFill>
 <xdr:spPr>
 ...
 </xdr:spPr>
</xdr:pic>

```

End example]

#### Parent Elements

**Parent Elements**

absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

**Child Elements****Subclause**

blipFill (Picture Fill)

§5.6.2.2

nvPicPr (Non-Visual Properties for a Picture)

§5.6.2.21

spPr (Shape Properties)

§5.6.2.29

style (Shape Style)

§5.6.2.30

**Attributes****Description**

fPublished (Publish to Server Flag)

This attribute indicates whether the shape shall be published with the worksheet when sent to the server.

The possible values for this attribute are defined by the XML Schema boolean datatype.

macro (Reference To Custom Function)

This element specifies the custom function associated with the object. [*Example: A macro script, add-in function, and so on. end example*]

The format of this string shall be application-defined, and should be ignored if not understood.

[*Example:*

&lt; ... macro="DoWork()" /&gt;

*end example*]

The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Picture">
 <sequence>
 <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional" default=""/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

**5.6.2.25 pos (Position)**

This element describes the position of a drawing element within a spreadsheet.

Parent Elements
absoluteAnchor (§5.6.2.1)

1

Attributes	Description
<b>x (X-Axis Coordinate)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
<b>y (Y-Axis Coordinate)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Point2D">
4 <attribute name="x" type="ST_Coordinate" use="required"/>
5 <attribute name="y" type="ST_Coordinate" use="required"/>
6 </complexType>

```

7 

### 5.6.2.26 row (Row)

8 This element specifies the row that will be used within the from and to elements to specify anchoring  
9 information for a shape within a spreadsheet.

10 The possible values for this element are defined by the ST\_RowID simple type (§5.6.3.3).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

### 5.6.2.27 rowOff (Row Offset)

This element is used to specify the row offset within a cell. The units for which this attribute is specified in reside within the simple type definition referenced below.

The possible values for this element are defined by the ST\_Coordinate simple type (§5.1.12.16).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

### 5.6.2.28 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the SpreadsheetDrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
nvSpPr (Non-Visual Properties for a Shape)	§5.6.2.22
spPr (Shape Properties)	§5.6.2.29
style (Shape Style)	§5.6.2.30
txBody (Shape Text Body)	§5.6.2.33

Attributes	Description
fLocksText (Lock Text Flag)	<p>This attribute indicates whether to allow text editing within this drawing object when the parent worksheet is protected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fPublished (Publish to Server Flag)	<p>This attribute indicates whether the shape shall be published with the worksheet when sent to the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the object. <i>[Example: A macro script, add-in function, and so on. end example]</i></p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p><i>[Example:</i></p>

Attributes	Description
	<p>&lt; ... macro="DoWork()" /&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
textlink (Text Link)	<p>This attribute specifies a formula linking to spreadsheet cell data.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Shape">
 <sequence>
 <element name="nvSpPr" type="CT_ShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="txBody" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional"/>
 <attribute name="textlink" type="xsd:string" use="optional"/>
 <attribute name="fLocksText" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

#### 5.6.2.29 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a special shape such as a connector shape or picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe additional object-specific properties within a document. This allows for these shapes to have both the properties of a shape as well as specific properties that are unique to only them.

Parent Elements
cxnSp (§5.6.2.12); pic (§5.6.2.24); sp (§5.6.2.28)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

1

Attributes	Description
bwMode (Black and White Mode)  Namespace: .../drawingml/2006/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[Note: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ShapeProperties">
4 <sequence>
5 <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
6 <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
8 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
9 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
10 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
11 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
12 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
13 </sequence>
14 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
15 </complexType>

```

16 

### 5.6.2.30 style (Shape Style)

17 The element specifies the style that will be applied to a shape and the corresponding references for each of the  
 18 style components such as lines and fills.

Parent Elements
cxnSp (§5.6.2.12); pic (§5.6.2.24); sp (§5.6.2.28)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ShapeStyle">
 <sequence>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.6.2.31 to (Ending Anchor Point)

This element specifies the second anchor point for the drawing element. This will be used to anchor the bottom and right sides of the shape within the spreadsheet. That is when the cell that is specified in the to element is adjusted, the shape will also be adjusted.

[Example: Consider the following SpreadsheetDrawingML

```

<xdr:twoCellAnchor>
 <xdr:from>
 <xdr:col>3</xdr:col>
 <xdr:colOff>447675</xdr:colOff>
 <xdr:row>8</xdr:row>
 <xdr:rowOff>28575</xdr:rowOff>
 </xdr:from>
 <xdr:to>
 <xdr:col>5</xdr:col>
 <xdr:colOff>466725</xdr:colOff>
 <xdr:row>14</xdr:row>
 <xdr:rowOff>9525</xdr:rowOff>
 </xdr:to>
 <xdr:sp macro="" textlink="">
 ...
 </xdr:sp>
</xdr:clientData/>

```

</xdr:twoCellAnchor>

The above example shows the second anchor point being specified via the to element. End example]

Parent Elements
twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
col (Column))	§5.6.2.10
colOff (Column Offset)	§5.6.2.11
row (Row)	§5.6.2.26
rowOff (Row Offset)	§5.6.2.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
 <sequence>
 <element name="col" type="ST_ColID"/>
 <element name="colOff" type="a:ST_Coordinate"/>
 <element name="row" type="ST_RowID"/>
 <element name="rowOff" type="a:ST_Coordinate"/>
 </sequence>
</complexType>
```

### 5.6.2.32 twoCellAnchor (Two Cell Anchor Shape Size)

This element specifies a two cell anchor placeholder for a group, a shape, or a drawing element. It moves with cells and its extents are in EMU units.

Parent Elements
wsDr (§5.6.2.34)

Child Elements	Subclause
clientData (Client Data)	§5.6.2.3
cxnSp (Connection Shape)	§5.6.2.12
from (Starting Anchor Point)	§5.6.2.14
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
pic (Picture)	§5.6.2.24
sp (Shape)	§5.6.2.28
to (Ending Anchor Point)	§5.6.2.31

Attributes	Description
editAs (Positioning and Resizing Behaviors)	<p>Specifies how the DrawingML contents shall be moved and/or resized when the rows and columns between its start and ending anchor (the from and to child elements) are resized, or have additional rows/columns inserted within them, or additional row/columns are added before them. The behaviors are discussed in the simple type referenced below.</p> <p>If this attribute is omitted, then its default value shall be assumed to be twoCell.</p> <p>[Example: Consider a drawing defined as follows:</p> <pre>&lt;ws:twoCellAnchor editAs="absolute"&gt;   ... &lt;/ws:twoCellAnchor&gt;</pre> <p>The editAs attribute has a value of absolute, which specifies that the sizing of this object shall not change, instead the anchor locations should be moved as needed to maintain the same size and position. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_EditAs simple type (§5.6.3.2).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwoCellAnchor">
 <sequence>
 <element name="from" type="CT_Marker"/>
 <element name="to" type="CT_Marker"/>
 <group ref="EG_ObjectChoices"/>
 <element name="clientData" type="CT_AnchorClientData" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="editAs" type="ST_EditAs" use="optional" default="twoCell"/>
</complexType>
```

### 5.6.2.33 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

#### Parent Elements

sp (§5.6.2.28)

#### Child Elements

#### Subclause

bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
 <sequence>
 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.6.2.34 wsDr (Worksheet Drawing)

This element specifies all drawing objects within the worksheet. It acts much like the spTree element within the DrawingML framework. Allowing for the specification of all shapes for a given part of a document, in this case a single Worksheet.

Parent Elements
Root element of SpreadsheetML Drawing part

Child Elements	Subclause
absoluteAnchor (Absolute Anchor Shape Size)	§5.6.2.1
oneCellAnchor (One Cell Anchor Shape Size)	§5.6.2.23
twoCellAnchor (Two Cell Anchor Shape Size)	§5.6.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Drawing">
 <sequence>
 <group ref="EG_Anchor" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.6.2.35 xfrm (2D Transform for Graphic Frames)

This element specifies a two dimensional transform for a Graphic Frame.

Parent Elements
graphicFrame (§5.6.2.15)

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description
------------	-------------

Attributes	Description
<b>flipH (Horizontal Flip)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.]</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>flipV (Vertical Flip)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.]</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>rot (Rotation)</b>  Namespace: .../drawingml/2006/main	<p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Transform2D">
3 <sequence>
4 <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
5 <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
8 <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
10 </complexType>

```

### 11 5.6.3 Simple Types

12 This is the complete list of simple types in the

13 <http://schemas.openxmlformats.org/drawingml/2006/spreadsheetDrawing> namespace.

### 5.6.3.1 ST\_ColID (Column ID)

This type specifies a column identification. The numerical value used for the column id should be non-negative and never exceed the number of total columns within the spreadsheet document.

This simple type's contents are a restriction of the XML Schema `int` datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

Referenced By
col (§5.6.2.10)

### 5.6.3.2 ST\_EditAs (Resizing Behaviors)

This simple type specifies all possible settings for how DrawingML contents shall be resized when the rows and columns between its start and ending anchor (the from and to child elements) are resized, or have additional rows/columns inserted within them.

[*Example:* Consider a drawing defined as follows:

```
<ws:twoCellAnchor editAs="absolute">
 ...
</ws:twoCellAnchor>
```

The `editAs` attribute has a value of `absolute`, which specifies that the sizing of this object shall not change, instead the anchor locations should be moved as needed to maintain the same size. *end example*]

This simple type's contents are a restriction of the XML Schema `token` datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
absolute (Do Not Move or Resize With Underlying Rows/Columns)	<p>Specifies that the current start and end positions shall be maintained with respect to the distances from the absolute start point of the worksheet.</p> <p>If additional rows/columns are added before the drawing, the drawing shall move its anchors as needed to maintain this same absolute position.</p>
oneCell (Move With Cells but Do Not Resize)	<p>Specifies that the current drawing shall move with its row and column (i.e. the object is anchored to the actual from row and column), but that the size shall remain absolute.</p> <p>If additional rows/columns are added between the from and to locations of the drawing, the drawing</p>

Enumeration Value	Description
	shall move its to anchors as needed to maintain this same absolute size.
twoCell (Move and Resize With Anchor Cells)	Specifies that the current drawing shall move and resize to maintain its row and column anchors (i.e. the object is anchored to the actual from and to row and column).

Referenced By
twoCellAnchor@editAs (§5.6.2.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EditAs">
 <restriction base="xsd:token">
 <enumeration value="twoCell"/>
 <enumeration value="oneCell"/>
 <enumeration value="absolute"/>
 </restriction>
</simpleType>
```

### 5.6.3.3 ST\_RowID (Row ID)

This type specifies a row identification. The numerical value used for the row id should be non-negative and never exceed the number of total rows within the spreadsheet document.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

Referenced By
row (§5.6.2.26)

## 5.7 DrawingML - Charts

The chart namespace in DrawingML is for representing visualizations of numeric data with column charts, pie charts, scatter charts, or other types of charts.

### 5.7.1 Table of Contents

**This subclause is informative.**

<b>5.7.2 Elements</b> .....	<b>3990</b>

## 5.7.2 Elements

In DrawingML, charts define a visualization of numeric data. The definition includes where the data shall come from, a cache of the data, and how the data shall be represented graphically. Other DrawingML elements are reused to define aspects of the formatting of the visualization.

See the informative material in Part 3 for a description and overview of the basic chart types and chart components.

### 5.7.2.1 applyToEnd (Apply to End)

This element specifies the picture shall be applied to the end of the point or series.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.2 applyToFront (Apply To Front)

This element specifies the picture shall be applied to the front of the point or series.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
------------	-------------

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

### 5 5.7.2.3 [applyToSides \(Apply To Sides\)](#)

6 This element specifies the picture shall be applied to the sides of the point or series.

Parent Elements
pictureOptions (§5.7.2.139)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Boolean">
10 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
11 </complexType>
```

### 12 5.7.2.4 [area3DChart \(3D Area Charts\)](#)

13 This element specifies the 3-D area series on this chart.

Parent Elements
plotArea (§5.7.2.146)

14

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
gapDepth (Gap Depth)	§5.7.2.74
grouping (Grouping)	§5.7.2.76
ser (Area Chart Series)	§5.7.2.174
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Area3DChart">
 <sequence>
 <group ref="EG_AreaChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="gapDepth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="3"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.5 areaChart (Area Charts)

This element specifies the 2-D area series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
grouping (Grouping)	§5.7.2.76
ser (Area Chart Series)	§5.7.2.174
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AreaChart">
 <sequence>
 <group ref="EG_AreaChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.6 auto (Automatic Category Axis)

This element specifies that this axis is a date or text axis based on the data that is used for the axis labels, not a specific choice.

#### Parent Elements

catAx (§5.7.2.25); dateAx (§5.7.2.39)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property is not applied.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.7 autoTitleDeleted (Auto Title Is Deleted)

This element specifies the title shall not be shown for this chart.

#### Parent Elements

chart (§5.7.2.27)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is

Attributes	Description
	<p>omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.8 autoUpdate (Update Automatically)

This element specifies the external data shall be updated automatically when the document containing the chart is opened.

Parent Elements
externalData (§5.7.2.63)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.9 axId (Axis ID)

When specified as a child element of valAx, dateAx, catAx, or serAx, this element specifies the identifier for the axis. When specified as a child element of a chart, this element specifies the identifier of an axis that defines the coordinate space of the chart.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); catAx (§5.7.2.25); dateAx (§5.7.2.39); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); radarChart

**Parent Elements**

(§5.7.2.154); scatterChart (§5.7.2.162); serAx (§5.7.2.176); stockChart (§5.7.2.199); surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205); valAx (§5.7.2.227)

**Attributes****Description**

val (Integer Value)

Specifies that the contents of this attribute will contain an integer number.

The contents of this number are interpreted based on the context of the parent XML element.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.10 axPos (Axis Position)

This element specifies the position of the axis on the chart.

**Parent Elements**

catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

**Attributes****Description**

val (Axis Position Value)

Specifies the position of the axis on the chart.

The possible values for this attribute are defined by the ST\_AxPos simple type (§5.7.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxPos">
 <attribute name="val" type="ST_AxPos" use="required"/>
</complexType>
```

### 5.7.2.11 backWall (Back Wall)

This element specifies the back wall of the chart.

**Parent Elements**

chart (§5.7.2.27)

**Child Elements****Subclause**

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198
thickness (Thickness)	§5.7.2.207

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Surface">
 <sequence>
 <element name="thickness" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.12 backward (Backward)

This element specifies the number of categories (or units on a scatter chart) that the trend line extends before the data for the series that is being trended. On non-scatter charts, the value shall be 0 or 0.5.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute will contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>

```

### 5.7.2.13 bandFmt (Band Format)

This element specifies the formatting band of a surface chart.

Parent Elements
bandFmts (§5.7.2.14)

Child Elements	Subclause
idx (Index)	§5.7.2.84
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BandFmt">
 <sequence>
 <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.14 bandFmts (Band Formats)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

Parent Elements
surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205)

Child Elements	Subclause
bandFmt (Band Format)	§5.7.2.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BandFmts">
 <sequence>
 <element name="bandFmt" type="CT_BandFmt" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.7.2.15 bar3DChart (3D Bar Charts)

This element contains the 3-D bar or column series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
barDir (Bar Direction)	§5.7.2.17
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
gapDepth (Gap Depth)	§5.7.2.74

Child Elements	Subclause
gapWidth (Gap Width)	§5.7.2.75
grouping (Bar Grouping)	§5.7.2.77
ser (Bar Chart Series)	§5.7.2.175
shape (Shape)	§5.7.2.178
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Bar3DChart">
 <sequence>
 <group ref="EG_BarChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
 <element name="gapDepth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
 <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="3"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.16 barChart (Bar Charts)

This element contains the 2-D bar or column series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
barDir (Bar Direction)	§5.7.2.17
dLbIs (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
gapWidth (Gap Width)	§5.7.2.75
grouping (Bar Grouping)	§5.7.2.77
overlap (Overlap)	§5.7.2.132
ser (Bar Chart Series)	§5.7.2.175
serLines (Series Lines)	§5.7.2.177
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarChart">
 <sequence>
 <group ref="EG_BarChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
 <element name="overlap" type="CT_Overlap" minOccurs="0" maxOccurs="1"/>
 <element name="serLines" type="CT_ChartLines" minOccurs="0" maxOccurs="unbounded"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.17 barDir (Bar Direction)

This element specifies whether the series form a bar (horizontal) chart or a column (vertical) chart

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16)

Attributes	Description
val (Bar Direction Value)	Specifies the direction of the series.  The possible values for this attribute are defined by the ST_BarDir simple type (§5.7.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarDir">
 <attribute name="val" type="ST_BarDir" default="col"/>
</complexType>
```

### 5.7.2.18 baseTimeUnit (Base Time Unit)

This element specifies the smallest time unit that is represented on the date axis.

Parent Elements
dateAx (§5.7.2.39)

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks.  The possible values for this attribute are defined by the ST_TimeUnit simple type (§5.7.3.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeUnit">
 <attribute name="val" type="ST_TimeUnit" default="days"/>
</complexType>
```

### 5.7.2.19 bubble3D (3D Bubble)

This element specifies that the bubbles have a 3-D effect applied to them.

#### Parent Elements

bubbleChart (§5.7.2.20); dPt (§5.7.2.52); ser (§5.7.2.168)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.20 bubbleChart (Bubble Charts)

This element contains the bubble series on this chart.

#### Parent Elements

plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
bubble3D (3D Bubble)	§5.7.2.19
bubbleScale (Bubble Scale)	§5.7.2.21
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
ser (Bubble Chart Series)	§5.7.2.168

Child Elements	Subclause
showNegBubbles (Show Negative Bubbles)	§5.7.2.186
sizeRepresents (Size Represents)	§5.7.2.194
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_BubbleChart">
 <sequence>
 <element name="varyColors" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="ser" type="CT_BubbleSer" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="bubble3D" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="bubbleScale" type="CT_BubbleScale" minOccurs="0" maxOccurs="1"/>
 <element name="showNegBubbles" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="sizeRepresents" type="CT_SizeRepresents" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.21 bubbleScale (Bubble Scale)

This element specifies the scale factor for the bubble chart. This element can be an integer value from 0 to 300, corresponding to a percentage of the default size.

Parent Elements
bubbleChart (§5.7.2.20)

Attributes	Description
val (Bubble Scale Value)	<p>Specifies how to scale bubbles on a bubble chart.</p> <p>The possible values for this attribute are defined by the ST_BubbleScale simple type (§5.7.3.5).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_BubbleScale">
 <attribute name="val" type="ST_BubbleScale" default="100"/>
</complexType>

```

### 5.7.2.22 bubbleSize (Bubble Size)

This element specifies the data for the sizes of the bubbles on the bubble chart.

Parent Elements
ser (§5.7.2.168)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_NumDataSource">
3 <sequence>
4 <choice minOccurs="1" maxOccurs="1">
5 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
6 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
7 </choice>
8 </sequence>
9 </complexType>

```

### 10 5.7.2.23 [builtInUnit \(Built in Display Unit Value\)](#)

11 This element specifies the display unit is one of the built in values.

Parent Elements
dispUnits (§5.7.2.45)

12

Attributes	Description
val (Built In Unit Value)	Specifies the type of display unit scaling applied to the axis.  The possible values for this attribute are defined by the ST_BuiltInUnit simple type (§5.7.3.6).

13 The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_BuiltInUnit">
15 <attribute name="val" type="ST_BuiltInUnit" default="thousands"/>
16 </complexType>

```

### 17 5.7.2.24 [cat \(Category Axis Data\)](#)

18 This element specifies the data used for the category axis.

Parent Elements
ser (§5.7.2.174); ser (§5.7.2.171); ser (§5.7.2.175); ser (§5.7.2.170); ser (§5.7.2.169); ser (§5.7.2.173)

19

Child Elements	Subclause
multiLvlStrRef (Multi Level String Reference)	§5.7.2.116
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

Child Elements	Subclause
strLit (String Literal)	§5.7.2.201
strRef (String Reference)	§5.7.2.202

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_AxDataSource">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="multiLvlStrRef" type="CT_MultiLvlStrRef" minOccurs="1" maxOccurs="1"/>
 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
 <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
 <element name="strLit" type="CT_StrData" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>

```

### 5.7.2.25 catAx (Category Axis Data)

This element specifies the category axis of the chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
auto (Automatic Category Axis)	§5.7.2.6
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
crossAx (Crossing Axis ID)	§5.7.2.31
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
extLst (Chart Extensibility)	§5.7.2.64
lblAlgn (Label Alignment)	§5.7.2.90
lblOffset (Label Offset)	§5.7.2.91
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111

 </sequence>
</complexType>
```

### 5.7.2.30 clrMapOvr (Color Map Override)

This element represents color mapping information. It is used to override the applications color mapping if the user has selected keep source formatting after a copy-paste.

#### Parent Elements

chartSpace (§5.7.2.29)

#### Child Elements

extLst (Extension List)

#### Subclause

§5.1.2.1.15

#### Attributes

#### Description

accent1 (Accent 1)

Specifies a color defined which is associated as the accent 1 color.

Namespace:  
.../drawingml/2006/main

The possible values for this attribute are defined by the ST\_ColorSchemeIndex simple type (§5.1.12.14).

accent2 (Accent 2)

Specifies a color defined which is associated as the accent 2 color.

Namespace:  
.../drawingml/2006/main

The possible values for this attribute are defined by the ST\_ColorSchemeIndex simple type (§5.1.12.14).

accent3 (Accent 3)

Specifies a color defined which is associated as the accent 3 color.

Namespace:

The possible values for this attribute are defined by the ST\_ColorSchemeIndex simple

Attributes	Description
.../drawingml/2006/main	type (§5.1.12.14).
accent4 (Accent 4)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 4 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 5 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 6 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg1 (Background 1)  Namespace: .../drawingml/2006/main	A color defined which is associated as the first background color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg2 (Background 2)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the second background color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a followed hyperlink.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a hyperlink.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the first text color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color.

Attributes	Description
Namespace: .../drawingml/2006/main	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ColorMapping">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>

 <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>

```

### 5.7.2.31 crossAx (Crossing Axis ID)

This element specifies the ID of axis that this axis crosses. For instance, a category axis may cross a value axis, and the category axis's crossAx would contain the ID of the value axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute will contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>

```

### 5.7.2.32 `crossBetween` (Cross Between)

This element specifies whether the value axis crosses the category axis between categories.

If not specified, then the application should choose an appropriate behavior.

Parent Elements
valAx (§5.7.2.227)

Attributes	Description
val (Cross Between Value)	Specifies whether the value axis crosses the category axis between categories or on categories.  The possible values for this attribute are defined by the ST_CrossBetween simple type (§5.7.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CrossBetween">
 <attribute name="val" type="ST_CrossBetween" use="required"/>
</complexType>
```

### 5.7.2.33 `crosses` (Crosses)

This element specifies how this axis crosses the perpendicular axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Crosses Value)	Specifies where the axis crosses its perpendicular axis.  The possible values for this attribute are defined by the ST_Crosses simple type (§5.7.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Crosses">
 <attribute name="val" type="ST_Crosses" use="required"/>
</complexType>
```

### 5.7.2.34 `crossesAt` (Crossing Value)

This element specifies where on the axis the perpendicular axis crosses. The units are dependent on the type of axis.

When specified as a child element of `valAx`, the value is a decimal number on the value axis. When specified as a child element of `dateAx`, the date is defined as a integer number of days since Dec. 31, 1899, unless `date1904` is set, in which case they are defined as an integer number of days since Dec. 31, 1903. When specified as a child element of `catAx`, the value is an integer category number, starting with 1 as the first category.

Parent Elements
<code>catAx</code> (§5.7.2.25); <code>dateAx</code> (§5.7.2.39); <code>serAx</code> (§5.7.2.176); <code>valAx</code> (§5.7.2.227)

Attributes	Description
<code>val</code> (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number.  The contents of this number are interpreted based on the context of the parent XML element.  The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.35 `custSplit` (Custom Split)

This element contains the custom split information for a pie-of-pie or bar-of-pie chart with a custom split type.

Parent Elements
<code>ofPieChart</code> (§5.7.2.127)

Child Elements	Subclause
<code>secondPiePt</code> (Second Pie Point)	§5.7.2.164

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustSplit">
 <sequence>
 <element name="secondPiePt" type="CT_UnsignedInt" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.7.2.36 `custUnit` (Custom Display Unit)

This element specifies a custom value for the display unit.

Parent Elements
<code>dispUnits</code> (§5.7.2.45)

1

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute will contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Double">
4 <attribute name="val" type="xsd:double" use="required"/>
5 </complexType>

```

6 **5.7.2.37 data (Data Cannot Be Changed)**

7 This element specifies that the user cannot change the choice of data used for the chart

Parent Elements
protection (§5.7.2.150)

8

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

9 The following XML Schema fragment defines the contents of this element:

```

10 <complexType name="CT_Boolean">
11 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
12 </complexType>

```

13 **5.7.2.38 date1904 (1904 Date System)**

14 This element specifies that the chart uses the 1904 date system. If the 1904 date system is used, then all dates  
15 and times shall be specified as a decimal number of days since Dec. 31, 1903. If the 1904 date system is not  
16 used, then all dates and times shall be specified as a decimal number of days since Dec. 31, 1899.

Parent Elements
-----------------

Parent Elements
chartSpace (§5.7.2.29)

1

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Boolean">
4 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
5 </complexType>

```

### 6 5.7.2.39 dateAx (Date Axis)

7 This element specifies a date axis for the chart.

Parent Elements
plotArea (§5.7.2.146)

8

Child Elements	Subclause
auto (Automatic Category Axis)	§5.7.2.6
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
baseTimeUnit (Base Time Unit)	§5.7.2.18

12 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
13 </sequence>
14 </complexType>

```

#### 15 5.7.2.40 delete (Delete)

16 This element specifies that the chart element specified by its containing element shall be deleted from the chart.

17 This should be set to true if the application adds these elements by default even after the user has specified that  
18 they should be removed from the chart.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); dLbl (§5.7.2.47); dLbls (§5.7.2.49); legendEntry (§5.7.2.95); serAx (§5.7.2.176); valAx (§5.7.2.227)

19

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.  A value of on, 1, or true specifies that the property is applied. This is the default value for

Attributes	Description
	<p>this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

#### 5.7.2.41 depthPercent (Depth Percent)

This element specifies the depth of a 3-D chart as a percentage of the chart width (between 20 and 2000 percent).

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (Depth Percent Value)	<p>Specifies an integer value for the property defined by the parent XML element.</p> <p>The possible values for this attribute are defined by the ST_DepthPercent simple type (§5.7.3.9).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DepthPercent">
 <attribute name="val" type="ST_DepthPercent" default="100"/>
</complexType>
```

#### 5.7.2.42 dispBlanksAs (Display Blanks As)

This element specifies how blank cells shall be plotted on a chart .

Parent Elements
chart (§5.7.2.27)

Attributes	Description
val (Display Blanks As Value)	<p>Specifies how blank cells are plotted on the chart.</p> <p>The possible values for this attribute are defined by the ST_DispBlanksAs simple type (§5.7.3.10).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DisbBlanksAs">
 <attribute name="val" type="ST_DisbBlanksAs" default="zero"/>
</complexType>
```

### 5.7.2.43 dispEq (Display Equation)

This element specifies that the equation for the trendline is displayed on the chart (in the same label as the R-squared value).

#### Parent Elements

trendline (§5.7.2.212)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property is not applied.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.44 dispRSqr (Display R Squared Value)

This element specifies that the R-squared value of the trendline is displayed on the chart (in the same label as the equation).

#### Parent Elements

trendline (§5.7.2.212)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	A value of off, 0, or false specifies that the property is not applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

#### 5 5.7.2.45 [dispUnits \(Display Units\)](#)

6 This element specifies the scaling value of the display units for the value axis.

Parent Elements
valAx (§5.7.2.227)

7

Child Elements	Subclause
builtInUnit (Built in Display Unit Value)	§5.7.2.23
custUnit (Custom Display Unit)	§5.7.2.36
dispUnitsLbl (Display Units Label)	§5.7.2.46
extLst (Chart Extensibility)	§5.7.2.64

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_DisUnits">
10 <sequence>
11 <choice>
12 <element name="custUnit" type="CT_Double" minOccurs="1" maxOccurs="1"/>
13 <element name="builtInUnit" type="CT_BuiltInUnit" minOccurs="1" maxOccurs="1"/>
14 </choice>
15 <element name="dispUnitsLbl" type="CT_DisUnitsLbl" minOccurs="0" maxOccurs="1"/>
16 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
17 </sequence>
18 </complexType>
```

#### 19 5.7.2.46 [dispUnitsLbl \(Display Units Label\)](#)

20 This element specifies the display unit label for the value axis in the specified chart.

Parent Elements
dispUnits (§5.7.2.45)

21

Child Elements	Subclause
layout (Layout)	§5.7.2.88

Child Elements	Subclause

tx (Chart Text)	§5.7.2.215
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DispatchUnitsLbl">
 <sequence>
 <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
 <element name="tx" type="CT_Tx" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.47 dLbl (Data Label)

This element specifies a data label.

Parent Elements
dLbls (§5.7.2.49); pivotFmt (§5.7.2.143)

Child Elements	Subclause
delete (Delete)	§5.7.2.40
dLblPos (Data Label Position)	§5.7.2.48
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
layout (Layout)	§5.7.2.88
numFmt (Number Format)	§5.7.2.122
separator (Separator)	§5.7.2.167
showBubbleSize (Show Bubble Size)	§5.7.2.179
showCatName (Show Category Name)	§5.7.2.180
showLegendKey (Show Legend Key)	§5.7.2.185
showPercent (Show Percent)	§5.7.2.188
showSerName (Show Series Name)	§5.7.2.189
showVal (Show Value)	§5.7.2.190
spPr (Shape Properties)	§5.7.2.198
tx (Chart Text)	§5.7.2.215
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DLbl">
 <sequence>
 <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
 <choice>
 <element name="delete" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
 <group ref="Group_DLbl" minOccurs="1" maxOccurs="1"/>
 </choice>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.48 dLblPos (Data Label Position)

This element specifies the position of the data label.

##### Parent Elements

dLbl (§5.7.2.47); dLbIs (§5.7.2.49)

##### Attributes

val (Data Label Position Value)

##### Description

Specifies how the data label is positioned on the chart.

The possible values for this attribute are defined by the ST\_DLblPos simple type (§5.7.3.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DLblPos">
 <attribute name="val" type="ST_DLblPos" use="required"/>
</complexType>
```

#### 5.7.2.49 dLbIs (Data Labels)

This element serves as a root element that specifies the settings for the data labels for an entire series or the entire chart. It contains child elements that specify the specific formatting and positioning settings.

##### Parent Elements

area3DChart (§5.7.2.4); areaChart (§5.7.2.5); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); doughnutChart (§5.7.2.50); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142); radarChart (§5.7.2.154); scatterChart (§5.7.2.162); ser (§5.7.2.168); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175); ser (§5.7.2.172); ser (§5.7.2.169); ser (§5.7.2.170); stockChart (§5.7.2.199)

##### Child Elements

delete (Delete)

dLbl (Data Label)

##### Subclause

§5.7.2.40

§5.7.2.47

Child Elements	Subclause
dLblPos (Data Label Position)	§5.7.2.48
extLst (Chart Extensibility)	§5.7.2.64
leaderLines (Leader Lines)	§5.7.2.92
numFmt (Number Format)	§5.7.2.122
separator (Separator)	§5.7.2.167
showBubbleSize (Show Bubble Size)	§5.7.2.179
showCatName (Show Category Name)	§5.7.2.180
showLeaderLines (Show Leader Lines)	§5.7.2.184
showLegendKey (Show Legend Key)	§5.7.2.185
showPercent (Show Percent)	§5.7.2.188
showSerName (Show Series Name)	§5.7.2.189
showVal (Show Value)	§5.7.2.190
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_DLbls">
3 <sequence>
4 <element name="dLbl" type="CT_DLbl" minOccurs="0" maxOccurs="unbounded"/>
5 <choice>
6 <element name="delete" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
7 <group ref="Group_DLbls" minOccurs="1" maxOccurs="1"/>
8 </choice>
9 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
10 </sequence>
11 </complexType>

```

## 12 5.7.2.50 doughnutChart (Doughnut Charts)

13 This element contains the doughnut chart series.

Parent Elements
plotArea (§5.7.2.146)

14

Child Elements	Subclause
dLbIs (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
firstSliceAng (First Slice Angle)	§5.7.2.68
holeSize (Hole Size)	§5.7.2.82

Child Elements	Subclause
ser (Pie Chart Series)	§5.7.2.170
varyColors (Vary Colors by Point)	§5.7.2.228

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_DoughnutChart">
3 <sequence>
4 <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
5 <element name="firstSliceAng" type="CT_FirstSliceAng" minOccurs="0" maxOccurs="1"/>
6 <element name="holeSize" type="CT_HoleSize" minOccurs="0" maxOccurs="1"/>
7 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 </complexType>

```

### 10 5.7.2.51 downBars (Down Bars)

11 This element specifies the down bars.

Parent Elements
upDownBars (§5.7.2.219)

12

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

13 The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_UpDownBar">
15 <sequence>
16 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
17 </sequence>
18 </complexType>

```

### 19 5.7.2.52 dPt (Data Point)

20 This element specifies a single data point.

Parent Elements
ser (§5.7.2.172); ser (§5.7.2.170); ser (§5.7.2.174); ser (§5.7.2.173); ser (§5.7.2.169); ser (§5.7.2.175); ser (§5.7.2.168)

21

Child Elements	Subclause
bubble3D (3D Bubble)	§5.7.2.19
explosion (Explosion)	§5.7.2.61
extLst (Chart Extensibility)	§5.7.2.64

Child Elements	Subclause
idx (Index)	§5.7.2.84
invertIfNegative (Invert if Negative)	§5.7.2.86
marker (Marker)	§5.7.2.106
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DPt">
 <sequence>
 <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
 <element name="invertIfNegative" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
 <element name="bubble3D" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="explosion" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.53 dropLines (Drop Lines)

This element specifies drop lines.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ChartLines">
 <sequence>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.54 dTable (Data Table)

This element specifies a data table.

Parent Elements
plotArea (§5.7.2.146)

1

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
showHorzBorder (Show Horizontal Border)	§5.7.2.182
showKeys (Show Legend Keys)	§5.7.2.183
showOutline (Show Outline Border)	§5.7.2.187
showVertBorder (Show Vertical Border)	§5.7.2.191
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_DTable">
4 <sequence>
5 <element name="showHorzBorder" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
6 <element name="showVertBorder" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
7 <element name="showOutline" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
8 <element name="showKeys" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
9 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
10 <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
11 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
12 </sequence>
13 </complexType>

```

#### 14 5.7.2.55 errBars (Error Bars)

15 This element specifies error bars. The errValType element controls whether the minus, plus, or val elements are  
 16 used.

Parent Elements
ser (§5.7.2.172); ser (§5.7.2.168); ser (§5.7.2.174); ser (§5.7.2.169); ser (§5.7.2.175)

17

Child Elements	Subclause
errBarType (Error Bar Type)	§5.7.2.56
errDir (Error Bar Direction)	§5.7.2.57
errValType (Error Bar Value Type)	§5.7.2.58
extLst (Chart Extensibility)	§5.7.2.64
minus (Minus)	§5.7.2.114
noEndCap (No End Cap)	§5.7.2.119
plus (Plus)	§5.7.2.148
spPr (Shape Properties)	§5.7.2.198

Child Elements	Subclause
val (Error Bar Value)	§5.7.2.226

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ErrBars">
 <sequence>
 <element name="errDir" type="CT_ErrDir" minOccurs="0" maxOccurs="1"/>
 <element name="errBarType" type="CT_ErrBarType" minOccurs="1" maxOccurs="1"/>
 <element name="errValType" type="CT_ErrValType" minOccurs="1" maxOccurs="1"/>
 <element name="noEndCap" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="plus" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="minus" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.56 errBarType (Error Bar Type)

This element specifies the type of the error bars - positive, negative, or both.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Error Bar Type Value)	Specifies the type of error bars.  The possible values for this attribute are defined by the ST_ErrBarType simple type (§5.7.3.12).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ErrBarType">
 <attribute name="val" type="ST_ErrBarType" default="both"/>
</complexType>

```

### 5.7.2.57 errDir (Error Bar Direction)

This element specifies the direction of the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Error Bar	Specifies the direction of the error bars.

Attributes	Description
Direction Value)	The possible values for this attribute are defined by the ST_ErrDir simple type (§5.7.3.13).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_ErrDir">
3 <attribute name="val" type="ST_ErrDir" use="required"/>
4 </complexType>
```

### 5 5.7.2.58 errValType (Error Bar Value Type)

6 This element specifies the type of values used to determine the length of the error bars.

Parent Elements
errBars (§5.7.2.55)

7

Attributes	Description
val (Error Bar Type Value)	Specifies the type of values of the error bars.  The possible values for this attribute are defined by the ST_ErrValType simple type (§5.7.3.14).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_ErrValType">
10 <attribute name="val" type="ST_ErrValType" default="fixedVal"/>
11 </complexType>
```

### 12 5.7.2.59 evenFooter (Even Footer)

13 This element specifies the footer to use on even numbered pages.

14 The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

### 15 5.7.2.60 evenHeader (Even Header)

16 This element specifies the header to use on even numbered pages.

17 The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

### 5.7.2.61 explosion (Explosion)

This element specifies the amount the data point shall be moved from the center of the pie.

Parent Elements
dPt (§5.7.2.52); ser (§5.7.2.170)

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute will contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.62 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that will be used for later versions of generating applications.

Parent Elements
extLst (§5.7.2.64)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	<p>Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag.</p> <p>The possible values for this attribute are defined by the XML Schema token datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extension">
 <sequence>
 <any processContents="lax"/>
 </sequence>
 <attribute name="uri" type="xsd:token"/>
</complexType>
```

### 5.7.2.63 externalData (External Data Relationship)

This element specifies the relationship to the data for this chart.

The data may be linked, pointing to a spreadsheet in another file. Or, the data may be embedded, contained in a separate part within the same xml package containing the chart. In this case, it shall be stored as an embedded Spreadsheet object in Open XML format.

This is not used by a spreadsheet application as the spreadsheet application can maintain its own reference to the data in the spreadsheet via the formula <f> element.

#### Parent Elements

chartSpace (§5.7.2.29)

#### Child Elements

autoUpdate (Update Automatically)

#### Subclause

§5.7.2.8

#### Attributes

#### Description

id (Relationship Reference)	Specifies the relationship ID for the relationship for this chart. The relationship explicitly targeted by this attribute shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/package">http://schemas.openxmlformats.org/officeDocument/2006/relationships/package</a> .
Namespace: .../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalData">
 <sequence>
 <element name="autoUpdate" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 5.7.2.64 extLst (Chart Extensibility)

This element contains tags used for future extensibility of the file format.

### Parent Elements

area3DChart (§5.7.2.4); areaChart (§5.7.2.5); backWall (§5.7.2.11); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); catAx (§5.7.2.25); chart (§5.7.2.27); chartSpace (§5.7.2.29); dateAx (§5.7.2.39); dispUnits (§5.7.2.45); dLbl (§5.7.2.47); dLbls (§5.7.2.49); doughnutChart (§5.7.2.50); dPt (§5.7.2.52); dTable (§5.7.2.54); errBars (§5.7.2.55); floor (§5.7.2.69); layout (§5.7.2.88); legend (§5.7.2.94); legendEntry (§5.7.2.95); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); manualLayout (§5.7.2.105); marker (§5.7.2.106); multiLvlStrCache (§5.7.2.115); multiLvlStrRef (§5.7.2.116); numCache (§5.7.2.121); numLit (§5.7.2.123); numRef (§5.7.2.124); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142); pivotFmt (§5.7.2.143); pivotSource (§5.7.2.145); plotArea (§5.7.2.146); radarChart (§5.7.2.154); scaling (§5.7.2.161); scatterChart (§5.7.2.162); ser (§5.7.2.174); ser (§5.7.2.170); ser (§5.7.2.172); ser (§5.7.2.175); ser (§5.7.2.169); ser (§5.7.2.168); ser (§5.7.2.173); ser (§5.7.2.171); serAx (§5.7.2.176); sideWall (§5.7.2.192); stockChart (§5.7.2.199); strCache (§5.7.2.200); strLit (§5.7.2.201); strRef (§5.7.2.202); surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205); title (§5.7.2.211); trendline (§5.7.2.212); trendlineLbl (§5.7.2.213); upDownBars (§5.7.2.219); valAx (§5.7.2.227); view3D (§5.7.2.229)

### Child Elements

### Subclause

ext (Extension)

§5.7.2.62

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionList">
 <sequence>
 <element name="ext" type="CT_Extension" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.7.2.65 f (Formula)

This element specifies a reference to source of the data contained in this chart. This shall be used by the spreadsheet application only. A presentation, or word processing application should use the externalData element.

This reference is in the form of a book, sheet, and cell reference or a book, optional sheet, and defined name reference. This reference does not include the equals sign. *[Example:*

```
<c:cat>
 <c:strRef>
 <c:f>Sheet1!A1:C1</c:f>
 <c:strCache>
 ...
 </c:strCache>
 </c:strRef>
</c:cat>
```

The above example shows a formula reference used for the string cache. In this case the series names, which are referenced by the formula element, are in cells A1, B1, and C1.

1 *end example*

2 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
multiLvlStrRef (§5.7.2.116); numRef (§5.7.2.124); strRef (§5.7.2.202)

### 3 5.7.2.66 firstFooter (First Footer)

4 This element specifies the footer to use on the first page.

5 The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

### 6 5.7.2.67 firstHeader (First Header)

7 This element specifies the header to use on the first page.

8 The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

### 9 5.7.2.68 firstSliceAng (First Slice Angle)

10 This element specifies the angle of the first pie or doughnut chart slice, in degrees (clockwise from up).

Parent Elements
doughnutChart (§5.7.2.50); pieChart (§5.7.2.142)

11

Attributes	Description
val (First Slice Angle Value)	Specifies the angle of the first slice.  The possible values for this attribute are defined by the ST_FirstSliceAng simple type (§5.7.3.15).

12 The following XML Schema fragment defines the contents of this element:

```
13 <complexType name="CT_FirstSliceAng">
14 <attribute name="val" type="ST_FirstSliceAng" default="0"/>
15 </complexType>
```

### 16 5.7.2.69 floor (Floor)

17 This element specifies the floor of a 3D chart.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198
thickness (Thickness)	§5.7.2.207

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Surface">
 <sequence>
 <element name="thickness" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.70 [fmtId \(Format ID\)](#)

This element represents a pivot format ID. It serves as a link back to the correct pivotTable which in turn specifies a link that then defines which set of chart format rules apply to this chart.

This ID shall match the chartFormat element, chart attribute, described in §3.10.1.12 of the SpreadsheetML reference material. The chartFormat element also contains a format attribute which is used to index into the pivotFmts collection (§5.7.2.144).

Parent Elements
pivotSource (§5.7.2.145)

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute will contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.71 formatCode (Format Code)

This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§3.8.30) formatCode attribute.

The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
numCache (§5.7.2.121); numLit (§5.7.2.123)

### 5.7.2.72 formatting (Formatting)

This element specifies that a user cannot change formatting on chart elements.

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.73 forward (Forward)

This element specifies the number of categories (or units on a scatter chart) that the trendline extends after the data for the series that is being trended. On non-scatter charts, the value must be a multiple of 0.5.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute will contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

#### 5.7.2.74 gapDepth (Gap Depth)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Parent Elements
area3DChart (§5.7.2.4); bar3DChart (§5.7.2.15); line3DChart (§5.7.2.97)

Attributes	Description
val (Gap Size Value)	<p>Specifies that the contents of this attribute will contain a gap amount between 0 and 500.</p> <p>The possible values for this attribute are defined by the ST_GapAmount simple type (§5.7.3.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GapAmount">
 <attribute name="val" type="ST_GapAmount" default="150"/>
</complexType>
```

#### 5.7.2.75 gapWidth (Gap Width)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16); ofPieChart (§5.7.2.127); upDownBars (§5.7.2.219)

Attributes	Description
val (Gap Size Value)	<p>Specifies that the contents of this attribute will contain a gap amount between 0 and 500.</p> <p>The possible values for this attribute are defined by the ST_GapAmount simple type</p>

Attributes	Description
	(§5.7.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GapAmount">
 <attribute name="val" type="ST_GapAmount" default="150"/>
</complexType>
```

### 5.7.2.76 grouping (Grouping)

This element specifies the type of grouping for a column, line, or area chart.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); line3DChart (§5.7.2.97); lineChart (§5.7.2.98)

Attributes	Description
val (Grouping Value)	Specifies the grouping value.  The possible values for this attribute are defined by the ST_Grouping simple type (§5.7.3.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Grouping">
 <attribute name="val" type="ST_Grouping" default="standard"/>
</complexType>
```

### 5.7.2.77 grouping (Bar Grouping)

This element specifies the type of grouping for a bar chart.

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16)

Attributes	Description
val (Bar Grouping Value)	Specifies the bar grouping value.  The possible values for this attribute are defined by the ST_BarGrouping simple type (§5.7.3.4).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarGrouping">
 <attribute name="val" type="ST_BarGrouping" default="clustered"/>
</complexType>
```

### 5.7.2.78 h (Height)

This element specifies the height (if Height Mode is Factor) or bottom (if Height Mode is edge) of the chart element as a fraction of the height of the chart.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute will contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.79 headerFooter (Header and Footer)

This element specifies the headers and footers that shall be used when the chart is printed.

Parent Elements
printSettings (§5.7.2.149)

Child Elements	Subclause
evenFooter (Even Footer)	§5.7.2.59
evenHeader (Even Header)	§5.7.2.60
firstFooter (First Footer)	§5.7.2.66
firstHeader (First Header)	§5.7.2.67
oddFooter (Odd Footer)	§5.7.2.125
oddHeader (Odd Header)	§5.7.2.126

Attributes	Description
alignWithMargins (Align With Margins)	<p>Specifies the header and footer should align with the left and right margins of the chart.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is</p>

Attributes	Description
	<p>omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
differentFirst (Different First)	<p>Specifies the header and footer are different for the first page.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
differentOddEven (Different Odd Even)	<p>Specifies the header and footer are different on odd-numbered pages and even-numbered pages.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_HeaderFooter">
3 <sequence>
4 <element name="oddHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
5 <element name="oddFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
6 <element name="evenHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
7 <element name="evenFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
8 <element name="firstHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
9 <element name="firstFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
10 </sequence>
11 <attribute name="alignWithMargins" type="xsd:boolean" default="true"/>
12 <attribute name="differentOddEven" type="xsd:boolean" default="false"/>
13 <attribute name="differentFirst" type="xsd:boolean" default="false"/>
14 </complexType>

```

### 15 5.7.2.80 [hiLowLines](#) (High Low Lines)

16 This element specifies the high-low lines for the series.

Parent Elements
lineChart (§5.7.2.98); stockChart (§5.7.2.199)

1

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

2 The following XML Schema fragment defines the contents of this element:

3 `<complexType name="CT_ChartLines">`  
 4  `<sequence>`  
 5  `<element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>`  
 6  `</sequence>`  
 7 `</complexType>`

### 8 5.7.2.81 hMode (Height Mode)

9 This element specifies how to interpret the Height element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

10

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width.  The possible values for this attribute are defined by the ST_LayoutMode simple type (§5.7.3.20).

11 The following XML Schema fragment defines the contents of this element:

12 `<complexType name="CT_LayoutMode">`  
 13  `<attribute name="val" type="ST_LayoutMode" default="factor"/>`  
 14 `</complexType>`

### 15 5.7.2.82 holeSize (Hole Size)

16 This element specifies the size of the hole in a doughnut chart group.

Parent Elements
doughnutChart (§5.7.2.50)

17

Attributes	Description
val (Hole Size Value)	Specifies that the contents of this attribute will contain a hole size between 10 and 90 that is measured as a percentage of the size of the plot area.  The possible values for this attribute are defined by the ST_HoleSize simple type (§5.7.3.18).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HoleSize">
 <attribute name="val" type="ST_HoleSize" default="10"/>
</complexType>
```

### 5.7.2.83 hPercent (Height Percent)

This element specifies the height of a 3-D chart as a percentage of the chart width.

#### Parent Elements

view3D (§5.7.2.229)

Attributes	Description
val (Height Percent Value)	<p>Specifies that the contents of this attribute will contain a height percent between 5 and 500.</p> <p>The possible values for this attribute are defined by the ST_HPercent simple type (§5.7.3.19).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HPercent">
 <attribute name="val" type="ST_HPercent" default="100"/>
</complexType>
```

### 5.7.2.84 idx (Index)

This element specifies the index of the containing element. This index shall determine which of the parent's children collection this element applies to.

#### Parent Elements

bandFmt (§5.7.2.13); dLbl (§5.7.2.47); dPt (§5.7.2.52); legendEntry (§5.7.2.95); pivotFmt (§5.7.2.143); ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175)

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute will contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.85 [intercept \(Intercept\)](#)

This element specifies the value where the trendline shall cross the y axis. This property shall be supported only when the trendline type is exp, linear, or poly.

#### Parent Elements

trendline (§5.7.2.212)

#### Attributes

val (Floating Point Value)

#### Description

Specifies that the contents of this attribute will contain a floating point number.

The contents of this number are interpreted based on the context of the parent XML element.

The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.86 [invertIfNegative \(Invert if Negative\)](#)

This element specifies the parent element shall invert its colors if the value is negative.

#### Parent Elements

dPt (§5.7.2.52); ser (§5.7.2.175); ser (§5.7.2.168)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property is not applied.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.87 lang (Editing Language)

This element specifies the primary editing language which was use when this chart was last modified.

#### Parent Elements

chartSpace (§5.7.2.29)

#### Attributes

#### Description

val (Language Code)

Specifies a language tag as defined by RFC 3066. See simple type for additional information.

The possible values for this attribute are defined by the ST\_TextLanguageID simple type (§5.7.3.47).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextLanguageID">
 <attribute name="val" type="ST_TextLanguageID" use="required"/>
</complexType>
```

### 5.7.2.88 layout (Layout)

This element specifies how the chart element is placed on the chart.

#### Parent Elements

dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); legend (§5.7.2.94); plotArea (§5.7.2.146); title (§5.7.2.211); trendlineLbl (§5.7.2.213)

#### Child Elements

#### Subclause

extLst (Chart Extensibility)

§5.7.2.64

manualLayout (Manual Layout)

§5.7.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Layout">
 <sequence>
 <element name="manualLayout" type="CT_ManualLayout" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.89 layoutTarget (Layout Target)

This element specifies whether to layout the plot area by its inside (not including axis and axis labels) or outside (including axis and axis labels).

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Target Value)	Specifies the layout target value.  The possible values for this attribute are defined by the ST_LayoutTarget simple type (§5.7.3.21).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutTarget">
 <attribute name="val" type="ST_LayoutTarget" default="outer"/>
</complexType>
```

### 5.7.2.90 lblAlign (Label Alignment)

This element specifies the text alignment for the tick labels on the axis.

Parent Elements
catAx (§5.7.2.25)

Attributes	Description
val (Label Alignment Value)	Specifies the label alignment.  The possible values for this attribute are defined by the ST_LblAlign simple type (§5.7.3.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LblAlign">
 <attribute name="val" type="ST_LblAlign" use="required"/>
</complexType>
```

### 5.7.2.91 lblOffset (Label Offset)

This element specifies the distance of labels from the axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39)

Attributes	Description
val (Label Offset Value)	Specifies the contents of this attribute will contain an integer between 0 and 1000.  The possible values for this attribute are defined by the ST_LblOffset simple type (§5.7.3.23).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_LblOffset">
3 <attribute name="val" type="ST_LblOffset" default="100"/>
4 </complexType>
```

### 5 5.7.2.92 leaderLines (Leader Lines)

6 This element specifies the leader lines for data labels.

Parent Elements
dLbIs (§5.7.2.49)

7

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_ChartLines">
10 <sequence>
11 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
12 </sequence>
13 </complexType>
```

### 14 5.7.2.93 legacyDrawingHF (Legacy Drawing for Headers and Footers)

15 This element specifies the VML Drawing part that contains any pictures used in the header or footer of the chart.

Parent Elements
printSettings (§5.7.2.149)

16

Attributes	Description
id (Relationship Reference)	Specifies the relationship ID for the relationship for this Chart, Chart Drawing, or VML Drawing part. The type of relationship needed is specified by the parent element.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelId">
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 5.7.2.94 legend (Legend)

This element specifies the legend.

#### Parent Elements

chart (§5.7.2.27)

#### Child Elements

#### Subclause

extLst (Chart Extensibility)

§5.7.2.64

layout (Layout)

§5.7.2.88

legendEntry (Legend Entry)

§5.7.2.95

legendPos (Legend Position)

§5.7.2.96

overlay (Overlay)

§5.7.2.133

spPr (Shape Properties)

§5.7.2.198

txPr (Text Properties)

§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Legend">
 <sequence>
 <element name="legendPos" type="CT_LegendPos" minOccurs="0" maxOccurs="1"/>
 <element name="legendEntry" type="CT_LegendEntry" minOccurs="0" maxOccurs="unbounded"/>
 <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
 <element name="overlay" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.95 legendEntry (Legend Entry)

This element specifies a legend entry.

#### Parent Elements

legend (§5.7.2.94)

#### Child Elements

#### Subclause

delete (Delete)

§5.7.2.40

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_LegendEntry">
 <sequence>
 <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
 <choice>
 <element name="delete" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
 <group ref="EG_LegendEntryData" minOccurs="1" maxOccurs="1"/>
 </choice>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.96 legendPos (Legend Position)

This element specifies the position of the legend.

Parent Elements
legend (§5.7.2.94)

Attributes	Description
val (Legend Position Value)	<p>Specifies the position of the legend.</p> <p>The possible values for this attribute are defined by the ST_LegendPos simple type (§5.7.3.24).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_LegendPos">
 <attribute name="val" type="ST_LegendPos" default="r"/>
</complexType>

```

### 5.7.2.97 line3DChart (3D Line Charts)

This element contains the 3-D line chart series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
gapDepth (Gap Depth)	§5.7.2.74
grouping (Grouping)	§5.7.2.76
ser (Line Chart Series)	§5.7.2.169
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Line3DChart">
 <sequence>
 <group ref="EG_LineChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="gapDepth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="3" maxOccurs="3"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.98 lineChart (Line Charts)

This element contains the 2-D line chart series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
grouping (Grouping)	§5.7.2.76
hiLowLines (High Low Lines)	§5.7.2.80
marker (Show Marker)	§5.7.2.107
ser (Line Chart Series)	§5.7.2.169
smooth (Smoothing)	§5.7.2.195
upDownBars (Up/Down Bars)	§5.7.2.219
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineChart">
 <sequence>
 <group ref="EG_LineChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="hiLowLines" type="CT_ChartLines" minOccurs="0" maxOccurs="1"/>
 <element name="upDownBars" type="CT_UpDownBars" minOccurs="0" maxOccurs="1"/>
 <element name="marker" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="smooth" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.99 logBase (Logarithmic Base)

This element specifies the logarithmic base for a logarithmic axis.

#### Parent Elements

scaling (§5.7.2.161)

#### Attributes

val (Logarithmic Base Value)

#### Description

Specifies the contents of this attribute will contain a floating point value greater than or equal to 2.

The possible values for this attribute are defined by the ST\_LogBase simple type (§5.7.3.25).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LogBase">
 <attribute name="val" type="ST_LogBase" use="required"/>
</complexType>
```

### 5.7.2.100 lvl (Level)

This element specifies data for a single level of labels for a category axis.

#### Parent Elements

multiLvlStrCache (§5.7.2.115)

#### Child Elements

pt (String Point)

#### Subclause

§5.7.2.152

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Lvl1">
 <sequence>
 <element name="pt" type="CT_StrVal" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

**5.7.2.101 majorGridlines (Major Gridlines)**

This element specifies major gridlines.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
 <sequence>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

**5.7.2.102 majorTickMark (Major Tick Mark)**

This element specifies the major tick marks.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position.  The possible values for this attribute are defined by the ST_TickMark simple type (§5.7.3.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TickMark">
 <attribute name="val" type="ST_TickMark" default="cross"/>
</complexType>
```

**5.7.2.103 majorTimeUnit (Major Time Unit)**

This element specifies the time unit for major tick marks.

Parent Elements
dateAx (§5.7.2.39)

Attributes	Description
val (Time Unit Value)	<p>Specifies the time unit for the tick marks.</p> <p>The possible values for this attribute are defined by the ST_TimeUnit simple type (§5.7.3.50).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeUnit">
 <attribute name="val" type="ST_TimeUnit" default="days"/>
</complexType>
```

#### 5.7.2.104 majorUnit (Major Unit)

This element specifies the distance between major ticks.

Parent Elements
dateAx (§5.7.2.39); valAx (§5.7.2.227)

Attributes	Description
val (Major Unit Value)	<p>Specifies the contents of this attribute will contain a positive floating point number.</p> <p>The possible values for this attribute are defined by the ST_AxisUnit simple type (§5.7.3.1).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxisUnit">
 <attribute name="val" type="ST_AxisUnit" use="required"/>
</complexType>
```

#### 5.7.2.105 manualLayout (Manual Layout)

This element specifies the exact position of a chart element.

Parent Elements
layout (§5.7.2.88)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
h (Height)	§5.7.2.78

Child Elements	Subclause
hMode (Height Mode)	§5.7.2.81
layoutTarget (Layout Target)	§5.7.2.89
w (Width)	§5.7.2.230
wMode (Width Mode)	§5.7.2.232
x (Left)	§5.7.2.233
xMode (Left Mode)	§5.7.2.234
y (Top)	§5.7.2.236
yMode (Top Mode)	§5.7.2.237

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ManualLayout">
 <sequence>
 <element name="layoutTarget" type="CT_LayoutTarget" minOccurs="0" maxOccurs="1"/>
 <element name="xMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
 <element name="yMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
 <element name="wMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
 <element name="hMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
 <element name="x" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="y" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="w" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="h" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.7.2.106 marker (Marker)

This element specifies a data marker.

Parent Elements
dPt (§5.7.2.52); pivotFmt (§5.7.2.143); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.169)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
size (Size)	§5.7.2.193
spPr (Shape Properties)	§5.7.2.198
symbol (Symbol)	§5.7.2.206

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
 <sequence>
 <element name="symbol" type="CT_MarkerStyle" minOccurs="0" maxOccurs="1"/>
 <element name="size" type="CT_MarkerSize" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.107 marker (Show Marker)

This element is a Boolean that, when true, specifies that the marker shall be shown.

#### Parent Elements

lineChart (§5.7.2.98)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property is not applied.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.108 max (Maximum)

This element specifies the maximum value of the axis.

#### Parent Elements

scaling (§5.7.2.161)

#### Attributes

val (Floating Point Value)

#### Description

Specifies that the contents of this attribute will contain a floating point number.

The contents of this number are interpreted based on the context of the parent XML element.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Double">
3 <attribute name="val" type="xsd:double" use="required"/>
4 </complexType>
```

#### 5 5.7.2.109 min (Minimum)

6 This element specifies the minimum value of the axis.

Parent Elements
scaling (§5.7.2.161)

7

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number.  The contents of this number are interpreted based on the context of the parent XML element.  The possible values for this attribute are defined by the XML Schema double datatype.

