This element specifies what the result which shall be generated when a mail merge is carried out on a given WordprocessingML source document. In other words, this element is used to specify what is to be done with the merged documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.

If this element is omitted, then the default destination of merged documents shall be assumed to be of type newDocument.

[*Note:* The aspects of the mail merge outside of connecting to an external data source and populating the fields within a given merged document with external data from the specified external data source are not specified by this Office Open XML Standard.

For example, if a given merged WordprocessingML document contains a destination element with its val attribute equal to email, the hosting application may surface a user interface specific to creating emails with the data resulting from populating fields within a given merged WordprocessingML document with external data from the specified external data source. WordprocessingML only provides a flag (via the destination element) to tell the hosting application to surface this user interface. *end note*]

[*Example:* Consider a WordprocessingML source document containing the following WordprocessingML:

```

1    <w:mailMerge>
2      <w:destination w:val="newDocument" />
3      ...
4    </w:mailMerge>

```

The destination element's val attribute is set to newDocument, specifying that when the mail merge is carried out, the source document shall be used to generate a specified number of new documents, which may be handled as appropriate. *end example*]

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (Mail Merge Merged Document Type)	<p>Specifies the type of merged documents which shall be the result of carrying out a mail merge on a given source WordprocessingML document.</p> <p>[<i>Example:</i> Consider the WordprocessingML mail merge data specified as follows:</p> <pre><w:destination w:val="email" /></pre> <p>This specifies that a given merged WordprocessingML document will be used by the hosting application to generate e-mails containing the static contents of the merged document as well as external data populated into mapped fields. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_MailMergeDest simple type (§2.18.60).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MailMergeDest">
  <attribute name="val" type="ST_MailMergeDest" use="required"/>
</complexType>

```

2.14.12 doNotSuppressBlankLines (Remove Blank Lines from Merged Documents)

This element specifies how an application performing the mail merge shall handle blank lines in the merged documents resulting from the mail merge. Typically, when a mail merge is performed, any blank lines which result from lines whose sole contents are merge fields with no content are removed from the merged document in order to prevent extraneous blank lines from appearing in the merged documents. When this element is present, the merged documents which are generated from the mail merge shall not have any blank lines removed before they are sent to their destination format.

If this element is omitted, the merged documents generated from this mail merge shall have all blank lines suppressed if they consist of only merge fields with values consisting of empty strings.

[*Example:* Consider a WordprocessingML document containing a single WordprocessingML field calling for Test data as seen in the first column of the table below. If the current record in the mail merge data source contains an empty string for the Test column, the resulting merged document would be displayed as follows depending on the setting for the doNotSuppressBlankLines element:

Source Document	<w:doNotSuppressBlankLines val="on" />	<w:doNotSuppressBlankLines val="off" />
One Two {MERGEFIELD "Test" } Three	One Two Three	One Two Three

With this element set to a value of on, the blank lines in the resulting document shall not be suppressed when the resulting merged documents are created. *end example*

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.14.13 dynamicAddress (Use Country-Based Address Field Ordering)

This element specifies that the contents of the AddressBlock MERGEFIELD field shall be dynamically ordered based on the country associated with the current record or if the country-invariant version of the address field

shall be used in its place. [*Rationale*: When a source document is combined with the contents of a data source in order to produce multiple merged documents, it is often necessary to use an address form specific to the destination country for each particular record in the data source, rather than one static address form for all records. *end rationale*] If this element is set to true, then the mail merge shall use an address form suited to the country associated with the current record in the external data source.

If this element is omitted, then the form of the address shall be dynamically determined based on the country specified in the current record.

[*Example*: Consider a merged WordprocessingML document that is specified to *not* dynamically create the address field order based on the country associated with the current record. This requirement may be specified using the following WordprocessingML:

```
<w:fieldMapData>
...
  <w:dynamicAddress w:val="off" />
</w:fieldMapData>
```

The dynamicAddress element is set to a value of off, specifying that the dynamic address format shall not be used when performing a mail merge with the specified data source. *end example*]

Parent Elements
fieldMapData (§2.14.15)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.14.14 fHdr (First Row of Data Source Contains Column Names)

This element specifies that a hosting application shall treat the first row of data in the specified external data source as a header row containing the names of each column in the data source, rather than data to populate mapped fields in a merged document. When present, this information shall not change the indices specified in the recipientData elements (§2.14.28), but shall indicate that the first row is not part of the mail merge when it is performed.

If this element is omitted, then the first row of the data source shall not be considered a header row when a mail merge is performed.

[*Example:* Consider a WordprocessingML source document that has been connected to an external data source whose first row of data is not data the hosting application is to populate mapped fields with, but rather contains column names for each column in the data source. This setting on the data source is specified using the following fragment of WordprocessingML:

```
<w:fHdr w:val="on" />
```

The fHdr element specifies that the data source's first row is a header row, rather than regular data to be used in the mail merge. *end example*]

Parent Elements
odso (§2.14.25)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.14.15 fieldMapData (External Data Source to Merge Field Mapping)

This element specifies how a column specified in the external data source that has been connected to a WordprocessingML document shall be mapped to the pre-defined MERGEFIELD fields (§2.16.5.42) within the given merged document's contents. Each instance of a fieldMapData element contains the information needed to map one column in the external data source to a single type of pre-defined MERGEFIELD field for the purposes of the mail merge in the current document.

[Example: Consider a single merged document. The WordprocessingML below demonstrates the mapping of the Country column from the external data source to the predefined WordprocessingML Country or Region merge field when the merged document is populated with external data as part of a mail merge:

```
<w:odso>
...
  <w:fieldMapData>
    <w:type w:val="dbColumn" />
    <w:name w:val="Country" />
    <w:mappedName w:val="Country or Region" />
    <w:column w:val="9" />
  ...
</w:fieldMapData>
</w:odso>
```

The fieldMapData element specifies the mapping between the external data source and a single merge field as follows: the child elements specify that the tenth column in the data source, last titled Country in the specified external data source when the connection was last made is to be mapped to the predefined WordprocessingML merge field calling for Country or Region data.

With the fieldMapData element configured as such, an application may be used in conjunction with this WordprocessingML document to populate the document with data mapped from the specified external data source to fields within the merged document. *end example*

Parent Elements
odso (§2.14.25)

Child Elements	Subclause
column (Index of Column Being Mapped)	§2.14.7
dynamicAddress (Use Country-Based Address Field Ordering)	§2.14.13
lid (Merge Field Name Language ID)	§2.14.17
mappedName (Predefined Merge Field Name)	§2.14.23
name (Data Source Name for Column)	§2.14.24
type (Merge Field Mapping)	§2.14.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OdsoFieldMapData">
  <sequence>
    <element name="type" type="CT_MailMergeOdsoFMDFieldType" minOccurs="0"/>
    <element name="name" type="CT_String" minOccurs="0"/>
    <element name="mappedName" type="CT_String" minOccurs="0"/>
    <element name="column" type="CT_DecimalNumber" minOccurs="0"/>
    <element name="lid" type="CT_Lang" minOccurs="0"/>
    <element name="dynamicAddress" type="CT_OnOff" minOccurs="0"/>
  </sequence>
</complexType>
```

2.14.16 headerSource (Header Definition File Path)

This element specifies the location of a file that contains the column header information which shall be used when connecting to an external data source that does not have column header data specified. Specifically, this element specifies a file that corresponds with the aforementioned external data source. [Note: Column headers are needed to enable a hosting application to associate external data source's columns to fields via the fieldMapData element (§2.14.15).

If this element is omitted, then the column header definition data is not specified in an external file and shall be retrieved from the primary data source associated with the mail merge.

[Example: Consider a WordprocessingML merged document containing the following WordprocessingML:

```
<w:settings>
  ...
  <w:headerSource r:id="rId2" />
  ...
</w:settings>
```

This mail merge's headerSource element specifies via its r:id attribute value of rId2 that the external data source to be used for the column header information for the given WordprocessingML document is the data source targeted by the relationship whose Id attribute is equal to rId2. If we examine the corresponding relationship part item for the setting part, as follows:

```
<Relationships>
  <Relationship Id="rId2"
    Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMergeSource" Target="file:///c:/headerData.txt" TargetMode="External" />
</Relationships>
```

Since the relationship whose Id attribute value is rId2 specifies the column header data file path for the data source effectively specifies a file path of c:\headerData.txt. *end example*]

Parent Elements

mailMerge (§2.14.20)

1

Attributes	Description
<p>id (Relationship to Part)</p> <p>Namespace: .../officeDocument/2006/relationships</p>	<p>Specifies the relationship ID to a specified part.</p> <p>The specified relationship shall match the type required by the parent element:</p> <ul style="list-style-type: none"> • http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element • http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element • http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements • http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element <p>[Example: Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId10" /></pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Rel">
4   <attribute ref="r:id" use="required"/>
5 </complexType>
```

6 **2.14.17 lid (Merge Field Name Language ID)**

7 This element specifies the language ID for the language which was used to generate the merge field name which
8 was associated with a given column in the data source, as specified by the fieldMapData element (§2.14.15).
9 This element specifies that when this field mapping is processed by an application, it shall interpret the merge
10 field name as the name for the specified language.

11 If this element is omitted, then the mapped field names specified in the current document may be interpreted
12 using any method desired by the consuming application (i.e. no language data is included with the field mapping
13 information).

14 [Example: Consider the following WordprocessingML fragment for a field mapping for a document to be merged
15 to an external data source. If the merge field name stored in the file corresponds with the U.S. English version of
16 the merge field names, that information would be stored as follows:

```

1    <w:fieldMapData>
2      <w:name w:val="Title" />
3      <w:column w:val="3" />
4      <w:mappedName w:val="Courtesy Title" />
5      <w:lid w:val="en-US" />
6    </w:fieldMapData>

```

The lid element specifies that the mapping of the data contained in the fourth column of external data source named Title to the WordprocessingML of 'Courtesy Title', shall be associated with the U.S. English language as specified by the val attribute equal to en-US. *end example*

Parent Elements
fieldMapData (§2.14.15)

Attributes	Description
val (Language Code)	<p>Specifies an ISO 639-1 letter code or 4 digit hexadecimal code for a specific language.</p> <p>This code is interpreted in the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an object which shall specify the English(Canada) language. That object would use the ISO 639-1 letter code of en-CA to specify this language. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).</p>

The following XML Schema fragment defines the contents of this element:

```

12 <complexType name="CT_Lang">
13   <attribute name="val" type="ST_Lang" use="required"/>
14 </complexType>

```

2.14.18 linkToQuery (Query Contains Link to External Query File)

This element specifies that the current WordprocessingML document's query string, stored in the query element (§2.14.26) and used to specify the data to be imported from the external data source, actually contains a reference to an external query file which contains the actual query data to be used against the specified external data source for the mail merge. This query shall mimic a SQL query and be of the following form:

```
SELECT * FROM <query file path>.
```

If this element is omitted, then the query specified for the data source attached to the current document shall be assumed to not be a query containing a link to an external file.

[*Example:* Consider a mail merge source document that uses the linkToQuery element to specify that the query used is stored in the specified external data source as follows:

```

1      <w:mailMerge>
2          ...
3      <w:linkToQuery />
4      <w:query w:val="SELECT * FROM C:\queryExample.txt" />
5          ...
6      </w:mailMerge>

```

The linkToQuery element specifies that the query string stored in the query element (§2.14.26) is actually just a reference to an externally stored query file, in this case, an external query file stored at c:\queryExample.txt. *end example*]

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>

```

2.14.19 mailAsAttachment (Merged Document To E-Mail Attachment)

This element specifies that, after importing external data into fields to generate a series of destination WordprocessingML documents as e-mails, the resulting documents should be emailed as an attachment rather than the body of the actual e-mail.

If this element is omitted, then its value shall be assumed to be false (i.e. the destination source is not an e-mail attachment). If the destination element (§2.14.11) specifies that the merged document destination is not email, then this element shall be ignored.

[*Example:* Consider a merged WordprocessingML document that has been connected to an external data source containing three records and that contains the following WordprocessingML in its mail merge properties as follows:

```
<w:mailMerge>
...
  <w:destination w:val="email" />
  <w:mailAsAttachment />
...
</w:mailMerge>
```

After the external data has been imported into the merged document's respective merge fields, three emails will be generated (as specified by the destination element (§2.14.11) with a val attribute of email, each an attachment consisting of one of the three documents resulting from the mail merge result (rather than just including the merged document as the body of the email). *end example*]

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.14.20 mailMerge (Mail Merge Settings)

This element specifies all of the mail merge information for a document that has been connected to an external data source as part of a mail merge operation.

The document which contains this mail merge data may be of one of two types:

- A *source document*, the document which contains all of the information for the mail merge, and is used in conjunction with an application to connect to an external data source and create one document for each record in that data source.
- A *merged document*, a document which contains all of the information for the mail merge as well as a reference to a single specific record which shall be used to populate the values of all of the merge fields in that document.

The information in this element shall contain all data needed to connect to a data source and populate any merge fields in the document with data from that data source.

[*Example*: Consider the following WordprocessingML fragment for a document which is part of a mail merge:

```
<w:mailMerge>
...
<w:dataType w:val="spreadsheet" />
<w:query w:val="SELECT * FROM `Sheet1$`" />
<w:dataSource r:id="rId1" />
...
</w:mailMerge>
```

Here, the `dataType` (§2.14.10) and `dataSource` (§2.14.9) elements specify that the given document shall be connected to the external data source referenced by the relationship whose `id` value is equal to `rId1`. While connected to the external data source, the document together with a hosting application may extract data from the external data source as specified by the `query` (§2.14.26) element. *end example*]

    <element name="checkErrors" type="CT_DecimalNumber" minOccurs="0"/>
    <element name="odso" type="CT_Odso" minOccurs="0"/>
  </sequence>
</complexType>

```

2.14.21 mailSubject (Merged E-mail or Fax Subject Line)

This element specifies the text which shall appear in the subject line of the e-mails or faxes that result after the actions of a mail merge have imported external data into fields within a merged WordprocessingML document whose destination, as specified in the destination element (§2.14.21), is email or fax.

If this element is omitted, then no subject line text shall be associated with each merged document produced via a mail merge using the specified mail merge data. If the destination element (§2.14.11) specifies that the merged document destination is not email or fax, this element shall be ignored.

[Example: Consider a merged WordprocessingML document containing fields and the following WordprocessingML as part of its mail merge data:

```

1    <w:mailMerge>
2    ...
3    <w:destination w:val="email" />
4    <w:mailSubject w:val="Example Subject Line" />
5    ...
6    </w:mailMerge>

```

The mailSubject element specifies that after the specified external data has been imported into the specified fields in the merged document, each record merged shall result in a single e-mail message, each with their subject line reading Example Subject Line. *end example*

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre> <w:pPr> <w:pStyle w:val="heading1" /> </w:pPr> </pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre> <w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr> </pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_String">
  <attribute name="val" type="ST_String" use="required"/>
</complexType>

```

2.14.22 mainDocumentType (Source Document Type)

This element specifies the type of a given WordprocessingML source document.

If this element is omitted, then its value shall be assumed to be `formLetters`.

[*Note:* This element is generally used in conjunction with the behavior of an application to customize aspects of the mail merge user interface and experience independent of the WordprocessingML file format. For example, if a given WordprocessingML merged document contains a `mainDocumentType` element with its `val` attribute equal to `envelopes`, the hosting application may surface a piece of user interface specific to creating envelopes when the given document is opened.

In addition, what a hosting application does with the documents that result from importing external data into specified fields can be determined based on the `mainDocumentType` element, but other than this, is independent of a given merged document's WordprocessingML. For example, if a given merged WordprocessingML document contains a `mainDocumentType` element with its `val` attribute equal to `email`, the hosting application may call a email service after importing external data into specified fields, in order to generate emails containing the resulting documents.

WordprocessingML simply provides the `mainDocumentType` that can serve as a trigger for an application to surface user interface specific to a type of mail merge. *end note*]

[*Example:* Consider the WordprocessingML below:

```
<w:mailMerge>
  <w:mainDocumentType w:val="formLetters" />
  ...
</w:mailMerge>
```

In this example, the source document is of the `formLetters` type, as specified by the `mainDocumentType` element's `val` attribute being equal to `formLetters`. *end example*]

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (Mail Merge Source Document Type)	<p>Specifies the type of source document which is specified by the given WordprocessingML document.</p> <p>[<i>Example:</i> Consider the WordprocessingML below:</p> <pre><w:mainDocumentType w:val="formLetters" /></pre> <p>This WordprocessingML specifies that a given source document is a <code>formLetters</code> document. This setting implies nothing about the file, but may be interpreted by an</p>

```
<complexType name="CT_MailMergeDocType">
  <attribute name="val" type="ST_MailMergeDocType" use="required"/>
</complexType>
```

2.14.23 mappedName (Predefined Merge Field Name)

This element specifies the predefined WordprocessingML MERGEFIELD field name which shall be mapped to the column number specified by the column element (§2.14.7) within this field mapping. [Guidance: This element allows the current column from the specified data source to be mapped to a predefined field name, allowing applications to have one standard set of field names to use regardless of the data source column names, for example, to create the address formats to place into an ADDRESSBLOCK field. *end guidance*]

If this element is omitted, then the current data source column mapping shall not have a predefined merge field name mapped to its contents, and shall only be referenced via the data source column name specified by the name element (§2.14.24) when referenced by one or more MERGEFIELD fields. If the application does not have a predefined merge field whose name matches the name specified using the val attribute, then this element may be ignored.

[Example: Consider the following WordprocessingML fragment, representing two columns from an external data source which have been mapped to the built-in fields First Name and Last Name, respectively:

```
<w:fieldMapData>
  <w:column w:val="0" />
  <w:name w:val="Column Name A" />
  <w:mappedName w:val="First Name" />
  ...
</w:fieldMapData>
<w:fieldMapData>
  <w:column w:val="1" />
  <w:name w:val="Column Name B" />
  <w:mappedName w:val="Last Name" />
  ...
</w:fieldMapData>
```

The first and second columns, specified by the column element values of 0 and 1 respectively, specify that the predefined WordprocessingML field names First Name and Last Name are mapped to the columns of the external data source, and the data source names for those columns are Column Name A and Column Name B, respectively.

Therefore, if MERGEFIELD fields calling for First Name and Last Name are inserted in a WordprocessingML document connected to the external data source with the field mappings specified above, when the mail merge takes place, the data from the first and second column will populate the fields calling for First Name and Last Name data within the merged WordprocessingML document. *end example*

Parent Elements
fieldMapData (§2.14.15)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
  <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.14.24 name (Data Source Name for Column)

This element specifies the column name within a given external data source for the column whose index is specified via the column element (§2.14.7). This data source name provides a column name which shall be used to map a specific MERGEFIELD field in the document, as specified by the parent field mapping data. The val

attribute specifies the name of this column in the data source when the connection is initially established, which is then used permanently to link columns in the database to MERGEFIELD fields in the document.

If this element is omitted, no data source name is provided for the current column.

[*Example:* Consider a source document that is connected to an external data source with three columns. Within this external data source, these are three columns are ordered and titled as follows: first, middle, and last, respectively. The following WordprocessingML specifies that when this document was connected to the data source, these columns were ordered in this manner:

```
<w:fieldMapData>
...
<w:name w:val="first" />
<w:column w:val="0" />
</w:fieldMapData>
<w:fieldMapData>
...
<w:name w:val="middle" />
<w:column w:val="1" />
</w:fieldMapData>
<w:fieldMapData>
...
<w:name w:val="last" />
<w:column w:val="2" />
</w:fieldMapData>
```

The WordprocessingML above demonstrates that the column name first shall be associated with the first column in the external database by specifying a column element with its val attribute equal to 0. In addition, the column name middle shall be associated with the second column in the external database by specifying a column element with its val attribute equal to 1. Finally, the column name last shall be associated with the third column in the external database by specifying a column element with its val attribute equal to 2. *end example]*

Parent Elements

fieldMapData (§2.14.15)

Attributes

Description

val (String Value)

Specifies that its contents will contain a string.

The contents of this string are interpreted based on the context of the parent XML element.

[*Example:* Consider the following WordprocessingML fragment:

Attributes	Description
	<pre data-bbox="451 283 950 388"><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p data-bbox="414 420 1409 457">The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p data-bbox="414 493 922 531">However, consider the following fragment:</p> <pre data-bbox="451 567 1079 703"><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p data-bbox="414 739 1409 844">In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p data-bbox="414 879 1477 917">The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
  <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.14.25 odso (Office Data Source Object Settings)

This element specifies a group of additional settings for the mail merge information which comprise an extension to the standard settings stored with a mail merge which performs two functions:

- First, it provides additional information about the mail merge data source, specifically: information about how to map the columns in the data source to MERGEFIELD fields and information about records which shall be included and excluded when creating merged documents, and column delimiters used in text data sources. This information may be used regardless of the value of the dataType element (§2.14.10) when it is present.
- Second, it provides an alternate set of connection information which should be used when the dataType element (§2.14.10) specifies a value of native. This alternate connection string provides additional connection information for applications which choose to support the ODSO connection string syntax. If the dataType element (§2.14.10) specifies that the data type of the current mail merge is not native, then the second group of settings specified within this element shall be ignored in favor of their non-ODSO equivalents.

[Example: Consider the WordprocessingML for a source document whose mail merge includes mail merge information including ODSO settings as follows:

```

1    <w:odso>
2      <w:udl w:val="..." />
3      <w:table w:val="Sheet1$" />
4      <w:src r:id="rId1" />
5      <w:colDelim w:val="9" />
6      <w:fHdr w:val="1" />
7      <w:fieldMapData>
8        <w:type w:val="dbColumn" />
9        <w:name w:val="Title" />
10       <w:mappedName w:val="Courtesy Title" />
11       <w:lid w:val="en-US" />
12     </w:fieldMapData>
13     <w:recipientData r:id="rId2" />
14     ...
15   </w:odso>

```

The odso element and its child elements provide all of the information specified above that is needed to carry out a mail merge with the current document. This includes alternate connection information using the udl, table, and src elements, and additional mail merge information in the other child elements. *end example*]

Parent Elements
mailMerge (§2.14.20)

Child Elements	Subclause
colDelim (Column Delimiter for Data Source)	§2.14.5
fHdr (First Row of Data Source Contains Column Names)	§2.14.14
fieldMapData (External Data Source to Merge Field Mapping)	§2.14.15
recipientData (Reference to Inclusion/Exclusion Data for Data Source)	§2.14.27
src (ODSO Data Source File Path)	§2.14.30
table (Data Source Table Name)	§2.14.31
type (ODSO Data Source Type)	§2.14.33
udl (UDL Connection String)	§2.14.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Odso">
  <sequence>
    <element name="udl" type="CT_String" minOccurs="0"/>
    <element name="table" type="CT_String" minOccurs="0"/>
    <element name="src" type="CT_Rel" minOccurs="0"/>
    <element name="colDelim" type="CT_DecimalNumber" minOccurs="0"/>
    <element name="type" type="CT_MailMergeSourceType" minOccurs="0"/>
    <element name="fHdr" type="CT_OnOff" minOccurs="0"/>
    <element name="fieldMapData" type="CT_OdsoFieldMapData" minOccurs="0" maxOccurs="unbounded"/>
    <element name="recipientData" type="CT_Rel" minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
</complexType>
```

2.14.26 query (Query For Data Source Records To Merge)

This element contains the Structured Query Language string that shall be run against the specified external data source to return the set of records from the external data which shall be imported into merged WordprocessingML documents when the mail merge operation is performed.

If this element is omitted, then no query shall be associated with the current data source.

[*Example:* Consider a WordprocessingML document that has been connected to an external database. In addition, consider that the data specifies that the table within the database titled Documentation shall be the specific table whose data is imported. This shall be specified in WordprocessingML as follows:

```
<w:query w:val="SELECT * FROM Documentation" />
```

The query element specifies the syntax for the data source query via its val attribute. *end example*

Parent Elements
mailMerge (§2.14.20)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p>

Attributes	Description
	<p>However, consider the following fragment:</p> <pre data-bbox="454 323 1079 453"><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
  <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.14.27 recipientData (Reference to Inclusion/Exclusion Data for Data Source)

This element shall specify a reference to the part which contains data about whether the set of records in the associated data source have been explicitly included or excluded from the specified mail merge. Only those records which shall not be used to generate merged WordprocessingML documents must be stored within the referenced part, as all records shall be merged by default as part of the mail merge operation. [*Guidance:* Applications may choose to store only those records which are excluded for efficiency, or a list of all records in order to determine which set of records were added/removed between mail merge operations. *end guidance*]

[*Rationale:* When defining a mail merge, it is possible that a user wishes to connect to a specified data source, but specify only a subset of the records returned by the query specified by the query element (§2.14.26) which shall be merged as part of the mail merge operation. This element allows applications to utilize a separate part to store this information, either the shared part defined by this Office Open XML Standard, or an application-specific part as needed. *end rationale*]

If the relationship type of the relationship specified by this element is not <http://schemas.openxmlformats.org/officeDocument/2006/mailMergeRecipientData>, is not present, or does not have a TargetMode attribute value of Internal, then the document shall be considered non-conformant. If an application cannot process external content of the content type specified by the targeted part, then it may be ignored.

This Office Open XML Standard defines one shared mechanism for storing this data: using the Mail Merge Recipient Data part. This mechanism shall be used if the associated data source has a column which may be used as the unique key. However, when using data sources which do not have a unique key, applications may store their own part (of an application-defined content type) using this relationship.

1 [Example: Consider a WordprocessingML document which is a mail merge source document, containing
2 inclusion/exclusion data for the data source. The document settings part would contain the mail merge data:

```
3 <w:settings>  
4 ...  
5 <w:mailMerge>  
6 ...  
7 <w:odso>  
8 ...  
9 <w:recipientData r:id="recipient1" />  
10 </w:odso>  
11 </w:mailMerge>  
12 </w:settings>
```

13 The recipientData element specifies that the external content targeted by the relationship with an ID of
14 recipient1 contains the recipient inclusion/exclusion data for the mail merge operation. Examining the
15 contents of the corresponding relationship part item, we can see the targets for that relationship:

```
16 <Relationships ... >  
17 ...  
18 <Relationship Id="recipient1" TargetMode="Internal"  
19 Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMe  
20 rgeRecipientData" Target="recipientData.xml" />  
21 ...  
22 </Relationships>
```

23 The corresponding relationship part item shows that the file containing this data is located next to the main
24 document and is named recipientData.xml. *end example]*

Parent Elements
odso (§2.14.25)

25

Attributes	Description
id (Relationship to Part) Namespace: .../officeDocument /2006/relationshi ps	Specifies the relationship ID to a specified part. The specified relationship shall match the type required by the parent element: <ul style="list-style-type: none">• http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element• http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element• http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements• http://schemas.openxmlformats.org/officeDocument/2006/relationships/pr

Attributes	Description
	<p>interSettings for the printerSettings element</p> <p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre data-bbox="454 388 738 420"><... r:id="rId10" /></pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rel">
  <attribute ref="r:id" use="required"/>
</complexType>
```

2.14.28 recipientData (Data About Single Data Source Record)

This element specifies information about a single record within an external data source. If a record shall be merged into a merged document, then no information is needed about that record within this part. However, if a given record shall not be merged into a merged document, then the value of the unique key for that record shall be stored within the uniqueTag element as a child of this element (along with the active element) to indicate this exclusion.

[*Note:* This mapping is necessary in place of simply using the element order to correspond to the record indices in the external data source, as records may be added or deleted from external data sources, and a means must be provided to maintain WordprocessingML external record specific data like that specified in the active element (§2.14.1) and the corresponding external data record when the WordprocessingML document is reconnected to the external data source; irrespective of the ordering of the records within the external data source. In other words, this element, and its child elements enable merged WordprocessingML documents to maintain the relationship between the records within an external data and record specific WordprocessingML parameters. *end note*]

[*Example:* Consider a merged WordprocessingML document that:

Annex K. Has been connected to a specified external data source containing three records; and

13. Has been configured by the hosting application to not populate a merged document with the record pertaining to John Smith in the external data source.

Consider also that the first time the given WordprocessingML document was connected to the external data source, John Smith's record was in the second record in the data source.

When this merged document is connected to the external data source the recipientData element may be used to store the number and value of the column containing the unique key for each data record within the external

1 data source including John Smith's. This setting is represented using the following WordprocessingML to use
2 the hash codes within the recipientData element to uniquely identify the three records within the external data
3 source.

```
4 <w:recipientData>
5   <w:column w:val="1" />
6   <w:uniqueTag w:val="1408613399" />
7 </w:recipientData>
8 <w:recipientData>
9   <w:column w:val="1" />
10  <w:active w:val="0" />
11  <w:uniqueTag w:val="870254691" />
12 </w:recipientData>
13 <w:recipientData>
14   <w:column w:val="1" />
15   <w:uniqueTag w:val="1107777181" />
16 </w:recipientData>
```

17 Here, the first, second (John Smith record), and third records within the specified data source whose unique key
18 values are 1408613399, 870254691, and 1107777181 have been associated with with recipient data via the
19 active element to specify that the record associated with the given record (John Smith's record) shall not be
20 used to populate a merged WordprocessingML document.

21 With these association in place, if a fourth record is added to the given external data source above John Smith's
22 record, when the given merged WordprocessingML document is reconnected to the external data source, the
23 hosting application will still know that John Smith's record shall not be used to populate a merged
24 WordprocessingML document as it is associated via its unique key value and is not dependent on the given
25 record's ordinal position within the external data source. *end example*]

26

Parent Elements
Root element of WordprocessingML Mail Merge Recipient Data partrecipients (§2.14.29)

Child Elements	Subclause
active (Record Is Included in Mail Merge)	§2.14.1
column (Index of Column Containing Unique Values for Record)	§2.14.6
uniqueTag (Unique Value for Record)	§2.14.35

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RecipientData">
  <sequence>
    <element name="active" type="CT_OnOff" minOccurs="0"/>
    <element name="column" type="CT_DecimalNumber" minOccurs="1"/>
    <element name="uniqueTag" type="xsd:base64Binary" minOccurs="1"/>
  </sequence>
</complexType>
```

2.14.29 recipients (Inclusion/Exclusion Data for Data Source)

This element specifies all of the inclusion/exclusion data for the contents of the specified mail merge data source. It is the root element for the Mail Merge Recipient Data part.

[*Example:* Consider a document which is the source document for a mail merge operation. If two records of the three specified by the data source were excluded from the mail merge, the resulting recipient data part would appear as follows:

```
<w:recipients>
  <w:recipientData>
    <w:active w:val="false"/>
    ...
  </w:recipientData>
  <w:recipientData>
    <w:active w:val="false"/>
    ...
  </w:recipientData>
  <w:recipientData>
    ...
  </w:recipientData>
</w:recipients>
```

The recipients element contains all of the recipient inclusion/exclusion data for this mail merge document. *end example]*

Child Elements	Subclause
recipientData (Data About Single Data Source Record)	§2.14.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Recipients">
  <sequence>
    <element name="recipientData" type="CT_RecipientData" minOccurs="1" maxOccurs="unbounded"/>
  </sequence>
</complexType>
```

2.14.30 src (ODSO Data Source File Path)

This element specifies the relationship whose target is the location of the external data source to be connected to a given WordprocessingML document to perform the mail merge (for a source document) or to find the associated field data (for a merged document) when the merge type, specified using the dataType element (§2.14.10), is set to native.

If this element is omitted, then no file location is specified for the data source for the current mail merge. If no relationship exists with the given relationship ID, or this relationship is not of the Mail Merge Data Source relationship type, then this document shall be considered non-conformant.

The data source location is only used under the following conditions:

- The dataType element (§2.14.10) is set to native
- The current application is able to use the information contained in the odso element (§2.14.25) to access the data source

[Guidance: In this case, using the data source file path in the src element will provide an equal or greater amount of information for the mail merge data source for clients which can consume it. end guidance]

[Example: Consider a WordprocessingML source document containing the following mail merge data:

```
<w:odso>
...
<w:src r:id="rId1" />
...
</w:odso>
```

This mail merge's src element specifies via its r:id attribute value of rId1 that the external data source to be connected to the given WordprocessingML document is the data source targeted by the relationship whose Id attribute is equal to rId1. If we examine the corresponding relationship part item for the setting part, as follows:

```
<Relationships>
  <Relationship Id="rId1"
    Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/mailMergeSource" Target="file:///c:/example_file.mdb" TargetMode="External" />
</Relationships>
```

Since the relationship whose Id attribute value is rId1 specifies the source file path for the data source, that data source effectively specifies a file path of c:\example_file.mdb. end example]

Parent Elements
odso (§2.14.25)

Attributes	Description
<p>id (Relationship to Part)</p> <p>Namespace: .../officeDocument/2006/relationships</p>	<p>Specifies the relationship ID to a specified part.</p> <p>The specified relationship shall match the type required by the parent element:</p> <ul style="list-style-type: none">• http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element• http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element• http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements• http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element <p>[Example: Consider an XML element which has the following id attribute:</p> <p style="text-align: center;"><... r:id="rId10" /></p> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Rel">
3   <attribute ref="r:id" use="required"/>
4 </complexType>
```

5 **2.14.31 table (Data Source Table Name)**

6 This element specifies the particular set of data that a source or merged WordprocessingML document shall be
7 connected to within an external data source containing multiple data sets. In other words, when connecting to a
8 WordprocessingML document to an external data source that may have more than one repository of data within
9 it, such as a database with multiple tables or a spreadsheet with multiple worksheets, this element is used to
10 distinguish the specific table or spreadsheet from which data will be imported from within the external data
11 source.

12 [Example: Consider a WordprocessingML document that has been connected to database containing two tables
13 named Table One and Table Two, respectively. To specify that the mail merge shall import data from Table
14 One into the WordprocessingML document, this requirement would be specified using the following
15 WordprocessingML:

```

1    <w:odso>
2    ...
3    <w:table w:val="Table One" />
4    ...
5    </w:odso>

```

6 The table element with a value of Table One specifies that the external data shall be retrieved from this table in
7 the data source. *end example*

Parent Elements
odso (§2.14.25)

8

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre> <w:pPr> <w:pStyle w:val="heading1" /> </w:pPr> </pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre> <w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr> </pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

9 The following XML Schema fragment defines the contents of this element:

```

10 <complexType name="CT_String">
11   <attribute name="val" type="ST_String" use="required"/>
12 </complexType>

```

2.14.32 type (Merge Field Mapping)

This element specifies if a given mail merge field has been mapped to a column in the given external data source or not.

If this element is omitted, then the field mapping shall be considered to be of type null (i.e. not mapped).

[Example: Consider the WordprocessingML for a single field mapping within a mail merge source document:

```
<w:odso>
...
<w:fieldMapData>
  <w:type w:val="dbColumn" />
  <w:name w:val="Country" />
  <w:mappedName w:val="Country or Region" />
  <w:column w:val="9" />
...
</w:fieldMapData>
</w:odso>
```

In this example, the country column within the given external data source shall be mapped to the mail merge field Country or Region, as specified by the type element's val attribute being equal to dbColumn. end example

Parent Elements
fieldMapData (§2.14.15)

Attributes	Description
val (Merge Field Mapping Type)	<p>Specifies if the given mail merge field has been mapped to a column in the given external data source (i.e. if the merge field mapping is valid or not).</p> <p>[Example: Consider the following WordprocessingML fragment for a mail merge source or merged document:</p> <pre><w:type w:val="null" /></pre> <p>In this example, the given mail merge field shall not be mapped to a column in the given external data source, as specified by the type element's val attribute being equal to null. end example]</p> <p>The possible values for this attribute are defined by the ST_MailMergeOdsoFMDFieldType simple type (§2.18.62).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MailMergeOdsoFMDFieldType">
  <attribute name="val" type="ST_MailMergeOdsoFMDFieldType" use="required"/>
</complexType>
```

2.14.33 type (ODSO Data Source Type)

This element specifies the type of external data source to be connected to via as part of the ODSO connection information for this mail merge. This setting is purely a suggestion of the data source type which is being used for this mail merge, and may be ignored in favor of an alternative mechanism if one is present.

[*Example:* Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:type w:val="database" />
```

The type element's val attribute is equal to database, specifying that the given merged WordprocessingML document has been connected to an external data source via the ODSO settings, and that the resulting data source was a database. *end example*]

Parent Elements

odso (§2.14.25)

Attributes

Description

val (Data Source Type Value)

Specifies the type of an external data source used for a mail merge operation.

[*Example:* Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:type w:val="text" />
```

The val attribute is equal to text, specifying that the given merged WordprocessingML document has been connected to an external data source via the ODSO settings, and that the resulting data source was a text file. *end example*]

The possible values for this attribute are defined by the ST_MailMergeSourceType simple type (§2.18.63).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MailMergeSourceType">
  <attribute name="val" use="required" type="ST_MailMergeSourceType"/>
</complexType>
```

2.14.34 udl (UDL Connection String)

This element specifies the Universal Data Link (UDL) connection string used to reconnect to an external data source. The string within this element's val attribute shall contain the connection string that the hosting

application shall pass to a external data source access application to enable the WordprocessingML document to be reconnected to the specified external data source.

If this string is omitted, then no UDL connection string shall be associated with the ODSO data for this mail merge.

This connection string is only used under the following conditions:

- The dataType element (§2.14.10) is set to native
- The current application is able to use the information contained in the odso element (§2.14.25) to access the data source

[*Guidance:* In this case, using the connection string in the udl element will provide an equal or greater amount of information for the mail merge data source for clients which can consume it. *end guidance*]

[*Example:* Consider a merged WordprocessingML document that has been connected to an external data source for the purposes of a mail merge. The following WordprocessingML fragment represents the legacy connection string used to connect to the external data source when the merged WordprocessingML document is reopened:

```
<w:udl w:val="Provider=Example;Password=Test;User ID=readonly;..." />
```

The udl element specifies that the string Provider=Example;Password=Test;User ID=readonly;... shall be used to enable the given WordprocessingML document to be reconnected to the specified external data source. *end example*]

Parent Elements

odso (§2.14.25)

Attributes

val (String Value)

Description

Specifies that its contents will contain a string.

The contents of this string are interpreted based on the context of the parent XML element.

[*Example:* Consider the following WordprocessingML fragment:

```
<w:pPr>
  <w:pStyle w:val="heading1" />
</w:pPr>
```

The value of the val attribute is the ID of the associated paragraph style's styleId.

However, consider the following fragment:

```
<w:sdtPr>
```

Attributes	Description
	<pre data-bbox="454 247 1079 346"><w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p data-bbox="414 388 1412 493">In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p data-bbox="414 525 1477 556">The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
  <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.14.35 uniqueTag (Unique Value for Record)

This element specifies the contents of a given record within the specified external data source, in the column containing unique data for every record within the external data source. This element is used in conjunction with the column (§2.14.7) element to maintain a relationship between the records within an external data source and a given merged WordprocessingML document.

The contents of this attribute shall be the base64-encoded value of the unique tag value as specified by the data source.

[*Note:* This information is necessary as part of a mail merge as records may be added or deleted from external data sources, and a means must be provided to maintain record-specific inclusion or exclusion data using the active element (§2.14.1) and the affected external data record when the WordprocessingML document is reconnected to the external data source irrespective of the ordering of the records within the external data source. *end note*]

[*Example:* Consider the following WordprocessingML fragment for the information about a single record in a source document for a mail merge:

```
<w:recipientData>
  <w:active w:val="0" />
  <w:column w:val="12" />
  <w:uniqueTag w:val="258865469" />
</w:recipientData>
```

The external data record associated with this information is specified via the column in the external data source corresponding to the column element with a val attribute equal to 12, which contains a row whose value in this column has a value corresponding to the uniqueTag element with a val attribute equal to 258865469. This record will not be imported into the merged WordprocessingML document as the active (§2.14.1) element associated with the given external data record has a val attribute equal to 0.

In other words, when the specified external data source is connected to, the record within the thirteenth column of the external data source that has the contents 258865469, and not populate mapped fields in a merged document with data from that record. *end example*]

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
recipientData (§2.14.28)

2.14.36 viewMergedData (View Merged Data Within Document)

This element specifies that a specific merged document shall display the data from the specified external data source where merge fields have been inserted. The activeRecord element (§2.14.2) is used to specify which record within the external data source is to have its applicable data displayed where applicable within the WordprocessingML merged document.

If the activeRecord element is not present in the WordprocessingML for the document with the viewMergedData's val attribute equal to on, the hosting application may behave as if the activeRecord element's val attribute was equal to 1. This element is ignored if the viewMergedData (§2.14.36) element is not present or present with a val attribute equal to Off, 0, or false.

[Example: Consider a merged WordprocessingML document containing two WordprocessingML fields calling for Courtesy Title and Last Name data and a sample text paragraph. Also, note that the external data source this merged document is connected to contains two records, both containing name and address information, with the first record pertaining to Mr. Doe, and the second pertaining to Ms. Smith.

This table below illustrates the necessary WordprocessingML to display applicable data from the specified external data source within the merged document where fields have been inserted:

<w:viewMergedData val="off"/>	<w:viewMergedData val="on" /> <w:activeRecord w:val="1" />	<w:viewMergedData val="off" /> <w:activeRecord w:val="1" />
Dear {MERGEFIELD "Courtesy Title" \m} {MERGEFIELD "Last Name" \m}, Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sincerely,	Dear Mr. Doe: Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sincerely,	Dear {MERGEFIELD "Courtesy Title" \m} {MERGEFIELD "Last Name" \m}, Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sample letter text. Sincerely,

1 The viewMergedData element specifies that the specified record in the external data source shall be displayed
2 in place of merge fields in the current document. *end example*]

Parent Elements
mailMerge (§2.14.20)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_OnOff">  
6   <attribute name="val" type="ST_OnOff"/>  
7 </complexType>
```

8 **2.15 Settings**

9 Within a WordprocessingML document, *settings* specify stored preferences which shall be used when processing
10 the contents of the document. These settings are typically divided into three categories:

- 11 • *Document Settings* - settings which influence the appearance and behavior of the current document, as
12 well as store document-level state.
- 13 • *Compatibility Settings* - settings which tell applications to perform behaviors which are designed to
14 maintain visual output of previous word processing applications. These settings are for backward
15 compatibility and are all ignorable.
- 16 • *Web Settings* - settings which affect how this document shall be handled when it is saved as HTML.
17 These settings exist primarily for backward compatibility reasons and are all ignorable.