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Double">
10 <attribute name="val" type="xsd:double" use="required"/>
11 </complexType>
```

#### 12 5.7.2.110 minorGridlines (Minor Gridlines)

13 This element specifies the minor gridlines.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

14

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
 <sequence>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.111 minorTickMark (Minor Tick Mark)

This element specifies the minor tick marks for the axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position.  The possible values for this attribute are defined by the ST_TickMark simple type (§5.7.3.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TickMark">
 <attribute name="val" type="ST_TickMark" default="cross"/>
</complexType>
```

#### 5.7.2.112 minorTimeUnit (Minor Time Unit)

This element specifies the time unit for the minor tick marks.

Parent Elements
dateAx (§5.7.2.39)

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks.  The possible values for this attribute are defined by the ST_TimeUnit simple type (§5.7.3.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeUnit">
 <attribute name="val" type="ST_TimeUnit" default="days"/>
</complexType>
```

#### 5.7.2.113 minorUnit (Minor Unit)

This element specifies the distance between minor tick marks.

Parent Elements
dateAx (§5.7.2.39); valAx (§5.7.2.227)

1

Attributes	Description
val (Major Unit Value)	Specifies the contents of this attribute will contain a positive floating point number.  The possible values for this attribute are defined by the ST_AxisUnit simple type (§5.7.3.1).

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_AxisUnit">
4 <attribute name="val" type="ST_AxisUnit" use="required"/>
5 </complexType>
```

### 6 5.7.2.114 minus (Minus)

7 This element specifies the error bar value in the negative direction. It shall be used only when the errValType is  
8 cust.

Parent Elements
errBars (§5.7.2.55)

9

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

10 The following XML Schema fragment defines the contents of this element:

```
11 <complexType name="CT_NumDataSource">
12 <sequence>
13 <choice minOccurs="1" maxOccurs="1">
14 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
15 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
16 </choice>
17 </sequence>
18 </complexType>
```

### 19 5.7.2.115 multiLvlStrCache (Multi Level String Cache)

20 This element specifies the last data shown on the chart for a category axis.

Parent Elements
multiLvlStrRef (§5.7.2.116)

21

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
lvl (Level)	§5.7.2.100
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MultiLvlStrData">
 <sequence>
 <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="lvl" type="CT_Lvl" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.116 multiLvlStrRef (Multi Level String Reference)

This element specifies a reference to data for the category axis with a cache of the last values used.

Parent Elements
cat (§5.7.2.24); xVal (§5.7.2.235)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
f (Formula)	§5.7.2.65
multiLvlStrCache (Multi Level String Cache)	§5.7.2.115

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MultiLvlStrRef">
 <sequence>
 <element name="f" type="xsd:string" minOccurs="1" maxOccurs="1"/>
 <element name="multiLvlStrCache" type="CT_MultiLvlStrData" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.117 name (Trendline Name)

This element specifies the name of the trendline.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
trendline (§5.7.2.212)

### 5.7.2.118 **name (Pivot Name)**

This element specifies the name of the pivot table to get the data for the chart from.

The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
pivotSource (§5.7.2.145)

### 5.7.2.119 **noEndCap (No End Cap)**

This element specifies an end cap is not drawn on the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.120 **noMultiLvlLbl (No Multi-level Labels)**

This element specifies the labels shall be shown as flat text. If this element is not included or is set to false, then the labels shall be drawn as a hierarchy.

Parent Elements
catAx (§5.7.2.25)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is</p>

Attributes	Description
	<p>omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

### 5 5.7.2.121 numCache (Number Cache)

6 This element specifies the last data shown on the chart for a series.

Parent Elements
numRef (§5.7.2.124)

7

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
formatCode (Format Code)	§5.7.2.71
pt (Numeric Point)	§5.7.2.151
ptCount (Point Count)	§5.7.2.153

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_NumData">
10 <sequence>
11 <element name="formatCode" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
12 <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
13 <element name="pt" type="CT_NumVal" minOccurs="0" maxOccurs="unbounded"/>
14 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
15 </sequence>
16 </complexType>
```

### 17 5.7.2.122 numFmt (Number Format)

18 This element specifies number formatting for the parent element.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); dLbl (§5.7.2.47); dLbls (§5.7.2.49); serAx (§5.7.2.176); trendlineLbl (§5.7.2.213); valAx (§5.7.2.227)

19

Attributes	Description
------------	-------------

Attributes	Description
formatCode (Number Format Code)	<p>This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§3.8.30) formatCode attribute.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§5.7.3.52).</p>
sourceLinked (Linked to Source)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_NumFmt">
3 <attribute name="formatCode" type="ST_Xstring" use="required"/>
4 <attribute name="sourceLinked" type="xsd:boolean"/>
5 </complexType>
```

### 6 5.7.2.123 numLit (Number Literal)

7 This element specifies a set of numbers used for the parent element.

Parent Elements
bubbleSize (§5.7.2.22); cat (§5.7.2.24); minus (§5.7.2.114); plus (§5.7.2.148); val (§5.7.2.225); xVal (§5.7.2.235); yVal (§5.7.2.238)

8

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
formatCode (Format Code)	§5.7.2.71
pt (Numeric Point)	§5.7.2.151
ptCount (Point Count)	§5.7.2.153

9 The following XML Schema fragment defines the contents of this element:

```
10 <complexType name="CT_NumData">
11 <sequence>
12 <element name="formatCode" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
13 <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
14 <element name="pt" type="CT_NumVal" minOccurs="0" maxOccurs="unbounded"/>
15 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
16 </sequence>
17 </complexType>
```

5.7.2.124 numRef (Number Reference)

This element specifies a reference to numeric data with a cache of the last values used.

Parent Elements
bubbleSize (§5.7.2.22); cat (§5.7.2.24); minus (§5.7.2.114); plus (§5.7.2.148); val (§5.7.2.225); xVal (§5.7.2.235); yVal (§5.7.2.238)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
f (Formula)	§5.7.2.65
numCache (Number Cache)	§5.7.2.121

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumRef">
 <sequence>
 <element name="f" type="xsd:string" minOccurs="1" maxOccurs="1"/>
 <element name="numCache" type="CT_NumData" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.7.2.125 oddFooter (Odd Footer)

This element specifies the footer to use on odd numbered pages.

The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.126 oddHeader (Odd Header)

This element specifies the header to use on odd numbered pages.

The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.127 ofPieChart (Pie of Pie or Bar of Pie Charts)

This element contains the pie of pie or bar of pie series on this chart. Only the first series shall be displayed. The splitType element shall determine whether the splitPos and custSplit elements apply.

Parent Elements
-----------------

Parent Elements
plotArea (§5.7.2.146)

1

Child Elements	Subclause
custSplit (Custom Split)	§5.7.2.35
dLbIs (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
gapWidth (Gap Width)	§5.7.2.75
ofPieType (Pie of Pie or Bar of Pie Type)	§5.7.2.128
secondPieSize (Second Pie Size)	§5.7.2.165
ser (Pie Chart Series)	§5.7.2.170
serLines (Series Lines)	§5.7.2.177
splitPos (Split Position)	§5.7.2.196
splitType (Split Type)	§5.7.2.197
varyColors (Vary Colors by Point)	§5.7.2.228

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_OfPieChart">
4 <sequence>
5 <element name="ofPieType" type="CT_OfPieType" minOccurs="1" maxOccurs="1"/>
6 <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
7 <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
8 <element name="splitType" type="CT_SplitType" minOccurs="0" maxOccurs="1"/>
9 <element name="splitPos" type="CT_Double" minOccurs="0" maxOccurs="1"/>
10 <element name="custSplit" type="CT_CustSplit" minOccurs="0" maxOccurs="1"/>
11 <element name="secondPieSize" type="CT_SecondPieSize" minOccurs="0" maxOccurs="1"/>
12 <element name="serLines" type="CT_ChartLines" minOccurs="0" maxOccurs="unbounded"/>
13 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
14 </sequence>
15 </complexType>

```

### 16 5.7.2.128 ofPieType (Pie of Pie or Bar of Pie Type)

17 This element specifies whether this chart is pie of pie or bar of pie.

Parent Elements
ofPieChart (§5.7.2.127)

18

Attributes	Description
val (Pie of Pie or Bar of Pie Type Value)	Specifies the type of pie of pie or bar of pie chart.

Attributes	Description
	The possible values for this attribute are defined by the ST_OfPieType simple type (§5.7.3.28).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OfPieType">
3 <attribute name="val" type="ST_OfPieType" default="pie"/>
4 </complexType>
```

### 5 5.7.2.129 order (Order)

6 This element specifies the order of the series in the collection. It is 0 based.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175)

7

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number.  The contents of this number are interpreted based on the context of the parent XML element.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_UnsignedInt">
10 <attribute name="val" type="xsd:unsignedInt" use="required"/>
11 </complexType>
```

### 12 5.7.2.130 order (Polynomial Trendline Order)

13 This element specifies the order of the polynomial trend line. It is ignored for other trend line types.

Parent Elements
trendline (§5.7.2.212)

14

Attributes	Description
val (Order Value)	Specifies that the contents of this attribute will contain an integer between 2 and 6.  The possible values for this attribute are defined by the ST_Order simple type (§5.7.3.29).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Order">
 <attribute name="val" type="ST_Order" default="2"/>
</complexType>
```

### 5.7.2.131 orientation (Axis Orientation)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

#### Parent Elements

scaling (§5.7.2.161)

#### Attributes

val (Orientation Value)

#### Description

Specifies the orientation of the axis.

The possible values for this attribute are defined by the ST\_Orientation simple type (§5.7.3.30).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Orientation">
 <attribute name="val" type="ST_Orientation" default="minMax"/>
</complexType>
```

### 5.7.2.132 overlap (Overlap)

This element specifies how much bars and columns shall overlap on 2-D charts.

#### Parent Elements

barChart (§5.7.2.16)

#### Attributes

val (Overlap Value)

#### Description

Specifies the contents of this attribute will contain an integer between -100 and 100.

The possible values for this attribute are defined by the ST\_Overlap simple type (§5.7.3.31).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Overlap">
 <attribute name="val" type="ST_Overlap" default="0"/>
</complexType>
```

### 5.7.2.133 overlay (Overlay)

This element specifies that other chart elements shall be allowed to overlap this chart element.

Parent Elements
legend (§5.7.2.94); title (§5.7.2.211)

1

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Boolean">
4 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
5 </complexType>
```

### 6 5.7.2.134 pageMargins (Page Margins)

7 This element specifies the page margins for a chart.

Parent Elements
printSettings (§5.7.2.149)

8

Attributes	Description
b (Bottom)	<p>Specifies the contents of this attribute will contain the bottom page margin in inches.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
footer (Footer)	<p>Specifies the contents of this attribute will contain the footer margin in inches.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
header (Header)	<p>Specifies the contents of this attribute will contain the header margin in inches.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
l (Left)	<p>Specifies the contents of this attribute will contain the left page margin in inches.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
r (Right)	<p>Specifies the contents of this attribute will contain the right page margin in inches.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

Attributes	Description
t (Top)	Specifies the contents of this attribute will contain the top page margin in inches.  The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageMargins">
 <attribute name="l" type="xsd:double" use="required"/>
 <attribute name="r" type="xsd:double" use="required"/>
 <attribute name="t" type="xsd:double" use="required"/>
 <attribute name="b" type="xsd:double" use="required"/>
 <attribute name="header" type="xsd:double" use="required"/>
 <attribute name="footer" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.135 pageSetup (Page Setup)

This element defines the page setup for the chart.

Parent Elements
printSettings (§5.7.2.149)

Attributes	Description
blackAndWhite (Black and White)	Specifies the page shall print in black and white.  The possible values for this attribute are defined by the XML Schema boolean datatype.
copies (Copies)	Specifies the number of copies that shall be printed.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
draft (Draft)	Specifies the page shall be printed in draft mode.  The possible values for this attribute are defined by the XML Schema boolean datatype.
firstPageNumber (First Page Number)	Specifies the page number.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Specifies the horizontal resolution to print in dots per inch.  The possible values for this attribute are defined by the XML Schema int datatype.
orientation (Orientation)	Specifies the orientation of the paper.  The possible values for this attribute are defined by the ST_PageSetupOrientation simple type (§5.7.3.32).

Attributes	Description			
paperSize (Page Size)	Specifies the paper size according to the following table.			
	Paper Size	Width	Height	Value
	Letter paper	8.5 in.	11 in.	1
	Legal paper	8.5 in.	14 in.	5
	Standard paper	10 in.	11 in.	45
	Standard paper	10 in.	14 in.	16
	Standard paper	11 in.	17 in.	17
	Standard paper	15 in.	11 in.	46
	Standard paper	9 in.	11 in.	44
	SuperA/SuperA/A4 paper	227 mm	356 mm	57
	A2 paper	420 mm	594 mm	66
	A3 paper	297 mm	420 mm	8
	A3 extra paper	322 mm	445 mm	63
	A3 extra transverse paper	322 mm	445 mm	68
	A3 transverse paper	297 mm	420 mm	67
	A4 paper	210 mm	297 mm	9
	A4 extra paper	236 mm	322 mm	53
	A4 plus paper	210 mm	330 mm	60
	A4 transverse paper	210 mm	297 mm	55
	A4 small paper	210 mm	297 mm	10
	A5 paper	148 mm	210 mm	11
	A5 extra paper	174 mm	235 mm	64
	A5 transverse paper	148 mm	210 mm	61
	SuperB/SuperB/A3 paper	305 mm	487 mm	58
	B4 paper	250 mm	353 mm	12

Attributes	Description			
	B5 paper	176 mm	250 mm	13
	ISO B5 extra paper	201 mm	276 mm	65
	JIS B5 transverse paper	182 mm	257 mm	62
	C paper	17 in.	22 in.	24
	D paper	22 in.	34 in.	25
	#10 envelope	4.125 in.	9.5 in.	20
	#11 envelope	4.5 in.	10.375 in.	21
	#12 envelope	4.75 in.	11 in.	22
	#14 envelope	5 in.	11.5 in.	23
	#9 envelope	3.875 in.	8.875 in.	19
	B4 envelope	250 mm	353 mm	33
	B5 envelope	176 mm	250 mm	34
	B6 envelope	176 mm	125 mm	35
	C3 envelope	324 mm	458 mm	29
	C4 envelope	229 mm	324 mm	30
	C5 envelope	162 mm	229 mm	28
	C6 envelope	114 mm	162 mm	31

		The possible values for this attribute are defined by the XML Schema unsignedInt datatype.		
useFirstPageNumber (Use First Page Number)	Specifies to use the first page number instead of automatically generating a page number.  The possible values for this attribute are defined by the XML Schema boolean datatype.			
verticalDpi	Specifies the vertical resolution to print in dots per inch.			

Attributes	Description
(Vertical DPI)	The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PageSetup">
 <attribute name="paperSize" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="firstPageNumber" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="orientation" type="ST_PageSetupOrientation" use="optional" default="default"/>
 <attribute name="blackAndWhite" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="draft" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="useFirstPageNumber" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="horizontalDpi" type="xsd:int" use="optional" default="600"/>
 <attribute name="verticalDpi" type="xsd:int" use="optional" default="600"/>
 <attribute name="copies" type="xsd:unsignedInt" use="optional" default="1"/>
</complexType>

```

### 5.7.2.136 period (Period)

This element specifies the period of the trend line for a moving average trend line. It is ignored for other trend line types.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Period Value)	Specifies the contents of this attribute will contain an integer between 2 and 255.  The possible values for this attribute are defined by the ST_Period simple type (§5.7.3.33).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Period">
 <attribute name="val" type="ST_Period" default="2"/>
</complexType>

```

### 5.7.2.137 perspective (Perspective)

This element specifies the field of view angle for the 3-D chart. This element is ignored if Right Angle Axes is true.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
------------	-------------

Attributes	Description
val (Perspective Value)	Specifies the contents of this attribute will contain an integer between 0 and 100.  The possible values for this attribute are defined by the ST_Perspective simple type (§5.7.3.34).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Perspective">
3 <attribute name="val" type="ST_Perspective" default="30"/>
4 </complexType>
```

### 5 5.7.2.138 pictureFormat (Picture Format)

6 This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

Parent Elements
pictureOptions (§5.7.2.139)

7

Attributes	Description
val (Picture Format Value)	Specifies the stretching and stacking of the picture.  The possible values for this attribute are defined by the ST_PictureFormat simple type (§5.7.3.35).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_PictureFormat">
10 <attribute name="val" type="ST_PictureFormat" use="required"/>
11 </complexType>
```

### 12 5.7.2.139 pictureOptions (Picture Options)

13 This element specifies the picture to be used on the data point, series, wall, or floor.

Parent Elements
backWall (§5.7.2.11); dPt (§5.7.2.52); floor (§5.7.2.69); ser (§5.7.2.175); ser (§5.7.2.174); sideWall (§5.7.2.192)

14

Child Elements	Subclause
applyToEnd (Apply to End)	§5.7.2.1
applyToFront (Apply To Front)	§5.7.2.2
applyToSides (Apply To Sides)	§5.7.2.3
pictureFormat (Picture Format)	§5.7.2.138
pictureStackUnit (Picture Stack Unit)	§5.7.2.140

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureOptions">
 <sequence>
 <element name="applyToFront" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="applyToSides" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="applyToEnd" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="pictureFormat" type="CT_PictureFormat" minOccurs="0" maxOccurs="1"/>
 <element name="pictureStackUnit" type="CT_PictureStackUnit" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.140 pictureStackUnit (Picture Stack Unit)

This element specifies the unit for each picture on the chart. This element applies only if the Picture Format is Stack and Scale.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
val (Picture Stack Unit)	Specifies the contents of this attribute will contain a floating point number.  The possible values for this attribute are defined by the ST_PictureStackUnit simple type (§5.7.3.36).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureStackUnit">
 <attribute name="val" type="ST_PictureStackUnit" use="required"/>
</complexType>
```

#### 5.7.2.141 pie3DChart (3D Pie Charts)

This element contains the 3-D pie series for this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
ser (Pie Chart Series)	§5.7.2.170
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Pie3DChart">
 <sequence>
 <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.142 pieChart (Pie Charts)

This element contains the 2-D pie series for this chart.

##### Parent Elements

plotArea (§5.7.2.146)

##### Child Elements

##### Subclause

dLbIs (Data Labels)

§5.7.2.49

extLst (Chart Extensibility)

§5.7.2.64

firstSliceAng (First Slice Angle)

§5.7.2.68

ser (Pie Chart Series)

§5.7.2.170

varyColors (Vary Colors by Point)

§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PieChart">
 <sequence>
 <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="firstSliceAng" type="CT_FirstSliceAng" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.143 pivotFmt (Pivot Format)

This element contains a set of formatting to be applied to the chart that is based on a pivotTable.

##### Parent Elements

pivotFmts (§5.7.2.144)

##### Child Elements

##### Subclause

dLbl (Data Label)

§5.7.2.47

extLst (Chart Extensibility)

§5.7.2.64

idx (Index)

§5.7.2.84

marker (Marker)

§5.7.2.106

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PivotFmt">
 <sequence>
 <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
 <element name="dLbl" type="CT_DLbl" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.7.2.144 pivotFmts (Pivot Formats)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
pivotFmt (Pivot Format)	§5.7.2.143

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PivotFmts">
 <sequence>
 <element name="pivotFmt" type="CT_PivotFmt" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>

```

#### 5.7.2.145 pivotSource (Pivot Source)

This element specifies the source pivot table for a pivot chart.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
fmtId (Format ID)	§5.7.2.70
name (Pivot Name)	§5.7.2.118

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotSource">
 <sequence>
 <element name="name" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 <element name="fmtId" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.7.2.146 plotArea (Plot Area)

This element specifies the plot area of the chart.

##### Parent Elements

chart (§5.7.2.27)

##### Child Elements

##### Subclause

area3DChart (3D Area Charts)	§5.7.2.4
areaChart (Area Charts)	§5.7.2.5
bar3DChart (3D Bar Charts)	§5.7.2.15
barChart (Bar Charts)	§5.7.2.16
bubbleChart (Bubble Charts)	§5.7.2.20
catAx (Category Axis Data)	§5.7.2.25
dateAx (Date Axis)	§5.7.2.39
doughnutChart (Doughnut Charts)	§5.7.2.50
dTable (Data Table)	§5.7.2.54
extLst (Chart Extensibility)	§5.7.2.64
layout (Layout)	§5.7.2.88
line3DChart (3D Line Charts)	§5.7.2.97
lineChart (Line Charts)	§5.7.2.98
ofPieChart (Pie of Pie or Bar of Pie Charts)	§5.7.2.127
pie3DChart (3D Pie Charts)	§5.7.2.141
pieChart (Pie Charts)	§5.7.2.142
radarChart (Radar Charts)	§5.7.2.154
scatterChart (Scatter Charts)	§5.7.2.162
serAx (Series Axis)	§5.7.2.176
spPr (Shape Properties)	§5.7.2.198
stockChart (Stock Charts)	§5.7.2.199
surface3DChart (3D Surface Charts)	§5.7.2.204

Child Elements	Subclause
surfaceChart (Surface Charts)	§5.7.2.205
valAx (Value Axis)	§5.7.2.227

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PlotArea">
 <sequence>
 <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
 <choice minOccurs="1" maxOccurs="unbounded">
 <element name="areaChart" type="CT_AreaChart" minOccurs="1" maxOccurs="1"/>
 <element name="area3DChart" type="CT_Area3DChart" minOccurs="1" maxOccurs="1"/>
 <element name="lineChart" type="CT_LineChart" minOccurs="1" maxOccurs="1"/>
 <element name="line3DChart" type="CT_Line3DChart" minOccurs="1" maxOccurs="1"/>
 <element name="stockChart" type="CT_StockChart" minOccurs="1" maxOccurs="1"/>
 <element name="radarChart" type="CT_RadarChart" minOccurs="1" maxOccurs="1"/>
 <element name="scatterChart" type="CT_ScatterChart" minOccurs="1" maxOccurs="1"/>
 <element name="pieChart" type="CT_PieChart" minOccurs="1" maxOccurs="1"/>
 <element name="pie3DChart" type="CT_Pie3DChart" minOccurs="1" maxOccurs="1"/>
 <element name="doughnutChart" type="CT_DoughnutChart" minOccurs="1" maxOccurs="1"/>
 <element name="barChart" type="CT_BarChart" minOccurs="1" maxOccurs="1"/>
 <element name="bar3DChart" type="CT_Bar3DChart" minOccurs="1" maxOccurs="1"/>
 <element name="ofPieChart" type="CT_OFPieChart" minOccurs="1" maxOccurs="1"/>
 <element name="surfaceChart" type="CT_SurfaceChart" minOccurs="1" maxOccurs="1"/>
 <element name="surface3DChart" type="CT_Surface3DChart" minOccurs="1" maxOccurs="1"/>
 <element name="bubbleChart" type="CT_BubbleChart" minOccurs="1" maxOccurs="1"/>
 </choice>
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="valAx" type="CT_ValAx" minOccurs="1" maxOccurs="1"/>
 <element name="catAx" type="CT_CatAx" minOccurs="1" maxOccurs="1"/>
 <element name="dateAx" type="CT_DateAx" minOccurs="1" maxOccurs="1"/>
 <element name="serAx" type="CT_SerAx" minOccurs="1" maxOccurs="1"/>
 </choice>
 <element name="dTable" type="CT_DTable" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.7.2.147 plotVisOnly (Plot Visible Only)

This element specifies that only visible cells should be plotted on the chart.

Parent Elements
chart (§5.7.2.27)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.148 plus (Plus)

This element specifies the error bar value in the positive direction. It shall be used only when the errValType is cust.

Parent Elements
errBars (§5.7.2.55)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>
```

### 5.7.2.149 printSettings (Print Settings)

This element specifies the print settings for the chart.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
headerFooter (Header and Footer)	§5.7.2.79
legacyDrawingHF (Legacy Drawing for Headers and Footers)	§5.7.2.93
pageMargins (Page Margins)	§5.7.2.134
pageSetup (Page Setup)	§5.7.2.135

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PrintSettings">
 <sequence>
 <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
 <element name="pageSetup" type="CT_PageSetup" minOccurs="0" maxOccurs="1"/>
 <element name="legacyDrawingHF" type="CT_RelId" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.150 protection (Protection)

This element specifies protection for the chart. If the chart is on a protected worksheet or chart sheet, then these settings shall control how a user is able to interact with the chart.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
chartObject (Chart Object)	§5.7.2.28
data (Data Cannot Be Changed)	§5.7.2.37
formatting (Formatting)	§5.7.2.72
selection (Selection)	§5.7.2.166
userInterface (User Interface)	§5.7.2.220

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Protection">
 <sequence>
 <element name="chartObject" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="data" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="formatting" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="selection" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="userInterface" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.151 pt (Numeric Point)

This element specifies data for a particular data point.

Parent Elements
numCache (§5.7.2.121); numLit (§5.7.2.123)

Child Elements	Subclause
v (Numeric Value)	§5.7.2.224

Attributes	Description
formatCode (Number Format)	A string representing the format code to apply. For more information see see the SpreadsheetML numFmt element's (§3.8.30) formatCode attribute.  The possible values for this attribute are defined by the ST_Xstring simple type (§5.7.3.52).
idx (Index)	The index of the series in the collection  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumVal">
 <sequence>
 <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="idx" type="xsd:unsignedInt" use="required"/>
 <attribute name="formatCode" type="ST_Xstring" use="optional"/>
</complexType>
```

### 5.7.2.152 pt (String Point)

This element specifies string data for a specific data point.

Parent Elements
lvl (§5.7.2.100); strCache (§5.7.2.200); strLit (§5.7.2.201)

Child Elements	Subclause
v (Text Value)	§5.7.2.223

Attributes	Description
idx (Index)	A 0 based index into a set of points. Represents the data point number this data is for.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrVal">
 <sequence>
 <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="idx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.153 ptCount (Point Count)

This element contains the number of values in the cache.

#### Parent Elements

multiLvlStrCache (§5.7.2.115); numCache (§5.7.2.121); numLit (§5.7.2.123); strCache (§5.7.2.200); strLit (§5.7.2.201)

#### Attributes

#### Description

val (Integer Value)

Specifies that the contents of this attribute will contain an integer number.

The contents of this number are interpreted based on the context of the parent XML element.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.154 radarChart (Radar Charts)

This element contains the radar chart series on this chart.

#### Parent Elements

plotArea (§5.7.2.146)

#### Child Elements

#### Subclause

axId (Axis ID)

§5.7.2.9

dLbls (Data Labels)

§5.7.2.49

extLst (Chart Extensibility)

§5.7.2.64

radarStyle (Radar Style)

§5.7.2.155

ser (Radar Chart Series)

§5.7.2.173

Child Elements	Subclause
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadarChart">
 <sequence>
 <element name="radarStyle" type="CT_RadarStyle" minOccurs="1" maxOccurs="1"/>
 <element name="varyColors" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="ser" type="CT_RadarSer" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.155 radarStyle (Radar Style)

This element specifies what type of radar chart shall be drawn.

Parent Elements
radarChart (§5.7.2.154)

Attributes	Description
val (Radar Style Value)	Specifies the style of the radar chart.  The possible values for this attribute are defined by the ST_RadarStyle simple type (§5.7.3.37).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadarStyle">
 <attribute name="val" type="ST_RadarStyle" default="standard"/>
</complexType>
```

### 5.7.2.156 rAngAx (Right Angle Axes)

This element specifies that the chart axes are at right angles, rather than drawn in perspective. Applies only to 3-D charts.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.  A value of on, 1, or true specifies that the property is applied. This is the default value for

Attributes	Description
	<p>this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

### 5 5.7.2.157 rich (Rich Text)

6 This element contains a string with rich text formatting.

Parent Elements
tx (§5.7.2.215)

7

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_TextBody">
10 <sequence>
11 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
12 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
13 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
14 </sequence>
15 </complexType>
```

### 16 5.7.2.158 rotX (X Rotation)

17 This element specifies the amount a 3-D chart shall be rotated in the X direction.

Parent Elements
view3D (§5.7.2.229)

18

Attributes	Description
val (X Rotation Value)	Specifies the contents of this attribute will contain an integer between -90 and 90.

Attributes	Description
	The possible values for this attribute are defined by the ST_RotX simple type (§5.7.3.38).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_RotX">
3 <attribute name="val" type="ST_RotX" default="0"/>
4 </complexType>
```

### 5 5.7.2.159 [rotY \(Y Rotation\)](#)

6 This element specifies the amount a 3-D chart shall be rotated in the Y direction.

Parent Elements
view3D (§5.7.2.229)

7

Attributes	Description
val (Y Rotation Value)	Specifies the contents of this attribute will contain an integer between 0 and 360.  The possible values for this attribute are defined by the ST_RotY simple type (§5.7.3.39).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_RotY">
10 <attribute name="val" type="ST_RotY" default="0"/>
11 </complexType>
```

### 12 5.7.2.160 [roundedCorners \(Rounded Corners\)](#)

13 This element specifies the chart area shall have rounded corners.

Parent Elements
chartSpace (§5.7.2.29)

14

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.  A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.  A value of off, 0, or false specifies that the property is not applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.161 scaling (Scaling)

This element contains additional axis settings.

#### Parent Elements

catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

#### Child Elements

#### Subclause

extLst (Chart Extensibility)

§5.7.2.64

logBase (Logarithmic Base)

§5.7.2.99

max (Maximum)

§5.7.2.108

min (Minimum)

§5.7.2.109

orientation (Axis Orientation)

§5.7.2.131

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scaling">
 <sequence>
 <element name="logBase" type="CT_LogBase" minOccurs="0" maxOccurs="1"/>
 <element name="orientation" type="CT_Orientation" minOccurs="0" maxOccurs="1"/>
 <element name="max" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="min" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.162 scatterChart (Scatter Charts)

This element contains the scatter chart series for this chart.

#### Parent Elements

plotArea (§5.7.2.146)

#### Child Elements

#### Subclause

axId (Axis ID)

§5.7.2.9

dLbIs (Data Labels)

§5.7.2.49

extLst (Chart Extensibility)

§5.7.2.64

scatterStyle (Scatter Style)

§5.7.2.163

Child Elements	Subclause
ser (Scatter Chart Series)	§5.7.2.172
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ScatterChart">
 <sequence>
 <element name="scatterStyle" type="CT_ScatterStyle" minOccurs="1" maxOccurs="1"/>
 <element name="varyColors" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="ser" type="CT_ScatterSer" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.163 scatterStyle (Scatter Style)

This element specifies the type of lines for the scatter chart.

Parent Elements
scatterChart (§5.7.2.162)

Attributes	Description
val (Scatter Style Value)	Specifies the style of the scatter chart.  The possible values for this attribute are defined by the ST_ScatterStyle simple type (§5.7.3.40).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ScatterStyle">
 <attribute name="val" type="ST_ScatterStyle" default="marker"/>
</complexType>

```

### 5.7.2.164 secondPiePt (Second Pie Point)

This element specifies a data point that shall be drawn in the second pie or bar in a pie of pie or bar of pie chart.

Parent Elements
custSplit (§5.7.2.35)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number.

Attributes	Description
	<p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.165 [secondPieSize \(Second Pie Size\)](#)

This element specifies the size of the second pie or bar of a pie of pie chart or a bar of pie chart, as a percentage of the size of the first pie.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Second Pie Size Value)	<p>Specifies the contents of this attribute will contain an integer between 5 and 200.</p> <p>The possible values for this attribute are defined by the ST_SecondPieSize simple type (§5.7.3.41).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SecondPieSize">
 <attribute name="val" type="ST_SecondPieSize" default="75"/>
</complexType>
```

### 5.7.2.166 [selection \(Selection\)](#)

This element specifies the chart elements are protected from selection.

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p>

Attributes	Description
	<p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

#### 5 5.7.2.167 separator (Separator)

6 This element specifies text that shall be used to separate the parts of a data label. The default is a comma,  
7 except for pie charts showing only category name and percentage, when a line break shall be used instead.

8 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

#### 9 5.7.2.168 ser (Bubble Chart Series)

10 This element specifies a series on a bubble chart.

Parent Elements
bubbleChart (§5.7.2.20)

11

Child Elements	Subclause
bubble3D (3D Bubble)	§5.7.2.19
bubbleSize (Bubble Size)	§5.7.2.22
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
invertIfNegative (Invert if Negative)	§5.7.2.86
order (Order)	§5.7.2.129
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216

Child Elements	Subclause
xVal (X Values)	§5.7.2.235
yVal (Y Values)	§5.7.2.238

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_BubbleSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="invertIfNegative" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
 <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="2"/>
 <element name="xVal" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="yVal" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="bubbleSize" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="bubble3D" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.169 ser (Line Chart Series)

This element specifies a series on a line chart.

Parent Elements
line3DChart (§5.7.2.97); lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106
order (Order)	§5.7.2.129
smooth (Smoothing)	§5.7.2.195
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
 <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="1"/>
 <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="smooth" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.7.2.170 [ser](#) (Pie Chart Series)

This element specifies a series on a doughnut or pie chart.

Parent Elements

doughnutChart (§5.7.2.50); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142)

Child Elements

Subclause

cat (Category Axis Data)

§5.7.2.24

dLbls (Data Labels)

§5.7.2.49

dPt (Data Point)

§5.7.2.52

explosion (Explosion)

§5.7.2.61

extLst (Chart Extensibility)

§5.7.2.64

idx (Index)

§5.7.2.84

order (Order)

§5.7.2.129

spPr (Shape Properties)

§5.7.2.198

tx (Series Text)

§5.7.2.216

val (Values)

§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PieSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="explosion" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.171 ser (Surface Chart Series)

This element specifies a series on a surface chart.

#### Parent Elements

surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205)

#### Child Elements

#### Subclause

cat (Category Axis Data)

§5.7.2.24

extLst (Chart Extensibility)

§5.7.2.64

idx (Index)

§5.7.2.84

order (Order)

§5.7.2.129

spPr (Shape Properties)

§5.7.2.198

tx (Series Text)

§5.7.2.216

val (Values)

§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SurfaceSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.172 ser (Scatter Chart Series)

This element specifies a series on a scatter chart.

#### Parent Elements

scatterChart (§5.7.2.162)

1

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106
order (Order)	§5.7.2.129
smooth (Smoothing)	§5.7.2.195
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216
xVal (X Values)	§5.7.2.235
yVal (Y Values)	§5.7.2.238

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ScatterSer">
4 <sequence>
5 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
6 <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
7 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
8 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
9 <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
10 <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="2"/>
11 <element name="xVal" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
12 <element name="yVal" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
13 <element name="smooth" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
14 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
15 </sequence>
16 </complexType>

```

### 17 5.7.2.173 ser (Radar Chart Series)

18 This element specifies a series on a radar chart.

Parent Elements
radarChart (§5.7.2.154)

19

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106
order (Order)	§5.7.2.129
spPr (Shape Properties)	§5.7.2.198
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_RadarSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbIs" minOccurs="0" maxOccurs="1"/>
 <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.174 ser (Area Chart Series)

This element specifies a series on an area chart.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
order (Order)	§5.7.2.129
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198

Child Elements	Subclause
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_AreaSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
 <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="2"/>
 <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.175 ser (Bar Chart Series)

This element specifies a series on a bar chart.

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
invertIfNegative (Invert if Negative)	§5.7.2.86
order (Order)	§5.7.2.129
pictureOptions (Picture Options)	§5.7.2.139
shape (Shape)	§5.7.2.178
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216

Child Elements	Subclause
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_BarSer">
 <sequence>
 <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
 <element name="invertIfNegative" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
 <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
 <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
 <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="1"/>
 <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
 <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.176 serAx (Series Axis)

This element specifies a series axis for the chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
crossAx (Crossing Axis ID)	§5.7.2.31
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
extLst (Chart Extensibility)	§5.7.2.64
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111
numFmt (Number Format)	§5.7.2.122
scaling (Scaling)	§5.7.2.161
spPr (Shape Properties)	§5.7.2.198

Child Elements	Subclause
tickLblPos (Tick Label Position)	§5.7.2.208
tickLblSkip (Tick Label Skip)	§5.7.2.209
tickMarkSkip (Tick Mark Skip)	§5.7.2.210
title (Title)	§5.7.2.211
txPr (Text Properties)	§5.7.2.217

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_SerAx">
3 <sequence>
4 <group ref="EG_AxShared" minOccurs="1" maxOccurs="1"/>
5 <element name="tickLblSkip" type="CT_Skip" minOccurs="0" maxOccurs="1"/>
6 <element name="tickMarkSkip" type="CT_Skip" minOccurs="0" maxOccurs="1"/>
7 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 </complexType>

```

## 10 5.7.2.177 serLines (Series Lines)

11 This element specifies series lines for the chart.

Parent Elements
barChart (§5.7.2.16); ofPieChart (§5.7.2.127)

12

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

13 The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_ChartLines">
15 <sequence>
16 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
17 </sequence>
18 </complexType>

```

## 19 5.7.2.178 shape (Shape)

20 This element specifies the shape of a series or a 3-D bar chart.

Parent Elements
bar3DChart (§5.7.2.15); ser (§5.7.2.175)

21

Attributes	Description
val (Shape Value)	Specifies the shape of the series.

Attributes	Description
	The possible values for this attribute are defined by the ST_Shape simple type (§5.7.3.42).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Shape">
3 <attribute name="val" type="ST_Shape" default="box"/>
4 </complexType>
```

#### 5 5.7.2.179 showBubbleSize (Show Bubble Size)

6 This element specifies the bubble size shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Boolean">
10 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
11 </complexType>
```

#### 12 5.7.2.180 showCatName (Show Category Name)

13 This element specifies that the category name shall be shown in the data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

14

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for</p>

Attributes	Description
	<p>this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

### 5 5.7.2.181 [showDLbIsOverMax \(Show Data Labels over Maximum\)](#)

6 This element specifies data labels over the maximum of the chart shall be shown.

Parent Elements
chart (§5.7.2.27)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Boolean">
10 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
11 </complexType>
```

### 12 5.7.2.182 [showHorzBorder \(Show Horizontal Border\)](#)

13 This element specifies the horizontal borders shall be shown in a data table.

Parent Elements
dTable (§5.7.2.54)

14

Attributes	Description
------------	-------------

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

### 5 5.7.2.183 [showKeys \(Show Legend Keys\)](#)

6 This element specifies the legend keys shall be shown in a data table.

Parent Elements
dTable (§5.7.2.54)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Boolean">
10 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
11 </complexType>
```

### 12 5.7.2.184 [showLeaderLines \(Show Leader Lines\)](#)

13 This element specifies leader lines shall be shown for data labels.

Parent Elements
dLbls (§5.7.2.49)

14

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

#### 5 5.7.2.185 [showLegendKey \(Show Legend Key\)](#)

6 This element specifies legend keys shall be shown in data labels.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Boolean">
10 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
11 </complexType>
```

#### 12 5.7.2.186 [showNegBubbles \(Show Negative Bubbles\)](#)

13 This element specifies negative sized bubbles shall be shown on a bubble chart.

Parent Elements
bubbleChart (§5.7.2.20)

14

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

2 `<complexType name="CT_Boolean">`  
3 `<attribute name="val" type="xsd:boolean" use="optional" default="true"/>`  
4 `</complexType>`

5 **5.7.2.187**      [showOutline \(Show Outline Border\)](#)

6 This element specifies the outline shall be shown on a data table.

Parent Elements
dTable (§5.7.2.54)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

9 `<complexType name="CT_Boolean">`  
10 `<attribute name="val" type="xsd:boolean" use="optional" default="true"/>`  
11 `</complexType>`

12 **5.7.2.188**      [showPercent \(Show Percent\)](#)

13 This element specifies that the percentage shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

14

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

2 `<complexType name="CT_Boolean">`  
3 `<attribute name="val" type="xsd:boolean" use="optional" default="true"/>`  
4 `</complexType>`

5 **5.7.2.189 showSerName (Show Series Name)**

6 This element specifies that the series name shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

9 `<complexType name="CT_Boolean">`  
10 `<attribute name="val" type="xsd:boolean" use="optional" default="true"/>`  
11 `</complexType>`

12 **5.7.2.190 showVal (Show Value)**

13 This element specifies that the value shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

14

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Boolean">
3 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
4 </complexType>
```

#### 5 5.7.2.191 showVertBorder (Show Vertical Border)

6 This element specifies the vertical border shall be shown in a data table.

Parent Elements
dTable (§5.7.2.54)

7

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Boolean">
10 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
11 </complexType>
```

#### 12 5.7.2.192 sideWall (Side Wall)

13 This element specifies the side wall.

Parent Elements
chart (§5.7.2.27)

14

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198
thickness (Thickness)	§5.7.2.207

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Surface">
 <sequence>
 <element name="thickness" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.193 size (Size)

This element specifies the size of the marker in points.

Parent Elements
marker (§5.7.2.106)

Attributes	Description
val (Marker Size Value)	Specifies the contents of this attribute will contain an integer between 2 and 72.  The possible values for this attribute are defined by the ST_MarkerSize simple type (§5.7.3.26).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MarkerSize">
 <attribute name="val" type="ST_MarkerSize" default="5"/>
</complexType>

```

### 5.7.2.194 sizeRepresents (Size Represents)

This element specifies how the bubble size values are represented on the chart.

Parent Elements
bubbleChart (§5.7.2.20)

Attributes	Description
val (Size Represents)	Specifies how the bubble sizes represent the values.

Attributes	Description
Value)	The possible values for this attribute are defined by the ST_SizeRepresents simple type (§5.7.3.43).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SizeRepresents">
 <attribute name="val" type="ST_SizeRepresents" default="area"/>
</complexType>
```

### 5.7.2.195 smooth (Smoothing)

This element specifies the line connecting the points on the chart shall be smoothed using Catmull-Rom splines.

Parent Elements
lineChart (§5.7.2.98); ser (§5.7.2.172); ser (§5.7.2.169)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.196 splitPos (Split Position)

This element specifies a value that shall be used to determine which data points are in the second pie or bar on a pie of pie or bar of pie chart.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number.

Attributes	Description
	The contents of this number are interpreted based on the context of the parent XML element.
	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.197 splitType (Split Type)

This element specifies how to determine which data points are in the second pie or bar on a pie of pie or bar of pie chart.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Split Type Value)	Specifies how to split the data points between the first pie and second pie or bar.
	The possible values for this attribute are defined by the ST_SplitType simple type (§5.7.3.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SplitType">
 <attribute name="val" type="ST_SplitType" default="auto"/>
</complexType>
```

### 5.7.2.198 spPr (Shape Properties)

This element specifies the formatting for the parent chart element. The custGeom, prstGeom, scene3d, and xfrm elements are not supported. The bwMode attribute is not supported.

Parent Elements
backWall (§5.7.2.11); bandFmt (§5.7.2.13); catAx (§5.7.2.25); chartSpace (§5.7.2.29); dateAx (§5.7.2.39); dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); dLbls (§5.7.2.49); downBars (§5.7.2.51); dPt (§5.7.2.52); dropLines (§5.7.2.53); dTable (§5.7.2.54); errBars (§5.7.2.55); floor (§5.7.2.69); hiLowLines (§5.7.2.80); leaderLines (§5.7.2.92); legend (§5.7.2.94); majorGridlines (§5.7.2.101); marker (§5.7.2.106); minorGridlines (§5.7.2.110); pivotFmt (§5.7.2.143); plotArea (§5.7.2.146); ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175); serAx (§5.7.2.176); serLines (§5.7.2.177); sideWall (§5.7.2.192); title (§5.7.2.211); trendline (§5.7.2.212); trendlineLbl (§5.7.2.213); upBars (§5.7.2.218); valAx (§5.7.2.227)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

1

Attributes	Description
bwMode (Black and White Mode)  Namespace: .../drawingml/2006/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
 <sequence>
 <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

### 5.7.2.199 stockChart (Stock Charts)

This element contains the collection of stock chart series.

#### Parent Elements

plotArea (§5.7.2.146)

#### Child Elements

#### Subclause

axId (Axis ID)

§5.7.2.9

dLbIs (Data Labels)

§5.7.2.49

dropLines (Drop Lines)

§5.7.2.53

extLst (Chart Extensibility)

§5.7.2.64

hiLowLines (High Low Lines)

§5.7.2.80

ser (Line Chart Series)

§5.7.2.169

upDownBars (Up/Down Bars)

§5.7.2.219

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StockChart">
 <sequence>
 <element name="ser" type="CT_LineSer" minOccurs="3" maxOccurs="4"/>
 <element name="dLbIs" type="CT_DLbIs" minOccurs="0" maxOccurs="1"/>
 <element name="dropLines" type="CT_ChartLines" minOccurs="0" maxOccurs="1"/>
 <element name="hiLowLines" type="CT_ChartLines" minOccurs="0" maxOccurs="1"/>
 <element name="upDownBars" type="CT_UpDownBars" minOccurs="0" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.200 strCache (String Cache)

This element specifies the last string data used for a chart.

Parent Elements
strRef (§5.7.2.202)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pt (String Point)	§5.7.2.152
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrData">
 <sequence>
 <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="pt" type="CT_StrVal" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.201 strLit (String Literal)

This element specifies a set of strings used for a chart

Parent Elements
cat (§5.7.2.24); xVal (§5.7.2.235)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pt (String Point)	§5.7.2.152
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrData">
 <sequence>
 <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
 <element name="pt" type="CT_StrVal" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.202 strRef (String Reference)

This element specifies a reference to data for a single data label or title with a cache of the last values used.

Parent Elements
-----------------

Parent Elements
cat (§5.7.2.24); tx (§5.7.2.215); tx (§5.7.2.216); xVal (§5.7.2.235)

1

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
f (Formula)	§5.7.2.65
strCache (String Cache)	§5.7.2.200

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_StrRef">
4 <sequence>
5 <element name="f" type="xsd:string" minOccurs="1" maxOccurs="1"/>
6 <element name="strCache" type="CT_StrData" minOccurs="0" maxOccurs="1"/>
7 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 </complexType>

```

### 10 5.7.2.203 style (Style)

11 This element specifies the style that shall be applied to the chart.

Parent Elements
chartSpace (§5.7.2.29)

12

Attributes	Description
val (Style Type)	Specifies the chart style.  The possible values for this attribute are defined by the ST_Style simple type (§5.7.3.46).

13 The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_Style">
15 <attribute name="val" type="ST_Style" use="required"/>
16 </complexType>

```

### 17 5.7.2.204 surface3DChart (3D Surface Charts)

18 This element contains the set of 3-D surface series.

Parent Elements
plotArea (§5.7.2.146)

19

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
bandFmts (Band Formats)	§5.7.2.14
extLst (Chart Extensibility)	§5.7.2.64
ser (Surface Chart Series)	§5.7.2.171
wireframe (Wireframe)	§5.7.2.231

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Surface3DChart">
 <sequence>
 <group ref="EG_SurfaceChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="3" maxOccurs="3"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.205 surfaceChart (Surface Charts)

This element contains the set of 2-D contour charts.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
bandFmts (Band Formats)	§5.7.2.14
extLst (Chart Extensibility)	§5.7.2.64
ser (Surface Chart Series)	§5.7.2.171
wireframe (Wireframe)	§5.7.2.231

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SurfaceChart">
 <sequence>
 <group ref="EG_SurfaceChartShared" minOccurs="1" maxOccurs="1"/>
 <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="3"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.206 symbol (Symbol)

This element specifies the marker that shall be used for the data points.

Parent Elements
-----------------

Parent Elements
marker (§5.7.2.106)

Attributes	Description
val (Marker Style Value)	<p>Specifies the marker style.</p> <p>The possible values for this attribute are defined by the ST_MarkerStyle simple type (§5.7.3.27).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MarkerStyle">
 <attribute name="val" type="ST_MarkerStyle" use="required"/>
</complexType>
```

### 5.7.2.207 thickness (Thickness)

This element specifies the thickness of the walls or floor as a percentage of the largest dimension of the plot volume.

Parent Elements
backWall (§5.7.2.11); floor (§5.7.2.69); sideWall (§5.7.2.192)

Attributes	Description
val (Integer Value)	<p>Specifies that the contents of this attribute will contain an integer number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.7.2.208 tickLblPos (Tick Label Position)

This element specifies the position of the tick labels on the axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Tick Label Position Value)	Specifies the tick label position.  The possible values for this attribute are defined by the ST_TickLblPos simple type (§5.7.3.48).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TickLblPos">
3 <attribute name="val" type="ST_TickLblPos" default="nextTo"/>
4 </complexType>
```

#### 5 5.7.2.209 tickLblSkip (Tick Label Skip)

6 This element specifies how many tick labels to skip between label that is drawn.

Parent Elements
catAx (§5.7.2.25); serAx (§5.7.2.176)

7

Attributes	Description
val (Tick Skip Value)	Specifies the contents of this attribute will contain an integer greater than or equal to one.  The possible values for this attribute are defined by the ST_Skip simple type (§5.7.3.44).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_Skip">
10 <attribute name="val" type="ST_Skip" use="required"/>
11 </complexType>
```

#### 12 5.7.2.210 tickMarkSkip (Tick Mark Skip)

13 This element specifies how many tick marks shall be skipped before the next one shall be drawn.

Parent Elements
catAx (§5.7.2.25); serAx (§5.7.2.176)

14

Attributes	Description
val (Tick Skip Value)	Specifies the contents of this attribute will contain an integer greater than or equal to one.  The possible values for this attribute are defined by the ST_Skip simple type (§5.7.3.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Skip">
 <attribute name="val" type="ST_Skip" use="required"/>
</complexType>
```

#### 5.7.2.211 title (Title)

This element specifies a title.

##### Parent Elements

catAx (§5.7.2.25); chart (§5.7.2.27); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

##### Child Elements

##### Subclause

extLst (Chart Extensibility)

§5.7.2.64

layout (Layout)

§5.7.2.88

overlay (Overlay)

§5.7.2.133

spPr (Shape Properties)

§5.7.2.198

tx (Chart Text)

§5.7.2.215

txPr (Text Properties)

§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Title">
 <sequence>
 <element name="tx" type="CT_Tx" minOccurs="0" maxOccurs="1"/>
 <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
 <element name="overlay" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.7.2.212 trendline (Trendlines)

This element specifies a trendline.

##### Parent Elements

ser (§5.7.2.175); ser (§5.7.2.172); ser (§5.7.2.169); ser (§5.7.2.168); ser (§5.7.2.174)

##### Child Elements

##### Subclause

backward (Backward)

§5.7.2.12

dispEq (Display Equation)

§5.7.2.43

dispRSqr (Display R Squared Value)

§5.7.2.44

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
forward (Forward)	§5.7.2.73
intercept (Intercept)	§5.7.2.85
name (Trendline Name)	§5.7.2.117
order (Polynomial Trendline Order)	§5.7.2.130
period (Period)	§5.7.2.136
spPr (Shape Properties)	§5.7.2.198
trendlineLbl (Trendline Label)	§5.7.2.213
trendlineType (Trendline Type)	§5.7.2.214

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Trendline">
 <sequence>
 <element name="name" type="xsd:string" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="trendlineType" type="CT_TrendlineType" minOccurs="1" maxOccurs="1"/>
 <element name="order" type="CT_Order" minOccurs="0" maxOccurs="1"/>
 <element name="period" type="CT_Period" minOccurs="0" maxOccurs="1"/>
 <element name="forward" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="backward" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="intercept" type="CT_Double" minOccurs="0" maxOccurs="1"/>
 <element name="dispRSqr" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="dispEq" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="trendlineLbl" type="CT_TrendlineLbl" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.213 trendlineLbl (Trendline Label)

This element specifies the label for the trendline.

Parent Elements
trendline (§5.7.2.212)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
layout (Layout)	§5.7.2.88
numFmt (Number Format)	§5.7.2.122
spPr (Shape Properties)	§5.7.2.198
tx (Chart Text)	§5.7.2.215

Child Elements	Subclause
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TrendlineLbl">
 <sequence>
 <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
 <element name="tx" type="CT_Tx" minOccurs="0" maxOccurs="1"/>
 <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.7.2.214 trendlineType (Trendline Type)

This element specifies the type of the trendline.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Trendline Type Value)	Specifies the trendline type.  The possible values for this attribute are defined by the ST_TrendlineType simple type (§5.7.3.51).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TrendlineType">
 <attribute name="val" type="ST_TrendlineType" default="linear"/>
</complexType>

```

### 5.7.2.215 tx (Chart Text)

This element specifies text to use on a chart, including rich text formatting.

Parent Elements
dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); title (§5.7.2.211); trendlineLbl (§5.7.2.213)

Child Elements	Subclause
rich (Rich Text)	§5.7.2.157
strRef (String Reference)	§5.7.2.202

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tx">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
 <element name="rich" type="a:CT_TextBody" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>
```

5.7.2.216 tx (Series Text)

This element specifies text for a series name, without rich text formatting.

Parent Elements

ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175)

Child Elements

Subclause

strRef (String Reference)

§5.7.2.202

v (Text Value)

§5.7.2.223

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SerTx">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
 <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>
```

5.7.2.217 txPr (Text Properties)

This element specifies text formatting. The lstStyle element is not supported.

Parent Elements

catAx (§5.7.2.25); chartSpace (§5.7.2.29); dateAx (§5.7.2.39); dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); dLbls (§5.7.2.49); dTable (§5.7.2.54); legend (§5.7.2.94); legendEntry (§5.7.2.95); pivotFmt (§5.7.2.143); serAx (§5.7.2.176); title (§5.7.2.211); trendlineLbl (§5.7.2.213); valAx (§5.7.2.227)

Child Elements

Subclause

bodyPr (Body Properties)

§5.1.5.1.1

lstStyle (Text List Styles)

§5.1.5.4.12

p (Text Paragraphs)

§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
 <sequence>
 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

**5.7.2.218 upBars (Up Bars)**

This element specifies the up bars on the chart.

Parent Elements
upDownBars (§5.7.2.219)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UpDownBar">
 <sequence>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

**5.7.2.219 upDownBars (Up/Down Bars)**

This element specifies the up and down bars.

Parent Elements
lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
downBars (Down Bars)	§5.7.2.51
extLst (Chart Extensibility)	§5.7.2.64
gapWidth (Gap Width)	§5.7.2.75
upBars (Up Bars)	§5.7.2.218

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UpDownBars">
 <sequence>
 <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
 <element name="upBars" type="CT_UpDownBar" minOccurs="0" maxOccurs="1"/>
 <element name="downBars" type="CT_UpDownBar" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.220 `userInterface` (User Interface)

This element specifies that the protection applies to the user interface only, and not to changes made through the object model.

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.221 `userShapes` (User Shapes)

This element shall specify the shapes drawn on top of the chart.

Child Elements	Subclause
absSizeAnchor (Absolute Anchor Shape Size)	§5.8.2.1
relSizeAnchor (Relative Anchor Shape Size)	§5.8.2.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Drawing">
 <sequence>
 <group ref="EG_Anchor" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

**5.7.2.222 userShapes (Reference to Chart Drawing Part)**

This element specifies a relationship to a separate part which contains a drawing to be drawn on top of the chart.

**Parent Elements**

chartSpace (§5.7.2.29)

**Attributes**

**Description**

id (Relationship Reference)	Specifies the relationship ID for the relationship for this Chart, Chart Drawing, or VML Drawing part. The type of relationship needed is specified by the parent element.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelId">
 <attribute ref="r:id" use="required"/>
</complexType>
```

**5.7.2.223 v (Text Value)**

This element specifies a text value for a category axis label or a series name.

The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

**Parent Elements**

pt (§5.7.2.152); tx (§5.7.2.216)

**5.7.2.224 v (Numeric Value)**

This element specifies a numeric value.

The possible values for this element are defined by the ST\_Xstring simple type (§5.7.3.52).

**Parent Elements**

pt (§5.7.2.151)

### 5.7.2.225 val (Values)

This element specifies the data values which shall be used to define the location of data markers on a chart.

Parent Elements
ser (§5.7.2.174); ser (§5.7.2.171); ser (§5.7.2.175); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.173)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>
```

### 5.7.2.226 val (Error Bar Value)

This element specifies a value which is used with the Error Bar Type to determine the length of the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute will contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.227 valAx (Value Axis)

This element specifies a value axis.

**Parent Elements**

plotArea (§5.7.2.146)

1

**Child Elements****Subclause**

axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
crossAx (Crossing Axis ID)	§5.7.2.31
crossBetween (Cross Between)	§5.7.2.32
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
dispUnits (Display Units)	§5.7.2.45
extLst (Chart Extensibility)	§5.7.2.64
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
majorUnit (Major Unit)	§5.7.2.104
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111
minorUnit (Minor Unit)	§5.7.2.113
numFmt (Number Format)	§5.7.2.122
scaling (Scaling)	§5.7.2.161
spPr (Shape Properties)	§5.7.2.198
tickLblPos (Tick Label Position)	§5.7.2.208
title (Title)	§5.7.2.211
txPr (Text Properties)	§5.7.2.217

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ValAx">
4 <sequence>
5 <group ref="EG_AxShared" minOccurs="1" maxOccurs="1"/>
6 <element name="crossBetween" type="CT_CrossBetween" minOccurs="0" maxOccurs="1"/>
7 <element name="majorUnit" type="CT_AxisUnit" minOccurs="0" maxOccurs="1"/>
8 <element name="minorUnit" type="CT_AxisUnit" minOccurs="0" maxOccurs="1"/>
9 <element name="dispUnits" type="CT_DispatchUnits" minOccurs="0" maxOccurs="1"/>
10 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
11 </sequence>
12 </complexType>

```

### 5.7.2.228 varyColors (Vary Colors by Point)

This element specifies that each data marker in the series shall have a different color.

3

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); doughnutChart (§5.7.2.50); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142); radarChart (§5.7.2.154); scatterChart (§5.7.2.162)

Attributes	Description
val (Boolean Value)	<p>Specifies a boolean value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.229 view3D (View In 3D)

This element specifies the 3-D view of the chart.

10

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
depthPercent (Depth Percent)	§5.7.2.41
extLst (Chart Extensibility)	§5.7.2.64
hPercent (Height Percent)	§5.7.2.83
perspective (Perspective)	§5.7.2.137
rAngAx (Right Angle Axes)	§5.7.2.156
rotX (X Rotation)	§5.7.2.158
rotY (Y Rotation)	§5.7.2.159

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_View3D">
 <sequence>
 <element name="rotX" type="CT_RotX" minOccurs="0" maxOccurs="1"/>
 <element name="hPercent" type="CT_HPercent" minOccurs="0" maxOccurs="1"/>
 <element name="rotY" type="CT_RotY" minOccurs="0" maxOccurs="1"/>
 <element name="depthPercent" type="CT_DepthPercent" minOccurs="0" maxOccurs="1"/>
 <element name="rAngAx" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
 <element name="perspective" type="CT_Perspective" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.7.2.230 w (Width)

This element specifies the width (if Width Mode is Factor) or right (if Width Mode is Edge) of the chart element as a fraction of the width of the chart.

#### Parent Elements

manualLayout (§5.7.2.105)

#### Attributes

val (Floating Point Value)

#### Description

Specifies that the contents of this attribute will contain a floating point number.

The contents of this number are interpreted based on the context of the parent XML element.

The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.231 wireframe (Wireframe)

This element specifies the surface chart is drawn as a wireframe.

#### Parent Elements

surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205)

#### Attributes

val (Boolean Value)

#### Description

Specifies a boolean value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property is applied. This is the default value for

Attributes	Description
	<p>this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 5.7.2.232 wMode (Width Mode)

This element specifies how to interpret the Width element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Mode Value)	<p>Specifies the layout mode for the width.</p> <p>The possible values for this attribute are defined by the ST_LayoutMode simple type (§5.7.3.20).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutMode">
 <attribute name="val" type="ST_LayoutMode" default="factor"/>
</complexType>
```

### 5.7.2.233 x (Left)

This element specifies the x location (left) of the chart element as a fraction of the width of the chart. If Left Mode is Factor, then the position is relative to the default position for the chart element.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Floating Point Value)	<p>Specifies that the contents of this attribute will contain a floating point number.</p> <p>The contents of this number are interpreted based on the context of the parent XML element.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Double">
3 <attribute name="val" type="xsd:double" use="required"/>
4 </complexType>
```

### 5 5.7.2.234 xMode (Left Mode)

6 This element specifies how to interpret the Left element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

7

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width.  The possible values for this attribute are defined by the ST_LayoutMode simple type (§5.7.3.20).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_LayoutMode">
10 <attribute name="val" type="ST_LayoutMode" default="factor"/>
11 </complexType>
```

### 12 5.7.2.235 xVal (X Values)

13 This element specifies the x values which shall be used to define the location of data markers on a chart.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.172)

14

Child Elements	Subclause
multiLvlStrRef (Multi Level String Reference)	§5.7.2.116
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124
strLit (String Literal)	§5.7.2.201
strRef (String Reference)	§5.7.2.202

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxDataSource">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="multiLvlStrRef" type="CT_MultiLvlStrRef" minOccurs="1" maxOccurs="1"/>
 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
 <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
 <element name="strLit" type="CT_StrData" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>
```

### 5.7.2.236 y (Top)

This element specifies the top of the chart element as a fraction of the height of the chart. If Top Mode is Factor, then the position is relative to the default position for the chart element.

#### Parent Elements

manualLayout (§5.7.2.105)

#### Attributes

val (Floating Point Value)

#### Description

Specifies that the contents of this attribute will contain a floating point number.

The contents of this number are interpreted based on the context of the parent XML element.

The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 5.7.2.237 yMode (Top Mode)

This element specifies how to interpret the Top element for this manual layout.

#### Parent Elements

manualLayout (§5.7.2.105)

#### Attributes

val (Layout Mode Value)

#### Description

Specifies the layout mode for the width.

The possible values for this attribute are defined by the ST\_LayoutMode simple type

Attributes	Description
	(§5.7.3.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutMode">
 <attribute name="val" type="ST_LayoutMode" default="factor"/>
</complexType>
```

### 5.7.2.238 yVal (Y Values)

This element specifies the y values which shall be used to define the location of data markers on a chart.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.172)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
 <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
 </choice>
 </sequence>
</complexType>
```

## 5.7.3 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/drawingml/2006/chart> namespace.

### 5.7.3.1 ST\_AxisUnit (Axis Unit)

This simple type specifies that its contents will contain a positive floating point number.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than 0.

Referenced By
majorUnit@val (§5.7.2.104); minorUnit@val (§5.7.2.113)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AxisUnit">
 <restriction base="xsd:double">
 <minExclusive value="0"/>
 </restriction>
</simpleType>
```

### 5.7.3.2 ST\_AxPos (Axis Position)

This simple type specifies the possible positions for an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that the axis shall be displayed at the bottom of the plot area.
l (Left)	Specifies that the axis shall be displayed at the left of the plot area.
r (Right)	Specifies that the axis shall be displayed at the right of the plot area.
t (Top)	Specifies that the axis shall be displayed at the top of the plot area.

#### Referenced By

axPos@val (§5.7.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AxPos">
 <restriction base="xsd:string">
 <enumeration value="b"/>
 <enumeration value="l"/>
 <enumeration value="r"/>
 <enumeration value="t"/>
 </restriction>
</simpleType>
```

### 5.7.3.3 ST\_BarDir (Bar Direction)

This simple type specifies the possible directions for a bar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
bar (Bar)	Specifies that the chart is a bar chart - the data markers are horizontal rectangles.
col (Column)	Specifies that the chart is a column chart - the data markers are vertical rectangles.

1

Referenced By
barDir@val (§5.7.2.17)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_BarDir">
4 <restriction base="xsd:string">
5 <enumeration value="bar"/>
6 <enumeration value="col"/>
7 </restriction>
8 </simpleType>
```

#### 9 5.7.3.4 ST\_BarGrouping (Bar Grouping)

10 This simple type specifies the possible groupings for a bar chart.

11 This simple type's contents are a restriction of the XML Schema string datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
clustered (Clustered)	Specifies that the chart series are drawn next to each other along the category axis.
percentStacked (100% Stacked)	Specifies that the chart series are drawn next to each other along the value axis and scaled to total 100%.
stacked (Stacked)	Specifies that the chart series are drawn next to each other on the value axis.
standard (Standard)	Specifies that the chart series are drawn next to each other on the depth axis.

13

Referenced By
grouping@val (§5.7.2.77)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BarGrouping">
 <restriction base="xsd:string">
 <enumeration value="percentStacked"/>
 <enumeration value="clustered"/>
 <enumeration value="standard"/>
 <enumeration value="stacked"/>
 </restriction>
</simpleType>
```

### 5.7.3.5 ST\_BubbleScale (Bubble Scale)

This simple type specifies that its contents will contain an integer between 0 and 300.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 300.

#### Referenced By

bubbleScale@val (§5.7.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BubbleScale">
 <restriction base="xsd:unsignedInt">
 <minInclusive value="0"/>
 <maxInclusive value="300"/>
 </restriction>
</simpleType>
```

### 5.7.3.6 ST\_BuiltInUnit (Built-In Unit)

This simple type specifies the built in display units for an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
billions (Billions)	Specifies the values on the chart shall be divided by 1,000,000,000.
hundredMillions (Hundred Millions)	Specifies the values on the chart shall be divided by 100,000,000.
hundreds (Hundreds)	Specifies the values on the chart shall be divided by 100.
hundredThousands (Hundred Thousands)	Specifies the values on the chart shall be divided by

Enumeration Value	Description
	100,000.
millions (Millions)	Specifies the values on the chart shall be divided by 1,000,000.
tenMillions (Ten Millions)	Specifies the values on the chart shall be divided by 10,000,000.
tenThousands (Ten Thousands)	Specifies the values on the chart shall be divided by 10,000.
thousands (Thousands)	Specifies the values on the chart shall be divided by 1,000.
trillions (Trillions)	Specifies the values on the chart shall be divided by 1,000,000,000.

1

Referenced By
builtInUnit@val (§5.7.2.23)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_BuiltInUnit">
4 <restriction base="xsd:string">
5 <enumeration value="hundreds"/>
6 <enumeration value="thousands"/>
7 <enumeration value="tenThousands"/>
8 <enumeration value="hundredThousands"/>
9 <enumeration value="millions"/>
10 <enumeration value="tenMillions"/>
11 <enumeration value="hundredMillions"/>
12 <enumeration value="billions"/>
13 <enumeration value="trillions"/>
14 </restriction>
15 </simpleType>

```

### 16 5.7.3.7 ST\_CrossBetween (Cross Between)

17 This simple type specifies the possible crossing states of an axis.

18 This simple type's contents are a restriction of the XML Schema string datatype.

19 The following are possible enumeration values for this type:

Enumeration Value	Description
between (Between)	Specifies the value axis shall cross the category axis between data markers.
midCat (Midpoint of Category)	Specifies the value axis shall cross the category axis at the midpoint of a category.

20

**Referenced By**

crossBetween@val (§5.7.2.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CrossBetween">
 <restriction base="xsd:string">
 <enumeration value="between"/>
 <enumeration value="midCat"/>
 </restriction>
</simpleType>
```

### 5.7.3.8 ST\_Crosses (Crosses)

This simple type specifies the possible crossing points for an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoZero (Axis Crosses at Zero)	The category axis crosses at the zero point of the value axis (if possible), or the minimum value (if the minimum is greater than zero) or the maximum (if the maximum is less than zero).
max (Maximum)	The axis crosses at the maximum value
min (Minimum)	Axis crosses at the minimum value of the chart.

**Referenced By**

crosses@val (§5.7.2.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Crosses">
 <restriction base="xsd:string">
 <enumeration value="autoZero"/>
 <enumeration value="max"/>
 <enumeration value="min"/>
 </restriction>
</simpleType>
```

### 5.7.3.9 ST\_DepthPercent (Depth Percent)

This simple type specifies that its contents will contain a whole number between 20 and 2000, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 20.
- This simple type has a maximum value of less than or equal to 2000.

Referenced By
depthPercent@val (§5.7.2.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DepthPercent">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="20"/>
 <maxInclusive value="2000"/>
 </restriction>
</simpleType>
```

### 5.7.3.10 ST\_DispBlanksAs (Display Blanks As)

- This simple type specifies the possible ways to display blanks.
- This simple type's contents are a restriction of the XML Schema string datatype.
- The following are possible enumeration values for this type:

Enumeration Value	Description
gap (Gap)	Specifies that blank values shall be left as a gap.
span (Span)	Specifies that blank values shall be spanned with a line.
zero (Zero)	Specifies that blank values shall be treated as zero.

Referenced By
dispBlanksAs@val (§5.7.2.42)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DispBlanksAs">
 <restriction base="xsd:string">
 <enumeration value="span"/>
 <enumeration value="gap"/>
 <enumeration value="zero"/>
 </restriction>
</simpleType>
```

### 5.7.3.11 ST\_DLblPos (Data Label Position)

- This simple type specifies the possible positions for a data label.
- This simple type's contents are a restriction of the XML Schema string datatype.
- The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that data labels shall be displayed below the data marker.
bestFit (Best Fit)	Specifies that data labels shall be displayed in the best position.
ctr (Center)	Specifies that data labels shall be displayed centered on the data marker.
inBase (Inside Base)	Specifies that data labels shall be displayed inside the base of the data marker.
inEnd (Inside End)	Specifies that data labels shall be displayed inside the end of the data marker.
l (Left)	Specifies that data labels shall be displayed to the left of the data marker.
outEnd (Outside End)	Specifies that data labels shall be displayed outside the end of the data marker.
r (Right)	Specifies that data labels shall be displayed to the right of the data marker.
t (Top)	Specifies that data labels shall be displayed above the data marker.

1

Referenced By
dLblPos@val (§5.7.2.48)

```
3 <simpleType name="ST_DLblPos">
4 <restriction base="xsd:string">
5 <enumeration value="bestFit"/>
6 <enumeration value="b"/>
7 <enumeration value="ctr"/>
8 <enumeration value="inBase"/>
9 <enumeration value="inEnd"/>
10 <enumeration value="l"/>
11 <enumeration value="outEnd"/>
12 <enumeration value="r"/>
13 <enumeration value="t"/>
14 </restriction>
15 </simpleType>
```

16 5.7.3.12 ST\_ErrBarType (Error Bar Type)

17 This simple type specifies the possible ways to draw an error bar.

18 This simple type's contents are a restriction of the XML Schema string datatype.

1 The following are possible enumeration values for this type:

Enumeration Value	Description
both (Both)	Specifies that error bars shall be shown in the positive and negative directions.
minus (Minus)	Specifies that error bars shall be shown in the negative direction only.
plus (Plus)	Specifies that error bars shall be shown in the positive direction only.

2

Referenced By
errBarType@val (§5.7.2.56)

3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_ErrBarType">
5 <restriction base="xsd:string">
6 <enumeration value="both"/>
7 <enumeration value="minus"/>
8 <enumeration value="plus"/>
9 </restriction>
10 </simpleType>

```

### 11 5.7.3.13 ST\_ErrDir (Error Bar Direction)

12 This simple type specifies the possible directions for error bars.

13 This simple type's contents are a restriction of the XML Schema string datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
x (X)	Specifies that error bars shall be shown in the x direction.
y (Y)	Specifies that error bars shall be shown in the y direction.

15

Referenced By
errDir@val (§5.7.2.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ErrDir">
 <restriction base="xsd:string">
 <enumeration value="x"/>
 <enumeration value="y"/>
 </restriction>
</simpleType>
```

#### 5.7.3.14 ST\_ErrValType (Error Value Type)

This simple type specifies the possible ways to determine the length of the error bars

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cust (Custom Error Bars)	Specifies that the length of the error bars shall be determined by the Plus and Minus elements.
fixedVal (Fixed Value)	Specifies that the length of the error bars shall be the fixed value determined by Error Bar Value.
percentage (Percentage)	Specifies that the length of the error bars shall be Error Bar Value percent of the data.
stdDev (Standard Deviation)	Specifies that the length of the error bars shall be Error Bar Value standard deviations of the data.
stdErr (Standard Error)	Specifies that the length of the error bars shall be Error Bar Value standard errors of the data.

#### Referenced By

errValType@val (§5.7.2.58)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ErrValType">
 <restriction base="xsd:string">
 <enumeration value="cust"/>
 <enumeration value="fixedVal"/>
 <enumeration value="percentage"/>
 <enumeration value="stdDev"/>
 <enumeration value="stdErr"/>
 </restriction>
</simpleType>
```

#### 5.7.3.15 ST\_FirstSliceAng (First Slice Angle)

This simple type specifies that its contents will contain an integer between 0 and 360.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 360.

Referenced By
firstSliceAng@val (§5.7.2.68)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FirstSliceAng">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="0"/>
 <maxInclusive value="360"/>
 </restriction>
</simpleType>
```

### 5.7.3.16 ST\_GapAmount (Gap Amount)

This simple type specifies that its contents will contain an integer between 0 and 500, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 500.

Referenced By
gapDepth@val (§5.7.2.74); gapWidth@val (§5.7.2.75)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_GapAmount">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="0"/>
 <maxInclusive value="500"/>
 </restriction>
</simpleType>
```

### 5.7.3.17 ST\_Grouping (Grouping)

This simple type specifies the possible groupings for a bar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
percentStacked (100% Stacked)	Specifies that the chart series are drawn next to each other along the value axis and scaled to total 100%.
stacked (Stacked)	Specifies that the chart series are drawn next to each other on the value axis.
standard (Standard)	Specifies that the chart series are drawn on the value axis.

1

Referenced By
grouping@val (§5.7.2.76)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Grouping">
4 <restriction base="xsd:string">
5 <enumeration value="percentStacked"/>
6 <enumeration value="standard"/>
7 <enumeration value="stacked"/>
8 </restriction>
9 </simpleType>
```

### 10 5.7.3.18 ST\_HoleSize (Hole Size)

11 This simple type specifies that its contents will contain an integer between 10 and 90, whose contents are a  
12 percentage.

13 This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

14 This simple type also specifies the following restrictions:

- 15 • This simple type has a minimum value of greater than or equal to 10.
- 16 • This simple type has a maximum value of less than or equal to 90.

Referenced By
holeSize@val (§5.7.2.82)

17 The following XML Schema fragment defines the contents of this simple type:

```

18 <simpleType name="ST_HoleSize">
19 <restriction base="xsd:unsignedByte">
20 <minInclusive value="10"/>
21 <maxInclusive value="90"/>
22 </restriction>
23 </simpleType>
```

### 5.7.3.19 ST\_HPercent (Height Percent)

This simple type specifies that its contents will contain an integer between 5 and 500, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 5.
- This simple type has a maximum value of less than or equal to 500.

#### Referenced By

hPercent@val (§5.7.2.83)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HPercent">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="5"/>
 <maxInclusive value="500"/>
 </restriction>
</simpleType>
```

### 5.7.3.20 ST\_LayoutMode (Layout Mode)

This simple type specifies the possible ways to store a chart element's position.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
edge (Edge)	Specifies that the Width or Height shall be interpreted as the Right or Bottom of the chart element.
factor (Factor)	Specifies that the Width or Height shall be interpreted as the Width or Height of the chart element.

#### Referenced By

hMode@val (§5.7.2.81); wMode@val (§5.7.2.232); xMode@val (§5.7.2.234); yMode@val (§5.7.2.237)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LayoutMode">
 <restriction base="xsd:string">
 <enumeration value="edge"/>
 <enumeration value="factor"/>
 </restriction>
</simpleType>
```

### 5.7.3.21 ST\_LayoutTarget (Layout Target)

This simple type specifies the possible ways to layout the plot area.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
inner (Inner)	Specifies that the plot area size shall determine the size of the plot area, not including the tick marks and axis labels.
outer (Outer)	Specifies that the plot area size shall determine the size of the plot area, the tick marks, and the axis labels.

#### Referenced By

layoutTarget@val (§5.7.2.89)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LayoutTarget">
 <restriction base="xsd:string">
 <enumeration value="inner"/>
 <enumeration value="outer"/>
 </restriction>
</simpleType>
```

### 5.7.3.22 ST\_LblAlgn (Label Alignment)

This simple type specifies the possible ways to align the tick labels.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies that the text shall be centered.
l (Left)	Specifies that the text shall be left justified.
r (Right)	Specifies that the text shall be right justified.

#### Referenced By

lblAlgn@val (§5.7.2.90)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LblAlign">
 <restriction base="xsd:string">
 <enumeration value="ctr"/>
 <enumeration value="l"/>
 <enumeration value="r"/>
 </restriction>
</simpleType>
```

### 5.7.3.23 ST\_LblOffset (Label Offset)

This simple type specifies that its contents will contain an integer between 0 and 1000, whose contents are a percentage of the default value.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 1000.

#### Referenced By

lblOffset@val (§5.7.2.91)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LblOffset">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="0"/>
 <maxInclusive value="1000"/>
 </restriction>
</simpleType>
```

### 5.7.3.24 ST\_LegendPos (Legend Position)

This simple type specifies the possible positions for a legend.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that the legend shall be drawn at the bottom of the chart.
l (Left)	Specifies that the legend shall be drawn at the left of the chart.
r (Right)	Specifies that the legend shall be drawn at the right of the chart.
t (Top)	Specifies that the legend shall be drawn at the top of

Enumeration Value	Description
	the chart.
tr (Top Right)	Specifies that the legend shall be drawn at the top right of the chart.

1

Referenced By
legendPos@val (§5.7.2.96)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_LegendPos">
4 <restriction base="xsd:string">
5 <enumeration value="b"/>
6 <enumeration value="tr"/>
7 <enumeration value="l"/>
8 <enumeration value="r"/>
9 <enumeration value="t"/>
10 </restriction>
11 </simpleType>
```

### 12 5.7.3.25 ST\_LogBase (Logarithmic Base)

13 This simple type specifies that its contents will contain an floating point number greater than or equal to two.

14 This simple type's contents are a restriction of the XML Schema double datatype.

15 This simple type also specifies the following restrictions:

- 16 • This simple type has a minimum value of greater than or equal to 2.
- 17 • This simple type has a maximum value of less than or equal to 1000.

Referenced By
logBase@val (§5.7.2.99)

18 The following XML Schema fragment defines the contents of this simple type:

```

19 <simpleType name="ST_LogBase">
20 <restriction base="xsd:double">
21 <minInclusive value="2"/>
22 <maxInclusive value="1000"/>
23 </restriction>
24 </simpleType>
```

### 25 5.7.3.26 ST\_MarkerSize (Marker Size)

26 This simple type specifies that its contents will contain an integer between 2 and 72, whose contents are a size  
27 in points.

28 This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 72.

Referenced By
size@val (§5.7.2.193)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MarkerSize">
 <restriction base="xsd:unsignedByte">
 <minInclusive value="2"/>
 <maxInclusive value="72"/>
 </restriction>
</simpleType>
```

### 5.7.3.27 ST\_MarkerStyle (Marker Style)

This picture shows each of the marker styles. Black is used as the line color, while red is used as the fill color. The height of the dash and the dot are 1/5th of the height of the marker. The width of the dot is 1/2 the width of the marker. The dash and dot have fills as well, but the markers need to be made quite large before these are visible.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
circle (Circle)	Specifies a circle shall be drawn at each data point.
dash (Dash)	Specifies a dash shall be drawn at each data point.
diamond (Diamond)	Specifies a diamond shall be drawn at each data point.
dot (Dot)	Specifies a dot shall be drawn at each data point.
none (None)	Specifies nothing shall be drawn at each data point.

Enumeration Value	Description
picture (Picture)	Specifies a picture shall be drawn at each data point.
plus (Plus)	Specifies a plus shall be drawn at each data point.
square (Square)	Specifies a square shall be drawn at each data point.
star (Star)	Specifies a star shall be drawn at each data point.
triangle (Triangle)	Specifies a triangle shall be drawn at each data point.
x (X)	Specifies an X shall be drawn at each data point.

1

Referenced By
symbol@val (§5.7.2.206)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_MarkerStyle">
4 <restriction base="xsd:string">
5 <enumeration value="circle"/>
6 <enumeration value="dash"/>
7 <enumeration value="diamond"/>
8 <enumeration value="dot"/>
9 <enumeration value="none"/>
10 <enumeration value="picture"/>
11 <enumeration value="plus"/>
12 <enumeration value="square"/>
13 <enumeration value="star"/>
14 <enumeration value="triangle"/>
15 <enumeration value="x"/>
16 </restriction>
17 </simpleType>

```

### 18 5.7.3.28 ST\_OfPieType (Pie of Pie or Bar of Pie Type)

19 This simple type specifies the possible types of Pie or Pie or Bar of Pie charts.

20 This simple type's contents are a restriction of the XML Schema string datatype.

21 The following are possible enumeration values for this type:

Enumeration Value	Description
bar (Bar)	Specifies that the chart is a bar of pie chart, not a pie of pie chart.
pie (Pie)	Specifies that the chart is pie of pie chart, not a bar of pie chart.

22

Referenced By
---------------

**Referenced By**

ofPieType@val (§5.7.2.128)

```
<simpleType name="ST_OfPieType">
 <restriction base="xsd:string">
 <enumeration value="pie"/>
 <enumeration value="bar"/>
 </restriction>
</simpleType>
```

### 5.7.3.29 ST\_Order (Order)

This simple type specifies that its contents will contain an integer between 2 and 6, whose contents are the order of the trendline polynomial.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 6.

**Referenced By**

order@val (§5.7.2.130)

```
<simpleType name="ST_Order">
 <restriction base="xsd:unsignedByte">
 <minInclusive value="2"/>
 <maxInclusive value="6"/>
 </restriction>
</simpleType>
```

### 5.7.3.30 ST\_Orientation (Orientation)

This simple type specifies the possible ways to place a picture on a data point, series, wall, or floor.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
maxMin (Maximum to Minimum)	Specifies that the values on the axis shall be reversed so they go from maximum to minimum.
minMax (Minimum to Maximum)	Specifies that the axis values shall be in the usual order, minimum to maximum.

**Referenced By**

orientation@val (§5.7.2.131)

```
<simpleType name="ST_Orientation">
 <restriction base="xsd:string">
 <enumeration value="maxMin"/>
 <enumeration value="minMax"/>
 </restriction>
</simpleType>
```

### 5.7.3.31 ST\_Overlap (Overlap)

This simple type specifies that its contents will contain an integer between -100 and 100, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema byte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -100.
- This simple type has a maximum value of less than or equal to 100.

**Referenced By**

overlap@val (§5.7.2.132)

```
<simpleType name="ST_Overlap">
 <restriction base="xsd:byte">
 <minInclusive value="-100"/>
 <maxInclusive value="100"/>
 </restriction>
</simpleType>
```

### 5.7.3.32 ST\_PageSetupOrientation (Printed Page Orientation)

This simple type specifies the page orientation of the printed page(s) on which this chart shall appear.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default Page Orientation)	Specifies that the page orientation shall be the default orientation of the system.
landscape (Landscape Page)	Specifies that the printed page shall have landscape orientation.

Enumeration Value	Description
portrait (Portrait Page)	Specifies that the printed page shall have portrait orientation.

1

Referenced By
pageSetup@orientation (§5.7.2.135)

```
3 <simpleType name="ST_PageSetupOrientation">
4 <restriction base="xsd:string">
5 <enumeration value="default"/>
6 <enumeration value="portrait"/>
7 <enumeration value="landscape"/>
8 </restriction>
9 </simpleType>
```

10 **5.7.3.33 ST\_Period (Period)**

11 This simple type specifies that its contents will contain an integer between 2 and 255.

12 This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

13 This simple type also specifies the following restrictions:

- 14 • This simple type has a minimum value of greater than or equal to 2.
- 15 • This simple type has a maximum value of less than or equal to 255.

Referenced By
period@val (§5.7.2.136)

16 The following XML Schema fragment defines the contents of this simple type:

```
17 <simpleType name="ST_Period">
18 <restriction base="xsd:unsignedByte">
19 <minInclusive value="2"/>
20 <maxInclusive value="255"/>
21 </restriction>
22 </simpleType>
```

23 **5.7.3.34 ST\_Perspective (Perspective)**

24 This simple type specifies that its contents will contain an integer between 0 and 100, whose contents are a  
25 percentage.

26 This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

27 This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 240.

Referenced By
perspective@val (§5.7.2.137)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Perspective">
 <restriction base="xsd:unsignedByte">
 <minInclusive value="0"/>
 <maxInclusive value="240"/>
 </restriction>
</simpleType>
```

### 5.7.3.35 ST\_PictureFormat (Picture Format)

This simple type specifies the possible ways to place a picture on a data point, series, wall, or floor.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
stack (Stack)	Specifies that the picture shall be stacked.
stackScale (Stack and Scale)	Specifies that the picture shall be stacked after being scaled so that it's height is one Picture Stack Unit. Does not apply to walls or floor.
stretch (Stretch)	Specifies that the picture shall be anisotropic stretched to fill the data point, series, wall or floor.

Referenced By
pictureFormat@val (§5.7.2.138)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PictureFormat">
 <restriction base="xsd:string">
 <enumeration value="stretch"/>
 <enumeration value="stack"/>
 <enumeration value="stackScale"/>
 </restriction>
</simpleType>
```

### 5.7.3.36 ST\_PictureStackUnit (Picture Stack Unit)

This simple type specifies that its contents will contain an floating point number greater than zero.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than 0.

Referenced By
pictureStackUnit@val (§5.7.2.140)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PictureStackUnit">
 <restriction base="xsd:double">
 <minExclusive value="0"/>
 </restriction>
</simpleType>
```

### 5.7.3.37 ST\_RadarStyle (Radar Style)

This simple type specifies the possible styles of radar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
filled (Filled)	Specifies that the radar chart shall be filled and have lines but no markers.
marker (Marker)	Specifies that the radar chart shall have lines and markers but no fill.
standard (Standard)	Specifies that the radar chart shall have lines but no markers and no fill.

Referenced By
radarStyle@val (§5.7.2.155)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RadarStyle">
 <restriction base="xsd:string">
 <enumeration value="standard"/>
 <enumeration value="marker"/>
 <enumeration value="filled"/>
 </restriction>
</simpleType>
```

### 5.7.3.38 ST\_RotX (X Rotation)

This simple type specifies that its contents will contain an integer between -90 and 90, whose contents are an angle in degrees.

This simple type's contents are a restriction of the XML Schema byte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -90.
- This simple type has a maximum value of less than or equal to 90.

Referenced By
rotX@val (§5.7.2.158)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RotX">
 <restriction base="xsd:byte">
 <minInclusive value="-90"/>
 <maxInclusive value="90"/>
 </restriction>
</simpleType>
```

### 5.7.3.39 ST\_RotY (Y Rotation)

This simple type specifies that its contents will contain an integer between 0 and 360, whose contents are an angle in degrees.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 360.

Referenced By
rotY@val (§5.7.2.159)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RotY">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="0"/>
 <maxInclusive value="360"/>
 </restriction>
</simpleType>
```

### 5.7.3.40 ST\_ScatterStyle (Scatter Style)

This simple type specifies the possible styles of scatter chart.

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
line (Line)	Specifies the points on the scatter chart shall be connected with straight lines but markers shall not be drawn.
lineMarker (Line with Markers)	Specifies the points on the scatter chart shall be connected with straight lines and markers shall be drawn.
marker (Marker)	Specifies the points on the scatter chart shall not be connected with lines and markers shall be drawn.
none (None)	Specifies the points on the scatter chart shall not be connected with straight lines and markers shall not be drawn.
smooth (Smooth)	Specifies the the points on the scatter chart shall be connected with smoothed lines and markers shall not be drawn.
smoothMarker (Smooth with Markers)	Specifies the the points on the scatter chart shall be connected with smoothed lines and markers shall be drawn.

3

Referenced By
scatterStyle@val (§5.7.2.163)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_ScatterStyle">
6 <restriction base="xsd:string">
7 <enumeration value="none"/>
8 <enumeration value="line"/>
9 <enumeration value="lineMarker"/>
10 <enumeration value="marker"/>
11 <enumeration value="smooth"/>
12 <enumeration value="smoothMarker"/>
13 </restriction>
14 </simpleType>
```

#### 15 5.7.3.41 ST\_SecondPieSize (Second Pie Size)

16 This simple type specifies that its contents will contain an integer between 5 and 200, whose contents consist of  
 17 a percentage.

18 This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 5.
- This simple type has a maximum value of less than or equal to 200.

Referenced By
secondPieSize@val (§5.7.2.165)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SecondPieSize">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="5"/>
 <maxInclusive value="200"/>
 </restriction>
</simpleType>
```

### 5.7.3.42 ST\_Shape (Shape)

This simple type specifies the possible shapes for a 3-D data marker.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
box (Box)	Specifies the chart shall be drawn with a box shape.
cone (Cone)	Specifies the chart shall be drawn as a cone, with the base of the cone on the floor and the point of the cone at the top of the data marker.
coneToMax (Cone to Max)	Specifies the chart shall be drawn with truncated cones such that the point of the cone would be the maximum data value.
cylinder (Cylinder)	Specifies the chart shall be drawn as a cylinder.
pyramid (Pyramid)	Specifies the chart shall be drawn as a rectangular pyramid, with the base of the pyramid on the floor and the point of the pyramid at the top of the data marker.
pyramidToMax (Pyramid to Maximum)	Specifies the chart shall be drawn with truncated cones such that the point of the cone would be the maximum data value.

Referenced By
shape@val (§5.7.2.178)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Shape">
 <restriction base="xsd:string">
 <enumeration value="cone"/>
 <enumeration value="coneToMax"/>
 <enumeration value="box"/>
 <enumeration value="cylinder"/>
 <enumeration value="pyramid"/>
 <enumeration value="pyramidToMax"/>
 </restriction>
</simpleType>
```

#### 5.7.3.43 ST\_SizeRepresents (Size Represents)

This simple type specifies the possible ways to represent data as bubble chart sizes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
area (Bubble Size Represents Area)	Specifies the area of the bubbles shall be proportional to the bubble size value.
w (Bubble Size Represents Width)	Specifies the radius of the bubbles shall be proportional to the bubble size value.

#### Referenced By

sizeRepresents@val (§5.7.2.194)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SizeRepresents">
 <restriction base="xsd:string">
 <enumeration value="area"/>
 <enumeration value="w"/>
 </restriction>
</simpleType>
```

#### 5.7.3.44 ST\_Skip (Skip)

This simple type specifies that its contents will contain an integer greater than or equal to one.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.

#### Referenced By

Referenced By
tickLblSkip@val (§5.7.2.209); tickMarkSkip@val (§5.7.2.210)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Skip">
 <restriction base="xsd:unsignedShort">
 <minInclusive value="1"/>
 </restriction>
</simpleType>
```

### 5.7.3.45 ST\_SplitType (Split Type)

This simple type specifies the possible ways to split a pie of pie or bar of pie chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Default Split)	Specifies the data points shall be split using the default mechanism for this chart type.
cust (Custom Split)	Specifies the data points shall be split between the pie and the second chart according to the Custom Split values.
percent (Split by Percentage)	Specifies the data points shall be split between the pie and the second chart by putting the points with percentage less than Split Position percent in the second chart.
pos (Split by Position)	Specifies the data points shall be split between the pie and the second chart by putting the last Split Position of the data points in the second chart
val (Split by Value)	Specifies the data points shall be split between the pie and the second chart by putting the data points with value less than Split Position in the second chart

Referenced By
splitType@val (§5.7.2.197)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SplitType">
 <restriction base="xsd:string">
 <enumeration value="auto"/>
 <enumeration value="cust"/>
 <enumeration value="percent"/>
 <enumeration value="pos"/>
 <enumeration value="val"/>
 </restriction>
</simpleType>
```

### 5.7.3.46 ST\_Style (Style)

This simple type specifies that its contents will contain an integer between 1 and 48. The value determines the default formatting for all chart elements through the tables described below.

The default font is the minor font as defined by the document's theme. The default font size for each element is the font size of the chart, except for the title which is always 120% the font size of the chart. If the chart does not have a font size set, then the default font size is 10. Axis titles and chart titles are bold by default, while all other chart elements are normal. The default font color is the same as the Axis & Major Gridlines Line Color.

The default line style, fill style, and effect style are determined by the tables below. Each of the default includes a themed line, fill, or effect (None, Subtle, Moderate, or Intense) and a color to be used when applying that line, fill, or effect. In some cases, both the themed formatting and the color vary per style, in other cases they do not. The default line width is determined by the theme, except for lines for data points it is multiplied by the line width value given in the table.

Table 1: Chart element defaults

This table lists whether the default is constant or whether it depends on the ST\_Style using one of the later tables.

	Line		Fill		Effect	
Chart Element	Themed Line	Color	Themed Fill	Color	Themed Effect	Color
Axis	Subtle	Table 2	No Fill		No Effect	
Axis Title	No Line		No Fill		No Effect	
Chart Area	Table 2		Subtle	Table 3	No Effect	
Chart Title	No Line		No Fill		No Effect	
Data Labels	No Line		No Fill		No Effect	
Data Table	Subtle	Table 2	No Fill		No Effect	
Down Bars	Table 4		Table 4		Table 4	dk1
Fills for Data Points (2-D)	Subtle	Table 5	Table 5		Table 5	dk1
Fills for Data Points (3-D)	Subtle	Table 5	Table 5		Table 5	dk1
Floor	Table 2		Table 3		No Effect	

	Line		Fill		Effect	
Legend	No Line		No Fill		No Effect	
Lines for Data Points	Subtle	Table 5	N/A		No Effect	
Major Gridlines	Subtle	Table 2	N/A		No Effect	
Markers for Data Points	Subtle	Table 5	Table 5		Table 5	dk1
Minor Gridlines	Subtle	Table 2	N/A		No Effect	
Other Lines	Subtle	Table 2	N/A		No Effect	
Plot Area (2-D charts)	No Line		Subtle	Table 3	No Effect	
Plot Area (3-D charts)	No Line		No Fill		No Effect	
Trendline Labels	No Line		No Fill		No Effect	
Up Bars	Table 4		Table 4		Table 4	dk1
Walls	No Line		Table 3		No Effect	

1 Other Lines includes Drop Lines, Error Bars, High Low Lines, Leader Lines, Series Lines, and Trendlines.

2 Fills for Data Points (2-D) includes 2-D bar, filled radar, stock, bubble, pie, doughnut and area charts.

3 Fills for Data Points (3-D) includes all 3-D charts.

4 Lines for Data Points includes lines on 2-D line, scatter, bubble, and radar charts.

5 Markers for Data Points includes markers on 2-D line, scatter, and radar charts.

6

7 Table 2: Default line formatting per chart style

8 This table lists line formatting for several chart elements by style.

Style	Axis & Major Gridlines	Minor Gridlines	Chart Area, Data Table, & Floor	Other Lines	Floor & Chart Area
	Color	Color	Color	Color	Themed Line
1-32	tx1	50% tint of tx1	75% tint of tx1	tx1	Subtle
33-34	dk1	50% tint of tx1	75% tint of dk1	dk1	Subtle
35-40	dk1	50% tint of tx1	75% tint of dk1	25% shade of dk1	Subtle
41-48	dk1	90% tint of tx1	lt1	lt1	No Line

9

10

11

12 Table 3: Default fill formatting per chart style

- 1 This table lists fill formatting for several chart elements by style.

Style	Chart Area	Floor, Walls & Plot Area (2-D)	Floor & Walls
	Color	Color	Themed Fill
1-32	bg1	bg1	No Fill
33-34	lt1	20% tint of dk1	Subtle
35-40	lt1	accent1-6	Subtle
41-48	dk1	95% tint of dk1	Subtle

2

3

- 4 Table 4: Up and down bars default formatting per chart style

- 5 This table lists line, fill, and effect formatting for up and down bars by style. The color listed as accent1-6 means  
6 that the first style uses accent1, the next uses accent2, up to the sixth uses accent6.

	Up Bars	Down Bars	Up & Down Bars			
			Themed			
Style	Fill Color	Fill Color	Fill	Effect	Line	Line Color
1	25% tint of dk1	85% tint of dk1	Subtle	None	Subtle	tx1
2	5% tint of dk1	95% tint of dk1	Subtle	None	Subtle	tx1
3-8	25% tint of accent1-6	25% shade of accent1-6	Subtle	None	Subtle	tx1
9	25% tint of dk1	85% tint of dk1	Subtle	Subtle	Subtle	tx1
10	5% tint of dk1	95% tint of dk1	Subtle	Subtle	Subtle	tx1
11-16	25% tint of accent1-6	25% shade of accent1-6	Subtle	Subtle	Subtle	tx1
17	25% tint of dk1	85% tint of dk1	Intense	Moderate	No ne	None
18	5% tint of dk1	95% tint of dk1	Intense	Moderate	None	None
19-24	25% tint of accent1-6	25% shade of accent1-6	Intense	Moderate	None	None
25	25% tint of dk1	85% tint of dk1	Intense	Intense	None	None

	Up Bars	Down Bars	Up & Down Bars			
26	5% tint of dk1	95% tint of dk1	Intense	Intense	None	None
27-32	25% tint of accent1-6	25% shade of accent1-6	Intense	Intense	None	None
33	lt1	85% tint of dk1	Subtle	None	Subtle	dk1
34	lt1	95% tint of dk1	Subtle	None	Subtle	dk1
35-40	lt1	25% shade of accent1-6	Subtle	None	Subtle	25% shade of accent1-6
41	25% tint of dk1	85% tint of dk1	Intense	Intense	None	None
42	lt1	dk1	Intense	Intense	None	None
43-48	25% tint of accent1-6	25% shade of accent1-6	Intense	Intense	None	None

1

2

3 Table 5: Default data point formatting per chart style

4 This table lists line, fill, and effect formatting for data points by style. Some of the formatting is a repeating  
5 pattern described in the next table (denoted by "Pattern"). Other use a fade pattern in which the first series is a  
6 certain% shade of the color listed and the last series is an certain% tint of the color listed. The intermediate  
7 colors are linearly interpolated by shade and tint to the listed color. The starting shade% and ending tint% are  
8 determined by the spreadsheet application, where shades are always darker than tints.

9 Note: A suggested way to implement this percentage is by using the formula: shade/tint percent =  $-70 + 140 * (\text{SeriesFormattingIndex} / (\text{HighestFormattingIndexOfAllSeriesOnAllGraphs} + 1))$ . In this case the series  
10 formatting index is the idx attribute value for the series. Negative outputs are shades, and positive outputs are  
11 tints.  
12

13 Note: The arrows across the top of the table indicate which columns apply for that row: i.e., for Fills, Lines, or  
14 Markers. So, for example, only the last two columns for Lines for Data Points apply.

Fills for Data Points (2-D)	↓	↓		↓	↓		
Fills for Data Points (3-D)		↓	↓	↓	↓		
Lines for Data Points						↓	↓
Markers for Data Points	↓	↓					↓
Effect	Fill	Fill	Fill	Line	Line	Line	Line

Style	Themed Effect	Themed Fill	Pattern	Themed Fill	Themed Line	Color or Pattern	Width	Pattern
1	No Effect	Subtle	1	Subtle	No Line		3	1
2	No Effect	Subtle	2	Subtle	No Line		3	2
3	No Effect	Subtle	accent1 fade	Subtle	No Line		3	accent1
4	No Effect	Subtle	accent2 fade	Subtle	No Line		3	accent2
5	No Effect	Subtle	accent3 fade	Subtle	No Line		3	accent3
6	No Effect	Subtle	accent4 fade	Subtle	No Line		3	accent4

48	Intense	Intense	accent6 fade	Subtle	No Line		5	acce

1

2 Table 6: Default data point formatting per data point

3 This table contains the formatting patterns used for each data point when there are is one series, or each series  
4 when there is just one series. The patterns in this table can repeat, see the pictures below the table for an  
5 illustration.

Pattern	Data Point 1	Data Point 2	Data Point 3	Data Point 4	Data Point 5	Data Point 6
1	88.5% tint of dk1	55% tint of dk1	78% tint of dk1	92.5% tint of dk1	70% tint of dk1	30% tint of dk1
2	accent1	accent2	accent3	accent4	Accent5	accent6
3	50% shade of accent1	50% shade of accent2	50% shade of accent3	50% shade of accent4	50% shade of accent5	50% shade of accent6
4	5% tint of dk1	55% tint of dk1	78% tint of dk1	15% tint of dk1	70% tint of dk1	30% tint of dk1

6

7

Above are two charts showing the same monochromatic pattern, just with a different number of series. Note that these charts just have tint and shade adjusted for each series beginning and ending at the same values.

Above is a pattern that has 6 distinct accent colors. The colors repeat every 6 data points, but the tint/shade is changed for each set.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 48.

**Referenced By**

style@val (\$5.7.2.203)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Style">
 <restriction base="xsd:unsignedByte">
 <minInclusive value="1"/>
 <maxInclusive value="48"/>
 </restriction>
</simpleType>
```

#### 5.7.3.47 ST\_TextLanguageID (Chart Language Tag)

This simple type specifies a language code value. *Language tags* are a standard mechanism defined by RFC 3066 to specify a language, and consist of a combination of:

- A two-letter ISO 639-1 language code
- A country code

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
lang@val (§5.7.2.87)

#### 5.7.3.48 ST\_TickLblPos (Tick Label Position)

This simple type specifies the possible positions for tick labels.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
high (High)	Specifies the axis labels shall be at the high end of the perpendicular axis.
low (Low)	Specifies the axis labels shall be at the low end of the perpendicular axis.
nextTo (Next To)	Specifies the axis labels shall be next to the axis.
none (None)	Specifies the axis labels are not drawn.

Referenced By
tickLblPos@val (§5.7.2.208)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TickLblPos">
 <restriction base="xsd:string">
 <enumeration value="high"/>
 <enumeration value="low"/>
 <enumeration value="nextTo"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

### 5.7.3.49 ST\_TickMark (Tick Mark)

This simple type specifies the possible positions for tick marks.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cross (Cross)	Specifies the tick marks shall cross the axis.
in (Inside)	Specifies the tick marks shall be inside the plot area.
none (None)	Specifies there shall be no tick marks.
out (Outside)	Specifies the tick marks shall be outside the plot area.

#### Referenced By

majorTickMark@val (§5.7.2.102); minorTickMark@val (§5.7.2.111)

 <restriction base="xsd:string">
 <enumeration value="cross"/>
 <enumeration value="in"/>
 <enumeration value="none"/>
 <enumeration value="out"/>
 </restriction>
</simpleType>
```

### 5.7.3.50 ST\_TimeUnit (Time Unit)

This simple type specifies a unit of time.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
days (Days)	Specifies the chart data shall be shown in days.

Enumeration Value	Description
months (Months)	Specifies the chart data shall be shown in months.
years (Years)	Specifies the chart data shall be shown in years.

```

### 10 5.7.3.51 ST\_TrendlineType (Trendline Type)

11 This simple type specifies all types of trendline which are available for series in a chart.

12 This simple type's contents are a restriction of the XML Schema string datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
exp (Exponential)	Specifies the trendline shall be an exponential curve in the form $y = ab^x$ .
linear (Linear)	Specifies the trendline shall be a line in the form $y = mx + b$ .
log (Logarithmic)	Specifies the trendline shall be a logarithmic curve in the form $y = a \log x + b$ , where log is the natural logarithm.
movingAvg (Moving Average)	Specifies the trendline shall be a moving average of period Period.
poly (Polynomial)	Specifies the trendline shall be a polynomial curve of order Order in the form $y = ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g$ .
power (Power)	Specifies the trendline shall be a power curve in the form $y = ax^b$ .

14

Referenced By
trendlineType@val (§5.7.2.214)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TrendlineType">
 <restriction base="xsd:string">
 <enumeration value="exp"/>
 <enumeration value="linear"/>
 <enumeration value="log"/>
 <enumeration value="movingAvg"/>
 <enumeration value="poly"/>
 <enumeration value="power"/>
 </restriction>
</simpleType>
```

### 5.7.3.52 ST\_Xstring (String With Encoded Characters)

This simple type specifies that its contents will contain a string. Any character in the string may be encoded by use of a \ followed by the hexadecimal representation of the Unicode code points.

This simple type's contents are a restriction of the XML Schema string datatype.

## 5.8 DrawingML - Chart Drawings

Within a chart, it is sometimes necessary to include DrawingML elements (shapes or pictures) which should be a child object within the parent chart. This relationship allows those elements to optionally be resized with the chart, automatically moved with the chart, etc.

The Chart Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a chart.

### 5.8.1 Table of Contents

## 23 **5.8.2 Elements**

24 The following element define the contents of the ChartDrawing namespace:

### 25 **5.8.2.1 absSizeAnchor (Absolute Anchor Shape Size)**

26 This element specifies that the shape described here to reside within a chart should be sized based on relative  
 27 anchor points. This is achieved via two elements. The from element specifies the top left corner of the shape  
 28 bounding box in a RTL(right-to-left) implementation. The ext element then specifies the bottom right corner of  
 29 the shape bounding box in a RTL(right-to-left) implementation and thus the size of the shape.

30

Parent Elements
userShapes (§5.7.2.221)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.8.2.9
ext (Shape Extent)	§5.8.2.10
from (Starting Anchor Point)	§5.8.2.11
graphicFrame (Graphic Frame)	§5.8.2.12
grpSp (Group Shape)	§5.8.2.13

Child Elements	Subclause
pic (Picture)	§5.8.2.20
sp (Shape)	§5.8.2.22

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_AbsSizeAnchor">
 <sequence>
 <element name="from" type="CT_Marker"/>
 <element name="ext" type="a:CT_PositiveSize2D"/>
 <group ref="EG_ObjectChoices"/>
 </sequence>
</complexType>

```

### 5.8.2.2 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example:* Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```

<p:pic>
 ..
 <p:blipFill>
 <a:blip r:embed="rId2"/>
 <a:stretch>
 <a:fillRect/>
 </a:stretch>
 </p:blipFill>
 ..
</p:pic>

```

- 1 The above picture object is shown as an example of this fill type. End example]
- 2 [Example: Consider now the same picture object but with an additional gradient fill applied within the shape
- 3 properties portion of the picture.

```

4 <p:pic>
5 ..
6 <p:blipFill>
7 <a:blip r:embed="rId2"/>
8 <a:stretch>
9 <a:fillRect/>
10 </a:stretch>
11 </p:blipFill>
12 <p:spPr>
13 <a:gradFill>
14 <a:gsLst>
15 <a:gs pos="0">
16 <a:schemeClr val="tx2">
17 <a:shade val="50000"/>
18 </a:schemeClr>
19 </a:gs>
20 <a:gs pos="39999">
21 <a:schemeClr val="tx2">
22 <a:tint val="20000"/>
23 </a:schemeClr>
24 </a:gs>
25 <a:gs pos="70000">
26 <a:srgbClr val="C4D6EB"/>
27 </a:gs>
28 <a:gs pos="100000">
29 <a:schemeClr val="bg1"/>
30 </a:gs>
31 </a:gsLst>
32 </a:gradFill>
33 </p:spPr>
34 ..
35 </p:pic>

```

1

2 The above picture object is shown as an example of this double fill type. *End example*]

3

Parent Elements
pic (§5.8.2.20)

4

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting)  Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.  [Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i> ]  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape)  Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
 <sequence>
 <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
 <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
 <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

### 5.8.2.3 cNvCxnSpPr (Non-Visual Connection Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the parent chart.

Parent Elements
nvCxnSpPr (§5.8.2.15)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualConnectorProperties">
 <sequence>
 <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
 <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.4 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the chart.

Parent Elements
nvGraphicFramePr (§5.8.2.16)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
 <sequence>
 <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
 maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.5 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the chart.

Parent Elements
nvGrpSpPr (§5.8.2.17)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
 <sequence>
 <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.6 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[Example: Consider the following DrawingML.

```
<p:pic>
 ..
 <p:nvPicPr>
 <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
 <p:cNvPicPr>
 <a:picLocks noChangeAspect="1"/>
```

```

1 </p:cNvPicPr>
2 <p:nvPr/>
3 </p:nvPicPr>
4 ..
5 </p:pic>

```

End example]

Parent Elements
nvPicPr (§5.8.2.18)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResi ze (Relative Resize Preferred)	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size.
Namespace: .../drawingml/200 6/main	<p>[Example: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

10 <complexType name="CT_NonVisualPictureProperties">
11 <sequence>
12 <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
13 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
14 </sequence>
15 <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
16 </complexType>

```

### 5.8.2.7 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following ChartDrawingML.

```
<cdr:pic>
 ..
 <cdr:nvPicPr>
 <cdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
 </cdr:nvPicPr>
 ..
</cdr:pic>
```

End example]

Parent Elements
nvCxnSpPr (§5.8.2.15); nvGraphicFramePr (§5.8.2.16); nvGrpSpPr (§5.8.2.17); nvPicPr (§5.8.2.18); nvSpPr (§5.8.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text which may be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [Note: An application may have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p>

Attributes	Description
	<p>[<i>Example</i>: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</p> <pre data-bbox="451 394 760 426">&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 940 678 972">&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).</p>
<p>name (Name)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies the name of the object. [<i>Note</i>: Typically, this will be used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 1381 776 1413">&lt; ... name="foo.jpg" &gt;</pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
 <sequence>
 <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
 <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="ST_DrawingElementId" use="required"/>
 <attribute name="name" type="xsd:string" use="required"/>
 <attribute name="descr" type="xsd:string" use="optional" default=""/>
 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.8.2.8 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with.

[Example: Consider the shape that has a shape lock applied to it.

```
<cdr:sp>
 <cdr:nvSpPr>
 <cdr:cNvPr id="2" name="Rectangle 1"/>
 <cdr:cNvSpPr>
 <a:spLocks noGrp="1"/>
 </cdr:cNvSpPr>
 </cdr:nvSpPr>
 ..
</cdr:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. End example]

#### Parent Elements

nvSpPr (§5.8.2.19)

#### Child Elements

extLst (Extension List)

spLocks (Shape Locks)

#### Subclause

§5.1.2.1.15

§5.1.2.1.34

#### Attributes

txBox (Text Box)

Namespace:  
.../drawingml/200

#### Description

Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.

Attributes	Description
6/main	<p>[Note: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
 <sequence>
 <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="textBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 5.8.2.9 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector will take. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[Example: Consider the following connector shape that connects two regular shapes.

```
<cp:grpSp>
 ..
 <cp:sp>
 <cp:nvSpPr>
 <cp:cNvPr id="1" name="Rectangle 1"/>
 <cp:cNvSpPr/>
 <cp:nvPr/>
 </cp:nvSpPr>
 ..
 </cp:sp>
 <cp:sp>
 <cp:nvSpPr>
 <cp:cNvPr id="2" name="Rectangle 2"/>
 <cp:cNvSpPr/>
 <cp:nvPr/>
 </cp:nvSpPr>
```

```

1 ..
2 </cp:sp>
3 <cp:cxnSp>
4 <cp:nvCxnSpPr>
5 <cp:cNvPr id="3" name="Elbow Connector 3"/>
6 <cp:cNvCxnSpPr>
7 <a:stCxn id="1" idx="3"/>
8 <a:endCxn id="2" idx="1"/>
9 </cp:cNvCxnSpPr>
10 <cp:nvPr/>
11 </cp:nvCxnSpPr>
12 ...
13 </cp:cxnSp>
14 </cp:grpSp>

```

End example]

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
nvCxnSpPr (Connector Non Visual Properties)	§5.8.2.15
spPr (Shape Properties)	§5.8.2.23
style (Shape Style)	§5.8.2.24

Attributes	Description
fPublished (Publish to Server)	<p>Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.</p> <p>[<i>Example:</i> Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server.</p> <pre> &lt;cdr:relSizeAnchor&gt;   ..   &lt;cdr:sp fPublished="0"&gt;     ..     &lt;/cdr:sp&gt;     ..   &lt;/cdr:relSizeAnchor&gt; end example] </pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
macro (Reference	This element specifies the custom function associated with the chart. [ <i>Example:</i> A macro

Attributes	Description
to Custom Function)	<p>script, add-in function, and so on. <i>end example</i>]</p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p>[Example:</p> <pre>&lt;cdr:... macro="DoWork()" &gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Connector">
3 <sequence>
4 <element name="nvCxnSpPr" type="CT_ConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
5 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
6 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="macro" type="xsd:string" use="optional"/>
9 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
10 </complexType>
```

#### 11 5.8.2.10 ext (Shape Extent)

12 This element describes the length and width properties for how far a drawing element should extend for.

Parent Elements
absSizeAnchor (§5.8.2.1)

13

Attributes	Description
<p>cx (Extent Length)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>&lt;... cx="1828800" cy="200000"/&gt;</pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size

Attributes	Description
Namespace: .../drawingml/2006/main	<p>of the object as displayed (the result of any scaling to the original object).</p> <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
 <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
 <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

#### 5.8.2.11 from (Starting Anchor Point)

This element specifies the first anchor point for the drawing element. This will be used to anchor the top and left sides of the shape within the chart. That is when the corresponding chart is adjusted, the shape will also be adjusted.

[Example: Consider the following Chart Drawing content:

```
<cdr:relSizeAnchor>
 <cdr:from>
 <cdr:x>0.04583</cdr:x>
 <cdr:y>0.53125</cdr:y>
 </cdr:from>
 <cdr:to>
 <cdr:x>0.24583</cdr:x>
 <cdr:y>0.86458</cdr:y>
 </cdr:to>
 <cdr:sp macro="" textlink="">
 ...
 </cdr:sp>
</cdr:relSizeAnchor>
```

The above example shows the first anchor point being specified via the from element. End example]

Parent Elements
absSizeAnchor (§5.8.2.1); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
x (Relative X Coordinate)	§5.8.2.27
y (Relative Y Coordinate)	§5.8.2.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
 <sequence>
 <element name="x" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
 <element name="y" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.12 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Graphic Frame Properties)	§5.8.2.16
xfrm (Graphic Frame Transform)	§5.8.2.28

Attributes	Description
fPublished (Publish To Server)	<p>Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.</p> <p>[<i>Example:</i> Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server.</p> <pre>&lt;cdr:relSizeAnchor&gt;   ..   &lt;cdr:sp fPublished="0"&gt;     ..   &lt;/cdr:sp&gt;   .. &lt;/cdr:relSizeAnchor&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the chart. [<i>Example:</i> A macro script, add-in function, and so on. <i>end example</i>]</p>

Attributes	Description
	<p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p>[Example:</p> <p style="padding-left: 40px;"><code>&lt;cdr:... macro="DoWork()" &gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GraphicFrame">
 <sequence>
 <element name="nvGraphicFramePr" type="CT_GraphicFrameNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="xfrm" type="a:CT_Transform2D" minOccurs="1" maxOccurs="1"/>
 <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional"/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 5.8.2.13 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```

<cdr:grpSp>
 <cdr:nvGrpSpPr>
 <cdr:cNvPr id="10" name="Group 9"/>
 <cdr:cNvGrpSpPr/>
 <cdr:nvPr/>
 </cdr:nvGrpSpPr>
 <cdr:grpSpPr>
 <a:xfrm>
 <a:off x="838200" y="990600"/>
 <a:ext cx="2426208" cy="978408"/>
 <a:chOff x="838200" y="990600"/>
 <a:chExt cx="2426208" cy="978408"/>
 </a:xfrm>

```

```

1 </cdr:grpSpPr>
2 <cdr:sp>
3 ..
4 </cdr:sp>
5 <cdr:sp>
6 ..
7 </cdr:sp>
8 <cdr:sp>
9 ..
10 </cdr:sp>
11 </cdr:grpSp>

```

12 In the above example we see three shapes specified within a single group. These three shapes have their  
13 position and sizes specified just as they normally would within the shape tree. The generating application should  
14 apply the transformation after the bounding box for the group shape has been calculated. end example]

15

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.8.2.9
graphicFrame (Graphic Frame)	§5.8.2.12
grpSp (Group Shape)	§5.8.2.13
grpSpPr (Group Shape Properties)	§5.8.2.14
nvGrpSpPr (Non-Visual Group Shape Properties)	§5.8.2.17
pic (Picture)	§5.8.2.20
sp (Shape)	§5.8.2.22

16 The following XML Schema fragment defines the contents of this element:

```

17 <complexType name="CT_GroupShape">
18 <sequence>
19 <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
20 <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
21 <choice minOccurs="0" maxOccurs="unbounded">
22 <element name="sp" type="CT_Shape"/>
23 <element name="grpSp" type="CT_GroupShape"/>
24 <element name="graphicFrame" type="CT_GraphicFrame"/>
25 <element name="cxnSp" type="CT_Connector"/>
26 <element name="pic" type="CT_Picture"/>
27 </choice>
28 </sequence>
29 </complexType>

```

#### 5.8.2.14 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§5.8.2.13)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
xfrm (2D Transform for Grouped Objects)	§5.1.9.5

Attributes	Description
bwMode (Black and White Mode)  Namespace: .../drawingml/2006/main	<p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes will use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeProperties">
 <sequence>
 <element name="xfrm" type="CT_GroupTransform2D" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

### 5.8.2.15 nvCxnSpPr (Connector Non Visual Properties)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§5.8.2.9)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connection Shape Drawing Properties)	§5.8.2.3
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvCxnSpPr" type="a:CT_NonVisualConnectorProperties" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.16 nvGraphicFramePr (Non-Visual Graphic Frame Properties)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§5.8.2.12)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§5.8.2.4
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicFrameNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.17 nvGrpSpPr (Non-Visual Group Shape Properties)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§5.8.2.13)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§5.8.2.5
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGrpSpPr" type="a:CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.18 nvPicPr (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following DrawingML.

```
<p:pic>
 ..
<p:nvPicPr>
```

```

1 ..
2 </p:nvPicPr>
3 ..
4 </p:pic>

```

5 *End example]*

Parent Elements
pic (§5.8.2.20)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.8.2.6
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

7 The following XML Schema fragment defines the contents of this element:

```

8 <complexType name="CT_PictureNonVisual">
9 <sequence>
10 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
11 <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
12 </sequence>
13 </complexType>

```

#### 14 5.8.2.19 nvSpPr (Non-Visual Shape Properties)

15 This element specifies all non-visual properties for a shape. This element is a container for the non-visual  
 16 identification properties, shape properties and application properties that are to be associated with a shape.  
 17 This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements
sp (§5.8.2.22)

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7
cNvSpPr (Non-Visual Shape Drawing Properties)	§5.8.2.8

19 The following XML Schema fragment defines the contents of this element:

```

20 <complexType name="CT_ShapeNonVisual">
21 <sequence>
22 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
23 <element name="cNvSpPr" type="a:CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
24 </sequence>
25 </complexType>

```

### 5.8.2.20 `pic` (Picture)

This element specifies the existence of a picture object within the document.