18 The first two groups are stored in the Document Settings part, and the last group is stored in the Web Settings
19 part.

2.15.1 Document Settings

The first group of settings stored in WordprocessingML is document settings. These settings specify all document-level properties which affect the handling of the current document.

[Example: Consider the following WordprocessingML fragment for the document settings in a WordprocessingML document:

```
<w:settings>
  <w:defaultTabStop w:val="720" />
  <w:characterSpacingControl w:val="dontCompress" />
</w:settings>
```

The settings element contains all of the document settings for this document. In this case, the two settings applied are automatic tab stop increments of 0.5" using the defaultTabStop element (§2.15.1.24), and no character level whitespace compression using the characterSpacingControl element (§2.15.1.18). end example]

2.15.1.1 activeWritingStyle (Grammar Checking Settings)

This element specifies information about the parameters of the grammar checking which was performed on the contents of the current WordprocessingML document. [Note: This information may be used as desired by applications; for example, to determine if the current grammar checking state, specified by the proofState element (§2.15.1.65) is sufficient. end note]

[Example: Consider the following WordprocessingML fragment from the document settings:

```
<w:activeWritingStyle w:lang="en-CA" w:vendorID="64" w:dllVersion="131078"
w:nlCheck="1" w:optionSet="0" />
```

The activeWritingStyle element's lang attribute specifies that the English (Canada) language setting for grammatical and stylistic checks shall be applied; the vendorID attribute specifies information about the vendor associated with the DLL used to perform the grammatical and stylistic checks; the dllVersion attribute specifies the version of this DLL; the nlCheck attribute specifies if natural language checks were performed or not; and the optionSet element specifies that the hosting application should allow its grammar engine to check both the grammar and style of the given WordprocessingML document, if that functionality is available. end example]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
appName (Application Name)	Specifies the name of the application which specified the grammatical settings contained on the attributes for this element. If an application reads these settings and does not understand the value of this attribute, then its settings may be ignored and the application's default settings used instead.

Attributes	Description
	<p>[Example: Consider the WordprocessingML below:</p> <pre data-bbox="483 352 1208 386"><w:activeWritingStyle ... w:appName="testApp"/></pre> <p>The appName attribute has a value of testApp, specifying that the application called testApp specified the grammar checking rules of the given WordprocessingML document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
checkStyle (Check Stylistic Rules With Grammar)	<p>Specifies if the grammar content checking performed on this document included stylistic rules for the document content. If specified, applications which support this functionality shall check stylistic rules as well as grammatical ones when checking the grammatical content of this document.</p> <p>[Example: Consider the WordprocessingML below:</p> <pre data-bbox="483 861 1224 894"><w:activeWritingStyle ... w:checkStyle="false"/></pre> <p>The checkStyle attribute has a value of false, specifying that hosting applications shall only check grammatical rules of the given WordprocessingML document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
dllVersion (Grammatical Check Engine Version)	<p>Specifies the version of the engine that was used to check the grammatical content of the WordprocessingML document.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre data-bbox="483 1260 1256 1293"><w:activeWritingStyle ... w:dllVersion="131078" /></pre> <p>The dllVersion attribute specifies that the writing style DLL version used to check the writing style of is the writing style DLL version associated with the decimal number 131078. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>
lang (Writing Style Language)	<p>Specifies the language of the engine used to perform the grammatical content checking.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre data-bbox="483 1696 1127 1730"><w:activeWritingStyle w:lang="en-CA" .../></pre> <p>The lang attribute has a value of en-CA, therefore the grammatical check language is specified as English (en) and Canada (CA), resulting in use of the English (Canada) grammar checker. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).
nlCheck (Natural Language Grammar Check)	<p>Specifies whether the engine that was used to check the grammatical content of the WordprocessingML document performed natural language-based analysis.</p> <p>[Example: Consider the WordprocessingML below:</p> <pre data-bbox="483 512 1128 541"><w:activeWritingStyle ... w:nlCheck="1" /></pre> <p>The nlCheck attribute has a value of 1, specifying that the writing style DLL supported natural language analysis . <i>end example</i>].</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
vendorID (Grammatical Engine ID)	<p>Specifies a value indicating a unique ID for the writing style engine that was used to check the grammatical content of the WordprocessingML document.</p> <p>[Example: Consider the WordprocessingML below:</p> <pre data-bbox="483 911 1144 940"><w:activeWritingStyle ... w:vendorID="64"/></pre> <p>The vendorId attribute has a value of 64, specifying that the grammatical checker used is identified by the decimal number 64. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_WritingStyle">
  <attribute name="lang" type="ST_Lang" use="required"/>
  <attribute name="vendorID" type="ST_DecimalNumber" use="required"/>
  <attribute name="dllVersion" type="ST_DecimalNumber" use="required"/>
  <attribute name="nlCheck" type="ST_OnOff" use="optional"/>
  <attribute name="checkStyle" type="ST_OnOff" use="required"/>
  <attribute name="appName" type="ST_String" use="required"/>
</complexType>

```

2.15.1.2 alignBordersAndEdges (Align Paragraph and Table Borders with Page Border)

This element specifies that paragraph borders specified using the pBdr element (§2.3.1.24) and table borders using the tblBorders element (§2.4.37) shall be adjusted to align with extents of the page border defined using the pgBorders element (§2.6.10) if the spacing between these borders is less than or equal to 10.5 points (one character width) or less from the page border. The presence of this setting shall ensure there are no gaps of one character width or less between adjoining page and paragraph/table borders, as borders which are perfectly aligning shall not be displayed in favor of the intervening page border.

If this element is omitted, then borders shall not be automatically adjusted to prevent gaps of less than one character width. If the page border is not measured from the text extents using a value of text in the offsetFrom attribute on the pgBorders element, then it may be ignored.

[Example: Consider the following WordprocessingML fragment from the document settings:

```
<w:alignBordersAndEdges w:val="true"/>
```

The alignBordersAndEdges element has a value of true specifying that borders shall be adjusted to prevent gaps of less than one character width. If a document has a page border specified to appear 4 points from the text extents, and within that page a paragraph border specified to appear one point from the text extents, that would normally appear like this:

If this element is present, then those gaps (which are all of three points in width) shall be adjusted to ensure that the borders align exactly and the paragraph border is suppressed:

end example]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. end example]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.3 alwaysMergeEmptyNamespace (Do Not Mark Custom XML Elements With No Namespace As Invalid)

This element specifies whether custom XML markup specified via the customXml element which has no associated namespace shall be treated as an error and moved into a special error namespace (for the purposes of validation) when the document is opened. If this element is turned on, when an application determines that the current XML markup is in the empty namespace, those elements shall not automatically be moved into an error namespace.

If this element is not present in a WordprocessingML document than custom XML markup which has no associated namespace shall be treated as an error and moved into a special error namespace when the document is opened.

[Example: Consider a WordprocessingML document which should not automatically flag empty namespace XML as invalid. This requirement would be specified using the following WordprocessingML:

```
<w:alwaysMergeEmptyNamespace w:val="true"/>
```

The alwaysMergeEmptyNamespace element's val attribute has a value of true specifying that custom XML markup in the empty namespace shall never be treated as an error. *end example*]

Parent Elements

settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.4 alwaysShowPlaceholderText (Use Custom XML Element Names as Default Placeholder Text)

This element specifies that each custom XML element specified using the customXml element within this document shall always show some form of in-document placeholder text presentation when it contains no run content. If the placeholder element (§2.5.2.24) is present in the custom XML element's properties, then this is the placeholder text displayed and this effect has no effect. If the placeholder element is omitted, then the application shall use the name of the element to generate default placeholder text in its place.

If this element is omitted, then custom XML markup which does not contain a placeholder element within its properties shall not display any placeholder text.

[Example: Consider the following WordprocessingML fragment from the document settings:

```
<w:alwaysShowPlaceholderText w:val="true" />
```

The alwaysShowPlaceholderText element has a value of true, which specifies that placeholder text shall be generated using the element's name if no placeholder text is present. If two custom XML elements are defined as follows:

```
<w:customXml w:name="spec" ... >
  <w:customXmlPr>
    <w:placeholder w:val="Type the name of the specification." />
  </w:customXmlPr>
</w:customXml>
...
<w:customXml w:name="spec" ... >
</w:customXml>
```

The first custom XML element has placeholder text, and the second doesn't, so if this element is omitted, these two elements might be displayed as follows:

Type the name of the specification.

Notice that the second custom XML element has no placeholder text, and therefore is not displayed. However, when this element is present, then the application should generate default placeholder text in its place:

Type the name of the specification.

[spec]

The application generated default placeholder text from the element name, resulting in a value of [spec] in the document. *end example*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">  
  <attribute name="val" type="ST_OnOff"/>  
</complexType>
```

2.15.1.5 attachedSchema (Attached Custom XML Schema)

This element specifies that the custom XML schema whose target namespace matches the value specified in the val attribute should be associated with this document when it is loaded, if such a schema is available to the hosting application. Applications may also load and utilize any additional schemas as well as those explicitly mentioned here. [Note: These custom XML schemas may then be used to validate the structure of the custom XML markup in the document, etc. *end note*]

If no elements of this type are present, then no custom XML schemas have been explicitly associated with the contents of this document.

[Example: Consider the following WordprocessingML fragment from the document settings:

1 <w:attachedSchema w:val="http://www.example.com/schema1" />
2 <w:attachedSchema w:val="http://www.example.com/schema2" />

3 The attachedSchema elements specify that two custom XML schemas with namespaces of
4 http://www.example.com/schema1 and http://www.example.com/schema2 should be associated with the
5 custom XML markup in the current document. *end example*]

Parent Elements
settings (§2.15.1.78)

6

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

7 The following XML Schema fragment defines the contents of this element:

```
8 <complexType name="CT_String">  
9   <attribute name="val" type="ST_String" use="required"/>  
10</complexType>
```

2.15.1.6 attachedTemplate (Attached Document Template)

This element specifies the location of a document template which shall be attached to the current WordprocessingML document if it is accessible and of a format supported by an application. Specifically, this element's val attribute shall contain the file path of the associated document template.

If this element is omitted, then the document shall not have an attached document template, and applications should use their default template in its place.

[Example: Consider a WordprocessingML document which is attached to a WordprocessingML template located on the local C drive within a file whose name is c:\template.dotx. This association is specified using the following WordprocessingML:

```
<w:attachedTemplate w:val="c:\template.dotx" />
```

The attachedTemplate element contains the path to the associated template. end example]

Parent Elements

settings (§2.15.1.78)

Attributes

Description

id (Relationship to Part)

Specifies the relationship ID to a specified part.

Namespace:
.../officeDocument
/2006/relationships

The specified relationship shall match the type required by the parent element:

- http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element
- http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element
- http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements
- http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element

[Example: Consider an XML element which has the following id attribute:

```
<... r:id="rId10" />
```

The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. end example]

The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

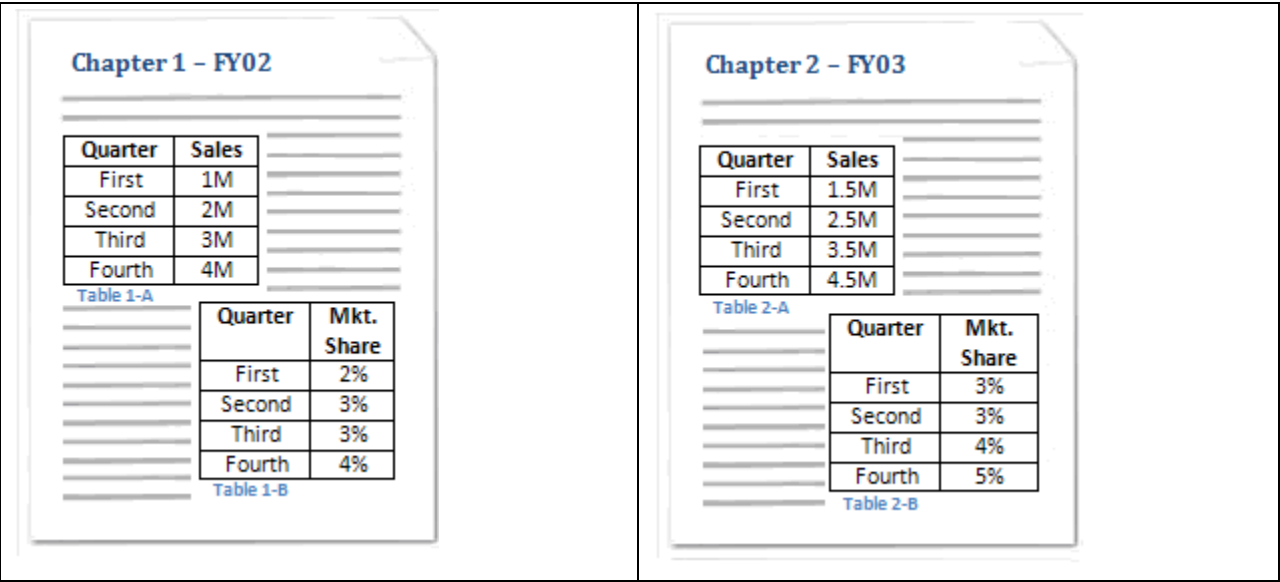

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rel">
  <attribute ref="r:id" use="required"/>
</complexType>
```

2.15.1.7 autoCaption (Single Automatic Captioning Setting)

This element specifies what type(s) of objects shall automatically labeled with captions (§2.15.1.17), and with which captions the specified objects shall be labeled as defined in the caption element (§2.15.1.16).

[Example: Consider the diagram below illustrating a two page WordprocessingML document that has leveraged WordprocessingML to automatically label WordprocessingML tables with a specified caption when tables are inserted into the given document.

This type of automatic captioning is specified using the following WordprocessingML fragment:

```
<w:captions>
  <w:caption w:name="Table" w:pos="below" w:chapNum="On" w:heading="2"
w:numFmt="upperCase" w:sep="8212" />
  <w:autoCaptions>
    <w:autoCaption w:name="wfwTable" w:caption="Table" />
  </w:autoCaptions>
</w:captions>
```

Here, the autoCaption element specifies through the name attribute being set equal to wfwTable that tables will automatically be labeled with the caption specified in the caption element whose name attribute is equal to Table, as the caption element's caption attribute has a value of Table. end example]

Parent Elements

Parent Elements
autoCaptions (§2.15.1.8)

1

Attributes	Description
caption (Caption Used for Automatic Captioning)	<p>Specifies the caption defined in using the caption element (§2.15.1.16) which shall be used to automatically label a given type of object inserted in a WordprocessingML document. The caption settings are linked by matching the value of this attribute with the name attribute of the corresponding caption element.</p> <p>[Example: Consider the WordprocessingML below</p> <pre><w:captions> <w:caption w:name="table" w:pos="below" w:chapNum="1" w:heading="0" w:noLabel="1" w:numFmt="upperRoman" /> <w:autoCaptions> <w:autoCaption w:name="Paint.Picture" w:caption="table" /> </w:autoCaptions> </w:captions></pre> <p>The autoCaption element specifies through the name attribute being set equal to wfwTable that tables will automatically be labeled with the caption whose name attribute is equal to Table (specified by the caption element's attribute name having a value of Table). <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
name (Identifier of Object to be Automatically Captioned)	<p>Specifies a unique identifier which may be used to associate objects inserted into the document which are to be automatically labeled with a caption when inserted into the WordprocessingML document.</p> <p>[Example: Consider the WordprocessingML below specifying that WordprocessingML tables should be labeled with the custom caption:</p> <pre><w:autoCaption w:name="wfwTables" w:caption="custom" /></pre> <p>The name attribute value of wfwTables specifies that WordprocessingML tables shall be labeled with the custom caption. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

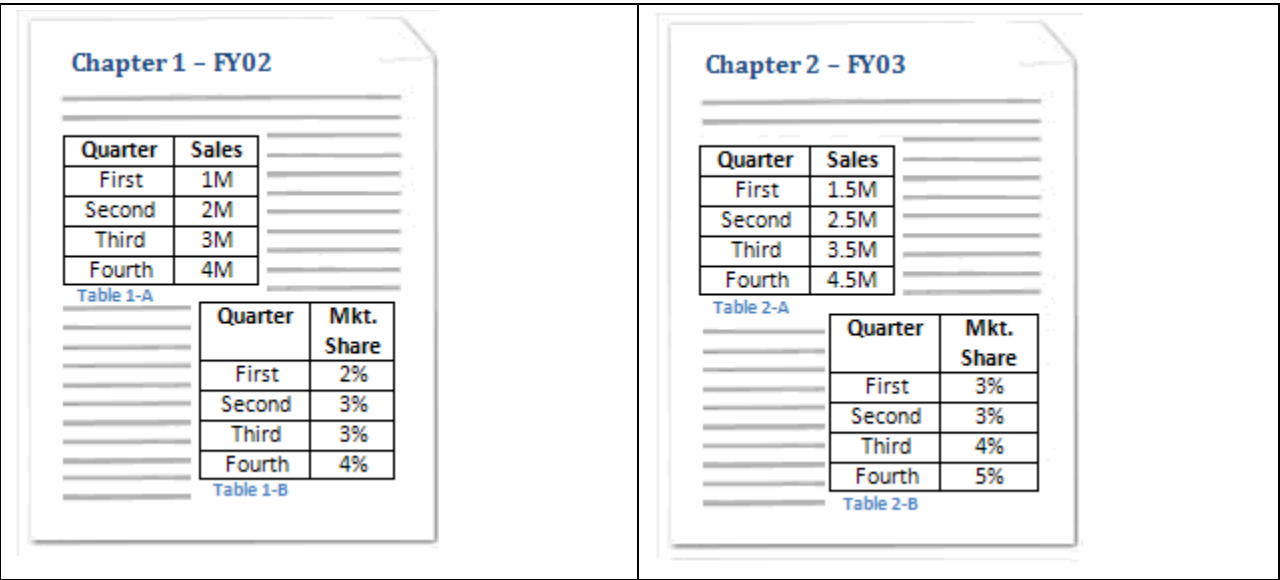

2 The following XML Schema fragment defines the contents of this element:

3	<complexType name="CT_AutoCaption">
4	<attribute name="name" type="ST_String" use="required"/>
5	<attribute name="caption" type="ST_String" use="required"/>
6	</complexType>

2.15.1.8 autoCaptions (Automatic Captioning Settings)

This element specifies that one or more types of objects, when inserted into a WordprocessingML document, will automatically be labeled with a specific caption defined using the caption element (§2.15.1.16).

[Example: Consider the following example illustrating a two page WordprocessingML document that has leveraged WordprocessingML to automatically label WordprocessingML tables with a specified caption.

This type of automatic captioning is specified using the following WordprocessingML fragment:

```
<w:captions>
  <w:caption w:name="Table" w:pos="below" w:chapNum="On" w:heading="2"
w:numFmt="upperCase" w:sep="8212" />
  <w:autoCaptions>
    <w:autoCaption w:name="wfwTable" w:caption="Table" />
  </w:autoCaptions>
</w:captions>
```

The autoCaptions element specifies set of objects that when inserted into a WordprocessingML document will automatically be labeled with a given caption. *end example*]

Parent Elements	
captions (§2.15.1.17)	

Child Elements	Subclause
autoCaption (Single Automatic Captioning Setting)	§2.15.1.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AutoCaptions">
  <sequence>
    <element name="autoCaption" type="CT_AutoCaption" minOccurs="1" maxOccurs="unbounded"/>
  </sequence>
</complexType>
```

2.15.1.9 autoFormatOverride (Allow Automatic Formatting to Override Formatting Protection Settings)

This element specifies whether formatting automatically applied by an application (i.e. not explicitly applied by a user or an application) shall be allowed to override formatting protection enabled via the formatting attribute on the documentProtection element (§2.15.1.9) when those formatting operations would add formatting which has been explicitly disabled. *[Example: Automatically adding superscript to the st in the string 1st. end example]*

If this element is omitted, then no automatic formatting rule(s) shall be allowed to override the formatting restrictions enabled for the document.

[Example Consider a WordprocessingML document which has been protected such that a user shall not be able to directly format text within the document. Consider also that the hosting application has been constructed such that if a user enters an ampersand, then one or more alphabetical characters, then another ampersand, that the alphabetical characters are to take on italicized formatting.]

If the autoFormatOverride element is omitted or set to false and document protection is enabled, the aforementioned series of events will not cause the English alphabetical characters to be italicized as the document protection preventing formatting of the document in question will supersede the formatting to take place after these events. If this operation should not be prevented when active formatting restrictions are used, this would be specified using the following WordprocessingML:

```
<w:autoFormatOverride w:val="true"/>
```

The autoFormatOverride element's val attribute is equal to on specifying that the automatic formatting behavior shall be applied regardless of the formatting restrictions in place. *End Example]*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	<p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3   <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.1.10 autoHyphenation (Automatically Hyphenate Document Contents When Displayed)**

6 This element specifies whether the content of a given WordprocessingML document should automatically be
7 hyphenated by the hosting application before it is displayed, if the application supports this functionality.

8 If this element is omitted, then hyphenation shall not automatically be performed by application displaying this
9 document.

10 [Example: Consider the images below illustrating a paragraph of text in a WordprocessingML document:

12 If the content in this document shall automatically be hyphenated when it is displayed, that requirement would
13 be specified using the following WordprocessingML in the document settings:

```
14 <w:autoHyphenation w:val="true" />
```

15 The resulting output might look like the following (depending on the application's hyphenation algorithm and
16 the hyphenation zone setting (§2.15.1.53):

18 The autoHyphenation element has its val attribute equal to true, the document is automatically hyphenated
19 and the word sample, beginning at the end of the second line, is hyphenated automatically and thus carried
20 over onto the third line. Conversely, when the autoHyphenation element has its val attribute equal to off, the
21 entire word sample is carried over to the third line as it was not hyphenated automatically and could not fit
22 onto the second line. *end example*]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4   <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

6 2.15.1.11 bookFoldPrinting (Book Fold Printing)

7 This element specifies if the contents of a given WordprocessingML document should be printed as signatures.
8 *Signatures* are printed *sheets*, which depict several pages of a document that are folded and bound with other
9 signatures to form a booklet, a set of which can be bound together to form a book like publication. Specifically,
10 this element specifies that each page in a given WordprocessingML document should be oriented in a landscape
11 fashion, divided in half vertically with two left margins emanating from the bisector of the page, and two right
12 margins instantiated at the left and right side of each page.

13 This element is used in conjunction with the bookFoldPrintingSheets element (§2.15.1.12) to enable a
14 WordprocessingML document to be printed such that the series of signatures printed may be folded and bound
15 to create a booklet.

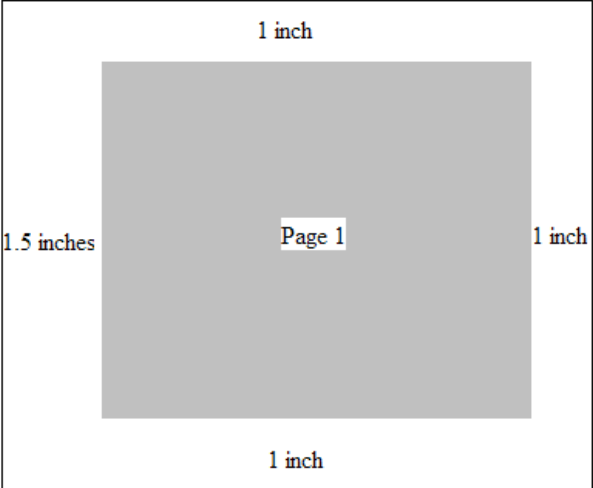

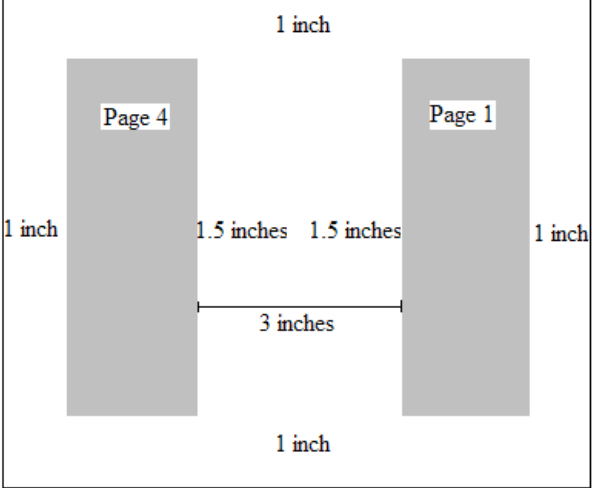

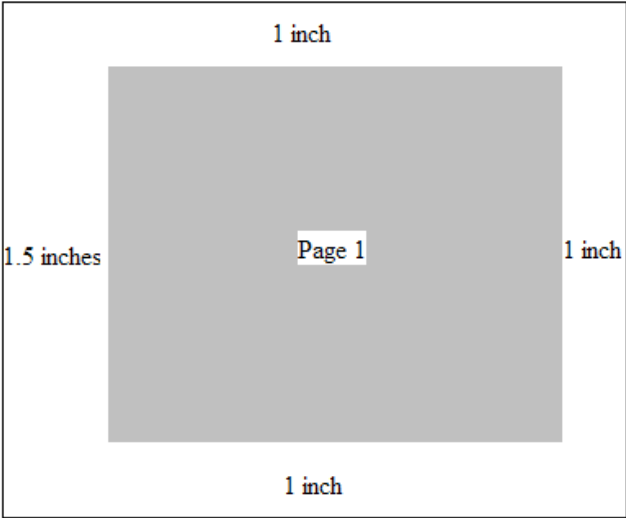

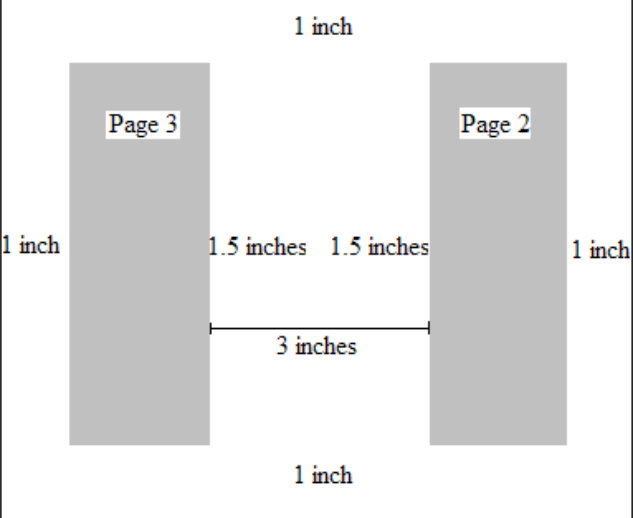

16 This element has no impact on the settings of printer leveraged by the hosting application. In other words, if the
17 printer leveraged by the hosting application has been configured to print on one side of a page, including the
18 WordprocessingML for this element has no effect.

19 If this element is omitted, then pages shall not be printed as signatures. If the bookFoldRevPrinting element
20 (§2.15.1.13) is also specified, then this element shall be ignored.

1 [Example: Consider a four page WordprocessingML document with a 2,160 twentieths of a point (one and a half
2 inch) left margin, and 1,440 twentieths of a point (one inch) bottom, right, and top margins using the pgMar
3 element (§2.6.11) surrounding the text extents of the page (represented by the gray shaded area in diagrams
4 below). These page margins are specified using the following WordprocessingML:

5 <w:pgMar w:top="1440" w:right="1440" w:bottom="1440" w:left="2160" />

6 The necessary WordprocessingML and consequential effect of setting the bookFoldPrinting element's val
7 attribute to true versus false and the bookFoldPrintingSheets element's val attribute to 4, is depicted
8 graphically below—diagrams not drawn to scale:

<code><w: bookFoldPrinting w:val="false"/></code>	<code><w: bookFoldPrinting w:val="true" /></code>
First Printed Sheet	First Printed Signature
	
Second Printed Sheet	Second Printed Signature
	

Assuming the page was already oriented in a landscape fashion, setting the bookFoldPrinting element's val attribute to true divided the page in half vertically, with two left margins emanating from the bisector of the page, and right margins instantiated at the left and right side of each page, enabling two signatures to be printed.

In addition, this element is used in conjunction with the bookFoldPrintingSheets element to enable the given WordprocessingML document to be printed such that the series of signatures printed may be folded and bound to create a booklet. Specifically, the signatures may be placed back to back, with top the bottom of each sheet aligned, and folded such that a booklet is created. *end example*]

[*Note*: This element could also be leveraged by the hosting application to notify the application to display two pages per sheets within its user interface to allow for a WYSIWYG user experience. *end note*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

<pre><complexType name="CT_OnOff"> <attribute name="val" type="ST_OnOff"/> </complexType></pre>

2.15.1.12 bookFoldPrintingSheets (Number of Pages Per Booklet)

This element shall be used in conjunction with the bookFoldPrinting (§2.15.1.11) and bookFoldRevPrinting (§2.15.1.13) elements to specify the number of pages to be included in each booklet when printing a series of signatures. Signatures are printed *sheets*, which depict several pages of a document that are to be folded and bound with other signatures to form a booklet. Booklets can be bound together to form a book like publication.

- 1 If this element is omitted, then its default behavior shall be to print the contents of the content on a single
2 sheet. A *sheet* is a single piece of paper which is folded and cut to produce a book.
- 3 [Example: Consider a four page WordprocessingML document will be printed as a set of two signatures to be
4 compiled into a single booklet. This setting would be specified using the following WordprocessingML fragment
5 in the document settings part:
- 6 `<w:bookFoldPrinting w:val="true" />`
7 `<w:bookFoldPrintingSheets w:val="4" />`
- 8 The bookFoldPrintingSheets element's val attribute specifies that 4 pages shall be included in each booklet.
9 Since each signature contains two pages and are printed such that the signatures may be placed back to back,
10 with top the bottom of each sheet aligned, and folded such that the booklet is created, a booklet containing four
11 pages distributed over two signatures may be created.
- 12 This setting is depicted visually using the illustration below (gray shading represents a page):

1 *end example]*

Parent Elements
settings (§2.15.1.78)

2

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <pre><w:... w:val="1512645511" /></pre> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_DecimalNumber">
5   <attribute name="val" type="ST_DecimalNumber" use="required"/>
6 </complexType>
```

7 **2.15.1.13 bookFoldRevPrinting (Reverse Book Fold Printing)**

8 This element specifies if pages of a given WordprocessingML document are to be printed as signatures in
9 reverse order. *Signatures* are printed *sheets*, which depict several pages of a document that are folded and

1 bound with other signatures to form a booklet, a set of which can be bound together to form a book like
2 publication. Specifically, this element specifies that each page in a given WordprocessingML document should
3 be oriented in a landscape fashion and divided in half vertically, with two left margins emanating from the
4 bisector of the page, and right margins instantiated at the left and right side of each page.

5 In addition, this element is used in conjunction with the bookFoldPrintingSheets element (§2.15.1.12) to
6 enable given WordprocessingML document to be printed such that the series of signatures printed may be
7 folded and bound to create a booklet.

8 This element has no impact on the settings of printer leveraged by the hosting application. In other words, if the
9 printer leveraged by the hosting application has been configured to print on one side of a page, including the
10 WordprocessingML for this element has no effect.

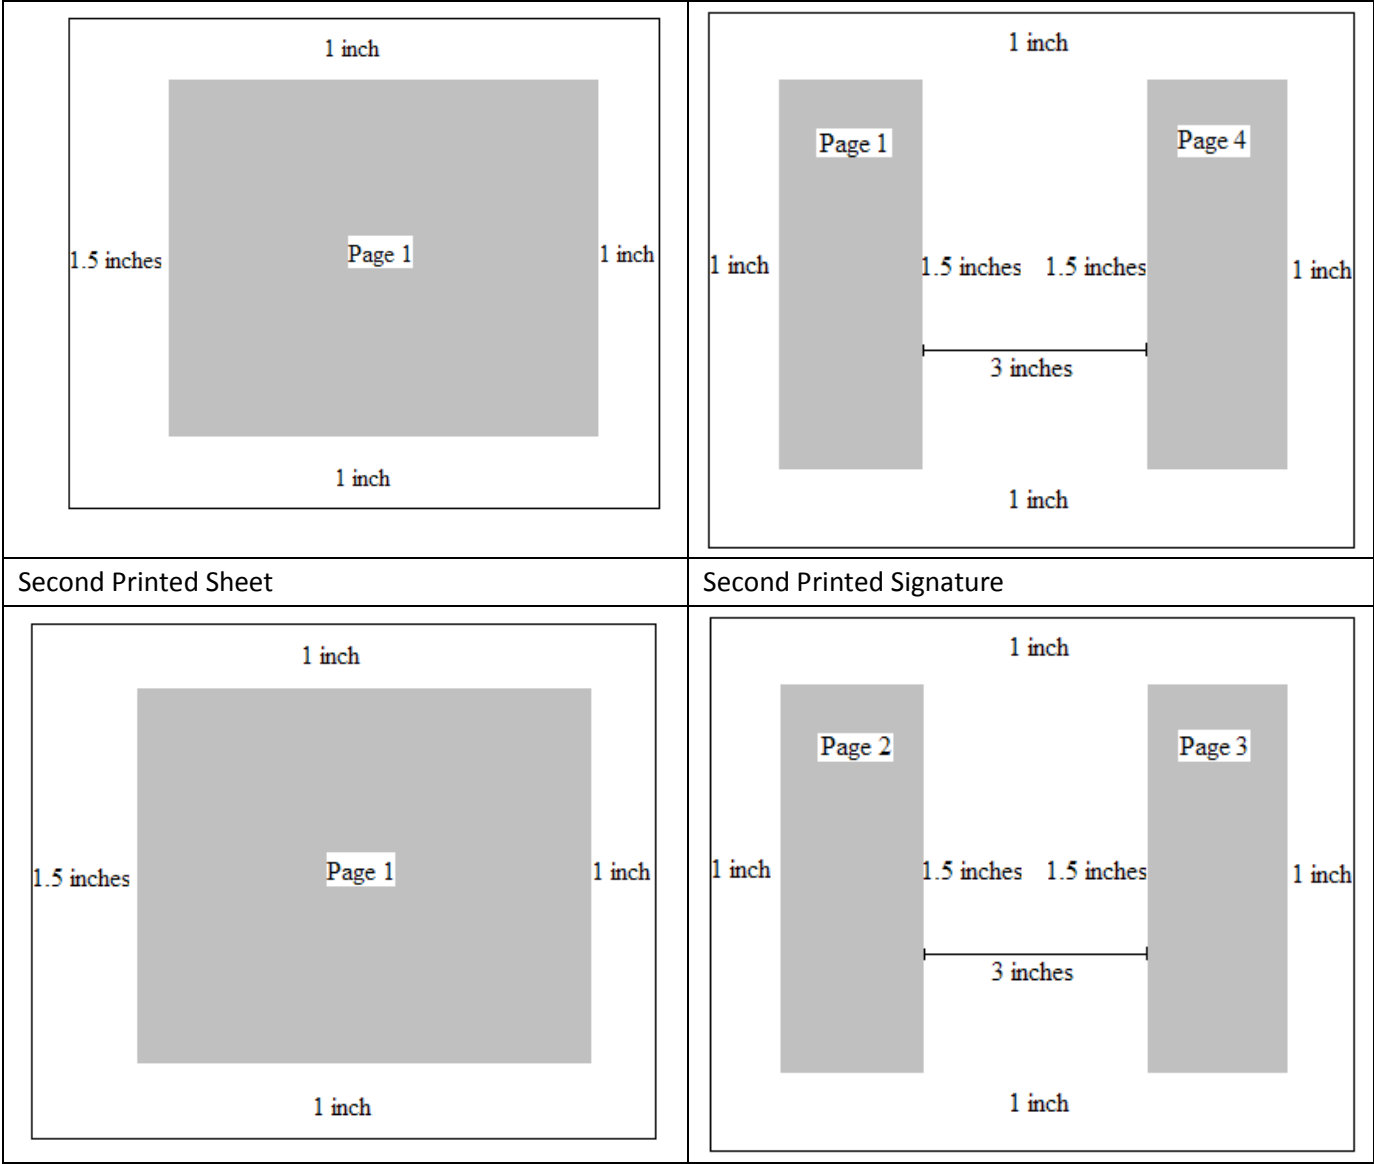

11 If this element is omitted, then pages shall not be printed as reverse book fold signatures. If the
12 bookFoldPrinting element (§2.15.1.11) is also specified, then that element shall be ignored, and this element
13 shall be used instead.

14 *[Example:* Consider a four page WordprocessingML document with a 2,160 twentieths of a point (one and a half
15 inch) left margin, and 1,440 twentieths of a point (one inch) bottom, right, and top margins using the pgMar
16 element (§2.6.11) surrounding the text extents of the page (represented by the gray shaded area in diagrams
17 below). These page margins are specified using the following WordprocessingML:

18 <w:pgMar w:top="1440" w:right="1440" w:bottom="1440" w:left="2160" />

19 The necessary WordprocessingML and consequential effect of setting the bookFoldRevPrinting element's val
20 attribute to true versus false and the bookFoldPrintingSheets element's val attribute to 4, is depicted
21 graphically below—diagrams not drawn to scale:

<code><w: bookFoldRevPrinting w:val="false"/></code>	<code><w: bookFoldRevPrinting w:val="true"/></code> <code><w: bookFoldPrintingSheets w:val="4"/></code>
First Printed Sheet	First Printed Signature

1

2 Assuming the page was already oriented in a landscape fashion, setting the bookFoldRevPrinting element’s val

3 attribute to true divided the page in half vertically, with two left margins emanating from the bisector of the

4 page, and right margins instantiated at the left and right side of each page, enabling two signatures to be

5 printed.

6 In addition, this element is used in conjunction with the bookFoldPrintingSheets element to enable the given

7 WordprocessingML document to be printed such that the series of signatures printed may be folded and bound

8 to create a booklet. Specifically, the signatures may be placed back to back, with top the bottom of each sheet

9 aligned, and folded such that a booklet is created. *end example*]

10 [Note: This element could also be leveraged by the hosting application to notify the application to display two

11 pages per sheets within its user interface to allow for a WYSIWYG user experience. *end note*]

4   <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

6 2.15.1.14 bordersDoNotSurroundFooter (Page Border Excludes Footer)

7 This element specifies that a given WordprocessingML document’s page border specified using the pgBorders
8 element (§2.6.10) should not surround contents of the footer.

9 If this element is omitted, then the page border shall not exclude the footer on the page. As well, this element
10 shall be ignored if the pgBorders element has an offsetFrom attribute which is not equal to text.

11 [Note: If the pgBorders element has a offsetFrom attribute equal to page, the bordersDontSurroundFooter
12 element shall be ignored as specifying the pgBorders element with a offsetFrom attribute equal to page is to
13 specify that the positioning of borders within the document shall be calculated relative to the edge of the page
14 and therefore irrespective of document content in the footer. *end note*]

15 [Example: Consider the following page in a WordprocessingML document:

16

If this WordprocessingML document is modified to leverage the behavior enabled by this element, this setting would be specified using the following WordprocessingML fragment in the document settings:

```
<w:bordersDontSurroundFooter w:val="true"/>
```

The bordersDontSurroundFooter element's val attribute is equal to true specifying that the page border shall not surround the text extents of the footer, as follows:

end example]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">  
  <attribute name="val" type="ST_OnOff"/>  
</complexType>
```

2.15.1.15 bordersDoNotSurroundHeader (Page Border Excludes Header)

This element specifies that a given WordprocessingML document's page border specified using the pgBorders element (§2.6.10) should not surround contents of the header.

If this element is omitted, then the page border shall not exclude the header on the page. As well, this element shall be ignored if the pgBorders element has a offsetFrom attribute which is not equal to text.