[Example: Consider the following ChartDrawingML that specifies the existence of a picture within a document.

This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<cdr:pic>
 <cdr:nvPicPr>
 <cdr:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
 <cdr:cNvPicPr>
 <a:picLocks noChangeAspect="1"/>
 </cdr:cNvPicPr>
 </cdr:nvPicPr>
 <cdr:nvPr/>
</cdr:nvPicPr>
<cdr:blipFill>
 ...
</cdr:blipFill>
<cdr:spPr>
 ...
</cdr:spPr>
</cdr:pic>
```

End example]

#### Parent Elements

#### Child Elements

#### Subclause

blipFill (Picture Fill)

§5.8.2.2

nvPicPr (Non-Visual Picture Properties)

§5.8.2.18

spPr (Shape Properties)

§5.8.2.23

style (Shape Style)

§5.8.2.24

#### Attributes

#### Description

fPublished (Publish to Server)

Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.

[Example: Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server.

```
<cdr:relSizeAnchor>
```

```
..
```

Attributes	Description
	<pre> &lt;cdr:sp fPublished="0"&gt; .. &lt;/cdr:sp&gt; .. &lt;/cdr:relSizeAnchor&gt; end example] </pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the chart. <i>[Example: A macro script, add-in function, and so on. end example]</i></p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p><i>[Example:</i></p> <pre> &lt;cdr:... macro="DoWork()" &gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Picture">
 <sequence>
 <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional" default=""/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 5.8.2.21 relSizeAnchor (Relative Anchor Shape Size)

This element specifies that the shape described here to reside within a chart should be sized based on relative anchor points. This is achieved via two elements. The from element specifies the top left corner of the shape bounding box in a RTL(right-to-left) implementation. The to element then specifies the bottom right corner of the shape bounding box in a RTL(right-to-left) implementation and thus the size of the shape.

Parent Elements
userShapes (§5.7.2.221)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
cxnSp (Connection Shape)	§5.8.2.9
from (Starting Anchor Point)	§5.8.2.11
graphicFrame (Graphic Frame)	§5.8.2.12
grpSp (Group Shape)	§5.8.2.13
pic (Picture)	§5.8.2.20
sp (Shape)	§5.8.2.22
to (Ending Anchor Point)	§5.8.2.25

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelSizeAnchor">
 <sequence>
 <element name="from" type="CT_Marker"/>
 <element name="to" type="CT_Marker"/>
 <group ref="EG_ObjectChoices"/>
 </sequence>
</complexType>
```

### 5.8.2.22 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to geometry, each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
nvSpPr (Non-Visual Shape Properties)	§5.8.2.19
spPr (Shape Properties)	§5.8.2.23
style (Shape Style)	§5.8.2.24
txBody (Shape Text Body)	§5.8.2.26

Attributes	Description
fLocksText (Lock Text)	Specifies whether to allow for the editing of text within this shape when the worksheet on which the shape resides has been protected as defined by SpreadsheetML. This allows for the specifying of locked or "protected" text on a per-shape basis within a spreadsheet document. If this attribute is not specified then a value of 0, or false will be assumed.  <i>[Example: Consider the following shape that does not have locked text on.]</i>

Attributes	Description
	<pre> &lt;cdr:relSizeAnchor&gt;   ..   &lt;cdr:sp fLocksText="0"&gt;     ..   &lt;/cdr:sp&gt;   .. &lt;/cdr:relSizeAnchor&gt; end example] </pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fPublished (Publish to Server)	<p>Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.</p> <p>[Example: Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server.</p> <pre> &lt;cdr:relSizeAnchor&gt;   ..   &lt;cdr:sp fPublished="0"&gt;     ..   &lt;/cdr:sp&gt;   .. &lt;/cdr:relSizeAnchor&gt; end example] </pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
macro (Reference to Custom Function)	<p>This element specifies the custom function associated with the chart. [Example: A macro script, add-in function, and so on. <i>end example</i>]</p> <p>The format of this string shall be application-defined, and should be ignored if not understood.</p> <p>[Example:</p> <pre> &lt;cdr:... macro="DoWork()" &gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
textlink (Text Link)	<p>Specifies whether the text contained within this shape is linked to a cell within the spreadsheet. That is the text within the shape will have the value defined in the referenced spreadsheet cell.</p> <p>[Example: Consider the following shape with text linked to cell A1.</p> <pre> &lt;cdr:relSizeAnchor&gt;   ..   &lt;cdr:sp macro="" textlink="A1"&gt; </pre>

Attributes	Description
	<pre> .. &lt;/cdr:sp&gt; .. &lt;/cdr:relSizeAnchor&gt; end example] </pre> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Shape">
 <sequence>
 <element name="nvSpPr" type="CT_ShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="txBody" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="macro" type="xsd:string" use="optional"/>
 <attribute name="textlink" type="xsd:string" use="optional"/>
 <attribute name="fLocksText" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 5.8.2.23 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a special shape such as a connector shape or picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe additional object-specific properties within a document. This allows for these shapes to have both the properties of a shape as well as specific properties that are unique to only them.

Parent Elements
cxnSp (§5.8.2.9); pic (§5.8.2.20); sp (§5.8.2.22)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44

Child Elements	Subclause
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

1

Attributes	Description
<b>bwMode (Black and White Mode)</b>  Namespace: .../drawingml/2006/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ShapeProperties">
4 <sequence>
5 <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
6 <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
8 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
9 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
10 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
11 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
12 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
13 </sequence>
14 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
15 </complexType>

```

#### 16 5.8.2.24 style (Shape Style)

17 The element specifies the style that will be applied to a shape and the corresponding references for each of the  
 18 style components such as lines and fills.

Parent Elements
cxnSp (§5.8.2.9); pic (§5.8.2.20); sp (§5.8.2.22)

19

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ShapeStyle">
 <sequence>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.8.2.25 to (Ending Anchor Point)

This element specifies the second anchor point for the drawing element. This will be used to anchor the bottom and right sides of the shape within the spreadsheet. That is when the corresponding chart is adjusted, the shape will also be adjusted.

[Example: Consider the following ChartDrawingML

```

<cdr:relSizeAnchor>
 <cdr:from>
 <cdr:x>0.04583</cdr:x>
 <cdr:y>0.53125</cdr:y>
 </cdr:from>
 <cdr:to>
 <cdr:x>0.24583</cdr:x>
 <cdr:y>0.86458</cdr:y>
 </cdr:to>
 <cdr:sp macro="" textlink="">
 ...
 </cdr:sp>
</cdr:relSizeAnchor>

```

The above example shows the second anchor point being specified via the to element. End example]

Parent Elements
relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
x (Relative X Coordinate)	§5.8.2.27
y (Relative Y Coordinate)	§5.8.2.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
 <sequence>
 <element name="x" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
 <element name="y" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.8.2.26 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
sp (§5.8.2.22)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
 <sequence>
 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.8.2.27 x (Relative X Coordinate)

This element specifies the relative x coordinate that is used to define the percentage-based horizontal position for a shape within a chart drawing object. The coordinate boundaries are specified within the corresponding simple type listed below.

The possible values for this element are defined by the ST\_MarkerCoordinate simple type (§5.8.3.1).

Parent Elements
from (§5.8.2.11); to (§5.8.2.25)

### 5.8.2.28 xfrm (Graphic Frame Transform)

This element specifies a 2-D transform to be applied to a Graphic Frame.

Parent Elements
graphicFrame (§5.8.2.12)

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description
<b>flipH (Horizontal Flip)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>flipV (Vertical Flip)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>rot (Rotation)</b>  Namespace: .../drawingml/2006/main	<p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Transform2D">
 <sequence>
 <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
 <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
 <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.8.2.29 y (Relative Y Coordinate)

This element specifies the relative y coordinate that is used to define the percentage-based vertical position for a shape within a chart drawing object. The coordinate boundaries are specified within the corresponding simple type listed below.

The possible values for this element are defined by the ST\_MarkerCoordinate simple type (§5.8.3.1).

Parent Elements
from (§5.8.2.11); to (§5.8.2.25)

## 5.8.3 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/drawingml/2006/chartDrawing> namespace.

### 5.8.3.1 ST\_MarkerCoordinate (Chart Marker Coordinate Value)

This simple type specifies the chart marker coordinate value. It is to be represented as a fractional position between 0.0 and 1.0 of the chart width or height with 0.0 being the left or top edge.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.0.
- This simple type has a maximum value of less than or equal to 1.0.

Referenced By
x (§5.8.2.27); y (§5.8.2.29)

## 5.9 DrawingML - Diagrams

A DrawingML diagram allows the definition of diagrams using DrawingML objects and constructs. This namespace defines the contents of a DrawingML diagram.

### 5.9.1 Table of Contents

**This subclause is informative.**

1	<b>5.9.2 Diagram Definition .....</b>	<b>4197</b>

7 **End of informative text.**

## 8 **5.9.2 Diagram Definition**

9 This section specifies the elements which define the layout and hierarchy of a diagram based on its constituent  
10 nodes and connections.

### 11 **5.9.2.1 adj (Shape Adjust)**

12 Shape adjust value. These can be used to modify the adjust handles supported on various auto shapes. It is only  
13 possible to set the initial value, not to modify it using constraints and rules.

14 *[Example: Consider the following example of the adj element in a DrawingML diagram:*

```
15 <adjLst>
16 <adj idx="2" val=".35" />
17 </adjLst>
```

18 In this example we have a single adjust handle being modified by setting its value to 0.35. *end example]*

Parent Elements
adjLst (§5.9.2.2)

Attributes	Description
idx (Adjust Handle Index)	Adjust value index. Different shapes support different adjust handles.  The possible values for this attribute are defined by the ST_Index1 simple type (§5.9.7.38).
val (Value)	An absolute value.  The possible values for this attribute are defined by the XML Schema double datatype.

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_Adj">
22 <attribute name="idx" type="ST_Index1" use="required"/>
23 <attribute name="val" type="xsd:double" use="required"/>
24 </complexType>
```

### 5.9.2.2 adjLst (Shape Adjust List)

This element is simply a list of shape adjusts.

[Example: Consider the following example of the adjLst element in a DrawingML diagram:

```
<adjLst>
 <adj idx="1" val="1.35" />
 <adj idx="2" val=".35" />
</adjLst>
```

In this example we have a two adjust handle being modified for the containing shape. *end example]*

Parent Elements
shape (§5.9.2.27)

Child Elements	Subclause
adj (Shape Adjust)	§5.9.2.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdjLst">
 <sequence>
 <element name="adj" type="CT_Adj" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.2.3 alg (Algorithm)

The algorithm used by the containing layout node. The algorithm defines the behavior of the layout node along with the behavior and layout of the nested layout nodes.

[Example: Consider the following example of alg being used in a DrawingML diagram:

```
<layoutNode name="arrow">
 <varLst/>
 <alg type="tx" />
 <shape type="upArrow">
 <adjLst>
 <adj idx="2" val=".35" />
 </adjLst>
 </shape>
 <presOf axis="desOrSelf" ptType="node" />
 <ruleLst/>
</layoutNode>
```

In this example, the tx algorithm is being used to layout text within the containing layout node. *end example]*

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13
param (Parameter)	§5.9.2.20

Attributes	Description
rev (Revision Number)	The revision number of an algorithm.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Algorithm Type)	Specifies the algorithm type.  The possible values for this attribute are defined by the ST_AlgorithmType simple type (§5.9.7.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Algorithm">
 <sequence>
 <element name="param" type="CT_Parameter" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="type" type="ST_AlgorithmType" use="required"/>
 <attribute name="rev" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

#### 5.9.2.4 cat (Category)

This element specifies a category in the user interface where this layout definition will display to the user.

[*Example:* Consider the following example of a cat in a DrawingML diagram:

```
<catLst>
 <cat type="relationship" pri="19000" />
</catLst>
```

In this example we define a single category called relationship which has a priority of 19000. *end example*]

Parent Elements
catLst (§5.9.2.5)

Attributes	Description
pri (Priority)	The priority within the category for this diagram determines the order in which it will display in the user interface. Lower numbers are displayed at the beginning of the list.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Category Type)	Specifies the category type associated with the element.  The possible values for this attribute are defined by the XML Schema anyURI datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Category">
3 <attribute name="type" type="xsd:anyURI" use="required"/>
4 <attribute name="pri" type="xsd:unsignedInt" use="required"/>
5 </complexType>
```

### 6 5.9.2.5 catLst (Category List)

7 This element is simply a list of cat elements.

8 *[Example: Consider the following example of a catLst element in a DrawingML diagram:*

```
9 <catLst>
10 <cat type="list" pri="18000" />
11 <cat type="relationship" pri="19000" />
12 </catLst>
```

13 In this example we define two different categories which are to be displayed in the user interface. *end example]*

Parent Elements
layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17)

14

Child Elements	Subclause
cat (Category)	§5.9.2.4

15 The following XML Schema fragment defines the contents of this element:

```
16 <complexType name="CT_Categories">
17 <sequence>
18 <element name="cat" type="CT_Category" minOccurs="0" maxOccurs="unbounded"/>
19 </sequence>
20 </complexType>
```

### 21 5.9.2.6 choose (Choose Element)

22 The choose element wraps if/else blocks into a choose block.

[Example: Consider the following example of a choose element in a DrawingML diagram:

```
<choose name="Name1">
 <if name="Name2" func="var" arg="dir" op="equ" val="norm">
 <alg type="snake">
 <param type="grDir" val="tL"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
 </alg>
 </if>
 <else name="Name3">
 <alg type="snake">
 <param type="grDir" val="tR"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
 </alg>
 </else>
</choose>
```

In this example, a choose element is used to define two different sets of parameters associated with a snake algorithm depending upon the direction in which the user wants the algorithm to flow (RTL or LTR). *end example]*

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
else (Else)	§5.9.2.12
if (If)	§5.9.2.15

Attributes	Description
name (Name)	A unique name associated with the choose statement.  [Example: Consider the following example of a choose element in a DrawingML diagram:  <choose name="Name1">  ...  </choose>

Attributes	Description
	<p>&lt;/choose&gt;</p> <p>In this example, the choose element is named Name1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Choose">
 <sequence>
 <element name="if" type="CT_When" maxOccurs="unbounded"/>
 <element name="else" type="CT_Otherwise" minOccurs="0"/>
 </sequence>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>

```

### 5.9.2.7 clrData (Color Transform Sample Data)

This element defines the sample data that is to be used in the user interface controls regarding displaying color transforms for a given diagram. This sample data predefines a data model to be combined with a layout definition in order to create a diagram which a color transform can be applied and displayed to the user as an example of the color transform.

[Example: Consider the following example of a clrData element in a DrawingML diagram:

```

<clrData>
 <dataModel>
 <ptLst>
 <pt modelId="0" type="doc"/>
 <pt modelId="1"/>
 <pt modelId="2"/>
 <pt modelId="3"/>
 <pt modelId="4"/>
 <pt modelId="5"/>
 <pt modelId="6"/>
 </ptLst>
 <cxnLst>
 <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
 <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
 <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
 <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
 <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
 <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
 </cxnLst>
 </dataModel>
</clrData>

```

```

1 <whole/>
2 </dataModel>
3 </clrData>
4

```

In this example we define 6 points which all connect back to a seventh document type point. *end example*]

Parent Elements
layoutDef (§5.9.2.16)

Child Elements	Subclause
dataModel (Data Model)	§5.9.2.10

Attributes	Description
useDef (Use Default)	<p>If the value of this attribute is <code>true</code>, the data model defined in the <code>clrData</code> element is ignored and a default data model is used instead.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

9 <complexType name="CT_SampleData">
10 <sequence>
11 <element name="dataModel" type="CT_DataModel" minOccurs="0"/>
12 </sequence>
13 <attribute name="useDef" type="xsd:boolean" use="optional" default="false"/>
14 </complexType>

```

### 5.9.2.8 constr (Constraint)

This element is used to specify size, position of nodes, text values, and layout dependencies between nodes in a layout definition.

[*Example:* Consider the following example of a constraint list which contains some example constraints being defined and applied to layout nodes in the layout definition:

```

20 <constrLst>
21 <constr type="w" for="ch" forName="node1" refType="w" refForName=""/>
22 <constr type="h" for="ch" forName="node1" refType="w" refFor="ch"
23 refForName="node1" op="equ" fact="0.6"/>
24 <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch"
25 refForName="node1" op="equ" fact="0.1"/>
26 <constr type="primFontSz" for="ch" forName="node1" refForName="" op="equ"
27 val="100"/>
28 </constrLst>

```

- 1 In this example we can see constraints being defined for the width and height along with the primary font size  
 2 for a layout node referenced by node1. The width for a transition is also specified. *end example*]

3

Parent Elements
constrLst (§5.9.2.9)

4

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
fact (Factor)	<p>Factor used in a reference constraint or a rule in order to modify a referenced value by the factor defined.</p> <p>[<i>Example:</i> Consider the following example of fact in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w"   refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, the width for transition1 is being defined as one-tenth the width of node1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
for (For)	<p>Specifies the axis of layout nodes to apply a constraint or rule to.</p> <p>[<i>Example:</i> Consider the following example of for in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w"   refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, the for attribute is specifying that node1 is a child node to the current layout node. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§5.9.7.20).</p>
forName (For Name)	<p>Specifies the name of the layout node to apply a constraint or rule to.</p> <p>[<i>Example:</i> Consider the following example of forName in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w"   refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, forName is specifying the layout node named transition1 for its reference. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
op (Operator)	<p>The operator constraint used to evaluate the condition.</p> <p>[<i>Example:</i> Consider the following example of op in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, op is specifying an equality defined between the two referencing values. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_BoolOperator simple type (§5.9.7.10).</p>
ptType (Data Point Type)	<p>Specifies the type of data point to select.</p> <p>The possible values for this attribute are defined by the ST_ElementType simple type (§5.9.7.25).</p>
refFor (Reference For)	<p>The for value of the referenced constraint.</p> <p>[<i>Example:</i> Consider the following example of refFor in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, refFor is specifying the reference constraint is a child of the current layout node. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§5.9.7.20).</p>
refForName (Reference For Name)	<p>The name of the layout node referenced by a reference constraint.</p> <p>[<i>Example:</i> Consider the following example of refForName in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, refForName is specifying the layout node named node1 for its reference. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
refPtType (Reference Point Type)	The point type used in the referenced constraint.

Attributes	Description
	The possible values for this attribute are defined by the ST_ElementType simple type (§5.9.7.25).
refType (Reference Type)	<p>Specifies the type of a reference constraint.</p> <p>[<i>Example:</i> Consider the following example of refType in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, refType is specifying referencing the width attribute of node1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ConstraintType simple type (§5.9.7.21).</p>
type (Constraint Type)	<p>Specifies the constraint to apply to this layout node.</p> <p>[<i>Example:</i> Consider the following example of type in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, type is specifying the width attribute of transition1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ConstraintType simple type (§5.9.7.21).</p>
val (Value)	<p>Specifies an absolute value instead of reference another constraint.</p> <p>[<i>Example:</i> Consider the following example of forName in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" val="10"/&gt;</pre> <p>In this example, val is specifying the absolute value of the width of transition1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Constraint">
 <sequence>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_ConstraintAttributes"/>
 <attributeGroup ref="AG_ConstraintRefAttributes"/>
 <attribute name="op" type="ST_BoolOperator" use="optional" default="none"/>
 <attribute name="val" type="xsd:double" use="optional" default="0"/>
 <attribute name="fact" type="xsd:double" use="optional" default="1"/>
</complexType>
```

5.9.2.9      constrLst (Constraint List)

This element is simply a list of constraints.

[Example: Consider the following example of a constraint list which contains some example constraints which are being defined and applied to layout nodes in the layout definition:

```
<constrLst>
 <constr type="w" for="ch" forName="node1" refType="w" refForName=""/>
 <constr type="h" for="ch" forName="node1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.6"/>
 <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.1"/>
 <constr type="primFontSz" for="ch" forName="node1" refForName="" op="equ"
val="100"/>
</constrLst>
```

In this example we can see constraints being defined for the width and height along with the primary font size for a layout node referenced by node1. The width for a transition is also specified. *end example]*

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
constr (Constraint)	§5.9.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Constraints">
 <sequence>
 <element name="constr" type="CT_Constraint" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.2.10 dataModel (Data Model)

The data for this instance of the diagram. Either a sample data model, or the data the user has entered.

Parent Elements
Root element of DrawingML Diagram Data partclrData (§5.9.2.7); sampData (§5.9.2.26); styleData (§5.9.2.29)

Child Elements	Subclause
bg (Background Formatting)	§5.9.3.1
cxnLst (Connection List)	§5.9.3.3
extLst (Extension List)	§5.9.2.13
ptLst (Point List)	§5.9.3.6
whole (Whole E2O Formatting)	§5.9.3.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataModel">
 <sequence>
 <element name="ptLst" type="CT_PtList"/>
 <element name="cxnLst" type="CT_CxnList" minOccurs="0" maxOccurs="1"/>
 <element name="bg" type="a:CT_BackgroundFormatting" minOccurs="0"/>
 <element name="whole" type="a:CT_WholeE2oFormatting" minOccurs="0"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.9.2.11 desc (Description)

This element holds a description for a layout definition. The description can be used to describe the qualities associated with a particular layout definition.

Parent Elements
layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17)

Attributes	Description
lang (Language)	The natural language of the title or description of this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.
val (Value)	The string which is used as the description of the layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Description">
 <attribute name="lang" type="xsd:string" use="optional" default=""/>
 <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.2.12 else (Else)

This element is similar to an else statement in a programming language in that it wraps elements which are to be used when the if conditionals are not true.

[Example: Consider the following example of an else element in a DrawingML diagram within the context of a choose statement:

```
<choose name="Name1">
 <if name="Name2" func="var" arg="dir" op="equ" val="norm">
 <alg type="snake">
 <param type="grDir" val="tL"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
 </alg>
 </if>
 <else name="Name3">
 <alg type="snake">
 <param type="grDir" val="tR"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
 </alg>
 </else>
</choose>
```

In this example, a else element is used to define a set of parameters associated with the snake algorithm when the diagram is reversed. end example]

Parent Elements
choose (§5.9.2.6)

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6

Child Elements	Subclause
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27

1

Attributes	Description
name (Name)	<p>A unique name associated with the choose statement.</p> <p>[<i>Example:</i> Consider the following example of a else element in a DrawingML diagram:</p> <pre>&lt;else name="Name1"&gt; ... &lt;/else&gt;</pre> <p>In this example, the else element is named Name1. <i>end example</i>].</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Otherwise">
4 <choice minOccurs="0" maxOccurs="unbounded">
5 <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
6 <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
7 <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
8 <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
9 <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
10 <element name="forEach" type="CT_ForEach"/>
11 <element name="layoutNode" type="CT_LayoutNode"/>
12 <element name="choose" type="CT_Choose"/>
13 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
14 </choice>
15 <attribute name="name" type="xsd:string" use="optional" default=""/>
16 </complexType>
```

### 17 5.9.2.13 extLst (Extension List)

18 This element specifies an extension list, within which all future extensions will be defined within ext elements.

The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the existing diagram syntax.

Parent Elements
alg (§5.9.2.3); colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4); constr (§5.9.2.8); cxn (§5.9.3.2); dataModel (§5.9.2.10); else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17); layoutNode (§5.9.2.19); presOf (§5.9.2.21); pt (§5.9.3.5); rule (§5.9.2.24); shape (§5.9.2.27); styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8); styleLbl (§5.9.5.10); styleLbl (§5.9.4.10)

Child Elements	Subclause
ext (Extension)	§5.1.2.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfficeArtExtensionList">
 <sequence>
 <group ref="EG_OfficeArtExtensionList" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.9.2.14 forEach (For Each)

A looping structure, similar to a for loop in a programming language, which defines what data model points will use this layout node.

[Example: Consider the following example of a forEach being used within a DrawingML diagram:

```
<forEach name="Name5" ref="" axis="ch" ptType="node">
 <layoutNode name="node1" styleLbl="" moveWith="">
 <alg type="sp"/>
 <shape
 xmlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships"
 r:blip=""
 <adjLst/>
 </shape>
 <constrLst/>
 </layoutNode>
</forEach>
```

In this example, the forEach element will create a layout node, referenced by the name node1, for every associated data model point in the diagram. In this particular instance the forEach will create the layout node for every child of the current point node. *end example]*

Parent Elements
-----------------

1

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

2

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27

Attributes	Description
axis (Axis)	<p>Specifies the axis on which to select data from the data model.</p> <p>[<i>Example:</i> For example, <code>axis="ch"</code> will select children of the current point node and <code>axis="des"</code> will select all descendants. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_AxisTypes</code> simple type (§5.9.7.7).</p>
cnt (Count)	<p>Specifies the count of items to use in a data set.</p> <p>[<i>Example:</i> Consider the following example of a <code>forEach</code> in a DrawingML diagram:</p> <pre>&lt;forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2"&gt;</pre> <p>...</p> <pre>&lt;/forEach&gt;</pre> <p>In this example, up to two children will be obtained through this <code>forEach</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_UnsignedInts</code> simple type (§5.9.7.63).</p>
hideLastTrans (Hide Last Transition)	<p>In algorithms that support transitions, this attribute specifies that the last transition will not be rendered. This allows for diagrams that start and end with a node.</p> <p>The possible values for this attribute are defined by the <code>ST_Booleans</code> simple type</p>

Attributes	Description
	(§5.9.7.9).
name (Name)	<p>A unique identifier for the layout node.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
ptType (Data Point Type)	<p>Specifies the type of data point to select.</p> <p>[<i>Example:</i> Consider the following example of a <code>forEach</code> in a DrawingML diagram:</p> <pre data-bbox="456 558 1430 726">&lt;forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2"&gt; ... &lt;/forEach&gt;</pre> <p>In this example, the <code>forEach</code> will select all node type points in the set. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_ElementTypes</code> simple type (§5.9.7.26).</p>
ref (Reference)	<p>When used on a for-each element, causes the specified for-each element to be used instead.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
st (Start)	<p>Specifies where to start in a data set.</p> <p>[<i>Example:</i> Consider the following example of a <code>forEach</code> in a DrawingML diagram:</p> <pre data-bbox="456 1220 1208 1251">&lt;presOf axis="desOrSelf" ptType="node" st="2"/&gt;</pre> <p>In this example, the second element in the set will be the first point returned. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_Ints</code> simple type (§5.9.7.39).</p>
step (Step)	<p>Specifies the step to use in a data set. A step with a value of 2 will return every other item in the set.</p> <p>The possible values for this attribute are defined by the <code>ST_Ints</code> simple type (§5.9.7.39).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ForEach">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
 <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
 <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
 <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
 <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
 <element name="forEach" type="CT_ForEach"/>
 <element name="layoutNode" type="CT_LayoutNode"/>
 <element name="choose" type="CT_Choose"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </choice>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
 <attribute name="ref" type="xsd:string" use="optional" default=""/>
 <attributeGroup ref="AG_IteratorAttributes"/>
</complexType>
```

### 5.9.2.15 if (If)

Like an if statement in a programming language, wraps elements which are to be used under the conditions defined by its attributes.

[Example: Consider the following example of an if element in a DrawingML diagram within the context of a choose statement:

```
<choose name="Name1">
 <if name="Name2" func="var" arg="dir" op="equ" val="norm">
 <alg type="snake">
 <param type="grDir" val="tL"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
 </alg>
 </if>
 <else name="Name3">
 <alg type="snake">
 <param type="grDir" val="tR"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
 </alg>
 </else>
</choose>
```

In this example, a if element is used to define a set of parameters associated with the snake algorithm when the diagram is in the normal direction. *end example]*

1

Parent Elements
choose (§5.9.2.6)

2

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27

Attributes	Description
arg (Argument)	<p>Specifies the variable to use as part of the test in an if element. Ignored unless the function attribute is set to "var".</p> <p>The possible values for this attribute are defined by the ST_FunctionArgument simple type (§5.9.7.29).</p>
axis (Axis)	<p>Specifies the axis on which to select data from the data model.</p> <p>[<i>Example:</i> For example, axis="ch" will select children of the current point node and axis="des" will select all descendants. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_AxisTypes simple type (§5.9.7.7).</p>
cnt (Count)	<p>Specifies the count of items to use in a data set.</p> <p>[<i>Example:</i> Consider the following example of a forEach in a DrawingML diagram:</p> <pre>&lt;forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2"&gt;</pre> <p>...</p> <pre>&lt;/forEach&gt;</pre> <p>In this example, up to two children will be obtained through this forEach. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_UnsignedInts simple type</p>

Attributes	Description
	(§5.9.7.63).
func (Function)	<p>The function used to evaluate the if condition.</p> <p>[<i>Example:</i> Consider the following example of func being used in DrawingML:</p> <pre>&lt;if name="Name2" func="var" arg="dir" op="equ" val="norm"&gt; ... &lt;/if&gt;</pre> <p>In this example, func is set to var. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FunctionType simple type (§5.9.7.31).</p>
hideLastTrans (Hide Last Transition)	<p>In algorithms that support transitions, this attribute specifies that the last transition will not be rendered. This allows for diagrams that start and end with a node.</p> <p>The possible values for this attribute are defined by the ST_Booleans simple type (§5.9.7.9).</p>
name (Name)	<p>A unique identifier for the layout node.</p> <p>The function used to evaluate the if condition.</p> <p>[<i>Example:</i> Consider the following example of name being used in DrawingML:</p> <pre>&lt;if name="Name2" func="var" arg="dir" op="equ" val="norm"&gt; ... &lt;/if&gt;</pre> <p>In this example, the name attribute is set to Name2. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
op (Operator)	<p>The operator used to evaluate the condition.</p> <p>[<i>Example:</i> Consider the following example of op being used in DrawingML:</p> <pre>&lt;if name="Name2" func="var" arg="dir" op="equ" val="norm"&gt; ... &lt;/if&gt;</pre> <p>In this example, op is being used to test the equality of the argument and value. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FunctionOperator simple type (§5.9.7.30).</p>
ptType (Data Point)	Specifies the type of data point to select.

Attributes	Description
Type)	<p>[<i>Example</i>: Consider the following example of a forEach in a DrawingML diagram:</p> <pre>&lt;forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2"&gt;</pre> <p>...</p> <pre>&lt;/forEach&gt;</pre> <p>In this example, the forEach will select all node type points in the set. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ElementTypes simple type (§5.9.7.26).</p>
st (Start)	<p>Specifies where to start in a data set.</p> <p>[<i>Example</i>: Consider the following example of a forEach in a DrawingML diagram:</p> <pre>&lt;presOf axis="desOrSelf" ptType="node" st="2"/&gt;</pre> <p>In this example, the second element in the set will be the first point returned. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).</p>
step (Step)	<p>Specifies the step to use in a data set. A step with a value of 2 will return every other item in the set.</p> <p>The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).</p>
val (Value)	<p>An absolute value.</p> <p>The possible values for this attribute are defined by the ST_FunctionValue simple type (§5.9.7.32).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_When">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
 <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>

 <attribute name="name" type="xsd:string" use="optional" default=""/>
 <attributeGroup ref="AG_IteratorAttributes"/>
 <attribute name="func" type="ST_FunctionType" use="required"/>
 <attribute name="arg" type="ST_FunctionArgument" use="optional" default="none"/>
 <attribute name="op" type="ST_FunctionOperator" use="required"/>
 <attribute name="val" type="ST_FunctionValue" use="required"/>
</complexType>
```

#### 5.9.2.16 layoutDef (Layout Definition)

This element is the root element for defining a layout definition. The layout definition is defined through a set of nested layout nodes. The layout definition is responsible for defining the look of a diagram.

##### Parent Elements

Root element of DrawingML Diagram Layout Definition part

##### Child Elements

##### Subclause

catLst (Category List)	§5.9.2.5
clrData (Color Transform Sample Data)	§5.9.2.7
desc (Description)	§5.9.2.11
extLst (Extension List)	§5.9.2.13
layoutNode (Layout Node)	§5.9.2.19
sampData (Sample Data)	§5.9.2.26
styleData (Style Data)	§5.9.2.29
title (Title)	§5.9.2.30

##### Attributes

##### Description

defStyle (Default Style)	<p>This attribute defines a reference to a default style which is to be applied to the diagram.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
--------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Attributes	Description
minVer (Minimum Version)	Minimum product version that can support this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.
uniqueId (Unique Identifier)	The unique identifier for this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DiagramDefinition">
 <sequence>
 <element name="title" type="CT_Name" minOccurs="0" maxOccurs="unbounded"/>
 <element name="desc" type="CT_Description" minOccurs="0" maxOccurs="unbounded"/>
 <element name="catLst" type="CT_Categories" minOccurs="0"/>
 <element name="sampData" type="CT_SampleData" minOccurs="0"/>
 <element name="styleData" type="CT_SampleData" minOccurs="0"/>
 <element name="clrData" type="CT_SampleData" minOccurs="0"/>
 <element name="layoutNode" type="CT_LayoutNode"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="uniqueId" type="xsd:string" use="optional" default=""/>
 <attribute name="minVer" type="xsd:string" use="optional"
 default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
 <attribute name="defStyle" type="xsd:string" use="optional" default=""/>
</complexType>

```

### 5.9.2.17 layoutDefHdr (Layout Definition Header)

This element is the header information representing the minimum knowledge needed by an application to preload information about a layout definition. This preloading allows for the actual load of the layout definition to occur at a later time which will help with any performance concerns an application may have.

[Example: Consider the following example of a layoutDefHdr within a DrawingML diagram:

```

<layoutDefHdr uniqueId="urn:layout/default">
 <title val="Basic Block List" />
 <desc val="" />
 <catLst>
 <cat type="list" pri="1000" />
 </catLst>
</layoutDefHdr>

```

In this example we define a title along with a category and prioritization for the diagram referenced by the uniqueId of urn:layout:default. *end example*]

Parent Elements
layoutDefHdrLst (§5.9.2.18)

1

Child Elements	Subclause
catLst (Category List)	§5.9.2.5
desc (Description)	§5.9.2.11
extLst (Extension List)	§5.9.2.13
title (Title)	§5.9.2.30

2

Attributes	Description
defStyle (Default Style)	This attribute defines a reference to a default style which is to be applied to the diagram. The possible values for this attribute are defined by the XML Schema string datatype.
minVer (Minimum Version)	Minimum product version that can support this Diagram Layout. The possible values for this attribute are defined by the XML Schema string datatype.
resId (Resource Identifier)	Resource ID used internally. The possible values for this attribute are defined by the XML Schema int datatype.
uniqueId (Unique Identifier)	The unique identifier for this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_DiagramDefinitionHeader">
5 <sequence>
6 <element name="title" type="CT_Name" minOccurs="1" maxOccurs="unbounded"/>
7 <element name="desc" type="CT_Description" minOccurs="1" maxOccurs="unbounded"/>
8 <element name="catLst" type="CT_Categories" minOccurs="0"/>
9 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
10 </sequence>
11 <attribute name="uniqueId" type="xsd:string" use="required"/>
12 <attribute name="minVer" type="xsd:string" use="optional"
13 default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
14 <attribute name="defStyle" type="xsd:string" use="optional" default=""/>
15 <attribute name="resId" type="xsd:int" use="optional" default="0"/>
16 </complexType>

```

### 17 5.9.2.18 layoutDefHdrLst (Diagram Layout Header List)

18 This element is simply a list of layout definition headers. This list of headers is used internally as a way to group  
 19 all of the layout definition headers together into a single structure.

Child Elements	Subclause
layoutDefHdr (Layout Definition Header)	§5.9.2.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DiagramDefinitionHeaderLst">
 <sequence>
 <element name="layoutDefHdr" type="CT_DiagramDefinitionHeader" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

5.9.2.19 layoutNode (Layout Node)

The layout node is the basic building block of diagrams. The layout node is responsible for defining how shapes are arranged in a diagram and how the data maps to a particular shape in a diagram.

[Example: Consider the following example of a basic layout node defined in a DrawingML diagram:

```
<layoutNode name="node">
 <varLst>
 <bulletEnabled val="1"/>
 </varLst>
 <presOf axis="desOrSelf" ptType="node"/>
 <alg type="tx"/>
 <shape type="rect"
 xmlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships"
 r:blip=""
 <adjLst/>
 </shape>
 <constrLst/>
 <ruleLst>
 <rule type="primFontSz" forName="" val="2" fact="NaN" max="NaN"/>
 </ruleLst>
</layoutNode>
```

In this example we define a layout node which holds text and is a rectangle. *end example]*

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutDef (§5.9.2.16); layoutNode (§5.9.2.19)

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14

Child Elements	Subclause
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27
varLst (Variable List)	§5.9.2.31

1

Attributes	Description
chOrder (Child Order)	Specifies the ordering of the child layout nodes for a given layout node.  The possible values for this attribute are defined by the ST_ChildOrderType simple type (§5.9.7.15).
moveWith (Move With)	Reference to another layout node that this layout node moves with.  The possible values for this attribute are defined by the XML Schema string datatype.
name (Name)	A unique identifier for the layout node.  The possible values for this attribute are defined by the XML Schema string datatype.
styleLbl (Style Label)	Specify which formatting option from a style or color variation should be applied to this layout node.  The possible values for this attribute are defined by the XML Schema string datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_LayoutNode">
4 <choice minOccurs="0" maxOccurs="unbounded">
5 <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
6 <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
7 <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
8 <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
9 <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
10 <element name="varLst" type="CT_LayoutVariablePropertySet" minOccurs="0" maxOccurs="1"/>
11 <element name="forEach" type="CT_ForEach"/>
12 <element name="layoutNode" type="CT_LayoutNode"/>
13 <element name="choose" type="CT_Choose"/>
14 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
15 </choice>
16 <attribute name="name" type="xsd:string" use="optional" default=""/>
17 <attribute name="styleLbl" type="xsd:string" use="optional" default=""/>
18 <attribute name="chOrder" type="ST_ChildOrderType" use="optional" default="b"/>
19 <attribute name="moveWith" type="xsd:string" use="optional" default=""/>
20 </complexType>

```

### 5.9.2.20 param (Parameter)

The parameter element modifies the default behavior of an algorithm.

[Example: Consider the following example of a param being used in a DrawingML diagram:

```
<alg type="snake">
 <param type="grDir" val="tL"/>
 <param type="flowDir" val="row"/>
 <param type="contDir" val="sameDir"/>
 <param type="off" val="ctr"/>
</alg>
```

In this example we see the snake algorithm being utilized and four parameters being set which are associated with the snake algorithm and modify its behavior. *end example]*

Parent Elements
alg (§5.9.2.3)

Attributes	Description
type (Parameter Type)	Specifies the parameter which is being modified.  The possible values for this attribute are defined by the ST_ParameterId simple type (§5.9.7.48).
val (Value)	Specifies the actual value to be given to the type defined.  The possible values for this attribute are defined by the ST_ParameterVal simple type (§5.9.7.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Parameter">
 <attribute name="type" type="ST_ParameterId" use="required"/>
 <attribute name="val" type="ST_ParameterVal" use="required"/>
</complexType>
```

### 5.9.2.21 presOf (Presentation Of)

This element specifies a particular data model point which is to be mapped to the containing layout node. This attribute is responsible for defining the mapping of data to the layout nodes in a diagram.

[Example: Consider the following example of presOf in use within a DrawingML diagram:

```
<presOf axis="desOrSelf" ptType="node"/>
```

In this example the presOf element is mapping to a particular data model point. *end example]*

1

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

2

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
axis (Axis)	<p>Specifies the axis on which to select data from the data model.</p> <p>[<i>Example:</i> For example, <code>axis="ch"</code> will select children of the current point node and <code>axis="des"</code> will select all descendants. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_AxisTypes</code> simple type (§5.9.7.7).</p>
cnt (Count)	<p>Specifies the count of items to use in a data set.</p> <p>[<i>Example:</i> Consider the following example of a <code>forEach</code> in a DrawingML diagram:</p> <pre>&lt;forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2"&gt; ... &lt;/forEach&gt;</pre> <p>In this example, up to two children will be obtained through this <code>forEach</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_UnsignedInts</code> simple type (§5.9.7.63).</p>
hideLastTrans (Hide Last Transition)	<p>In algorithms that support transitions, this attribute specifies that the last transition will not be rendered. This allows for diagrams that start and end with a node.</p> <p>The possible values for this attribute are defined by the <code>ST_Booleans</code> simple type (§5.9.7.9).</p>
ptType (Data Point Type)	<p>Specifies the type of data point to select.</p> <p>[<i>Example:</i> Consider the following example of a <code>forEach</code> in a DrawingML diagram:</p> <pre>&lt;forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2"&gt; ... &lt;/forEach&gt;</pre>

Attributes	Description
	<p>In this example, the forEach will select all node type points in the set. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ElementTypes simple type (§5.9.7.26).</p>
st (Start)	<p>Specifies where to start in a data set.</p> <p>[Example: Consider the following example of a forEach in a DrawingML diagram:</p> <pre>&lt;presOf axis="desOrSelf" ptType="node" st="2"/&gt;</pre> <p>In this example, the second element in the set will be the first point returned. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).</p>
step (Step)	<p>Specifies the step to use in a data set. A step with a value of 2 will return every other item in the set.</p> <p>The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_PresentationOf">
3 <sequence>
4 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attributeGroup ref="AG_IteratorAttributes"/>
7 </complexType>
```

8 **5.9.2.22 relIds (Explicit Relationships to Diagram Parts)**

9 This element specifies the relationship IDs used to explicitly reference each of the four constituent parts of a  
10 DrawingML diagram:

- 11
- 12
- 13
- 14
- Diagram Colors (cs attribute)
  - Diagram Data (dm attribute)
  - Diagram Layout Definition (lo attribute)
  - Diagram Style (qs attribute)

Attributes	Description
<p>cs (Explicit Relationship to Diagram Colors Part)</p> <p>Namespace: .../officeDocument</p>	<p>Specifies the relationship ID for the explicit relationship to the Diagram Colors part used by this diagram.</p> <p>This relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramColors">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramColors</a> or the document shall be considered non-conformant.</p>

Attributes	Description
/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
dm (Explicit Relationship to Diagram Data Part)  Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Data part used by this diagram.  This relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramData">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramData</a> or the document shall be considered non-conformant.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
lo (Explicit Relationship to Diagram Layout Definition Part)  Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Layout Definition part used by this diagram.  This relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramLayout">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramLayout</a> or the document shall be considered non-conformant.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
qs (Explicit Relationship to Style Definition Part)  Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Style part used by this diagram.  This relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramQuickStyle">http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramQuickStyle</a> or the document shall be considered non-conformant.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_RelIds">
3 <attribute ref="r:dm" use="required"/>
4 <attribute ref="r:lo" use="required"/>
5 <attribute ref="r:qs" use="required"/>
6 <attribute ref="r:cs" use="required"/>
7 </complexType>

```

### 8 5.9.2.23 [resizeHandles \(Shape Resize Style\)](#)

9 This element defines the behavior when resizing shapes within a diagram. Because the size of the shape plays a  
10 large role in the overall layout of other nodes within the diagram, there are two ways resize can occur on a  
11 node.

#### Parent Elements

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Shape Resize Style Type)	<p>Specifies the behavior for a shape when resizing shapes within a diagram.</p> <p>If this attribute is not specified, the default value shall be rel.</p> <p>The possible values for this attribute are defined by the ST_ResizeHandlesStr simple type (§5.9.7.53).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ResizeHandles">
 <attribute name="val" type="ST_ResizeHandlesStr" default="rel" use="optional"/>
</complexType>
```

#### 5.9.2.24 rule (Rule)

This element allows for a rule to be specified which changes the value of an existing constraint.

[*Example:* Consider the following example of a rule in a DrawingML diagram:

```
<ruleLst>
 <rule type="primFontSz" val="2" />
</ruleLst>
```

In this example a rule is being defined that will shrink the primary font size down to a lower limit of 2pt font when the text no longer fits correctly in the layout node. *end example*]

Parent Elements
ruleLst (§5.9.2.25)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
fact (Factor)	<p>Factor used in a reference constraint or a rule in order to modify a referenced value by the factor defined.</p> <p>[<i>Example:</i> Consider the following example of fact in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w"</pre>

Attributes	Description
	<pre>refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, the width for transition1 is being defined as one-tenth the width of node1. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
for (For)	<p>Specifies the axis of layout nodes to apply a constraint or rule to.</p> <p>[<i>Example:</i> Consider the following example of for in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, the for attribute is specifying that node1 is a child node to the current layout node. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§5.9.7.20).</p>
forName (For Name)	<p>Specifies the name of the layout node to apply a constraint or rule to.</p> <p>[<i>Example:</i> Consider the following example of forName in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, forName is specifying the layout node named transition1 for its reference. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
max (Max Value)	<p>Sets the maximum value for a constraint so rules can no longer increase the constraint beyond that value.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
ptType (Data Point Type)	<p>Specifies the type of data point to select.</p> <p>The possible values for this attribute are defined by the ST_ElementType simple type (§5.9.7.25).</p>
type (Constraint Type)	<p>Specifies the constraint to apply to this layout node.</p> <p>[<i>Example:</i> Consider the following example of type in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/&gt;</pre> <p>In this example, type is specifying the width attribute of transition1. <i>end example</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_ConstraintType simple type (§5.9.7.21).
val (Value)	<p>Specifies an absolute value instead of reference another constraint.</p> <p>[<i>Example:</i> Consider the following example of forName in use in a DrawingML diagram:</p> <pre>&lt;constr type="w" for="ch" forName="transition1" val="10"/&gt;</pre> <p>In this example, val is specifying the absolute value of the width of transition1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumericRule">
 <sequence>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_ConstraintAttributes"/>
 <attribute name="val" type="xsd:double" use="optional" default="NaN"/>
 <attribute name="fact" type="xsd:double" use="optional" default="NaN"/>
 <attribute name="max" type="xsd:double" use="optional" default="NaN"/>
</complexType>
```

### 5.9.2.25 ruleLst (Rule List)

This element is simply a list of rules.

This element allows for a rule to be specified which changes the value of an existing constraint.

[*Example:* Consider the following example of a ruleLst in a DrawingML diagram:

```
<ruleLst>
 <rule type="primFontSz" val="2" />
</ruleLst>
```

In this example a single rule is being defined in the ruleLst that will shrink the primary font size down to a lower limit of 2pt font when the text no longer fits correctly in the layout node. *end example*]

#### Parent Elements

else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

#### Child Elements

rule (Rule)

#### Subclause

§5.9.2.24

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rules">
 <sequence>
 <element name="rule" type="CT_NumericRule" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.2.26 sampData (Sample Data)

This element defines the sample data model which is used to pre-populate a diagram with placeholder data in order for the diagram to display itself in the user interface which shows all of the available diagrams to a user.

[Example: Consider the following example of a sampData element within a DrawingML diagram:

```
<sampData>
 <dataModel>
 <ptLst>
 <pt modelId="0" type="doc"/>
 <pt modelId="1">
 <prSet phldr="1"/>
 </pt>
 <pt modelId="2">
 <prSet phldr="1"/>
 </pt>
 <pt modelId="3">
 <prSet phldr="1"/>
 </pt>
 <pt modelId="4">
 <prSet phldr="1"/>
 </pt>
 <pt modelId="5">
 <prSet phldr="1"/>
 </pt>
 </ptLst>
 <cxnLst>
 <cxn modelId="6" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
 <cxn modelId="7" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
 <cxn modelId="8" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
 <cxn modelId="9" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
 <cxn modelId="10" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
 </cxnLst>
 <bg/>
 <whole/>
 </dataModel>
</sampData>
```

- 1 In this example we define the sample data to consist of five nodes all attached to a document point type node.  
 2 When displayed, this diagram will show five shapes in the diagram. *end example]*

Parent Elements
layoutDef (§5.9.2.16)

3

Child Elements	Subclause
dataModel (Data Model)	§5.9.2.10

4

Attributes	Description
useDef (Use Default)	If the value of this attribute is <code>true</code> , the data model defined in the <code>clrData</code> element is ignored and a default data model is used instead.  The possible values for this attribute are defined by the XML Schema boolean datatype.

- 5 The following XML Schema fragment defines the contents of this element:

```

6 <complexType name="CT_SampleData">
7 <sequence>
8 <element name="dataModel" type="CT_DataModel" minOccurs="0"/>
9 </sequence>
10 <attribute name="useDef" type="xsd:boolean" use="optional" default="false"/>
11 </complexType>

```

### 12 5.9.2.27 [shape \(Shape\)](#)

- 13 The shape displayed by the containing layout node. Not all layout nodes display shapes.

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

14

Child Elements	Subclause
adjLst (Shape Adjust List)	§5.9.2.2
extLst (Extension List)	§5.9.2.13

15

Attributes	Description
blip (Relationship to Image Part)	Specifies the relationship ID of the explicit relationship to an image which shall be used as the image for the contents of this shape.
Namespace: .../officeDocument /2006/relationshi	This relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or

Attributes	Description
ps	the document shall be considered non-conformant.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
blipPhldr (Image Placeholder)	Specifies whether to use an image placeholder or not.  The possible values for this attribute are defined by the XML Schema boolean datatype.
hideGeom (Hide Geometry)	When set to "true", hides the geometry of the shape. The text is still visible.  The possible values for this attribute are defined by the XML Schema boolean datatype.
lkTxEntry (Prevent Text Editing)	Prevents text editing on this shape.  The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation)	Rotates the shape by the specified number of degrees.  The possible values for this attribute are defined by the XML Schema double datatype.
type (Shape Type)	Specifies the type of shape.  The possible values for this attribute are defined by the ST_LayoutShapeType simple type (§5.9.7.40).
zOrderOff (Z-Order Offset)	Offsets the shape from its default z-order stacking, which is based on the order the layout nodes appear in the XML.  The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Shape">
 <sequence>
 <element name="adjLst" type="CT_AdjLst" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="rot" type="xsd:double" use="optional" default="0"/>
 <attribute name="type" type="ST_LayoutShapeType" use="optional" default="none"/>
 <attribute ref="r:blip" use="optional"/>
 <attribute name="zOrderOff" type="xsd:int" use="optional" default="0"/>
 <attribute name="hideGeom" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="lkTxEntry" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="blipPhldr" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 5.9.2.28 style (Shape Style)

This element specifies the style information for a shape, as defined by its DrawingML child elements.

#### Parent Elements

Parent Elements
prSet (§5.9.3.4); styleLbl (§5.9.5.10)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ShapeStyle">
 <sequence>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 5.9.2.29 styleData (Style Data)

This element defines the style data model which is used to pre-populate a diagram with placeholder data in order for the diagram to display itself in the user interface which shows a quick style applied to the diagram.

[Example: Consider the following example of a styleData being used within a DrawingML diagram:

```

<styleData>
 <dataModel>
 <ptLst>
 <pt modelId="0" type="doc"/>
 <pt modelId="1"/>
 <pt modelId="2"/>
 </ptLst>
 <cxnLst>
 <cxn modelId="3" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
 <cxn modelId="4" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
 </cxnLst>
 <bg/>
 <whole/>
 </dataModel>
</styleData>

```

In this example we define a data model which has only two nodes which will be shown in the user interface when a layout definition is combined with this data model. *end example*]

Parent Elements
layoutDef (§5.9.2.16)

Child Elements	Subclause
dataModel (Data Model)	§5.9.2.10

Attributes	Description
useDef (Use Default)	<p>If the value of this attribute is true, the data model defined in the clrData element is ignored and a default data model is used instead.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SampleData">
 <sequence>
 <element name="dataModel" type="CT_DataModel" minOccurs="0"/>
 </sequence>
 <attribute name="useDef" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.9.2.30 title (Title)

Title of the Diagram Layout.

Parent Elements
layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17)

Attributes	Description
lang (Language)	<p>Specifies the language of the title or description of this layout definition.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
val (Value)	<p>Specifies the title or description of this layout definition.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Name">
 <attribute name="lang" type="xsd:string" use="optional" default=""/>
 <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

### 5.9.2.31 varLst (Variable List)

This element consists of a list of variables which interact with user interface components.

[Example: Consider the following example of a varLst in a DrawingML diagram:

```
<varLst>
 <chMax val="2" />
 <dir val="norm" />
 <resizeHandles val="exact" />
</varLst>
```

In this example we see different variables being defined which modify the behavior of user interface components directly. *end example*

#### Parent Elements

layoutNode (§5.9.2.19)

#### Child Elements

#### Subclause

animLvl (Level Animation)	§5.9.6.1
animOne (One by One Animation String)	§5.9.6.2
bulletEnabled (Show Insert Bullet)	§5.9.6.3
chMax (Maximum Children)	§5.9.6.4
chPref (Preferred Number of Children)	§5.9.6.5
dir (Diagram Direction)	§5.9.6.6
hierBranch (Organization Chart Branch Style)	§5.9.6.7
orgChart (Show Organization Chart User Interface)	§5.9.6.8
resizeHandles (Shape Resize Style)	§5.9.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutVariablePropertySet">
 <sequence>
 <element name="orgChart" type="CT_OrgChart" minOccurs="0" maxOccurs="1"/>
 <element name="chMax" type="CT_ChildMax" minOccurs="0" maxOccurs="1"/>
 <element name="chPref" type="CT_ChildPref" minOccurs="0" maxOccurs="1"/>
 <element name="bulletEnabled" type="CT_BulletEnabled" minOccurs="0" maxOccurs="1"/>
 <element name="dir" type="CT_Direction" minOccurs="0" maxOccurs="1"/>
 <element name="hierBranch" type="CT_HierBranchStyle" minOccurs="0" maxOccurs="1"/>
 <element name="animOne" type="CT_AnimOne" minOccurs="0" maxOccurs="1"/>
 <element name="animLvl" type="CT_AnimLvl" minOccurs="0" maxOccurs="1"/>
 <element name="resizeHandles" type="CT_ResizeHandles" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.9.3 Data

This section specifies the data that is to be contained within a diagram.

#### 5.9.3.1 bg (Background Formatting)

This element defines formatting that can be applied to the background shape of the entire diagram. The background shape can hold formatting options just as a normal shape can hold within DrawingML.

[Example: Consider the following example of a bg in DiagramML:

```
<bg>
 <solidFill>
 <schemeClr val="tx1"/>
 </solidFill>
 <effectLst>
 <glow rad="152400">
 <schemeClr val="accent1">
 <alpha val="75000"/>
 </schemeClr>
 </glow>
 </effectLst>
</bg>
```

In this example we see a solid fill applied to the background of the diagram along with a glow. *end example*]

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BackgroundFormatting">
 <sequence>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.9.3.2 cxn (Connection)

This element defines a connection between two points. A connection defines a relationship between two points in a diagram.

[Example: Consider the following example of a cxn in DiagramML:

```
<cxnLst>
 <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
 <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
 <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
 <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
 <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
 <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
</cxnLst>
```

In this example we see 6 cxn elements defined within a cxnLst element (§5.9.3.3). In this example, a relationship is being defined between point 0 and every other point in the diagram. *end example*]

Parent Elements
-----------------

cxnLst (§5.9.3.3)
-------------------

Child Elements
----------------

extLst (Extension List)
-------------------------

Subclause
-----------

§5.9.2.13
-----------

Attributes
------------

Description
-------------

destId (Destination Identifier)
---------------------------------

The model identifier of the destination point for a connection.  [Example: Consider the following example cxn within DiagramML:  <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>  In this example we see the destination identifier referencing a point who's model identifier is 4. <i>end example</i> ]  The possible values for this attribute are defined by the ST_ModelId simple type
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Attributes	Description
	(§5.9.7.42).
destOrd (Destination Position)	<p>The relative position of the destination point among it's siblings.</p> <p>[<i>Example:</i> Consider the following example cxn within DiagramML:</p> <pre>&lt;cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/&gt;</pre> <p>In this example we see the destination position is 0. This means that it is ranked first among its siblings if there are sibling points present. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
modelId (Model Identifier)	<p>The unique identifier associated with this cxn.</p> <p>[<i>Example:</i> Consider the following example cxn within DiagramML:</p> <pre>&lt;cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/&gt;</pre> <p>In this example we see the model identifier is 10. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).</p>
parTransId (Parent Transition Identifier)	<p>The model identifier of the point representing the parent transition. An example of a parent transition can be thought of as the shape connecting two points, such as an arrow in the diagram.</p> <p>The unique identifier associated with this cxn.</p> <p>[<i>Example:</i> Consider the following example cxn within DiagramML:</p> <pre>&lt;cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"   parTransId="9" sibTransId="5"/&gt;</pre> <p>In this example we see the parent transition identifier is referencing a point who's model identifier is 9. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).</p>
presId (Presentation Identifier)	<p>The unique identifier of the layout associated to the cxn (only the active presentation (layout) is saved so all the presId's in the file should be the same).</p> <p>[<i>Example:</i> Consider the following example cxn within DiagramML:</p> <pre>&lt;cxn modelId="10" type="presParOf" srcId="0" destId="4"   srcOrd="3" destOrd="0" presId="urn:sampleLayouts/layout1"/&gt;</pre>

Attributes	Description
	<p>In this example we see the presentation identifier is <code>urn:sampleLayouts/layout1</code>. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
sibTransId (Sibling Transition Identifier)	<p>The model identifier of the point representing the sibling transition. An example of a sibling transition can be thought of as the shape connecting two points, such as an arrow in the diagram.</p> <p>[<i>Example:</i> Consider the following example <code>cxn</code> within DiagramML:</p> <pre>&lt;cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"   parTransId="9" sibTransId="5"/&gt;</pre> <p>In this example we see the sibling transition identifier is referencing a point who's model identifier is 5. <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_ModelId</code> simple type (§5.9.7.42).</p>
srcId (Source Identifier)	<p>The model identifier of the source point for a connection.</p> <p>[<i>Example:</i> Consider the following example <code>cxn</code> within DiagramML:</p> <pre>&lt;cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/&gt;</pre> <p>In this example we see the souce identifier referencing a point who's model identifier is 0. <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_ModelId</code> simple type (§5.9.7.42).</p>
srcOrd (Source Position)	<p>The relative position of the source point among it's siblings.</p> <p>[<i>Example:</i> Consider the following example <code>cxn</code> within DiagramML:</p> <pre>&lt;cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/&gt;</pre> <p>In this example we see the source position is 3. This means that it is ranked third among its siblings. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema <code>unsignedInt</code> datatype.</p>
type (Point Type)	<p>The type of point, which will correspond to a connection in this case.</p> <p>[<i>Example:</i> Consider the following example <code>cxn</code> within DiagramML:</p>

Attributes	Description
	<p><code>&lt;cxn modelId="10" type="presParOf" srcId="0" destId="4" srcOrd="3" destOrd="0" presId="urn:sampleLayouts/layout1"/&gt;</code></p> <p>In this example we see the point type is defined as <code>presParOf</code>. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_CxnType</code> simple type (§5.9.7.23).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Cxn">
 <sequence>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="modelId" type="ST_ModelId" use="required"/>
 <attribute name="type" type="ST_CxnType" use="optional" default="parOf"/>
 <attribute name="srcId" type="ST_ModelId" use="required"/>
 <attribute name="destId" type="ST_ModelId" use="required"/>
 <attribute name="srcOrd" type="xsd:unsignedInt" use="required"/>
 <attribute name="destOrd" type="xsd:unsignedInt" use="required"/>
 <attribute name="parTransId" type="ST_ModelId" use="optional" default="0"/>
 <attribute name="sibTransId" type="ST_ModelId" use="optional" default="0"/>
 <attribute name="presId" type="xsd:string" use="optional" default=""/>
</complexType>

```

### 5.9.3.3 cxnLst (Connection List)

This element defines a group of connections. There can be a connection list defined for any data model which holds all of the connections between points defined in the diagram.