[Note: If the pgBorders element has a offsetFrom attribute equal to page, the bordersDontSurroundHeader element shall be ignored as specifying the pgBorders element with a offsetFrom attribute equal to page is to specify that the positioning of borders within the document shall be calculated relative to the edge of the page and therefore irrespective of document content in the header. end note]

[Example: Consider the following page in a WordprocessingML document:

If this WordprocessingML document is modified to leverage the behavior enabled by this element, this setting would be specified using the following WordprocessingML fragment in the document settings:

```
<w:bordersDontSurroundHeader w:val="true"/>
```

The bordersDontSurroundHeader element's val attribute is equal to true specifying that the page border shall not surround the text extents of the header, as follows:

end example]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p>

Attributes	Description
	<p><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.16 caption (Single Caption Type Definition)

This element specifies the contents and positioning for captions which may be used to automatically label objects in a WordprocessingML document. A *caption* is a string that labels an object included in a WordprocessingML document, and typically consists of a string plus a field which numbers this item within a collection of similar objects.

[Example: Consider the diagram below illustrating a WordprocessingML document containing a table that has been labeled with a caption:

In this diagram, the table contained in the WordprocessingML document has been labeled by inserting a caption below the table consisting of the string Table followed by a field whose result is a decimal number. The settings which automatically produced this form of caption are specified using the following WordprocessingML fragment:

```
<w:captions>
  <w:caption w:name="Table" w:pos="below" w:numFmt="decimal" />
</w:captions>
```

1 The caption element specifies the parameters for the resulting caption to be used to automatically label content
2 within the WordprocessingML document. Specifically, the name and numFmt attributes specify that captions of
3 this type inserted in the given WordprocessingML document shall consist of the string Table followed by an
4 incrementing decimal number field. In addition, the pos attribute specifies that these captions shall be placed
5 below the object they are used to label.

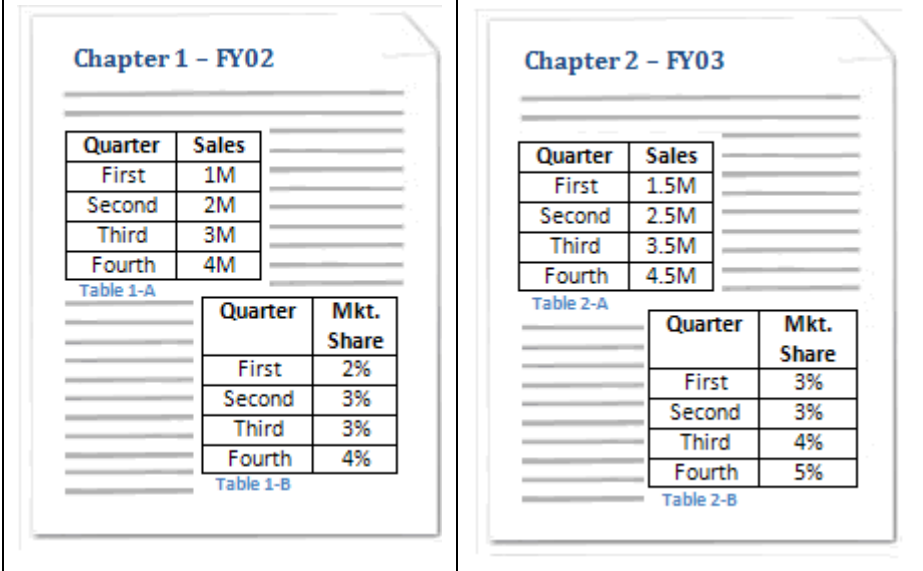

6 WordprocessingML is designed such that the caption element may be used in conjunction with applications to
7 provide a dynamic captioning experience. In other words, an application may use the WordprocessingML in the
8 example above to automatically insert a caption consisting of the string Table followed by an incrementing
9 decimal number field below tables when tables are inserted into a WordprocessingML document as defined by
10 the autoCaption element (§2.15.1.7). *end example*

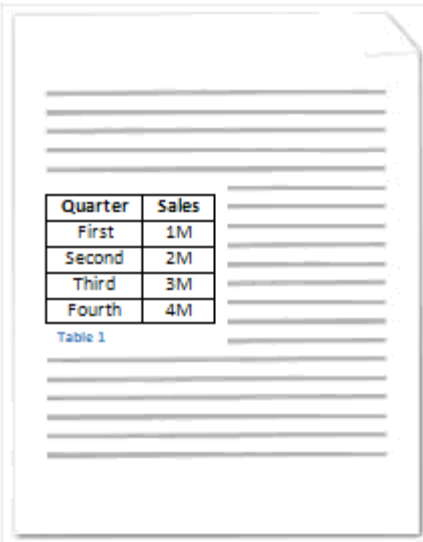

11

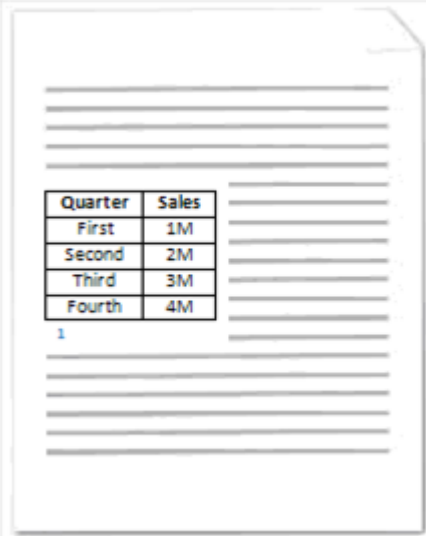

Parent Elements
captions (§2.15.1.17)

Attributes	Description
chapNum (Include Chapter Number in Field for Caption)	<p>Specifies whether or not to display numbering associated with the most recent chapter heading in the WordprocessingML document within the caption field. A <i>chapter heading</i> is a paragraph of text within a WordprocessingML document that is formatted with a style that has been specified by the heading attribute to demarcate chapters in documents.</p> <p>Only a style with its styleID attribute equal to Heading1, Heading2, Heading3, Heading4, Heading5, Heading6, Heading7, Heading8, or Heading9 may be specified as the style used to demarcate chapters in a document. The choice of which of these heading levels shall be used to determine the current chapter number is defined by the value of the corresponding heading attribute. [<i>Example</i>: Heading1 is used as the chapter heading when chapNum is true and heading is 1. <i>end example</i>]</p> <p>If this attribute is omitted, then chapter numbers shall not be included in the resulting caption.</p> <p>[<i>Example</i>: Consider the diagram below:</p>

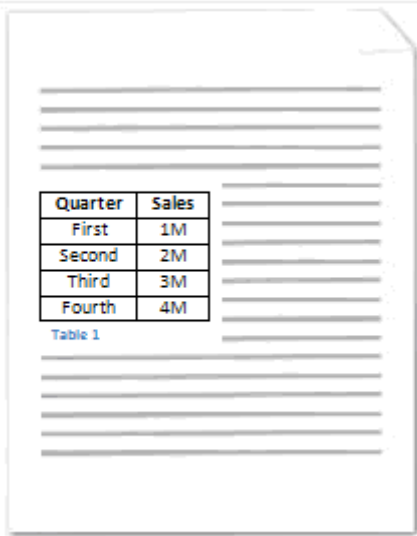

Attributes	Description				
	<p>This diagram depicts a WordprocessingML document containing two chapters, each containing two tables labeled with captions. The Heading 2 style has been associated with chapter headings and applied to the strings: Chapter 1 - FY02 and Chapter 2 - FY03 in this document.</p> <p>Specifically, the style used to demarcate chapters, is the style with a styleID attribute equal to Heading2 as specified by the heading attribute value of 2 in the WordprocessingML for this caption, defined as follows:</p> <pre><w:caption w:name="Table" w:pos="below" w:chapNum="true" w:heading="2" w:numFmt="upperCase" w:sep="8212" /></pre> <p>The chapNum attribute has a value of true, specifying that the captions used to label the tables within this document will contain a symbol corresponding to the one-based index of the chapter in which it is contained.</p> <p>This can be seen in that the captions in Chapter 1 contain a 1, while the captions in Chapter 2 contain a 2, each corresponding with their respective chapter number. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>				
heading (Style for Chapter Headings)	<p>Specifies the given style that is used to demarcate chapter headings in a document.</p> <p>This value is used to link the chapter headings with paragraphs with a styleID attribute as follows:</p> <table border="1"> <thead> <tr> <th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>1</td><td>Style with styleID of Heading1</td></tr> </tbody> </table>	Value	Description	1	Style with styleID of Heading1
Value	Description				
1	Style with styleID of Heading1				

Attributes	Description	
	2	Style with styleID of Heading2
	3	Style with styleID of Heading3
	4	Style with styleID of Heading4
	5	Style with styleID of Heading5
	6	Style with styleID of Heading6
	7	Style with styleID of Heading7
	8	Style with styleID of Heading8
	9	Style with styleID of Heading9
	Any other value	Application-defined. May be ignored.
<p>If this attribute is omitted, then its value shall be assumed to be 1.</p> <p>[Example: Consider the diagram below:</p>		
 <p>The diagram illustrates a WordprocessingML document structure. It contains two main sections, 'Chapter 1 - FY02' and 'Chapter 2 - FY03', both using the 'Heading 2' style. Each chapter contains two tables. Chapter 1 includes 'Table 1-A' (Sales) and 'Table 1-B' (Mkt. Share). Chapter 2 includes 'Table 2-A' (Sales) and 'Table 2-B' (Mkt. Share). The tables are styled with 'Heading 2'.</p>		
<p>This diagram depicts a WordprocessingML document containing two chapters, each containing two tables labeled with captions. The Heading 2 style has been associated with chapter headings and applied to the strings: Chapter 1 - FY02 and Chapter 2 - FY03 in this document.</p> <p>Specifically, the style used to demarcate chapter headings is the style with its styleID attribute equal to Heading" as specified by the heading attribute value of 2 in the WordprocessingML below.</p> <pre><w:caption w:name="Table" w:pos="below" w:chapNum="On" w:heading="2" w:numFmt="upperCase" w:sep="8212" /></pre>		

Attributes	Description										
	<p>In other words, the WordprocessingML above may be used to label tables inserted in a given WordprocessingML document generated by an application with a caption consisting of: the string <code>Table</code> followed by a decimal number corresponding with the chapter number in which the table is present, a dash as defined in the <code>sep</code> attribute, and a capital English letter defined by the <code>numFmt</code> attribute corresponding with the given table's ordering within the current chapter. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_DecimalNumber</code> simple type (§2.18.16).</p>										
name (Caption Type Name)	<p>Specifies the literal string component of this caption.</p> <p>This value is used as follows:</p> <ul style="list-style-type: none">• It is added to the field containing the chapter number and item number of this object when a caption is automatically added to the document.• It is used to uniquely label this caption type, allowing it to be linked with classes of objects via the <code>autoCaption</code> element (§2.15.1.7)• It may be used to label this caption type in a user interface. <p>[<i>Example:</i> Consider the diagram below illustrating a WordprocessingML document containing a table that has been labeled with a caption:</p> <div data-bbox="417 1045 837 1583"><table border="1"><thead><tr><th>Quarter</th><th>Sales</th></tr></thead><tbody><tr><td>First</td><td>1M</td></tr><tr><td>Second</td><td>2M</td></tr><tr><td>Third</td><td>3M</td></tr><tr><td>Fourth</td><td>4M</td></tr></tbody></table><p>Table 1</p></div> <p>In this diagram, the table contained in the WordprocessingML document has been labeled by inserting a caption below the table consisting of the string <code>Table</code> followed by a decimal number. This caption format is specified with the following WordprocessingML:</p> <pre><w:caption w:name="Table" w:pos="below" w:numFmt="decimal" /></pre> <p>Specifically, the name attribute specifies that the first part of the string that comprises</p>	Quarter	Sales	First	1M	Second	2M	Third	3M	Fourth	4M

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Caption">
3   <attribute name="name" type="ST_String" use="required"/>
4   <attribute name="pos" type="ST_CaptionPos" use="optional"/>
5   <attribute name="chapNum" type="ST_OnOff" use="optional"/>
6   <attribute name="heading" type="ST_DecimalNumber" use="optional"/>
7   <attribute name="noLabel" type="ST_OnOff" use="optional"/>
8   <attribute name="numFmt" type="ST_NumberFormat" use="optional"/>
9   <attribute name="sep" type="ST_ChapterSep" use="optional"/>
10 </complexType>
```

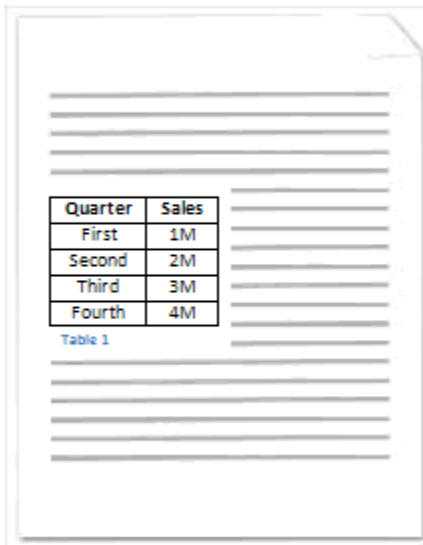

2.15.1.17 captions (Caption Settings)

This element specifies the presence of information about captions in a given WordprocessingML document. This information is divided into two components:

- The child element `caption` defines the format for a single type of caption to be automatically added to the document.
- The child element `autoCaptions` defines the types of objects to which a caption format shall automatically be applied.

This information should be used to determine the captions which are automatically added to objects when they are inserted into a WordprocessingML document. [*Note: This setting is typically ignored unless it is specified in an application's default template. end note*]

[*Example: Consider the diagram below illustrating a WordprocessingML document containing a table that has been labeled with a caption: end example*]

The diagram shows a document page with a table and a caption. The table has two columns: 'Quarter' and 'Sales'. The rows are: 'First' with '1M', 'Second' with '2M', 'Third' with '3M', and 'Fourth' with '4M'. Below the table is the caption 'Table 1'.

Quarter	Sales
First	1M
Second	2M
Third	3M
Fourth	4M

Table 1

In this diagram, the table contained in the WordprocessingML document has been labeled by inserting a caption below the table consisting of the string `Table` followed by a decimal number. This automatically inserted caption format is specified using the following WordprocessingML:

```
<w:captions>
  <w:caption w:name="Table" w:pos="below" w:numFmt="decimal" />
</w:captions>
```

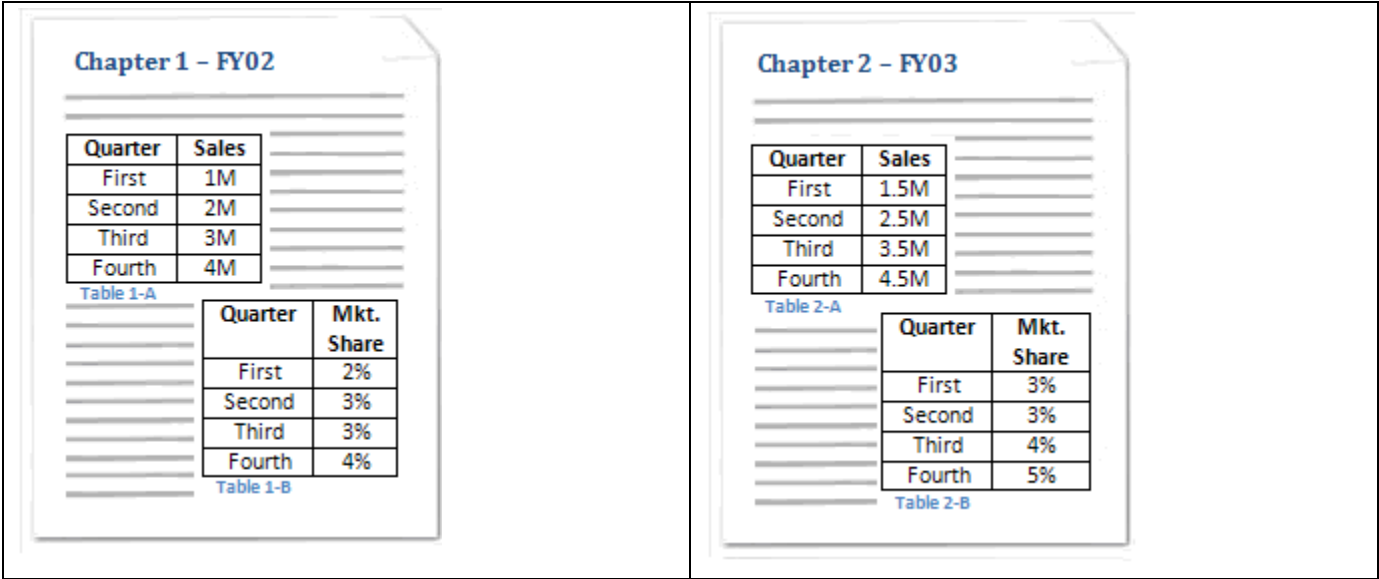

Here, the `captions` element specifies the presence of one or more caption formats in a given WordprocessingML document with its child element `caption`. Specifically, the child element `caption` specifies a single type of caption to be used within the WordprocessingML document. [*end example*]

Captioning leverages fields (§2.16.5) to label objects with reference to either:

- Other captioned objects within a given document
- Other captioned objects within the same chapter in a given document (when chapter numbers are added by specifying the chapNum attribute on the caption type.

A *chapter* is a section of text within a WordprocessingML document that is preceded by content with a style that has been specified by to demarcate chapters in documents. Only one style may be specified as the style used for a single caption type to demarcate chapters in a document. A chapter ends immediately above the next instance of content with the style used to demarcate chapters.

[Example: Consider the diagram below:

This diagram depicts a WordprocessingML document containing two chapters, each containing two tables labeled with captions. The style associated with chapter demarcation has been applied to the strings: Chapter 1 - FY02 and Chapter 2 - FY03 in this document. Specifically, the style used to demarcate chapters is the style with its styleID attribute equal to Heading2 as specified by the heading attribute value of 2 in the WordprocessingML for the caption format:

```
<w:caption w:name="Table" w:pos="below" w:chapNum="On" w:heading="2"
w:numFmt="upperCase" w:sep="8212" />
```

In other words, the WordprocessingML above may be used to label objects (in this case, tables) inserted in a given WordprocessingML document generated by an application with a caption consisting of: the string Table followed by a decimal number corresponding with the chapter number in which the table is present, a hyphen, and a capital English letter corresponding with the given table's index within the given chapter. *end example*]

[Note: WordprocessingML is designed such that the caption element may be used in conjunction with applications to provide a dynamic captioning experience. In other words, an application may use the WordprocessingML in the example above to automatically insert a caption consisting of the string Table

followed by an incrementing decimal number field below tables when tables are inserted into a WordprocessingML document as defined by the autoCaption element (§2.15.1.7). *End note*

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
autoCaptions (Automatic Captioning Settings)	§2.15.1.8
caption (Single Caption Type Definition)	§2.15.1.16

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Captions">
  <sequence>
    <element name="caption" type="CT_Caption" minOccurs="1" maxOccurs="unbounded"/>
    <element name="autoCaptions" type="CT_AutoCaptions" minOccurs="0" maxOccurs="1"/>
  </sequence>
</complexType>
```

2.15.1.18 characterSpacingControl (Character-Level Whitespace Compression)

This element specifies how full-width characters in the current WordprocessingML document should be compressed to remove additional whitespace when the contents of this document are displayed, specifically by specifying the set(s) of characters which may be compressed to remove additional whitespace. [*Note*: The behavior of this element is functionally identical to the CSS text-justify-trim property. *end note*]

If this element is omitted, then the default value shall be dontCompress.

[*Example*: Consider the WordprocessingML below:

```
<w:characterSpacingControl w:val="dontCompress" />
```

The characterSpacingControl element has a val attribute value of dontCompress, which specifies that no character compression shall be applied to any character when the document is displayed. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Value)	Specifies the set(s) of characters which should be compressed when the contents of this document are displayed. [<i>Example</i> : Consider a WordprocessingML document for which only full-width punctuation characters shall have their whitespace compression applied. This requirement would be specified using the following WordprocessingML:

Attributes	Description
	<p data-bbox="456 285 1354 317"><w:characterSpacingControl w:val="compressPunctuation"/></p> <p data-bbox="415 354 1443 457">The val attribute value of compressPunctuation specifies that character compression shall be applied to full-width punctuation characters only when the document is displayed. <i>end example</i>]</p> <p data-bbox="415 497 1425 562">The possible values for this attribute are defined by the ST_CharacterSpacing simple type (§2.18.10).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CharacterSpacing">
  <attribute name="val" type="ST_CharacterSpacing" use="required"/>
</complexType>
```

2.15.1.19 clickAndTypeStyle (Paragraph Style Applied to Automatically Generated Paragraphs)

This element specifies the paragraph style, specified using the style element, which shall be applied to paragraphs which are automatically created when text is inserted into a WordprocessingML document in an area of the document that has no other style associated with it. This style is referenced via the val attribute, which stores the style ID of the style (stored in the styleId attribute on the style definition).

[*Guidance:* Consider a WordprocessingML document opened in an application that allows users to place their cursor anywhere within the document editing canvas and enter text. The clickAndTypeStyle element should be used to specify the paragraph style to be associated with the paragraph of text entered after a user places their cursor somewhere in the blank document that results in the generation of new paragraphs. *end guidance*]

If this element is omitted, then the default paragraph style (the paragraph style whose default attribute is set to true), shall be used for automatically generated paragraphs. If the style whose styleId is specified using the val attribute is not a paragraph style or does not exist in the document, then the default paragraph style shall be used instead.

[*Example:* Consider a WordprocessingML document that has specified that paragraphs which are automatically created when text is inserted in a given area of the document which has no other style associated with it shall be associated with the paragraph style that has a styleId equal to BalloonText.

This is accomplished by specifying a clickAndTypeStyle element with a val attribute equal to the value of the ID of the desired style. This constraint would be specified using the following WordprocessingML:

```
<w:clickAndTypeStyle w:val="BalloonText" />
```

The corresponding style in the styles part would be defined as follows:

```
1 <w:style w:type="paragraph" w:styleId="BalloonText">
2   ...
3 </w:style>
```

4 The clickAndTypeStyle element specifies the use of the paragraph style with the style ID of BalloonText. *end*
5 *example*]

Parent Elements
settings (§2.15.1.78)

6

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example</i>: Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

7 The following XML Schema fragment defines the contents of this element:

```
8 <complexType name="CT_String">
9   <attribute name="val" type="ST_String" use="required"/>
10 </complexType>
```

11 **2.15.1.20** **clrSchemeMapping (Theme Color Mappings)**

12 This element specifies the theme color, stored in the document's Theme part to which the value of this theme
13 color shall be mapped. This mapping enables multiple theme colors to be chained together.

[*Example*: Consider a WordprocessingML document that shall have the theme color value background1 mapped to the theme color light1 as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:

```
<w:clrSchemeMapping w:bg1="light1" />
```

The clrSchemeMapping element's attribute background1 has a value of light1, specifying that theme color value background1 shall be mapped to the theme color light1. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
accent1 (Accent 1 Theme Color Mapping)	<p>Specifies the theme color in the document's theme part which shall be used in place of this color when it is referenced by document content.</p> <p>If this attribute is omitted, then the accent1 theme color shall be used.</p> <p>[<i>Example</i>: Consider a WordprocessingML document that shall have references to the theme color accent1 mapped to the theme color lt1 as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre><w:clrSchemeMapping w:accent1="light1" /></pre> <p>The accent1 attribute has a value of light1, specifying that uses of the theme color value accent1 shall be mapped to the theme color lt1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§2.18.12).</p>
accent2 (Accent 2 Theme Color Mapping)	<p>Specifies the theme color in the document's theme part which shall be used in place of this color when it is referenced by document content.</p> <p>If this attribute is omitted, then the accent2 theme color shall be used.</p> <p>[<i>Example</i>: Consider a WordprocessingML document that shall have the references to the theme color accent2 mapped to the theme color hlink as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre><w:clrSchemeMapping w:accent2="hyperlink" /></pre> <p>The accent2 attribute has a value of hyperlink, specifying that uses of the theme color value accent2 shall be mapped to the theme color hlink. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§2.18.12).
accent3 (Accent3 Theme Color Mapping)	<p>Specifies the theme color in the document's theme part which shall be used in place of this color when it is referenced by document content.</p> <p>If this attribute is omitted, then the accent3 theme color shall be used.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that shall have references to the theme color accent3 mapped to the theme color dk1 as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre><w:clrSchemeMapping w:accent3="dark1" /></pre> <p>The accent3 attribute has a value of dark1, specifying that uses of the theme color value accent3 shall be mapped to the theme color dk1. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§2.18.12).</p>
accent4 (Accent4 Theme Color Mapping)	<p>Specifies the theme color in the document's theme part which shall be used in place of this color when it is referenced by document content.</p> <p>If this attribute is omitted, then the accent4 theme color shall be used.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that shall have references to the theme color accent4 mapped to the theme color dk2 as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre><w:clrSchemeMapping w:accent4="dark2" /></pre> <p>The accent4 attribute has a value of dark2, specifying that uses of the theme color value accent3 shall be mapped to the theme color dk2. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§2.18.12).</p>
accent5 (Accent5 Theme Color Mapping)	<p>Specifies the theme color in the document's theme part which shall be used in place of this color when it is referenced by document content.</p> <p>If this attribute is omitted, then the accent5 theme color shall be used.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that shall have references to the theme color accent5 mapped to the theme color accent1 as defined in the document's theme part. Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <p><w:... w:val="1512645511" /></p> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <complexType name="CT_DecimalNumber">
4 <attribute name="val" type="ST_DecimalNumber" use="required"/>
5 </complexType>

6 2.15.1.22 decimalSymbol (Radix Point for Field Code Evaluation)

7 This element specifies the character that shall be interpreted as the radix point when evaluating the contents of

8 all fields in the current document.

9 [*Rationale:* When evaluating field instructions based on the contents of the current document, it is necessary to

10 know the character which shall be treated as the radix point in order to prevent changes to the calculation of

11 the same field instructions based on the current user's locale. This element stores the radix point which shall be

12 used to evaluate fields in the contents of this document, irrespective of the locale of the application loading the

13 file. *end rationale*]

14 If this element is omitted, the application shall use the default radix point of its current locale setting to evaluate

15 field instructions. If this element's attribute value is more than a single character, then the document is non-

16 conformant.

17 [*Example:* Consider a WordprocessingML document which should use the comma character as the radix point

18 for all field instructions. This requirement is specified using the following WordprocessingML in the document

19 settings:

20 <w:decimalSymbol w:val="," />

- 1
- The decimalSymbol element's val attribute has a value of , specifying that the comma character shall be
- 2
- interpreted as the radix point.
- 3
- For instance, the string 12.345,00 would be interpreted as a numeric value of twelve thousand three hundred
- 4
- and forty five. If the decimalSymbol was a period, the same string would be twelve and three hundred and forty
- 5
- five thousandths. *end example*]

Parent Elements
settings (§2.15.1.78)

6

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

- 7
- The following XML Schema fragment defines the contents of this element:

8	<complexType name="CT_String">
9	<attribute name="val" type="ST_String" use="required"/>
10	</complexType>

11

2.15.1.23 defaultTableStyle (Default Table Style for Newly Inserted Tables)

- 12
- This element specifies the table style which shall automatically be applied to the table properties of tables
- 13
- added to this document by an application. Note that it does not change the table style applied to tables which

do not reference a style, instead, it automatically applies the style to that table via the `tblStyle` element (§2.4.59). This link is made by referencing the `styleId` attribute value of the table style which shall be used to format newly inserted tables.

If this element is omitted, then no table style shall automatically be applied to inserted tables (therefore inheriting the default table style). If the referenced style is not present or not a table style, then no table style shall automatically be applied to inserted tables.

[*Example*: Consider a WordprocessingML document which should use the `LightShading-Accent3` style. This requirement is specified using the following WordprocessingML in the document settings:

```
<w:defaultTableStyle w:val="LightShading-Accent3" />
```

The corresponding table style must therefore exist in the styles part:

```
<w:style w:type="table" w:styleId="LightShading-Accent3">
  ...
</w:style>
```

The `defaultTableStyle` element's `val` attribute has a value of `LightShading-Accent3` specifying that that style will be applied automatically to newly inserted tables. *end example*]

Parent Elements

settings (§2.15.1.78)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example</i>: Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the <code>val</code> attribute is the ID of the associated paragraph style's <code>styleId</code>.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre>

Attributes	Description
	<p>In this case, the decimal number in the <code>val</code> attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
  <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.15.1.24 defaultTabStop (Distance Between Automatic Tab Stops)

This element specifies the value which shall be used as the multiplier to generate automatic tab stops in this document. *Automatic tab stops* refer to the tab stop locations which occur after all custom tab stops in the current paragraph have been surpassed.

If this element is omitted, then automatic tab stops should be generated at 720 twentieths of a point (0.5") intervals across the displayed page.

[*Example:* Consider a WordprocessingML document which should have automatic tab stops every 360 twentieths of a point (0.25 inches). This requirement is specified using the following WordprocessingML in the document settings:

```
<w:defaultTabStop w:val="360" />
```

The `defaultTabStop` element's `val` attribute has a value of 360 specifying that automatic tab stops shall occur every 1/4th of an inch across the page.

If a custom tab stop was located at 2.28", then the next three automatic tab stops would be at 2.5", 2.75" and 3.0" (the next three multiples of the default tab stop value). *end example*

settings (§2.15.1.78)

Attributes	Description
<code>val</code> (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a <code>val</code> attribute containing a positive measurement in twentieths of a point:</p> <pre><w:... w:val="720" /></pre>

Attributes	Description
	<p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§2.18.105).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TwipsMeasure">
3   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
4 </complexType>
```

5 2.15.1.25 displayBackgroundShape (Display Background Objects When Displaying
6 Document)

7 This element specifies whether the images and colors defined in the document's background using the
8 background element (§2.2.1) shall be displayed when the document is displayed in print layout view as
9 specified in the view element (§2.15.1.93).

10 If this element is omitted, then background shapes shall not be displayed when the document is displayed in
11 print layout view.

12 [Example: Consider a WordprocessingML document that has a turquoise background specified for all pages and
13 is being displayed in page layout view, as follows:

14
15 If the document's background should not be displayed, that requirement would be specified using the following
16 WordprocessingML in the document settings:

```
17 <w:displayBackgroundShape w:val="true" />
```

1 The resulting document would display the background in page layout view:

2
3 *end example]*

settings (§2.15.1.78)

4

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

5 The following XML Schema fragment defines the contents of this element:

```
6 <complexType name="CT_OnOff">
7   <attribute name="val" type="ST_OnOff"/>
8 </complexType>
```

2.15.1.26 `displayHorizontalDrawingGridEvery` (Distance between Horizontal Gridlines)

This element specifies the number of horizontal grid units defined using the `drawingGridHorizontalSpacing` element (§2.15.1.44) which shall be allowed between subsequent visible horizontal drawing grid lines in this document, if gridlines are being shown. [Note: The display of gridlines is an application-level setting not specified in this Office Open XML Standard. *end note*] The *drawing grid* is a grid which may be used by applications to help position floating objects in the document.

If this element is omitted, then gridlines shall be displayed for each horizontal grid unit.

[Example: Consider the image below illustrating a WordprocessingML document in which all horizontal grid units are visible (the default setting):

If the gridlines in this document shall only be displayed for every 4th horizontal drawing gridline, that requirement would be specified using the following WordprocessingML in the document settings:

```
<w:displayHorizontalDrawingGridEvery w:val="4" />
```

The resulting grid would look like the following:

1 The displayHorizontalDrawingGridEvery element has its val attribute equal to 4, therefore every fourth
2 gridline is displayed in the document when the drawing grid is turned on. *end example*]

settings (§2.15.1.78)

3

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example</i>: Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <p><w:... w:val="1512645511" /></p> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

4 The following XML Schema fragment defines the contents of this element:

5 <complexType name="CT_DecimalNumber"> 6 <attribute name="val" type="ST_DecimalNumber" use="required"/> 7 </complexType>

8 **2.15.1.27 displayVerticalDrawingGridEvery (Distance between Vertical Gridlines)**

9 This element specifies the number of vertical grid units defined using the drawingGridVerticalSpacing element
10 (§2.15.1.46) which shall be allowed between subsequent vertical gridlines in this document, if gridlines are being
11 shown. [*Note*: The display of gridlines is an application-level setting not specified in this Office Open XML
12 Standard. *end note*] The *drawing grid* is a grid which may be used by applications to help position floating
13 objects in the document.

14 If this element is omitted, then vertical gridlines shall not be displayed.

15 [*Example*: Consider the image below illustrating a WordprocessingML document in which all vertical grid units
16 are visible (the default setting):

If the vertical drawing gridlines in this document shall only be displayed for every 4th gridline, that requirement would be specified using the following WordprocessingML in the document settings:

```
<w:displayVerticalDrawingGridEvery w:val="4" />
```

The resulting grid would look like the following:

The displayVerticalDrawingGridEvery element has its val attribute equal to 4, therefore every fourth vertical gridline is displayed in the document when the drawing grid is turned on. *end example*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Decimal Number Value)	Specifies that the contents of this attribute will contain a decimal number. The contents of this decimal number are interpreted based on the context of the parent XML element.

Attributes	Description
	<p>[<i>Example</i>: Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <p><w:... w:val="1512645511" /></p> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DecimalNumber">
  <attribute name="val" type="ST_DecimalNumber" use="required"/>
</complexType>
```

2.15.1.28 documentProtection (Document Editing Restrictions)

This element specifies the set of document protection restrictions which have been applied to the contents of a WordprocessingML document. These restrictions shall be enforced by applications editing this document when the enforcement attribute is turned on, and should be ignored (but persisted) otherwise. *Document protection* is a set of restrictions used to prevent unintentional changes to all or part of a WordprocessingML document - since this protection does not encrypt the document, malicious applications may circumvent its use. This protection is not intended as a security feature and may be ignored.

If this element is omitted, then no protection shall be applied to this document.

When a password is supplied via an application which shall be hashed and stored in this element, that process shall be done in two stages:

First, the password shall be hashed using the following algorithm:

- Truncate the password to 15 characters.
- Construct a new NULL-terminated string consisting of single-byte characters:
 - Get the single-byte values by iterating through the Unicode characters of the truncated password. For each character, if the low byte is not equal to 0, take it. Otherwise, take the high byte.
- From now on, the single-byte character string is used.
- If the password is empty, return 0.
- Compute the high-order word of the new key:
 - Initialize from the initial code array (see below), depending on the password’s length. For each character in the password:

- For every bit in the character, starting with the least significant and progressing to (but excluding) the most significant, if the bit is set, XOR the key's high-order word with the corresponding word from the encryption matrix
- Compute the low-order word of the new key:
 - Initialize with 0
 - For each character in the password, going backwards, low-order word = (((low-order word SHR 14) AND 0x0001) OR (low-order word SHL 1) AND 0x7FFF) XOR character
 - Lastly, low-order word = (((low-order word SHR 14) AND 0x0001) OR (low-order word SHL 1) AND 0x7FFF) XOR password length XOR 0xCE4B.

Initial code array

The initial code array contains the initial values for the key's high-order word. The initial value depends on the length of the password, as follows:

Password length	Initial value for the key's high-order word
1	0xE1F0
2	0x1D0F
3	0xCC9C
4	0x84C0
5	0x110C
6	0x0E10
7	0xF1CE
8	0x313E
9	0x1872
10	0xE139
11	0xD40F
12	0x84F9
13	0x280C
14	0xA96A
15	0x4EC3

Encryption matrix

The encryption matrix contains codes used during the calculation of the key's high-order word. As described in the algorithm above, for every bit of the password's characters, if the bit is set, a corresponding value is taken from this encryption matrix and is used to XOR the key's high-order word with it. Each row in the encryption matrix corresponds to a single character from the password, and each of the seven columns corresponds to a particular bit (0-6) in this character.

- 1 The values are taken in such a way so that the last character of the password uses the last row in the encryption
 2 matrix. The next-to-last character uses the next-to-last row in the matrix, and so on. This means that the
 3 beginning of the matrix may be unused, depending on the length of the password.

	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6
Last-14	0xAEFC	0x4DD9	0x9BB2	0x2745	0x4E8A	0x9D14	0x2A09

4

- 5 *[Example: Consider a password which has been supplied - the string "Example". It is already under 15 characters,*
 6 *so truncation does not affect it. It is then converted to a string of single-byte characters.*

- 7 • The password is 7 characters long, so, from the initial code array, the initial value for the key's high-
 8 order word is 0xF1CE.
- 9 • The key's high-order word is then computed further depending on the password's characters:
- 10 • The first character is 'E' (0x45). This is the first character of a 7-character password, so its
 11 corresponding row in the encryption matrix is "Last-6".
- 12 • Bit 0 is set, therefore the key's high-order word is combined (via XOR) with the corresponding
 13 value for Bit 0 on row "Last-6", which is 0xB861. The new result is 0xF1CE XOR 0xB861 = 0x49AF.
- 14 • Bit 2 is set, so the key's high-order word is XOR-ed with the corresponding value for Bit 2 on row
 15 "Last-6", which is 0xC1C6. The new result is 0x49AF XOR 0xC1C6 = 0x8869.
- 16 • This process is repeated for each bit.
- 17 • The next character is 'x' (0x78). Its corresponding row in the encryption matrix is "Last-5".

- Bit 3 is set. The value for Bit 3 on row “Last-5” in the encryption matrix is 0x0D42. The current value for the key’s high-order byte is 0x5585, so the new one should be $0x5585 \text{ XOR } 0x0D42 = 0x58C7$.

- This process is repeated for each bit.

- This process is repeated for all characters.

- After the last character has been processed, the above step produced 0x64CE for the key’s high-order word. Now the low-order word needs to be calculated:

- The initial value is 0.

- It is then calculated using the password:

- The last character of the password is ‘e’ (0x65), so, by the formula, low-order word = (((low-order word SHR 14) AND 0x0001) OR ((low-order word SHL 1) AND 0x7FFF)) XOR ‘e’ = (((0 SHR 14) AND 0x0001) OR ((0 SHL 1) AND 0x7FFF)) XOR 0x65 = 0x0065.

- The next to last character of the password is ‘l’ (0x6C). Again, by the formula, (((0x0065 SHR 14) AND 0x0001) OR ((0x0065 SHL 1) AND 0x7FFF)) XOR 0x6C = (0x0000 OR 0x00CA) XOR 0x6C = 0x00CA XOR 0x6C = 0x00A6.

- This process is repeated for each character.

- After the password’s first character has been processed, we have 0x1199 for the key’s low-order word. Lastly, the password’s length is combined into it: low-order word = (((0x1199 SHR 14) AND 0x0001) OR ((0x1199 SHL 1) AND 0x7FFF)) XOR 0x0007 XOR 0xCE4B = 0x2332 XOR 0x0007 XOR 0xCE4B = 0x2335 XOR 0xCE4B = 0xED7E.

- The end result for the key is 0x64CEED7E.

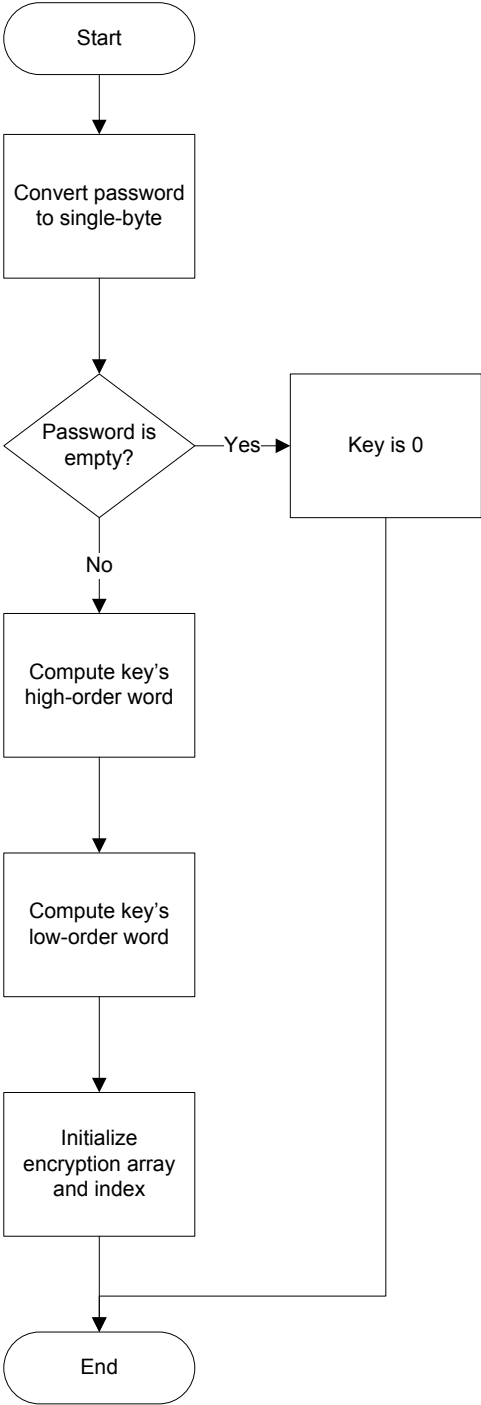

end example]

[*Rationale:* This pre-processing step is necessary for compatibility with legacy word processing applications which hashed their password solely using this mechanism. *end rationale]*

Second, the byte order of the result shall be reversed [*Example:* 0x64CEED7E becomes 7EEDCE64. *end example]*, and that value shall be hashed as defined by the attribute values.

[*Note:* The algorithm above can be stated as follows using diagrams:

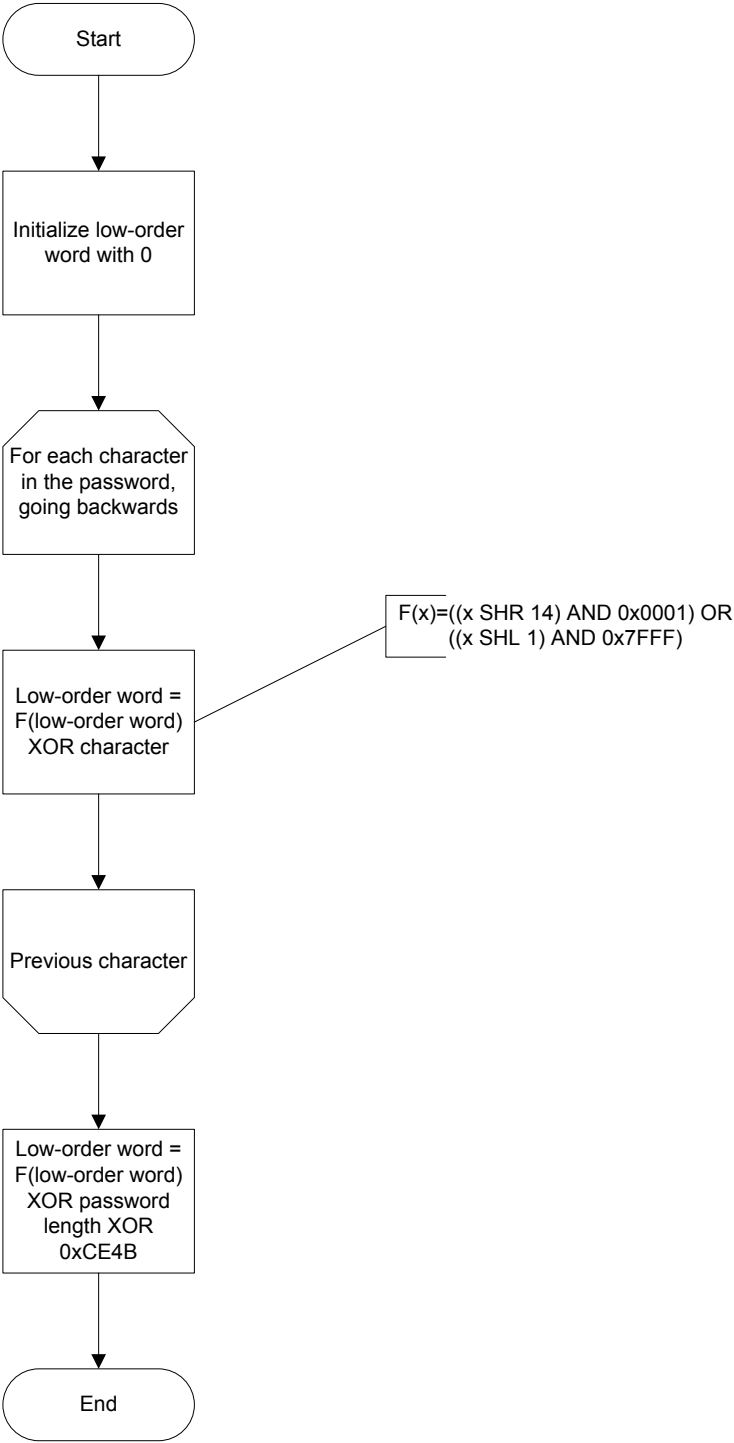

Calculate Key

Compute Key's High-Order Word

Compute Key's Low-Order Word

1 *end note]*

2 [Example: Consider a WordprocessingML document which specifies that applications shall not allow any
3 modifications to this document other than the addition of comments. This requirement would be specified using
4 the following WordprocessingML in the document settings:

```
5 <w:documentProtection w:edit="comments" w:enforcement="true" ...
6   w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny"
7   w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

8 The documentProtection element has an edit attribute value of comments, specifying that the only modification
9 allowed should be comments, the enforcement attribute has a value of true, specifying that the document
10 protection specified is to be enforced on the given document. Finally, in order for the hosting application to stop
11 enforcement of the document protection applied to the document, the hosting application would have to be
12 provided with a password that the hosting application would then hash, compare to the value of the hash
13 attribute (9oN7nWkCAyEZib1RomSJTjmPpCY=), and if the two values matched, halt enforcement of any
14 document protection. *end example]*

settings (§2.15.1.78)

15

Attributes	Description
algIdExt (Cryptographic Algorithm Extensibility)	<p>Specifies that a cryptographic algorithm which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined. [Rationale: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined hashing algorithms in order to remain secure. <i>end rationale]</i></p> <p>If this value is present, the cryptAlgorithmClass, cryptAlgorithmType, and cryptAlgorithmSid attribute values shall be ignored in favor of the algorithm defined by this attribute.</p> <p>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:algIdExt="0000000A" w:algIdExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algIdExt attribute value of 0000000A specifies that the algorithm with hex code A shall be used as defined by the futureCryptography application. <i>end example]</i></p>

Attributes	Description										
	The possible values for this attribute are defined by the ST_LongHexNumber simple type (§2.18.57).										
algIdExtSource (Algorithm Extensibility Source)	<p>Specifies the application which defined the algorithm value specified by the algIdExt attribute.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:algIdExt="0000000A" w:algIdExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The algIdExtSource attribute value of futureCryptography specifies that the algorithm used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>										
cryptAlgorithmClass (Cryptographic Algorithm Class)	<p>Specifies the class of cryptographic algorithm used by this protection. [<i>Note:</i> The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. <i>end note</i>]</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny" w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_AlgClass simple type (§2.18.1).</p>										
cryptAlgorithmSid (Cryptographic Hashing Algorithm)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and user-supplied password in order to compute a hash value for comparison.</p> <p>The possible values for this attribute shall be interpreted as follows:</p> <table border="1" data-bbox="415 1625 1351 1871"> <thead> <tr> <th>Value</th><th>Algorithm</th></tr> </thead> <tbody> <tr> <td>1</td><td>MD2</td></tr> <tr> <td>2</td><td>MD4</td></tr> <tr> <td>3</td><td>MD5</td></tr> <tr> <td>4</td><td>SHA-1</td></tr> </tbody> </table>	Value	Algorithm	1	MD2	2	MD4	3	MD5	4	SHA-1

cryptAlgorithmType (Cryptographic Algorithm Type)	<p data-bbox="415 1323 1443 1423">Specifies the type of cryptographic algorithm used by this protection. [<i>Note:</i> The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. <i>end note</i>]</p> <p data-bbox="415 1465 1399 1533">[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre data-bbox="454 1570 1128 1707"><w:... w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny" w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p data-bbox="415 1745 1471 1812">The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm may have been used for the password. <i>end example</i>]</p> <p data-bbox="415 1850 1369 1883">The possible values for this attribute are defined by the ST_AlgType simple type</p>																						

Attributes	Description
	(§2.18.2).
cryptProvider (Cryptographic Provider)	<p>Specifies the cryptographic provider which was used to generate the hash value stored in this document. If the user provided a cryptographic provider which was not the system's built-in provider, then that provider shall be stored here so it can subsequently be used if available.</p> <p>If this attribute is omitted, then the built-in cryptographic provider on the system shall be used.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptProvider="Krista'sProvider" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The cryptProvider attribute value of Krista'sProvider specifies that the cryptographic provider with name "Krista's Provider" shall be used if available. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
cryptProviderType (Cryptographic Provider Type)	<p>Specifies the type of cryptographic provider to be used.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptProviderType="rsaAES" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_CryptProv simple type (§2.18.14).</p>
cryptProviderTypeExt (Cryptographic Provider Type Extensibility)	<p>Specifies that a cryptographic provider type which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the cryptProviderTypeExtSource attribute in order to determine the provider type used, which shall be application-defined. [<i>Rationale:</i> This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined cryptographic provider types in order to remain secure. <i>end rationale</i>]</p> <p>If this value is present, the cryptProviderType attribute value shall be ignored in favor of the provider type defined by this attribute.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptProviderTypeExt="00A5691D" w:cryptProvideTypeExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The cryptProviderTypeExt attribute value of 00A5691D specifies that the provider type associated with hex code A5691D shall be used as defined by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_LongHexNumber simple type (§2.18.57).</p>
cryptProviderTypeExtSource (Provider Type Extensibility Source)	<p>Specifies the application which defined the provider type value specified by the cryptProviderTypeExt attribute.</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptProviderTypeExt="00A5691D" w:cryptProvideTypeExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The cryptProvideTypeExtSource attribute value of futureCryptography specifies that the provider type used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
cryptSpinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (using each iteration's result as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hash attribute. [<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptSpinCount="100000" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The cryptSpinCount attribute value of 100000 specifies that the hashing function shall be run one hundred thousand times to generate a hash value for comparison with the hash attribute. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).
edit (Document Editing Restrictions)	<p>Specifies the set of editing restrictions which shall be enforced on a given WordprocessingML document, as defined by the simple type referenced below</p> <p>If this attribute is omitted, the consumer shall behave as though there are no editing restrictions applied to this document; equivalent to an attribute value of none.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that contains the following WordprocessingML specifying that hosting applications shall enforce read-only protection for a given document:</p> <pre data-bbox="451 688 1417 720"><w:documentProtection w:edit="readOnly" w:enforcement="1" /></pre> <p>The edit attribute has a value of readOnly and a enforcement attribute with a value of 1, specifying that read-only document protection shall be enforced on the given document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DocProtect simple type (§2.18.22).</p>
enforcement (Enforce Document Protection Settings)	<p>Specifies if the document protection settings shall be enforced for a given WordprocessingML document. If the value of this element is off, 0, or false, all the WordprocessingML pertaining to document protection is still preserved in the document, but is not enforced. If the value of this element is on, 1, or true, the document protection is enforced.</p> <p>If this attribute is omitted, then document protection settings shall not be enforced by applications.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that contains the following WordprocessingML specifying that hosting applications shall apply read-only protection for a given document:</p> <pre data-bbox="451 1449 1417 1480"><w:documentProtection w:edit="readOnly" w:enforcement="1" /></pre> <p>The enforcement attribute has a value of 1, specifying that the document protection specified shall be enforced on the given document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
formatting (Only Allow Formatting With Unlocked Styles)	<p>Specifies if formatting restrictions are in effect for a given WordprocessingML document. This enables the document to restrict the types of styles that may exist in a given WordprocessingML document. Specifically, by setting this attribute's value equal to true, every style whose locked element (§2.7.3.7) has a value of true (or latent styles (§2.7.3.5) whose locked attribute is true) shall not be available for use in the application, nor should any direct formatting. Only styles with a locked value of false may be used.</p>

Attributes	Description
	<p>If this attribute is omitted, then no formatting restrictions shall be applied, even when document protection is enforced.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that shall apply formatting protection. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre><w:documentProtection w:formatting="true" w:enforcement="true" /></pre> <p>If the following definition for a style was also present in the document:</p> <pre><w:style w:type="paragraph" w:styleId="Heading1"> <w:name w:val="heading 1" /> <w:locked="1" /> ... </w:style></pre> <p>The formatting attribute has a value of true specifying that the applications shall not allow the style above to be added to the WordprocessingML document. This does not preclude previous uses of that style (which shall not be removed), but does prevent new uses of this style from being added. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
hash (Password Hash)	<p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then no password shall be associated with the protection, and it may be turned off without supplying any password.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny" w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The hash attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password shall be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema base64Binary datatype.
salt (Salt for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hash attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre><w:... w:salt="ZUdHa+D8F/OAKP3I7ssUnQ==" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The salt attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password shall have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema base64Binary datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_DocProtect">  
3   <attribute name="edit" type="ST_DocProtect" use="optional"/>  
4   <attribute name="formatting" type="ST_OnOff" use="optional"/>  
5   <attribute name="enforcement" type="ST_OnOff"/>  
6   <attributeGroup ref="AG_Password"/>  
7 </complexType>
```

8 **2.15.1.29 documentType (Document Classification)**

9 This element specifies the classification of a given WordprocessingML document as a letter, email, or general
10 document.

11 [*Note:* This element may be used by hosting applications to facilitate customized user interface and/or
12 automatic formatting behaviors based on the 'type' of a given WordprocessingML document. *end note*]

13 If this element is omitted, then the document shall be classified as a general document.

1 [Example: Consider a set of WordprocessingML documents which should be classified as 'letters'. This
2 classification would be specified using the following WordprocessingML in the document settings of these
3 documents:

4 <w:documentType w:val="letter" />

5 The documentType element's val attribute is equal to letter, specifying that the hosting application shall
6 apply the behaviors it has specified for letters to the given WordprocessingML document. *end example*]

Parent Elements
settings (§2.15.1.78)

7

Attributes	Description
val (Document Classification Value)	<p>Specifies the classification of the document based on the types defined in the referenced simple type definition.</p> <p>[Example: Consider a WordprocessingML document which should be classified as an e-mail message. This classification would be specified using the following WordprocessingML in the document settings:</p> <p style="text-align: center;"><w:documentType w:val="eMail" /></p> <p>The val attribute is equal to eMail, specifying that the hosting application may apply e-mail behaviors (if any) to this document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DocType simple type (§2.18.23).</p>

8 The following XML Schema fragment defines the contents of this element:

9 <complexType name="CT_DocType">
10 <attribute name="val" type="ST_DocType" use="required"/>
11 </complexType>

12 **2.15.1.30 docVar (Single Document Variable)**

13 This element specifies the parameters of a single document variable. A *document variable* is a storage location
14 for arbitrary customer data in name/value pairs that will be persisted in a given WordprocessingML document.
15 Specifically, this element specifies through its name and val attributes the name and value pair for a given
16 document variable.

17 [Note: This mechanism is maintained for legacy compatibility only, and should be avoided in favor of the custom
18 XML data support defined in this Office Open XML Standard. *end note*]

19 [Example: Consider the following WordprocessingML fragment specifying a document variable named example
20 and containing the value example value:

```
1 <w:docVars>
2   <w:docVar w:name="example" w:val="example value" />
3 </w:docVars>
```

4 The docVar element defines a single document variable, named example using the name attribute, and
5 assigned the value example value through the val attribute. *end example*]

Parent Elements
docVars (§2.15.1.31)

6

Attributes	Description
name (Document Variable Name)	<p>Specifies the name of the parent document variable.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment specifying a document variable:</p> <pre><w:docVars> <w:docVar w:name="example name" w:val="example value" /> </w:docVars></pre> <p>The name attribute specifies that the name of the document variable is example name. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
val (Document Variable Value)	<p>Specifies the value of the parent document variable.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment specifying a document variable:</p> <pre><w:docVars> <w:docVar w:name="example name" w:val="Tristan Davis" /> </w:docVars></pre> <p>The val attribute specifies that the value of the document variable is Tristan Davis. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

7 The following XML Schema fragment defines the contents of this element:

```
8 <complexType name="CT_DocVar">
9   <attribute name="name" type="ST_String" use="required"/>
10  <attribute name="val" type="ST_String" use="required"/>
11 </complexType>
```

2.15.1.31 docVars (Document Variables)

This element specifies the presence of document variables in a WordprocessingML. A *document variable* is a storage location for arbitrary customer data in name/value pairs that will be persisted in a given WordprocessingML document.

[*Note:* This mechanism is maintained for legacy compatibility only, and should be avoided in favor of the custom XML data support defined in this Office Open XML Standard. *end note*]

[*Example:* Consider the following WordprocessingML specifying three document variables:

```
<w:docVars>
  <w:docVar ... />
  <w:docVar ... />
  <w:docVar ... />
</w:docVars>
```

The docVars element contains three child elements each defining a single document variable in this document. *end example*]

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
docVar (Single Document Variable)	§2.15.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DocVars">
  <sequence>
    <element name="docVar" type="CT_DocVar" minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
</complexType>
```

2.15.1.32 doNotAutoCompressPictures (Do Not Automatically Compress Images)

This element specifies that pictures in this document shall not automatically be compressed when saving the document in order to reduce the overall size of the resulting WordprocessingML document.

If this element is omitted, applications may perform basic compression on images before saving the contents of the document.

[*Example:* Consider a WordprocessingML document which should never have its images compressed before they are saved. This requirement would be specified using the following WordprocessingML:

```
<w:doNotAutoCompressPictures w:val="true"/>
```

1 The doNotAutoCompressPictures element's val attribute has a value of true specifying that images shall not
2 be automatically compressed when the document is saved. *end example*]

Parent Elements
settings (§2.15.1.78)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4 The following XML Schema fragment defines the contents of this element:

<pre><complexType name="CT_OnOff"> <attribute name="val" type="ST_OnOff"/> </complexType></pre>

8 **2.15.1.33 doNotDemarcateInvalidXml (Do Not Show Visual Indicator For Invalid Custom XML Markup)**
9

10 This element specifies whether a visual cue should be displayed around content contained in a
11 WordprocessingML document which is contained with custom XML markup specified via the customXml
12 element when an application determines that the current XML markup (or its contents) violate the constraints
13 of the attached XML schema(s).

14 If this element is not present in a WordprocessingML document visual cues shall be displayed on content
15 contained in custom XML markup in a WordprocessingML document which is considered to be invalid based on
16 the associated XML schema(s).

17 [*Example:* Consider a WordprocessingML document which should show no visual indication of invalid custom
18 XML markup. This requirement would be specified using the following WordprocessingML:

19 `<w:doNotDemarcateInvalidXml w:val="true"/>`

1 The doNotDemarcateInvalidXml element's val attribute has a value of true specifying the display of any visual
2 indication of invalid custom XML markup shall be suppressed for this document. *end example*]

Parent Elements
settings (§2.15.1.78)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_OnOff">  
6   <attribute name="val" type="ST_OnOff"/>  
7 </complexType>
```

8 **2.15.1.34 doNotDisplayPageBoundaries (Do Not Display Visual Boundary For Header/Footer**
9 **or Between Pages)**

10 This element specifies whether applications displaying this document should display the contents of the header
11 and footer when displaying the document in print layout view (§2.15.1.93) or should collapse those areas as well
12 as the whitespace on all displayed pages so that the text extents are directly following one another. [*Rationale:*
13 Collapsing the ends of pages makes it easier to read the contents of the document, since the text flows between
14 pages without whitespace, while maintaining the WYSIWYG functionality of print layout view for the document's
15 main content. *end rationale*]

16 If this element is omitted, then all pages should be shown at their full size (including whitespace and
17 headers/footers) when they are displayed in print layout view.

18 [*Example:* Consider the images below illustrating two pages in a WordprocessingML document:

- 1
- 2 If document shall automatically have whitespace between pages removed when it is displayed, that
- 3 requirement would be specified using the following WordprocessingML in the document settings:
- 4 `<w:doNotDisplayPageBoundaries w:val="true" />`
- 5 The resulting output might look like the following:

6

1 The doNotDisplayPageBoundaries element has its val attribute equal to true, therefore the document is
2 automatically displayed with whitespace between text extents on following pages compressed, allowing the
3 pages to be viewed more easily. *end example*]

Parent Elements
settings (§2.15.1.78)

4

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

5 The following XML Schema fragment defines the contents of this element:

<pre><complexType name="CT_OnOff"> <attribute name="val" type="ST_OnOff"/> </complexType></pre>

9 **2.15.1.35 doNotEmbedSmartTags (Remove Smart Tags When Saving)**

10 This element specifies if any smart tags specified using the smartTag element shall be removed from the
11 contents of this document before it is resaved. This setting shall also prevent the addition of new smart tags to
12 the content of the document.

13 If this element is omitted, then smart tags shall not be removed from the file when it is saved.

14 [*Example:* Consider a WordprocessingML document which should never be saved with smartTag elements in its
15 contents. This requirement is specified using the following WordprocessingML fragment in the document
16 settings:

```
<w:doNotEmbedSmartTags w:val="true"/>
```

18 The doNotEmbedSmartTags element's val attribute has a value of true specifying that smart tags shall never
19 be saved in the contents of this document. For example, if a run formerly looked like this:

```
1      <w:p>
2          <w:r>
3              <w:t xml:space="preserve">Hello</w:t>
4          </w:r>
5          <w:smartTag ... >
6              <w:r>
7                  <w:t>world</w:t>
8              </w:r>
9          </w:smartTag>
10     </w:p>
```

11 The presence of this element specifies that the SmartTag element shall be removed, and applications may then
12 choose to combine duplicated runs as desired. *end example]*

Parent Elements

13

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><w:... w:val="off"/></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_OnOff">
16     <attribute name="val" type="ST_OnOff"/>
17 </complexType>
```

18 **2.15.1.36 doNotHyphenateCaps (Do Not Hyphenate Words in ALL CAPITAL LETTERS)**

19 This element specifies whether or not words comprised of all capital letters shall be hyphenated within a given
20 document when automatic hyphenation is specified via the autoHyphenation element (§2.15.1.10).

If this element is omitted, then words in ALL CAPITAL LETTERS shall be hyphenated when the document is hyphenated.

[*Example:* Consider a document which is automatically hyphenated containing the following paragraph of content:

THIS IS A HYPHENATION EXAMPLE. THIS IS A SHORT HYPHENATION EXAMPLE. THIS IS A SHORT HYPHENATION EXAMPLE.

If words in ALL CAPITAL LETTERS shall not be hyphenated, this requirement would be specified by adding the following WordprocessingML to the document settings part:

<w:doNotHyphenateCaps w:val="true"/>

The resulting content would not be hyphenated:

THIS IS A HYPHENATION EXAMPLE. THIS IS A SHORT HYPHENATION EXAMPLE. THIS IS A SHORT HYPHENATION EXAMPLE.

The doNotHyphenateCaps element val set to true, specifying that the first line of text to end with the word SHORT as the word HYPHENATION had to be moved to the second line since it could not fit in its entirety on the first line.

Conversely, setting the doNotHyphenateCaps element val set to off (the default) caused the first line of text to contain a hyphenated portion of the word HYPHENATION as hyphenation of words comprised of all capital letters is permitted. *end example]*

Parent Elements

settings (§2.15.1.78)

Attributes

Description

val (On/Off Value)

Specifies a binary value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property shall be explicitly turned off.

[*Example:* For example, consider the following on/off property:

<w:... w:val="off"/>

Attributes	Description
	<p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.37 doNotIncludeSubdocsInStats (Do Not Include Content in Text Boxes, Footnotes, and Endnotes in Document Statistics)

This element specifies if document content contained in text boxes, footnotes, and endnotes shall be excluded when an application calculates a given document's statistics when these values are calculated and/or displayed by an application.

[*Note*: Some examples of document statistics that an application may chose to calculate are: number of words, number of characters, number of paragraphs, number of pages, number of lines, and so on. *end note*]

[*Example*: Consider a WordprocessingML that specifies that it shall not include these document stories when its contents are used to calculate document statistics. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:doNotIncludeSubdocsInStats w:val="true"/>
```

The doNotIncludeSubdocsInStats element's val attribute has a value of true specifying that only the contents of the main document story should be used when calculating document statistics. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre>

Attributes	Description
	<p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3   <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 2.15.1.38 doNotShadeFormData (Do Not Show Visual Indicator For Form Fields)

6 This element specifies whether a visual cue should be displayed around form fields contained in a
7 WordprocessingML document specified via the FORMTEXT, FORMCHECKBOX, or FORMDROPDOWN fields.

8 If this element is not present in a WordprocessingML document visual cues should be displayed on form fields
9 contained in the document.

10 [Example: Consider a WordprocessingML document which should no visual indication of form fields. This
11 requirement would be specified using the following WordprocessingML:

```
12 <w:doNotShadeFormData w:val="true"/>
```

13 The doNotShadeFormData element's val attribute has a value of true specifying the display of any visual
14 indication of form fields shall be suppressed for this document. *end example*]

Parent Elements
settings (§2.15.1.78)

15

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.39 doNotTrackFormatting (Do Not Track Formatting Revisions When Tracking Revisions)

This element specifies that applications shall not track revisions made to the formatting of this WordprocessingML document when the trackRevisions element (§2.15.1.90) is turned on.

If this element is omitted, then revisions to formatting shall be generated by changes to the contents of this document when the trackRevisions element is turned on.

[*Example:* Consider a WordprocessingML document containing the text run `Example` that shall have revisions tracked. Example WordprocessingML from Document 1 is given below:

```
<w:document>
  <w:body>
    <w:p>
      <w:r>
        <w:t>Example</w:t>
      </w:r>
    </w:p>
  </w:body>
</w:document>
```

If the word `text` was added to the end of this document and bolded, the resulting WordprocessingML would be output as follows:

```

1      <w:document>
2      <w:body>
3      <w:p>
4      <w:r>
5      <w:t>Example</w:t>
6      </w:r>
7      <w:ins ... >
8      <w:r>
9      <w:rPr>
10     <w:b/>
11     <w:rPrChange ... >
12     <w:rPr/>
13     <w:rPrChange>
14     </w:rPr>
15     <w:t>text</w:t>
16     </w:r>
17     </w:ins>
18 </w:p>
19 </w:body>
20 </w:document>

```

21 If changes to formatting were turned off using the following WordprocessingML syntax in the document
 22 settings:

```

23 <w:settings>
24 <w:trackRevisions w:val="true" />
25 <w:doNotTrackFormatting w:val="true" />
26 ...
27 </w:settings>

```

28 The same revision (the word text was added to the end of this document and bolded) would result in the
 29 following markup:

```
1      <w:document>
2        <w:body>
3          <w:p>
4            <w:r>
5              <w:t>Example</w:t>
6            </w:r>
7            <w:ins ... >
8              <w:r>
9                <w:rPr>
10                  <w:b/>
11                </w:rPr>
12                <w:t>text</w:t>
13              </w:r>
14            </w:ins>
15          </w:p>
16        </w:body>
17      </w:document>
```

18 The doNotTrackFormatting element's val attribute was set to true, therefore the changes to the formatting of
19 the document were not tracked as revisions in the document's WordprocessingML. Specifically, applying bold
20 formatting to the text was not tracked as a revision with the rPrChange (§2.13.5.32) element. *end example*

Parent Elements
settings (§2.15.1.78)

21

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><w:... w:val="off"/></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.40 doNotTrackMoves (Do Not Use Move Syntax When Tracking Revisions)

This element specifies that applications shall not track revisions made to this WordprocessingML document as moves when the trackRevisions element (§2.15.1.90) is turned on, even when that syntax is appropriate. Instead, applications should use a standard insertion and deletion annotation syntax. Existing moves shall not be modified. [Rationale: This element is provided to enable interoperability with earlier word processing applications which do not understand moves. end rationale]

If this element is omitted, then move annotations may be generated by changes to the contents of this document when the trackRevisions element is turned on as appropriate.

[Example: Consider a WordprocessingML that specifies that it shall not have additional moves added to its contents. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:doNotTrackMoves w:val="true"/>
```

The doNotTrackMoves element's val attribute has a value of true specifying that insertion/deletion annotations shall be used rather than moves when revisions are tracked in this document. end example]

Parent Elements

settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. end example]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.41 doNotUseMarginsForDrawingGridOrigin (Do Not Use Margins for Drawing Grid Origin)

This element specifies that the top-left corner of the page shall not be used as the origin for the drawing grid. The *drawing grid* is a virtual grid which may be used by applications to specify where drawing objects shall be positioned on a page when inserted (i.e. to ensure objects are aligned, etc.). If this element is present the grid shall start at the top-left edge of the page and not the text extents.

If this element is omitted, then the gridlines shall start at the topmost edge of the text extents.

[*Example:* Consider a WordprocessingML document whose drawing grid shall begin at the top left edge of the page. This requirement would be specified using the following WordprocessingML markup in the document settings:

```
<w:doNotUseMarginsForDrawingGridOrigin w:val="true" />
```

The doNotUseMarginsForDrawingGridOrigin element's val attribute is equal to true specifying that the document's drawing grid shall begin from the top left corner of the page, rather than the top left corner of the text extents. *end example*]

Parent Elements

settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.42 doNotValidateAgainstSchema (Do Not Validate Custom XML Markup Against Schemas)

This element specifies that applications shall not validate the custom XML markup in this document against the applicable custom XML schema(s), even when those schemas are available. The application should silently behave as if it was unable to provide this functionality.

If this element is omitted, then applications which support this functionality should attempt to validate the custom XML contents against any available related custom XML schema(s).

[*Example:* Consider a WordprocessingML document which should not have its custom XML content validated even by applications which support this operation. This requirement is specified using the following WordprocessingML in the document settings:

```
<w:doNotValidateAgainstSchema w:val="true" />
```

The doNotValidateAgainstSchema element's val attribute has a value of true specifying that the custom XML markup in this document shall not be validated. *end example*]

Parent Elements

settings (§2.15.1.78)

Attributes

Description

val (On/Off Value)

Specifies a binary value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property shall be explicitly turned off.

[*Example:* For example, consider the following on/off property:

```
<w:... w:val="off" />
```

The val attribute explicitly declares that the property is turned off. *end example*]

The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.43 drawingGridHorizontalOrigin (Drawing Grid Horizontal Origin Point)

This element specifies the distance from of the left edge of the page which shall be used as the origin for the horizontal gridlines used by the drawing grid. The *drawing grid* is a virtual grid which may be used by applications to specify where drawing objects shall be positioned on a page when inserted (i.e. to ensure objects are aligned, etc.). Since the grid always covers the entire page when the doNotUseMarginsForDrawingGridOrigin element (§2.15.1.41) is specified, this element shall only affect the starting edge of the first horizontal gridline displayed (i.e. it only adjusts the grid by the modulus of the value against the width of one grid unit).

If this element is omitted, then the gridlines shall start at the leftmost edge of the page. If the doNotUseMarginsForDrawingGridOrigin element is not specified, then this element is ignored.

[Example: Consider a WordprocessingML document whose drawing grid shall begin three inches (4320 twentieths of a point) before the left edge of the page. This requirement would be specified using the following WordprocessingML markup in the document settings:

```
<w:settings>
  ...
  <w:dontuseMarginsForDrawingGridOrigin w:val="true" />
  <w:drawingGridHorizontalOrigin w:val="4320" />
  ...
</w:settings>
```

The drawingGridHorizontalOrigin element's val attribute is equal to 4320 specifying that the horizontal edge of the document's drawing grid shall begin three inches (4320 twentieths of a point) from the left edge of the page, since the dontUseMarginsForDrawingGridOrigin element's val attribute is equal to true. end example]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML element with a val attribute containing a positive measurement in twentieths of a point:</p> <pre><w:... w:val="720" /></pre>

Attributes	Description
	<p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§2.18.105).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TwipsMeasure">
3   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
4 </complexType>
```

5 **2.15.1.44 drawingGridHorizontalSpacing (Drawing Grid Horizontal Grid Unit Size)**

6 This element specifies the width of horizontal grid units in this document. The *drawing grid* is a grid which may
7 be used by applications to help position floating objects in the document.

8 If this element is omitted, then each horizontal grid unit shall be 180 twentieths of a point (0.125") in width.

9 [Example: Consider the image below illustrating a WordprocessingML document in which all horizontal grid units
10 are each 144 twentieths of a point wide (and all are showing):

11
12 If the gridlines in this document shall only be displayed for every half an inch, that requirement would be
13 specified using the following WordprocessingML in the document settings:

```
14 <w:drawingGridHorizontalSpacing w:val="720" />
```

15 The resulting grid would look like the following:

1

2 The drawingGridHorizontalSpacing element has its val attribute equal to 720, therefore every horizontal
3 gridline has a width of one half of an inch (720 twentieths of a point). *end example*

4

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a val attribute containing a positive measurement in twentieths of a point:</p> <p style="text-align: center;"><code><w:... w:val="720" /></code></p> <p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§2.18.105).</p>

5 The following XML Schema fragment defines the contents of this element:

6 <code><complexType name="CT_TwipsMeasure"></code>
7 <code> <attribute name="val" type="ST_TwipsMeasure" use="required"/></code>
8 <code></complexType></code>

2.15.1.45 **drawingGridVerticalOrigin** (Drawing Grid Vertical Origin Point)

This element specifies the distance from the top edge of the page which shall be used as the origin for the vertical gridlines used by the drawing grid. The *drawing grid* is a virtual grid which may be used by applications to specify where drawing objects shall be positioned on a page when inserted (i.e. to ensure objects are aligned, etc.). Since the grid always covers the entire page when the `doNotUseMarginsForDrawingGridOrigin` element (§2.15.1.41) is specified, this element shall only affect the starting edge of the first vertical gridline displayed (i.e. it only adjusts the grid by the modulus of the value against the width of one grid unit).

If this element is omitted, then the gridlines shall start at the topmost edge of the page. If the `doNotUseMarginsForDrawingGridOrigin` element is not specified, then this element is ignored.

[*Example:* Consider a WordprocessingML document whose drawing grid shall begin one inch (1440 twentieths of a point) before the top edge of the page. This requirement would be specified using the following WordprocessingML markup in the document settings:

```
<w:settings>
...
<w:dontuseMarginsForDrawingGridOrigin w:val="true" />
<w:drawingGridVerticalOrigin w:val="1440" />
...
</w:settings>
```

The `drawingGridVerticalOrigin` element's `val` attribute is equal to 1440 specifying that the vertical edge of the document's drawing grid shall begin one inch (1440 twentieths of a point) from the top edge of the page, since the `dontUseMarginsForDrawingGridOrigin` element's `val` attribute is equal to `true`. *end example]*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a <code>val</code> attribute containing a positive measurement in twentieths of a point:</p> <pre><w:... w:val="720" /></pre> <p>The <code>val</code> attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_TwipsMeasure</code> simple type</p>

Attributes	Description
	(\$2.18.105).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">  
  <attribute name="val" type="ST_TwipsMeasure" use="required"/>  
</complexType>
```

2.15.1.46 drawingGridVerticalSpacing (Drawing Grid Vertical Grid Unit Size)

This element specifies the width of vertical grid units in this document. The *drawing grid* is a grid which may be used by applications to help position floating objects in the document.

If this element is omitted, then each vertical grid unit shall be 180 twentieths of a point (0.125") in width.

[Example: Consider the image below illustrating a WordprocessingML document in which all vertical grid units are each 144 twentieths of a point high (and all are showing):

If the vertical gridlines in this document shall only be displayed for every half an inch, that requirement would be specified using the following WordprocessingML in the document settings:

```
<w:drawingGridVerticalSpacing w:val="720" />
```

The resulting grid would look like the following:

1

2 The drawingGridVerticalSpacing element has its val attribute equal to 720, therefore every vertical gridline has
3 a height of one half of an inch (720 twentieths of a point). *end example*]

4

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a val attribute containing a positive measurement in twentieths of a point:</p> <p style="text-align: center;"><code><w:... w:val="720" /></code></p> <p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§2.18.105).</p>

5 The following XML Schema fragment defines the contents of this element:

6	<code><complexType name="CT_TwipsMeasure"></code>
7	<code> <attribute name="val" type="ST_TwipsMeasure" use="required"/></code>
8	<code></complexType></code>

2.15.1.47 **forceUpgrade** (Upgrade Document on Open)

This element specifies that the contents of this document may be upgraded and that the resulting document shall not have its functionality limited to only those functions compatible with earlier word processing applications. The only actions required as part of upgrading the document are:

- The removal of this and the `uiCompat97to2003` element (§2.15.3.54). This is needed in order to prevent future applications from disabling functionality on the resulting 'upgraded' document. If an application does not know how to upgrade a document, this element and the `uiCompat97to2003` element should be ignored and persisted.
- The removal of all compatibility options (§2.15.3.9) on the document which maintain compatibility with previous word processing applications. The compatibility settings which simply affect a given behavior shall not be turned off.

[*Note:* The remaining operations which shall be performed as part of upgrading the document are application-defined and outside the scope of this Office Open XML Standard. *end note*]

[*Example:* Consider a WordprocessingML document that specifies that it shall automatically be upgraded when it is opened by an application. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:forceUpgrade w:val="true"/>
```

The `forceUpgrade` element's `val` attribute has a value of `true` specifying that this document shall be upgraded by any application which supports this operation. *end example*]

Parent Elements
settings (§2.15.1.78)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

2.15.1.48 **formsDesign** (Structured Document Tag Placeholder Text Should be Resaved)

This element specifies that the document was last saved while the placeholder text of all structured document tags in this document were being edited. This means that the placeholder text currently displayed in all structured document tags which are displaying the `showingPlcHdr` element (§2.5.2.38) shall be committed to the corresponding glossary document entry as specified using the `docPart` element (§2.12.5) when this document is opened, in order to ensure that the most recent placeholder text is stored in the glossary document entry. If the current placeholder text cannot be saved as a glossary document entry, then it should be modified as needed before saving.

If this element is omitted, then the placeholder text in this document should not automatically be resaved when the document is opened.

[*Example*: Consider a WordprocessingML document that specifies that its placeholder text should be resaved to the glossary document when the file is opened. This requirement would be specified using the following WordprocessingML in the document settings part:

`<w:formsDesign w:val="true"/>`

The formsDesign element's val attribute has a value of true specifying that this document should be resaved to its glossary document by any application which supports this operation. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <p><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.49 gutterAtTop (Position Gutter At Top of Page)

This element specifies that a given WordprocessingML document's gutter shall be positioned at the top of the document's pages when the document is displayed. A *gutter* is the white space formed by the inner margins of two pages facing one another; such as the white space between the text on pages of a book when the book is opened.

If this element is omitted, then the gutter shall not be positioned at the top of the page. If the mirrorMargins (§2.15.1.57), bookFoldPrinting (§2.15.1.11), bookFoldRevPrinting (§2.15.1.13), or printTwoOnOne (§2.15.1.64) elements are used within a given document, the gutterAtTop element shall not be used. Rather,

the gutter shall be positioned automatically as necessary to enable the printing and page layout capabilities of these settings.

[Example: Consider a one page WordprocessingML document with a 1,440 twentieths of a point (one inch) top margin and gutter, and a 720 twentieths of a point (one half of an inch) header. Consider also, that the gutter shall exist at the top of the document's pages. This requirement is specified using the following WordprocessingML in the section properties:

```
<w:pgMar w:top="1440" ... w:header="720" ... w:gutter="1440" />
```

And the following WordprocessingML in the document settings:

```
<w:gutterAtTop w:val="true" />
```

The resulting document's pages would have the gutter positioned as follows:

The gutterAtTop element's val attribute is equal to on, specifying that the gutter shall appear at the top of each page. end example]

Parent Elements

settings (§2.15.1.78)

Attributes

Description

val (On/Off Value)

Specifies a binary value for the property defined by the parent XML element.

A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	<p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <div><div><w:... w:val="off"/></div><p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p><p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p></div>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.50 [hdrShapeDefaults \(Default Properties for VML Objects in Header and Footer\)](#)

This element specifies the default parameters for object using the ' (§6.1) inserted in the header and footer of a WordprocessingML document. The definition and semantics of these parameters is described in the VML - Office Drawing subclause (§6.2) of this Office Open XML Standard.

If this element is omitted, then no default properties are applied to VML objects in the header and footer of this document.

[Example: Consider a WordprocessingML document whose document settings contain the following markup:

```
<w:hdrShapeDefaults>
  <o:shapedefaults v:ext="edit" spidmax="2050" fillcolor="none [3207]"
strokecolor="none [3041]">
    <v:fill color="none [3207]" />
    <v:stroke color="none [3041]" weight="3pt" />
    <v:shadow on="t" type="perspective" color="none [1607]" opacity=".5"
offset="1pt" offset2="1pt" />
  </o:shapedefaults>
  <o:shapelayout v:ext="edit">
    <o:idmap v:ext="edit" data="2" />
  </o:shapelayout>
</w:hdrShapeDefaults>
```

The `hdrShapeDefaults` element specifies a set of shape defaults which shall be applied to the set of all shapes present in the header and footer of this document. *end example*]

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
Any element from the urn:schemas-microsoft-com:office:office namespace	§6.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeDefaults">
  <choice maxOccurs="unbounded">
    <any processContents="lax" namespace="urn:schemas-microsoft-com:office:office" minOccurs="0"
      maxOccurs="unbounded"/>
  </choice>
</complexType>
```

2.15.1.51 hideGrammaticalErrors (Do Not Display Visual Indication of Grammatical Errors)

This element specifies whether a visual cue should be displayed around run content contained in a WordprocessingML document which has been flagged as a possible grammatical error using the proofErr element (§2.13.8.1) or via the application's own grammar engine.

If this element is not present in a WordprocessingML document, visual cues shall be displayed on content contained in a WordprocessingML document which is considered to contain grammatical errors.

[Example: Consider a WordprocessingML document which should show no visual indication of grammatical errors. This requirement would be specified using the following WordprocessingML:

```
<w:hideGrammaticalErrors w:val="true"/>
```

The hideGrammaticalErrors element's val attribute has a value of true specifying the display of any visual indication of grammatical errors shall be suppressed for this document. end example]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. end example]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
  <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.52 hideSpellingErrors (Do Not Display Visual Indication of Spelling Errors)

This element specifies whether a visual cue should be displayed around run content contained in a WordprocessingML document which has been flagged as a possible spelling error using the proofErr element (§2.13.8.1) or via the application's own spelling engine.

If this element is not present in a WordprocessingML document, visual cues shall be displayed on content contained in a WordprocessingML document which is considered to contain spelling errors.

[Example: Consider a WordprocessingML document which should show no visual indication of spelling errors. This requirement would be specified using the following WordprocessingML:

```
<w:hideSpellingErrors w:val="true"/>
```

The hideSpellingErrors element's val attribute has a value of true specifying the display of any visual indication of spelling errors shall be suppressed for this document. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre><w:... w:val="off"/></pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a val attribute containing a positive measurement in twentieths of a point:</p> <pre><w:... w:val="720" /></pre> <p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§2.18.105).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
  <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

2.15.1.54 ignoreMixedContent (Ignore Mixed Content When Validating Custom XML Markup)

This element specifies that applications should ignore all text content which is not contained within a leaf custom XML markup element when validating the contents of the custom XML markup in this document against one or more attached custom XML schema(s). A *leaf element* is a custom XML element which has no child custom XML elements (it is a leaf in the custom XML tree).

If this element is omitted, then text content in leaf elements shall not be ignored when validating the custom XML markup against one or more custom XML schema(s).

[*Example:* Consider a WordprocessingML document which should not have its custom XML content validated even by applications which support this operation. This requirement is specified using the following WordprocessingML in the document settings:

```
<w:doNotValidateAgainstSchema w:val="true" />
```

The doNotValidateAgainstSchema element's val attribute has a value of true specifying that the custom XML markup in this document shall not be validated. *end example]*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3   <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.1.55 linkStyles (Automatically Update Styles From Document Template)**

6 This element specifies that styles in the given document shall be updated to match the styles in the attached
7 template specified using the attachedTemplate element (§2.15.1.6) when the document is opened by a hosting
8 application. This setting enables the styles contained in documents with attached templates to stay
9 synchronized with the styles used in the attached template.

10 If this element is omitted, then styles shall not be updated based on the document template regardless of its
11 availability. If the attached template cannot be located or is not a valid file, then this setting should be silently
12 ignored.

13 [Example: Consider a WordprocessingML document which should always update its styles with those defined in
14 the document's attached template. This requirement would be specified using the following WordprocessingML
15 in the document settings:

```
16 <w:settings>
17   <w:linkStyles w:val="true" />
18   <w:attachedTemplate r:id="rId10" />
19   ...
20 </w:settings>
```

21 The linkStyles element has a val attribute value of true, specifying that applications should attempt to locate
22 the document template referenced by the relationship specified in the attachedTemplate element and update
23 the document's styles with the styles from that template. *end example*]

Parent Elements
settings (§2.15.1.78)

1

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code><w:... w:val="off"/></code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <code><complexType name="CT_OnOff"></code>
4 <code> <attribute name="val" type="ST_OnOff"/></code>
5 <code></complexType></code>

6 **2.15.1.56 listSeparator (List Separator for Field Code Evaluation)**

7 This element specifies the character that shall be interpreted as a list item separator when evaluating the
8 contents of all fields in the current document.

9 [*Rationale:* When evaluating field instructions based on the contents of the current document, it is necessary to
10 know the character which shall be treated as the list separator in order to prevent changes to the calculation of
11 the same field instructions based on the current user's locale. This element stores the list separator which shall
12 be used to evaluate fields in the contents of this document, irrespective of the locale of the application loading
13 the file. *end rationale*]

14 If this element is omitted, the application shall use the default list separator of its current locale setting to
15 evaluate field instructions. If this element's attribute value is more than a single character, then the document is
16 non-conformant.

17 [*Example:* Consider a WordprocessingML document which should use the semicolon character as the list
18 separator for all field instructions. This requirement is specified using the following WordprocessingML in the
19 document settings:

20 `<w:listSeparator w:val=";" />`

- 1
- The listSeparator element's val attribute has a value of ; specifying that the semicolon character shall be
- 2
- interpreted as a list item separator.
- 3
- For instance, the string 10;20,5 would be interpreted as having two values - 10 and 20,5. If the listSeparator
- 4
- was a comma, the same string would be interpreted as 10;20 and 5. *end example]*

Parent Elements
settings (§2.15.1.78)

5

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre><w:pPr> <w:pStyle w:val="heading1" /> </w:pPr></pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre><w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr></pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

- 6
- The following XML Schema fragment defines the contents of this element:
- 7
- ```
<complexType name="CT_String">
 <attribute name="val" type="ST_String" use="required"/>
</complexType>
```
- 8
- 
- 9

10

2.15.1.57      mirrorMargins (Mirror Page Margins)

- 11
- This element specifies that the left and right margins defined in the section properties shall be swapped on
- 12
- facing pages.

[*Guidance*: This setting is generally used when printing on both sides of pages and binding them like a book. *end guidance*]

[*Example*: Consider a graphical representation (below) of a three page WordprocessingML document with a left margin of 1" and a right margin of 2".

If the mirrorMargins element is present in the document settings with its val attribute equal to true, as follows:

```
<w:mirrorMargins w:val="true" />
```

The resulting pages will have mirrored margins as follows (un this representation, the gray rectangles representing the text extents on each page):

*end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.1.58 noLineBreaksAfter (Custom Set of Characters Which Cannot End a Line)**

This element specifies the set of characters which shall be restricted from ending a line for runs of text which shall be subject to custom line breaking logic using the kinsoku element (§2.3.1.16) when the contents of the document are displayed. This constraint shall only apply to text which has been flagged in the language of this rule via the lang element (§2.3.2.18) or automatic detection methods outside the scope of this Office Open XML Standard.

If this element is omitted, then no custom set of characters shall be used to restrict the characters which may end a line when using the kinsoku element.

[Example: Consider a paragraph of WordprocessingML text displayed as follows, with the dollar symbol \$ was flagged as Japanese content using the following WordprocessingML in the run properties:

```
<w:r>
 <w:rPr>
 <w:lang w:eastAsia="ja-JP" />
 </w:rPr>
 <w:t>$</w:t>
</w:r>
```

This is a sample line of text. This is a sample line of text. This is a sample line of text. This is a \$ sample line of text.

This text is displayed and the resulting first line ends with the dollar sign symbol. If this character shall not be used to end a line, that requirement would be specified as follows in the document settings:

```
<w:noLineBreaksAfter w:lang="ja-JP" w:val="$" />
```

The noLineBreaksAfter element's val attribute has a value of ja-JP, specifying that all dollar signs in this document which are marked as Japanese text shall not be allowed to end a line. This means that the dollar sign character must therefore be moved to the next line as it can no longer be the last character on a line:

This is a sample line of text. This is a sample line of text. This is a sample line of text. This is a \$ sample line of text.

end example]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
<b>lang</b> (Language For Which Custom Line Breaking Rule Applies)	<p>Specifies the language of text for which the parent custom line breaking rule shall be applied. Applications supporting this functionality shall support custom line breaking for the following four languages:</p> <ul style="list-style-type: none"> <li>• Chinese (Traditional)</li> <li>• Chinese (Simplified)</li> <li>• Japanese</li> <li>• Korean</li> </ul> <p>Applications may also support custom line breaking rules for other languages, but this is not required.</p> <p>[<i>Example</i>: Consider a WordprocessingML document which shall have a custom line breaking rule for Japanese. That requirement would be specified as follows in the document settings:</p> <pre>&lt;w:... w:lang="ja-JP" w:val="\$" /&gt;</pre> <p>The lang attribute has a value of ja-JP, specifying that the rules shall be applied to Japanese text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).</p>
<b>val</b> (Characters For Custom Line Breaking Rule)	<p>Specifies the set of characters which shall be included in the custom line breaking rule.</p> <p>[<i>Example</i>: Consider a WordprocessingML document which shall have a custom line breaking rule for Japanese. That requirement would be specified as follows in the document settings:</p> <pre>&lt;w:... w:lang="ja-JP" w:val="\$" /&gt;</pre> <p>The val attribute has a value of \$, specifying that the dollar sign character is the only restricted character for Japanese text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Kinsoku">
3 <attribute name="lang" type="ST_Lang" use="required"/>
4 <attribute name="val" type="ST_String" use="required"/>
5 </complexType>
```

#### 6 2.15.1.59 noLineBreaksBefore (Custom Set Of Characters Which Cannot Begin A Line)

7 This element specifies the set of characters which shall be restricted from beginning a new line for runs of text  
 8 which shall be subject to custom line breaking logic using the kinsoku element (§2.3.1.16) when the contents of  
 9 the document are displayed. This constraint shall only apply to text which has been flagged in the language of

1 this rule via the lang element (§2.3.2.18) or automatic detection methods outside the scope of this Office Open  
2 XML Standard.

3 If this element is omitted, then no custom set of characters shall be used to restrict the characters which may  
4 end a line when using the kinsoku element.

5 [Example: Consider a paragraph of WordprocessingML text displayed as follows, with the dollar symbol \$ was  
6 flagged as Korean content using the following WordprocessingML in the run properties:

```
7 <w:r>
8 <w:rPr>
9 <w:lang w:eastAsia="ko-KR" />
10 </w:rPr>
11 <w:t>$</w:t>
12 </w:r>
```

13 This is a sample line of text. This is a sample line of text. This is a sample line of text. This is a  
\$ sample line of text.

14 This text is displayed and the resulting second line begins with the dollar sign symbol. If this character shall not  
15 be used to begin a line, that requirement would be specified as follows in the document settings:

```
16 <w:noLineBreaksBefore w:lang="ko-KR" w:val="$" />
```

17 The noLineBreaksBefore element's val attribute has a value of ko-KR, specifying that all dollar signs in this  
18 document which are marked as Korean text shall not be allowed to begin a line. This means that the previous  
19 word character must therefore be moved to the next line as the dollar sign can no longer be the first character  
20 on a line:

21 This is a sample line of text. This is a sample line of text. This is a sample line of text. This is  
a \$ sample line of text.

22 end example]

Parent Elements	
settings (§2.15.1.78)	

23

Attributes	Description
lang (Language For Which Custom Line Breaking Rule Applies)	Specifies the language of text for which the parent custom line breaking rule shall be applied. Applications supporting this functionality shall support custom line breaking for the following four languages: <ul style="list-style-type: none"><li>Chinese (Traditional)</li><li>Chinese (Simplified)</li><li>Japanese</li></ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>• Korean</li> </ul> <p>Applications may also support custom line breaking rules for other languages, but this is not required.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which shall have a custom line breaking rule for Japanese. That requirement would be specified as follows in the document settings:</p> <pre>&lt;w:... w:lang="ja-JP" w:val="\$" /&gt;</pre> <p>The lang attribute has a value of ja-JP, specifying that the rules shall be applied to Japanese text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).</p>
val (Characters For Custom Line Breaking Rule)	<p>Specifies the set of characters which shall be included in the custom line breaking rule.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which shall have a custom line breaking rule for Japanese. That requirement would be specified as follows in the document settings:</p> <pre>&lt;w:... w:lang="ja-JP" w:val="\$" /&gt;</pre> <p>The val attribute has a value of \$, specifying that the dollar sign character is the only restricted character for Japanese text. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Kinsoku">
3 <attribute name="lang" type="ST_Lang" use="required"/>
4 <attribute name="val" type="ST_String" use="required"/>
5 </complexType>
```

#### 6 2.15.1.60 noPunctuationKerning (Never Kern Punctuation Characters)

7 This element specifies that punctuation characters shall not be kerned in the current document when kerning is  
8 enabled on a run using the kern element (§2.3.2.17). *Kerning* refers to a process by which a hosting application  
9 shall reduce the spacing of adjacent characters and/or punctuation to improve the visual appearance of text.  
10 Well kerned text has a similar amount of blank space between each pair of characters and/or each set of a  
11 character and punctuation symbol. When kerning is enabled, Latin text shall always be kerned, and this option  
12 shall control whether punctuation characters are also kerned.

13 If this element is omitted, then punctuation characters shall be kerned when kerning is enabled on a given run.

[*Example:* Consider a WordprocessingML document that shall not kern punctuation even when kerning is enabled on a given run. This requirement is specified using the following WordprocessingML in the document settings:

`<w:noPunctuationKerning w:val="true" />`

The noPunctuationKerning element's val attribute has a value of true, specifying that punctuation characters shall not be kerned in this document. *end example]*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p><code>&lt;w:... w:val="off" /&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

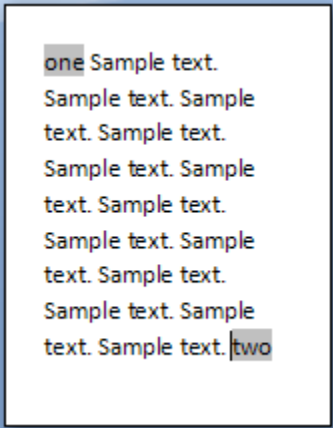

**2.15.1.61 printFormsData (Only Print Form Field Content)**

This element specifies that printing the contents of this document shall only print the contents of WordprocessingML form fields defined using the FORMTEXT, FORMCHECKBOX, and FORMDROPDOWN field codes in their current locations on the page - all other document contents shall be suppressed.

[*Rationale:* This setting is typically used to allow duplication of paper forms in electronic WordprocessingML document form, allowing the resulting online document to be printed into the correct locations on the existing paper form. *end rationale]*

If this element is omitted, then the contents of the entire document (not just form fields) should be printed according to the normal print settings.

1 [Example: Consider a WordprocessingML document which has form fields in the top right and bottom left  
2 corners of the first page, as follows (with the text box form fields shaded in grey):

3  
4 If the only content which shall be printed on the page are the form fields' contents, this requirement is specified  
5 using the following WordprocessingML in the document settings:

6 <w:printFormsData w:val="true" />

7 The printFormsData element's val attribute as a value of true, specifying that only form field data shall be  
8 printed, resulting in output as follows when printed:

9  
10 end example]

Parent Elements
-----------------

settings (§2.15.1.78)
-----------------------

Attributes	Description
------------	-------------

val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.  A value of on, 1, or true specifies that the property shall be explicitly applied. This is the
--------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Attributes	Description
	<p>default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of <code>off</code>, <code>0</code>, or <code>false</code> specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The <code>val</code> attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.1.62 printFractionalCharacterWidth (Print Fractional Character Widths)

This element specifies the contents of this document shall be printed with fractional character widths. *Fractional character widths* exist when the spacing between characters is not constant (i.e. a proportional font face is used).

[*Note:* Fractional character widths are generally used in conjunction with large font sizes to prevent characters from running together or having too much space between one another. *end note*]

[*Example:* Consider a WordprocessingML document which should be printed using fractional character widths as needed. This requirement is specified using the following WordprocessingML markup in the document settings:

```
<w:printFractionalCharacterWidth w:val="true"/>
```

The `printFractionalCharacterWidth` element's `val` attribute is equal to `true`, specifying that fractional character widths may be used as necessary. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code>, <code>1</code>, or <code>true</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p>

Attributes	Description
	<p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.1.63 printPostScriptOverText (Print PostScript Codes With Document Text)

This element specifies that the PostScript codes specified in WordprocessingML documents containing PRINT fields shall be included in foreground (on the same Z-order as text) with the data printed in the contents of a given WordprocessingML document.

[*Note:* This setting is maintained to ensure compatibility of legacy word processing documents. The PRINT field should not be used in lieu of newer technologies in this Office Open XML Standard. *end note*]

If this element is omitted, then the contents of PRINT fields shall be printed behind text (i.e. in the background).

[*Example:* Consider a WordprocessingML document containing PRINT fields whose PostScript code shall be printed in the foreground of the WordprocessingML document. This requirement is specified using the following WordprocessingML in the document settings:

```
<w:printPostScriptOverText w:val="true"/>
```

The printPostScriptOverText element's val attribute is equal to true specifying that the PostScript codes shall be treated as results for the main text level of the document (i.e. not behind that text). *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but</p>

Attributes	Description
	<p>this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="padding-left: 40px;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.1.64 printTwoOnOne (Print Two Pages Per Sheet)**

6 This element specifies whether two pages should be printed on one sheet of paper when this document is  
7 printed. Specifically, this element specifies that each page displayed for the contents in a given  
8 WordprocessingML document should be the page size specified in the section settings divided in half with two  
9 top margins originating from the bisector of the page, and bottom margins instantiated at the top and bottom of  
10 each page.

11 If this element is omitted, then pages should be displayed and printed as one per sheet.

12 [Example: Consider a one section document with a 2,160 twentieths of a point (one and a half inch) top margin,  
13 and 1,440 twentieths of a point (one inch) bottom, right, and left margins surrounding the document editing  
14 canvas (represented by the gray shaded area in diagrams below). This page setup is represented in  
15 WordprocessingML using the following fragment:

```
16 <w:pgMar w:top="2160" w:right="1440" w:bottom="1440" w:left="1440" />
```

17 The resulting printed pages would appear as follows:

1

2 If a document should be displayed and printed as though two pages were printed on a single sheeting, this  
3 requirement would be specified using the following WordprocessingML:

4 `<w:printTwoOnOne w:val="true" />`

5 The printTwoOnOne element's val attribute is equal to true specifying that pages should be printed two to a  
6 sheet, resulting in the following printout given these page margins:

*end example]*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p>&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.65 proofState (Spelling and Grammatical Checking State)

This element specifies if the grammar and spell checking engines of the last application to process this document completed checking the grammar and spelling of a the document before the document was last saved. Applications which modify the document contents without checking spelling or grammar should reset these states as needed.

[Note: If this element specifies that an application's grammar and spell checking engines completed checking the grammar and spelling of the document when the document was last saved, then subsequent applications may elect to not run their grammar and spell checking engines when the given WordprocessingML document is loaded.

This may increase the speed with which the hosting application loads the file, and does not compromise the state of the grammar or spell checking of the document, as all errors have already been found and flagged with the proofErr element (§2.13.8.1) as the document has not been edited, only loaded, since it was last saved. *end note*

[Example: Consider a WordprocessingML document that is saved by a hosting application whose spelling and grammar checking engines have completed checking grammar and spelling in the given WordprocessingML document. This state is specified using the following WordprocessingML in the document settings:

<w:proofState w:spelling="clean" w:grammar="clean" />

The proofState element's attributes spelling and grammar attribute both have the value clean specifying that the hosting application's grammar and spell checking engines completed checking both the grammar and spelling of the given document when it was last saved. *end example*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
grammar (Grammatical Checking State)	<p>Specifies if an application's grammar checking engine completed checking the grammatical content of the document when it was last saved.</p> <p>If this attribute is omitted, then its value is assumed to be dirty (not complete).</p> <p>[Example: Consider a WordprocessingML document saved by a hosting application whose spelling and grammar checking engines have completed checking grammar and spelling in the given WordprocessingML document. This state is specified using the following WordprocessingML in the document settings:</p>

Attributes	Description
	<p><code>&lt;w:proofState w:spelling="clean" w:grammar="clean" /&gt;</code></p> <p>The grammar attribute has the value <code>clean</code> specifying that the hosting application's grammar checking engine completed checking the grammar of the given document when it was last saved. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Proof simple type (§2.18.76).</p>
spelling (Spell Checking State)	<p>Specifies if an application's spell checking engine completed checking the spelling of the document when it was last saved.</p> <p>If this attribute is omitted, then its value is assumed to be <code>dirty</code> (not complete).</p> <p>[<i>Example:</i> Consider a WordprocessingML document saved by a hosting application whose spelling and grammar checking engines have completed checking grammar and spelling in the given WordprocessingML document. This state is specified using the following WordprocessingML in the document settings:</p> <p><code>&lt;w:proofState w:spelling="clean" w:grammar="clean" /&gt;</code></p> <p>The spelling attribute has the value <code>clean</code> specifying that the hosting application's spell checking engine completed checking the spelling of the given document when it was last saved. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Proof simple type (§2.18.76).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Proof">
3 <attribute name="spelling" type="ST_Proof" use="optional"/>
4 <attribute name="grammar" type="ST_Proof" use="optional"/>
5 </complexType>
```

6 **2.15.1.66 readModeInkLockDown (Freeze Document Layout)**

7 This element specifies the exact set of page and text sizing parameters which shall be used to display the  
8 contents of a WordprocessingML document. [*Rationale:* This setting is typically used for documents that have  
9 been annotated using ink. This setting freezes the document's presentation such that the ink annotations shall  
10 exist at the same position of the WordprocessingML document irrespective of the monitor on which the  
11 WordprocessingML document is rendered. *end rationale*]

12 This element shall only affect the display of WordprocessingML documents as follows:

- 13 • When the `actualPage` attribute is specified with a value of `true`, the given WordprocessingML  
14 document's pages shall be rendered as they would normally be displayed. The resulting pages may have  
15 their magnification setting changed as desired. All other attributes shall be ignored.

- When the `actualPage` attribute is specified with a value of `false`, the given WordprocessingML document's pages shall be rendered as *virtual pages* when loaded by a conforming hosting application irrespective of the given WordprocessingML document's view (§2.15.1.93). *Virtual pages* are pages with no correlation with the printed layout of a given WordprocessingML document that have been scaled by a conforming hosting application to improve the readability of a given WordprocessingML document when it is displayed. Specifically, the `w` and `h` attributes specify the width and height of the virtual pages, and the `fontSz` attribute specifies the scaling to be applied to text within the given WordprocessingML document.

[*Example:* Consider a WordprocessingML document that shall be displayed using virtual pages when its contents are displayed. This state is specified using the following WordprocessingML in the document settings:

```
<w:readModeInkLockDown w:w="692" w:h="986" w:fontSz="95" w:actualPg="0"/>
```

The `readModeInkLockDown` element has `w` and `h` attribute values which specify the width and height of the virtual pages to be used to render the given WordprocessingML document. Finally, the `fontSz` attribute specifies the scaling to be applied to text within the given WordprocessingML document. *end example*]

#### Parent Elements

settings (§2.15.1.78)

Attributes	Description
<code>actualPg</code> (Use Actual Pages, Not Virtual Pages)	<p>Specifies if applications shall render this WordprocessingML document with actual pages, not virtual pages. <i>Actual pages</i> are pages rendered as they will be printed.</p> <p>A value of <code>true</code> specifies that the given WordprocessingML document's pages will be rendered as they are printed, and the <code>w</code>, <code>h</code>, and <code>fontSz</code> attributes shall be ignored. A value of <code>false</code> specifies that the given WordprocessingML document's pages shall be rendered as virtual pages using the other attributes on this element.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that shall be displayed using virtual pages. This state is specified using the following WordprocessingML in the document settings:</p> <pre>&lt;w:readModeInkLockDown w:w="692" w:h="986" w:fontSz="95" w:actualPg="0" /&gt;</pre> <p>The <code>actualPage</code> attribute is equal to <code>0</code> specifying that the given WordprocessingML document shall be rendered by conforming hosting applications using virtual pages. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>
<code>fontSz</code> (Font Size Scaling)	Specifies the percentage that text in a given WordprocessingML document shall be scaled by before it is displayed on a virtual page. The attribute's value stores the percentage

Attributes	Description
	<p>specified as an integer who units correspond to the percentage that text runs shall be scaled to [<i>Example: 200 means a scale to 200% end example</i>].</p> <p>This attribute shall only be used if the actualPage attribute equals off, 0, or false.</p> <p>[<i>Example: Consider a WordprocessingML document that shall be displayed using virtual pages. This state is specified using the following WordprocessingML in the document settings:</i></p> <pre data-bbox="451 569 1352 636">&lt;w:readModeInkLockDown w:w="692" w:h="986" w:fontSz="95" w:actualPg="0" /&gt;</pre> <p>The fontSz attribute is equal to 95 specifying that the text in the WordprocessingML document shall be displayed at 95% of its normal size when it is displayed on a virtual page. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>
h (Virtual Page Height)	<p>Specifies the height of the virtual pages which shall be used in this document. This value is specified in pixels.</p> <p>This attribute shall only be used if the actualPage attribute equals off, 0, or false.</p> <p>[<i>Example: Consider a WordprocessingML document that shall be displayed using virtual pages. This state is specified using the following WordprocessingML in the document settings:</i></p> <pre data-bbox="451 1220 1352 1287">&lt;w:readModeInkLockDown w:w="692" w:h="986" w:fontSz="95" w:actualPg="0" /&gt;</pre> <p>The h attribute is equal to 986 specifying that virtual pages in this document shall be 986 pixels high. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PixelsMeasure simple type (§2.18.74).</p>
w (Virtual Page Width)	<p>Specifies the width of the virtual pages which shall be used in this document. This value is specified in pixels.</p> <p>This attribute shall only be used if the actualPage attribute equals off, 0, or false.</p> <p>[<i>Example: Consider a WordprocessingML document that shall be displayed using virtual pages. This state is specified using the following WordprocessingML in the document settings:</i></p> <pre data-bbox="451 1833 1352 1900">&lt;w:readModeInkLockDown w:w="692" w:h="986" w:fontSz="95" w:actualPg="0" /&gt;</pre>

Attributes	Description
	<p>The w attribute is equal to 692 specifying that virtual pages in this document shall be 692 pixels wide. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PixelsMeasure simple type (§2.18.74).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ReadingModeInkLockDown">
 <attribute name="actualPg" type="ST_OnOff" use="required"/>
 <attribute name="w" type="ST_PixelsMeasure" use="required"/>
 <attribute name="h" type="ST_PixelsMeasure" use="required"/>
 <attribute name="fontSz" type="ST_DecimalNumber" use="required"/>
</complexType>

```

#### 2.15.1.67 [removeDateAndTime \(Remove Date and Time from Annotations\)](#)

This element specifies that the date and time information shall be removed from all annotations which are present in the current document when it is saved. Annotations store this information in the date attribute on the annotation's XML element.

If this element is omitted, then date information shall not be removed when the document is saved. If the removePersonalInformation element is not turned on, then this setting shall be ignored.

[*Example:* Consider a WordprocessingML document that shall not save date and time information on annotations in the document content. This state is specified using the following WordprocessingML in the document settings:

```

<w:settings>
 ...
 <w:removePersonalInformation w:val="true" />
 <w:removeDateAndTime w:val="true" />
 ...
</w:settings>

```

The removeDateAndTime element's val attribute has a value of true specifying that all annotations in the document shall have and date and time information removed before they are saved by omitting their date attributes. *end example*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.1.68 [removePersonalInformation \(Remove Personal Information from Document Properties\)](#)

This element specifies that hosting applications shall remove all personal information of document authors upon saving a given WordprocessingML document. The definition and extent of personal information is not defined by this Office Open XML Standard.

If this element is omitted, then personal information shall not be removed when the document is saved.

[Example: Consider a WordprocessingML document that shall not save personal information in the document. This state is specified using the following WordprocessingML in the document settings:

```
<w:removePersonalInformation w:val="true" />
```

The removePersonalInformation element's val attribute has a value of true specifying that applications shall remove any personal information when saving this file. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the</p>

Attributes	Description
	<p>default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of <code>off</code>, <code>0</code>, or <code>false</code> specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The <code>val</code> attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 2.15.1.69 revisionView (Visibility of Annotation Types)

6 This element specifies which forms of annotations shall be visible for a WordprocessingML document when it is  
7 displayed. This setting shall not affect whether annotations are added or persisted, it shall only affect the display  
8 of the annotations which exist in the document's contents (persisted or in memory).

9 If this element is omitted, then all forms of annotations shall be visible.

10 [*Example:* Consider the WordprocessingML below specifying that only formatting and ink annotations within a  
11 given WordprocessingML document shall be displayed when the document is opened:

```
12 <w:revisionView w:markup="false" w:comments="false" w:insDel="false" />
```

13 The `revisionView` element specifies that the visibility of the markup region, comments and content  
14 additions/deletions shall be suppressed by setting a value of `false`. Since the `formatting` and `inkAnnotation`  
15 attributes are omitted, they inherit the default of `true` and shall be displayed. *end example*]

Parent Elements
settings (§2.15.1.78)

16

Attributes	Description
comments (Display Comments)	<p>Specifies if comments should be included when the contents of this document are displayed.</p> <p>If this attribute is omitted, then comments shall be displayed when annotations are visible based on application-level settings.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider the WordprocessingML below specifying that comments shall be displayed:</p> <pre>&lt;w:revisionView w:comments="true" /&gt;</pre> <p>The comments attribute has a value of <code>true</code>, specifying that comments shall be rendered when the document's annotations are displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
formatting (Display Formatting Revisions)	<p>Specifies if revisions to properties (i.e. formatting revisions) should be included when the contents of this document are displayed.</p> <p>If this attribute is omitted, then formatting revisions shall be displayed when annotations are visible based on application-level settings.</p> <p>[<i>Example:</i> Consider the WordprocessingML below specifying that formatting revisions shall be displayed:</p> <pre>&lt;w:revisionView w:formatting="true" /&gt;</pre> <p>The formatting attribute has a value of <code>true</code>, specifying that formatting revisions shall be rendered when the document's annotations are displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
inkAnnotations (Display Ink Annotations)	<p>Specifies if ink annotations, specified in VML syntax (§6.1), should be included when the contents of this document are displayed.</p> <p>If this attribute is omitted, then ink annotations shall be displayed when annotations are visible based on application-level settings.</p> <p>[<i>Example:</i> Consider the WordprocessingML below specifying that ink annotations shall be displayed:</p> <pre>&lt;w:revisionView w:inkAnnotations="true" /&gt;</pre> <p>The inkAnnotations attribute has a value of <code>true</code>, specifying that ink annotations shall be rendered when the document's annotations are displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
insDel (Display Content Revisions)	<p>Specifies if revisions to content (i.e. insertions, deletions, and moves) should be included when the contents of this document are displayed.</p> <p>If this attribute is omitted, then insertions, deletions, and moves shall be displayed when annotations are visible based on application-level settings.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider the WordprocessingML below specifying that insertions, deletions, and moves shall be displayed:</p> <p><code>&lt;w:revisionView w:insDel="true" /&gt;</code></p> <p>The insDel attribute has a value of true, specifying that insertions, deletions, and moves shall be rendered when the document's annotations are displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
markup (Display Visual Indicator Of Markup Area)	<p>Specifies if the application shall visually indicate any additional non-printing area used to display annotations when the annotations in this document are displayed.</p> <p>If this attribute is omitted, then any additional non-printing area shall be indicated when they are visible based on application-level settings.</p> <p>[<i>Example:</i> Consider the WordprocessingML below specifying that no visual indicator shall be displayed for non-printing regions holding annotations:</p> <p><code>&lt;w:revisionView w:markup="false" /&gt;</code></p> <p>The markup attribute has a value of false, specifying that nothing shall be rendered indicating when a non-printing region is added when the document's annotations are displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TrackChangesView">
3 <attribute name="markup" type="ST_OnOff" use="optional"/>
4 <attribute name="comments" type="ST_OnOff" use="optional"/>
5 <attribute name="insDel" type="ST_OnOff" use="optional"/>
6 <attribute name="formatting" type="ST_OnOff" use="optional"/>
7 <attribute name="inkAnnotations" type="ST_OnOff" use="optional"/>
8 </complexType>
```

9 **2.15.1.70 rsid (Single Session Revision Save ID)**

10 This element specifies the revision save ID that was associated with a single editing session for a document. An  
11 editing session is a span of time that begins and ends with any event that produces an editable file, such as a  
12 save or an e-mail send, and contains no such event. When revision save IDs are added to a document, they shall  
13 follow these rules:

- 14 • Every editing session shall be assigned a revision save ID that is larger than all earlier ones in the same  
15 file

- Revision save IDs should be randomly generated based on the current time (to minimize the chance that two disparate editing sessions starting with the same immediate predecessor are assigned the same revision save ID)
- Changes to document content in an editing session shall be stamped with the current revision save ID using the appropriate rsid\* attributes
- An identical rsid value between two documents with the same rsidRoot (§2.15.1.71) shall indicate the same editing sessions

[*Note:* A revision save ID should be treated as unique within the context of all documents with the same rsidRoot value. Although in practice it is possible for two independent sessions to result in the same value, this outcome is extremely rare as the values are based on the current time. However, the meaning of two revision save IDs is not defined for documents with a different rsidRoot. Applications may use this information as desired. *end note*]

[*Example:* Consider the following fragments from two WordprocessingML documents' document settings:

Document 1	Document 2
<pre>&lt;w:rsids&gt;   &lt;w:rsidRoot w:val="00464813"/&gt;   &lt;w:rsid w:val="00455AAB" /&gt;   &lt;w:rsid w:val="00464813" /&gt;   &lt;w:rsid w:val="00996E03" /&gt; &lt;/w:rsids&gt;</pre>	<pre>&lt;w:rsids&gt;   &lt;w:rsidRoot w:val="00464813"/&gt;   &lt;w:rsid w:val="00455AAB" /&gt;   &lt;w:rsid w:val="00464813" /&gt;   &lt;w:rsid w:val="00473403" /&gt;   &lt;w:rsid w:val="0048414E" /&gt; &lt;/w:rsids&gt;</pre>

The rsid elements are identical for the first three editing sessions for both documents, indicating that these documents, although they are now separate, originated from the same document. The documents were then separated and the first was saved once afterwards; and the second, twice. *end example*]

Parent Elements
rsids (§2.15.1.72)

Attributes	Description
val (Long Hexadecimal Number Value)	<p>Specifies a number value specified as a four digit hexadecimal number), whose contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following value for an attribute of type ST_LongHexNumber: 00BE2C6C.</p> <p>This value is valid, as it contains four hexadecimal digits, each an encoding of an octet of the actual decimal number value. It may therefore be interpreted as desired in the context of the parent XML element, <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_LongHexNumber simple type (§2.18.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LongHexNumber">
 <attribute name="val" type="ST_LongHexNumber" use="required"/>
</complexType>
```

#### 2.15.1.71 rsidRoot (Original Document Revision Save ID)

This element specifies the revision save ID which was associated with the first editing session for this document.

[Note: This information shall be identical between any number of copies of the same document, as they all originate from the same original editing session. Applications may use this information as desired. *end note*]

If this element is omitted, then the original document revision save ID is unknown.

[Example: Consider the following fragments from two WordprocessingML documents' document settings:

Document 1	Document 2
<pre>&lt;w:rsids&gt;   &lt;w:rsidRoot w:val="00464813"/&gt;   &lt;w:rsid w:val="00455AAB" /&gt;   &lt;w:rsid w:val="00464813" /&gt;   &lt;w:rsid w:val="00996E03" /&gt; &lt;/w:rsids&gt;</pre>	<pre>&lt;w:rsids&gt;   &lt;w:rsidRoot w:val="00464813"/&gt;   &lt;w:rsid w:val="00455AAB" /&gt;   &lt;w:rsid w:val="00464813" /&gt;   &lt;w:rsid w:val="00473403" /&gt;   &lt;w:rsid w:val="0048414E" /&gt; &lt;/w:rsids&gt;</pre>

The rsidRoot element's val attribute has a value of 00464813 for both documents, indicating that these documents, although they are now separate, originated from the same document. This information may be used as desired. *end example*]

Parent Elements
rsids (§2.15.1.72)

Attributes	Description
val (Long Hexadecimal Number Value)	<p>Specifies a number value specified as a four digit hexadecimal number), whose contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following value for an attribute of type ST_LongHexNumber: 00BE2C6C.</p> <p>This value is valid, as it contains four hexadecimal digits, each an encoding of an octet of</p>

Attributes	Description
	the actual decimal number value. It may therefore be interpreted as desired in the context of the parent XML element, <i>end example</i>
	The possible values for this attribute are defined by the ST_LongHexNumber simple type (§2.18.57).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_LongHexNumber">
3 <attribute name="val" type="ST_LongHexNumber" use="required"/>
4 </complexType>
```

5 **2.15.1.72 rsids (Listing of All Revision Save ID Values)**

6 This element specifies the set of revision save ID values for the current document. *Revision save ID values* refer  
7 to four digit hexadecimal values which uniquely identify an editing session in the life of the current document.  
8 An *editing session* is the period of time between two subsequent save operations by an application.

9 [Guidance: The set of revision save IDs stored with a document only supplies information about the editing  
10 session in which document components were last saved, which may be used by applications in any manner  
11 desired. *end guidance*]

12 If this element is omitted, then no information is available about the set of revision save ID values for this  
13 document.

14 [Example: Consider a WordprocessingML document with the following information present in its document  
15 settings:

```
16 <w:rsids>
17 <w:rsidRoot w:val="00464813" />
18 <w:rsid w:val="00455AAB" />
19 <w:rsid w:val="00464813" />
20 <w:rsid w:val="00473403" />
21 </w:rsids>
```

22 The rsids element contains four child elements, specifying that the document was edited over four distinct  
23 editing sessions (i.e. it was saved three times). *end example*]

Parent Elements
settings (§2.15.1.78)

24

Child Elements	Subclause
rsid (Single Session Revision Save ID)	§2.15.1.70
rsidRoot (Original Document Revision Save ID)	§2.15.1.71

Parent Elements

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <code>&lt;complexType name="CT_OnOff"&gt;</code>
4 <code>  &lt;attribute name="val" type="ST_OnOff"/&gt;</code>
5 <code>&lt;/complexType&gt;</code>

6 2.15.1.74 [saveInvalidXml \(Allow Saving Document As XML File When Custom XML Markup Is Invalid\)](#)

7

8 This element specifies that this document should be capable of being saved into a format consisting of a single

9 XML file (not defined by this Office Open XML Standard) when its contents are invalid based on the custom XML

10 markup contained in the document. This setting has no effect on documents that do not contain custom XML

11 markup, or that do contain custom XML markup but do not have a schema attached. [Guidance: Because this

12 setting specifies behavior when saving to an alternative file format not defined by this Office Open XML

13 Standard, this behavior is optional. *end guidance*]

14 If this element is omitted, then applications should not allow this document to be saved into a single XML file

15 when its contents are invalid based on the custom XML markup contained in the document. If the

16 doNotValidateAgainstSchema element (§2.15.1.42) is set, then the XML is never "invalid" and this property is

17 ignored.

18 [Example: Consider a WordprocessingML document which should be saved into a single XML file even when its

19 custom XML content is marked invalid by applications which support this operation. This requirement is

20 specified using the following WordprocessingML in the document settings:

21 `<w:saveInvalidXml w:val="true" />`

1 The saveInvalidXml element's val attribute has a value of true specifying that the content in this document can  
2 be saved regardless of its validation status. *end example*]

Parent Elements
settings (§2.15.1.78)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4 The following XML Schema fragment defines the contents of this element:

<pre>&lt;complexType name="CT_OnOff"&gt;   &lt;attribute name="val" type="ST_OnOff"/&gt; &lt;/complexType&gt;</pre>
-----------------------------------------------------------------------------------------------------------------------------

8 **2.15.1.75 savePreviewPicture (Generate Thumbnail For Document On Save)**

9 This element specifies if a document's Thumbnail part should be generated for the contents of the first page of  
10 this document when saved by application which support document thumbnail generation.

11 If this element is omitted, then applications may choose to save a thumbnail, however, that behavior is not  
12 required. If this element is specified, a thumbnail must be produced if that functionality is supported.

13 [*Example:* Consider a WordprocessingML document that specifies that a document thumbnail shall always be  
14 created when it is saved. This requirement would be specified using the following WordprocessingML in the  
15 document settings part:

```
<w:savePreviewPicture w:val="true"/>
```

17 The savePreviewPicture element's val attribute has a value of true specifying that a document thumbnail  
18 should be generated each time this document is saved. *end example*]

Parent Elements
-----------------

Parent Elements
settings (§2.15.1.78)

1

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <code>&lt;complexType name="CT_OnOff"&gt;</code>
4 <code>  &lt;attribute name="val" type="ST_OnOff"/&gt;</code>
5 <code>&lt;/complexType&gt;</code>

6 **2.15.1.76**      **saveThroughXslt (Custom XSL Transform To Use When Saving As XML File)**

7 This element specifies the location of a custom XSL transform which shall be used when this document is saved  
8 as a single XML file (in a format not defined by this Office Open XML Standard). [Guidance: Because this setting  
9 specifies behavior when saving to an alternative file format not defined by this Office Open XML Standard, this  
10 behavior is optional. *end guidance*]

11 If this element is omitted, then no custom XSL transform shall be used when saving this file as a single XML file.  
12 If the useXSLTWhenSaving element (§2.15.1.92) is omitted or set to false, then this transform shall not be  
13 applied when the document is saved as a single XML file.

14 [Example: Consider a XML document that shall have the XSL transform applied when the document is saved as a  
15 single XML file. This requirement would be specified using the following WordprocessingML in the document  
16 settings:

```
17 <w:useXSLTWhenSaving w:val="on"/>
18 <w:saveThroughXslt r:id="rId5" />
```

- 1 The useXSLTWhenSaving element's val is set to on indicating that applications shall apply the XSLT specified by  
 2 the relationship targeted by the id attribute of the saveThroughXslt element, located at rId5, when saving as a  
 3 single XML file. *end example]*

Parent Elements
settings (§2.15.1.78)

4

Attributes	Description
id (XSL Transformation Location)  Namespace: .../officeDocument/2006/relationships	<p>Specifies an explicit relationship to the location of the XSL Transformation which shall be applied.</p> <p>The relationship targeted by this element shall be of type <code>http://schemas.openxmlformats.org/officeDocument/2006/relationships/transform</code>, or this document shall be declared invalid.</p> <p>[<i>Example:</i> Consider a XML document that shall have the XSL transform located at <code>c:\Example Transform.xslt</code> applied when the document is saved as a single XML file. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre>&lt;w:saveThroughXslt r:id="rId5" /&gt;</pre> <p>The saveThroughXslt element specifies that the relationship located at rId5 shall be used when saving as a single XML file in this case, that relationship shall target <code>c:\Example Transform.xslt</code>. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
solutionID (Local Identifier for XSL Transform)	<p>Specifies a string identifier which may be used to locate the XSL transform to be applied. The semantics of this attribute are not defined by this Office Open XML Standard - applications may use this information in any application-defined manner to resolve the location of the XSL transform to apply.</p> <p>If this attribute is omitted, then no local identifier is specified for the XSL transform. If both this and the xslt attributes are present, then this data shall be used first, and the latter shall only be used if this information cannot be used successfully.</p> <p>[<i>Example:</i> Consider a XML document that shall have the XSL transform identified by <code>mySolution</code> applied to when the document is saved as a single XML file. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre>&lt;w:saveThroughXslt w:solutionID="mySolution" /&gt;</pre> <p>The solutionID attribute has a value of <code>mySolution</code> indicating that applications shall</p>

Attributes	Description
	<p>apply the XSLT identified by this value (if known) when saving as a single XML file. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SaveThroughXslt">
 <attribute ref="r:id" use="optional"/>
 <attribute name="solutionID" type="ST_String" use="optional"/>
</complexType>
```

#### 2.15.1.77 saveXmlDataOnly (Only Save Custom XML Markup)

This element specifies that the contents of this document shall be saved as an XML file containing only the custom XML markup in this document in its regular form. The resulting document will not conform to this Office Open XML Standard (i.e. this is an export-only save option for a WordprocessingML document).