[Example: Consider the following example of a `cxnLst` in DiagramML:

```

<cxnLst>
 <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
 <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
 <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
 <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
 <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
 <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
</cxnLst>

```

In this example we see 6 `cxn` elements (§5.9.3.2) defined within a `cxnLst` element. In this example, a relationship is being defined between point 0 and every other point in the diagram. *end example*

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
cxn (Connection)	§5.9.3.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CxnList">
 <sequence>
 <element name="cxn" type="CT_Cxn" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.9.3.4 prSet (Property Set)

This element holds properties and customizations which are used throughout certain elements in DiagramML.

The properties can be grouped into the following general categories:

- Presentation Properties - presLayoutVars, style, presAssocId, presName, presStyleLbl, presStyleIdx, presStyleCnt
- Document Properties - loTypeId, loCatId, qsTypeId, qaCatId, csTypeId, coherent3DOff
- Semantic Element Properties - phldrT, phldr
- Customization Properties - custAng, custFlipVert, custFlipHor, custSzX, custSzY, custScaleX, custScaleY, custT, custLinFactX, custLinFactY, custLinFactNeighborX, custLinFactNeighborY, custRadScaleRad, custRadScaleInc

[Example: Consider the basic example of prSet in use in DrawingML on a document point type:

```
<prSet loTypeId="urn:microsoft.com/office/officeart/2005/8/layout/default"
 loCatId="list"
 qsTypeId="urn:microsoft.com/office/officeart/2005/8/quickstyle/3d1" qsCatId="3D"
 csTypeId="urn:microsoft.com/office/officeart/2005/8/colors/colorful2"
 csCatId="colorful" phldr="1"/>
```

In this example we define the layout identifier, the category of the layout, the quick style identifier, the quick style category, along with the color style and color style category. *end example*]

Parent Elements
pt (§5.9.3.5)

Child Elements	Subclause
presLayoutVars (Presentation Layout Variables)	§5.9.5.4
style (Shape Style)	§5.9.2.28

Attributes	Description
------------	-------------

Attributes	Description
coherent3DOff (Coherent 3D Behavior)	Enables or disables the Coherent 3D behavior for styles that specify this property. The possible values for this attribute are defined by the XML Schema boolean datatype.
csCatId (Color Transform Category)	This attribute specifies the identifier of the current color transform category. The possible values for this attribute are defined by the XML Schema string datatype.
csTypeId (Color Transform Type Identifier)	This attribute specifies the identifier of the currently applied color transform. The possible values for this attribute are defined by the XML Schema string datatype.
custAng (Custom Rotation)	Specifies the amount that rotation is customized by. The possible values for this attribute are defined by the XML Schema int datatype.
custFlipHor (Custom Horizontal Flip)	Specifies if there is a custom horizontal flip applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
custFlipVert (Custom Vertical Flip)	Specifies if there is a custom vertical flip applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
custLinFactNeighborX (Neighbor Offset Width)	Specifies the percentage of the neighbor's width used for offsetting shape. The possible values for this attribute are defined by the XML Schema int datatype.
custLinFactNeighborY (Neighbor Offset Height)	Specifies the percentage of the neighbor's height used for offsetting shape. The possible values for this attribute are defined by the XML Schema int datatype.
custLinFactX (Custom Factor Width)	Specifies the percentage of the current shape width used for offsetting the shape. The possible values for this attribute are defined by the XML Schema int datatype.
custLinFactY (Custom Factor Height)	Specifies the percentage of the current shape height used for offsetting the shape. The possible values for this attribute are defined by the XML Schema int datatype.
custRadScaleInc (Include Angle Scale)	Specifies the amount that the include angle has been scaled by. The possible values for this attribute are defined by the XML Schema int datatype.
custRadScaleRad (Radius Scale)	Specifies how much the radius has been scaled. The possible values for this attribute are defined by the XML Schema int datatype.
custScaleX (Width Scale)	Specifies the amount that the width has been scaled by. The possible values for this attribute are defined by the XML Schema int datatype.
custScaleY (Height Scale)	Specifies the amount that the height has been scaled by.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.
custSzX (Fixed Width Override)	Specifies a fixed width override for a shape.  The possible values for this attribute are defined by the XML Schema int datatype.
custSzY (Fixed Height Override)	Specifies a fixed height override for a shape.  The possible values for this attribute are defined by the XML Schema int datatype.
custT (Text Changed)	Specifies if the text has been customized which allows layout to ignore automatic formatting options available to the text.  The possible values for this attribute are defined by the XML Schema boolean datatype.
loCatId (Current Diagram Category)	Specifies the current identifier of the layout category applied to the diagram.  The possible values for this attribute are defined by the XML Schema string datatype.
loTypeId (Current Diagram Type)	Specifies the identifier for the layout currently applied to the diagram.  The possible values for this attribute are defined by the XML Schema string datatype.
phldr (Placeholder)	Indicates that the point is a placeholder or sample item.  The possible values for this attribute are defined by the XML Schema boolean datatype.
phldrT (Placeholder Text)	The text used for display in the element if the placeholder flag is set to true. If this property is not set than default placeholder text will be used.  The possible values for this attribute are defined by the XML Schema string datatype.
presAssocID (Presentation Element Identifier)	The point associated with this presentation element. This identifier is used together with presName to create a unique key for presentation element indexing.  The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
presName (Presentation Name)	The layout node name of this presentation element. This name is used together with presAssocID to create a unique key for presentation element indexing.  The possible values for this attribute are defined by the XML Schema string datatype.
presStyleCnt (Presentation Style Count)	Specifies the layout node style count of this presentation element.  The possible values for this attribute are defined by the XML Schema int datatype.
presStyleIdx (Presentation Style Index)	Specifies the layout node style index of this presentation element.  The possible values for this attribute are defined by the XML Schema int datatype.
presStyleLbl (Presentation Style Label)	Specifies the layout node style label of this presentation element.  The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
qsCatId (Current Style Category)	Specifies the identifier of the category of the currently applied quick style.  The possible values for this attribute are defined by the XML Schema string datatype.
qsTypeId (Current Style Type)	Specifies the identifier of the currently applied quick style.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ElemPropSet">
 <sequence>
 <element name="presLayoutVars" type="CT_LayoutVariablePropertySet" minOccurs="0"
 maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="presAssocID" type="ST_ModelId" use="optional"/>
 <attribute name="presName" type="xsd:string" use="optional"/>
 <attribute name="presStyleLbl" type="xsd:string" use="optional"/>
 <attribute name="presStyleIdx" type="xsd:int" use="optional"/>
 <attribute name="presStyleCnt" type="xsd:int" use="optional"/>
 <attribute name="loTypeId" type="xsd:string" use="optional"/>
 <attribute name="loCatId" type="xsd:string" use="optional"/>

 <attribute name="qsCatId" type="xsd:string" use="optional"/>
 <attribute name="csTypeId" type="xsd:string" use="optional"/>
 <attribute name="csCatId" type="xsd:string" use="optional"/>
 <attribute name="coherent3DOff" type="xsd:boolean" use="optional"/>
 <attribute name="phldrT" type="xsd:string" use="optional"/>
 <attribute name="phldr" type="xsd:boolean" use="optional"/>
 <attribute name="custAng" type="xsd:int" use="optional"/>
 <attribute name="custFlipVert" type="xsd:boolean" use="optional"/>
 <attribute name="custFlipHor" type="xsd:boolean" use="optional"/>
 <attribute name="custSzX" type="xsd:int" use="optional"/>
 <attribute name="custSzY" type="xsd:int" use="optional"/>
 <attribute name="custScaleX" type="xsd:int" use="optional"/>
 <attribute name="custScaleY" type="xsd:int" use="optional"/>
 <attribute name="custT" type="xsd:boolean" use="optional"/>
 <attribute name="custLinFactX" type="xsd:int" use="optional"/>
 <attribute name="custLinFactY" type="xsd:int" use="optional"/>
 <attribute name="custLinFactNeighborX" type="xsd:int" use="optional"/>
 <attribute name="custLinFactNeighborY" type="xsd:int" use="optional"/>
 <attribute name="custRadScaleRad" type="xsd:int" use="optional"/>
 <attribute name="custRadScaleInc" type="xsd:int" use="optional"/>
</complexType>

```

### 5.9.3.5 pt (Point)

This element defines a point in DiagramML. A point in DiagramML is defined to hold data associated with a particular point or node in a diagram. Transitions between nodes in a diagram along with the nodes themselves are defined as different types of points. A point is not only responsible for holding the data associated with a

node in a diagram, but also for holding customization properties made to the text and shape associated with the particular node.

[Example: Consider the following example of a pt in DiagramML:

```
<pt modelId="{C6A8900D-3F1B-4F1D-A514-4E8BDD964568}">
 <prSet phldrT="[Text]"/>
 <spPr/>
 <t>
 <bodyPr/>
 <lstStyle/>
 <p>
 <r>
 <rPr lang="en-US" smtClean="0"/>
 <t>Text 2</t>
 </r>
 <endParaRPr lang="en-US" dirty="0"/>
 </p>
 </t>
</pt>
```

In this example we define a point which holds the data associated with a node in a diagram. The actual text in the diagram is defined in the text body, t, tag and consists of the string "Text 2". There are no overrides made to the shape properties and placeholder text defined for this node when there is no text body present. *end example]*

#### Attributes

#### Description

cxnId (Connection Identifier)

The model identifier of the connection that represents the transition node.

[Example: Consider the following example of a cxnId:

```
<dgm:pt modelId="5" type="parTrans" cxnId="9">
```

Attributes	Description
	<pre>       &lt;dgm:prSet/&gt;       &lt;dgm:spPr/&gt;     &lt;/dgm:pt&gt; </pre> <p>In this example we define the connection related to this point to reference connection 9. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).</p>
modelId (Model Identifier)	<p>The unique identifier of the element within the data model. This identifier should be unique only relative to the containing data model.</p> <p>[<i>Example:</i> Consider the following example of a cxnId:</p> <pre>       &lt;dgm:pt modelId="5" type="parTrans" cxnId="9"&gt;         &lt;dgm:prSet/&gt;         &lt;dgm:spPr/&gt;       &lt;/dgm:pt&gt; </pre> <p>In this example we define the point type is to be 5. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).</p>
type (Point Type)	<p>The type of point that this is.</p> <p>[<i>Example:</i> Consider the following example of a cxnId:</p> <pre>       &lt;dgm:pt modelId="5" type="parTrans" cxnId="9"&gt;         &lt;dgm:prSet/&gt;         &lt;dgm:spPr/&gt;       &lt;/dgm:pt&gt; </pre> <p>In this example the point type is defined as a parTrans point type. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PtType simple type (§5.9.7.50).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Pt">
 <sequence>
 <element name="prSet" type="CT_ElemPropSet" minOccurs="0" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
 <element name="t" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="modelId" type="ST_ModelId" use="required"/>
 <attribute name="type" type="ST_PtType" use="optional" default="node"/>
 <attribute name="cxnId" type="ST_ModelId" use="optional" default="0"/>
</complexType>
```

### 5.9.3.6 ptLst (Point List)

This element simply holds a list of points within the data model.

[Example: Consider the following example of a very simple point list in DiagramML:

```
<dgm:ptLst>
 <dgm:pt modelId="0" type="doc"/>
 <dgm:pt modelId="1"/>
 <dgm:pt modelId="2"/>
 <dgm:pt modelId="3"/>
 <dgm:pt modelId="4"/>
 <dgm:pt modelId="5"/>
 <dgm:pt modelId="6"/>
</dgm:ptLst>
```

In this example we define a single document type point and five node type points. *end example]*

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
pt (Point)	§5.9.3.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PtList">
 <sequence>
 <element name="pt" type="CT_Pt" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.3.7 spPr (Shape Properties)

This element specifies the properties for a single shape in a diagram's data, as defined using DrawingML child elements.

Parent Elements
pt (§5.9.3.5)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode)  Namespace: .../drawingml/2006/main	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note:</i> This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
 <sequence>
 <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

### 5.9.3.8 t (Text Body)

Text body containing the default body, paragraph and character properties. There should be a single paragraph and no text runs. Any runs in the first paragraph and paragraphs in addition to the first are ignored.

Parent Elements
pt (§5.9.3.5)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
 <sequence>
 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.3.9 whole (Whole E20 Formatting)

Formatting that applies to the entire diagram object, and not just the background, includes line and effect properties.

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
ln (Outline)	§5.1.2.1.24

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WholeE2oFormatting">
 <sequence>
 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

## 5.9.4 Color Information

This section defines the coloring information that is to be associated with a diagram.

### 5.9.4.1 cat (Color Transform Category)

This element specifies the category in the user interface that a color transform is to be displayed within.

[*Example:* Consider the following example of a cat in DiagramML:

```
<dgm:cat type="mainScheme" pri="10300"/>
```

In this example we see a cat defined with a type and priority. *end example*]

Parent Elements
catLst (§5.9.4.2)

Attributes	Description
pri (Priority)	<p>The priority within the category for this color variation determines the order in which it will display in the user interface. The lower numbers are to be displayed at the beginning of the list.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
type (Category Type)	<p>The category type used to organize the color transforms in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema anyURI datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTCategory">
 <attribute name="type" type="xsd:anyURI" use="required"/>
 <attribute name="pri" type="xsd:unsignedInt" use="required"/>
</complexType>
```

#### 5.9.4.2 catLst (Color Transform Category List)

This element defines a list of color transform categories. This list can be used to populate user interface components which could separate color transforms into categories.

[*Example:* Consider the following example of a catLst in DiagramML:

```
<dgm:catLst>
 <dgm:cat type="mainScheme" pri="10300"/>
</dgm:catLst>
```

In this example we see a catLst defined which holds a single *color transform category* (§5.9.4.1). *end example*]

Parent Elements
colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4)

Child Elements	Subclause
cat (Color Transform Category)	§5.9.4.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTCategories">
 <sequence minOccurs="0" maxOccurs="unbounded">
 <element name="cat" type="CT_CTCategory" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 5.9.4.3 colorsDef (Color Transform Definitions)

This element is the root element for color transforms. Held within this element are all of the available color transforms themselves along with other elements and attributes associated with defining the general color transform properties and attributes.

[*Example:* Consider the following example of a colorsDef in DiagramML:

```
<dgm:colorsDef
 xmlns:dgm="http://schemas.openxmlformats.org/drawingml/2006/3/diagram"
 xmlns:a="http://schemas.openxmlformats.org/drawingml/2006/3/main"
 uniqueId="urn:microsoft.com/office/officeart/2005/8/colors/accent0_3"
 minVer="12.0">
 <dgm:title lang="" val=""/>
 <dgm:desc lang="" val=""/>
 <dgm:catLst>
 <dgm:cat type="mainScheme" pri="10300"/>
 </dgm:catLst>
 <dgm:styleLbl name="node0">
 ...
```

```

1 </dgm:styleLbl>
2 ...
3 </dgm:colorsDef>

```

In this example we see a sampling of a colorsDef being defined with a number of styleLbl elements held within the colorsDef. *end example*

#### Parent Elements

Root element of DrawingML Diagram Colors part

#### Child Elements

#### Subclause

catLst (Color Transform Category List)

§5.9.4.2

desc (Description)

§5.9.4.6

extLst (Extension List)

§5.9.2.13

styleLbl (Style Label)

§5.9.4.10

title (Title)

§5.9.4.11

#### Attributes

#### Description

minVer (Minimum Version)

The minimum product version that can support this color transform.

[*Example:* Consider the following example:

```

<colorsDef uniqueId="urn:colors/accent0_3" minVer="12.0">
...
</colorsDef>

```

In this example we see the minVer set to 12.0. *end example*

The possible values for this attribute are defined by the XML Schema string datatype.

uniqueId (Unique ID)

A unique id associated with the color transform definition.

[*Example:* Consider the following example:

```

<colorsDef uniqueId="urn:colors/accent0_3" minVer="12.0">
...
</colorsDef>

```

In this example we see the uniqueId set to urn:colors/accent0\_3. *end example*

The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorTransform">
 <sequence>
 <element name="title" type="CT_CTName" minOccurs="0" maxOccurs="unbounded"/>
 <element name="desc" type="CT_CTDescription" minOccurs="0" maxOccurs="unbounded"/>
 <element name="catLst" type="CT_CTCategories" minOccurs="0"/>
 <element name="styleLbl" type="CT_CTStyleLabel" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="uniqueId" type="xsd:string" use="optional" default=""/>
 <attribute name="minVer" type="xsd:string" use="optional"
 default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
</complexType>
```

#### 5.9.4.4 colorsDefHdr (Color Transform Definition Header)

This element specifies header information associated with a color transform definition. The header information is used by an application to preprocess required data in order to help with possible performance concerns associated with an initial full load of a color transform definition.

[Example: Consider the following example of a colorsDefHdr within DiagramML:

```
<colorsDefHdr uniqueId="urn:colors/accent0_1">
 <title val="Main 1" />
 <desc val="" />
 <catLst>
 <cat type="mainScheme" pri="10100" />
 </catLst>
</colorsDefHdr>
```

In this example we see a color transform definition header which defines a title and category for a set of color transforms. *end example*]

Parent Elements
colorsDefHdrLst (§5.9.4.5)

Child Elements	Subclause
catLst (Color Transform Category List)	§5.9.4.2
desc (Description)	§5.9.4.6
extLst (Extension List)	§5.9.2.13
title (Title)	§5.9.4.11

Attributes	Description
minVer (Minimum	The minimum product version that can support the associated color transform definition.

Attributes	Description
Version)	The possible values for this attribute are defined by the XML Schema string datatype.
resId (Resource ID)	This attribute is the id which associates this header to the actual color transform definition.  The possible values for this attribute are defined by the XML Schema int datatype.
uniqueId (Unique ID)	This attribute defines a unique identifier for the associated color transform definition.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ColorTransformHeader">
 <sequence>
 <element name="title" type="CT_CTName" minOccurs="1" maxOccurs="unbounded"/>
 <element name="desc" type="CT_CTDescription" minOccurs="1" maxOccurs="unbounded"/>
 <element name="catLst" type="CT_CTCategories" minOccurs="0"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="uniqueId" type="xsd:string" use="required"/>
 <attribute name="minVer" type="xsd:string" use="optional"
 default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
 <attribute name="resId" type="xsd:int" use="optional" default="0"/>
</complexType>

```

#### 5.9.4.5 colorsDefHdrLst (Color Transform Header List)

This element is simply a list of color transform definition headers and is used to consolidate multiple headers in a group.

Child Elements	Subclause
colorsDefHdr (Color Transform Definition Header)	§5.9.4.4

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ColorTransformHeaderLst">
 <sequence>
 <element name="colorsDefHdr" type="CT_ColorTransformHeader" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>

```

#### 5.9.4.6 desc (Description)

This element holds a description for a color definition. The description can be used to describe the qualities associated with a particular color transform definition.

Parent Elements
-----------------

Parent Elements
colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4)

Attributes	Description
lang (Language)	The natural language of the color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	The string which is used as the description of the color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTDescription">
 <attribute name="lang" type="xsd:string" use="optional" default=""/>
 <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

#### 5.9.4.7 effectClrLst (Effect Color List)

This element defines a list of colors applied to effects within a color transform.

[*Example:* Consider the following example of an effectClrLst in DiagramML:

```
<dgm:effectClrLst meth="repeat">
 <a:schemeClr val="dk2">
 <a:tint val="60000"/>
 </a:schemeClr>
</dgm:effectClrLst>
```

In this example we see a single color defined in the effectClrLst, more specifically we see a scheme color being utilized with a tint applied to the color. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

1

Attributes	Description
hueDir (Hue Direction)	<p>The direction around the color wheel the hue shift (if defined) will occur.</p> <p>[Example: Consider the following example of a hueDir in use:</p> <pre>&lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example an lnClrLst is defined with a hue direction defined as clockwise. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).</p>
meth (Color Application Method Type)	<p>The type of method used to apply the color transform.</p> <p>[Example: Consider the following example of a meth in use:</p> <pre>&lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example and lnClrLst is defined using the repeat color application method. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).</p>

2 The following XML Schema fragment defines the contents of this element:

3	<complexType name="CT_Colors">
4	<sequence>
5	<group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
6	</sequence>
7	<attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
8	<attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
9	</complexType>

10 **5.9.4.8 fillClrLst (Fill Color List)**

11 This element defines a list of colors which are used as fill colors in the color transform. The fill colors define the  
 12 color of the nodes in a diagram.

[*Example:* Consider the following example of a fillClrLst in DiagramML:

```
<dgm:fillClrLst meth="repeat">
 <a:schemeClr val="dk2"/>
</dgm:fillClrLst>
```

In this example the fillClrList contains a single scheme color and is utilizing the repeat method for color application. *end example*

#### Parent Elements

styleLbl (§5.9.4.10)

#### Child Elements

#### Subclause

hslClr (Hue, Saturation, Luminance Color Model)

§5.1.2.2.13

prstClr (Preset Color)

§5.1.2.2.22

schemeClr (Scheme Color)

§5.1.2.2.29

scrgbClr (RGB Color Model - Percentage Variant)

§5.1.2.2.30

srgbClr (RGB Color Model - Hex Variant)

§5.1.2.2.32

sysClr (System Color)

§5.1.2.2.33

#### Attributes

#### Description

hueDir (Hue Direction)

The direction around the color wheel the hue shift (if defined) will occur.

[*Example:* Consider the following example of a hueDir in use:

```
<dgm:lnClrLst hueDir="cw" meth="repeat">
 <a:schemeClr val="dk2">
 <a:tint val="60000"/>
 </a:schemeClr>
</dgm:lnClrLst>
```

In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*

The possible values for this attribute are defined by the ST\_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)

The type of method used to apply the color transform.

[*Example:* Consider the following example of a meth in use:

```
<dgm:lnClrLst hueDir="cw" meth="repeat">
 <a:schemeClr val="dk2">
```

Attributes	Description
	<pre>&lt;a:tint val="60000"/&gt; &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example and lnClrLst is defined using the repeat color application method. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
 <sequence>
 <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
 <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

#### 5.9.4.9 lnClrLst (Line Color List)

This element defines a list of colors which are used as line colors in the color transform. The line colors define the color of the lines used on a given node in a diagram

[Example: Consider the following example of a lnClrLst in DiagramML:

```
<dgm:lnClrLst meth="repeat">
 <a:schemeClr val="dk2"/>
</dgm:lnClrLst>
```

In this example the lnClrList contains a single scheme color and is utilizing the repeat method for color application. *end example*

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

1

Attributes	Description
hueDir (Hue Direction)	<p>The direction around the color wheel the hue shift (if defined) will occur.</p> <p>[Example: Consider the following example of a hueDir in use:</p> <pre>&lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example an lnClrLst is defined with a hue direction defined as clockwise. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).</p>
meth (Color Application Method Type)	<p>The type of method used to apply the color transform.</p> <p>[Example: Consider the following example of a meth in use:</p> <pre>&lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example and lnClrLst is defined using the repeat color application method. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Colors">
4 <sequence>
5 <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
8 <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
9 </complexType>
```

10 **5.9.4.10 styleLbl (Style Label)**

11 This element defines a style label. The style label is used to define a color transform that is applied to a given  
 12 node in a diagram.

1 [Example: Consider the following example of a styleLbl in DiagramML:

```

2 <dgm:styleLbl name="exampleStyleLabel">
3 <dgm:fillClrLst>
4 <a:schemeClr val="accent2"/>
5 <a:schemeClr val="accent3"/>
6 </dgm:fillClrLst>
7 <dgm:linClrLst meth="repeat">
8 <a:schemeClr val="lt1"/>
9 </dgm:linClrLst>
10 <dgm:effectClrLst/>
11 <dgm:txLinClrLst/>
12 <dgm:txFillClrLst/>
13 <dgm:txEffectClrLst/>
14 </dgm:styleLbl>

```

15 In this example we see a style label defined in its entirety. This style label can be used on a layout node in order  
16 to define the color transform that is to be applied to the node. *end example]*

17

Parent Elements
colorsDef (§5.9.4.3)

18

Child Elements	Subclause
effectClrLst (Effect Color List)	§5.9.4.7
extLst (Extension List)	§5.9.2.13
fillClrLst (Fill Color List)	§5.9.4.8
linClrLst (Line Color List)	§5.9.4.9
txEffectClrLst (Text Effect Color List)	§5.9.4.12
txFillClrLst (Text Fill Color List)	§5.9.4.13
txLinClrLst (Text Line Color List)	§5.9.4.14

Attributes	Description
name (Name)	<p>A name given to the style label. This name can be referenced by layout nodes in order to apply the style label to the layout node.</p> <p>[Example: Consider the following example of a styleLbl in DiagramML:</p> <pre> &lt;dgm:styleLbl name="exampleStyleLabel"&gt; ... &lt;/dgm:styleLbl&gt; </pre> <p>In this example we see a style label defined with the name exampleStyleLabel</p>

Attributes	Description
	defined. <i>end example</i> ]  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CTStyleLabel">
 <sequence>
 <element name="fillClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
 <element name="linClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
 <element name="effectClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
 <element name="txLinClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
 <element name="txFillClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
 <element name="txEffectClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="xsd:string" use="required"/>
</complexType>

```

#### 5.9.4.11 title (Title)

The name or title given to the color definition header.

Parent Elements
colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4)

Attributes	Description
lang (Language)	The natural language of the title or description of a color transform definition.  The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	A string used for a description of a color transform definition.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CTName">
 <attribute name="lang" type="xsd:string" use="optional" default=""/>
 <attribute name="val" type="xsd:string" use="required"/>
</complexType>

```

#### 5.9.4.12 txEffectClrLst (Text Effect Color List)

This element defines a list of colors which are used as text effect colors in the color transform. The text effect colors define the color of the text effects used on a given node in a diagram

[Example: Consider the following example of a txEffectClrLst in DiagramML:

```

1 <dgm:txEffectClrLst meth="repeat">
2 <a:schemeClr val="dk2"/>
3 </dgm:txEffectClrLst>

```

4 In this example the txEffectClrLst contains a single scheme color and is utilizing the repeat method for color  
5 application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

6

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

7

Attributes	Description
hueDir (Hue Direction)	<p>The direction around the color wheel the hue shift (if defined) will occur.</p> <p>[<i>Example:</i> Consider the following example of a hueDir in use:</p> <pre> &lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt; </pre> <p>In this example an lnClrLst is defined with a hue direction defined as clockwise. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).</p>
meth (Color Application Method Type)	<p>The type of method used to apply the color transform.</p> <p>[<i>Example:</i> Consider the following example of a meth in use:</p> <pre> &lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; </pre>

Attributes	Description
	<p><code>&lt;/dgm:lnClrLst&gt;</code></p> <p>In this example and <code>lnClrLst</code> is defined using the <code>repeat</code> color application method. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_ClrAppMethod</code> simple type (§5.9.7.16).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Colors">
 <sequence>
 <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
 <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>

```

#### 5.9.4.13 txFillClrLst (Text Fill Color List)

This element defines a list of colors which are used as text colors in the color transform. The text colors define the color of the text used in a given node in a diagram

[Example: Consider the following example of a `txFillClrLst` in DiagramML:

```

<dgm:txFillClrLst meth="repeat">
 <a:schemeClr val="dk2"/>
</dgm:txFillClrLst>

```

In this example the `txFillClrLst` contains a single scheme color and is utilizing the `repeat` method for color application. *end example*

Parent Elements
<code>styleLbl</code> (§5.9.4.10)

Child Elements	Subclause
<code>hslClr</code> (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
<code>prstClr</code> (Preset Color)	§5.1.2.2.22
<code>schemeClr</code> (Scheme Color)	§5.1.2.2.29
<code>scrgbClr</code> (RGB Color Model - Percentage Variant)	§5.1.2.2.30
<code>srgbClr</code> (RGB Color Model - Hex Variant)	§5.1.2.2.32
<code>sysClr</code> (System Color)	§5.1.2.2.33

Attributes	Description
hueDir (Hue Direction)	<p>The direction around the color wheel the hue shift (if defined) will occur.</p> <p>[<i>Example:</i> Consider the following example of a hueDir in use:</p> <pre>&lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example an lnClrLst is defined with a hue direction defined as clockwise. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).</p>
meth (Color Application Method Type)	<p>The type of method used to apply the color transform.</p> <p>[<i>Example:</i> Consider the following example of a meth in use:</p> <pre>&lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt;</pre> <p>In this example and lnClrLst is defined using the repeat color application method. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Colors">
3 <sequence>
4 <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
5 </sequence>
6 <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
7 <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
8 </complexType>
```

#### 9 5.9.4.14 txLinClrLst (Text Line Color List)

10 This element defines a list of colors which are used as text line colors in the color transform. The text line colors  
11 define the color of the line on text used in a given node in a diagram

12 [*Example:* Consider the following example of a txLinClrLst in DiagramML:

```

1 <dgm:txLinClrLst meth="repeat">
2 <a:schemeClr val="dk2"/>
3 </dgm:txLinClrLst>

```

4 In this example the txLinClrLst contains a single scheme color and is utilizing the repeat method for color  
5 application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

6

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

7

Attributes	Description
hueDir (Hue Direction)	<p>The direction around the color wheel the hue shift (if defined) will occur.</p> <p>[<i>Example:</i> Consider the following example of a hueDir in use:</p> <pre> &lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; &lt;/dgm:lnClrLst&gt; </pre> <p>In this example an lnClrLst is defined with a hue direction defined as clockwise. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).</p>
meth (Color Application Method Type)	<p>The type of method used to apply the color transform.</p> <p>[<i>Example:</i> Consider the following example of a meth in use:</p> <pre> &lt;dgm:lnClrLst hueDir="cw" meth="repeat"&gt;   &lt;a:schemeClr val="dk2"&gt;     &lt;a:tint val="60000"/&gt;   &lt;/a:schemeClr&gt; </pre>

Attributes	Description
	<code>&lt;/dgm:lnClrLst&gt;</code>  In this example and <code>lnClrLst</code> is defined using the <code>repeat</code> color application method. <i>end example</i>  The possible values for this attribute are defined by the <code>ST_ClrAppMethod</code> simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Colors">
 <sequence>
 <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
 <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>

```

## 5.9.5 Style Definitions

This section describes the styling information to be associated with a diagram.

### 5.9.5.1 cat (Category)

The category in the user interface where this quick style will display in the user interface.

[Example: Consider the following example of a cat in use in DiagramML:

```

<catLst>
 <cat type="3D" pri="11100"/>
</catLst>

```

In this example we see a 3D category type being defined with a priority of 11100. *end example*

Parent Elements
catLst (§5.9.5.2)

Attributes	Description
pri (Priority)	The priority within the category for this style determines the order in which it will display in the user interface. Lower numbers are displayed at the beginning of the list.  The possible values for this attribute are defined by the XML Schema <code>unsignedInt</code> datatype.
type (Category Type)	Category type. This is used to organize the quick style in the user interface.  The possible values for this attribute are defined by the XML Schema <code>anyURI</code> datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDCategory">
 <attribute name="type" type="xsd:anyURI" use="required"/>
 <attribute name="pri" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 5.9.5.2 catLst (Category List)

This element is simply a list of categories.

[*Example:* Consider the following example of a catLst in use in DiagramML:

```
<catLst>
 <cat type="Simple" pri="10000"/>
 <cat type="3D" pri="11100"/>
</catLst>
```

In this example two categories defined in the category list. *end example*]

Parent Elements
styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8)

Child Elements	Subclause
cat (Category)	§5.9.5.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDCategories">
 <sequence minOccurs="0" maxOccurs="unbounded">
 <element name="cat" type="CT_SDCategory" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.5.3 desc (Style Label Description)

This element defines a description for a style label definition. The description is simply a string describing the characteristics of the style label definition.

[*Example:* Consider the following example of the desc element in DiagramML:

```
<desc lang="" val="3-D Style 1"/>
```

In this example we define the description to be 3-D Style 1. *end example*]

Parent Elements
styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8)

Attributes	Description
lang (Natural Language)	The natural language of the title or description of this quick style. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	The string used for the description. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDDescription">
 <attribute name="lang" type="xsd:string" use="optional" default=""/>
 <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

#### 5.9.5.4 presLayoutVars (Presentation Layout Variables)

This element specified the layout property set. This set of properties determine different aspects concerning the layout of a diagram. All of the elements associated with enabling or disabling aspects of the user interface are also defined here.

Parent Elements
prSet (§5.9.3.4)

Child Elements	Subclause
animLvl (Level Animation)	§5.9.6.1
animOne (One by One Animation String)	§5.9.6.2
bulletEnabled (Show Insert Bullet)	§5.9.6.3
chMax (Maximum Children)	§5.9.6.4
chPref (Preferred Number of Children)	§5.9.6.5
dir (Diagram Direction)	§5.9.6.6
hierBranch (Organization Chart Branch Style)	§5.9.6.7
orgChart (Show Organization Chart User Interface)	§5.9.6.8
resizeHandles (Shape Resize Style)	§5.9.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutVariablePropertySet">
 <sequence>
 <element name="orgChart" type="CT_OrgChart" minOccurs="0" maxOccurs="1"/>
 <element name="chMax" type="CT_ChildMax" minOccurs="0" maxOccurs="1"/>
 <element name="chPref" type="CT_ChildPref" minOccurs="0" maxOccurs="1"/>
 <element name="bulletEnabled" type="CT_BulletEnabled" minOccurs="0" maxOccurs="1"/>
 <element name="dir" type="CT_Direction" minOccurs="0" maxOccurs="1"/>
 <element name="hierBranch" type="CT_HierBranchStyle" minOccurs="0" maxOccurs="1"/>
 <element name="animOne" type="CT_AnimOne" minOccurs="0" maxOccurs="1"/>
 <element name="animLvl" type="CT_AnimLvl" minOccurs="0" maxOccurs="1"/>
 <element name="resizeHandles" type="CT_ResizeHandles" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.9.5.5 scene3d (3-D Scene)

The 3-D scene which consists of a camera, a light rig, and an optional backdrop to catch shadows.

Parent Elements
styleDef (§5.9.5.7); styleLbl (§5.9.5.10)

Child Elements	Subclause
backdrop (Backdrop Plane)	§5.1.7.2
camera (Camera)	§5.1.7.5
extLst (Extension List)	§5.1.2.1.15
lightRig (Light Rig)	§5.1.7.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scene3D">
 <sequence>
 <element name="camera" type="CT_Camera" minOccurs="1" maxOccurs="1"/>
 <element name="lightRig" type="CT_LightRig" minOccurs="1" maxOccurs="1"/>
 <element name="backdrop" type="CT_Backdrop" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.9.5.6 sp3d (3-D Shape Properties)

A set of 3-D properties which a shape can contain.

Parent Elements
styleLbl (§5.9.5.10)

Child Elements	Subclause
bevelB (Bottom Bevel)	§5.1.7.3
bevelT (Top Bevel)	§5.1.7.4
contourClr (Contour Color)	§5.1.7.6
extLst (Extension List)	§5.1.2.1.15
extrusionClr (Extrusion Color)	§5.1.7.7

1

Attributes	Description
contourW (Contour Width)  Namespace: .../drawingml/2006/main	<p>Defines the width of the contour on the shape.</p> <p>[<i>Example:</i> Consider the following example of a contourW in use within the sp3d element:</p> <pre> &lt;a:sp3d extrusionH="165100" contourW="50800"   prstMaterial="plastic"&gt;   &lt;a:bevelT w="254000" h="254000"/&gt;   &lt;a:bevelB w="254000" h="254000"/&gt;   &lt;a:extrusionClr&gt;     &lt;a:srgbClr val="FF0000"/&gt;   &lt;/a:extrusionClr&gt;   &lt;a:contourClr&gt;     &lt;a:schemeClr val="accent3"/&gt;   &lt;/a:contourClr&gt; &lt;/a:sp3d&gt; </pre> <p>In this example, we see a countourW defined as 50800. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
extrusionH (Extrusion Height)  Namespace: .../drawingml/2006/main	<p>Defines the height of the extrusion applied to the shape.</p> <p>[<i>Example:</i> Consider the following example of an extrusionH in use within the sp3d element:</p> <pre> &lt;a:sp3d extrusionH="165100" contourW="50800"   prstMaterial="plastic"&gt;   &lt;     &lt;a:bevelT w="254000" h="254000"/&gt;     &lt;a:bevelB w="254000" h="254000"/&gt;     &lt;a:extrusionClr&gt;       &lt;a:srgbClr val="FF0000"/&gt;     &lt;/a:extrusionClr&gt;     &lt;a:contourClr&gt;       &lt;a:schemeClr val="accent3"/&gt;     &lt;/a:contourClr&gt;   &lt;/a:sp3d&gt; </pre>

Attributes	Description
	<p><code>&lt;/a:sp3d&gt;</code></p> <p>In this example, we see a <code>extrusionH</code> defined as <code>165100</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_PositiveCoordinate</code> simple type (§5.1.12.42).</p>
<p><code>prstMaterial</code> (Preset Material Type)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape.</p> <p>[<i>Example:</i> Consider the following example of a <code>prstMaterial</code> in use within the <code>sp3d</code> element:</p> <pre> &lt;a:sp3d extrusionH="165100" contourW="50800"   prstMaterial="plastic"&gt;   &lt;a:bevelT w="254000" h="254000"/&gt;   &lt;a:bevelB w="254000" h="254000"/&gt;   &lt;a:extrusionClr&gt;     &lt;a:srgbClr val="FF0000"/&gt;   &lt;/a:extrusionClr&gt;   &lt;a:contourClr&gt;     &lt;a:schemeClr val="accent3"/&gt;   &lt;/a:contourClr&gt; &lt;/a:sp3d&gt; </pre> <p>In this example, we see a <code>prstMaterial</code> defined as <code>plastic</code>. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_PresetMaterialType</code> simple type (§5.1.12.50).</p>
<p><code>z</code> (Shape Depth)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Defines the <code>z</code> coordinate for the 3D shape.</p> <p>The possible values for this attribute are defined by the <code>ST_Coordinate</code> simple type (§5.1.12.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape3D">
 <sequence>
 <element name="bevelT" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
 <element name="bevelB" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
 <element name="extrusionClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="contourClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="z" type="ST_Coordinate" use="optional" default="0"/>
 <attribute name="extrusionH" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="contourW" type="ST_PositiveCoordinate" use="optional" default="0"/>
 <attribute name="prstMaterial" type="ST_PresetMaterialType" use="optional" default="warmMatte"/>
</complexType>
```

#### 5.9.5.7 styleDef (Style Definition)

This element is the root tag for a style definition.

[Example: Consider the following example of a styleDef in DiagramML:

```
<dgm:styleDef
 xmlns:dgm="http://schemas.openxmlformats.org/drawingml/2006/3/diagram"
 xmlns:a="http://schemas.openxmlformats.org/drawingml/2006/3/main"
 uniqueId="urn:microsoft.com/office/officeart/2005/8/quickstyle/3d1"
 minVer="12.0">
 <dgm:title lang="" val="3-D Style 1"/>
 <dgm:desc lang="" val="3-D Style 1"/>
 <dgm:catLst>
 <dgm:cat type="3D" pri="11100"/>
 </dgm:catLst>
 <dgm:scene3d>
 <a:camera prst="orthographicFront"/>
 <a:lightRig rig="threePt" dir="t"/>
 </dgm:scene3d>
 <dgm:style>
 ...
 </dgm:style>
 <dgm:styleLbl name="node0">
 <dgm:scene3d>
 <a:camera prst="orthographicFront"/>
 <a:lightRig rig="flat" dir="t"/>
 </dgm:scene3d>
 <dgm:sp3d prstMaterial="flat">
 <a:bevelT w="120900" h="88900"/>
 <a:bevelB w="88900" h="31750" prst="angle"/>
 </dgm:sp3d>
```

```

1 <dgm:txPr/>
2 <dgm:style>
3 <a:lnRef idx="0">
4 <a:scrgbClr r="0" g="0" b="0"/>
5 </a:lnRef>
6 <a:fillRef idx="3">
7 <a:scrgbClr r="0" g="0" b="0"/>
8 </a:fillRef>
9 <a:effectRef idx="2">
10 <a:scrgbClr r="0" g="0" b="0"/>
11 </a:effectRef>
12 <a:fontRef idx="minor">
13 <a:schemeClr val="lt1"/>
14 </a:fontRef>
15 </dgm:style>
16 </dgm:styleLbl>
17 ...
18 </styleDef>

```

In this example we see a styleDef being defined along with many properties. *end example*]

Parent Elements
Root element of DrawingML Diagram Style part

Child Elements	Subclause
catLst (Category List)	§5.9.5.2
desc (Style Label Description)	§5.9.5.3
extLst (Extension List)	§5.9.2.13
scene3d (3-D Scene)	§5.9.5.5
styleLbl (Style Label)	§5.9.5.10
title (Title)	§5.9.5.11

Attributes	Description
minVer (Minimum Version)	<p>The minimum product version that can support this quick style.</p> <p>[Example: Consider the following example of a styleDef in DiagramML:</p> <pre>&lt;styleDef uniqueId="urn:quickstyle/3d1" minVer="12.0"&gt;</pre> <p>...</p>

Attributes	Description
	<p><code>&lt;/styleDef&gt;</code></p> <p>In this example we see the minVer defined to be 12.0. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
uniqueId (Unique Style ID)	<p>Unique ID that identifies a style.</p> <p>[Example: Consider the following example of a styleDef in DiagramML:</p> <p><code>&lt;styleDef uniqueId="urn:quickstyle/3d1" minVer="12.0"&gt;</code></p> <p>...</p> <p><code>&lt;/styleDef&gt;</code></p> <p>In this example we see the uniqueId defined to be urn:quickstyle/3d1. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_StyleDefinition">
3 <sequence>
4 <element name="title" type="CT_SDName" minOccurs="0" maxOccurs="unbounded"/>
5 <element name="desc" type="CT_SDDescription" minOccurs="0" maxOccurs="unbounded"/>
6 <element name="catLst" type="CT_SDCategories" minOccurs="0"/>
7 <element name="scene3d" type="a:CT_Scene3D" minOccurs="0" maxOccurs="1"/>
8 <element name="styleLbl" type="CT_StyleLabel" minOccurs="1" maxOccurs="unbounded"/>
9 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
10 </sequence>
11 <attribute name="uniqueId" type="xsd:string" use="optional" default=""/>
12 <attribute name="minVer" type="xsd:string" use="optional"
13 default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
14 </complexType>
```

15 **5.9.5.8 styleDefHdr (Style Definition Header)**

16 This element specifies header information associated with a style definition. The header information is used by  
17 an application to preprocess required data in order to help with possible performance concerns associated with  
18 an initial full load of a color transform definition.

19 [Example: Consider the following example of a styleDefHdr element within DiagramML:

```
20 <styleDefHdr uniqueId="urn:quickstyle/3d1">
21 <title val="3D" />
```

```

1 <desc val="" />
2 <catLst>
3 <cat type="3D" pri="10100" />
4 </catLst>
5 </ styleDefHdr >

```

In this example we see a style definition header which defines a title and category for a set of style definitions.  
*end example]*

#### Parent Elements

styleDefHdrLst (§5.9.5.9)

#### Child Elements

#### Subclause

catLst (Category List)

§5.9.5.2

desc (Style Label Description)

§5.9.5.3

extLst (Extension List)

§5.9.2.13

title (Title)

§5.9.5.11

#### Attributes

#### Description

minVer (Minimum Version)

The minimum product version that can support this quick style.

The possible values for this attribute are defined by the XML Schema string datatype.

resId (Resource ID)

This attribute is the id which associates this header to the actual style definition part.

The possible values for this attribute are defined by the XML Schema int datatype.

uniqueId (Unique Style ID)

This attribute defines a unique identifier for the associated style definition.

The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_StyleDefinitionHeader">
12 <sequence>
13 <element name="title" type="CT_SDName" minOccurs="1" maxOccurs="unbounded"/>
14 <element name="desc" type="CT_SDDescription" minOccurs="1" maxOccurs="unbounded"/>
15 <element name="catLst" type="CT_SDCategories" minOccurs="0"/>
16 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
17 </sequence>
18 <attribute name="uniqueId" type="xsd:string" use="required"/>
19 <attribute name="minVer" type="xsd:string" use="optional"
20 default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
21 <attribute name="resId" type="xsd:int" use="optional" default="0"/>
22 </complexType>

```

### 5.9.5.9 styleDefHdrLst (List of Style Definition Headers)

This element is simply a list of style definition headers and is used to consolidate multiple headers into one group.

Child Elements	Subclause
styleDefHdr (Style Definition Header)	§5.9.5.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleDefinitionHeaderLst">
 <sequence>
 <element name="styleDefHdr" type="CT_StyleDefinitionHeader" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 5.9.5.10 styleLbl (Style Label)

This element defines the actual style which is applied to a node in a diagram. The style is referenced from within layout node. The style label contains formatting (without defining color) such as the 3D properties and text properties associated with a shape.

[Example: Consider the following example of a styleLbl in DiagramML:

```
<styleLbl name="node0">
 <scene3d>
 <camera prst="orthographicFront"/>
 <lightRig rig="flat" dir="t"/>
 </scene3d>
 <sp3d prstMaterial="flat">
 <bevelT w="120900" h="88900"/>
 <bevelB w="88900" h="31750" prst="angle"/>
 </sp3d>
 <txPr/>
 <style>
 <lnRef idx="0">
 <scrgbClr r="0" g="0" b="0"/>
 </lnRef>
 <fillRef idx="3">
 <scrgbClr r="0" g="0" b="0"/>
 </fillRef>
 <effectRef idx="2">
 <scrgbClr r="0" g="0" b="0"/>
 </effectRef>
 <fontRef idx="minor">
 <schemeClr val="lt1"/>
 </fontRef>
 </style>
</styleLbl>
```

```

1 </fontRef>
2 </style>
3 </styleLbl>

```

In this example we see a styleLbl defined which sets 3D properties for the scene, shape 3D properties, line, fill, effect and font properties. *end example*]

Parent Elements
styleDef (§5.9.5.7)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13
scene3d (3-D Scene)	§5.9.5.5
sp3d (3-D Shape Properties)	§5.9.5.6
style (Shape Style)	§5.9.2.28
txPr (Text Properties)	§5.9.5.12

Attributes	Description
name (Style Name)	The name of the style. This appears as the tooltip in the user interface.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_StyleLabel">
 <sequence>
 <element name="scene3d" type="a:CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="sp3d" type="a:CT_Shape3D" minOccurs="0" maxOccurs="1"/>
 <element name="txPr" type="CT_TextProps" minOccurs="0" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="xsd:string" use="required"/>
</complexType>

```

### 5.9.5.11 title (Title)

This element defines the title given to a style definition header. The title is simply a name for the style definition.

[Example: Consider the following example of title being used in DiagramML:

```

<styleDefHdr uniqueId="urn:quickstyle/3d1" minVer="12.0">
 <title val="My Title"/>

```

```

1 <desc val="My Description"/>
2
3 ...
4
5 </styleDefHdr>

```

In this example we see the title being set to My Title. *end example*]

Parent Elements
styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8)

Attributes	Description
lang (Natural Language)	The natural language of the title or description of this quick style. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	The string used for the description. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

9 <complexType name="CT_SDName">
10 <attribute name="lang" type="xsd:string" use="optional" default=""/>
11 <attribute name="val" type="xsd:string" use="required"/>
12 </complexType>

```

### 5.9.5.12 txPr (Text Properties)

This element defines special text formatting that can be applied to text through a style label.

Parent Elements
styleLbl (§5.9.5.10)

Child Elements	Subclause
flatTx (No text in 3D scene)	§5.1.7.8
sp3d (Apply 3D shape properties)	§5.1.7.12

The following XML Schema fragment defines the contents of this element:

```

17 <complexType name="CT_TextProps">
18 <sequence>
19 <group ref="a:EG_Text3D" minOccurs="0" maxOccurs="1"/>
20 </sequence>
21 </complexType>

```

## 5.9.6 Layout Definition

This section specifies the node layout information to be associated with a diagram.

### 5.9.6.1 animLvl (Level Animation)

This variable is used to indicate the animate by level string which is displayed to a user in the user interface.

[Example: Consider the following example of animLvl in use in DiagramML:

```
<varLst>
 <chMax val="1" />
 <dir val="norm" />
 <animLvl val="ctr" />
 <resizeHandles val="exact" />
</varLst>
```

In this example we see that the animLvl is set to ctr. This is being defined in a radial type diagram which will allow the user to specify that animation is to start at the center of the diagram. *end example]*

#### Parent Elements

presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

#### Attributes

val (Level Animation Value)

#### Description

This attribute indicates the string to use for level animation in the user interface.

The possible values for this attribute are defined by the ST\_AnimLvlStr simple type (§5.9.7.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimLvl">
 <attribute name="val" type="ST_AnimLvlStr" default="none" use="optional"/>
</complexType>
```

### 5.9.6.2 animOne (One by One Animation String)

This variable is used to indicate the string to use for one-by-one animation in the user interface. This is used primarily when defining hierarchical diagrams to specify different ways animations applies to different levels of the diagram.

[Example: Consider the following example of animOne used in a hierarchical type diagram:

```
<varLst>
 <chPref val="1" />
 <dir val="norm" />
 <animOne val="branch" />
```

```

1 <animLvl val="lvl" />
2 <resizeHandles val="exact" />
3 </varLst>

```

In this example we see that the animOne element is defined to animate the diagram per branch. *end example*

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (One By One Animation Value)	Specifies the type of one-by-one animation to use for a diagram.  The possible values for this attribute are defined by the ST_AnimOneStr simple type (§5.9.7.3).

The following XML Schema fragment defines the contents of this element:

```

7 <complexType name="CT_AnimOne">
8 <attribute name="val" type="ST_AnimOneStr" default="one" use="optional"/>
9 </complexType>

```

### 5.9.6.3 bulletEnabled (Show Insert Bullet)

This element is used to indicate when to enable the ‘Insert Bullet’ button in the user interface.

*[Example: Consider the following example of bulletEnabled in DiagramML:*

```

13 <varLst>
14 <bulletEnabled val="true" />
15 </varLst>

```

In this example we see that the insert button in the user interface is to be enabled when the focus is within the containing layout node. *end example*

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Show Insert Bullet Value)	This attribute is used to indicate when to enable the ‘Insert Bullet’ button. A value of true will enable the insert bullet button.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BulletEnabled">
 <attribute name="val" type="xsd:boolean" default="false" use="optional"/>
</complexType>
```

#### 5.9.6.4 chMax (Maximum Children)

This element is used to indicate when to enable and disable the user interface components associated with adding a new shape to a diagram. This element defines a max number of nodes a diagram can support through the user interface directly.

[Example: Consider the following example of chMax usage in DiagramML:

```
<varLst>
 <chMax val="5"/>
 <dir val="norm"/>
 <resizeHandles val="exact" />
</varLst>
```

In this example we define the user interface to only be enabled to insert five nodes. *end example]*

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Maximum Children Value)	This attribute indicates the maximum number of children the node can have before the user interface should be disabled. A value of -1 indicates an infinite number of children. Default value is -1.  The possible values for this attribute are defined by the ST_NodeCount simple type (§5.9.7.43).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChildMax">
 <attribute name="val" type="ST_NodeCount" default="-1" use="optional"/>
</complexType>
```

#### 5.9.6.5 chPref (Preferred Number of Children)

This variable indicates the number of children that the current node prefers to have. This determines what the next action of the 'Add Shape' button should be in the user interface.

[Example: Consider the following example of chPref being used in DiagramML:

```
<varLst>
 <chMax val="3" />
```

```

1 <chPref val="1" />
2 <dir val="norm" />
3 <animLvl val="lvl" />
4 <resizeHandles val="rel" />
5 </varLst>

```

In this example, chPref is set to a single node and the user interface will disable after a single node has been inserted. *end example]*

#### Parent Elements

presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

#### Attributes

#### Description

val (Preferred Number of Children Value)

This attribute indicates the number of children that the current node prefers to have. This determines what the next action of the 'Add Shape' button should be. A value of -1 indicates an infinite number of children. Default value is -1.

The possible values for this attribute are defined by the ST\_NodeCount simple type (§5.9.7.43).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ChildPref">
 <attribute name="val" type="ST_NodeCount" default="-1" use="optional"/>
</complexType>

```

### 5.9.6.6 dir (Diagram Direction)

This element indicates whether the diagram should switch direction. This element provides the ability to define different behavior for diagrams considering LTR or RTL directions.

#### Parent Elements

presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

#### Attributes

#### Description

val (Diagram Direction Value)

This variable indicates whether the diagram should switch direction.

The possible values for this attribute are defined by the ST\_Direction simple type (§5.9.7.24).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Direction">
 <attribute name="val" type="ST_Direction" default="norm" use="optional"/>
</complexType>

```

### 5.9.6.7 hierBranch (Organization Chart Branch Style)

This element defines the layout style of a branch in an organizational chart.