[*Rationale*: This setting is typically used to extract custom XML markup from a WordprocessingML document for further processing by XML-enabled applications. *end rationale*]

If this element is omitted, then the contents of the entire document (not just custom XML markup) should be saved according to the definition of WordprocessingML in this Office Open XML Standard.

[*Example*: Consider a WordprocessingML document which should be saved as an XML file containing only its custom XML markup. This requirement is specified using the following WordprocessingML fragment in the document settings:

```
<w:saveXmlDataOnly w:val="true"/>
```

The saveXmlDataOnly element's val attribute has a value of true specifying that only custom XML shall be saved into a regular XML file when saving this document. For example, the document body formerly looked like this:

```
<w:body>
 <w:p>
 <w:customXml w:element="root" w:namespaceuri="urn:example">
 <w:r>
 <w:t>Hello world<w:t>
 </w:r>
 </w:customXml>
 </w:p>
</w:body>
```

The presence of this element specifies that the resulting document only contains the custom Xml markup, resulting in the following:

1       <ns0:root xmlns:ns0="urn:example">Hello world</ns0:root>  
2   *end example]*

Parent Elements
settings (§2.15.1.78)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;">&lt;w:... w:val="off" /&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4   The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_OnOff">
6 <attribute name="val" type="ST_OnOff"/>
7 </complexType>
```

8   2.15.1.78       settings (Document Settings)

9   This element specifies the settings that are applied to a WordprocessingML document. This element is the root  
10 element of the Document Settings part in a WordprocessingML document.

11 [*Example:* Consider the following WordprocessingML fragment for the settings part of a document:

```
12 <w:settings>
13 <w:defaultTabStop w:val="720" />
14 <w:characterSpacingControl w:val="dontCompress" />
15 </w:settings>
```

16   The settings element contains all of the settings for this document. In this case, the two settings applied are  
17 automatic tab stop increments of 0.5" using the defaultTabStop element, and no character level whitespace  
18 compression using the characterSpacingControl element. *end example]*

```

2.15.1.79      **shapeDefaults (Default Properties for VML Objects in Main Document)**

This element specifies the default parameters for object using the VML syntax (§6.1) inserted in the body (the main document story, comments, footnotes, and endnotes) of the WordprocessingML document. The definition and semantics of these parameters is described in the VML - Office Drawing subclause (§6.2) of this Office Open XML Standard.

If this element is omitted, then no default properties are applied to VML objects in the body of this document.

[Example: Consider a WordprocessingML document whose document settings contain the following markup:

```
<w:shapeDefaults>
 <o:shapedefaults v:ext="edit" spidmax="1026" />
 <o:shapelayout v:ext="edit">
 <o:idmap v:ext="edit" data="1" />
 </o:shapelayout>
</w:shapeDefaults>
```

The shapeDefaults element specifies a set of shape defaults which shall be applied to the set of all shapes present in the body document. *end example]*

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
Any element from the urn:schemas-microsoft-com:office:office namespace	§6.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeDefaults">
 <choice maxOccurs="unbounded">
 <any processContents="lax" namespace="urn:schemas-microsoft-com:office:office" minOccurs="0"
 maxOccurs="unbounded"/>
 </choice>
</complexType>
```

2.15.1.80      **showEnvelope (Show E-Mail Message Header)**

This element specifies that an e-mail message header shall be displayed when this document is opened, if an e-mail header is supported by the application opening the file.

If this element is omitted, then applications shall not display the e-mail message header automatically when this file is opened, even if one is available in the application opening the file.

[Example: Consider a WordprocessingML document which should show an e-mail message header when opened. This requirement is specified using the following WordprocessingML in the document settings:

`<w:showEnvelope w:val="true" />`

The showEnvelope element's val attribute has a value of true specifying that an e-mail message header shall be displayed when the document is viewed, whenever such functionality is available. *end example*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.1.81 showXMLTags (Show Visual Indicators for Custom XML Markup Start/End Locations)

This element specifies that some visual indicator shall be provided for the start and end locations of custom XML markup present in this document, if any.

If this element is omitted, then applications should not provide any visual indicator of the locations of custom XML markup start/end tags.

[Example: Consider a WordprocessingML document which should show a visual indicator to the location of custom XML markup elements. This requirement is specified using the following WordprocessingML in the document settings:

`<w:showXMLTags w:val="true" />`

1 The showXMLTags element's val attribute has a value of true specifying that custom XML markup should have  
2 a visual indicator in the document when displayed. *end example*]

Parent Elements
settings (§2.15.1.78)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_OnOff">
6 <attribute name="val" type="ST_OnOff"/>
7 </complexType>
```

8 **2.15.1.82 smartTagType (Supplementary Smart Tag Information)**

9 This element specifies optional supplementary information about one or more smart tags (§2.5.1.9) used in the  
10 current WordprocessingML document. This supplementary data is linked to the smart tag to which it applies via  
11 its name and namespaceuri attributes.

12 [*Example:* Consider a smart tag which has supplementary information defined as using the following  
13 WordprocessingML:

```
14 <w:smartTagType w:name="companyName" w:namespaceuri="urn:smartTagExample"
15 w:url="http://www.contoso.com/smartTag" >
```

16 The name and namespaceuri attributes specify that the smart tag to which this data shall be companyName in  
17 the urn:smartTagExample namespace. The supplementary data is an associated URL of  
18 http://www.contoso.com/smartTag. *end example*]

Parent Elements
-----------------

Parent Elements
settings (§2.15.1.78)

1

Attributes	Description
name (Smart Tag Name)	<p>Specifies the name of the smart tag within the document for which supplementary data is provided.</p> <p>[<i>Example:</i> Consider a smart tag which has a name of <code>companyName</code>. This name would be referenced using the following WordprocessingML:</p> <pre>&lt;w:smartTagType w:name="companyName" ... &gt;</pre> <p>The name attribute specifies that the name for this smart tag shall be <code>companyName</code>. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
namespaceuri (Smart Tag Namespace)	<p>Specifies the namespace URI of the smart tag for which supplementary data is provided.</p> <p>If this attribute is omitted, the URI shall be assumed to be null (no associated URI).</p> <p>[<i>Example:</i> Consider a smart tag which shall have a namespace URI of <code>urn:smartTagExample</code>. This namespace would be referenced using the following WordprocessingML:</p> <pre>&lt;w:smartTagType w:namespaceuri="urn:smartTagExample" /&gt;</pre> <p>The namespaceuri attribute specifies that the namespace for the smart tag to which this data applies shall be <code>urn:smartTagExample</code>. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
url (Smart Tag Supplementary URL)	<p>Specifies a URL provided for a particular smart tag type in this document. [<i>Note:</i> This URL is typically used to provide access to a URL for additional updates to this smart tag type as requested by the smart tag provider. <i>end note</i>]</p> <p>If this attribute is omitted, then no supplementary URL is provided for this type.</p> <p>[<i>Example:</i> Consider a smart tag which shall have a supplementary URL of <code>http://www.contoso.com/smartTag</code>. This URL would be specified using the following WordprocessingML:</p> <pre>&lt;w:smartTagType ... w:url="http://www.contoso.com/smartTag" /&gt;</pre> <p>The url attribute specifies that the supplementary data for the smart tag to which this data applies shall be <code>http://www.contoso.com/smartTag</code>. <i>end example</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTagType">
 <attribute name="namespaceuri" type="ST_String"/>
 <attribute name="name" type="ST_String"/>
 <attribute name="url" type="ST_String"/>
</complexType>
```

#### 2.15.1.83 strictFirstAndLastChars (Use Strict Kinsoku Rules for Japanese Text)

This element specifies that the strict set of Kinsoku rules shall be applied to Japanese text in this document when the kinsoku element (§2.3.1.16) is applied to that text. The resulting line breaking rules are provided on the kinsoku element.

If this element is omitted, then standard rules shall apply to Japanese text when the kinsoku element is applied to that text.

[*Example:* Consider a WordprocessingML document that specifies that strict Kinsoku rules shall be applied to Japanese text. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:strictFirstAndLastChars w:val="true"/>
```

The strictFirstAndLastChars element's val attribute has a value of true specifying that a document shall apply the strict set of invalid characters for the start and end of a line. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.1.84 styleLockQFSet (Prevent Replacement of Styles Part)

This element specifies whether applications shall prevent the replacement of the complete set of styles stored in the Styles part when editing this document. This setting should not preclude the editing or removal of individual styles, instead, it should only prevent the removal and replacement of the entire styles part in a single operation (either through a user interface or a programmatic operation).

If this element is omitted, then applications may allow the replacement of the entire styles part in this document.

[*Example:* Consider a WordprocessingML document that specifies that applications shall prevent the replacement of the entire styles part. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:styleLockQFSet w:val="true"/>
```

The styleLockQFSet element's val attribute has a value of true specifying that individual style changes should be allowed, but the styles data shall not be replaced as a whole via a single operation. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.1.85 styleLockTheme (Prevent Modification of Themes Part)

This element specifies whether applications shall prevent the modification of the document's theme information stored in the Theme part when editing this document. This setting should not preclude the use of the theme information, instead, it should only prevent the modification of the theme part in a single operation (either through a user interface or a programmatic operation).

If this element is omitted, then applications may allow the replacement or modification of the theme part in this document.

[*Example:* Consider a WordprocessingML document that specifies that applications shall prevent the modification of the theme part. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:styleLockTheme w:val="true"/>
```

The styleLockTheme element's val attribute has a value of true specifying that theme data shall not be modified when modifying the contents of this document. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 2.15.1.86 stylePaneFormatFilter (Suggested Filtering for List of Document Styles)

6 This element specifies a set of suggested filters which should be applied to the list of document styles in this  
7 application if the styles are displayed in a user interface.

8 The val attribute of this element contains a bitmask of the following filtering options:

Value	Description
0x0001	Specifies that all styles present in the styles part should be displayed in the list of document styles.
0x0002	Specifies that only styles with the customStyle attribute should be displayed in the list of document styles.
0x0004	Specifies that all latent styles should be displayed in the list of document styles.
0x0008	Specifies that only styles used in the document should be displayed in the list of document styles.
0x0010	Undefined. Shall not be used.
0x0020	Specifies that heading styles (styles with a styleId of Heading1 to Heading9) should be displayed in the list of document styles when the previous style is used in the document and/or is present in the styles part.
0x0040	Specifies that numbering styles should be displayed in the list of document styles.
0x0080	Specifies that table styles should be displayed in the list of document styles.
0x0100	Specifies that all unique forms of run-level direct formatting should be displayed in the list of document styles as though they were each a unique style.
0x0200	Specifies that all unique forms of paragraph-level direct formatting should be displayed in the list of document styles as though they were each a unique style.
0x0400	Specifies that all unique forms of direct formatting of numbering data should be displayed in the list of document styles as though they were each a unique style.
0x0800	Specifies that all unique forms of direct formatting of tables should be displayed in the list of document styles as though they were each a unique style.
0x1000	Specifies that a style should be present which removes all formatting and styles from text.
0x2000	Specifies that heading styles with a styleId of Heading1 to Heading3 should always be displayed in the list of document styles.
0x4000	Specifies that styles should only be shown the semiHidden element (§2.7.3.16) is false

Value	Description
	and the hidden element (§2.7.3.4) is false.
0x8000	Specifies that primary names for styles should not be shown if an alternate name using the name element (§2.7.3.9) exists.
Any other value	Undefined. Shall not be used.

If this element is omitted, then all settings defined by this element are turned off.

[*Example:* Consider a document with the following value in its document settings:

```
<w:stylePaneFormatFilter w:val="2002" />
```

The stylePaneFormatFilter element's settings specify two suggested filter options for the list of document styles:

- Only custom styles should be shown (0002)
- Heading styles with a styleId of Heading1 to Heading3 should always be displayed in the list (2000)

*end example]*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Two Digit Hexadecimal Value)	<p>Specifies a value specified as a two digit hexadecimal number), whose contents are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre>&lt;w:tblPr&gt;   &lt;w:tblLook w:val="0010" /&gt; &lt;/w:tblPr&gt;</pre> <p>The value of 0010 is interpreted in the context of the parent element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_ShortHexNumber simple type (§2.18.86).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShortHexNumber">
 <attribute name="val" type="ST_ShortHexNumber" use="required"/>
</complexType>
```

### 2.15.1.87 stylePaneSortMethod (Suggested Sorting for List of Document Styles)

This element specifies a suggested sorting which should be applied to the list of document styles in this application if the styles are displayed in a user interface.

The val attribute of this element specifies one of the following sorting options:

Value	Description
0x0000	Specifies that styles which are visible should be sorted by their names.
0x0001	Specifies that styles which are visible should be sorted by their UI priority using the uiPriority element (§2.7.3.19).
0x0002	Specifies that styles which are visible should be sorted by the default sorting of the host application.
0x0003	Specifies that styles which are visible should be sorted by the font which they apply.
0x0004	Specifies that styles which are visible should be sorted by the style on which they are based using the basedOn element (§2.7.3.3).
0x0005	Specifies that styles which are visible should be sorted by their style types (i.e. character, linked, paragraph).
Any other value	Undefined. Shall not be used.

If this element is omitted, then styles which are visible should be sorted by the default sorting of the host application.

[*Example:* Consider a document with the following value in its document settings:

```
<w:stylePaneSortMethod w:val="0005" />
```

The stylePaneFormatFilter element's val attribute specifies that styles which are visible should be sorted by their style types (i.e. character, linked, paragraph) via a value of 0005. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (Two Digit Hexadecimal Value)	<p>Specifies a value specified as a two digit hexadecimal number), whose contents are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre>&lt;w:tblPr&gt;   &lt;w:tblLook w:val="0010" /&gt;</pre>

Attributes	Description
	<p>&lt;/w:tblPr&gt;</p> <p>The value of 0010 is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ShortHexNumber simple type (§2.18.86).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_ShortHexNumber">
3 <attribute name="val" type="ST_ShortHexNumber" use="required"/>
4 </complexType>
```

5 **2.15.1.88 summaryLength (Percentage of Document to Use When Generating Summary)**

6 This element specifies the size for automatic document summaries performed on the content of a  
7 WordprocessingML document. An *automatic document summary* is a subset of text contained in a document  
8 deemed by the hosting application to summarize the content of the WordprocessingML document. The val  
9 attribute of this element specifies the size of an automatic document summary to be performed on a given  
10 WordprocessingML document as a percentage of the total size of the given WordprocessingML document.  
11 Performing an automatic document summary is a runtime operation outside the scope of this Office Open XML  
12 Standard.

13 If this element is omitted, then applications may summarize this document to any desired size.

14 [Example: Consider a WordprocessingML document whose automatic document summary shall be ten percent  
15 of the size of the given WordprocessingML document. This requirement would be specified using the following  
16 WordprocessingML in the document settings part:

```
17 <w:summaryLength w:val="10" />
```

18 The summaryLength element's val attribute is equal to 10 specifying that any automatic document summary  
19 shall be ten percent of the size of the document. *end example*]

Parent Elements
settings (§2.15.1.78)

20

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p>

Attributes	Description
	<p>&lt;w:... w:val="1512645511" /&gt;</p> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_DecimalNumber">
3 <attribute name="val" type="ST_DecimalNumber" use="required"/>
4 </complexType>
```

5 **2.15.1.89 themeFontLang (Theme Font Languages)**

6 This element specifies the language which shall be used to determine the appropriate theme fonts in the  
7 document's Theme part which map to the major/minor theme fonts.

8 These mappings are performed as follows:

- 9 • For majorAscii/majorHAnsi, locate the font element (§5.1.4.1.16) in the majorFont element  
10 (§5.1.4.1.24) in the theme part for the language specified by the val attribute
- 11 • For majorBidi, locate the font element in the majorFont element in the theme part for the language  
12 specified by the bidi attribute
- 13 • For majorEastAsia, locate the font element in the majorFont element in the theme part for the  
14 language specified by the eastAsia attribute
- 15 • For minorAscii/minorHAnsi, locate the font element in the minorFont element (§5.1.4.1.25) in the  
16 theme part for the language specified by the val attribute
- 17 • For minorBidi, locate the font element in the minorFont element in the theme part for the language  
18 specified by the bidi attribute
- 19 • For minorEastAsia, locate the font element in the minorFont element in the theme part for the  
20 language specified by the eastAsia attribute

21 If this element is omitted, then the default fonts for each region as specified by the latin, ea, and cs elements  
22 (§5.1.5.3.7; §5.1.5.3.3; §5.1.5.3.1) should be used.

23 [Example: Consider a document with the following WordprocessingML in its document settings:

```
24 <w:themeFontLang w:val="ja-JP" />
```

25 The themeFontLang element's val attribute has a value of ja-JP, specifying that the theme fonts used for Latin  
26 text shall be the theme fonts for Japanese. If the following content was present in the theme part:

```
1 ...
2 <a:majorFont>
3 ...
4 <a:font script="Jpan" typeface="MS Mincho"/>
5 ...
6 </a:majorFont>
7 ...
```

8 Then this setting would specify that uses of the majorAscii and majorHAnsi theme font enumerations shall be  
9 mapped to the MS Mincho font. *end example*]

10

Parent Elements
settings (§2.15.1.78)

Attributes	Description
bidi (Complex Script Language)	<p>Specifies the language which shall be used when processing the contents of this run which use complex script characters, as determined by the Unicode character values of the run content.</p> <p>If this attribute is omitted, then the languages for the contents of this run using complex script characters shall be automatically determined based on their contents using any appropriate method.</p> <p>[<i>Example:</i> Consider a run which contains complex script characters in its contents. If those contents should be interpreted as Hebrew, that requirement would be specified as follows in the resulting WordprocessingML:</p> <pre>&lt;w:r&gt;   &lt;w:rPr&gt;     &lt;w:lang w:bidi="he-IL" /&gt;   &lt;/w:rPr&gt; &lt;/w:r&gt;</pre> <p>The resulting run specifies that any complex script contents shall be spell and grammar checked using a Hebrew dictionary and grammar engine, if one is available. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).</p>
eastAsia (East Asian Language)	<p>Specifies the language which shall be used when processing the contents of this run which use East Asian characters, as determined by the Unicode character values of the run content.</p> <p>If this attribute is omitted, then the languages for the contents of this run using East Asian characters shall be automatically determined based on their contents using any appropriate method.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a run which contains East Asian characters in its contents. If those contents should be interpreted as Korean, that requirement would be specified as follows in the resulting WordprocessingML:</p> <pre>&lt;w:r&gt;   &lt;w:rPr&gt;     &lt;w:lang w:bidirectional="ko-KR" /&gt;   &lt;/w:rPr&gt; &lt;/w:r&gt;</pre> <p>The resulting run specifies that any complex script contents shall be spell and grammar checked using a Korean dictionary and grammar engine, if one is available. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).</p>
val (Latin Language)	<p>Specifies the language which shall be used to check spelling and grammar (if requested) when processing the contents of this run which use Latin characters, as determined by the Unicode character values of the run content.</p> <p>If this attribute is omitted, then the languages for the contents of this run using Latin characters shall be automatically determined based on their contents using any appropriate method.</p> <p>[<i>Example</i>: Consider a run which contains Latin characters in its contents. If those contents should be interpreted as English (Canada), that requirement would be specified as follows in the resulting WordprocessingML:</p> <pre>&lt;w:r&gt;   &lt;w:rPr&gt;     &lt;w:lang w:bidirectional="en-CA" /&gt;   &lt;/w:rPr&gt; &lt;/w:r&gt;</pre> <p>The resulting run specifies that any complex script contents shall be spell and grammar checked using a English (Canada) dictionary and grammar engine, if one is available. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Lang simple type (§2.18.51).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Language">
3 <attribute name="val" type="ST_Lang" use="optional"/>
4 <attribute name="eastAsia" type="ST_Lang" use="optional"/>
5 <attribute name="bidi" type="ST_Lang" use="optional"/>
6 </complexType>
```

### 2.15.1.90 `trackRevisions` (Track Revisions to Document)

This element specifies that applications shall track revisions made to the WordprocessingML document.

*Revisions* are changes to a WordprocessingML document which are recorded such that they can be viewed independently, accepted or removed, and reverted if needed. When revisions are tracked, the resulting WordprocessingML markup in the Revisions subclause of this document describes the necessary syntax.

If this element is omitted, then revisions shall not be generated by changes to the contents of this document.

[*Example:* Consider a WordprocessingML document containing the text run `Example` that shall not have revisions tracked. Example WordprocessingML from Document 1 is given below:

```
<w:document>
 <w:body>
 <w:p>
 <w:r>
 <w:t>Example</w:t>
 </w:r>
 </w:p>
 </w:body>
</w:document>
```

And the corresponding document settings:

```
<w:settings>
 <w:trackRevisions w:val="false"/>
 ...
</w:settings>
```

If the word `text` was added to the end of this document and bolded without revisions tracked, the resulting WordprocessingML would be output as follows:

```
1 <w:document>
2 <w:body>
3 <w:p>
4 <w:r>
5 <w:t>Example</w:t>
6 </w:r>
7 <w:r>
8 <w:rPr>
9 <w:b/>
10 </w:rPr>
11 <w:t>text</w:t>
12 </w:r>
13 </w:p>
14 </w:body>
15 </w:document>
```

16 And the corresponding document settings:

```
17 <w:settings>
18 <w:trackRevisions w:val="false"/>
19 ...
20 </w:settings>
```

21 Finally, assume the same insertion and formatting took place when the trackRevisions element's val attribute  
22 was set to on, the resulting WordprocessingML would be output as follows:

```
1 <w:document>
2 <w:body>
3 <w:p>
4 <w:r>
5 <w:t>Example</w:t>
6 </w:r>
7 <w:ins ... >
8 <w:r>
9 <w:rPr>
10 <w:b/>
11 <w:rPrChange ... >
12 <w:rPr/>
13 <w:rPrChange>
14 </w:rPr>
15 <w:t>text</w:t>
16 </w:r>
17 </w:ins>
18 </w:p>
19 </w:body>
20 </w:document>
```

21 And the corresponding document settings:

```
22 <w:settings>
23 <w:trackRevisions w:val="true"/>
24 ...
25 </w:settings>
```

26 The trackRevisions element's val attribute was set to true, therefore the changes to the content of the  
27 document were inserted using the appropriate annotation elements in the document's WordprocessingML.  
28 Specifically, inserting the text Text to the right of the existing text was tracked as a revision with the ins  
29 element. In addition, applying bold formatting to the text was tracked as a revision with the rPrChange  
30 element. *end example*

31

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.  A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	<p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.1.91      updateFields (Automatically Recalculate Fields on Open)

This element specifies whether the fields contained in this document should automatically have their field result recalculated from the field codes when this document is opened by an application which supports field calculations. [Note: Some fields are always recalculated (e.g. the page numbering), therefore this element only affects fields which are typically not automatically recalculated on opening the document. Also note that this setting shall not supersede any document protection (§2.15.1.28) or write protection (§2.15.1.94) settings. *end note*]

If this element is omitted, then fields should not automatically be recalculated on opening this document.

[Example: Consider a WordprocessingML document that specifies that applications should attempt to automatically recalculate fields from their field codes upon opening this document. This requirement would be specified using the following WordprocessingML in the document settings part:

`<w:updateFields w:val="true"/>`

The updateFields element's val attribute has a value of true specifying that all fields should automatically be recalculated when opening this document. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but</p>

Attributes	Description
	<p>this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <div><div>&lt;w:... w:val="off"/&gt;</div></div> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.1.92 useXSLTWhenSaving (Save Document as XML File through Custom XSL Transform)**

6 This element specifies that this document should be saved through the custom XSLT transform defined by the  
7 saveThroughXslt element (§2.15.1.76) in this document when it is saved as a single XML file (not defined by this  
8 Office Open XML Standard). [Guidance: Because this setting specifies behavior when saving to an alternative file  
9 format not defined by this Office Open XML Standard, this behavior is optional. *end guidance*]

10 If the saveXmlDataOnly element (§2.15.1.77) is specified, then the single XML file to be transformed is the  
11 custom XML markup of the document, otherwise, it a format outside the scope of this Office Open XML  
12 Standard. If the XSL transform specified by the saveThroughXslt element is not present, then this setting should  
13 be ignored.

14 If this element is omitted, then this document should not be saved through a custom XSL transform when it is  
15 saved as a single XML file.

16 [Example: Consider a WordprocessingML document which should be saved through a custom XSL transform  
17 when it is saved as a single XML file. This requirement is specified using the following WordprocessingML in the  
18 document settings:

```
19 <w:useXSLTWhenSaving w:val="true" />
```

20 The useXSLTWhenSaving element's val attribute has a value of true specifying that the content in this  
21 document should be saved as a single XML file through the custom XSLT specified by the saveThroughXslt  
22 element. *end example*]

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 2.15.1.93 [view \(Document View Setting\)](#)

6 This element specifies the manner in which the contents of this document should be displayed when opened by  
7 an application.

8 If this element is omitted, then an application may view the document in any desired default state.

9 [Example: Consider a WordprocessingML document that shall be displayed on the screen in the same form as it  
10 will be printed. This requirement would be specified using the following WordprocessingML in the document  
11 settings:

```
12 <w:view w:val="print" />
```

13 The view element's val attribute is equal to print specifying that the given WordprocessingML document shall  
14 be rendered as it will be printed. *end example*]

Parent Elements
settings (§2.15.1.78)

15

Attributes	Description
val (Document View Setting Value)	Specifies the view which shall be used to render the contents of a WordprocessingML document.

Attributes	Description
	<p>Applications may omit support for one or more of the views defined by the ST_View simple type (referenced below). If a WordprocessingML document containing an unsupported view is loaded by an application, it shall fall back to its default view (equivalent to use of the enumeration value none).</p> <p>[<i>Example:</i> Consider a WordprocessingML document that shall be rendered in a view meant to mimic how the document would look in a web browser (i.e. without a fixed page width). This requirement would be specified using the following WordprocessingML in the document settings:</p> <div><pre>&lt;w:view w:val="web" /&gt;</pre></div> <p>The val attribute is equal to web specifying that the given WordprocessingML document shall be rendered in a view mimicking web page display. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_View simple type (§2.18.112).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_View">
3 <attribute name="val" type="ST_View" use="required"/>
4 </complexType>
```

5 **2.15.1.94 writeProtection (Write Protection)**

6 This element specifies the write protection settings which have been applied to a WordprocessingML document.  
7 *Write protection* refers to a mode in which the document's contents cannot be edited, and the document cannot  
8 be resaved using the same file name. This setting is independent of the documentProtection (§2.15.1.28)  
9 element, but like document protection, this setting is not intended as a security feature and may be ignored.

10 When present, the write protection shall result in one of two write protection behaviors:

- 11 • If the password attribute is present, or both attributes are omitted, then the application shall prompt  
12 for a password to exit write protection. If the supplied password does not match the hash value in this  
13 attribute, then write protection shall be enabled.
- 14 • If only the recommended attribute is present, the application should provide user interface  
15 recommending that the user open this document in write protected state. If the user chooses to do so,  
16 the document shall be write protected, otherwise, it shall be opened fully editable.

17 If this element is omitted, then no write protection shall be applied to the current document.

18 [*Example:* Consider a WordprocessingML document that can be opened but only in a write protected state  
19 unless a password is provided , in which case the file would be opened in an editable state. This requirement  
20 would be specified using the following WordprocessingML in the document settings:

```
21 <w:writeProtection w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

- 1 The writeProtection element is present which specifies that write protection shall be turned on for this  
 2 document. Since the password attribute is equal to 9oN7nWkCAyEZib1RomSJTjmPpCY= the given  
 3 WordprocessingML document can only be opened in a write protected state unless a password which matches  
 4 the hash value 9oN7nWkCAyEZib1RomSJTjmPpCY= is provided; in which case the file would be opened in an  
 5 editable state. *end example*]

Parent Elements
settings (§2.15.1.78)

6

Attributes	Description
algIdExt (Cryptographic Algorithm Extensibility)	<p>Specifies that a cryptographic algorithm which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined. <i>[Rationale: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined hashing algorithms in order to remain secure. end rationale]</i></p> <p>If this value is present, the cryptAlgorithmClass, cryptAlgorithmType, and cryptAlgorithmSid attribute values shall be ignored in favor of the algorithm defined by this attribute.</p> <p><i>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</i></p> <pre>&lt;w:... w:algIdExt="0000000A"       w:algIdExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The algIdExt attribute value of 0000000A specifies that the algorithm with hex code A shall be used as defined by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_LongHexNumber simple type (§2.18.57).</p>
algIdExtSource (Algorithm Extensibility Source)	<p>Specifies the application which defined the algorithm value specified by the algIdExt attribute.</p> <p><i>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</i></p> <pre>&lt;w:... w:algIdExt="0000000A"       w:algIdExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre>

Attributes	Description																												
	<p>The algIdExtSource attribute value of futureCryptography specifies that the algorithm used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>																												
<p>cryptAlgorithmClass (Cryptographic Algorithm Class)</p>	<p>Specifies the class of cryptographic algorithm used by this protection. [Note: The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. <i>end note</i>]</p> <p>[Example: Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;w:... w:cryptAlgorithmClass="hash" w:cryptAlgorithmType="typeAny" w:cryptAlgorithmSid="1" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_AlgClass simple type (§2.18.1).</p>																												
<p>cryptAlgorithmSid (Cryptographic Hashing Algorithm)</p>	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the salt attribute and user-supplied password in order to compute a hash value for comparison.</p> <p>The possible values for this attribute shall be interpreted as follows:</p> <table border="1" data-bbox="415 1192 1351 1869"> <thead> <tr> <th>Value</th><th>Algorithm</th></tr> </thead> <tbody> <tr><td>1</td><td>MD2</td></tr> <tr><td>2</td><td>MD4</td></tr> <tr><td>3</td><td>MD5</td></tr> <tr><td>4</td><td>SHA-1</td></tr> <tr><td>5</td><td>MAC</td></tr> <tr><td>6</td><td>RIPEMD</td></tr> <tr><td>7</td><td>RIPEMD-160</td></tr> <tr><td>8</td><td>Undefined. Attributes	Description
	<pre>&lt;w:... w:cryptProvider="Krista'sProvider" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProvider attribute value of Krista'sProvider specifies that the cryptographic provider with name "Krista's Provider" shall be used if available. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
cryptProviderType (Cryptographic Provider Type)	<p>Specifies the type of cryptographic provider to be used.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;w:... w:cryptProviderType="rsaAES" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_CryptProv simple type (§2.18.14).</p>
cryptProviderType Ext (Cryptographic Provider Type Extensibility)	<p>Specifies that a cryptographic provider type which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the cryptProviderTypeExtSource attribute in order to determine the provider type used, which shall be application-defined. [<i>Rationale:</i> This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined cryptographic provider types in order to remain secure. <i>end rationale</i>]</p> <p>If this value is present, the cryptProviderType attribute value shall be ignored in favor of the provider type defined by this attribute.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;w:... w:cryptProviderTypeExt="00A5691D" w:cryptProvideTypeExtSource="futureCryptography" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProviderTypeExt attribute value of 00A5691D specifies that the provider type associated with hex code A5691D shall be used as defined by the futureCryptography application. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_LongHexNumber simple type (§2.18.57).</p>

Attributes	Description
<b>cryptProviderTypeExtSource (Provider Type Extensibility Source)</b>	<p>Specifies the application which defined the provider type value specified by the cryptProviderTypeExt attribute.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;w:... w:cryptProviderTypeExt="00A5691D"       w:cryptProvideTypeExtSource="futureCryptography"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProvideTypeExtSource attribute value of futureCryptography specifies that the provider type used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
<b>cryptSpinCount (Iterations to Run Hashing Algorithm)</b>	<p>Specifies the number of times the hashing function shall be iteratively run (using each iteration's result as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hash attribute. [<i>Rationale:</i> Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p> <pre>&lt;w:... w:cryptSpinCount="100000"       w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptSpinCount attribute value of 100000 specifies that the hashing function shall be run one hundred thousand times to generate a hash value for comparison with the hash attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>
<b>hash (Password Hash)</b>	<p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then no password shall be associated with the protection, and it may be turned off without supplying any password.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information stored in one of its protection elements:</p>

Attributes	Description
	<pre>&lt;w:... w:cryptAlgorithmClass="hash"   w:cryptAlgorithmType="typeAny"   w:cryptAlgorithmSid="1"   w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The hash attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password shall be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema base64Binary datatype.</p>
recommended (Recommend Write Protection in User Interface)	<p>Specifies that applications should provide user interface recommending that the user open this document in write protected state. If the user chooses to do so, the document shall be write protected, otherwise, it shall be opened fully editable.</p> <p>If this attribute is omitted, then user interface recommending that the user open this document in write protected state should not be provided. If the password attribute is also specified, then this setting shall be ignored.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which specifies that applications shall recommend write protection to this document. This requirement would be specified using the following WordprocessingML in the document settings:</p> <pre>&lt;w:writeProtection w:recommended="true" /&gt;</pre> <p>The recommended attribute has a value of true specifying that the applications shall hash any password provided, and if it matches this hash value, may only then halt enforcement of write protection. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
salt (Salt for Password Verifier)	<p>Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hash attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example:</i> Consider a WordprocessingML document with the following information</p>

Attributes	Description
	<p>stored in one of its protection elements:</p> <pre>&lt;w:... w:salt="ZUdHa+D8F/OAKP3I7ssUnQ==" w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The salt attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password shall have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema base64Binary datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WriteProtection">
 <attribute name="recommended" type="ST_OnOff" use="optional"/>
 <attributeGroup ref="AG_Password"/>
</complexType>
```

#### 2.15.1.95 zoom (Magnification Setting)

This element specifies the magnification level which should be applied to a document when it is displayed by an application. The zoom level is specified with the use of two attributes stored on this element:

- val, which stores the type of zoom applied to the document
- percent, which stores the zoom percentage to be used when rendering the document

If both attributes are present, then the percent attribute shall be treated as a 'cached' value and only used when the value none is specified for the val attribute.

If this element is omitted, then applications may display the document in any desired magnification setting.

[*Example:* Consider a WordprocessingML document that is to have its zoom level at seventy one percent when it is displayed. This requirement would be specified using the following WordprocessingML fragment in the document settings:

```
<w:zoom w:percent="71" />
```

The zoom element's percent attribute has a value of 71, specifying that the given document shall have its zoom level set to seventy one percent when it is displayed. *end example*

Parent Elements
settings (§2.15.1.78)

Attributes	Description
------------	-------------

Attributes	Description
percent (Zoom Percentage)	<p>Specifies the zoom percentage that should be applied when a given WordprocessingML document is rendered by conforming hosting applications. This value is the zoom percentage specified as an integer whose units correspond to the zoom percentage.</p> <p>If this attribute is omitted, then applications may use any desired default percentage for the magnification.</p> <p>If the val attribute is instantiated in addition to the percent attribute, then the percent attribute shall be treated as a cached value and only used when the value none is specified for the val attribute. If the value specified exceeds the maximum zoom level available in a conforming hosting application, the conforming hosting application shall display the document using its maximum zoom level. Correspondingly, if the value specified is less than the minimum zoom level available in the conforming hosting application, the conforming hosting application shall display the document using its minimum zoom level.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that is to have its zoom level at fifty percent when rendered by conforming hosting applications. This requirement would be specified using the following WordprocessingML:</p> <pre data-bbox="451 961 852 993">&lt;w:zoom w:percent="50" /&gt;</pre> <p>The percent attribute has a value of 50, specifying that the given WordprocessingML document shall to have its zoom level set to fifty percent when it is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>
val (Zoom Type)	<p>Specifies the type of zoom which shall be applied to a given document on open.</p> <p>If this attribute is not present, then the document shall be displayed as though the value had been set to none, and should rely on the value of the percent attribute for the actual zoom percentage.</p> <p>[<i>Example:</i> Consider a WordprocessingML document that should be visible without any horizontal scrolling when it is displayed. This requirement would be specified using the following WordprocessingML:</p> <pre data-bbox="451 1612 1112 1644">&lt;w:zoom w:val="bestFit" w:percent="90" /&gt;</pre> <p>The val attribute is equal to the value bestFit specifying that an application shall dynamically calculate the magnification needed such that the given document shall be visible on the horizontal plane of the document with no horizontal scrolling required to see any part of the WordprocessingML document's pages.</p> <p>Since both attributes are present, the percent attribute shall be treated as a 'cached'</p>

Attributes	Description
	value and ignored. <i>end example</i>  The possible values for this attribute are defined by the ST_Zoom simple type (§2.18.116).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Zoom">
3 <attribute name="val" type="ST_Zoom" use="optional"/>
4 <attribute name="percent" type="ST_DecimalNumber" use="required"/>
5 </complexType>
```

6 **2.15.2 Web Page Settings**

7 The next group of settings stored in WordprocessingML is web page settings. These settings specify two  
8 categories of settings:

- 9     • Settings which are related to HTML documents (i.e. frameset definitions) that may be used in  
10     WordprocessingML documents as well
- 11     • All settings which affect how this document shall be handled when it is saved as HTML. Actually saving a  
12     document as HTML is outside of the scope of this Office Open XML Standard, but in order to ensure the  
13     maximum interoperability between a WordprocessingML document and an HTML document, settings  
14     not explicitly stored elsewhere are stored in these settings.

15 [Example: Consider the following WordprocessingML fragment for the web page settings in a  
16 WordprocessingML document:

```
17 <w:webSettings>
18 <w:frameset>
19 ...
20 </w:frameset>
21 <w:doNotUseLongFileNames w:val="true" />
22 </w:webSettings>
```

23 The webSettings element contains all of the web page settings for this document. In this case, the web page  
24 settings specified for this document are: a frameset defined using the frameset element (§2.15.2.18); and a  
25 setting specifying that when this file is saved as a web page, all resulting files shall not exceed 8.3 characters in  
26 length using the doNotUseLongFileNames element (§2.15.2.13). *end example*

27 **2.15.2.1 allowPNG (Allow PNG as Graphic Format)**

28 This element specifies that applications shall allow use of the PNG file format when the contents of this  
29 WordprocessingML document are saved as a web page. This includes all supporting images used as part of this  
30 HTML web page.

If this element is omitted from the document, then the PNG file format shall not be allowed when this document is saved as a web page, and that another suitable file format (such as the JPEG file format) should be utilized in its place.

[*Note:* This setting is intended for applications to save web pages which can be supported by legacy web browsers which do not support the reading of PNG images. However, although PNG utilizes a lossless compression algorithm, JPEG uses 'lossy' compression and may in some cases result in lower fidelity images. *end note*]

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
 <w:allowPNG w:val="true" />
</w:webSettings>
```

The allowPNG element has a val attribute value of true, which specifies that applications may use the PNG graphic format as needed when saving this WordprocessingML document as a web page. *end example*]

Parent Elements
webSettings (§2.15.2.44)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.2.2 blockQuote (Data for HTML blockquote Element)

This element specifies that the current div element does not represent an HTML div element, but rather represents an HTML blockquote element. This element shall specify that this container shall be written out using the blockquote element if this document is subsequently saved as HTML.

If this element is omitted, then the current div element does not represent an HTML blockquote element. If both this element and the bodyDiv element (§2.15.2.3) are specified, then this element shall take precedence in all cases.

[Example: Consider a simple HTML document defined as follows:

```
<html>
 <body style="margin-left:200px;margin-top:50px">
 <p>Paragraph one.</p>
 <blockquote style="border: 5px solid #00FFFF">
 <p>Paragraph in a blockquote.</p>
 </blockquote>
 <p>Paragraph two.</p>
 </body>
</html>
```

When this document is saved in the WordprocessingML format, the information stored on the div, blockquote, and body elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1626542603">
 ...
 <w:divsChild>
 <w:div w:id="313534916">
 <w:blockQuote w:val="true" />
 ...
 </w:div>
 </w:divsChild>
 </w:div>
</w:divs>
```

The blockQuote element has a val attribute value of true, which specifies that the nested div element actually represents a nested HTML blockquote when this document is resaved as HTML. end example]

Parent Elements	
div (§2.15.2.6)	

Attributes	Description
------------	-------------

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.2.3 bodyDiv (Data for HTML body Element)**

6 This element specifies that the current div element does not represent an HTML div element, but rather  
7 represents formatting properties on the HTML body element. This element shall specify that the properties  
8 specified by this container shall be written out onto the body element if this document is subsequently saved as  
9 HTML.

10 If this element is omitted, then the current div element does not represent an HTML body element. If both this  
11 element and the blockQuote element (§2.15.2.2) are specified, then this element shall be ignored. If this  
12 element is specified on any div which is not the main div element for the document, then this element shall be  
13 ignored.

14 [Example: Consider a simple HTML document defined as follows:

```
15 <html>
16 <body style="margin-left:200px;margin-top:50px">
17 <p>Paragraph one.</p>
18 <blockquote style="border: 5px solid #00FFFF">
19 <p>Paragraph in a blockquote.</p>
20 </blockquote>
21 <p>Paragraph two.</p>
22 </body>
23 </html>
```

When this document is saved in the WordprocessingML format, the information stored on the `div`, `blockquote`, and `body` elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1626542603">
 <w:bodyDiv w:val="true" />
 ...
 <w:divsChild>
 ...
 </w:divsChild>
 </w:div>
</w:divs>
```

The `bodyDiv` element has a `val` attribute value of `true`, which specifies that the `div` element actually represents properties on the HTML body when this document is resaved as HTML. *end example*]

Parent Elements
div (§2.15.2.6)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of <code>on</code>, <code>1</code>, or <code>true</code> specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of <code>off</code>, <code>0</code>, or <code>false</code> specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The <code>val</code> attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.2.4 bottom (Bottom Border for HTML div)

This element specifies the border which shall be displayed at the bottom of the boundaries of the current HTML `div` object.

If this element is omitted, then this HTML `div` object shall not have a bottom border.

[*Example:* Consider a simple HTML document defined as follows:

```
<html>
 <body>
 <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
 <p>paragraph of text</p>
 </div>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1785730240">
 <w:divBdr>
 <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
 <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
 <w:bottom w:val="outset" w:sz="18" w:color="auto" />
 <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
 </w:divBdr>
 </w:div>
</w:divs>
```

The bottom element specifies border information about the bottom border for the single HTML `div` structure in the document; in this case, a 2.25 point bottom border of type outset. The initial 3 pixel border was converted to 2.25 points using the following logic:

$$3\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{576 \text{ eighth points}}{1 \text{ inch}} = 18 \text{ eighth points (2.25 points)}$$

*end example]*

Parent Elements
divBdr (§2.15.2.7)

1

Attributes	Description
color (Border Color)	<p>Specifies the color for this border.</p> <p>This color may either be presented as a hex value (in RRGGBB format), or auto to allow a consumer to automatically determine the border color as appropriate.</p> <p>[<i>Example</i>: Consider a border color with value auto, as follows:</p> <pre>&lt;w:bottom ... w:color="auto"/&gt;</pre> <p>This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. <i>end example</i>]</p> <p>If the border style (the val attribute) specifies the use of an art border, this attribute is ignored. As well, if the border specifies the use of a theme color via the themeColor attribute, this value is superseded by the theme color value.</p> <p>The possible values for this attribute are defined by the ST_HexColor simple type (§2.18.43).</p>
frame (Create Frame Effect)	<p>Specifies whether the specified border should be modified to create a frame effect by reversing the border's appearance from the edge nearest the text to the edge furthest from the text.</p> <p>If this attribute is omitted, then the border is not given any frame effect.</p> <p>[<i>Example</i>: Consider a bottom border which shall appear with a frame effect, which is specified in the following WordprocessingML:</p> <pre>&lt;w:bottom w:frame="true" ... /&gt;</pre> <p>This frame's val is true, indicating that the border frame effect shall be applied. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
shadow (Border Shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the right and top borders, this is accomplished by moving the order down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider a top border which shall appear with a shadow effect, resulting in the following WordprocessingML:</p> <pre>&lt;w:bottom w:shadow="true" ... /&gt;</pre> <p>This frame's <code>val</code> is <code>true</code>, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>
space (Border Spacing Measurement)	<p>Specifies the spacing offset that shall be used to place this border on the parent object.</p> <p>When a document has a page border that is relative to the page edges (using a value of <code>page</code> in the <code>offsetFrom</code> attribute on <code>pgBorders</code> (§2.6.10)), it shall specify the distance between the edge of the page and the beginning of this border in points.</p> <p>When a document has a page border that is relative to the text extents (using a value of <code>text</code> in the <code>offsetFrom</code> attribute on <code>pgBorders</code> (§2.6.10)), or any other border type, it shall specify the distance between the edge of the object and the beginning of this border in points.</p> <p>[<i>Example:</i> Consider a document with a set of page borders all specified to appear 24 points from the edge of the page. The resulting WordprocessingML would be as follows:</p> <pre>&lt;w:pgBorders w:offsetFrom="page"&gt;   &lt;w:bottom ... w:space="24"/&gt; &lt;/w:pgBorders</pre> <p>The <code>offsetFrom</code> attribute specifies that the <code>space</code> value will provide the offset of the page border from the page edge, and the value of the <code>space</code> attribute specifies that the page offset shall be 24 points. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_PointMeasure</code> simple type (§2.18.75).</p>
sz (Border Width)	<p>Specifies the width of the current border.</p> <p>If the border style (<code>val</code> attribute) specifies a line border, the width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>If the border style (<code>val</code> attribute) specifies an art border, the width of this border is specified in measurements of points, with a minimum value of one and a maximum value of 31. Any values outside this range may be reassigned to a more appropriate value.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top w:val="dashed" w:sz="24" .../&gt; &lt;w:left w:val="dashed" w:sz="24" .../&gt; &lt;w:bottom w:val="dashed" w:sz="24" .../&gt; &lt;w:right w:val="dashed" w:sz="24" .../&gt;</pre> <p>The border style is specified using the val attribute, and because that border style is a line border (dashed), the sz attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_EighthPointMeasure simple type (§2.18.27).</p>
<b>themeColor</b> (Border Theme Color)	<p>Specifies a theme color to be applied to the current border.</p> <p>The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows color information to be set centrally in the document.</p> <p>[<i>Example:</i> Consider a set of borders configured to use the accent2 theme color, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:bottom ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:left ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:right ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt;</pre> <p>The borders have a color with an RGB value of FFA8A0, however, because the themeColor attribute is specified, that value is ignored in favor of the accent2 theme color specified for this document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ThemeColor simple type (§2.18.104).</p>
<b>themeShade</b> (Border Theme Color Shade)	<p>Specifies the shade value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeShade is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The themeShade value is stored as a hex encoding of the shade value (from 0–255) applied to the current border.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a shade of 40% applied to a border in a document. This shade is calculated as follows:</p> $  \begin{aligned}  S_{xml} &= 0.4 * 255 \\  &= 102 \\  &= 66(hex)  \end{aligned}  $ <p>The resulting themeShade value in the file format would be 66. <i>end example</i>]</p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * \text{Shade}_{\text{percentage}}$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example</i>: Consider a document with a background using the accent2 theme color, whose RGB value (in RRGGBB hex format) is C0504D.</p> <p>The equivalent HSL color value would be <math>(\frac{1}{360}, 0.48, 0.53)</math>.</p> <p>Applying the shade formula with a shade percentage of 75% to the luminance, we get:</p> $  \begin{aligned}  L' &= 0.53 * 0.75 \\  &= 0.39698  \end{aligned}  $ <p>Taking the resulting HSL color value of <math>(\frac{1}{360}, 0.48, 0.39698)</math> and converting back to RGB, we get 943634.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre> &lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="943634" w:themeColor="accent2"   w:themeShade="BF"/&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
themeTint (Border Theme Color Tint)	<p>Specifies the tint value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeTint is supplied, then it is applied to the RGB value of the theme color (from</p>

Attributes	Description
	<p>the theme part) to determine the final color applied to this border.</p> <p>The themeTint value is stored as a hex encoding of the tint value (from 0–255) applied to the current border.</p> <p>[<i>Example:</i> Consider a tint of 60% applied to a border in a document. This tint is calculated as follows:</p> $  \begin{aligned}  T_{xml} &= 0.6 * 255 \\  &= 153 \\  &= 99(hex)  \end{aligned}  $ <p>The resulting themeTint value in the file format would be 99. <i>end example</i>]</p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * \text{Tint}_{pct} + (1 - \text{Tint}_{pct})$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example:</i> Consider a document with a background using the accent2 theme color, whose RGB value (in RRGGBB hex format) is 4F81BD.</p> <p>The equivalent HSL color value would be <math>\left(\frac{213}{360}, 0.45, 0.53\right)</math>.</p> <p>Applying the tint formula with a tint percentage of 60% to the luminance, we get:</p> $  \begin{aligned}  L' &= 0.53 * 0.6 + (1 - .6) \\  &= 0.71  \end{aligned}  $ <p>Taking the resulting HSL color value of <math>\left(\frac{213}{360}, 0.45, 0.71\right)</math> and converting back to RGB, we get 95B3D7.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre> &lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="95B3D7" w:themeColor="accent2"   w:themeTint="99"/&gt; </pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>

Attributes	Description
val (Border Style)	<p>Specifies the style of border used on this object.</p> <p>This border can either be an art border (a repeated image along the borders - only valid for page borders) or a line border (a line format repeated along the borders) - see the simple type definition for a description of each border style.</p> <p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p> <div>&lt;w:left w:val="single" .../&gt;</div> <p>This border's val is single, indicating that the border style is a single line. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Border simple type (§2.18.4).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Border">
3 <attribute name="val" type="ST_Border" use="required"/>
4 <attribute name="color" type="ST_HexColor" use="optional"/>
5 <attribute name="themeColor" type="ST_ThemeColor" use="optional"/>
6 <attribute name="themeTint" type="ST_UcharHexNumber" use="optional"/>
7 <attribute name="themeShade" type="ST_UcharHexNumber" use="optional"/>
8 <attribute name="sz" type="ST_EighthPointMeasure" use="optional"/>
9 <attribute name="space" type="ST_PointMeasure" use="optional"/>
10 <attribute name="shadow" type="ST_OnOff" use="optional"/>
11 <attribute name="frame" type="ST_OnOff" use="optional"/>
12 </complexType>
```

13 2.15.2.5 color (Frameset Splitter Color)

14 This element specifies the color of the splitters within the frameset in this WordprocessingML document. This  
15 element shall only be honored on the root frameset for this document, and may be ignored for all nested  
16 framesets in this document.

17 If this element is omitted, then the default color of the splitter may be automatically determined by the  
18 application displaying this WordprocessingML document (equivalent to a val attribute value of auto).

19 [*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
<w:frameset>
 <w:framesetSplitbar>
 <w:w w:val="200" />
 <w:color w:val="0000FF" />
 </w:framesetSplitbar>
 ...
</w:frameset>
```

The color element's val attribute specifies that the splitters shall be displayed in the RGB color 0000FF (blue) when the contents of this document are displayed. *end example*

Parent Elements
framesetSplitbar (§2.15.2.20)

Attributes	Description
themeColor (Run Content Theme Color)	<p>Specifies a theme color which should be applied to the current run.</p> <p>The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows for color information to be set centrally in the document.</p> <p>If the themeColor attribute is specified, then the val attribute is ignored for this run.</p> <p>[Example: Consider a run of text which should be displayed using the accent3 theme</p>

Attributes	Description
	<p>color from the document's Theme part. This requirement would be specified as follows in the resulting WordprocessingML:</p> <pre>&lt;w:rPr&gt;   &lt;w:color w:themeColor="accent3" /&gt; &lt;/w:rPr&gt;</pre> <p>The color attribute specifies that the run shall use the accent3 theme color. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ThemeColor simple type (§2.18.104).</p>
themeShade (Run Content Theme Color Shade)	<p>Specifies the shade value applied to the supplied theme color (if any) for this run's contents.</p> <p>If the themeShade is supplied, then it is applied to the RGB value of the theme color to determine the final color applied to this run.</p> <p>The themeShade value is stored as a hex encoding of the shade value (from 0 to 255) applied to the current border.</p> <p>[<i>Example:</i> Consider a shade of 40% applied to a run in a document. This shade is calculated as follows:</p> $  \begin{aligned}  S_{xml} &= 0.4 * 255 \\  &= 102 \\  &= 66(hex)  \end{aligned}  $ <p>The resulting themeShade value in the file format would be 66. <i>end example</i></p> <p>Given a input red, green, or blue color value C (from 0-255), an output color value of C' (from 0-255), and a shade value S (from 0-100), the shade is applied as follows:</p> $C' = \left(1 - \frac{S}{100}\right)C$ <p>[<i>Example:</i> Consider a document with a run using the accent6 theme color, whose RGB value (in RRGGBB hex format) is F79646.</p> <p>The hex value for the green component is 96 - 150 in decimal. Applying the shade formula with shade of 50%, the output decimal value of the green component is 75, or a hex value of 4B. This transformed value can be seen in the resulting run color WordprocessingML's val attribute:</p> <pre>&lt;w:color w:val="7B4B23" w:themeColor="accent6" w:themeShade="80" /&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
<p>themeTint (Run Content Theme Color Tint)</p>	<p>Specifies the tint value applied to the supplied theme color (if any) for this run's contents.</p> <p>If the themeTint is supplied, then it is applied to the RGB value of the theme color to determine the final color applied to this run.</p> <p>The themeTint value is stored as a hex encoding of the tint value (from 0 to 255) applied to the current border.</p> <p>[<i>Example:</i> Consider a tint of 60% applied to a run in a document. This tint is calculated as follows:</p> $  \begin{aligned}  T_{xml} &= 0.6 * 255 \\  &= 153 \\  &= 99(hex)  \end{aligned}  $ <p>The resulting themeTint value in the file format would be 99. <i>end example]</i></p> <p>Given a input red, green, or blue color value C (from 0-255), an output color value of C' (from 0-255), and a tint value T (from 0-100), the tint is applied as follows:</p> $C' = \left(1 - \frac{T}{100}\right) (255 - C) + C$ <p>[<i>Example:</i> Consider a document with a run using the accent1 theme color, whose RGB value (in RRGGBB hex format) is C0504D.</p> <p>The hex value for the green component is 50 - 80 in decimal. Applying the tint formula with tint of 60%, the output decimal value of the green component is 150, or a hex value of 96. This transformed value can be seen in the resulting run color's WordprocessingML val attribute:</p> <pre>&lt;w:color w:val="D99694" w:themeColor="accent1" w:themeTint="99" /&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
<p>val (Run Content Color)</p>	<p>Specifies the color for this run.</p> <p>This color may either be presented as a hex value (in RRGGBB format), or auto to allow a</p>

Attributes	Description
	<p>consumer to automatically determine the run color as appropriate.</p> <p>If the run specifies the use of a theme color via the themeColor attribute, then this value is superseded by the theme color value.</p> <p>[Example: Consider a run color with value auto, as follows:</p> <pre>&lt;w:rPr&gt;   &lt;w:color ... w:val="auto" /&gt; &lt;/w:rPr&gt;</pre> <p>This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the run contents can be distinguished against the page's background color. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_HexColor simple type (§2.18.43).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Color">
3 <attribute name="val" type="ST_HexColor" use="required"/>
4 <attribute name="themeColor" type="ST_ThemeColor" use="optional"/>
5 <attribute name="themeTint" type="ST_UcharHexNumber" use="optional"/>
6 <attribute name="themeShade" type="ST_UcharHexNumber" use="optional"/>
7 </complexType>
```

8 **2.15.2.6 div (Information About Single HTML div Element)**

9 This element specifies information about a single HTML **div**, **body**, or **blockquote** element which was  
10 included in this document, so that that information (which is stored on a logical structure with no direct analog  
11 in WordprocessingML) may be maintained when an HTML document is stored in the WordprocessingML format.

12 The div element stores the following information about these structures:

- 13
- 14 • The child HTML **div**, and **blockquote** elements
  - 15 • The borders for the element
  - The margins for the element

16 When the resulting WordprocessingML document is displayed by an application, the settings specified by this  
17 information shall be reflected in the formatting of the resulting paragraphs (i.e. this information shall not only  
18 be used when the document is resaved in the HTML format).

19 [Example: Consider a simple HTML document defined as follows:

```
1 <html>
2 <body>
3 <div style="border-left-style: solid; border-left-width: 1px; border-right-
4 style: solid; border-right-width: 1px; padding-left: 4px; padding-right: 4px;
5 padding-top: 1px; padding-bottom: 1px; margin-left: 50px">
6 <p>Paragraph one.</p>
7 <p>Paragraph two.</p>
8 </div>
9 </body>
10 </html>
```

11 This HTML would therefore normally appear as follows (image scaled appropriately):

12  
13 Now, when this document is saved in the WordprocessingML format, the information stored on the `div`,  
14 `blockquote`, and `body` elements is stored in the web setting part as follows:

```
15 <w:divs>
16 <w:div w:id="1785730240">
17 <w:marLeft w:val="750" />
18 <w:divBdr>
19 <w:left w:val="single" w:sz="6" w:color="auto" />
20 <w:right w:val="single" w:sz="6" w:color="auto" />
21 </w:divBdr>
22 </w:div>
23 </w:divs>
```

24 The `div` element specifies all margin and border information about the single HTML `div` structures in the  
25 document; in this case, the left indentation and the left and right borders. *end example*]

Parent Elements	
divs (§2.15.2.8); divsChild (§2.15.2.9)	

Child Elements	Subclause
blockquote (Data for HTML blockquote Element)	§2.15.2.2

marBottom (Bottom Margin for HTML div)	§2.15.2.23
marLeft (Left Margin for HTML div)	§2.15.2.25
marRight (Right Margin for HTML div)	§2.15.2.26
marTop (Top Margin for HTML div)	§2.15.2.27

1

Attributes	Description
id (div Data ID)	<p>Specifies a unique decimal number which shall be used to associate one or more structures in the WordprocessingML content with this HTML div information.</p> <p>When a WordprocessingML structure (a paragraph or a table row) is associated with div information, it shall be associated with the set of information which most immediately contains the current object.</p> <p>[Example: If a paragraph is wrapped within two HTML div elements, like this:</p> <pre>&lt;div&gt;   &lt;div&gt;     &lt;p&gt;Paragraph&lt;/p&gt;   &lt;/div&gt; &lt;/div&gt;</pre> <p>The resulting WordprocessingML paragraph shall reference the div Data ID associated with the inner HTML div element - the fact that it is also contained within the outer HTML div shall be implied by the nesting of the corresponding WordprocessingML div elements in the web settings part. <i>end example</i>]</p> <p>The ID specified by this attribute is then referenced by the divId element for all structures which are immediately contained within the specified HTML div.</p> <p>[Example: Consider a simple HTML document defined as follows:</p> <pre>&lt;html&gt;   &lt;body style=" margin-top:50px"&gt;     &lt;p&gt;Paragraph one.&lt;/p&gt;     &lt;div style="margin-left:50px"&gt;       &lt;p&gt;Paragraph two.&lt;/p&gt;     &lt;/div&gt;   &lt;/body&gt; &lt;/html&gt;</pre> <p>If the outer and inner body and div elements were assigned id attributes as follows:</p>

Attributes	Description
	<pre> &lt;w:divs&gt;   &lt;w:div w:id="1626542603"&gt;     &lt;w:bodyDiv w:val="1" /&gt;     ...     &lt;w:divsChild&gt;       &lt;w:div w:id="313534916"&gt;         ...         &lt;/w:div&gt;       &lt;/w:divsChild&gt;     &lt;/w:div&gt;   &lt;/w:divs&gt; </pre> <p>Then the first paragraph would reference the div ID of the outer div (since it is contained by the HTML body element) and the second paragraph would reference the div ID of the inner div (since it is contained within the child HTML div element), as follows:</p> <pre> &lt;w:p&gt;   &lt;w:pPr&gt;     &lt;w:divId w:val="1626542603" /&gt;   &lt;/w:pPr&gt;   &lt;w:r&gt;     &lt;w:t&gt;Paragraph one.&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:p&gt; &lt;w:p&gt;   &lt;w:pPr&gt;     &lt;w:divId w:val="313534916" /&gt;   &lt;/w:pPr&gt;   &lt;w:r&gt;     &lt;w:t&gt;Paragraph one.&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:p&gt; </pre> <p>The id attributes on the div elements link each paragraph with the corresponding container div element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Div">
 <sequence>
 <element name="blockQuote" type="CT_OnOff" minOccurs="0"/>
 <element name="bodyDiv" type="CT_OnOff" minOccurs="0"/>
 <element name="marLeft" type="CT_SignedTwipsMeasure"/>
 <element name="marRight" type="CT_SignedTwipsMeasure"/>
 <element name="marTop" type="CT_SignedTwipsMeasure"/>
 <element name="marBottom" type="CT_SignedTwipsMeasure"/>
 <element name="divBdr" type="CT_DivBdr" minOccurs="0"/>
 <element name="divsChild" type="CT_Divs" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="id" type="ST_DecimalNumber" use="required"/>
</complexType>
```

### 2.15.2.7 divBdr (Set of Borders for HTML div)

This element specifies the set of borders for the boundaries of the current HTML div, body, or blockquote element, using the four border types defined by its child elements.

If this element is omitted, then there shall be no borders associated with the current HTML v, body, or blockquote element.

[Example: Consider a simple HTML document defined as follows:

```
<html>
 <body>
 <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:3px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
 <p>paragraph of text</p>
 </div>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the div elements is stored in the web setting part as follows:

```
1 <w:divs>
2 <w:div w:id="1785730240">
3 <w:divBdr>
4 <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
5 <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
6 <w:bottom w:val="outset" w:sz="18" w:color="auto" />
7 <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
8 </w:divBdr>
9 </w:div>
10 </w:divs>
```

11 The divBdr element specifies border information about the single HTML div structure in the document. *end*  
12 *example]*

Parent Elements
div (§2.15.2.6)

13

Child Elements	Subclause
bottom (Bottom Border for HTML div)	§2.15.2.4
left (Left Border for HTML div)	§2.15.2.21
right (Right Border for HTML div)	§2.15.2.35
top (Top Border for HTML div)	§2.15.2.42

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_DivBdr">
16 <sequence>
17 <element name="top" type="CT_Border" minOccurs="0"/>
18 <element name="left" type="CT_Border" minOccurs="0"/>
19 <element name="bottom" type="CT_Border" minOccurs="0"/>
20 <element name="right" type="CT_Border" minOccurs="0"/>
21 </sequence>
22 </complexType>
```

23 **2.15.2.8**      **divs (Information about HTML div Elements)**

24 This element specifies all information about the set of HTML div elements (as well as the body and  
25 blockquote elements) which were included in this document, so that that information (which is stored on a  
26 logical structure with no direct analog in WordprocessingML) may be maintained when an HTML document is  
27 stored in the WordprocessingML format.

28 The divs element stores the following information about these structures:

- 29       • The parent/child structure of HTML div, blockquote, and body elements  
30       • The borders for each of these elements

- The margins for each of these elements

When the resulting WordprocessingML document is displayed by an application, the settings specified by this information shall be reflected in the formatting of the resulting paragraphs (i.e. this information shall not only be used when the document is resaved in the HTML format).

[Example: Consider a simple HTML document defined as follows:

```
<html>
 <body style="margin-left:200px;margin-top:50px">
 <p>Paragraph one.</p>
 <blockquote style="border: 5px solid #00FFFF">
 <p>Paragraph in a blockquote.</p>
 </blockquote>
 <p>Paragraph two.</p>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div`, `blockquote`, and `body` elements is stored in the web setting part as follows:

```
1 <w:divs>
2 <w:div w:id="1626542603">
3 <w:bodyDiv w:val="1" />
4 <w:marLeft w:val="3000" />
5 <w:marTop w:val="750" />
6 <w:divsChild>
7 <w:div w:id="313534916">
8 <w:blockQuote w:val="1" />
9 <w:marLeft w:val="720" />
10 <w:marRight w:val="720" />
11 <w:marTop w:val="100" />
12 <w:marBottom w:val="100" />
13 <w:divBdr>
14 <w:top w:val="single" w:sz="36" w:color="00FFFF" />
15 <w:left w:val="single" w:sz="36" w:color="00FFFF" />
16 <w:right w:val="single" w:sz="36" w:color="00FFFF" />
17 <w:bottom w:val="single" w:sz="36" w:color="00FFFF" />
18 </w:divBdr>
19 </w:div>
20 </w:divsChild>
21 </w:div>
22 </w:divs>
```

23 The divs element specifies all of the margin and border information about the necessary HTML structures in the  
24 document; in this case, the body element and the nested blockquote. *end example*]

Parent Elements	
webSettings (§2.15.2.44)	

25

Child Elements	Subclause
div (Information About Single HTML div Element)	§2.15.2.6

26 The following XML Schema fragment defines the contents of this element:

```
27 <complexType name="CT_Divs">
28 <sequence minOccurs="1" maxOccurs="unbounded">
29 <element name="div" type="CT_Div"/>
30 </sequence>
31 </complexType>
```

32 **2.15.2.9**      **divsChild (Child div Elements Contained within Current div)**

33 This element specifies the set of HTML div or blockquote elements which are contained within the current  
34 HTML div, body, or blockquote element, establishing the parent/child hierarchy of the original set of these  
35 elements.

When an HTML document containing these objects is saved in the WordprocessingML format, WordprocessingML objects store a reference to their most immediate parent `div`, `body`, or `blockquote` element using the `divId` element.

However, since only a single reference is stored, this information is often insufficient to determine the appropriate parent/child hierarchy for the original HTML `div` data, so it can be applied appropriately. This element allows that hierarchy to be stored, as child HTML `div` elements are stored within the `childDivs` element.

*[Example: Consider a simple HTML document defined as follows:*

```
<html>
 <body>
 <div style=" margin-top:50px">
 <p>Paragraph one.</p>
 <div style="margin-left:50px">
 <p>Paragraph two.</p>
 </div>
 </div>
 </body>
</html>
```

If the outer and inner `body` and `div` elements were assigned id attributes of 1626542603 and 313534916 respectively, then the first paragraph would reference the `div` ID of the outer `div` (since it is contained within that HTML `div` element) and the second paragraph would reference the `div` ID of the inner `div` (since it is contained within the child HTML `div` element), as follows:

```
<w:p>
 <w:pPr>
 <w:divId w:val="1626542603" />
 </w:pPr>
 <w:r>
 <w:t>Paragraph one.</w:t>
 </w:r>
</w:p>
<w:p>
 <w:pPr>
 <w:divId w:val="313534916" />
 </w:pPr>
 <w:r>
 <w:t>Paragraph one.</w:t>
 </w:r>
</w:p>
```

However, this information alone is insufficient - it is unclear if the second `div` is contained within, or simply adjacent to, the first one.

In order to preserve this information, the correct hierarchy is stored within the web settings part:

```
<w:divs>
 <w:div w:id="1626542603">
 ...
 <w:divsChild>
 <w:div w:id="313534916">
 ...
 </w:div>
 </w:divsChild>
 </w:div>
</w:divs>
```

The `divsChild` element contains the second `div` as a child of the first `div`, specifying that the first `div` covers both paragraphs. *end example*]

Parent Elements
div (§2.15.2.6)

Child Elements	Subclause
div (Information About Single HTML div Element)	§2.15.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Divs">
 <sequence minOccurs="1" maxOccurs="unbounded">
 <element name="div" type="CT_Div"/>
 </sequence>
</complexType>
```

### 2.15.2.10 doNotOrganizeInFolder (Do Not Place Supporting Files in Subdirectory)

This element specifies that applications shall not automatically place all supporting files (images which are part of this HTML web page, etc.) in a subdirectory when the contents of this WordprocessingML document are saved as a web page. Typically, applications which save a document as a web page consisting of multiple files save all supporting files in a subdirectory next to the main HTML file (in order to keep those files organized). This element specifies the files shall be placed in the same directory as the actual web page.

If this element is omitted from the document, then all supporting files should be saved into a subdirectory beneath the main web page file when this document is saved as a web page.

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```

1 <w:webSettings>
2 <w:doNotOrganizeInFolder w:val="true" />
3 </w:webSettings>

```

The doNotOrganizeInFolder element has a val attribute value of true, which specifies that applications should save all supplementary files in the same directory as the main web page HTML document when saving this WordprocessingML document as a web page. *end example*

Parent Elements
webSettings (§2.15.2.44)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off" /&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```

9 <complexType name="CT_OnOff">
10 <attribute name="val" type="ST_OnOff"/>
11 </complexType>

```

### 2.15.2.11 doNotRelyOnCSS (Do Not Rely on CSS for Font Face Formatting)

This element specifies whether applications may rely on the CSS properties for font face (the font-family property) when saving this WordprocessingML document as a web page. If this element is utilized, then the HTML font element should be used either in place of or in concert with these CSS properties in order to specify the font face formatting for the resulting web page.

If this element is omitted, then applications may choose to rely on the CSS properties for font face as desired.

[Note: This setting is intended for applications to save web pages which can be supported by legacy web browsers which do not support the reading of these CSS properties when attempting to read and display the resulting web page, in order to maximize the fidelity of the resulting output. *end note*]

1 [Example: Consider a WordprocessingML document which contains the following content within the web  
2 settings part:

```
3 <w:webSettings>
4 <w:doNotRelyOnCSS w:val="true" />
5 </w:webSettings>
```

6 The doNotRelyOnCSS element has a val attribute value of true, which specifies that applications should include  
7 the HTML font element when saving this WordprocessingML document as a web page. For example, this  
8 output:

```
9 text
```

10 This output would instead be saved as follows:

```
11 <span style='font-family:"Courier
12 New"'>text
```

13 *end example]*

Parent Elements
webSettings (§2.15.2.44)

14

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

15 The following XML Schema fragment defines the contents of this element:

```
16 <complexType name="CT_OnOff">
17 <attribute name="val" type="ST_OnOff"/>
18 </complexType>
```

2.15.2.12 doNotSaveAsSingleFile (Recommend Web Page Format over Single File Web Page Format)

This element specifies that applications should recommend that new web page files generated using this WordprocessingML document use a multi-file web page format (HTML), rather than a single-file web page format (MHTML) when this document is saved as an HTML web page. This setting shall not prevent the use of the MHTML format; it shall only cause applications to recommend (via a default) a non single-file format when saving as a web page.

[*Note*: This setting is primarily intended for applications which explicitly support a "Save as Web Page..." action, in order to determine the default setting for the resulting web page. *end note*]

[*Example*: Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
 <w:doNotSaveAsSingleFile w:val="true" />
</w:webSettings>
```

The doNotSaveAsSingleFile element specifies that applications should recommend a multi-file web page format when this document is subsequently saved as a web page. *end example*]

Parent Elements
webSettings (§2.15.2.44)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.2.13 doNotUseLongFileNames (Do Not Use File Names Longer than 8.3 Characters)**

This element specifies that applications shall ensure that the file names for all files generated when saving this document as a web page do not exceed eight characters with a three character extension. This includes all supporting files (images which are part of this HTML web page, etc.).

[*Note:* This setting is intended for applications to save web pages which can be supported by legacy web browsers which do not support the reading of long file names when attempting to read and display the resulting web page. *end note*]

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
 <w:doNotUseLongFileNames w:val="true" />
</w:webSettings>
```

The doNotUseLongFileNames element specifies that applications should ensure that all file names generated when this document is subsequently saved as a web page do not exceed the 8.3 character file name limitation. *end example*]

Parent Elements
webSettings (§2.15.2.44)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.2.14 encoding (Output Encoding When Saving as Web Page)

This element specifies the encoding which shall be used for the contents of this WordprocessingML document when it is saved as an HTML web page. The set of encodings supported by this element shall be derived from the standard set of character set definitions provided at <http://www.iana.org/assignments/character-sets>.

If this element is omitted, then the default encoding for the current system shall be used when this document is saved as a web page. If the value of the val attribute is unknown or supported by an application, then the default encoding for the current system shall be used when this document is saved as a web page.

[Example: Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
 <w:encoding w:val="utf-8" />
</w:webSettings>
```

The encoding element's val attribute has a value of utf-8, which specifies that this document shall be encoded in the UTF-8 format when it is saved as a web page. *end example*]

Parent Elements

webSettings (§2.15.2.44)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt;</pre>

Attributes	Description
	<p>...</p> <p>&lt;/w:sdtPr&gt;</p> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_String">
3 <attribute name="val" type="ST_String" use="required"/>
4 </complexType>
```

5 2.15.2.15 flatBorders (Frameset Splitter Border Style)

6 This element specifies the 3D style of the splitters within the frameset in this WordprocessingML document. This  
7 element shall only be honored on the root frameset for this document, and may be ignored for all nested  
8 framesets in this document. When this property is turned on, the borders for this frameset shall be flat (not 3D),  
9 otherwise they may be presented as 3D splitter when they are displayed.

10 If this element is omitted, then the default style of the splitter should be a 3D splitter.

11 [Example: Consider a frameset consisting of the following three frames:

12  
13 The following properties define the presentation of the splitter bars within this frameset:

```
1 <w:frameset>
2 <w:framesetSplitbar>
3 <w:w w:val="200" />
4 <w:color w:val="0000FF" />
5 <w:flatBorders w:val="true" />
6 </w:framesetSplitbar>
7 ...
8 </w:frameset>
```

9 The flatBorders element's val attribute has a value of true, which specifies that the style of the splitters shall  
10 be flat (the splitter may not be 3D when displayed). *end example*

Parent Elements
framesetSplitbar (§2.15.2.20)

11

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off" /&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

12 The following XML Schema fragment defines the contents of this element:

```
13 <complexType name="CT_OnOff">
14 <attribute name="val" type="ST_OnOff"/>
15 </complexType>
```

16 **2.15.2.16 frame (Single Frame Properties)**

17 This element specifies the properties for a single frame within a frameset document. When a document defines  
18 a frameset using the frameset element; that frameset is composed of a set of frames, each of which is specified  
19 by a single frame element.

20 [Example: Consider a WordprocessingML document which serves as the frameset container for a frameset  
21 consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
 <w:sz w:val="20%" />
 <w:name w:val="Frame 1" />
 <w:sourceFileName r:id="rId1" />
</w:frame>
<w:frameset>
...
</w:frameset>
</w:frameset>
```

The frame element specifies the set of properties for a single frame in the document. In this case, these properties (for the frame marked with Frame 1 in the diagram above) specify that the frame shall have the following properties:

- A height of 20% of the height of the document
- A name of Frame 1
- The contents of the frame shall be pulled from the document that is the target of the relationship with ID rId1

*end example]*

Parent Elements
frameset (§2.15.2.18); frameset (§2.15.2.19)

1

Child Elements	Subclause
linkedToFile (Maintain Link to Existing File)	§2.15.2.22
marH (Top and Bottom Margin for Frame)	§2.15.2.24
marW (Left and Right Margin for Frame)	§2.15.2.28
name (Frame Name)	§2.15.2.29
noResizeAllowed (Frame Cannot Be Resized)	§2.15.2.31
scrollbar (Scrollbar Display Option)	§2.15.2.37
sourceFileName (Source File for Frame)	§2.15.2.38
sz (Frame Size)	§2.15.2.39

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Frame">
4 <sequence>
5 <element name="sz" type="CT_String" minOccurs="0"/>
6 <element name="name" type="CT_String" minOccurs="0"/>
7 <element name="sourceFileName" type="CT_Rel" minOccurs="0"/>
8 <element name="marW" type="CT_PixelsMeasure" minOccurs="0"/>
9 <element name="marH" type="CT_PixelsMeasure" minOccurs="0"/>
10 <element name="scrollbar" type="CT_FrameScrollbar" minOccurs="0"/>
11 <element name="noResizeAllowed" type="CT_OnOff" minOccurs="0"/>
12 <element name="linkedToFile" type="CT_OnOff" minOccurs="0"/>
13 </sequence>
14 </complexType>
```

15 2.15.2.17 frameLayout (Frameset Layout)

16 This element specifies the order in which the frames (and nested framesets) in a frameset shall be displayed.  
17 When a frameset is created, it can only contain frames which are stacked in one direction:

- 18     • Vertically (one on top of another)
- 19     • Horizontally (one next to another)

20 This element specifies how the frames in this frameset are stacked, which shall also be used to interpret the  
21 sizes defined by the sz element (§2.15.2.39) for each frame. In order to determine the ordering of the  
22 constituent frames within this frameset, the ordering of the child frame and frameset elements shall be used.

23 If this element is omitted, then the frames in this frameset shall be stacked vertically on top of one another (a  
24 row frameset).

25 [Example: Consider a WordprocessingML document which serves as the frameset container for a frameset  
26 consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
 <w:frameLayout w:val="rows" />
 <w:frame>
 ...
 </w:frame>
 <w:frameset>
 <w:frameLayout w:val="cols" />
 <w:frame>
 ...
 </w:frame>
 <w:frame>
 ...
 </w:frame>
 </w:frameset>
</w:frameset>
```

The frameLayout element specifies that the outer frameset is a consists of the single frame and the child frameset stacked vertically, and an inner nested frameset consisting of two frames stacked horizontally. *end example*]

Parent Elements
frameset (§2.15.2.18); frameset (§2.15.2.19)

Attributes	Description
------------	-------------

Attributes	Description
val (Frameset Layout Value)	<p>Specifies the type of layout which shall be used to display the contents of the frames and nested framesets within this frameset, as defined by the simple type referenced below.</p> <p>[<i>Example:</i> Consider a frameset definition within a WordprocessingML document which defines the following frameset layout setting:</p> <pre>&lt;w:frame&gt;   &lt;w:frameLayout w:val="cols" /&gt;   ... &lt;/w:frame&gt;</pre> <p>The val attribute value of cols specifies that the contents of this frameset shall be stacked horizontally (in columns). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FrameLayout simple type (§2.18.35).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_FrameLayout">
3 <attribute name="val" type="ST_FrameLayout" use="required"/>
4 </complexType>
```

5 **2.15.2.18 frameset (Root Frameset Definition)**

6 This element specifies that this document is the container for a frameset. This WordprocessingML element is  
7 analogous to the frameset element in HTML.

8 When the frameset element is present within a document, that document shall serve as a frameset definition  
9 only; all of its normal document content shall therefore not be displayed as long as it contains at least one child  
10 frame or frameset element.

11 If this element is omitted, then the currently document shall not be treated as a frameset definition; its regular  
12 document content shall be displayed.

13 [*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset  
14 consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
 <w:frameLayout w:val="rows" />
 <w:frame>
 ...
 </w:frame>
 <w:frameset>
 <w:frameLayout w:val="cols" />
 <w:frame>
 ...
 </w:frame>
 <w:frame>
 ...
 </w:frame>
 </w:frameset>
</w:frameset>
```

The parent frameset element specifies that the current document is a frameset definition; that frameset consists of a single frame and another nested frameset stacked vertically. *end example*]

Parent Elements
webSettings (§2.15.2.44)

Child Elements	Subclause
frame (Single Frame Properties)	§2.15.2.16

Child Elements	Subclause
frameLayout (Frameset Layout)	§2.15.2.17
frameset (Nested Frameset Definition)	§2.15.2.19
framesetSplitbar (Frameset Splitter Properties)	§2.15.2.20
sz (Nested Frameset Size)	§2.15.2.40

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Frameset">
 <sequence>
 <element name="sz" type="CT_String" minOccurs="0"/>
 <element name="framesetSplitbar" type="CT_FramesetSplitbar" minOccurs="0"/>
 <element name="frameLayout" type="CT_FrameLayout" minOccurs="0"/>
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="frameset" type="CT_Frameset" minOccurs="0" maxOccurs="unbounded"/>
 <element name="frame" type="CT_Frame" minOccurs="0" maxOccurs="unbounded"/>
 </choice>
 </sequence>
</complexType>
```

2.15.2.19 frameset (Nested Frameset Definition)

This element specifies a frameset which has been nested within another frameset within a WordprocessingML document. This WordprocessingML element is analogous to the frameset element in HTML (when that frameset is the child of another frameset element).

[Example: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
1 <w:frameset>
2 <w:frameLayout w:val="rows" />
3 <w:frame>
4 ...
5 </w:frame>
6 <w:frameset>
7 <w:frameLayout w:val="cols" />
8 <w:frame>
9 ...
10 </w:frame>
11 <w:frame>
12 ...
13 </w:frame>
14 </w:frameset>
15 </w:frameset>
```

16 The child frameset element specifies the frameset definition for the inner frameset; that frameset consists of  
17 two frames (Frame 2 and Frame 3 in the image above) which have been laid out horizontally as columns. *end*  
18 *example]*

19

Parent Elements
frameset (§2.15.2.18); frameset (§2.15.2.19)

Child Elements	Subclause
frame (Single Frame Properties)	§2.15.2.16
frameLayout (Frameset Layout)	§2.15.2.17
frameset (Nested Frameset Definition)	§2.15.2.19
framesetSplitbar (Frameset Splitter Properties)	§2.15.2.20
sz (Nested Frameset Size)	§2.15.2.40

20 The following XML Schema fragment defines the contents of this element:

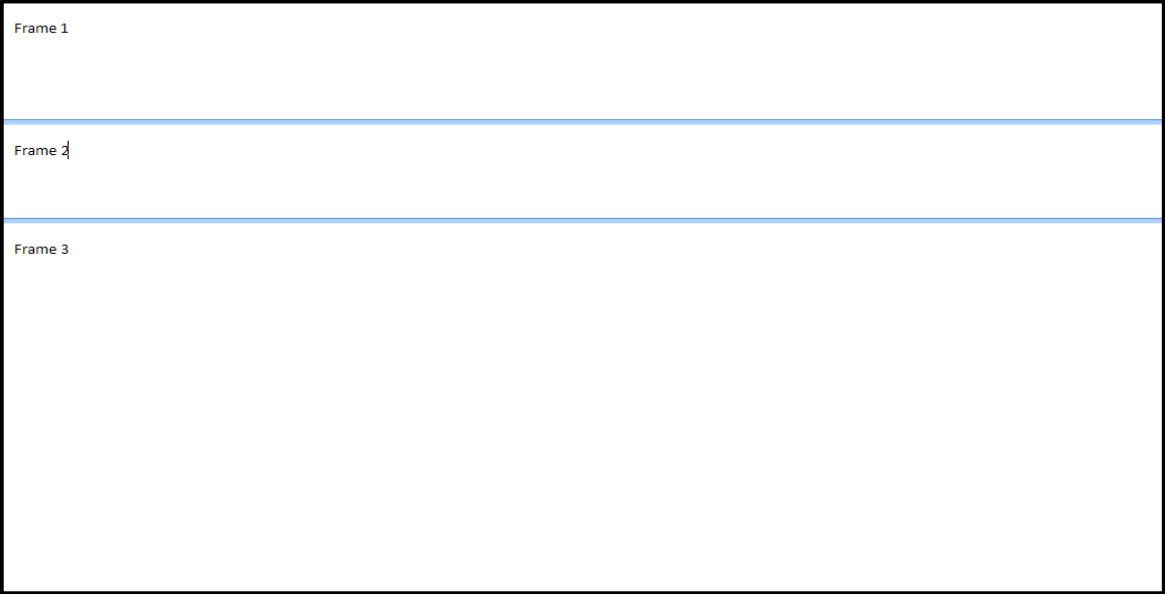

```
21 <complexType name="CT_Frameset">
22 <sequence>
23 <element name="sz" type="CT_String" minOccurs="0"/>
24 <element name="framesetSplitbar" type="CT_FramesetSplitbar" minOccurs="0"/>
25 <element name="frameLayout" type="CT_FrameLayout" minOccurs="0"/>
26 <choice minOccurs="0" maxOccurs="unbounded">
27 <element name="frameset" type="CT_Frameset" minOccurs="0" maxOccurs="unbounded"/>
28 <element name="frame" type="CT_Frame" minOccurs="0" maxOccurs="unbounded"/>
29 </choice>
30 </sequence>
31 </complexType>
```

2.15.2.20 framesetSplitbar (Frameset Splitter Properties)

This element specifies the properties for the splitters associated with this frameset. A *splitter* is a horizontal or vertical line which visually separates the contents of one frame from another within a frameset.