[*Example:* Consider the following example of hierBranch being used in DiagramML:

```
<varLst>
 <hierBranch val="init" />
</varLst>
```

In this example the value of hierBranch is defined as `init` which will be a kind of not set state, or initial state.  
*end example]*

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Organization Chart Branch Style Value)	<p>The value of this attribute indicates the layout style of a branch in an organization chart. The default value is <code>std</code>.</p> <p>The possible values for this attribute are defined by the <code>ST_HierBranchStyle</code> simple type (§5.9.7.35).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HierBranchStyle">
 <attribute name="val" type="ST_HierBranchStyle" default="std" use="optional"/>
</complexType>
```

### 5.9.6.8 orgChart (Show Organization Chart User Interface)

This element is used to indicate when to show user interface controls specifically associated with organizational charts such as being able to add an assistant to a selected node.

[*Example:* Consider the following example of orgChart used in DiagramML:

```
<varLst>
 <orgChart val="true" />
 <chPref val="1" />
 <dir val="norm" />
 <animOne val="branch" />
 <animLvl val="lvl" />
 <resizeHandles val="rel" />
</varLst>
```

In this example we set the orgChart value to `true` indicating that the organizational chart specific user interface controls are to be enabled when the containing diagram is used. *end example]*

1

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OrgChart">
4 <attribute name="val" type="xsd:boolean" default="false" use="optional"/>
5 </complexType>
```

## 6 5.9.7 Simple Types

7 This is the complete list of simple types in the  
8 <http://schemas.openxmlformats.org/drawingml/2006/diagram> namespace.

### 9 5.9.7.1 ST\_AlgorithmType (Algorithm Types)

10 Types of available algorithms.

11 This simple type's contents are a restriction of the XML Schema token datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
composite (Composite)	The composite algorithm specifies the size and position for all child layout nodes. You can use it to create graphics with a predetermined layout or in combination with other algorithms to create more complex shapes.
conn (Connector Algorithm)	The connector algorithm lays out and routes connecting lines, arrows, and shapes between layout nodes.
cycle (Cycle Algorithm)	The cycle algorithm lays out child layout nodes around a circle or portion of a circle using equal angle spacing.
hierChild (Hierarchy Child Algorithm)	The hierarchy child algorithm works with the hierRoot algorithm to create hierarchical tree layouts. This algorithm aligns and positions its child layout nodes in a linear path under the hierRoot layout node.
hierRoot (Hierarchy Root Algorithm)	The hierarchy root algorithm works with the hierChild algorithm to create hierarchical tree layouts. The hierRoot algorithm aligns and positions the hierRoot

Enumeration Value	Description
	layout node in relation to the hierChild layout nodes.
lin (Linear Algorithm)	The linear algorithm lays out child layout nodes along a linear path.
pyra (Pyramid Algorithm)	The pyramid algorithm lays out child layout nodes along a vertical path and works with the trapezoid shape to create a pyramid.
snake (Snake Algorithm)	The snake algorithm lays out child layout nodes along a linear path in two dimensions, allowing the linear flow to continue across multiple rows or columns.
sp (Space Algorithm)	The space algorithm is used to specify a minimum space between other layout nodes or as an indication to do nothing with the layout node's size and position.
tx (Text Algorithm)	The text algorithm sizes text to fit inside a shape and controls its margins and alignment.

1

Referenced By
alg@type (§5.9.2.3)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_AlgorithmType" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="composite"/>
6 <enumeration value="conn"/>
7 <enumeration value="cycle"/>
8 <enumeration value="hierChild"/>
9 <enumeration value="hierRoot"/>
10 <enumeration value="pyra"/>
11 <enumeration value="lin"/>
12 <enumeration value="sp"/>
13 <enumeration value="tx"/>
14 <enumeration value="snake"/>
15 </restriction>
16 </simpleType>

```

### 17 5.9.7.2 ST\_AnimLvlStr (Animation Level String Definition)

18 This simple type specifies the possible values for the string that should be displayed by a consumer for level  
19 animation of this diagram.

20 This simple type's contents are a restriction of the XML Schema token datatype.

21 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
ctr (From Center Animation)	This value specifies that the consumer shall allow "From Center At Once" or "From Center One by One" animation styles for this diagram.
lvl (By Level Animation)	This value specifies that the consumer shall display "By Level" animation types for this diagram.
none (Disable Level At Once)	This value specifies that the consumer shall disable level at once animation.

1

Referenced By
animLvl@val (§5.9.6.1); ST_FunctionValue (§5.9.7.32)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_AnimLvlStr" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="none"/>
6 <enumeration value="lvl"/>
7 <enumeration value="ctr"/>
8 </restriction>
9 </simpleType>
```

### 10 5.9.7.3 ST\_AnimOneStr (One by One Animation Value Definition)

11 This simple type defines the possible values for the string to use for one by one animation in the UI. Default  
12 value is one.

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
branch (By Branch One By One)	This value specifies that the one by one animation string in the user interface should read "By Branch One By One".
none (Disable One-by-One)	This value specifies that the consumer should disable one by one animation.
one (One By One)	This value specifies that the one by one animation string in the user interface should read "One By One".

15

Referenced By
animOne@val (§5.9.6.2); ST_FunctionValue (§5.9.7.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimOneStr" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="one"/>
 <enumeration value="branch"/>
 </restriction>
</simpleType>
```

#### 5.9.7.4 ST\_ArrowheadStyle (Arrowhead Styles)

This simple type defines different arrowhead style types for connectors.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
arr (Arrowhead Present)	Specifies that an arrowhead is to be used on the connector.
auto (Auto)	Specifies that the algorithm defines if an arrowhead is to be used on a connector.
noArr (No Arrowhead)	Specifies no arrowhead is to be used on the connector.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ArrowheadStyle" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="auto"/>
 <enumeration value="arr"/>
 <enumeration value="noArr"/>
 </restriction>
</simpleType>
```

#### 5.9.7.5 ST\_AutoTextRotation (Auto Text Rotation)

This simple type defines how text rotates within a shape when the shape is rotated by an algorithm during layout.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
grav (Gravity)	Specifies that when the angle of the text hits the

Enumeration Value	Description
	threshold of 90 degrees and 180 degrees, the text rotates by 180 degrees.
none (None)	Specifies that text always rotates with the shape.
upr (Upright)	Specifies that when the text angle hits 45, 135, 225, or 315 degree thresholds, then it rotates by negative 90 degrees.

1

Referenced By
ST_ParameterVal (§5.9.7.49)

2 The following XML Schema fragment defines the contents of this simple type:

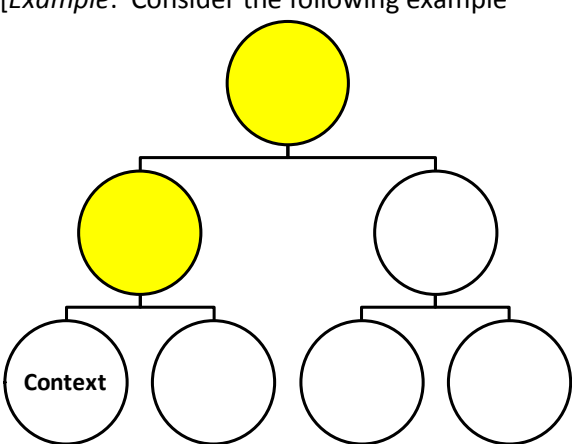

```
3 <simpleType name="ST_AutoTextRotation" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="none"/>
6 <enumeration value="upr"/>
7 <enumeration value="grav"/>
8 </restriction>
9 </simpleType>
```

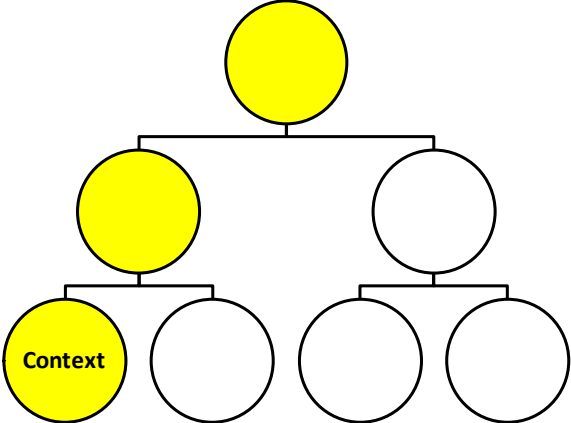

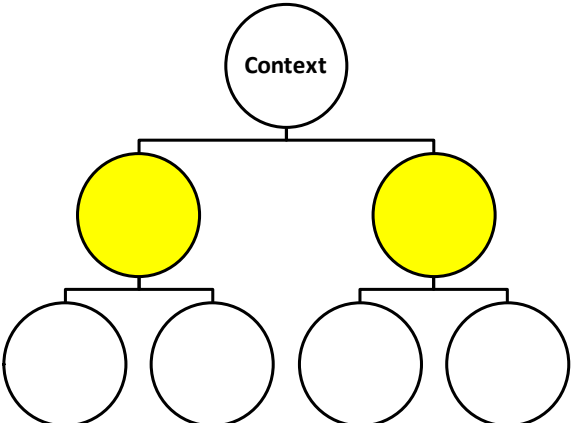

10 **5.9.7.6 ST\_AxisType (Axis Type)**

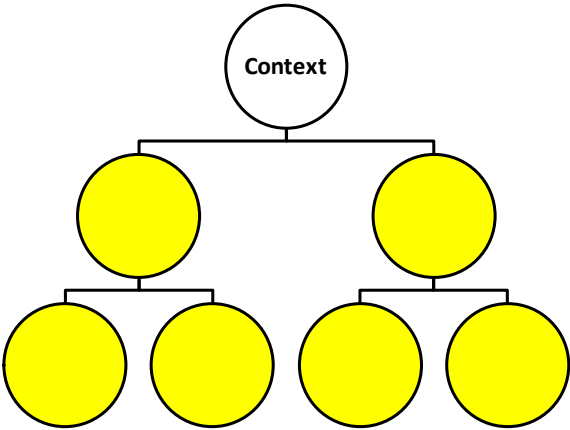

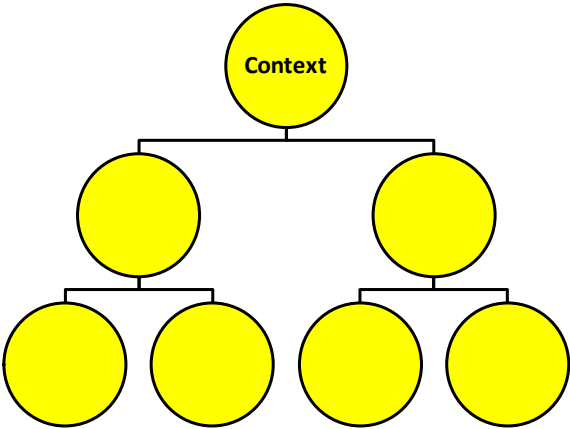

11 This simple type defines different node sets in relation to the current context node.

12 This simple type's contents are a restriction of the XML Schema token datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
ancst (Ancestor)	<p>Specifies a set of nodes between the current context node and the root node, including the root node.</p> <p>[Example: Consider the following example</p>  <p>Context</p>

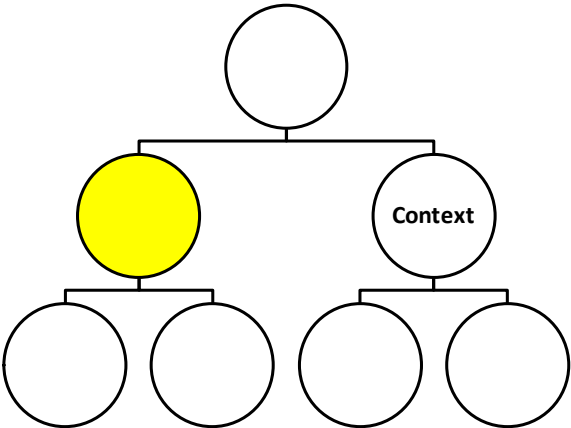

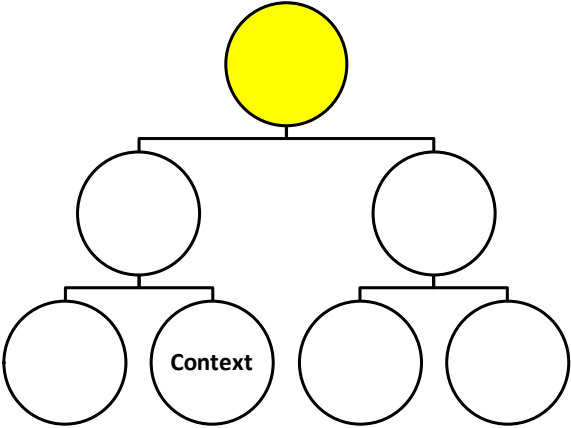

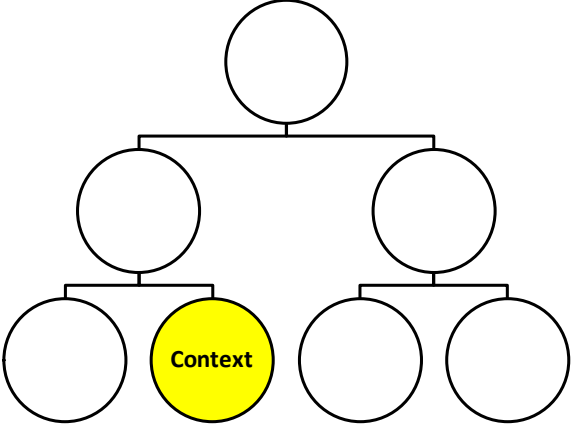

Enumeration Value	Description
	<i>end example]</i>
ancstOrSelf (Ancestor or Self)	<p>Specifies a set of nodes between the current context node and the root node, including the root node and the context node.</p> <p>[Example: Consider the following example</p>  <p><i>end example]</i></p>
ch (Child)	<p>Specifies a set of children of the current context node.</p> <p>[Example: Consider the following example</p>  <p><i>end example]</i></p>
des (Descendant)	<p>Specifies a set of all nodes beneath the current context node.</p> <p>[Example: Consider the following example</p>

Enumeration Value	Description
	<div><p><i>end example]</i></p></div>
desOrSelf (Descendant or Self)	<div><p>Specifies a set of all nodes beneath the current context node, including the context node.</p><p>[Example: Consider the following example</p><div><p><i>end example]</i></p></div></div>
follow (Follow)	<div><p>Specifies the set of nodes which are peers after the context node and all descendants of the peers.</p><p>[Example: Consider the following example</p></div>

Enumeration Value	Description
	<p><i>end example]</i></p>
followSib (Follow Sibling)	<p>Specifies the set of nodes which are peers after the context node.</p> <p>[<i>Example:</i> Consider the following example</p> <p><i>end example]</i></p>
none (None)	<p>Specifies no node.</p>
par (Parent)	<p>Specifies the parent node.</p> <p>[<i>Example:</i> Consider the following example</p>

Enumeration Value	Description
	<p><i>end example]</i></p>
preced (Preceding)	<p>Specifies the set of nodes which are peers before the context node and all the descendants of the peers.</p> <p>[<i>Example:</i> Consider the following example</p> <p><i>end example]</i></p>
precedSib (Preceding Sibling)	<p>Specifies the set of nodes which are peers before the context node.</p> <p>[<i>Example:</i> Consider the following example</p>

Enumeration Value	Description
	 <p><i>end example]</i></p>
root (Root)	<p>Specifies the top-most node of the diagram.</p> <p>[Example: Consider the following example</p>  <p><i>end example]</i></p>
self (Self)	<p>Specifies the calling context node.</p> <p>[Example: Consider the following example</p>  <p><i>end example]</i></p>

1

Referenced By
ST_AxisType (§5.9.7.6)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_AxisType" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="self"/>
6 <enumeration value="ch"/>
7 <enumeration value="des"/>
8 <enumeration value="desOrSelf"/>
9 <enumeration value="par"/>
10 <enumeration value="ancst"/>
11 <enumeration value="ancstOrSelf"/>
12 <enumeration value="followSib"/>
13 <enumeration value="precedSib"/>
14 <enumeration value="follow"/>
15 <enumeration value="preced"/>
16 <enumeration value="root"/>
17 <enumeration value="none"/>
18 </restriction>
19 </simpleType>

```

### 20 5.9.7.7 ST\_AxisTypes (Axis Type List)

21 This simple type represents a list of axis types.

22 This simple type allows a list of items of the ST\_AxisType simple type (§5.9.7.6).

Referenced By
forEach@axis (§5.9.2.14); if@axis (§5.9.2.15); presOf@axis (§5.9.2.21)

23 The following XML Schema fragment defines the contents of this simple type:

```

24 <simpleType name="ST_AxisTypes">
25 <list itemType="ST_AxisType"/>
26 </simpleType>

```

### 27 5.9.7.8 ST\_BendPoint (Bend Point)

28 This simple type defines where a bend is to occur within a connection between two nodes.

29 This simple type's contents are a restriction of the XML Schema token datatype.

30 The following are possible enumeration values for this type:

Enumeration Value	Description
beg (Beginning)	The bend is to occur at the beginning of the connection.

Enumeration Value	Description
def (Default)	The default bend is used. By default connections will bend in the center.
end (End)	The bend is to occur at the end of the connection.

1

Referenced By
ST_ParameterVal (§5.9.7.49)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_BendPoint" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="beg"/>
6 <enumeration value="def"/>
7 <enumeration value="end"/>
8 </restriction>
9 </simpleType>
```

### 10 5.9.7.9 ST\_Booleans (Boolean List.)

11 A list of booleans.

12 This simple type allows a list of items of the XML Schema boolean datatype.

Referenced By
forEach@hideLastTrans (§5.9.2.14); if@hideLastTrans (§5.9.2.15); presOf@hideLastTrans (§5.9.2.21)

13 The following XML Schema fragment defines the contents of this simple type:

```

14 <simpleType name="ST_Booleans">
15 <list itemType="xsd:boolean"/>
16 </simpleType>
```

### 17 5.9.7.10 ST\_BoolOperator (Boolean Constraint)

18 This simple type specified Boolean operations which can be applied to compare constraints.

19 This simple type's contents are a restriction of the XML Schema token datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
equ (Equal)	Equal operator.
gte (Greater Than or Equal to)	Specifies the greater than or equal to Boolean operator.
lte (Less Than or Equal to)	Specifies the less than or equal to Boolean operator.
none (None)	Specifies a none Boolean operator

1

Referenced By
constr@op (§5.9.2.8)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_BoolOperator" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="none"/>
6 <enumeration value="equ"/>
7 <enumeration value="gte"/>
8 <enumeration value="lte"/>
9 </restriction>
10 </simpleType>

```

### 11 5.9.7.11 ST\_Breakpoint (Breakpoint)

12 This simple type defines at what point the wrapping of nodes occurs for the snake algorithm.

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
bal (Balanced)	Specifies that the number of nodes in every row and every column should be equal.
endCnv (End of Canvas)	Specifies that nodes are added to the next column or row after filling the current column or row's space.
fixed (Fixed)	Specifies to use a user defined number of nodes in a column or row.

15

Referenced By
ST_ParameterVal (§5.9.7.49)

16 The following XML Schema fragment defines the contents of this simple type:

```

17 <simpleType name="ST_Breakpoint" final="restriction">
18 <restriction base="xsd:token">
19 <enumeration value="endCnv"/>
20 <enumeration value="bal"/>
21 <enumeration value="fixed"/>
22 </restriction>
23 </simpleType>

```

### 24 5.9.7.12 ST\_CenterShapeMapping (Center Shape Mapping)

25 This simple type defines the behavior of the cycle algorithm.

1 This simple type's contents are a restriction of the XML Schema token datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
fNode (First Node)	Specifies a node which is always in the center of a cycle diagram.
none (None)	Specifies the normal layout of a cycle diagram.

3

Referenced By
ST_ParameterVal (§5.9.7.49)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_CenterShapeMapping" final="restriction">
6 <restriction base="xsd:token">
7 <enumeration value="none"/>
8 <enumeration value="fNode"/>
9 </restriction>
10 </simpleType>
```

### 11 5.9.7.13 ST\_ChildAlignment (Child Alignment)

12 This simple type defines how to align a node in its allocated space.

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies to align the node to the bottom.
l (Left)	Specifies to align the node to the left.
r (Right)	Specifies to align the node to the right.
t (Top)	Specifies to align the node to the top.

15

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChildAlignment" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="t"/>
 <enumeration value="b"/>
 <enumeration value="l"/>
 <enumeration value="r"/>
 </restriction>
</simpleType>
```

#### 5.9.7.14 ST\_ChildDirection (Child Direction)

This simple type defines the layout direction of child nodes related to a specific parent node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
horz (Horizontal)	Specifies that the child nodes are to be laid out horizontally.
vert (Vertical)	Specifies that the child nodes are to be laid out vertically.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChildDirection" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="horz"/>
 <enumeration value="vert"/>
 </restriction>
</simpleType>
```

#### 5.9.7.15 ST\_ChildOrderType (Child Order)

This simple type specifies the child order for a given layout node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Child order along the bottom.
t (Top)	Top child order.

Referenced By
layoutNode@chOrder (§5.9.2.19)

1 The following XML Schema fragment defines the contents of this simple type:

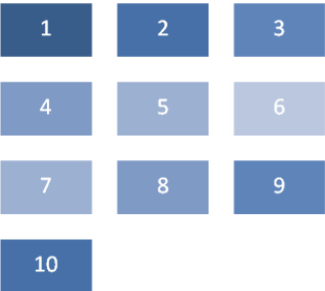

```
2 <simpleType name="ST_ChildOrderType" final="restriction">
3 <restriction base="xsd:token">
4 <enumeration value="b"/>
5 <enumeration value="t"/>
6 </restriction>
7 </simpleType>
```

8 **5.9.7.16 ST\_ClrAppMethod (Color Application Method Type)**

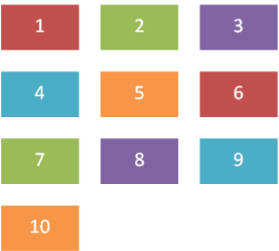

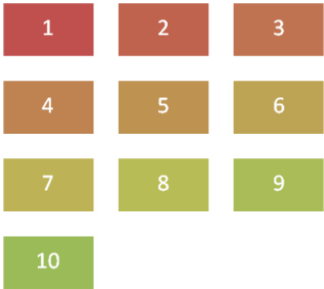

9 This type defines the way a given set of colors is applied to a set of nodes or items across a diagram.

10 This simple type's contents are a restriction of the XML Schema token datatype.

11 The following are possible enumeration values for this type:

Enumeration Value	Description
cycle (Cycle)	<p>The colors will apply from A to B to A if A and B were the colors present.</p> <p>[<i>Example:</i> Consider the following image as an example of cycle applied to a diagram:</p>  <p><b>Colors</b></p>  <p>In this example, the color A is applied to node 1 and node 10. Color B is considered the node color between A and A across the diagram. Colors interpolate across the diagram from A to B back to A. <i>end example</i>]</p>
repeat (Repeat)	<p>The colors will apply from A through B to A through B if A through B were the colors present.</p>

Enumeration Value	Description
	<p>[<i>Example</i>: Consider the following image as an example of repeat applied to a diagram:</p>  <p><b>Colors</b></p>  <p>In this example, the color A is applied to node 1, the next color to node 2, and so on through color B, then this coloring is repeated until there are no more nodes to color. <i>end example</i>]</p>
span (Span)	<p>The colors will interpolate from A to B across the entire diagram if A and B were the colors present.</p> <p>[<i>Example</i>: Consider the following image as an example of span applied to a diagram:</p>  <p><b>Colors</b></p>  <p>In this example, the color A is applied to node 1, the color B is applied to node 10 and the colors applied to nodes 2 through 9 are interpolated between colors A and B. <i>end example</i>]</p>

```

### 5.9.7.17 ST\_ConnectorDimension (Connector Dimension)

This simple type defines the dimensionality of the connection between two nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1D (1 Dimension)	Specifies a one dimensional connection, or rather a line.
2D (2 Dimensions)	Specifies a two dimensional connection which has both width and height.
cust (Custom)	Specifies a custom connection type.

Referenced By
ST_ParameterVal (\$5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectorDimension" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="1D"/>
 <enumeration value="2D"/>
 <enumeration value="cust"/>
 </restriction>
</simpleType>
```

### 5.9.7.18 ST\_ConnectorPoint (Connector Point)

This simple type defines different connection sites available on a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Auto)	Specifies that the algorithm will determine the best connection site to use.
bCtr (Bottom Center)	Specifies that the bottom, center connection site is to be used.
bL (Bottom Left)	Specifies that the bottom, left connection site is to be used.
bR (Bottom Right)	Specifies that the bottom right connection site is to be used.
ctr (Center)	Specifies that the center connection site is to be used.
midL (Middle Left)	Specifies that the middle left connection site is to be used.
midR (Middle Right)	Specifies that the middle right connection site is to be used.
radial (Radial)	Specifies connections along a radial path to support the use of connections in cycle diagrams.
tCtr (Top Center)	Specifies that the top center connection site is to be used.
tL (Top Left)	Specifies that the top left connection site is to be used.
tR (Top Right)	Specifies that the top right connection site is to be used.

5 <enumeration value="auto"/>
6 <enumeration value="bCtr"/>
7 <enumeration value="ctr"/>
8 <enumeration value="midL"/>
9 <enumeration value="midR"/>
10 <enumeration value="tCtr"/>
11 <enumeration value="bL"/>
12 <enumeration value="bR"/>
13 <enumeration value="tL"/>
14 <enumeration value="tR"/>
15 <enumeration value="radial"/>
16 </restriction>
17 </simpleType>

```

### 5.9.7.19 ST\_ConnectorRouting (Connector Routing)

This simple type defines how the routing of a connection between two nodes is supposed to progress from node 1 to node 2.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bend (Bending)	Specifies a bending connection which bends at a right angle.
curve (Curve)	Specifies a connection which is curved.
longCurve (Long Curve)	Specifies a connection that is curved that has a greater radius than a simple curved connection.
stra (Straight)	Specifies a straight connection.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectorRouting" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="stra"/>
 <enumeration value="bend"/>
 <enumeration value="curve"/>
 <enumeration value="longCurve"/>
 </restriction>
</simpleType>
```

### 5.9.7.20 ST\_ConstraintRelationship (Constraint Relationship)

This simple type specifies the types of constraint relationships which are present and can be used.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ch (Child)	The constraint should reference a child node.
des (Descendant)	The layout node can map to the descendants of the data point.
self (Self)	The layout node maps to the current data point.

## Referenced By

constr@for (§5.9.2.8); constr@refFor (§5.9.2.8); rule@for (§5.9.2.24)

 <restriction base="xsd:token">
 <enumeration value="self"/>
 <enumeration value="ch"/>
 <enumeration value="des"/>
 </restriction>
</simpleType>
```

### 5.9.7.21 ST\_ConstraintType (Constraint Type)

This simple type defines the list of possible constraints available for use.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alignOff (Alignment Offset)	This value defines the alignment offset for a node.
b (Bottom)	The bottom of the node.
begMarg (Beginning Margin)	Specifies the beginning margin.
begPad (Beginning Padding)	Specifies the beginning padding.
bendDist (Bending Distance)	Specifies the distance from the start of a connector to a bend in the connector.
bMarg (Bottom Margin)	Specifies the bottom margin.
bOff (Bottom Offset)	Specifies the bottom offset.
connDist (Connection Distance)	Specifies the connection distance.
ctrX (Center Height)	Specifies the center of the height.
ctrXOff (Center X Offset)	Specifies the center x coordinate offset.
ctrY (Center Width)	Specifies the center of the width.
ctrYOff (Center Y Offset)	Specifies the center y coordinate offset.
diam (Diameter)	Specifies the diameter.
endMarg (End Margin)	Specifies the ending margin.
endPad (End Padding)	Specifies the end padding.
h (Height)	Specifies the height.
hArH (Arrowhead Height)	Specifies the height of the arrowhead portion of the connector.
hOff (Height Offset)	Specifies the amount to offset the height.

Enumeration Value	Description
l (Left)	Specifies the left constraint.
lMarg (Left Margin)	Specifies the left margin.
lOff (Left Offset)	Specifies the left offset.
none (Unknown)	Unknown constraint.
primFontSz (Primary Font Size)	The primary font size.
pyraAcctRatio (Pyramid Accent Ratio)	Specifies the fraction of the width of the diagram that is reserved for the fly outs at their shortest distance.
r (Right)	Specifies the right constraint.
rMarg (Right Margin)	Specifies the right margin constraint.
rOff (Right Offset)	Specifies the right offset constraint.
secFontSz (Secondary Font Size)	The secondary font size.
secSibSp (Secondary Sibling Spacing)	The secondary sibling spacing.
sibSp (Sibling Spacing)	Specifies the minimum distance between sibling shapes.
sp (Spacing)	Specifies the spacing defined.
stemThick (Stem Thickness)	Specifies the thickness of the arrow's shaft.
t (Top)	Specifies the top constraint.
tMarg (Top Margin)	Top margin constraint.
tOff (Top Offset)	Top offset constraint.
userA (User Defined A)	User defined information.
userB (User Defined B)	User defined information.
userC (User Defined C)	User defined information.
userD (User Defined D)	User defined information.
userE (User Defined E)	User defined information.
userF (User Defined F)	User defined information.
userG (User Defined G)	User defined information.
userH (User Defined H)	User defined information.
userI (User Defined I)	User defined information.
userJ (User Defined J)	User defined information.
userK (User Defined K)	User defined information.
userL (User Defined L)	User defined information.
userM (User Defined M)	User defined information.
userN (User Defined N)	User defined information.
userO (User Defined O)	User defined information.
userP (User Defined P)	User defined information.

Enumeration Value	Description
userQ (User Defined Q)	User defined information.
userR (User Defined R)	User defined information.
userS (User Defined S)	User defined information.
userT (User Defined T)	User defined information.
userU (User Defined U)	User defined information.
userV (User Defined V)	User defined information.
userW (User Defined W)	User defined information.
userX (User Defined X)	User defined information.
userY (User Defined Y)	User defined information.
userZ (User Defined Z)	User defined information.
w (Width)	The width parameter.
wArH (Arrowhead Width)	Specifies the width of the arrowhead portion of the connector.
wOff (Width Offset)	Offsets the width by the specified amount.

17 **5.9.7.22**      **ST\_ContinueDirection (Continue Direction)**

18 This simple type specifies the behavior of the direction that additional nodes are added to new rows or columns  
19 in the snake algorithm.

20 This simple type's contents are a restriction of the XML Schema token datatype.

21 The following are possible enumeration values for this type:

Enumeration Value	Description
revDir (Reverse Direction)	<p>Specifies that the direction is to be revererd on a subsequent row or column.</p> <p>[<i>Example:</i> Consider the following diagram as an example of reverse direction</p>  <p><i>end example]</i></p>
sameDir (Same Direction)	<p>Specifies that the direction is to be maintained on a subsequent row or column.</p>

Enumeration Value	Description
	<p>[<i>Example</i>: Consider the following diagram as an example of same direction</p>  <p><i>end example</i>]</p>

7	<code>  &lt;/restriction&gt;</code>
8	<code>&lt;/simpleType&gt;</code>

9 **5.9.7.23 ST\_CxnType (Connection Type)**

10 This simple type defines the different types of relationships that can be defined between two nodes.

11 This simple type's contents are a restriction of the XML Schema token datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
parOf (Parent Of)	This defines a parent-child relationship in the sense that node X is a parent of node Y.
presOf (Presentation Of)	A presentation type relationship. This type of relationship exists to actually present data.
presParOf (Presentation Parent Of)	A relationship defining a parent of a presentation node.
unknownRelationship (Unknown Relationship)	The type of relationship is unknown.

6 <enumeration value="presOf"/>
7 <enumeration value="presParOf"/>
8 <enumeration value="unknownRelationship"/>
9 </restriction>
10 </simpleType>

```

#### 11 5.9.7.24 ST\_Direction (Diagram Direction Definition)

12 This simple type defines the possible values for a diagram's direction when displayed in an application.

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
norm (Normal Direction)	This value specifies that the direction of the diagram should not be switched.
rev (Reversed Direction)	This value specifies that the direction of the diagram should be switched.

15

Referenced By
dir@val (§5.9.6.6); ST_FunctionValue (§5.9.7.32)

16 The following XML Schema fragment defines the contents of this simple type:

```

#### 23 5.9.7.25 ST\_ElementType (Element Type)

24 This simple type defines the different types of data points which are supported.

25 This simple type's contents are a restriction of the XML Schema token datatype.

26 The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Defined as utilizing all of the nodes.
asst (Assistant)	The assistant nodes.
doc (Document)	Specifies the a node on the document level.
node (Node)	Data nodes that are children of other data nodes.
nonAsst (Non Assistant)	Selects all of the non-assistant nodes.
nonNorm (Non Normal)	Selects the non-normal elements.
norm (Normal)	Selects a normal elements.
parTrans (Parent Transition)	The transition associated with the parent node.
pres (Presentation)	This refers to a presentation node.
sibTrans (Sibling Transition)	Use only sibling transitions between data nodes. These transitions represent sibling relationships between nodes, and are frequently mapped to arrows between shapes in the drawing. A sibTrans value is sometimes used to create white space between nodes.

### 5.9.7.27 ST\_FallbackDimension (Fallback Dimension)

6 Specifies the dimensionality by which nodes can grow or shrink automatically.

7 This simple type's contents are a restriction of the XML Schema token datatype.

8 The following are possible enumeration values for this type:

Enumeration Value	Description
1D (1 Dimension)	Specifies that the node can grow or shrink by its height or its width, but not both.
2D (2 Dimensions)	Specifies that the node can grow or shrink by both height and width.

Referenced By
ST_ParameterVal (§5.9.7.49)

16 </simpleType>
```

### 5.9.7.28 ST\_FlowDirection (Flow Direction)

18 This simple type defines how the progression of new nodes are to be entered into the diagram.

19 This simple type's contents are a restriction of the XML Schema token datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
col (Column)	Specifies that the layout occurs in a column-based fashion. This would mean laying out the nodes from top to bottom, before moving left to right.
row (Row)	Specifies that the layout occurs in a row-based fashion.

Enumeration Value	Description
	This would mean laying out the nodes from left to right before moving from top to bottom.

16 </simpleType>
```

### 17 5.9.7.30 ST\_FunctionOperator (Function Operator)

18 This simple type defines the condition expression functions which can be used to perform operations.

19 This simple type's contents are a restriction of the XML Schema token datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
equ (Equal)	Equal function operator.
gt (Greater Than)	Specifies the grater than function operator.
gte (Greater Than or Equal to)	Specifies the greater than or equal to function operator.
lt (Less Than)	Specifies the less than function operator.

Enumeration Value	Description
lte (Less Than or Equal to)	Specifies the less than or equal to function operator.
neq (Not Equal To)	Specifies the not equal to function operator.

11 </restriction>
12 </simpleType>

```

### 13 5.9.7.31 ST\_FunctionType (Function Type)

14 This simple type defines the set of available conditional expression function types present for use.

15 This simple type's contents are a restriction of the XML Schema token datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
cnt (Count)	Specifies a count.
depth (Depth)	Specifies the depth.
maxDepth (Max Depth)	Defines the maximum depth.
pos (Position)	Retrieves the position of the node in the specified set of nodes.
posEven (Position Even)	Returns 1 if the specified node is at an even numbered position in the data model.
posOdd (Position Odd)	Returns 1 if the specified node is in an odd position in the data model.
revPos (Reverse Position)	Reverse position function.
var (Variable)	Used to reference a variable.

17

Referenced By

 <enumeration value="depth"/>
 <enumeration value="maxDepth"/>
 </restriction>
</simpleType>
```

### 5.9.7.32 ST\_FunctionValue (Function Value)

Conditional expression function value.

This simple type is defined as a union of the following types:

- TheXML Schema int datatype.
- TheXML Schema boolean datatype.
- TheST\_Direction simple type (§5.9.7.24).
- TheST\_HierBranchStyle simple type (§5.9.7.35).
- TheST\_AnimOneStr simple type (§5.9.7.3).
- TheST\_AnimLvlStr simple type (§5.9.7.2).
- TheST\_ResizeHandlesStr simple type (§5.9.7.53).

</simpleType>
```

### 5.9.7.33 ST\_GrowDirection (Grow Direction)

This simple type defines different starting locations for nodes within the snake algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bL (Bottom Left)	Specifies the placement of nodes is to start in the bottom left corner.

Enumeration Value	Description
bR (Bottom Right)	Specifies the placement of nodes is to start in the bottom right corner.
tL (Top Left)	Specifies the placement of nodes is to start in the top left corner.
tR (Top Right)	Specifies the placement of nodes is to start in the top right corner.

1

8 <enumeration value="bR"/>
9 </restriction>
10 </simpleType>
```

### 11 5.9.7.34 ST\_HierarchyAlignment (Hierarchy Alignment)

12 This simple type defines different relative locations of child nodes and their descendants to a parent node within  
13 a hierarchy diagram.

14 This simple type's contents are a restriction of the XML Schema token datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
bCtrCh (Bottom Center Child)	Specifies the child nodes are placed below the parent node and that they are center aligned to the parent node.
bCtrDes (Bottom Center Descendant)	Specifies the descendant nodes are placed below the parent node and that they are center aligned to the parent node.
bL (Bottom Left)	Specifies the child and descendant nodes are placed below the parent node and that the set is left aligned.
bR (Bottom Right)	Specifies the child and descendant nodes are placed below the parent node and the set is right aligned.
lB (Left Bottom)	Specifies the child and descendant nodes are placed to the left of the parent node and that the set is bottom aligned.

Enumeration Value	Description
lCtrCh (Left Center Child)	Specifies the child nodes are placed to the left of the parent node and that the set is center aligned.
lCtrDes (Left Center Descendant)	Specifies the descendant nodes are placed to the left of the parent node and that the set is center aligned.
lT (Left Top)	Specifies the child and descendant nodes are placed to the left of the parent node and that the set is top aligned.
rB (Right Bottom)	Specifies the child and descendant nodes are placed to the right of the parent node and that the set is bottom aligned.
rCtrCh (Right Center Children)	Specifies the child nodes are placed to the right of the parent node and that the set is center aligned.
rCtrDes (Right Center Descendants)	Specifies the descendant nodes are placed to the right of the parent node and that the set is center aligned.
rT (Right Top)	Specifies the child and descendant nodes are placed to the right of the parent node and that the set is top aligned.
tCtrCh (Top Center Children)	Specifies the child nodes are placed above the parent node and that the set is center aligned.
tCtrDes (Top Center Descendants)	Specifies the descendant nodes are placed above the parent node and that the set is center aligned.
tL (Top Left)	Specifies the child and descendant nodes are placed above the parent node and that the set is left aligned.
tR (Top Right)	Specifies the child and descendant nodes are placed above the parent node and that the set is right aligned.

 </restriction>
</simpleType>
```

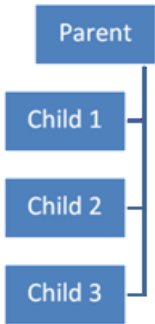

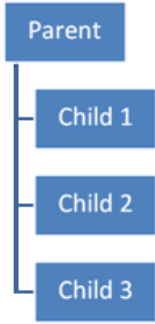

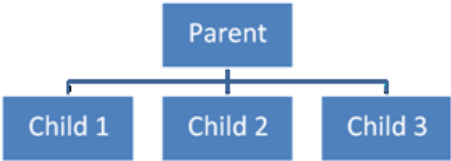

5.9.7.35 ST\_HierBranchStyle (Hierarchy Branch Style Definition)

This simple type specifies the possible values for the branch style of a hierarchy diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hang (Hanging)	<p>The branch style is hanging from the parent.</p> <p>[<i>Example:</i> Consider the following image as an example of a hanging branch style:</p>  <p><i>end example]</i></p>
init (Initial)	<p>This means that the value has not been set.</p>
l (Left)	<p>The branch style falls off the left.</p> <p>[<i>Example:</i> Consider the following image as an example</p>

Enumeration Value	Description
	<p>of a left hanging branch style:</p>  <p><i>end example]</i></p>
r (Right)	<p>The branch style falls off the right.</p> <p>[<i>Example:</i> Consider the following image as an example of a right hanging branch style:</p>  <p><i>end example]</i></p>
std (Standard)	<p>The standard branch style is to be used.</p> <p>[<i>Example:</i> Consider the following image as an example of a standard hanging branch style:</p>  <p><i>end example]</i></p>

 </restriction>
</simpleType>
```

### 5.9.7.36 ST\_HorizontalAlignment (Horizontal Alignment)

This simple type defines the horizontal alignment.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies center alignment.
l (Left)	Specifies left alignment.
none (None)	Specifies no alignment defined.
r (Right)	Specifies right alignment.

### Referenced By

ST\_ParameterVal (§5.9.7.49)

```
<simpleType name="ST_HorizontalAlignment" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="l"/>
 <enumeration value="ctr"/>
 <enumeration value="r"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

### 5.9.7.37 ST\_HueDir (Hue Direction)

When given two colors to interpolate between, one can go in one of two directions around the color wheel to perform the interpolation. This type defines that direction.

1 This simple type's contents are a restriction of the XML Schema token datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
ccw (Counterclockwise Hue Direction)	A hue interpolation in the counterclockwise direction.
cw (Clockwise Hue Direction)	A hue interpolation in the clockwise direction.

3

Referenced By
effectClrLst@hueDir (§5.9.4.7); fillClrLst@hueDir (§5.9.4.8); linClrLst@hueDir (§5.9.4.9); txEffectClrLst@hueDir (§5.9.4.12); txFillClrLst@hueDir (§5.9.4.13); txLinClrLst@hueDir (§5.9.4.14)

```

5 <simpleType name="ST_HueDir">
6 <restriction base="xsd:token">
7 <enumeration value="cw"/>
8 <enumeration value="ccw"/>
9 </restriction>
10 </simpleType>
```

### 11 5.9.7.38 ST\_Index1 (1-Based Index)

12 A 1-based index.

13 This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

14 This simple type also specifies the following restrictions:

- 15 • This simple type has a minimum value of greater than or equal to 1.

Referenced By
adj@idx (§5.9.2.1)

16 The following XML Schema fragment defines the contents of this simple type:

```

17 <simpleType name="ST_Index1">

#### 5.9.7.41 ST\_LinearDirection (Linear Direction)

This simple type defines the direction of growth of new nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fromB (From Bottom)	Specifies growth to start from the bottom.
fromL (From Left)	Specifies growth to start from the left.
fromR (From Right)	Specifies growth to start from the right.
fromT (From Top)	Specifies growth to start from the Top

**Referenced By**

 <enumeration value="fromB"/>
 </restriction>
</simpleType>
```

#### 5.9.7.42 ST\_ModelId (Model Identifier)

The unique ID of the element within the data model. Model Identifiers can be either longs or guids.

This simple type is defined as a union of the following types:

- TheXML Schema int datatype.
- TheST\_Guid simple type (§5.1.12.27).

##### Referenced By

cxn@destId (§5.9.3.2); cxn@modelId (§5.9.3.2); cxn@parTransId (§5.9.3.2); cxn@sibTransId (§5.9.3.2);

```
<simpleType name="ST_ModelId">
 <union memberTypes="xsd:int a:ST_Guid"/>
</simpleType>
```

#### 5.9.7.43 ST\_NodeCount (Number of Nodes Definition)

This simple type defines a count of the number of nodes for a property in a diagram. A value of -1 shall mean that the value is unbounded.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -1.

##### Referenced By

chMax@val (§5.9.6.4); chPref@val (§5.9.6.5)

 <minInclusive value="-1"/>
 </restriction>
</simpleType>
```

#### 5.9.7.44 ST\_NodeHorizontalAlignment (Node Horizontal Alignment)

This simple type defines the horizontal alignment of a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies center alignment.
l (Left)	Specifies left alignment.
r (Right)	Specifies right alignment.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

 <enumeration value="ctr"/>
 <enumeration value="r"/>
 </restriction>
</simpleType>
```

#### 5.9.7.45 ST\_NodeVerticalAlignment (Node Vertical Alignment)

This simple type defines the vertical alignment of a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies bottom alignment.
mid (Middle)	Specifies middle alignment.
t (Top)	Specifies top alignment.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_NodeVerticalAlignment" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="t"/>
 <enumeration value="mid"/>
 <enumeration value="b"/>
 </restriction>
</simpleType>
```

#### 5.9.7.46 ST\_Offset (Offset)

This simple type defines whether or not subsequent rows or columns in the snake algorithm are offset from the preceding row or column.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies no offset.
off (Offset)	Specifies that the nodes will be shifted by some amount relative to the preceding row or column.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Offset" final="restriction">
 <restriction base="xsd:token">

 <enumeration value="off"/>
 </restriction>
</simpleType>
```

#### 5.9.7.47 ST\_OutputShapeType (Output Shape Type)

Shapes which are special specifically for a DrawingML diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
conn (Connection)	Connection shape type.
none (None)	None.

Referenced By
ST_LayoutShapeType (§5.9.7.40)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OutputShapeType" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="conn"/>
 </restriction>
</simpleType>
```

#### 5.9.7.48 ST\_ParameterId (Parameter Identifier)

This simple type defines algorithm parameters which can be modified in order to adjust the behavior of algorithms for use in layout nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alignTx (Text Alignment)	This value defines how the text is aligned in a node.
ar (Aspect Ratio)	Specifies the aspect ratio (width to height) of the composite node to use when determining child constraints. A value of 0 means leave the width and height constraints as is. The algorithm may temporarily shrink one dimension to achieve that ratio. For example, if a composite node has a width constraint of 20 and height constraint of 10, and if ar=1.5, composite uses a width value of 15 to calculate the composite node's child constraints. However, the algorithm does not propagate this value to other nodes.
autoTxRot (Auto Text Rotation)	Auto text rotation.
begPts (Beginning Points)	Beginning Points
begSty (Beginning Arrowhead Style)	Beginning Arrowhead Style
bendPt (Bend Point)	The bend point.
bkpt (Breakpoint)	Specifies the point at which the diagram starts to snake. The value bal specifies that snaking begin at an even number of rows and columns. The value fixed specifies that snaking begin at a fixed point, for example, in a row that contains three nodes. The value endCnv specifies that snaking begin when there is no more room for a shape in the row.
bkPtFixedVal (Breakpoint Fixed Value)	Specifies where the snake should break, if bkpt=fixed.

Enumeration Value	Description
chAlign (Child Alignment)	Specifies the alignment of the children.
chDir (Child Direction)	The child direction.
connRout (Connection Route)	The route of the connection.
contDir (Continue Direction)	Specifies the direction of the subsequent row or column. For example, if the algorithm initially places the nodes from left to right, revDir places the nodes in the next row from right to left. However if the algorithm uses contDir, the nodes on the next row are arranged from left to right.
ctrShpMap (Center Shape Mapping)	Specifies where to place nodes in relation to the center circle.
dim (Connector Dimension)	Specifies the connector dimension.
dstNode (Destination Node)	Specifies the name of the layout node from which to end the connection from.
endPts (End Points)	Specifies the end points.
endSty (End Style)	Specifies the end style.
fallback (Fallback Scale)	1D specifies fallback. It only scales in one dimension. 2D specifies fallback. It scales in both dimensions equally.
flowDir (Flow Direction)	Specifies whether nodes are arranged in rows or columns.
grDir (Grow Direction)	Specifies from which corner the snake grows. For example, if the algorithm uses a top left value, the snake grows from the top left.
hierAlign (Hierarchy Alignment)	The alignment of the hierarchy.
horzAlign (Horizontal Alignment)	Aligns all the child nodes within the space reserved for the parent and adjusts child positions in the x direction.
linDir (Linear Direction)	Specifies the linear direction.
lnSpAfChP (Line Spacing After Children Paragraph)	Line spacing after children.
lnSpAfParP (Line Spacing After Parent Paragraph)	Line spacing after the parent.
lnSpCh (Line Spacing Children)	Line spacing of the children
lnSpPar (Line Spacing Parent)	Line spacing of the parent.
nodeHorzAlign (Node Horizontal Alignment)	Specifies how child nodes are aligned within the extents of the canvas. For example, you can align the tops of all the child nodes, but center all of them within the canvas.
nodeVertAlign (Node Vertical Alignment)	Specifies how child nodes are aligned within the extents of the canvas. Same as nodeHorzAlign, but in

Enumeration Value	Description
	the y direction.
off (Offset)	Specifies the offset.
parTxLTRAlign (Parent Text Left-to-Right Alignment)	Specifies the paragraph alignment of parent text when the shape has only parent text. This parameter applies when the text direction is left to right.
parTxRTLAlign (Parent Text Right-to-Left Alignment)	Specifies the paragraph alignment of parent text when the shape has only parent text. This parameter applies when the text direction is right to left.
pyraAcctBkgdNode (Pyramid Accent Background Node)	If pyramid has a composite child node, specifies the name of the node that is a child of the composite that makes up the child flyout shape. If the node specifies a shape of the nonIsoscelesTrapezoid autoshape, it modifies the adjust handles in order to fit the flyout flush against the side of the pyramid.
pyraAcctPos (Pyramid Accent Position)	Specifies the placement of the flyout grandchildren.
pyraAcctTxMar (Pyramid Accent Text Margin)	Specifies the placement of one edge of the child text (grandchild node). If the value is step, the text is against the edge of the pyramid. If the value is stack, the text aligns.
pyraAcctTxNode (Pyramid Accent Text Node)	If pyramid has a composite child node, specifies the child node that should hold the child text.
pyraLvlNode (Pyramid Level Node)	If pyramid has a composite child node, specifies the name of the node that is a child of the composite that makes up the pyramid itself. If the node specifies a trapezoid shape, it modifies the adjustment handles to construct a pyramid.
rotPath (Rotation Path)	The rotation path specified.
rtShortDist (Route Shortest Distance)	If true, the connector is routed through the shortest distance between the points.
secChAlign (Secondary Child Alignment)	The secondary child alignment.
secLinDir (Secondary Linear Direction)	The secondary linear direction.
shpTxLTRAlignCh (Shape Text Left-to-Right Alignment)	Specifies the paragraph alignment of all text within the shape when the shape contains both parent and child text. This parameter applies when the text direction is left to right.
shpTxRTLAlignCh (Shape Text Right-to-Left Alignment)	Specifies the paragraph alignment of all text within the shape when the shape contains both parent and child text. This parameter applies when the text direction is right to left.
spanAng (Span Angle)	Specifies the angle the cycle spans. Final shapealign text is placed at stAng+spanAng, unless spanAng=360.

Enumeration Value	Description
	In that case, the algorithm places the text so that shapes do not overlap.
srcNode (Source Node)	Specifies the name of the layout node from which to start the connection.
stAng (Start Angle)	Specifies the angle at which the first shape is placed. Angles are in degrees, measured clockwise from a line pointing straight upward from the center of the cycle.
stBulletLvl (Start Bullets At Level)	Specifies whether bullets start at the top level (1) or with children (2).
stElem (Start Element)	Specifies the point type of the layout node to use as the first shape in the cycle.
txAnchorHorz (Text Anchor Horizontal)	Specifies the y-axis position of the text area within a shape.
txAnchorHorzCh (Text Anchor Horizontal With Children)	Specifies that the definition can allow a different text anchoring on the x-axis, if child nodes exist in the shape.
txAnchorVert (Text Anchor Vertical)	Specifies the x-axis position of the text area within a shape.
txAnchorVertCh (Text Anchor Vertical With Children)	Specifies that the definition can allow a different text anchoring on the y-axis, if child nodes exist in the shape.
txBldir (Text Block Direction)	Specifies whether the text block is vertical or horizontal.
txDir (Text Direction)	Specifies where the text of the first node starts.
vertAlign (Vertical Alignment)	Aligns all the child nodes within the space reserved for the parent and adjusts child positions in the y direction.

#### 5.9.7.49 ST\_ParameterVal (Parameter Values)

Specifies the list of parameter types that can be used by a diagram.

This simple type is defined as a union of the following types:

- TheST\_HorizontalAlignment simple type (§5.9.7.36).
- TheST\_VerticalAlignment simple type (§5.9.7.65).
- TheST\_ChildDirection simple type (§5.9.7.14).
- TheST\_ChildAlignment simple type (§5.9.7.13).
- TheST\_SecondaryChildAlignment simple type (§5.9.7.55).
- TheST\_LinearDirection simple type (§5.9.7.41).
- TheST\_SecondaryLinearDirection simple type (§5.9.7.56).
- TheST\_StartingElement simple type (§5.9.7.57).
- TheST\_BendPoint simple type (§5.9.7.8).
- TheST\_ConnectorRouting simple type (§5.9.7.19).
- TheST\_ArrowheadStyle simple type (§5.9.7.4).
- TheST\_ConnectorDimension simple type (§5.9.7.17).
- TheST\_RotationPath simple type (§5.9.7.54).
- TheST\_CenterShapeMapping simple type (§5.9.7.12).
- TheST\_NodeHorizontalAlignment simple type (§5.9.7.44).
- TheST\_NodeVerticalAlignment simple type (§5.9.7.45).
- TheST\_FallbackDimension simple type (§5.9.7.27).
- TheST\_TextDirection simple type (§5.9.7.62).
- TheST\_PyramidAccentPosition simple type (§5.9.7.51).
- TheST\_PyramidAccentTextMargin simple type (§5.9.7.52).
- TheST\_TextBlockDirection simple type (§5.9.7.61).
- TheST\_TextAnchorHorizontal simple type (§5.9.7.59).
- TheST\_TextAnchorVertical simple type (§5.9.7.60).
- TheST\_TextAlignment simple type (§5.9.7.58).
- TheST\_AutoTextRotation simple type (§5.9.7.5).
- TheST\_GrowDirection simple type (§5.9.7.33).
- TheST\_FlowDirection simple type (§5.9.7.28).
- TheST\_ContinueDirection simple type (§5.9.7.22).
- TheST\_Breakpoint simple type (§5.9.7.11).
- TheST\_Offset simple type (§5.9.7.46).

- TheST\_HierarchyAlignment simple type (§5.9.7.34).
- TheXML Schema int datatype.
- TheXML Schema double datatype.
- TheXML Schema boolean datatype.
- TheXML Schema string datatype.
- TheST\_ConnectorPoint simple type (§5.9.7.18).

</simpleType>
```

### 5.9.7.50 ST\_PtType (Point Type)

This simple type defines the different point types which can be utilized to create diagrams in DiagramML.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
asst (Assistant Element)	This point type is used in a hierarchy diagram to represent an assistant element.
doc (Document)	This point type specifies a document type point. This point type can be thought of as the root node associated with the document itself.
node (Node)	The node point type specifies a basic point type.
parTrans (Parent Transition)	This point type specifies a parent transition element.
pres (Presentation)	Specifies a presentation point type.
sibTrans (Sibling Transition)	This point type specifies a sibling transition element.

Referenced By
pt@type (§5.9.3.5)

The following XML Schema fragment defines the contents of this simple type:

 <enumeration value="doc"/>
 <enumeration value="pres"/>
 <enumeration value="parTrans"/>
 <enumeration value="sibTrans"/>
 </restriction>
</simpleType>
```

#### 5.9.7.51 ST\_PyramidAccentPosition (Pyramid Accent Position)

This simple type defines different positioning for the accent shapes which can be associated with a pyramid algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aft (Pyramid Accent After)	Specifies that the accent shapes are to be placed to the right of the pyramid.
bef (Before)	Specifies that the accent shapes are to be placed to the left of the pyramid.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

```
<simpleType name="ST_PyramidAccentPosition" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="bef"/>
 <enumeration value="aft"/>
 </restriction>
</simpleType>
```

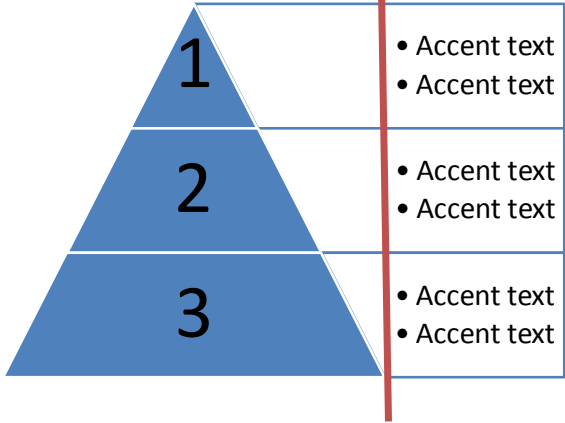

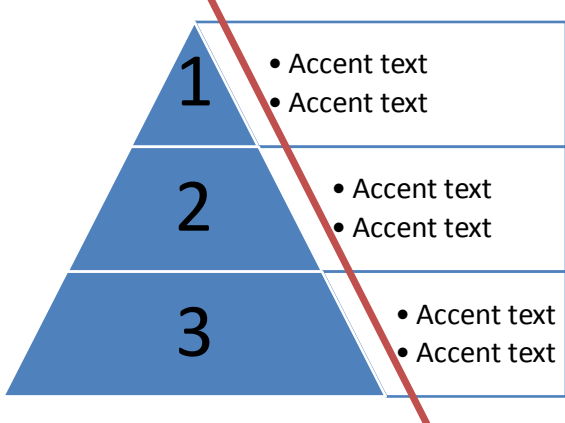

#### 5.9.7.52 ST\_PyramidAccentTextMargin (Pyramid Accent Text Margin)

This simple type defines different ways to lay out text in the accent shape for a pyramid algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
stack (Stack)	<p>Specifies that all accent shape text is to be left aligned.</p> <p>[Example: Consider the following example of a pyramid diagram</p>  <p>end example]</p> <p>The diagram shows a blue pyramid divided into three horizontal sections labeled 1, 2, and 3 from top to bottom. To the right of the pyramid is a light blue rectangular box divided into three horizontal sections, each containing two bullet points labeled 'Accent text'. A vertical red line is positioned to the right of the pyramid, separating it from the text box. The text 'end example]' is located below the diagram.</p>
step (Step)	<p>Specifies that all accent shape text is to be relative to the pyramid.</p> <p>[Example: Consider the following example of a pyramid diagram</p>  <p>end example]</p> <p>The diagram shows a blue pyramid divided into three horizontal sections labeled 1, 2, and 3 from top to bottom. To the right of the pyramid is a light blue rectangular box divided into three horizontal sections, each containing two bullet points labeled 'Accent text'. A diagonal red line is positioned to the right of the pyramid, separating it from the text box. The text 'end example]' is located below the diagram.</p>

```

### 5.9.7.53 ST\_ResizeHandlesStr (Resize Handle)

This simple type defines the possible behaviors when resizing shapes within a diagram. Because the size of the shape plays a large role in the overall layout of other nodes within the diagram, there are two ways resize can occur on a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
exact (Exact)	This value specifies that the resize of the shape occurs and sizes exactly to the size the user defines, which causes all other shapes in the diagram to shrink or grow accordingly.
rel (Relative)	This value specifies that resize operations happen relatively. This means that the relative size difference between nodes is maintained before and after the resize operation.

#### Referenced By

resizeHandles@val (§5.9.2.23); ST\_FunctionValue (§5.9.7.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ResizeHandlesStr" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="exact"/>
 <enumeration value="rel"/>
 </restriction>
</simpleType>
```

### 5.9.7.54 ST\_RotationPath (Rotation Path)

This simple type defines rotation properties for nodes within the cycle algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alongPath (Along Path)	Specifies that the nodes should rotate in relation to their placement along the cycle.
none (None)	Specifies that the nodes should not rotate.

1

Referenced By
ST_ParameterVal (§5.9.7.49)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_RotationPath" final="restriction">
4 <restriction base="xsd:token">
5 <enumeration value="none"/>
6 <enumeration value="alongPath"/>
7 </restriction>
8 </simpleType>
```

### 9 5.9.7.55 ST\_SecondaryChildAlignment (Secondary Child Alignment)

10 This simple type defines different alignment properties of the both hanging layout type of the hierarchy  
 11 algorithm.

12 This simple type's contents are a restriction of the XML Schema token datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that the children nodes should be bottom aligned.
l (Left)	Specifies that the children nodes should be left aligned.
none (None)	Specifies no alignment.
r (Right)	Specifies that the children nodes should be right aligned.
t (Top)	Specifies that the children nodes should be top aligned.

14

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SecondaryChildAlignment" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="t"/>
 <enumeration value="b"/>
 <enumeration value="l"/>
 <enumeration value="r"/>
 </restriction>
</simpleType>
```

5.9.7.56 ST\_SecondaryLinearDirection (Secondary Linear Direction)

This simple type defines different directions for the nodes in a both hanging layout in the hierarchy algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fromB (From Bottom)	Specifies that the nodes begin from the bottom and move upward.
fromL (From Left)	Specifies that the nodes begin from the left and move right.
fromR (From Right)	Specifies that the nodes begin from the right and move left.
fromT (From Top)	Specifies that the nodes begin from the top and move downward.
none (None)	Specifies no direction.

Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SecondaryLinearDirection" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="fromL"/>
 <enumeration value="fromR"/>
 <enumeration value="fromT"/>
 <enumeration value="fromB"/>
 </restriction>
</simpleType>
```

5.9.7.57 ST\_StartingElement (Starting Element)

This simple type defines behavior for the first node in a cycle algorithm.

1 This simple type's contents are a restriction of the XML Schema token datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
node (Node)	Specifies that a node should be placed first.
trans (Transition)	Specifies that a transition should be placed first.

3

Referenced By
ST_ParameterVal (§5.9.7.49)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_StartingElement" final="restriction">
6 <restriction base="xsd:token">
7 <enumeration value="node"/>
8 <enumeration value="trans"/>
9 </restriction>
10 </simpleType>
```

### 11 5.9.7.58 ST\_TextAlignment (Text Alignment)

12 This simple type defines alignment types for text within a node.

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies center aligned text.
l (Left)	Specifies left aligned text.
r (Right)	Specifies right aligned text.

15

Referenced By
ST_ParameterVal (§5.9.7.49)

16 The following XML Schema fragment defines the contents of this simple type:

```

17 <simpleType name="ST_TextAlignment" final="restriction">
18 <restriction base="xsd:token">
19 <enumeration value="l"/>
20 <enumeration value="ctr"/>
21 <enumeration value="r"/>
22 </restriction>
23 </simpleType>
```

### 5.9.7.59 [ST\\_TextAnchorHorizontal \(Text Anchor Horizontal\)](#)

This simple type defines horizontal anchor points for text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies text to be anchored to the center.
none (None)	Specifies no horizontal text anchor.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextAnchorHorizontal" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="ctr"/>
 </restriction>
</simpleType>
```

### 5.9.7.60 [ST\\_TextAnchorVertical \(Text Anchor Vertical\)](#)

This simple type defines vertical anchor points for text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies text to be anchored to the bottom.
mid (Middle)	Specifies text to be anchored to the middle.
t (Top)	Specifies text to be anchored to the top.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextAnchorVertical" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="t"/>
 <enumeration value="mid"/>
 <enumeration value="b"/>
 </restriction>
</simpleType>
```

#### 5.9.7.61 ST\_TextBlockDirection (Text Block Direction)

This simple type defines different layout options for text within a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
horz (Horizontal)	Specifies that the text is to be horizontal.
vert (Vertical Direction)	Specifies that the text is to be vertical.

#### Referenced By

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextBlockDirection" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="horz"/>
 <enumeration value="vert"/>
 </restriction>
</simpleType>
```

#### 5.9.7.62 ST\_TextDirection (Text Direction)

This simple type defines different way the growth of additional text can occur within a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fromB (From Bottom)	Specifies additional text grows from the bottom.
fromT (From Top)	Specifies additional text grows from the top.

#### Referenced By

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextDirection" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="fromT"/>
 <enumeration value="fromB"/>
 </restriction>
</simpleType>
```

### 5.9.7.63 ST\_UnsignedInts (Unsigned Integer List)

A list of unsigned integers.

This simple type allows a list of items of the XML Schema unsignedInt datatype.

Referenced By
forEach@cnt (§5.9.2.14); if@cnt (§5.9.2.15); presOf@cnt (§5.9.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnsignedInts">
 <list itemType="xsd:unsignedInt"/>
</simpleType>
```

### 5.9.7.64 ST\_VariableType (Variable Type)

Conditional expression variable type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
animLvl (Animation Level)	Specifies the animation level
animOne (Animate One)	Specifies animate as one.
bulEnabled (Bullets Enabled)	Specifies bullets enabled.
chMax (Child Max)	The maximum number of children.
chPref (Child Preference)	The preferred number of children.
dir (Direction)	Specifies the direction of the diagram.
hierBranch (Hierarchy Branch)	The hierarchy branch.
none (Unknown)	Unknown variable type.
orgChart (Organizational Chart Algorithm)	Algorithm that lays out an org chart.
resizeHandles (Resize Handles)	Specifies the resize handles.

**Referenced By**

ST\_FunctionArgument (§5.9.7.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VariableType" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="orgChart"/>
 <enumeration value="chMax"/>
 <enumeration value="chPref"/>
 <enumeration value="bulEnabled"/>
 <enumeration value="dir"/>
 <enumeration value="hierBranch"/>
 <enumeration value="animOne"/>
 <enumeration value="animLvl"/>
 <enumeration value="resizeHandles"/>
 </restriction>
</simpleType>
```

### 5.9.7.65 ST\_VerticalAlignment (Vertical Alignment)

This simple type defines different vertical alignment parameters.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies bottom aligned.
mid (Middle)	Specifies middle aligned.
none (None)	Specifies no vertical alignment.
t (Top)	Specifies top aligned.

**Referenced By**

ST\_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAlignment" final="restriction">
 <restriction base="xsd:token">
 <enumeration value="t"/>
 <enumeration value="mid"/>
 <enumeration value="b"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

## 6. VML Reference Material

### 6.1 VML

VML is a language for defining graphical objects in cases where DrawingML does not apply, such as text boxes and shapes in WordprocessingML documents and comments and controls in SpreadsheetML documents. This namespace provides the base elements and attributes for defining shape primitives. Other VML namespaces define elements that layer on information beyond the baseline graphical definition. To maintain backward compatibility, all VML namespaces defined in this specification maintain the legacy namespace structure already used by millions of documents.

[*Note:* The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example:* Assume the following shapes exist in a WordprocessingML document:

The drawing consists of four shapes. The arrows are specified by extending the shape type base definition in the shapetype element. Each shape representing an arrow references the shapetype it is extending via its type attribute.

```
<v:shapetype id="_x0000_t32" coordsize="21600,21600" o:spt="32" o:oned="t"
 path="m,121600,21600e" filled="f">
 <v:path arrowok="t" fillok="f" o:connecttype="none"/>
 <o:lock v:ext="edit" shapetype="t"/>
</v:shapetype>

<v:shape id="_x0000_s1030" type="#_x0000_t32" style="position:absolute;left:0;
 text-align:left;margin-left:105pt;margin-top:36pt;width:48pt;height:0;flip:x;
 z-index:251661312" o:connectortype="straight">
 <v:stroke endarrow="block"/>
</v:shape>

<v:shape id="_x0000_s1029" type="#_x0000_t32" style="position:absolute;left:0;
 text-align:left;margin-left:105pt;margin-top:21.75pt;width:48pt;height:0;
```

```
z-index:251660288" o:connectortype="straight">
<v:stroke endarrow="block"/>
</v:shape>
```

The rounded rectangles use the VML roundrect element.

```
<v:roundrect id="_x0000_s1028" style="position:absolute;left:0;
text-align:left;margin-left:153pt;margin-top:8.25pt;width:68.25pt;height:42pt;
z-index:251659264" arcsize="10923f"/>

<v:roundrect id="_x0000_s1027" style="position:absolute;left:0;
text-align:left;margin-left:36.75pt;margin-top:8.25pt;width:68.25pt;
height:42pt;z-index:251658240" arcsize="10923f"/>
```

*end example]*

Note that, throughout VML, numeric values that are allowed to take units may be specified in: cm (centimeters), mm (millimeters), in (inches), pt (points), pc (picas), px (pixels).

## 6.1.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:vml namespace:

[*Note:* As the VML format is a format provided for backward compatibility, many VML elements are defined in the same urn:schemas-microsoft-com:vml namespace that is already used by millions of documents already using VML. *end note*]

### 6.1.2.1 arc (Arc Segment)

This element specifies an arc defined as a segment of an oval. The CSS2 style content width and height define the width and height of that oval. The arc is defined by the intersection of the oval with the start and end radius vectors given by the angles. The angles are calculated on the basis of a circle (width equal to height) which is then scaled anisotropically to the desired width and height.

[*Example:* The following specifies a simple half-circle arc open at the top:

```
<v:arc
 style="position:relative;top:120;left:20;width:200;height:200"
 startangle="90" endangle="270">
</v:arc>
```

The shape looks like this:

*end example]*

textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>alt (Alternate Text)</p>	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderbottomcolor (Bottom Border Color)</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p>

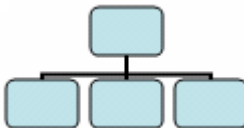

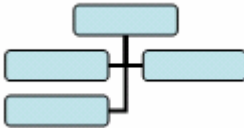

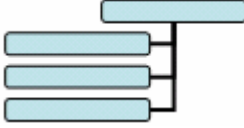

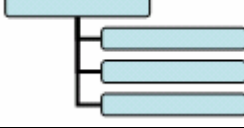

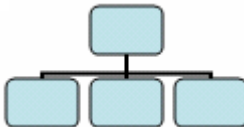

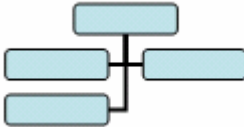

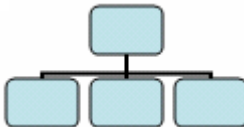

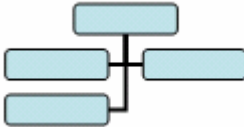

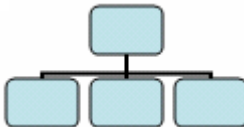

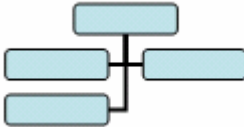

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderleftcolor (Border Left Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderrightcolor (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bordertopcolor (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bullet (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is a graphical bullet. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

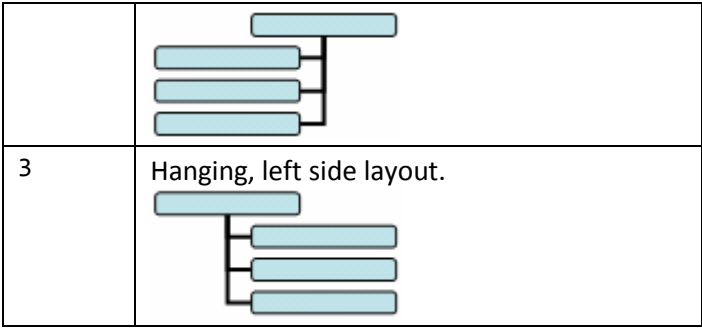

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
bwmode (Black-and-White Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow greyscale and pure B&amp;W might not.</p> <p>[Example: This shape renders in grayscale in a black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
bwnormal (Normal Black-and-White Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
bwpure (Pure	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is</p>

Attributes	Description
<p>Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>chromakey (Image Transparency Color)</p>	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>class (CSS Reference)</p>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[<i>Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>clip (Clipping Toggle)</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p>

Attributes	Description
<p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[Example:</p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>coordorigin (Coordinate Space Origin)</p>	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100).</p>

Attributes	Description				
	<p>The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
coordsize (Coordinate Space Size)	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
dgmlayout (Diagram Node Layout Identifier)  Namespace: urn:schemas-microsoft-	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.</td></tr></table>	Value	Description	0	Top-down, centered layout.
Value	Description				
0	Top-down, centered layout.				

Attributes	Description									
com:office:office										
	1	Hanging, both sides layout. 								
	2	Hanging, right side layout. 								
	3	Hanging, left side layout. 								
	<p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>									
dgmlayoutmru (Diagram Node Recent Layout Identifier)	Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:									
Namespace: urn:schemas- microsoft- com:office:office	<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout.</td></tr></table>		Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout.
Value	Description									
0	Top-down, centered layout. 									
1	Hanging, both sides layout. 									
2	Hanging, right side layout.									

Attributes	Description
	<div data-bbox="511 243 1208 569">  </div> <p data-bbox="415 604 535 636"><i>[Example:</i></p> <pre data-bbox="456 678 886 741">&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 783 574 814"><i>end example]</i></p> <p data-bbox="415 856 1446 888">The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmnodetyp</b> (Diagram Node Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 905 1446 968">Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p data-bbox="415 1010 535 1041"><i>[Example:</i></p> <pre data-bbox="456 1083 919 1146">&lt;v:shape ... dgmnodetyp="1"&gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 1188 574 1220"><i>end example]</i></p> <p data-bbox="415 1262 1446 1293">The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>doubleclicknotify</b> (Double-click Notification Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p data-bbox="415 1304 1471 1335">Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p data-bbox="415 1377 535 1409"><i>[Example:</i></p> <pre data-bbox="456 1451 1174 1514">&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p data-bbox="415 1556 574 1587"><i>end example]</i></p> <p data-bbox="415 1629 1390 1692">The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>endAngle</b> (Ending Angle)	<p data-bbox="415 1703 1382 1776">Specifies the angle that defines the endpoint of the arc. The angle is measured in degrees clockwise from the vertical. Default is 90.</p> <p data-bbox="415 1818 1211 1850"><i>[Example:</i> This arc ends at the bottom center of the shape's region:</p>

Attributes	Description
	<pre>&lt;v:arc ... endangle="180" ... &gt; &lt;/v:arc&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
fillcolor (Fill Color)	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
filled (Shape Fill Toggle)	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
forcedash (Force Dashed Outline)	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p>

Attributes	Description
<p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hralign (Horizontal Rule Alignment)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the alignment of a horizontal rule. Default is left.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
<p>href (Hyperlink Target)</p>	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Attributes	Description
<b>hrnoshade</b> (Horizontal Rule 3D Shading Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>hrpct</b> (Horizontal Rule Length Percentage)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<b>hrstd</b> (Horizontal Rule Standard Display Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>id</b> (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Attributes	Description
<p>insetmode (Text Inset Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
<p>insetpen (Inset Border From Path)</p>	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>ole (Embedded Object Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
<p>oleicon (Embedded Object Icon Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<p>oned (Shape Handle Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>opacity (Fill Color Opacity)</p>	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="451 1150 779 1371">  opacity="1"   opacity=".25" </div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>print (Print Toggle)</p>	<p>Specifies whether the shape will be printed. Default is true.</p> <p><i>[Example:</i></p> <pre data-bbox="451 510 967 575">&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>regroupid (Regroup ID)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p><i>[Example: The shape was part of a group identified by the ID 040754:</i></p> <pre data-bbox="451 947 1078 1012">&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>spid (Optional String)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>spt (Optional Number)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>startAngle (Starting Angle)</p>	<p>Specifies an angle that defines the starting point of the arc. The angle is measured in degrees clockwise from the vertical.</p> <p>Default is 0.</p> <p><i>[Example: This arc begins in the upper-right quadrant:</i></p>

Attributes	Description
	<pre>&lt;v:arc ... startangle="45" ... &gt; &lt;/v:arc&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
stroked (Shape Stroke Toggle)	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
strokeweight (Shape Stroke)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element</p>

Attributes	Description								
Weight)	<p>(§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 968 1479 1879"> <thead> <tr> <th data-bbox="415 968 662 1014">Property</th><th data-bbox="662 968 1479 1014">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1014 662 1287">flip</td><td data-bbox="662 1014 1479 1287"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1287 662 1696">height</td><td data-bbox="662 1287 1479 1696"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul> </td></tr> <tr> <td data-bbox="415 1696 662 1879">left</td><td data-bbox="662 1696 1479 1879"> <p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p>
Property	Description								
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>								
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>								
left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p>								

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>

Attributes	Description	
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>

Attributes	Description	
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-edited	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.</p>
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <b>static</b> - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• <b>absolute</b> - The element is positioned relative to the parent, using the top and left properties.</li> <li>• <b>relative</b> - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <b>&lt;percentage&gt;</b>- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• <b>inherit</b> - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• ltr - Text is displayed left-to-right.</li> <li>• rtl - Text is displayed right-to-left.</li> </ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>• horizontal - Text is displayed horizontally.</li> <li>• vertical - Text is displayed vertically.</li> <li>• vertical-ideographic - Ideographic text is displayed vertically.</li> <li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-to-text	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>
	mso-fit-text-to-shape	<p>Specifies whether the text stretches to fit the textbox. Default is false.</p>
	mso-layout-	<p>Specifies the alternate layout flow for text in textboxes. This</p>

Attributes	Description						
	flow-alt	property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.					
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.					
	mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: <ul style="list-style-type: none"><li>0</li><li>90</li><li>180</li><li>-90</li></ul>					
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.					
	v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: <ul style="list-style-type: none"><li>top</li><li>middle</li><li>bottom</li><li>top-center</li><li>middle-center</li><li>bottom-center</li><li>top-baseline</li><li>bottom-baseline</li><li>top-center-baseline</li><li>bottom-center-baseline</li></ul>					
	The following properties are only used by the textpath element (§6.1.2.23):						
<table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr><tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr></table>		Property	Description	font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.	font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.
Property	Description						
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.						
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.						

Attributes	Description																	
	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.																
	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>italic</li><li>oblique - Treated the same as italic.</li></ul>																
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>normal</li><li>small-caps</li></ul>																
	font-weight	<div>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>normal</td><td rowspan="6">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr><tr><td>300</td></tr><tr><td>400</td></tr><tr><td>bold</td><td rowspan="7">Treated as bold.</td></tr><tr><td>bolder</td></tr><tr><td>500</td></tr><tr><td>600</td></tr><tr><td>700</td></tr><tr><td>800</td></tr><tr><td>900</td></tr></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200	300	400	bold	Treated as bold.	bolder	500	600	700	800
Value	Description																	
normal	Treated as non-bold.																	
lighter																		
100																		
200																		
300																		
400																		
bold	Treated as bold.																	
bolder																		
500																		
600																		
700																		
800																		
900																		
mso-text-	Specifies whether a shadow is applied to the text on a text path.																	

Attributes	Description	
	shadow	Default is false.
	text-decoration	<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• underline</li> <li>• overline</li> <li>• line-through</li> <li>• blink</li> </ul>
	v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode	<p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.

Attributes	Description																
	<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> <li>• height</li> <li>• left</li> <li>• margin-left</li> <li>• margin-top</li> <li>• position</li> <li>• rotation</li> <li>• top</li> <li>• visibility</li> <li>• width</li> <li>• z-index</li> </ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>																
target (Hyperlink Display Target)	<p>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:</p> <table border="1" data-bbox="415 1251 1479 1887"> <thead> <tr> <th data-bbox="415 1251 626 1297">Value</th><th data-bbox="626 1251 1479 1297">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1297 626 1381">&lt;targetname&gt;</td><td data-bbox="626 1297 1479 1381">String containing the name of the frame or window in which to load the document.</td></tr> <tr> <td data-bbox="415 1381 626 1465">_blank</td><td data-bbox="626 1381 1479 1465">Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr> <tr> <td data-bbox="415 1465 626 1549">_media</td><td data-bbox="626 1465 1479 1549">Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr> <tr> <td data-bbox="415 1549 626 1633">_parent</td><td data-bbox="626 1549 1479 1633">Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr> <tr> <td data-bbox="415 1633 626 1717">_search</td><td data-bbox="626 1633 1479 1717">Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr> <tr> <td data-bbox="415 1717 626 1801">_self</td><td data-bbox="626 1717 1479 1801">Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr> <tr> <td data-bbox="415 1801 626 1885">_top</td><td data-bbox="626 1801 1479 1885">Specifies that the linked document is loaded into the topmost window.</td></tr> </tbody> </table>	Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:shape ...   href="http://www.openxmlformats.org"   target="_self" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>title (Shape Title)</p>	<p>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>userdrawn (Exists In Master Slide)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is false. If true, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Arc">
 <sequence>
 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attributeGroup ref="AG_AllCoreAttributes"/>
 <attributeGroup ref="AG_AllShapeAttributes"/>
 <attribute name="startAngle" type="xsd:decimal" use="optional"/>
 <attribute name="endAngle" type="xsd:decimal" use="optional"/>
</complexType>
```

6.1.2.2 background (Document Background)

This element describes the fill of the background of a page using vector graphics fills. Fills consist of simple colors, more advanced effects defined through the fill element (§6.1.2.5), or images.

[Example: The following shades the page background a pale red:

```
<v:background fillcolor="#c0504d">
</v:background>
```

This uses the fill element (§6.1.2.5) to create a gradient background fill:

```
<v:background>
 <v:fill type="gradient" color="#c0504d" color2="#f0504d" angle="45"/>
</v:background>
```

end example]

Parent Elements

Parent Elements
background (§2.2.1); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

Child Elements	Subclause
fill (Shape Fill Properties)	§6.1.2.5

Attributes	Description
<b>bwmode (Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering  <i>[Example: This shape renders in grayscale in a black-and-white environment:</i>  <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
<b>bwnormal (Normal Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.  <i>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</i>  <pre>&lt;v:shape ...   o:bwmode="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
<b>bwpure (Pure Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.  <i>[Example: This shape renders in high contrast when in a pure black-and-white environment:</i>  <pre>&lt;v:shape ... o:bwmode="highcontrast" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
fillcolor (Fill Color)	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
filled (Shape Fill Toggle)	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p>

Attributes	Description
	<p>[Example:</p> <div><div>&lt;v:shape ... id="myShape" ... &gt;</div><div>&lt;/v:shape&gt;</div></div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
targetscreen size (Target Screen Size)	<p>Specifies the target resolution used for WordprocessingML documents with a gradient or picture filled background. Default is no value. Allowed values are:</p> <div><div>Namespace:</div><div>urn:schemas-microsoft-com:office:office</div></div> <div><div>• 544,376</div><div>• 640,480</div><div>• 720,512</div><div>• 800,600</div><div>• 1024,768</div><div>• 1152,862</div></div> <p>The possible values for this attribute are defined by the ST_ScreenSize simple type (§6.2.3.22).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Background">
 <sequence>
 <element ref="fill" minOccurs="0"/>
 </sequence>
 <attributeGroup ref="AG_Id"/>
 <attributeGroup ref="AG_Fill"/>
 <attribute ref="o:bwmode"/>
 <attribute ref="o:bwpure"/>
 <attribute ref="o:bwnormal"/>
 <attribute ref="o:targetscreen size"/>
</complexType>
```

6.1.2.3 curve (Bezier Curve)

This element is used to draw a cubic bézier curve.

The following properties of the style attribute are ignored:

- top
- margin-top
- center-y
- left
- margin-left
- center-x

- width
- height

[Example: The following specifies a simple curve that opens upward:

```
<v:curve id="mycurve"
 from="10pt,10pt" to="100pt,10pt"
 control1="40pt,30pt" control2="85pt,30pt">
</v:curve>
```

This shape is created:

end example]

Attributes	Description
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
alt (Alternate Text)	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderbottomcolor (Bottom Border Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderleftcolor (Border Left Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderrightcolor (Border Right Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>bordertopcolor (Border Top Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>bullet (Graphical</p>	<p>Specifies whether the shape is a graphical bullet. Default is false.</p>

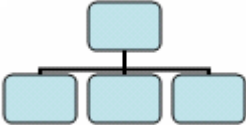

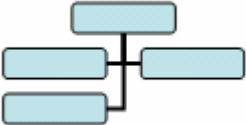

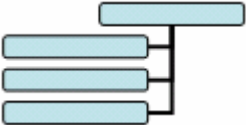

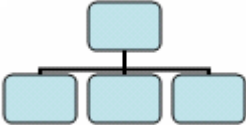

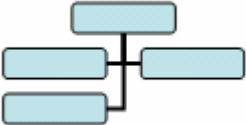

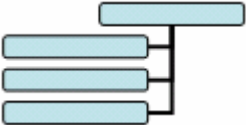

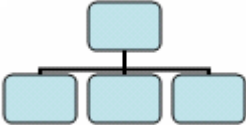

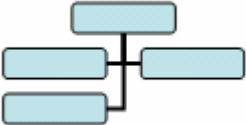

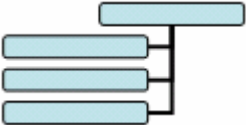

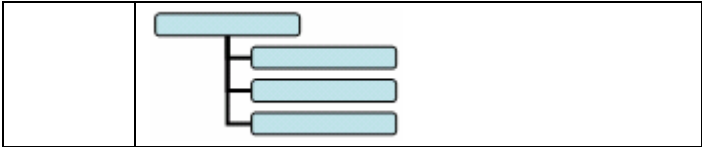

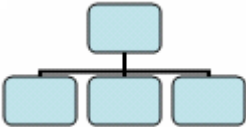

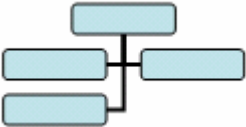

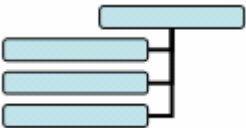

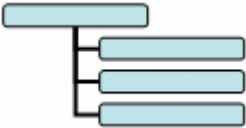

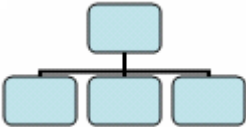

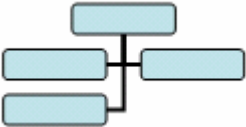

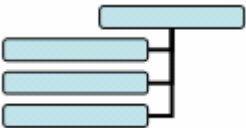

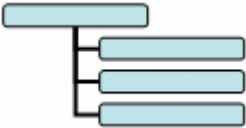

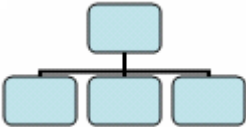

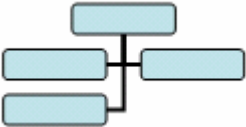

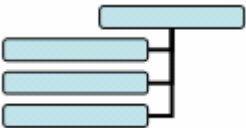

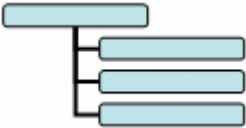

Attributes	Description
Bullet)  Namespace: urn:schemas- microsoft- com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
button (Button Behavior Toggle)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
bwmode (Black- and-White Mode)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow greyscale and pure B&amp;W might not.</p> <p>[Example: This shape renders in grayscale in a black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
bwnormal (Normal Black-and-White Mode)  Namespace: urn:schemas-	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</p>

Attributes	Description
microsoft-com:office:office	<pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
bwpure (Pure Black-and-White Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
chromakey (Image Transparency Color)	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
class (CSS Reference)	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[<i>Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt;</pre>

Attributes	Description
	<p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>clip (Clipping Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>control1 (First Curve Control Point)</p>	<p>Specifies the first control point for the curve, given in the coordinate space of the parent element. Default is "10,10". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:curve ... control1="20,30" ... &gt; &lt;/v:curve&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
control2 (Second Curve Control Point)	<p>Specifies the second control point for the curve, given in the coordinate space of the parent element. Default is "20,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p>[Example:</p> <pre>&lt;v:curve ... control2="50,20" ... &gt; &lt;/v:curve&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
coordorigin (Coordinate Space Origin)	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> <div data-bbox="415 1648 516 1749" data-label="Image"> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

Attributes	Description										
<div>coordsize (Coordinate Space Size)</div>	<div><p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p><p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p><p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p><pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre><div></div><p>end example]</p><p>The possible values for this attribute are defined by the XML Schema string datatype.</p></div>										
<div><div>dgmlayout (Diagram Node Layout Identifier)</div><div>Namespace: urn:schemas-microsoft-com:office:office</div></div>	<div><p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p><table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.<div></div></td></tr><tr><td>3</td><td>Hanging, left side layout.</td></tr></table></div>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout. <div></div>	3	Hanging, left side layout.
Value	Description										
0	Top-down, centered layout. <div></div>										
1	Hanging, both sides layout. <div></div>										
2	Hanging, right side layout. <div></div>										
3	Hanging, left side layout.										

Attributes	Description										
	<div><div></div><div><p>[Example:</p><pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre><p>end example]</p><p>The possible values for this attribute are defined by the XML Schema integer datatype.</p></div></div>										
<p>dgmlayoutmru (Diagram Node Recent Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.<div></div></td></tr><tr><td>3</td><td>Hanging, left side layout.<div></div></td></tr></table> <div><p>[Example:</p><pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre><p>end example]</p></div>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout. <div></div>	3	Hanging, left side layout. <div></div>
Value	Description										
0	Top-down, centered layout. <div></div>										
1	Hanging, both sides layout. <div></div>										
2	Hanging, right side layout. <div></div>										
3	Hanging, left side layout. <div></div>										

Attributes	Description
<p><b>dgmnodekind</b> (Diagram Node Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>The possible values for this attribute are defined by the XML Schema integer datatype.</p> <p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p><b>doubleclicknotify</b> (Double-click Notification Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p><b>fillcolor</b> (Fill Color)</p>	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p><b>filled</b> (Shape Fill)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is</p>

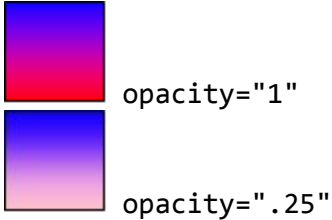

Attributes	Description
Toggle)	<p>overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
forcedash (Force Dashed Outline)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
from (Curve Starting Point)	<p>Specifies the starting point of the line in the coordinate space of the parent element. Default is "0,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p>[Example:</p> <pre>&lt;v:curve ... from="10,10" ... &gt; &lt;/v:curve&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hr (Horizontal Rule Toggle)	<p>Specifies that a shape is a horizontal rule. Default is false.</p>

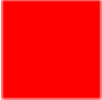

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hralign (Horizontal Rule Alignment)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the alignment of a horizontal rule. Default is left.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
href (Hyperlink Target)	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hrnoshade (Horizontal Rule 3D Shading Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hrpct (Horizontal Rule Length Percentage)	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
hrstd (Horizontal Rule Standard Display Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
insetmode (Text Inset Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p>

Attributes	Description
	<p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>ole (Embedded Object Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
<p>oleicon (Embedded Object Icon Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>oned (Shape Handle Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description
opacity (Fill Color Opacity)	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red"   color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
preferrelative (Relative Resize Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
print (Print Toggle)	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
regroupid (Regroup)	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes</p>

Attributes	Description
<p>ID)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>spid (Optional String)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>spt (Optional Number)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>strokecolor (Shape Stroke Color)</p>	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>stroked (Shape Stroke Toggle)</p>	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element</p>

Attributes	Description				
	<p>overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>				
<p>strokeweight (Shape Stroke Weight)</p>	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
<p>style (Shape Styling Properties)</p>	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1612 1479 1883"> <thead> <tr> <th data-bbox="415 1612 664 1661">Property</th><th data-bbox="664 1612 1479 1661">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1661 664 1883">flip</td><td data-bbox="664 1661 1479 1883"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> </ul> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> </ul>
Property	Description				
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> </ul>				

Attributes	Description	
		<ul style="list-style-type: none"> <li>• yx - Flip along both the x- and y-axis.</li> </ul>
	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <code>&lt;units&gt;</code>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code>- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• <code>&lt;units&gt;</code> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code>- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• <code>&lt;units&gt;</code>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code>- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the <code>mso-position-horizontal</code> property. Default is text. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin</p>

Attributes	Description	
		of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is

Attributes	Description	
		<p><code>inherit</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>hidden</code> - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• <code>inherit</code> - The visibility state is inherited from the parent of the shape.</li> </ul>
	<code>width</code>	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Default position of an element in the flow of the page.</li> <li>• <code>&lt;units&gt;</code>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <code>&lt;percentage&gt;</code>- Value expressed as a percentage of the parent object's width.</li> </ul>
	<code>z-index</code>	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>auto</code> - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• <code>&lt;order&gt;</code>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	<code>direction</code>	<p>Specifies the direction of the text in the textbox. Default is <code>ltr</code>. This property is superseded by the <code>mso-direction-alt</code> property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>ltr</code> - Text is displayed left-to-right.</li> <li>• <code>rtl</code> - Text is displayed right-to-left.</li> </ul>
	<code>layout-flow</code>	<p>Determines the flow of the text layout in a textbox. Default is <code>horizontal</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>horizontal</code> - Text is displayed horizontally.</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• <code>vertical</code> - Text is displayed vertically.</li> <li>• <code>vertical-ideographic</code> - Ideographic text is displayed vertically.</li> <li>• <code>horizontal-ideographic</code> - Ideographic text is displayed horizontally.</li> </ul>
	<code>mso-direction-alt</code>	Specifies an alternate direction for text in textboxes. Overrides the <code>direction</code> property. The only allowed value is <code>context</code> .
	<code>mso-fit-shape-to-text</code>	Specifies whether the shape stretches to fit the text in the textbox. Default is <code>false</code> .
	<code>mso-fit-text-to-shape</code>	Specifies whether the text stretches to fit the textbox. Default is <code>false</code> .
	<code>mso-layout-flow-alt</code>	Specifies the alternate layout flow for text in textboxes. This property is used instead of <code>layout-flow</code> when the layout flow is from bottom to top for non-ideographic languages. Its only value is <code>bottom-to-top</code> .
	<code>mso-next-textbox</code>	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	<code>mso-rotate</code>	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>
	<code>mso-text-scale</code>	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if <code>mso-fit-text-to-shape</code> is <code>true</code> .
	<code>v-text-anchor</code>	<p>Specifies the vertical anchoring of text in a textbox. Default is <code>top</code>. The alignment of a text anchor only becomes evident if <code>mso-fit-text-to-shape</code> is <code>false</code>. This property is different from the <code>vertical-align</code> CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <code>top</code></li> <li>• <code>middle</code></li> <li>• <code>bottom</code></li> <li>• <code>top-center</code></li> <li>• <code>middle-center</code></li> <li>• <code>bottom-center</code></li> </ul>

Attributes	Description								
		<ul style="list-style-type: none"><li>• top-baseline</li><li>• bottom-baseline</li><li>• top-center-baseline</li><li>• bottom-center-baseline</li></ul>							
	The following properties are only used by the textpath element (§6.1.2.23):								
	Property	Description							
	font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.							
	font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.							
	font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.							
	font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: <ul style="list-style-type: none"><li>• normal</li><li>• italic</li><li>• oblique - Treated the same as italic.</li></ul>							
	font-variant	Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are: <ul style="list-style-type: none"><li>• normal</li><li>• small-caps</li></ul>							
	font-weight	Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are: <table><tr><th>Value</th><th>Description</th></tr><tr><td>normal</td><td rowspan="4">Treated as non-bold.</td></tr><tr><td>lighter</td></tr><tr><td>100</td></tr><tr><td>200</td></tr></table>	Value	Description	normal	Treated as non-bold.	lighter	100	200
	Value	Description							
normal	Treated as non-bold.								
lighter									
100									
200									

Attributes	Description		
		300	Treated as bold.
		400	
		bold	
		bolder	
		500	
		600	
		700	
		800	
		900	
mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.		
text-decoration	Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: <ul style="list-style-type: none"><li>• none</li><li>• underline</li><li>• overline</li><li>• line-through</li><li>• blink</li></ul>		
v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.		
v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.		
v-text-align	Specifies the alignment of text. Default is left. Allowed values are: <ul style="list-style-type: none"><li>• left</li><li>• right</li><li>• center</li><li>• justify</li><li>• letter-justify - Distributes the extra space between the letters.</li><li>• stretch-justify - Stretches the letters to fill in the space.</li></ul>		

Attributes	Description					
	v-text-kern	Specifies whether kerning is turned on. Default is false.				
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.				
	v-text-spacing-mode	Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are: <ul style="list-style-type: none"><li>tightening</li><li>tracking</li></ul>				
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.				
	<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"><li>top</li><li>left</li><li>width</li><li>height</li></ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"><li>flip</li><li>height</li><li>left</li><li>margin-left</li><li>margin-top</li><li>position</li><li>rotation</li><li>top</li><li>visibility</li><li>width</li><li>z-index</li></ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>					
target (Hyperlink Display Target)	<p>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td></td><td></td></tr></table>		Value	Description		
Value	Description					

Attributes	Description														
	<table border="1"> <tr> <td data-bbox="414 247 625 325">&lt;targetname&gt;</td><td data-bbox="625 247 1481 325">String containing the name of the frame or window in which to load the document.</td></tr> <tr> <td data-bbox="414 325 625 409">_blank</td><td data-bbox="625 325 1481 409">Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
<targetname>	String containing the name of the frame or window in which to load the document.														
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.														
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.														
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.														
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.														
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).														
_top	Specifies that the linked document is loaded into the topmost window.														
title (Shape Title)	<p>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p>[Example:</p> <pre> &lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>														
to (Curve Ending Point)	<p>Specifies the ending point of the line in the coordinate space of the parent element. Default is "30,20". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p>[Example:</p> <pre> &lt;v:curve ... to="40,40" ... &gt; </pre>														

Attributes	Description
	<p><code>&lt;/v:curve&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>userdrawn (Exists In Master Slide)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the user has added the shape to a master slide. Default is <code>false</code>. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the <code>mso-wrap-mode</code> style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Curve">
 <sequence>

#### 6.1.2.4 f (Single Formula)

This element defines a single value as the result of the evaluation of an expression. The expression is defined by the eqn attribute and has the general form of an operation followed by up to three arguments, which consist of adjustment values (see the adj attribute of the shape element (§6.1.2.19)), the results of earlier formulas, fixed numbers or pre-defined values. Each f value is referenced using "@" followed by a number corresponding to the zero-based index for that value in the list of f elements. For example, the value of the second f element is referenced as "@2".

[Example: The following defines a blue arrow pointing to the right:

```
<v:shape coordsize="21600,21600" adj="18000,5400,10800"
 path="m @0,0 l @0,@1 0,@1 0,@3 @0,@3 @0,21600 21600,10800 x e"
 style='left:50pt;top:50pt;width:90pt;height:30pt'
 fillcolor="#4f81bd" strokecolor="#4f81bd" strokeweight="2pt">
 <v:formulas>
 <v:f eqn="val #0"/>
 <v:f eqn="val #1"/>
 <v:f eqn="val #2"/>
 <v:f eqn="sum height 0 #1"/>
 <v:f eqn="sum #2 0 #1"/>
 <v:f eqn="sum width 0 #0"/>
 <v:f eqn="prod @5 @4 #2"/>
 <v:f eqn="sum width 0 @6"/>
 </v:formulas>
</v:shape>
```

The shape looks like this:

end example]

Inexact.</td></tr> </table>	Operation	Description	val	v Returns the supplied value. Exact.	sum	$v + P1 - P2$ Addition and subtraction. Exact.	product	$v \times P1 / P2$ Multiplication and division. Rounds up.	mid	$(v + P1) / 2$ Simple average. Rounds toward zero.	abs	v  Absolute value. Exact.	min	min(v, P1) The lesser of two values. Exact.	max	max(v, P1) The greater of two values. Exact.	if	$v > 0 ? P1 : P2$ Conditional selection. Exact.	mod	$\sqrt{v^2 + P1^2 + P2^2}$ Modulus. Inexact.	atan2	atan2(P1, v) Trigonometric arc tangent of a quotient. Result is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.	sin	$v \times \sin(P1)$ Sine. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.	cos	$v \times \cos(P1)$ Cosine. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.	cosatan2	$v \times \cos(\text{atan2}(P2, P1))$ Preserves full accuracy in the intermediate calculation. Inexact.
Operation	Description																												
val	v Returns the supplied value. Exact.																												
sum	$v + P1 - P2$ Addition and subtraction. Exact.																												
product	$v \times P1 / P2$ Multiplication and division. Rounds up.																												
mid	$(v + P1) / 2$ Simple average. Rounds toward zero.																												
abs	v  Absolute value. Exact.																												
min	min(v, P1) The lesser of two values. Exact.																												
max	max(v, P1) The greater of two values. Exact.																												
if	$v > 0 ? P1 : P2$ Conditional selection. Exact.																												
mod	$\sqrt{v^2 + P1^2 + P2^2}$ Modulus. Inexact.																												
atan2	atan2(P1, v) Trigonometric arc tangent of a quotient. Result is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.																												
sin	$v \times \sin(P1)$ Sine. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.																												
cos	$v \times \cos(P1)$ Cosine. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.																												
cosatan2	$v \times \cos(\text{atan2}(P2, P1))$ Preserves full accuracy in the intermediate calculation. Inexact.																												

Attributes	Description														
	<table border="1"> <tr> <td data-bbox="415 245 570 365">sinatan2</td><td data-bbox="570 245 1203 365"> <math>v \times \sin(\text{atan2}(P2, P1))</math>  Preserves full accuracy in the intermediate calculation. Inexact. </td></tr> <tr> <td data-bbox="415 365 570 485">sqrt</td><td data-bbox="570 365 1203 485"> <math>\sqrt{v}</math>  Square root. Result is positive and rounds down. Inexact. </td></tr> <tr> <td data-bbox="415 485 570 642">sumangle</td><td data-bbox="570 485 1203 642"> <math>v + P1 \times 2^{16} - P2 \times 2^{16}</math>  Adds an existing angle in fd units (v) to two other angles specified in degrees. P1 and P2 are scaled by <math>2^{16}</math>. Exact. </td></tr> <tr> <td data-bbox="415 642 570 835">ellipse</td><td data-bbox="570 642 1203 835"> <math>P2 \sqrt{1 - \left(\frac{v}{P1}\right)^2}</math>  The eccentricity formula for an ellipse, where v is length of the semiminor axis and P1 is the length of the semimajor axis. Argument is in "fd" units or fractional degrees - degrees <math>\times 2^{16}</math>. Inexact. </td></tr> </table> <p>Formulas are evaluated to full precision, but the result is always a 32-bit integer. Formula authors should avoid formulas which are discontinuous - not only are many of the trigonometric operations inexact, the transformations within the coordinate spaces are also inexact. This can mean that a set of formulas which is discontinuous evaluates to give very different path values with the same input on two different systems.</p> <p>When an operation is marked as exact then a conforming implementation must always generate the correct arithmetic answer (unless the calculations overflow internally). The product operation is required to round to the nearest integer. If the result is exactly 0.5 then it must be rounded up to the next numerically greater integer. The mid operation is required to round towards 0.</p> <p>All other operations are inexact, but the implementation must round non-integral values down (towards -infinity) and should perform internal calculations with this form of rounding.</p> <p>The arguments used in the evaluation of a formula are normally either fixed numbers, the result of the evaluation of a previous formula or an adjust value - the value of the corresponding entry in the shape adj attribute. Fixed numbers must be positive integral values in the range 0 to 65535 (unsigned 16-bit numbers). The following named values are defined:</p> <table border="1"> <tr> <th data-bbox="415 1776 630 1822">Value</th><th data-bbox="630 1776 1203 1822">Description</th></tr> <tr> <td data-bbox="415 1822 630 1885">@n</td><td data-bbox="630 1822 1203 1885">The value of formula n, where n is the zero-</td></tr> </table>	sinatan2	$v \times \sin(\text{atan2}(P2, P1))$ Preserves full accuracy in the intermediate calculation. Inexact.	sqrt	$\sqrt{v}$ Square root. Result is positive and rounds down. Inexact.	sumangle	$v + P1 \times 2^{16} - P2 \times 2^{16}$ Adds an existing angle in fd units (v) to two other angles specified in degrees. P1 and P2 are scaled by $2^{16}$ . Exact.	ellipse	$P2 \sqrt{1 - \left(\frac{v}{P1}\right)^2}$ The eccentricity formula for an ellipse, where v is length of the semiminor axis and P1 is the length of the semimajor axis. Inexact.	tan	$v \times \tan(P1)$ Tangent. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.	Value	Description	@n	The value of formula n, where n is the zero-
sinatan2	$v \times \sin(\text{atan2}(P2, P1))$ Preserves full accuracy in the intermediate calculation. Inexact.														
sqrt	$\sqrt{v}$ Square root. Result is positive and rounds down. Inexact.														
sumangle	$v + P1 \times 2^{16} - P2 \times 2^{16}$ Adds an existing angle in fd units (v) to two other angles specified in degrees. P1 and P2 are scaled by $2^{16}$ . Exact.														
ellipse	$P2 \sqrt{1 - \left(\frac{v}{P1}\right)^2}$ The eccentricity formula for an ellipse, where v is length of the semiminor axis and P1 is the length of the semimajor axis. Inexact.														
tan	$v \times \tan(P1)$ Tangent. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$ . Inexact.														
Value	Description														
@n	The value of formula n, where n is the zero-														

Attributes	Description	
		based index of the formula in the list of formulas. n must be less than the current formula index.
	#n	Adjustment (adj) value n. n must be in the range 0 to 7.
	width	The width defined by the coordsize attribute.
	height	The height defined by the coordsize attribute.
	xcenter	The x ordinate of the center of the coordinate space defined by coordorigin and coordsize.
	ycenter	The y ordinate of the center of the coordinate space defined by coordorigin and coordsize.
	xlimo	The x value of the limo attribute (see also the path element (§6.1.2.14)).
	ylimo	The y value of the limo attribute (see also the path element (§6.1.2.14)).
	hasstroke	1 if the shape has a stroke operation, 0 if it does not, as determined by the on attribute of the stroke element (§6.1.2.21).
	hasfill	1 if the shape has a fill operation, 0 if it does not, as determined by the on attribute of the fill element (§6.1.2.5).
	pixellinewidth	The line width in output device pixels. This is used to outset lines from the edge of a rectangle on the assumption that the implementation draws to lower right pixel in preference to the upper left pixel when a line is on a pixel boundary.
	pixelwidth	The width of the shape in device pixels (i.e., the coordsize width transformed into device space).
	pixelheight	The height of the coordsize in device pixels.
	emuwidth	The width of the coordsize in EMUs.
	emuheight	The height of the coordsize in EMUs.
	emuwidth2	Half the width of the coordsize in EMUs.

Attributes	Description		
	<table border="1"> <tr> <td>emuheight2</td><td>Half the height of the coordsize in EMUs.</td></tr> </table> <p>The EMU, or English Metric Unit, is the smallest unit of measure in VML and corresponds to 914400 EMU per inch or 12700 EMU per point.</p> <p>See above for an example.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>	emuheight2	Half the height of the coordsize in EMUs.
emuheight2	Half the height of the coordsize in EMUs.

3 <attribute name="eqn" type="xsd:string"/>
4 </complexType>
```

### 5 6.1.2.5 fill (Shape Fill Properties)

6 This element specifies how the path should be filled if something beyond a solid color fill is desired. The  
7 attributes of the fill element can be used to describe a powerful set of image- or gradient-based fill patterns.  
8 Extensions to the VML fill definition are encoded as sub-elements of fill.

Parent Elements

Child Elements	Subclause
fill (Shape Fill Extended Properties)	§6.2.2.12

10

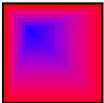

Attributes	Description
alignshape (Align Image With Shape)	<p>Specifies whether an image will align with the shape. Default is true.</p> <p>[Example: The image displayed in the shape is not rotated even though the shape is rotated 30 degrees:</p> <pre>&lt;v:shape coordorigin="0,0"   coordsize="200,200"   style="top:1;left:1;width:50;   height:50;rotation:30"   path="m 1,1 l 1,200, 200,200, 200,1 x e"&gt;   &lt;v:fill alignshape="false" type="frame"     src="myimage.gif"&gt;</pre>

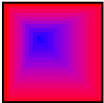

Attributes	Description
	<pre>&lt;/v:fill&gt; &lt;/v:shape&gt;</pre> <p>Applied to a simple square the fill looks like this:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>althref (Alternate Image Reference Location)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Defines an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p> <pre>&lt;v:fill ... althref="myimage.pcz" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>angle (Gradient Angle)</p>	<p>Specifies the direction of a gradient. The vector of a gradient is perpendicular to the vector of the blend direction from one color to another. The default value is zero degrees, which is a horizontal vector from left to right. Positive angles rotate the gradient in a counter-clockwise direction.</p> <p>[Example: The fill is composed of a 45-degree gradient of two colors. Blue is in the top left corner and red is in the bottom right corner.</p> <pre>&lt;v:fill type="gradient" color="red"   color2="blue" angle="45"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema decimal datatype.</p>
<p>aspect (Image Aspect Ratio)</p>	<p>Specifies how the fill image aspect ratio will be preserved. Default is ignore. Allowed values are:</p>

Attributes	Description
	<ul style="list-style-type: none"> <li>• ignore - Ignore aspect ratio.</li> <li>• atleast - At least as large as defined by the size attribute.</li> <li>• atmost - No larger than that defined by the size attribute.</li> </ul> <p>In each case, the size attribute will be adjusted to preserve the aspect ratio of the image.</p> <p>[Example: The image that makes up the fill is no larger than 20 points by 20 points, limiting the size of the tiles inside the shape.</p> <pre>&lt;v:fill type="tile" aspect="atmost"   size="20pt,20pt" src="myimage.gif"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</p>
color (Primary Color)	<p>Specifies the main fill color; functions the same as the fillcolor attribute of the shape element (§6.1.2.19). This attribute overrides the shape's fillcolor. Default is white. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: The shape is blue:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt;   &lt;v:fill color="blue"/&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
color2 (Secondary Color)	<p>Specifies the secondary fill color, used when a fill type is a pattern or a gradient. Default is white. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: The shape is filled with a horizontal gradient with red at the bottom and blue on top:</p> <pre>&lt;v:fill type="gradient"</pre>

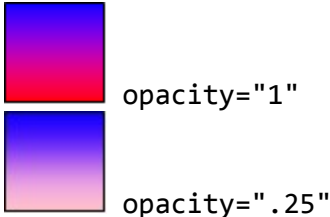

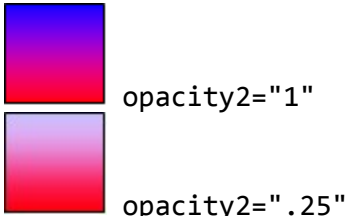

Attributes	Description
	<pre>color="red" color2="blue"&gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>colors (Intermediate Colors)</p>	<p>Specifies an array of comma-separated percentage-color pairs that define intermediate colors and their positions in a gradient fill. The primary color, specified either by the fillcolor attribute of the shape element (§6.1.2.19) or the color attribute of the fill element (§6.1.2.5), is used at the 0% endpoint. The secondary color, specified by the color2 attribute of the fill element (§6.1.2.5), is used at the 100% endpoint. The numeric values may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The shape is filled with a horizontal gradient colored, from bottom to top, red, yellow, green, blue:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" colors="30% yellow,70% green"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>detectmouseclick (Detect Mouse Click)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies whether a mouse click is detected on the fill of a shape.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>focus (Gradient Center)</p>	<p>Specifies the center starting position of a gradient. Values range from 100% to -100%. Default is 0.</p> <p>A value of 100% or -100% reverses the direction of the gradient (in effect swapping color and color2). A value of 50% changes the gradient so that color is at both ends and color2 is in the middle. A value of -50% changes the gradient so that color2 is at both ends and color is in the middle.</p>

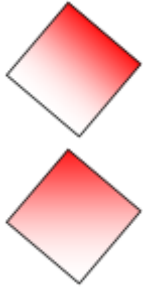

Attributes	Description
	<p>[Example: The shape is filled with a horizontal gradient with red at both ends and blue in the middle:</p> <pre>&lt;v:fill type="gradient"   color="red" color2="blue"   focus="50%"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>focusposition (Radial Gradient Center)</p>	<p>Specifies the position of the center rectangle of a radial gradient. The vector is a fraction of the width and height of the shape. The first is a percentage of the fill to the left edge; the second is a percentage of the fill to the top. Default is 0,0. To position a radial fill at the center of a shape, use a value of 50%,50%.</p> <p>[Example: The shape is filled with a rectangular gradient positioned in the top-left quadrant of the shape. The interior of the gradient is blue and the exterior is red:</p> <pre>&lt;v:fill type="gradientradial"   color="red" color2="blue"   focusposition="25%,25%"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>focussize (Radial Gradient Size)</p>	<p>Specifies the size of the center rectangle of a radial gradient. The vector is a fraction of the width and height of the shape. The first is a percentage of the fill to the right edge; the second is a percentage of the fill to the bottom. Default is 0,0.</p> <p>A focussize value of 100%,100% and a focusposition of 0,0 makes color2 dominate the gradient completely. Small values of around 10%,10% are recommended for balanced gradients.</p> <p>[Example: The shape is filled with a rectangular gradient positioned in the top-left quadrant of the shape. The interior of the gradient is blue and the exterior is red. The</p>

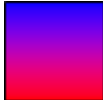

Attributes	Description
	<p>red portion is wider on the bottom and right sides of the blue region. The pure blue region is 25% the width and 25% the height of the shape:</p> <pre>&lt;v:fill type="gradientradial"   color="red" color2="blue"   focussize="25%,25%"   focusposition="25%,25%"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>href (Hyperlink Target)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>id (Relationship to Part)</p> <p>Namespace: .../officeDocument/2006/relationships</p>	<p>Specifies the relationship ID of the relationship to the image used for this fill. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>[Example: The markup specifies the associated relationship part with relationship ID rId10 contains the corresponding relationship information for the fill:</p>

Attributes	Description
	<pre>&lt; ... r:id="rId10" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
method (Gradient Fill Method)	<p>Specifies the method used to generate the transition from color to color2 in a gradient fill. Default is <i>sigma</i>.</p> <p>[Example:</p> <pre>&lt;v:fill type="gradient"   color="red" color2="blue" method="any"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FillMethod simple type (§6.1.3.4).</p>
on (Fill Toggle)	<p>Specifies whether to fill the shape. Default is <i>true</i>. This attribute overrides the shape's fill attribute.</p> <p>[Example: The shape has a transparent fill:</p> <pre>&lt;v:shape ... fill="true" ... &gt;   &lt;v:fill color="red" on="false"&gt;   &lt;/v:fill&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
opacity (Primary Color Opacity)	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red"</pre>

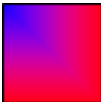

Attributes	Description
	<pre>color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>opacity2 (Secondary Color Opacity)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies the opacity of the secondary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The blue color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" o:opacity2=".25"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>origin (Fill Image Origin)</p>	<p>Specifies the position of the origin of a fill image as a point relative to the top left corner of the image. The vector is a fraction of the width and height of the image. Default is the center of the image. These numeric values may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The origin of the image is 25% to the right and 25% above the image's top left corner:</p> <pre>&lt;v:fill type="tile" src="myimage.gif" origin="0.25,-0.25"&gt; &lt;/v:fill&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
position (Fill Image Position)	<p>Specifies the position of the origin of a fill image as a point within its containing shape. The vector is a fraction of the width and height of the shape. These numeric values may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[<i>Example:</i> The origin of the image is positioned 25% to the right of the left edge of the shape and 25% down from the shape's top:</p> <pre>&lt;v:fill type="tile" src="myimage.gif"   position="0.25,0.25"&gt; &lt;/v:fill&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
recolor (Recolor Fill as Picture)	<p>Specifies that the fill uses an image. Default is false.</p> <p>[<i>Example:</i></p> <pre>&lt;v:fill r:id="rId4" o:title="MyPic" recolor="true"   type="frame"&gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
relid (Relationship to Part)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the relationship ID of the relationship to the image. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>[<i>Example:</i> The markup specifies the associated relationship part with relationship ID rId10 contains the corresponding relationship information:</p>

Attributes	Description
	<pre>&lt;v:fill ... o:relid="rId10" ...&gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§6.2.3.20).</p>
rotate (Rotate Fill with Shape)	<p>Specifies whether the fill is rotated with the shape. Default is false.</p> <p>[<i>Example:</i> The gradient is rotated with the shape:</p> <pre>&lt;v:fill color2="white" focus="100%" rotate="true"   type="gradient"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="451 821 831 1108">  <p>rotate="true"</p> <p>rotate="false"</p> </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
size (Fill Image Size)	<p>Specifies the size of the fill image. Default is the native image pixel size.</p> <p>[<i>Example:</i> The image is reduced in size disproportionately:</p> <pre>&lt;v:fill type="tile" src="myimage.gif"   size="25pt,15pt"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="414 1583 516 1684">  </div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
src (Fill Image)	<p>Specifies the URL specifying the fill image to use.</p>

Attributes	Description
Source)	<p>[Example:</p> <pre>&lt;v:fill ... src="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
title (Title)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies the title of an embedded fill image. This is typically set to the comment property of the image, which is often blank.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:title="alt text" ... &gt; &lt;/v:fill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
type (Fill Type)	<p>Specifies the type of fill. Default is solid. Allowed values are:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• gradient</li> <li>• gradientradial</li> <li>• tile</li> <li>• pattern</li> <li>• frame</li> </ul> <p>[Example: Applied to a simple square using the following fill element, the three gradient types look like this:</p> <pre>&lt;v:fill color="red" color2="blue" type="solid"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="451 1581 553 1686" style="display: inline-block; vertical-align: middle;">  </div> type="solid" <div data-bbox="451 1692 553 1791" style="display: inline-block; vertical-align: middle;">  </div> type="gradient"

Attributes	Description						
	<div> type="gradientradial"</div> <p>Applied to a simple square using the following fill elements, the three image types look like this:</p> <table><tr><td></td><td><pre>&lt;v:fill src="myimage.gif"   type="tile" size="50%,50%"&gt; &lt;/v:fill&gt;</pre></td></tr><tr><td></td><td><pre>&lt;v:fill src="myimage.gif"   type="frame" size="50%,50%"&gt; &lt;/v:fill&gt;</pre></td></tr><tr><td></td><td><pre>&lt;v:fill src="myimage.gif"   color="red" color2="blue"   type="pattern"&gt; &lt;/v:fill&gt;</pre></td></tr></table> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).</p>		<pre>&lt;v:fill src="myimage.gif"   type="tile" size="50%,50%"&gt; &lt;/v:fill&gt;</pre>		<pre>&lt;v:fill src="myimage.gif"   type="frame" size="50%,50%"&gt; &lt;/v:fill&gt;</pre>		<pre>&lt;v:fill src="myimage.gif"   color="red" color2="blue"   type="pattern"&gt; &lt;/v:fill&gt;</pre>
	<pre>&lt;v:fill src="myimage.gif"   type="tile" size="50%,50%"&gt; &lt;/v:fill&gt;</pre>						
	<pre>&lt;v:fill src="myimage.gif"   type="frame" size="50%,50%"&gt; &lt;/v:fill&gt;</pre>						
	<pre>&lt;v:fill src="myimage.gif"   color="red" color2="blue"   type="pattern"&gt; &lt;/v:fill&gt;</pre>						

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fill">

```

6.1.2.6 formulas (Set of Formulas)

This element defines a set of formulas whose calculated values are referenced by other attributes. Each formula is contained in a child f element (§6.1.2.4).

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Child Elements	Subclause
f (Single Formula)	§6.1.2.4

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Formulas">
 <sequence>
 <element name="f" type="CT_F" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 6.1.2.7 group (Shape Group)

This element is used to collect shapes and groups so they can be positioned and transformed as a single unit. A group contains group, shapetype, shape, pre-defined shape - arc, curve, image, line, oval, polyline, rect, roundrect - and lock elements.

[Example: The following example defines a few basic parts of a flying saucer graphic. The group consists of five shapes. Each shape's position is determined within the coordinate space of the group, which is defined by the group's attributes.

```
<v:group id="saucer"
 style='position:relative;left:200;top:200;width:50;height:50'
 coordorigin="0,0" coordsize="6000,6000">
 <v:shape id="body"
 style='position:relative;left:234.75pt;top:208.875pt;
 width:235.25pt;height:128.875pt' coordsize="3765,2060"
 path="m1285,2511126,469,580,1009,,1285,25,1412,93,1547,194,1673,
 1017,2026,2312,2060,3209,1756,3765,1388,3278,680,3059,319,2976,,
 1285,251,1285,251xe"
 fillcolor="#bcbcd6" stroked="f">
 <v:path arrowok="t"/>
 </v:shape>
 <v:shape id="canopy"
 style='position:relative;left:314.625pt;top:140.5pt;
 width:104pt;height:102pt' coordsize="1663,1633"
 path="m0,13551177,1498,353,1582,840,1633,1378,1498,1663,1295,
 1545,456,1260,10,1025,,656,260,253,874,,1355,,1355xe"
 fillcolor="#99ebff" stroked="f">
 <v:path arrowok="t"/>
 </v:shape>
 <v:shape id="light1"
 style='position:relative;left:408.625pt;top:268.75pt;
 width:24.25pt;height:27.375pt' coordsize="388,437"
 path="m209,0134,101,,302,125,437,329,327,388,152,209,,209,0xe"
 fillcolor="#fff27f" stroked="f">
 <v:path arrowok="t"/>
 </v:shape>
 <v:shape id="light2"
```

```

1 style='position:relative;left:356.625pt;top:279.25pt;
2 width:28.875pt;height:30pt' coordsize="462,479"
3 path="m135,0l0,186,59,422,344,479,462,228,135,,135,0xe"
4 fillcolor="#fff27f" stroked="f">
5 <v:path arrowok="t"/>
6 </v:shape>
7 <v:shape id="light3"
8 style='position:relative;left:302.625pt;top:274pt;
9 width:23pt;height:23.625pt' coordsize="369,378"
10 path="m0,59l226,,369,186,243,378,32,363,,59,,59xe"
11 fillcolor="#fff27f" stroked="f">
12 <v:path arrowok="t"/>
13 </v:shape>
14 </v:group>

```

16 *end example]*

Attributes	Description
allowincell (Allow in Table Cell)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
allowoverlap (Allow Shape Overlap)	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p>

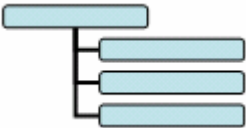

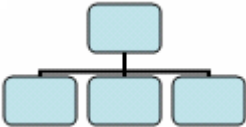

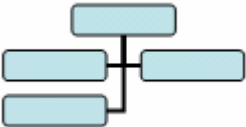

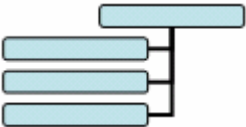

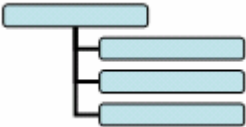

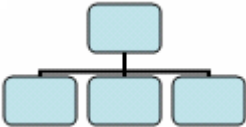

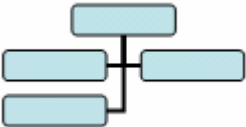

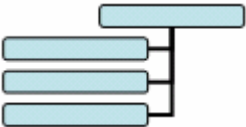

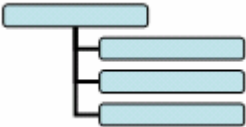

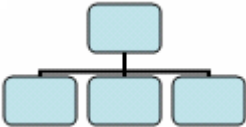

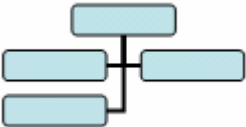

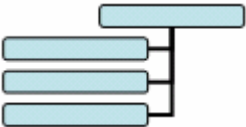

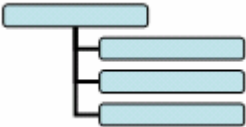

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
alt (Alternate Text)	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red"   alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderbottomcolor (Bottom Border Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderleftcolor (Border Left Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
<b>borderrightcolor</b> (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value.  <i>[Example:</i> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
<b>bordertopcolor</b> (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value.  <i>[Example:</i> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
<b>bullet</b> (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is <code>false</code> .  <i>[Example:</i> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>button</b> (Button Behavior Toggle)  Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is <code>false</code> .  <i>[Example:</i> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>class</b> (CSS	Specifies a reference to the definition of a CSS style. Default is no value.

Attributes	Description
Reference)	<p>[Example: The snippets below are equivalent:</p> <pre> ... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;  &lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
coordorigin (Coordinate Space Origin)	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre> &lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt; </pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
coordsize (Coordinate Space	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p>

Attributes	Description								
Size)	<p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
dgmlayout (Diagram Node Layout Identifier)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr></table>	Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 
Value	Description								
0	Top-down, centered layout. 								
1	Hanging, both sides layout. 								
2	Hanging, right side layout. 								

Attributes	Description										
	<div><div>3</div><div></div></div> <p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>										
<p>dgmlayoutmru (Diagram Node Recent Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre>	Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 	3	Hanging, left side layout. 
Value	Description										
0	Top-down, centered layout. 										
1	Hanging, both sides layout. 										
2	Hanging, right side layout. 										
3	Hanging, left side layout. 										

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>dgmnodekind (Diagram Node Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>doubleclicknotify (Double-click Notification Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that an event message is sent when a shape is double-clicked. Default is <i>false</i>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>editas (Group Diagram Type)</p>	<p>Specifies which diagram type the contained shapes represent. This is used in conjunction with the diagram element (§6.2.2.8). A value of <i>canvas</i> indicates that the group is a regular group of shapes and does not represent a diagram. Other values indicate that the diagram element and its children contain semantic information relevant to that type of diagram, which is represented by the shapes in the group.</p> <p>[Example:</p> <pre>&lt;v:group ... editas="orgchart"&gt; &lt;/v:group&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_EditAs simple type (§6.1.3.2).</p>
<p>fillcolor (Fill Color)</p>	<p>Specifies the color to use for the fill. Default is <i>white</i>. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as <i>red</i>, or six hexadecimal digits representing the red, green and blue values of the color, such as <i>#00FF30</i>. Full details are specified in the simple type description.</p>

Attributes	Description
	<p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f" fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hralign (Horizontal Rule Alignment)</p>	<p>Specifies the alignment of a horizontal rule. Default is left.</p> <p>[Example:</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
href (Hyperlink Target)	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hrnoshade (Horizontal Rule 3D Shading Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hrpct (Horizontal Rule Length Percentage)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
hrstd (Horizontal Rule Standard Display Toggle)  Namespace: urn:schemas-	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt;</pre>

Attributes	Description
microsoft-com:office:office	<p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
insetmode (Text Inset Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
oned (Shape Handle Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
print (Print Toggle)	<p>Specifies whether the shape will be printed. Default is true.</p>

Attributes	Description						
	<p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>						
<p>regroupid (Regroup ID)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>						
<p>spid (Optional String)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>						
<p>style (Shape Styling Properties)</p>	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1446 1479 1879"> <thead> <tr> <th data-bbox="415 1446 664 1493">Property</th><th data-bbox="664 1446 1479 1493">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1493 664 1766">flip</td><td data-bbox="664 1493 1479 1766"> <p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul> </td></tr> <tr> <td data-bbox="415 1766 664 1879">height</td><td data-bbox="664 1766 1479 1879"> <p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> </td></tr> </tbody> </table>	Property	Description	flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>
Property	Description						
flip	<p>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</p> <ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>						
height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>						

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the</li> </ul>

Attributes	Description	
		parent object's width.
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-top	<p>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-	<p>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this</p>

Attributes	Description	
	edited	property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not</li> </ul>

Attributes	Description	
		<p>processed.</p> <ul style="list-style-type: none"> <li>• <b>inherit</b> - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Default position of an element in the flow of the page.</li> <li>• <b>&lt;units&gt;</b>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• <b>&lt;percentage&gt;</b>- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>auto</b> - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• <b>&lt;order&gt;</b>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>
The following properties are only used by the textbox element (§6.1.2.22):		
	Property	Description
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>ltr</b> - Text is displayed left-to-right.</li> <li>• <b>rtl</b> - Text is displayed right-to-left.</li> </ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>• <b>horizontal</b> - Text is displayed horizontally.</li> <li>• <b>vertical</b> - Text is displayed vertically.</li> <li>• <b>vertical-ideographic</b> - Ideographic text is displayed vertically.</li> <li>• <b>horizontal-ideographic</b> - Ideographic text is displayed</li> </ul>

Attributes	Description	
		horizontally.
	mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
	mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
	mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
	mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• middle</li> <li>• bottom</li> <li>• top-center</li> <li>• middle-center</li> <li>• bottom-center</li> <li>• top-baseline</li> <li>• bottom-baseline</li> <li>• top-center-baseline</li> <li>• bottom-center-baseline</li> </ul>

Attributes	Description	
		<div> <div>bolder</div> <div>500</div> <div>600</div> <div>700</div> <div>800</div> <div>900</div> </div>
	mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.
	text-decoration	<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• none</li> <li>• underline</li> <li>• overline</li> <li>• line-through</li> <li>• blink</li> </ul>
	v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.

Attributes	Description				
	<table border="1" data-bbox="418 245 1477 632"> <tr> <td data-bbox="418 245 662 541">v-text-spacing-mode</td><td data-bbox="662 245 1477 541"> <p>Specifies the mode for letter spacing. 22 <attribute ref="o:tableproperties"/>
23 <attribute ref="o:tablelimits"/>
24 </complexType>
```

24 **6.1.2.8** [h \(Shape Handle\)](#)

25 This element defines a single handle, which is a user interface element tied to one or two adj values. Moving  
26 the handle changes its linked adj values, which in turn changes formulas and attributes that depend on them.

1 The handle is optionally constrained vertically or horizontally. The linked adj values store the position of the  
2 handle in the shape's coordinate space.

3 *[Example: The example below defines a simple kite shape with a resizable width:*

```
4 <v:shape coordsize="200,200" coordorigin="-100,-100" adj="100"
5 style="width:50;height:50;position:relative"
6 path="m @1,-50 l 0,-200 @0,-50 0,200 x e">
7 <v:formulas>
8 <v:f eqn="val #0"/>
9 <v:f eqn="sum 0 0 @0"/>
10 </v:formulas>
11 <v:handles>
12 <v:h position="#0,0"/>
13 </v:handles>
14 </v:shape>
```

15 *end example]*

16

Parent Elements
handles (§6.1.2.9)

Attributes	Description
invx (Invert Handle's X Position)	<p>Specifies whether the x position of the handle should be inverted according to:</p> $x_{\text{new}} = \text{coordorigin}_x + \text{coordsize}_x - x_{\text{old}}$ <p>Default is false.</p> <p><i>[Example:</i></p> <pre>&lt;v:handles&gt;   &lt;v:h ... invx="true" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
invy (Invert Handle's Y Position)	<p>Specifies whether the y position of the handle should be inverted according to:</p> $y_{\text{new}} = \text{coordorigin}_y + \text{coordsize}_y - y_{\text{old}}$ <p>Default is false.</p> <p><i>[Example:</i></p>

Attributes	Description
	<pre>&lt;v:handles&gt;   &lt;v:h ... invy="true" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
map (Handle Coordinate Mapping)	<p>Specifies how the x and y positions of the handle are mapped from the coordsize range into the specified range. Default is "0,1000".</p> <p>[Example:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... map="-1000,1000" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
polar (Handle Polar Center)	<p>Specifies the center position of a handle that uses polar coordinates. If specified, the position attribute is assumed to contain radius and angle values. If omitted, the position attribute is assumed to contain x and y positions. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... polar="0,0" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
position (Handle Position)	<p>Specifies the x and y position of the handle. If the polar attribute is present, defines the handle position using radius and angle values. Default is "0,0".</p> <p>Each value in the vector is one of the following:</p> <ul style="list-style-type: none"> <li>• constant</li> <li>• formula (e.g., @2)</li> <li>• adj value (e.g., #2)</li> <li>• center</li> <li>• topleft</li> <li>• bottomright</li> </ul>

Attributes	Description
	<p>Each of the above except for an adj value reference fixes the handle position for that dimension. Specifying an adj value allows the handle to move in that dimension and the handle position for that dimension is stored in the adj value.</p> <p>[Example: The handle's x position is fixed but it is free to move in the y dimension:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... position="topleft,#2" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
radiusrange (Handle Polar Radius Range)	<p>Specifies a range of minimum and maximum values that constrain the radius of a handle using polar coordinates. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.</p> <p>[Example: The polar handle may only be moved within a radius range of 25 to 50.</p> <pre>&lt;v:handles&gt;   &lt;v:h ... radiusrange="25,50" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
switch (Handle Inversion Toggle)	<p>Specifies whether the x and y dimensions of the handle are switched when the shape is taller than it is wide. Default is false. This is useful for shapes with limo stretch behavior.</p> <p>[Example:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... switch="true" ... /&gt; &lt;/v:handles&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.1.3.15).</p>
xrange (Handle X Position Range)	<p>Specifies a range of minimum and maximum values that constrain the x position of a handle. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.</p>

Attributes	Description
	<p>[Example: The handle's x position has a maximum bound of 500 and no minimum bound:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... xrange=",500" ... /&gt; &lt;/v:handles&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
yrange (Handle Y Position Range)	<p>Specifies a range of minimum and maximum values that constrain the y position of a handle. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.</p> <p>[Example: The handle's y position has a minimum bound of -500 and no maximum bound:</p> <pre>&lt;v:handles&gt;   &lt;v:h ... yrange="-500," ... /&gt; &lt;/v:handles&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_H">
3 <attribute name="position" type="xsd:string"/>
4 <attribute name="polar" type="xsd:string"/>
5 <attribute name="map" type="xsd:string"/>
6 <attribute name="invx" type="ST_TrueFalse"/>
7 <attribute name="invy" type="ST_TrueFalse"/>
8 <attribute name="switch" type="ST_TrueFalseBlank"/>
9 <attribute name="xrange" type="xsd:string"/>
10 <attribute name="yrange" type="xsd:string"/>
11 <attribute name="radiusrange" type="xsd:string"/>
12 </complexType>
```

13 6.1.2.9 handles (Set of Handles)

14 This element defines a set of user interface elements which can vary a shape's adj values. All dependent  
15 formulas and attributes are recalculated. Each handle is defined by a child h element.

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Child Elements	Subclause
h (Shape Handle)	§6.1.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Handles">
 <sequence>
 <element name="h" type="CT_H" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 6.1.2.10 image (Image File)

This element is used to draw an image that has been loaded from an external source. There is an implied rectangle that is the same size as the image. Any stroke or fill is applied to this implied rectangle. The stroke is drawn on top of the image. The fill is behind the image and therefore only visible through transparent areas of the image. Image transparency is either encoded in the file or defined via a color value using the chromakey attribute. Unlike the imagedata element (§6.1.2.11), the image element does not have a parent element.

*[Example:*

```
<v:image src="myimage.gif"
 style="position:relative;top:1;left:1;width:50;height:45"
 cropbottom="10%" gamma="0.5" gain="2">
</v:image>
```

Attributes	Description
<p>allowincell (Allow in Table Cell)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can be placed in a table. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt;</pre>

Attributes	Description
com:office:office	<p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
alt (Alternate Text)	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre data-bbox="451 653 902 751">&lt;v:shape ... fillcolor="red"   alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre data-bbox="451 863 1081 926">&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bilevel (Image Bilevel Toggle)	<p>Specifies that all colors in the picture shall be converted to either 0 or full intensity component values. This converts a color bitmap to 8 colors and a grayscale bitmap to black and white. Default is false.</p> <p>[Example:</p> <pre data-bbox="451 1297 967 1360">&lt;v:image ... bilevel="true" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
blacklevel (Image Brightness)	<p>Specifies the image brightness. Default is 0.</p> <p>[Example:</p> <pre data-bbox="451 1833 1000 1896">&lt;v:image ... blacklevel="0.1" ...&gt; &lt;/v:image&gt;</pre>

Attributes	Description
 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>	
<p><b>borderbottomcolor</b> (Bottom Border Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p><b>borderleftcolor</b> (Border Left Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p><b>borderrightcolor</b> (Border Right Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p><b>bordertopcolor</b> (Border Top Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>bullet (Graphical Bullet)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the shape is a graphical bullet. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>button (Button Behavior Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape will exhibit button press behavior on click. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>bwmode (Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is <code>auto</code>, which will use <code>o:bwnormal</code> for normal black-and-white rendering and <code>o:bwpure</code> for pure black-and-white rendering.</p> <p><code>bwnormal</code> and <code>bwpure</code> are subordinate to <code>bwmode</code>. If <code>bwmode</code> is "auto" then the value for <code>bwnormal</code> or <code>bwpure</code> is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow grayscale and pure B&amp;W might not.</p> <p>[Example: This shape renders in grayscale in a black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>bwnormal (Normal Black-and-White)</p>	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is <code>auto</code>.</p>

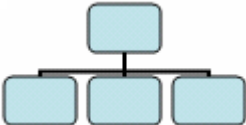

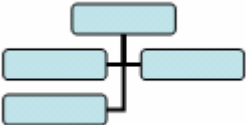

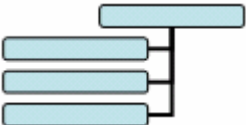

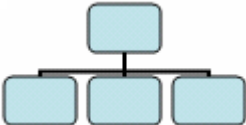

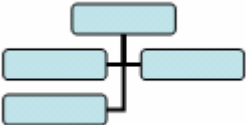

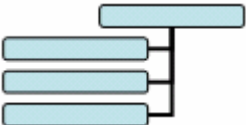

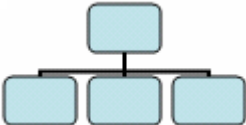

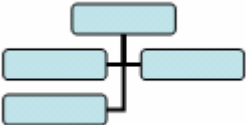

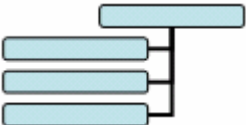

Attributes	Description
<p>Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[<i>Example:</i> This shape renders in a pale grayscale in a normal black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>bwpure (Pure Black-and-White Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p>[<i>Example:</i> This shape renders in high contrast when in a pure black-and-white environment:</p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<p>chromakey (Image Transparency Color)</p>	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[<i>Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>class (CSS Reference)</p>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p>[<i>Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle" style="top:1;left:1"&gt;</pre>

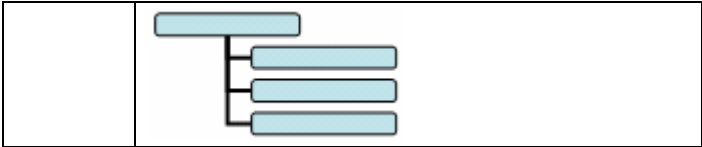

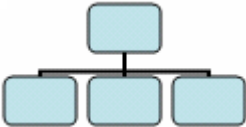

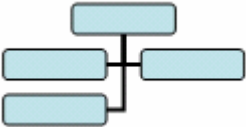

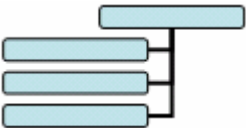

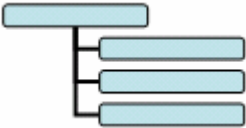

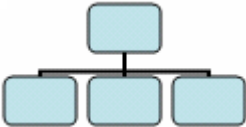

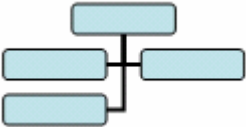

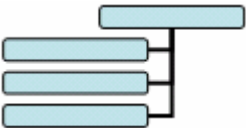

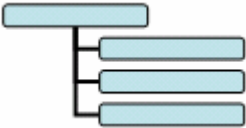

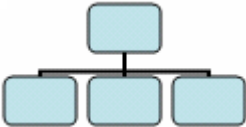

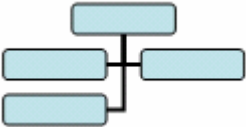

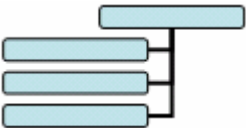

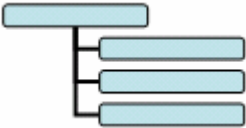

Attributes	Description
	<p><code>&lt;/v:shape&gt;</code></p> <p><code>&lt;v:shape ... style="top:1;left:1; width:50;height:100"&gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>clip (Clipping Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:clip="true"&gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:cliptowrap="true"&gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <p><code>&lt;v:shape ... o:connectortype="elbow" ... &gt;</code>  <code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type</p>

Attributes	Description
<b>coordorigin</b> (Coordinate Space Origin)	<p>(§6.2.3.6).</p> <p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[<i>Example:</i> The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>coordsize</b> (Coordinate Space Size)	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[<i>Example:</i> The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
cropbottom (Image Bottom Crop)	<p>Specifies the how much to crop the image from the bottom up as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre>&lt;v:image ... cropbottom="10%" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
cropleft (Image Left Crop)	<p>Specifies how much to crop the image from the left in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre>&lt;v:image ... cropleft="10%" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
cropright (Image Right Crop)	<p>Specifies how much to crop the image from the right in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre>&lt;v:image ... cropright="10%" ...&gt;</pre>

Attributes	Description										
	<div>&lt;/v:image&gt;</div> <div></div> <div>end example]</div> <div>The possible values for this attribute are defined by the XML Schema string datatype.</div>										
croptop (Image Top Crop)	<div>Specifies how much to crop the image from the top down as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</div> <div>[Example:</div> <div><div>&lt;v:image ... croptop="10%" ...&gt;</div><div>&lt;/v:image&gt;</div></div> <div></div> <div>end example]</div> <div>The possible values for this attribute are defined by the XML Schema string datatype.</div>

2	Hanging, right side layout. <div></div>										
3	Hanging, left side layout. <div></div>										

Attributes	Description
	<p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>dgmnodekind (Diagram Node Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<p>doubleclicknotify (Double-click Notification Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>fillcolor (Fill Color)</p>	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is</p>

Attributes	Description
Toggle)	<p>overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
forcedash (Force Dashed Outline)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
gain (Image Intensity)	<p>Specifies an adjustment for the intensity of all colors. Essentially sets how bright white will be. Default is 1.</p> <p>[Example:</p> <pre>&lt;v:image ... gain="0.5" ...&gt; &lt;/v:image&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

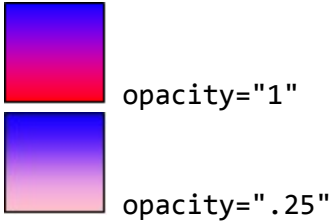

Attributes	Description
gamma (Image Gamma Correction)	<p>Specifies the gamma correction. Default is 1.</p> <p>Gamma correction is a factor by which the intended target display gamma differs from the sRGB profile. It can be used to correct for images not prepared for sRGB displays and to adjust overall image contrast. Decreasing it below 1 gives a higher contrast image.</p> <p>[Example:</p> <pre>&lt;v:image ... gamma="0.5" ...&gt; &lt;/v:image&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
grayscale (Image Grayscale Toggle)	<p>Specifies to display the image in grayscale. Default is false.</p> <p>[Example:</p> <pre>&lt;v:image ... gamma="0.5" ...&gt; &lt;/v:image&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
hr (Horizontal Rule Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hralign (Horizontal Rule Alignment)	<p>Specifies the alignment of a horizontal rule. Default is left.</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
href (Hyperlink Target)	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hrnoshade (Horizontal Rule 3D Shading Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that the horizontal rule does not have 3-D shading. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
hrpct (Horizontal Rule Length Percentage)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
hrstd (Horizontal Rule Standard Display Toggle)  Namespace:	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p>

Attributes	Description
urn:schemas-microsoft-com:office:office	<pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
id (Unique Identifier)	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
insetmode (Text Inset Mode)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
ole (Embedded)	<p>Specifies whether the shape is an embedded object. Default is false.</p>

Attributes	Description
<p>Object Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
<p>oleicon (Embedded Object Icon Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>oned (Shape Handle Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>opacity (Fill Color Opacity)</p>	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>print (Print Toggle)</p>	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>regroupid (Regroup ID)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[Example: The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>

Attributes	Description
spid (Optional String)  Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to identify the particular shape. Default is no value.  The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number)  Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.  The possible values for this attribute are defined by the XML Schema float datatype.
src (Image Source)	Specifies the URL of the image to use.  [Example:  <pre>&lt;v:image ... src="myimage.gif" ...&gt; &lt;/v:image&gt;</pre>  <i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.  [Example:  <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <i>end example]</i>  The possible values for this attribute are defined by the ST_ColorType simple type

Attributes	Description				
stroked (Shape Stroke Toggle)	<p>(§6.1.3.1).</p> <p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>				
strokeweight (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>				
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: <a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="415 1732 1481 1892"> <thead> <tr> <th data-bbox="415 1732 664 1780">Property</th><th data-bbox="664 1732 1481 1780">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="415 1780 664 1892">flip</td><td data-bbox="664 1780 1481 1892">Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</td></tr> </tbody> </table>	Property	Description	flip	Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:
Property	Description				
flip	Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:				

Attributes	Description	
		<ul style="list-style-type: none"> <li>• x - Flip along the y-axis, reversing the x-coordinates.</li> <li>• y - Flip along the x-axis, reversing the y-coordinates.</li> <li>• xy - Flip along both the y- and x-axis.</li> <li>• yx - Flip along both the x- and y-axis.</li> </ul>
	height	<p>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	left	<p>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-bottom	<p>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-	Specifies relative horizontal position data for objects in

Attributes	Description	
	horizontal-relative	<p>WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-right	<p>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>

Attributes	Description	
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.

Attributes	Description	
	top	<p>Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	visibility	<p>Specifies whether a shape is displayed. Only <code>inherit</code> and <code>hidden</code> are used; any other values are mapped to <code>inherit</code>. Default is <code>inherit</code>. Allowed values are:</p> <ul style="list-style-type: none"> <li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li> <li>• inherit - The visibility state is inherited from the parent of the shape.</li> </ul>
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li> <li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li> </ul>

Attributes	Description																		
	<p>The following properties are only used by the textbox element (§6.1.2.22):</p> <table border="1"> <thead> <tr> <th data-bbox="418 352 662 399">Property</th><th data-bbox="662 352 1481 399">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="418 399 662 667">direction</td><td data-bbox="662 399 1481 667"> <p>Specifies the direction of the text in the textbox. 400																			
bold	Treated as bold.																		
bolder																			
500																			
600																			
700																			
800																			
900																			
mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.																		
text-decoration	<p>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:</p> <ul style="list-style-type: none"><li>none</li><li>underline</li><li>overline</li><li>line-through</li><li>blink</li></ul>																		
v-rotate-	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.																		

Attributes	Description	
	letters	
	v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align	<p>Specifies the alignment of text. Default is left. Allowed values are:</p> <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> <li>• justify</li> <li>• letter-justify - Distributes the extra space between the letters.</li> <li>• stretch-justify - Stretches the letters to fill in the space.</li> </ul>
	v-text-kern	Specifies whether kerning is turned on. Default is false.
	v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode	<p>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:</p> <ul style="list-style-type: none"> <li>• tightening</li> <li>• tracking</li> </ul>
	v-text-spacing	Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.
<p>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:</p> <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• width</li> <li>• height</li> </ul> <p>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:</p> <ul style="list-style-type: none"> <li>• flip</li> </ul>		

Attributes	Description																
	<ul style="list-style-type: none"> <li>• height</li> <li>• left</li> <li>• margin-left</li> <li>• margin-top</li> <li>• position</li> <li>• rotation</li> <li>• top</li> <li>• visibility</li> <li>• width</li> <li>• z-index</li> </ul> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>																
target (Hyperlink Display Target)	<p>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:</p> <table border="1" data-bbox="415 814 1479 1451"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>&lt;targetname&gt;</td><td>String containing the name of the frame or window in which to load the document.</td></tr> <tr> <td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr> <tr> <td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr> <tr> <td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr> <tr> <td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr> <tr> <td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr> <tr> <td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr> </tbody> </table> <p>[Example:</p> <pre> &lt;v:shape ...   href="http://www.openxmlformats.org"   target="_self" ... &gt; &lt;/v:shape&gt; </pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>	Value	Description	<targetname>	String containing the name of the frame or window in which to load the document.	_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.	_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.	_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.	_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.	_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).	_top	Specifies that the linked document is loaded into the topmost window.
Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																
title (Shape Title)	Specifies the text displayed when the mouse pointer moves over the shape. Default is no																

Attributes	Description
	<p>value.</p> <p>[Example:</p> <pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>userdrawn (Exists In Master Slide)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the user has added the shape to a master slide. Default is <code>false</code>. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>userhidden (Hide Script Anchors)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>wrapcoords (Shape Bounding Polygon)</p>	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the <code>mso-wrap-mode</code> style attribute is set to <code>tight</code> or <code>through</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Image">
 <sequence>
 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attributeGroup ref="AG_AllCoreAttributes"/>
 <attributeGroup ref="AG_AllShapeAttributes"/>
 <attributeGroup ref="AG_ImageAttributes"/>
</complexType>

```

#### 6.1.2.11 imagedata (Image Data)

This element is used to draw an image that has been loaded from an external source. There is an implied rectangle that is the same size as the image. Any stroke or fill is applied to this implied rectangle. The stroke is drawn on top of the image. The fill is behind the image and therefore only visible through transparent areas of the image. Image transparency is either encoded in the file or defined via a color value using the chromakey attribute. Unlike the image element (§6.1.2.10), the imagedata element must have a parent element.

[Example:

```

<v:shape style="position:relative;top:1;left:1;width:50;height:50"
 path="m 0,0 l 1000,0 1000,1000 0,1000 x e" fillcolor="blue">
 <v:imagedata src="myimage.gif"/>
</v:shape>

```

*end example]*

Attributes	Description
althref (Alternate Image Reference)	<p>Defines an alternate reference for an image in Macintosh PICT format.</p> <p>[Example:</p>

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<pre>&lt;v:imagedata ... althref="myimage.pcz" ... &gt; &lt;/v:imagedata&gt;</pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bilevel (Image Bilevel Toggle)	<p>Specifies that all colors in the picture shall be converted to either 0 or full intensity component values. This converts a color bitmap to 8 colors and a grayscale bitmap to black and white. Default is <i>false</i>.</p> <p>[Example:</p> <pre>&lt;v:image ... bilevel="true" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
blacklevel (Image Brightness)	<p>Specifies the image brightness. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:image ... blacklevel="0.1" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
chromakey (Image Transparency Color)	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>cropbottom (Image Bottom Crop)</p>	<p>Specifies the how much to crop the image from the bottom up as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre data-bbox="451 617 998 684">&lt;v:image ... cropbottom="10%" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>cropleft (Image Left Crop)</p>	<p>Specifies how much to crop the image from the left in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre data-bbox="451 1184 967 1251">&lt;v:image ... cropleft="10%" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>cropright (Image Right Crop)</p>	<p>Specifies how much to crop the image from the right in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre data-bbox="451 1755 984 1822">&lt;v:image ... cropright="10%" ...&gt; &lt;/v:image&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
croptop (Image Top Crop)	<p>Specifies how much to crop the image from the top down as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example:</p> <pre>&lt;v:image ... croptop="10%" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
detectmouseclick (Detect Mouse Click)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a mouse click is detected on the fill of a shape.</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
embosscolor (Embossed Color)	<p>Specifies the color to use to create an embossed effect in the image. Default is no value. This can be set to a percentage of the shadow color to create an embossed picture effect.</p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
gain (Image Intensity)	<p>Specifies an adjustment for the intensity of all colors. Essentially sets how bright white will be. Default is 1.</p> <p>[Example:</p> <pre>&lt;v:image ... gain="0.5" ...&gt; &lt;/v:image&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
gamma (Image Gamma Correction)	<p>Specifies the gamma correction. Default is 1.</p> <p>Gamma correction is a factor by which the intended target display gamma differs from the sRGB profile. It can be used to correct for images not prepared for sRGB displays and to adjust overall image contrast. Decreasing it below 1 gives a higher contrast image.</p> <p>[Example:</p> <pre data-bbox="451 787 917 850">&lt;v:image ... gamma="0.5" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
grayscale (Image Grayscale Toggle)	<p>Specifies to display the image in grayscale. Default is false.</p> <p>[Example:</p> <pre data-bbox="451 1285 917 1348">&lt;v:image ... gamma="0.5" ...&gt; &lt;/v:image&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
href (Explicit Relationship to Hyperlink Target)  Namespace: .../officeDocument	<p>Specifies the relationship ID of the relationship to the hyperlink used for this VML object. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>[Example: The markup specifies the associated relationship part with relationship ID</p>

Attributes	Description
/2006/relationships	<p>rId10 contains the corresponding relationship information for the image data:</p> <pre>&lt; ... r:href="rId5" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
<p>href (Original Image Reference)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:fill ... o:href="myimage.gif" ... &gt; &lt;/v:fill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>id (Explicit Relationship to Image Data)</p> <p>Namespace: .../officeDocument/2006/relationships</p>	<p>Specifies the relationship ID of the relationship to the image used for this VML object. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>[Example: The markup specifies the associated relationship part with relationship ID rId10 contains the corresponding relationship information for the image data:</p> <pre>&lt; ... r:id="rId10" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

Attributes	Description
<p>movie (Movie Reference)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies a pointer to a movie image. This is a data block that contains a pointer to a pointer to movie data.</p> <p>[Example:</p> <pre>&lt;v:imagedata ... o:movie="1434" ...&gt; &lt;/v:imagedata&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>oleid (Image Embedded Object ID)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the embedded object ID of an image.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>pict (Explicit Relationship to Alternate Image Data)</p> <p>Namespace: .../officeDocument/2006/relationships</p>	<p>Specifies the relationship ID of the relationship to an alternate format image used for this VML object. The specified relationship shall be of type <a href="http://schemas.openxmlformats.org/officeDocument/2006/relationships/image">http://schemas.openxmlformats.org/officeDocument/2006/relationships/image</a> or the document shall be considered non-conformant.</p> <p>If this attribute is specified, the application should attempt to display the image defined by the relationship. If the application cannot display the format of that image, the r:id attribute is used.</p> <p>[Example: The markup specifies the associated relationship part with relationship ID rId7 contains the corresponding relationship information for the image data. The relationship part with relationship ID rId10 is used if the application cannot display the image referenced by rId7.:</p> <pre>&lt; ... r:id="rId10" r:pict="rId7"/&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
<p>recolortarget (Black Recoloring Color)</p>	<p>Specifies the color to which black should be recolored.</p> <p>[Example:</p> <pre>&lt;v:imagedata r:id="rId4" recolortarget="red"&gt; &lt;/v:imagedata&gt;</pre>

Attributes	Description
microsoft-com:office:office	<p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>borderrightcolor</b> (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>bordertopcolor</b> (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>bullet</b> (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is a graphical bullet. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>button</b> (Button Behavior Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>bwmode (Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow grayscale and pure B&amp;W might not.</p> <p><i>[Example: This shape renders in grayscale in a black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwnormal (Normal Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwpure (Pure Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in high contrast when in a pure black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type</p>

Attributes	Description
	(§6.2.3.2).
chromakey (Image Transparency Color)	<p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p><i>[Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
class (CSS Reference)	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p><i>[Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
clip (Clipping Toggle)  Namespace: urn:schemas- microsoft- com:office:office	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
cliptowrap (Clip to	Specifies that the clipping region for the shape aligns with the wrapping polygon that

Attributes	Description
<p>Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>coordorigin (Coordinate Space Origin)</p>	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> 

Attributes	Description								
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
<p>coordsize (Coordinate Space Size)</p>	<p>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</p> <p>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</p> <p>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> <div></div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>								
<p>dgmlayout (Diagram Node Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.</td></tr></table>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout.
Value	Description								
0	Top-down, centered layout. <div></div>								
1	Hanging, both sides layout. <div></div>								
2	Hanging, right side layout.								

Attributes	Description											
												
	3	Hanging, left side layout. 										
<p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>												
<p>dgmlayoutmru (Diagram Node Recent Layout Identifier)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p>[Example:</p>		Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 	3	Hanging, left side layout. 
Value	Description											
0	Top-down, centered layout. 											
1	Hanging, both sides layout. 											
2	Hanging, right side layout. 											
3	Hanging, left side layout. 											

Attributes	Description
	<pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmnodekind</b> (Diagram Node Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>doubleclicknotify</b> (Double-click Notification Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>fillcolor</b> (Fill Color)	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>forcedash (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>from (Line Start)</p>	<p>Specifies the starting point of the line in the coordinate space of the parent element. Default is "0,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p>[Example:</p> <pre>&lt;v:line from="10pt,10pt" to="50pt,50pt"&gt; &lt;/v:line&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>hr (Horizontal Rule Toggle)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that a shape is a horizontal rule. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>hralign (Horizontal Rule Alignment)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the alignment of a horizontal rule. Default is <code>left</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).</p>
<b>href (Hyperlink Target)</b>	<p>Specifies a hyperlink URL target for the shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>hrnoshade (Horizontal Rule 3D Shading Toggle)</b>  Namespace: urn:schemas-	<p>Specifies that the horizontal rule does not have 3-D shading. Default is <code>false</code>.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
microsoft-com:office:office	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hrpct (Horizontal Rule Length Percentage)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the length of a horizontal rule as a percentage of page width. Default is 0.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
<p>hrstd (Horizontal Rule Standard Display Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>insetmode (Text Inset Mode)</p> <p>Namespace: urn:schemas-microsoft-</p>	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt;</pre>

Attributes	Description
com:office:office	<p>&lt;/v:shape&gt;</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
insetpen (Inset Border From Path)	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
ole (Embedded Object Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
oleicon (Embedded Object Icon Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
oned (Shape Handle Toggle)  Namespace:	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p>

Attributes	Description
urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
opacity (Fill Color Opacity)	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red" color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre> <div data-bbox="451 926 779 1144">  opacity="1"   opacity=".25" </div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
preferrelative (Relative Resize Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
print (Print Toggle)	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p>

Attributes	Description
	<pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
regroupid (Regroup ID)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.</p> <p>[<i>Example:</i> The shape was part of a group identified by the ID 040754:</p> <pre>&lt;v:shape ... o:regroupid="040754" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
spid (Optional String)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional string that an application may use to identify the particular shape. Default is no value.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
spt (Optional Number)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0.</p> <p>The possible values for this attribute are defined by the XML Schema float datatype.</p>
strokecolor (Shape Stroke Color)	<p>Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[<i>Example:</i></p> <pre>&lt;v:shape ... strokecolor="red" ...&gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	 <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
stroked (Shape Stroke Toggle)	<p>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... fillcolor="red"   stroked="false" strokecolor="blue"...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
strokeweight (Shape Stroke Weight)	<p>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... strokeweight="3pt" ... &gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
style (Shape Styling Properties)	<p>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here:</p>

Attributes	Description										
	<p data-bbox="414 247 1453 317"><a href="http://www.w3.org/TR/REC-CSS2">http://www.w3.org/TR/REC-CSS2</a>. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:</p> <table border="1" data-bbox="414 352 1481 1890"> <thead> <tr> <th data-bbox="418 359 662 401">Property</th><th data-bbox="662 359 1481 401">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="418 401 662 667">flip</td><td data-bbox="662 401 1481 667"> <p data-bbox="673 409 1453 478">Specifies that the orientation of a shape is flipped. Attributes	Description	
		<p>ex). If no units are given, pixels (px) is assumed.</p> <ul style="list-style-type: none"> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	margin-left	<p>Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-right	<p>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt; - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li> </ul>
	margin-top	<p>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"> <li>• auto - Default position of an element in the flow of the page.</li> <li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li> <li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li> </ul>
	mso-position-horizontal	<p>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> </ul>

Attributes	Description	
		<ul style="list-style-type: none"> <li>• left</li> <li>• center</li> <li>• right</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-horizontal-relative	<p>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• char</li> </ul>
	mso-position-vertical	<p>Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• absolute</li> <li>• top</li> <li>• center</li> <li>• bottom</li> <li>• inside</li> <li>• outside</li> </ul>
	mso-position-vertical-relative	<p>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are:</p> <ul style="list-style-type: none"> <li>• margin</li> <li>• page</li> <li>• text</li> <li>• line</li> </ul>
	mso-wrap-distance-bottom	<p>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</p>
	mso-wrap-distance-left	<p>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin</p>

Attributes	Description	
		of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	<p>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:</p> <ul style="list-style-type: none"> <li>• square - Wraps text inside the shape in a square.</li> <li>• none - Text does not wrap.</li> </ul>
	position	<p>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</p> <ul style="list-style-type: none"> <li>• static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used.</li> <li>• absolute - The element is positioned relative to the parent, using the top and left properties.</li> <li>• relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.</li> </ul>
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:

Attributes	Description		
		<ul style="list-style-type: none"><li>• auto - Default position of an element in the flow of the page.</li><li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li><li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's height.</li></ul>	
	visibility	<p>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:</p> <ul style="list-style-type: none"><li>• hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.</li><li>• inherit - The visibility state is inherited from the parent of the shape.</li></ul>	
	width	<p>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</p> <ul style="list-style-type: none"><li>• auto - Default position of an element in the flow of the page.</li><li>• &lt;units&gt;- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.</li><li>• &lt;percentage&gt;- Value expressed as a percentage of the parent object's width.</li></ul>	
	z-index	<p>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:</p> <ul style="list-style-type: none"><li>• auto - Uses the order that the shapes appear in the page, bottom to top.</li><li>• &lt;order&gt;- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</li></ul>	
	The following properties are only used by the textbox element (§6.1.2.22):		
<table><tr><th>Property</th><th>Description</th></tr></table>		Property	Description
Property	Description		

Attributes	Description	
	direction	<p>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:</p> <ul style="list-style-type: none"> <li>• ltr - Text is displayed left-to-right.</li> <li>• rtl - Text is displayed right-to-left.</li> </ul>
	layout-flow	<p>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:</p> <ul style="list-style-type: none"> <li>• horizontal - Text is displayed horizontally.</li> <li>• vertical - Text is displayed vertically.</li> <li>• vertical-ideographic - Ideographic text is displayed vertically.</li> <li>• horizontal-ideographic - Ideographic text is displayed horizontally.</li> </ul>
	mso-direction-alt	<p>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</p>
	mso-fit-shape-to-text	<p>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</p>
	mso-fit-text-to-shape	<p>Specifies whether the text stretches to fit the textbox. Default is false.</p>
	mso-layout-flow-alt	<p>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</p>
	mso-next-textbox	<p>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</p>
	mso-rotate	<p>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:</p> <ul style="list-style-type: none"> <li>• 0</li> <li>• 90</li> <li>• 180</li> <li>• -90</li> </ul>
	mso-text-scale	<p>Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.</p>

Attributes	Description													
	v-text-anchor	<p>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:</p> <ul style="list-style-type: none"><li>• top</li><li>• middle</li><li>• bottom</li><li>• top-center</li><li>• middle-center</li><li>• bottom-center</li><li>• top-baseline</li><li>• bottom-baseline</li><li>• top-center-baseline</li><li>• bottom-center-baseline</li></ul>												
	The following properties are only used by the textpath element (§6.1.2.23):													
	<table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. Value	Description																
<targetname>	String containing the name of the frame or window in which to load the document.																
_blank	Specifies that the linked document is loaded into a new blank window. This window is not named.																
_media	Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.																
_parent	Specifies that the linked document is loaded into the immediate parent of the document containing the link.																
_search	Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.																
_self	Specifies that the linked document is loaded into the window in which the link was clicked (the active window).																
_top	Specifies that the linked document is loaded into the topmost window.																
title (Shape Title)	<p>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.</p> <p>[Example:</p>																

Attributes	Description
	<pre>&lt;v:shape ... title="tooltip" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
to (Line End Point)	<p>Specifies the ending point of the line in the coordinate space of the parent element. Default is "10,10". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.</p> <p>[Example:</p> <pre>&lt;v:line from="10pt,10pt" to="50pt,50pt"&gt; &lt;/v:line&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
userdrawn (Exists In Master Slide)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userdrawn="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
userhidden (Hide Script Anchors)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a script anchor is hidden. Default is false. If true, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:userhidden="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	<p>Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.</p> <p>[Example:</p> <div><pre>&lt;v:shape ...   wrapcoords="0,0 0,200, 200,200, 200,0" ... &gt; &lt;/v:shape&gt;</pre></div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Line">
 <sequence>
 <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attributeGroup ref="AG_AllCoreAttributes"/>
 <attributeGroup ref="AG_AllShapeAttributes"/>
 <attribute name="from" type="xsd:string" use="optional"/>
 <attribute name="to" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.13 oval (Oval)

This element draws an oval sized according to the CSS2 style content width and height.

[Example:

```
<v:oval fillcolor="blue"
 style="position:relative;top:1;left:1;width:150;height:50">
</v:oval>
```

end example]

Parent Elements
background (§2.2.1); group (§6.1.2.7); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

Child Elements	Subclause

1

Attributes	Description
allowincell (Allow in Table Cell)	Specifies whether a shape can be placed in a table. Default is false.
Namespace: urn:schemas-microsoft-com:office:office	<p>[Example:</p> <pre>&lt;v:shape ... o:allowincell="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>

Attributes	Description
<p>allowoverlap (Allow Shape Overlap)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a shape can overlap another shape. Default is true. If false, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:allowoverlap="false" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>alt (Alternate Text)</p>	<p>Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.</p> <p>[Example: The alt text describes the basic shape:</p> <pre>&lt;v:shape ... fillcolor="red" alt="Red rectangle"&gt; &lt;/v:shape&gt;</pre> <p>The alt text describes the contents of a shape displaying an image:</p> <pre>&lt;v:shape ... alt="Picture of a sunset"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderbottomcolor (Bottom Border Color)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the bottom border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderbottomcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>borderleftcolor (Border Left Color)</p> <p>Namespace: urn:schemas-</p>	<p>Specifies the left border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderleftcolor="red" ... &gt;</pre>

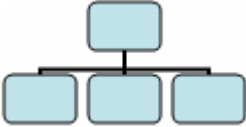

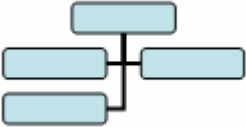

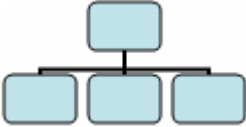

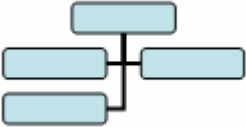

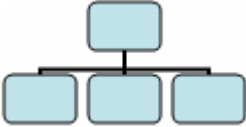

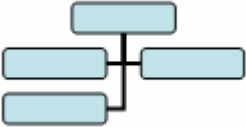

Attributes	Description
microsoft-com:office:office	<p><code>&lt;/v:shape&gt;</code></p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
borderrightcolor (Border Right Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the right border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:borderrightcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bordertopcolor (Border Top Color)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the top border color of an inline shape. Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bordertopcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
bullet (Graphical Bullet)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether the shape is a graphical bullet. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:bullet="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
button (Button Behavior Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies whether a shape will exhibit button press behavior on click. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:button="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

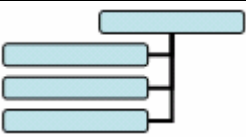

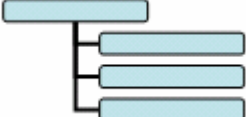

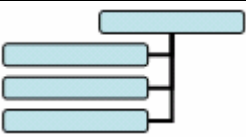

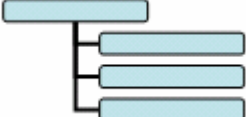

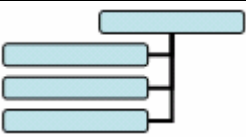

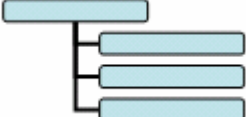

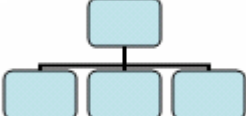

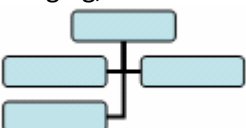

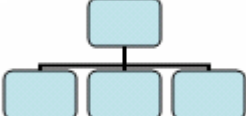

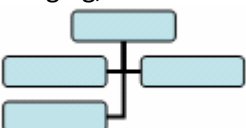

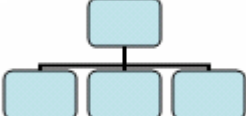

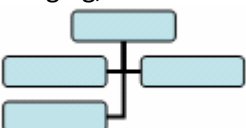

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>bwmode (Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering.</p> <p>bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&amp;W and pure B&amp;W. For example, normal B&amp;W might allow grayscale and pure B&amp;W might not.</p> <p><i>[Example: This shape renders in grayscale in a black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="grayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwnormal (Normal Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in a pale grayscale in a normal black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).</p>
<b>bwpure (Pure Black-and-White Mode)</b>  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.</p> <p><i>[Example: This shape renders in high contrast when in a pure black-and-white environment:</i></p> <pre>&lt;v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_BWMode simple type</p>

Attributes	Description
<p>chromakey (Image Transparency Color)</p>	<p>(§6.2.3.2).</p> <p>Specifies a color value that will be transparent and show anything behind the shape. Default is no value.</p> <p><i>[Example:</i></p> <pre>&lt;v:image ... chromakey="white" ...&gt; &lt;/v:image&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>class (CSS Reference)</p>	<p>Specifies a reference to the definition of a CSS style. Default is no value.</p> <p><i>[Example:</i> The snippets below are equivalent:</p> <pre>... .narrowstyle {width:50;height:100} ... &lt;v:shape ... class="narrowstyle"   style="top:1;left:1"&gt; &lt;/v:shape&gt;</pre> <pre>&lt;v:shape ... style="top:1;left:1;   width:50;height:100"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>clip (Clipping Toggle)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.</p> <p><i>[Example:</i></p> <pre>&lt;v:shape ... o:clip="true"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>cliptowrap (Clip to</p>	<p>Specifies that the clipping region for the shape aligns with the wrapping polygon that</p>

Attributes	Description
<p>Wrapping Polygon)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:cliptowrap="true"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>connectortype (Shape Connector Type)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of connector used for joining shapes. Default is straight.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:connectortype="elbow" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).</p>
<p>coordorigin (Coordinate Space Origin)</p>	<p>Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.</p> <p>This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.</p> <p>[Example: The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:</p> <pre>&lt;v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre> 

Attributes	Description								
	<div>end example]</div> <div>The possible values for this attribute are defined by the XML Schema string datatype.</div>								
<div>coordsize (Coordinate Space Size)</div>	<div>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".</div> <div>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.</div> <div>[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:</div> <div><pre>&lt;v:shape ... coordsize="200,200"   coordorigin="-100,-100"   path="m 0,0 l 0,50, 50,50, 50,0 x e"&gt; &lt;/v:shape&gt;</pre></div> <div></div> <div>end example]</div> <div>The possible values for this attribute are defined by the XML Schema string datatype.</div>								
<div>dgmlayout (Diagram Node Layout Identifier)</div> <div>Namespace: urn:schemas-microsoft-com:office:office</div>	<div>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</div> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.<div></div></td></tr><tr><td>1</td><td>Hanging, both sides layout.<div></div></td></tr><tr><td>2</td><td>Hanging, right side layout.</td></tr></table>	Value	Description	0	Top-down, centered layout. <div></div>	1	Hanging, both sides layout. <div></div>	2	Hanging, right side layout.
Value	Description								
0	Top-down, centered layout. <div></div>								
1	Hanging, both sides layout. <div></div>								
2	Hanging, right side layout.								

Attributes	Description										
	<table><tr><td></td><td></td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p>[Example:</p> <pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>			3	Hanging, left side layout. 						
											
3	Hanging, left side layout. 										
<p>dgmlayoutmru (Diagram Node Recent Layout Identifier)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout. </td></tr><tr><td>1</td><td>Hanging, both sides layout. </td></tr><tr><td>2</td><td>Hanging, right side layout. </td></tr><tr><td>3</td><td>Hanging, left side layout. </td></tr></table> <p>[Example:</p>	Value	Description	0	Top-down, centered layout. 	1	Hanging, both sides layout. 	2	Hanging, right side layout. 	3	Hanging, left side layout. 
Value	Description										
0	Top-down, centered layout. 										
1	Hanging, both sides layout. 										
2	Hanging, right side layout. 										
3	Hanging, left side layout. 										

Attributes	Description
	<pre>&lt;v:shape ... dgmlayout="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>dgmnodekind</b> (Diagram Node Identifier)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.</p> <p>[Example:</p> <pre>&lt;v:shape ... dgmnodekind="1"&gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema integer datatype.</p>
<b>doubleclicknotify</b> (Double-click Notification Toggle)  Namespace: urn:schemas-microsoft-com:office:office	<p>Specifies that an event message is sent when a shape is double-clicked. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:doubleclicknotify="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<b>fillcolor</b> (Fill Color)	<p>Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description.</p> <p>[Example: This shape is red if its fill is visible:</p> <pre>&lt;v:shape ... fillcolor="red" ... &gt; &lt;/v:shape&gt;</pre> <p>This is equivalent to:</p> <pre>&lt;v:shape ... fillcolor="#ff0000" ... &gt; &lt;/v:shape&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).</p>
<p>filled (Shape Fill Toggle)</p>	<p>Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute.</p> <p>[Example:</p> <pre>&lt;v:shape ... filled="f"   fillcolor="red" ...&gt; &lt;/v:shape&gt;</pre>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>forcedash (Force Dashed Outline)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.</p> <p>Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:forcedash="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>hr (Horizontal Rule Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies that a shape is a horizontal rule. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hr="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>hralign (Horizontal Rule Alignment)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is left.  <i>[Example:</i> <pre>&lt;v:shape ... o:hralign="center" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
<b>href (Hyperlink Target)</b>	Specifies a hyperlink URL target for the shape. Default is no value.  <i>[Example:</i> <pre>&lt;v:shape ... href="http://www.openxmlformats.org" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the XML Schema string datatype.
<b>hrnoshade (Horizontal Rule 3D Shading Toggle)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is false.  <i>[Example:</i> <pre>&lt;v:shape ... o:hrnoshade="true" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
<b>hrpct (Horizontal Rule Length Percentage)</b>  Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0.  <i>[Example:</i> <pre>&lt;v:shape ... o:hrpct="85" ... &gt; &lt;/v:shape&gt;</pre> <i>end example]</i>  The possible values for this attribute are defined by the XML Schema float datatype.
<b>hrstd (Horizontal</b>	<b>Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is</b>

Attributes	Description
<p>Rule Standard Display Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>true. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:hrstd="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>id (Unique Identifier)</p>	<p>Specifies a unique identifier that can be used to reference a VML object.</p> <p>Default is no value.</p> <p>[Example:</p> <pre>&lt;v:shape ... id="myShape" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>insetmode (Text Inset Mode)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:insetmode="auto" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</p>
<p>insetpen (Inset Border From Path)</p>	<p>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.</p> <p>[Example:</p> <pre>&lt;v:shape ... insetpen="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
<p>ole (Embedded Object Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the shape is an embedded object. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:ole="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).</p>
<p>oleicon (Embedded Object Icon Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether an embedded object will be displayed as an icon. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oleicon="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>oned (Shape Handle Toggle)</p> <p>Namespace: urn:schemas-microsoft-com:office:office</p>	<p>Specifies whether the extra handles of a shape are hidden. If true, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is false.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:oned="true" ... &gt; &lt;/v:shape&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>opacity (Fill Color Opacity)</p>	<p>Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.</p> <p>[Example: The red color is 25% opaque:</p> <pre>&lt;v:fill type="gradient" color="red"</pre>

Attributes	Description
	<pre>color2="blue" opacity=".25"&gt; &lt;/v:fill&gt;</pre>  <pre>opacity="1" opacity=".25"</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>preferrelative (Relative Resize Toggle)</p> <p>Namespace: urn:schemas- microsoft- com:office:office</p>	<p>Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.</p> <p>[Example:</p> <pre>&lt;v:shape ... o:preferrelative="true" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</p>
<p>print (Print Toggle)</p>	<p>Specifies whether the shape will be printed. Default is true.</p> <p>[Example:</p> <pre>&lt;v:shape ... print="false" ... &gt; &lt;/v:shape&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</p>