If this element is omitted, then the default parameters for each of the child frameset properties shall be used for all splitters in this frameset.

[Example: Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
<w:frameset>
 <w:framesetSplitbar>
 <w:w w:val="90" />
 <w:color w:val="auto" />
 </w:framesetSplitbar>
 ...
</w:frameset>
```

The framesetSplitbar element specifies the properties for all splitters in this frameset; in this case, those properties are that the splitter shall be 4.5 points (90 twentieths of a point) wide, and that the color of the splitter shall be automatically determined via the attribute value of auto. *end example*]

Parent Elements
frameset (§2.15.2.18); frameset (§2.15.2.19)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
color (Frameset Splitter Color)	§2.15.2.5
flatBorders (Frameset Splitter Border Style)	§2.15.2.15
noBorder (Do Not Display Frameset Splitters)	§2.15.2.30
w (Frameset Splitter Width)	§2.15.2.43

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FramesetSplitbar">
 <sequence>
 <element name="w" type="CT_TwipsMeasure" minOccurs="0"/>
 <element name="color" type="CT_Color" minOccurs="0"/>
 <element name="noBorder" type="CT_OnOff" minOccurs="0"/>
 <element name="flatBorders" type="CT_OnOff" minOccurs="0"/>
 </sequence>
</complexType>
```

2.15.2.21 left (Left Border for HTML div)

This element specifies the border which shall be displayed at the left of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a left border.

[Example: Consider a simple HTML document defined as follows:

```
<html>
 <body>
 <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
 <p>paragraph of text</p>
 </div>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the div elements is stored in the web setting part as follows:

```
1 <w:divs>
2 <w:div w:id="1785730240">
3 <w:divBdr>
4 <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
5 <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
6 <w:bottom w:val="outset" w:sz="18" w:color="auto" />
7 <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
8 </w:divBdr>
9 </w:div>
10 </w:divs>
```

11 The left element specifies border information about the left border for the single HTML div structure in the  
12 document; in this case, a 3 point bottom border of type single. The initial 4 pixel border was converted to 3  
13 points using the following logic:

$$4\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{576 \text{ eighth points}}{1 \text{ inch}} = 24 \text{ eighth points (3 points)}$$

14 *end example]*

15

Parent Elements	
divBdr (§2.15.2.7)	

Attributes	Description
color (Border Color)	<p>Specifies the color for this border.</p> <p>This color may either be presented as a hex value (in RRGGBB format), or auto to allow a consumer to automatically determine the border color as appropriate.</p> <p>[Example: Consider a border color with value auto, as follows:</p> <div>&lt;w:bottom ... w:color="auto"/&gt;</div> <p>This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. <i>end example]</i></p> <p>If the border style (the val attribute) specifies the use of an art border, this attribute is ignored. As well, if the border specifies the use of a theme color via the themeColor attribute, this value is superseded by the theme color value.</p> <p>The possible values for this attribute are defined by the ST_HexColor simple type (§2.18.43).</p>
frame (Create	Specifies whether the specified border should be modified to create a frame effect by

Attributes	Description
Frame Effect)	<p>reversing the border's appearance from the edge nearest the text to the edge furthest from the text.</p> <p>If this attribute is omitted, then the border is not given any frame effect.</p> <p>[<i>Example</i>: Consider a bottom border which shall appear with a frame effect, which is specified in the following WordprocessingML:</p> <pre data-bbox="456 533 951 562">&lt;w:bottom w:frame="true" ... /&gt;</pre> <p>This frame's val is true, indicating that the border frame effect shall be applied. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
shadow (Border Shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the right and top borders, this is accomplished by moving the order down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example</i>: Consider a top border which shall appear with a shadow effect, resulting in the following WordprocessingML:</p> <pre data-bbox="456 1150 967 1180">&lt;w:bottom w:shadow="true" ... /&gt;</pre> <p>This frame's val is true, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
space (Border Spacing Measurement)	<p>Specifies the spacing offset that shall be used to place this border on the parent object.</p> <p>When a document has a page border that is relative to the page edges (using a value of page in the offsetFrom attribute on pgBorders (§2.6.10)), it shall specify the distance between the edge of the page and the beginning of this border in points.</p> <p>When a document has a page border that is relative to the text extents (using a value of text in the offsetFrom attribute on pgBorders (§2.6.10)), or any other border type, it shall specify the distance between the edge of the object and the beginning of this border in points.</p> <p>[<i>Example</i>: Consider a document with a set of page borders all specified to appear 24 points from the edge of the page. The resulting WordprocessingML would be as follows:</p>

Attributes	Description
	<pre>&lt;w:pgBorders w:offsetFrom="page"&gt;   &lt;w:bottom ... w:space="24"/&gt; &lt;/w:pgBorders&gt;</pre> <p>The offsetFrom attribute specifies that the space value will provide the offset of the page border from the page edge, and the value of the space attribute specifies that the page offset shall be 24 points. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PointMeasure simple type (§2.18.75).</p>
sz (Border Width)	<p>Specifies the width of the current border.</p> <p>If the border style (val attribute) specifies a line border, the width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>If the border style (val attribute) specifies an art border, the width of this border is specified in measurements of points, with a minimum value of one and a maximum value of 31. Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top w:val="dashed" w:sz="24" .../&gt; &lt;w:left w:val="dashed" w:sz="24" .../&gt; &lt;w:bottom w:val="dashed" w:sz="24" .../&gt; &lt;w:right w:val="dashed" w:sz="24" .../&gt;</pre> <p>The border style is specified using the val attribute, and because that border style is a line border (dashed), the sz attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_EighthPointMeasure simple type (§2.18.27).</p>
themeColor (Border Theme Color)	<p>Specifies a theme color to be applied to the current border.</p> <p>The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows color information to be set centrally in the document.</p> <p>[<i>Example:</i> Consider a set of borders configured to use the accent2 theme color, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt;</pre>

Attributes	Description
	<pre>&lt;w:bottom ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:left ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:right ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt;</pre> <p>The borders have a color with an RGB value of FFA8A0, however, because the themeColor attribute is specified, that value is ignored in favor of the accent2 theme color specified for this document. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ThemeColor simple type (§2.18.104).</p>
<b>themeShade</b> (Border Theme Color Shade)	<p>Specifies the shade value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeShade is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The themeShade value is stored as a hex encoding of the shade value (from 0–255) applied to the current border.</p> <p>[<i>Example</i>: Consider a shade of 40% applied to a border in a document. This shade is calculated as follows:</p> $  \begin{aligned}  S_{xml} &= 0.4 * 255 \\  &= 102 \\  &= 66(hex)  \end{aligned}  $ <p>The resulting themeShade value in the file format would be 66. <i>end example</i></p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * \text{Shade}_{\text{percentage}}$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example</i>: Consider a document with a background using the accent2 theme color, whose RGB value (in RRGGBB hex format) is C0504D.</p> <p>The equivalent HSL color value would be <math>\left(\frac{1}{360}, 0.48, 0.53\right)</math>.</p>

Attributes	Description
	<p>Applying the shade formula with a shade percentage of 75% to the luminance, we get:</p> $L' = 0.53 * 0.75$ $= 0.39698$ <p>Taking the resulting HSL color value of <math>\left(\frac{1}{360}, 0.48, 0.39698\right)</math> and converting back to RGB, we get 943634.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre>&lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="943634" w:themeColor="accent2"   w:themeShade="BF"/&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
themeTint (Border Theme Color Tint)	<p>Specifies the tint value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeTint is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The themeTint value is stored as a hex encoding of the tint value (from 0–255) applied to the current border.</p> <p>[<i>Example:</i> Consider a tint of 60% applied to a border in a document. This tint is calculated as follows:</p> $T_{xml} = 0.6 * 255$ $= 153$ $= 99(hex)$ <p>The resulting themeTint value in the file format would be 99. <i>end example]</i></p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * Tint_{pct} + (1 - Tint_{pct})$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example:</i> Consider a document with a background using the accent2 theme color,</p>

Attributes	Description
	<p>whose RGB value (in RRGGBB hex format) is 4F81BD.</p> <p>The equivalent HSL color value would be <math>\left(\frac{213}{360}, 0.45, 0.53\right)</math>.</p> <p>Applying the tint formula with a tint percentage of 60% to the luminance, we get:</p> $L' = 0.53 * 0.6 + (1 - .6)$ $= 0.71$ <p>Taking the resulting HSL color value of <math>\left(\frac{213}{360}, 0.45, 0.71\right)</math> and converting back to RGB, we get 95B3D7.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre>&lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="95B3D7" w:themeColor="accent2"   w:themeTint="99"/&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
val (Border Style)	<p>Specifies the style of border used on this object.</p> <p>This border can either be an art border (a repeated image along the borders - only valid for page borders) or a line border (a line format repeated along the borders) - see the simple type definition for a description of each border style.</p> <p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p> <pre>&lt;w:left w:val="single" .../&gt;</pre> <p>This border's val is single, indicating that the border style is a single line. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Border simple type (§2.18.4).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
 <attribute name="val" type="ST_Border" use="required"/>
 <attribute name="color" type="ST_HexColor" use="optional"/>
 <attribute name="themeColor" type="ST_ThemeColor" use="optional"/>
 <attribute name="themeTint" type="ST_UcharHexNumber" use="optional"/>
 <attribute name="themeShade" type="ST_UcharHexNumber" use="optional"/>
 <attribute name="sz" type="ST_EighthPointMeasure" use="optional"/>
 <attribute name="space" type="ST_PointMeasure" use="optional"/>
 <attribute name="shadow" type="ST_OnOff" use="optional"/>
 <attribute name="frame" type="ST_OnOff" use="optional"/>
</complexType>
```

**2.15.2.22      [linkedToFile \(Maintain Link to Existing File\)](#)**

This element specifies that the file referenced by the sourceFileName element (§2.15.2.38) as the basis for the current frame shall not be changed, even when the file defined by the parent frameset is moved - i.e. the link shall remain exactly as specified.

[*Guidance:* Typically, when a document is incorporated into a frameset, a copy of that document is made such that all files encompassing the frameset are stored in a single subdirectory (so they can be moved as a single unit). However, if the link to the current file is absolute and shall not be changed even when the location of the main frameset document, then this element shall be set to indicate that setting. *end guidance*]

If this element is omitted, then a new file may be created as necessary when the parent frameset document is resaved to another location.

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
 <w:sz w:val="20%" />
 <w:name w:val="Frame 1" />
 <w:sourceFileName r:id="rId1" />
 <w:linkedToFile w:val="true" />
</w:frame>
<w:frameset>
...
</w:frameset>
</w:frameset>
```

The linkedToFile element specifies that the frame source location specified by the sourceFileName element (§2.15.2.38) shall not be modified, even if the parent frameset document is resaved to another location. *end example*]

Parent Elements
frame (§2.15.2.16)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.2.23 `marBottom` (Bottom Margin for HTML div)

This element specifies the margin which shall be displayed at the bottom of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a bottom margin.

[Example: Consider a simple HTML document defined as follows:

```
<html>
 <body>
 <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
bottom:100px">
 <p>paragraph of text</p>
 </div>
 <p>another paragraph of text</p>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the div elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1785730240">
 <w:marLeft w:val="3000" />
 <w:marRight w:val="750" />
 <w:marTop w:val="1500" />
 <w:marBottom w:val="1500" />
 </w:div>
</w:divs>
```

- 1 The `marBottom` element specifies margin information about the bottom margin for the single HTML `div`  
2 structure in the document; in this case, a 75 point bottom margin. The initial 100 pixel margin was converted to  
3 75 points using the following logic:

$$100\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 1500 \text{ twentieth points (75 points)}$$

4 *end example]*

Parent Elements
div (§2.15.2.6)

5

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[Example: Consider an attribute value of -720 whose type is <code>ST_SignedTwipsMeasure</code>. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_SignedTwipsMeasure</code> simple type (§2.18.88).</p>

- 6 The following XML Schema fragment defines the contents of this element:

```
7 <complexType name="CT_SignedTwipsMeasure">
8 <attribute name="val" type="ST_SignedTwipsMeasure" use="required"/>
9 </complexType>
```

10 **2.15.2.24 marH (Top and Bottom Margin for Frame)**

- 11 This element specifies the top and bottom margin height for a single frame in a frameset document, as follows:

This height is expressed in pixels.

If this element is omitted, then no top or bottom margin shall be used for this frame.

[*Example:* Consider a document that has a frame, where the margin height has been specified and is represented as the following WordprocessingML:

```
<w:frame>
 <w:marH w:val="594"/>
</w:frame>
```

The marH element has a val attribute value of 594, which specifies that this frame has a top and bottom margin value of 594 pixels, resulting in 594 pixels of space between the content and the top and bottom margins of the frame. *end example*]

Parent Elements
frame (§2.15.2.16)

Attributes	Description
val (Measurement in Pixels)	Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive measurement in pixels.  The contents of this measurement shall be interpreted based on the context of the parent XML element.

Attributes	Description
	<p>[<i>Example</i>: Consider an attribute value of 960 whose type is ST_PixelsMeasure. This attribute value specifies a value of 960 pixels. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PixelsMeasure simple type (§2.18.74).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_PixelsMeasure">
3 <attribute name="val" type="ST_PixelsMeasure" use="required"/>
4 </complexType>
```

5 **2.15.2.25 marLeft (Left Margin for HTML div)**

6 This element specifies the margin which shall be displayed at the left of the boundaries of the current HTML div  
7 object.

8 If this element is omitted, then this HTML div object shall not have a left margin.

9 [*Example*: Consider a simple HTML document defined as follows:

```
10 <html>
11 <body>
12 <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
13 bottom:100px">
14 <p>paragraph of text</p>
15 </div>
16 <p>another paragraph of text</p>
17 </body>
18 </html>
```

19 This HTML would therefore normally appear as follows (image scaled appropriately):

20

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1785730240">
 <w:marLeft w:val="3000" />
 <w:marRight w:val="750" />
 <w:marTop w:val="1500" />
 <w:marBottom w:val="1500" />
 </w:div>
</w:divs>
```

The `marLeft` element specifies margin information about the left margin for the single HTML `div` structure in the document; in this case, a 150 point left margin. The initial 200 pixel margin was converted to 150 points using the following logic:

$$200\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 3000 \text{ twentieth points (150 points)}$$

*end example]*

Parent Elements
div (§2.15.2.6)

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of -720 whose type is <code>ST_SignedTwipsMeasure</code>. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_SignedTwipsMeasure</code> simple type (§2.18.88).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SignedTwipsMeasure">
 <attribute name="val" type="ST_SignedTwipsMeasure" use="required"/>
</complexType>
```

### 2.15.2.26 `marRight` (Right Margin for HTML div)

This element specifies the margin which shall be displayed at the right of the boundaries of the current HTML div object.

If this element is omitted, then this HTML div object shall not have a right margin.

[Example: Consider a simple HTML document defined as follows:

```
<html>
 <body>
 <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
bottom:100px">
 <p>paragraph of text</p>
 </div>
 <p>another paragraph of text</p>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the div elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1785730240">
 <w:marLeft w:val="3000" />
 <w:marRight w:val="750" />
 <w:marTop w:val="1500" />
 <w:marBottom w:val="1500" />
 </w:div>
</w:divs>
```

1 The marRight element specifies margin information about the right margin for the single HTML div structure in  
2 the document; in this case, a 37.5 point right margin. The initial 50 pixel margin was converted to 37.5 points  
3 using the following logic:

$$50\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 750 \text{ twentieth points (37.5 points)}$$

4 *end example]*

Parent Elements
div (§2.15.2.6)

5

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[Example: Consider an attribute value of -720 whose type is ST_SignedTwipsMeasure. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (§2.18.88).</p>

6 The following XML Schema fragment defines the contents of this element:

```
7 <complexType name="CT_SignedTwipsMeasure">
8 <attribute name="val" type="ST_SignedTwipsMeasure" use="required"/>
9 </complexType>
```

10 **2.15.2.27 marTop (Top Margin for HTML div)**

11 This element specifies the margin which shall be displayed at the top of the boundaries of the current HTML div  
12 object.

13 If this element is omitted, then this HTML div object shall not have a top margin.

14 [Example: Consider a simple HTML document defined as follows:

```
15 <html>
16 <body>
17 <div style="margin-top:100px; margin-left:200px; margin-right:50px; margin-
18 bottom:100px">
19 <p>paragraph of text</p>
```

```
1 </div>
2 <p>another paragraph of text</p>
3 </body>
4 </html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```
9 <w:divs>
10 <w:div w:id="1785730240">
11 <w:marLeft w:val="3000" />
12 <w:marRight w:val="750" />
13 <w:marTop w:val="1500" />
14 <w:marBottom w:val="1500" />
15 </w:div>
16 </w:divs>
```

The `marTop` element specifies margin information about the top margin for the single HTML `div` structure in the document; in this case, a 75 point top margin. The initial 100 pixel margin was converted to 75 points using the following logic:

$$100\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{1440 \text{ twentieth points}}{1 \text{ inch}} = 1500 \text{ twentieth points (75 points)}$$

*end example]*

Parent Elements
div (§2.15.2.6)

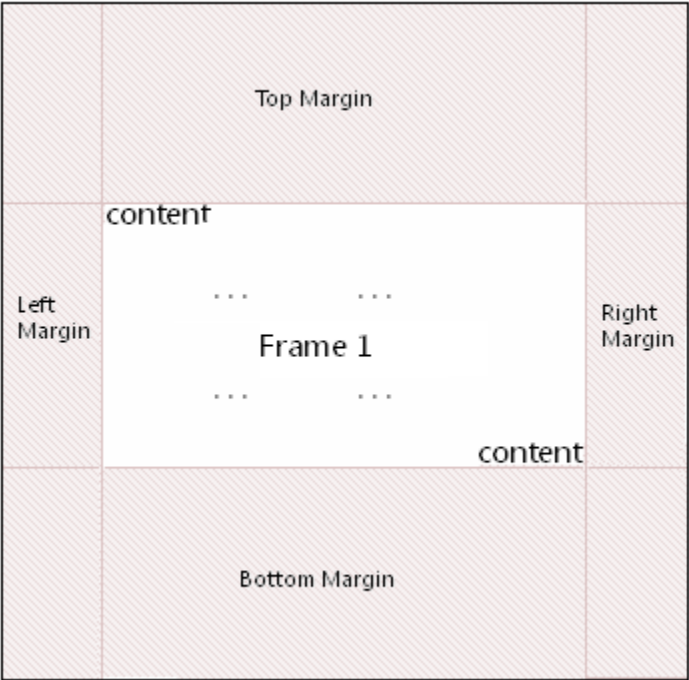

Attributes	Description
val (Positive or Negative Value in Twentieths of a Point)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive or negative measurement in twentieths of a point (equivalent to 1/1440th of an inch).</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of -720 whose type is ST_SignedTwipsMeasure. This attribute value specifies a value of negative one-half of an inch or -36 points (-720 twentieths of a point = -36 points = -0.5 inches). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_SignedTwipsMeasure simple type (§2.18.88).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_SignedTwipsMeasure">
3 <attribute name="val" type="ST_SignedTwipsMeasure" use="required"/>
4 </complexType>
```

5 **2.15.2.28 marW (Left and Right Margin for Frame)**

6 This element specifies the left and right margin height for a single frame in a frameset document, as follows:

7

8 This height is expressed in pixels.

9 If this element is omitted, then no left or right margin shall be used for this frame.

[*Example:* Consider a document that has a frame, where the frame's margins have been specified and is represented as the following WordprocessingML:

```
<w:frame>
 <w:marW w:val="294"/>
</w:frame>
```

The marW element has a val attribute value of 294, which specifies that this frame has a left and right margin value of 294 pixels, resulting in 294 pixels of space between the content and the left and right margins of the frame. *end example]*

Parent Elements
frame (§2.15.2.16)

Attributes	Description
val (Measurement in Pixels)	<p>Specifies a value whose contents shall contain a positive whole number, whose contents consist of a positive measurement in pixels.</p> <p>The contents of this measurement shall be interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider an attribute value of 960 whose type is ST_PixelsMeasure. This attribute value specifies a value of 960 pixels. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PixelsMeasure simple type (§2.18.74).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PixelsMeasure">
 <attribute name="val" type="ST_PixelsMeasure" use="required"/>
</complexType>
```

2.15.2.29      name (Frame Name)

This element specifies the name of a single frame within a frameset document. This property is analogous to the name attribute on the frame element in HTML.

[*Note:* The name of a frame may be used in web pages that reference a frame via targeted links, etc. *end note]*

If this element is omitted, then the current frame shall have no name associated with it.

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frame>
 <w:name w:val="Frame 1" />
</w:frame>
<w:frameset>
...
<w:frame>
 <w:name w:val="Frame 2" />
</w:frame>
<w:frame>
 <w:name w:val="Frame 3" />
</w:frame>
</w:frameset>
</w:frameset>
```

The name element specifies the name for each frame within this frameset; in this case, the frames have names of Frame 1, Frame 2, and Frame 3 respectively. *end example*]

Parent Elements
frame (§2.15.2.16)

Attributes	Description
val (String Value)	Specifies that its contents will contain a string.

Attributes	Description
	<p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt;   ... &lt;/w:sdtPr&gt;</pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_String">
3 <attribute name="val" type="ST_String" use="required"/>
4 </complexType>
```

5 **2.15.2.30 noBorder (Do Not Display Frameset Splitters)**

6 This element specifies whether the splitters shall be displayed for the contents of the frameset in this  
7 WordprocessingML document. This element shall only be honored on the root frameset for this document, and  
8 may be ignored for all nested framesets in this document. If this element is present, then no splitters shall be  
9 displayed, and all other frameset splitter properties may be ignored.

10 If this element is omitted, then the splitters in this document shall be displayed as defined by the w and color  
11 elements.

12 [*Example:* Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
<w:frameset>
 <w:framesetSplitbar>
 <w:w w:val="200" />
 <w:color w:val="0000FF" />
 </w:framesetSplitbar>
 ...
</w:frameset>
```

If the noBorder element is also specified:

```
<w:frameset>
 <w:framesetSplitbar>
 <w:w w:val="200" />
 <w:color w:val="0000FF" />
 <w:noBorder w:val="true" />
 </w:framesetSplitbar>
 ...
</w:frameset>
```

Then all frameset splitters are suppressed:

The noBorder element's val attribute has a value of true, which specifies that the splitters for this document shall not be displayed. *end example*]

Parent Elements
framesetSplitbar (§2.15.2.20)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.2.31 noResizeAllowed (Frame Cannot Be Resized)

This element specifies whether or not the size of the current frame shall be modifiable (i.e. whether the frame can be resized) when the contents of this document are saved as HTML and displayed in a web browser. When this element is set, the size of the frame shall be set to its current values. This property is analogous to the `noresize` attribute on the `frame` element in HTML.

If this element is omitted, the size of the frame shall be modifiable (the frame may be resized when it is displayed).

[*Example:* Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```

<w:frameset>
 ...
 <w:frameset>
 ...
 <w:frame>
 <w:name w:val="Frame 2" />
 <w:noResizeAllowed w:val="true" />
 </w:frame>
 ...
 </w:frameset>
</w:frameset>

```

- 1 The noResizeAllowed element has a val attribute of true, which specifies that the size of the frame specified  
 2 by Frame 2 shall not be modifiable (the two borders which intersect that frame cannot be resized). *end*  
 3 *example*]

Parent Elements
frame (§2.15.2.16)

4

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example</i>: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

- 5 The following XML Schema fragment defines the contents of this element:

```
6 <complexType name="CT_OnOff">
7 <attribute name="val" type="ST_OnOff"/>
8 </complexType>
```

### 9 2.15.2.32 optimizeForBrowser (Disable Features Not Supported by Target Web Browser)

- 10 This element specifies whether applications should attempt to detect the target web browser for any web page  
 11 produced from this document, and subsequently disable all user interface and output which is not supported by  
 12 that target web browser.

- 13 The target web browser can be determined by the state of the following elements:

- 14 • allowPNG
- 15 • doNotRelyOnCSS
- 16 • relyOnVML
- 17 • doNotSaveWebPagesAsSingleFile

- 18 The following table determines how this determination is made:

Settings	Target Browser
----------	----------------

Settings	Target Browser
allowPNG is off doNotRelyOnCSS is on relyOnVML is off doNotSaveWebPagesAsSingleFile is on	Microsoft Internet Explorer 3.0 or later Netscape Navigator 3.0 or later
allowPNG is off doNotRelyOnCSS is off relyOnVML is off doNotSaveWebPagesAsSingleFile is on	Netscape Navigator 4.0 or later
allowPNG is off doNotRelyOnCSS is off relyOnVML is off doNotSaveWebPagesAsSingleFile is off	Microsoft Internet Explorer 4.0 or later
allowPNG is off doNotRelyOnCSS is off relyOnVML is on doNotSaveWebPagesAsSingleFile is off	Microsoft Internet Explorer 5.0 or later
allowPNG is on doNotRelyOnCSS is off relyOnVML is on doNotSaveWebPagesAsSingleFile is off	Microsoft Internet Explorer 6.0 or later

1

2 If this element is omitted, then no user interface or output which is not supported by that target web browser  
3 shall be disabled.

4 *[Example: Consider a document whose web settings part contains the following WordprocessingML:*

```
5 <w:webSettings>
6 ...
7 <w:optimizeForBrowser />
8 <w:allowPNG w:val="on"/>
9 <w:relyOnVML w:val="on"/>
10 </w:webSettings>
```

11 The optimizeForBrowser element specifies that all settings which are not compatible with the target web  
12 browser shall be disabled. Since the settings of the four element described above match a target browser of  
13 Microsoft Internet Explorer 6.0, features not supported by Microsoft Internet Explorer 6.0 shall be disabled. *end*  
14 *example]*

Parent Elements
webSettings (§2.15.2.44)

15

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.2.33 pixelsPerInch (Pixels per Inch for Graphics/Images)**

6 This element specifies the number of pixels per inch (or density) that will be used for the display of pictures or  
7 table cells when a WordprocessingML document is saved as a web page. The size that is specified by this  
8 element affects the size of the pictures or table cells relative to the size of text in the document. The pixels per  
9 inch (ppi) measurement is relative to the screen resolution, and the resulting physical dimensions of the  
10 resulting image or cell in pixels (which are used in web pages, but not for printed documents) are the result of  
11 the original dimensions (in inches) multiplied by the number of pixels per inch.

12 The range of values for this element is typically from 19 to 480 pixels per inch. The common settings for popular  
13 screen sizes are 72, 96, and 120 pixels per inch.

14 If this element is omitted, then a default size of 96 pixels per inch shall be used when determining the number of  
15 pixels for images and/or table cells within this document.

16 [Note: This setting is typically only specified if the target screen resolution for the web page is known, as defined  
17 by the targetScreenSz element (§2.15.2.41) to set the optimum screen size for the web page. *end note*]

18 [Example: Consider a WordprocessingML document which contains the following content within the web  
19 settings part:

```
20 <w:webSettings>
21 <w:pixelsPerInch w:val="200" />
22 </w:webSettings>
```

1 The pixelsPerInch element's val attribute has a value of 200, which specifies that all inches to pixels  
2 conversions done when saving this web page shall be done assuming a transformation of 200 pixels per inch.  
3 *end example]*

Parent Elements
webSettings (§2.15.2.44)

4

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <p>&lt;w:... w:val="1512645511" /&gt;</p> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

5 The following XML Schema fragment defines the contents of this element:

<pre>&lt;complexType name="CT_DecimalNumber"&gt;   &lt;attribute name="val" type="ST_DecimalNumber" use="required"/&gt; &lt;/complexType&gt;</pre>
------------------------------------------------------------------------------------------------------------------------------------------------------------

9 2.15.2.34 relyOnVML (Utilize VML When Saving as Web Page)

10 This element specifies whether applications may utilize the Vector Markup Language format when saving the  
11 content of this WordprocessingML document as a web page, when graphical elements which can leverage this  
12 format are present in the document.

13 If this element is omitted, then a graphic image format should be used either in place of or in concert with the  
14 Vector Markup Language output in order to specify the formatting and positioning for objects which are part of  
15 the resulting web page.

16 [*Note:* This setting is intended for applications to save web pages which can be supported by legacy web  
17 browsers which do not support Vector Markup Language when attempting to read and display the resulting web  
18 page. *end note]*

19 [*Example:* Consider a WordprocessingML document which contains the following content within the web  
20 settings part:

```
1 <w:webSettings>
2 <w:relyOnVML w:val="false" />
3 </w:webSettings>
```

4 The relyOnVML element has a val attribute value of false, which specifies that applications should utilize a  
5 graphical image version of all objects which could utilize Vector Markup Language output. This does not  
6 preclude the use of the VML output, but does specify that a graphical element shall be included as well. *end*  
7 *example]*

Parent Elements
webSettings (§2.15.2.44)

8

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

9 The following XML Schema fragment defines the contents of this element:

```
10 <complexType name="CT_OnOff">
11 <attribute name="val" type="ST_OnOff"/>
12 </complexType>
```

13 **2.15.2.35 right (Right Border for HTML div)**

14 This element specifies the border which shall be displayed at the right of the boundaries of the current HTML  
15 div object.

16 If this element is omitted, then this HTML div object shall not have a right border.

17 [*Example:* Consider a simple HTML document defined as follows:

```
<html>
 <body>
 <div style=" border-left-style:solid; border-right-style:groove; border-
right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
style:outset; border-bottom-width:3px">
 <p>paragraph of text</p>
 </div>
 </body>
</html>
```

This HTML would therefore normally appear as follows (image scaled appropriately):

Now, when this document is saved in the WordprocessingML format, the information stored on the `div` elements is stored in the web setting part as follows:

```
<w:divs>
 <w:div w:id="1785730240">
 <w:divBdr>
 <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
 <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
 <w:bottom w:val="outset" w:sz="18" w:color="auto" />
 <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
 </w:divBdr>
 </w:div>
</w:divs>
```

The right element specifies border information about the right border for the single HTML `div` structure in the document; in this case, a 0.75 point bottom border of type `threeDEngrave`. The initial 1 pixel border was converted to 0.75 points using the following logic:

$$1\text{px} * \frac{1\text{ inch}}{96\text{ px}} * \frac{576\text{ eighth points}}{1\text{ inch}} = 6\text{ eighth points (0.75 points)}$$

*end example]*

Parent Elements
divBdr (§2.15.2.7)

Attributes	Description
color (Border Color)	<p>Specifies the color for this border.</p> <p>This color may either be presented as a hex value (in RRGGBB format), or auto to allow a consumer to automatically determine the border color as appropriate.</p> <p>[<i>Example</i>: Consider a border color with value auto, as follows:</p> <pre>&lt;w:bottom ... w:color="auto"/&gt;</pre> <p>This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. <i>end example</i>]</p> <p>If the border style (the val attribute) specifies the use of an art border, this attribute is ignored. As well, if the border specifies the use of a theme color via the themeColor attribute, this value is superseded by the theme color value.</p> <p>The possible values for this attribute are defined by the ST_HexColor simple type (§2.18.43).</p>
frame (Create Frame Effect)	<p>Specifies whether the specified border should be modified to create a frame effect by reversing the border's appearance from the edge nearest the text to the edge furthest from the text.</p> <p>If this attribute is omitted, then the border is not given any frame effect.</p> <p>[<i>Example</i>: Consider a bottom border which shall appear with a frame effect, which is specified in the following WordprocessingML:</p> <pre>&lt;w:bottom w:frame="true" ... /&gt;</pre> <p>This frame's val is true, indicating that the border frame effect shall be applied. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
shadow (Border Shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the right and top borders, this is accomplished by moving the order down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example</i>: Consider a top border which shall appear with a shadow effect, resulting in the following WordprocessingML:</p>

Attributes	Description
	<p><code>&lt;w:bottom w:shadow="true" ... /&gt;</code></p> <p>This frame's <code>val</code> is <code>true</code>, indicating that the shadow effect shall be applied to the border. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>
space (Border Spacing Measurement)	<p>Specifies the spacing offset that shall be used to place this border on the parent object.</p> <p>When a document has a page border that is relative to the page edges (using a value of <code>page</code> in the <code>offsetFrom</code> attribute on <code>pgBorders</code> (§2.6.10)), it shall specify the distance between the edge of the page and the beginning of this border in points.</p> <p>When a document has a page border that is relative to the text extents (using a value of <code>text</code> in the <code>offsetFrom</code> attribute on <code>pgBorders</code> (§2.6.10)), or any other border type, it shall specify the distance between the edge of the object and the beginning of this border in points.</p> <p>[<i>Example:</i> Consider a document with a set of page borders all specified to appear 24 points from the edge of the page. The resulting WordprocessingML would be as follows:</p> <pre>&lt;w:pgBorders w:offsetFrom="page"&gt;   &lt;w:bottom ... w:space="24"/&gt; &lt;/w:pgBorders</pre> <p>The <code>offsetFrom</code> attribute specifies that the <code>space</code> value will provide the offset of the page border from the page edge, and the value of the <code>space</code> attribute specifies that the page offset shall be 24 points. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_PointMeasure</code> simple type (§2.18.75).</p>
sz (Border Width)	<p>Specifies the width of the current border.</p> <p>If the border style (<code>val</code> attribute) specifies a line border, the width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>If the border style (<code>val</code> attribute) specifies an art border, the width of this border is specified in measurements of points, with a minimum value of one and a maximum value of 31. Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top w:val="dashed" w:sz="24" .../&gt; &lt;w:left w:val="dashed" w:sz="24" .../&gt;</pre>

Attributes	Description
	<p> <code>&lt;w:bottom w:val="dashed" w:sz="24" .../&gt;</code>  <code>&lt;w:right w:val="dashed" w:sz="24" .../&gt;</code> </p> <p>The border style is specified using the <code>val</code> attribute, and because that border style is a line border (dashed), the <code>sz</code> attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_EighthPointMeasure</code> simple type (§2.18.27).</p>
<b>themeColor</b> (Border Theme Color)	<p>Specifies a theme color to be applied to the current border.</p> <p>The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows color information to be set centrally in the document.</p> <p>[Example: Consider a set of borders configured to use the <code>accent2</code> theme color, resulting in the following WordprocessingML markup:</p> <pre> &lt;w:top ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:bottom ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:left ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:right ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; </pre> <p>The borders have a color with an RGB value of <code>FFA8A0</code>, however, because the <code>themeColor</code> attribute is specified, that value is ignored in favor of the <code>accent2</code> theme color specified for this document. <i>end example]</i></p> <p>The possible values for this attribute are defined by the <code>ST_ThemeColor</code> simple type (§2.18.104).</p>
<b>themeShade</b> (Border Theme Color Shade)	<p>Specifies the shade value applied to the supplied theme color (if any) for this border instance.</p> <p>If the <code>themeShade</code> is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The <code>themeShade</code> value is stored as a hex encoding of the shade value (from 0–255) applied to the current border.</p> <p>[Example: Consider a shade of 40% applied to a border in a document. This shade is calculated as follows:</p> $S_{xml} = 0.4 * 255$

Attributes	Description
	<p style="text-align: center;"> <math>= 102</math>  <math>= 66(hex)</math> </p> <p>The resulting themeShade value in the file format would be 66. <i>end example</i></p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * \text{Shade}_{\text{percentage}}$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example</i>: Consider a document with a background using the accent2 theme color, whose RGB value (in RRGGBB hex format) is C0504D.</p> <p>The equivalent HSL color value would be <math>(\frac{1}{360}, 0.48, 0.53)</math>.</p> <p>Applying the shade formula with a shade percentage of 75% to the luminance, we get:</p> $L' = 0.53 * 0.75$ $= 0.39698$ <p>Taking the resulting HSL color value of <math>(\frac{1}{360}, 0.48, 0.39698)</math> and converting back to RGB, we get 943634.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre>&lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="943634" w:themeColor="accent2"   w:themeShade="BF"/&gt;</pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
themeTint (Border Theme Color Tint)	<p>Specifies the tint value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeTint is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The themeTint value is stored as a hex encoding of the tint value (from 0–255) applied to the current border.</p>

Attributes	Description
	<p>[<i>Example</i>: Consider a tint of 60% applied to a border in a document. This tint is calculated as follows:</p> $T_{xml} = 0.6 * 255$ $= 153$ $= 99(hex)$ <p>The resulting themeTint value in the file format would be 99. <i>end example</i>]</p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * Tint_{pct} + (1 - Tint_{pct})$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example</i>: Consider a document with a background using the accent2 theme color, whose RGB value (in RRGGBB hex format) is 4F81BD.</p> <p>The equivalent HSL color value would be <math>(\frac{213}{360}, 0.45, 0.53)</math>.</p> <p>Applying the tint formula with a tint percentage of 60% to the luminance, we get:</p> $L' = 0.53 * 0.6 + (1 - .6)$ $= 0.71$ <p>Taking the resulting HSL color value of <math>(\frac{213}{360}, 0.45, 0.71)</math> and converting back to RGB, we get 95B3D7.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre>&lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="95B3D7" w:themeColor="accent2"   w:themeTint="99"/&gt;</pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
val (Border Style)	<p>Specifies the style of border used on this object.</p> <p>This border can either be an art border (a repeated image along the borders - only valid for page borders) or a line border (a line format repeated along the borders) - see the simple type definition for a description of each border style.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p> <p style="text-align: center;"><code>&lt;w:left w:val="single" .../&gt;</code></p> <p>This border's val is single, indicating that the border style is a single line. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Border simple type (§2.18.4).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
 <attribute name="val" type="ST_Border" use="required"/>
 <attribute name="color" type="ST_HexColor" use="optional"/>
 <attribute name="themeColor" type="ST_ThemeColor" use="optional"/>
 <attribute name="themeTint" type="ST_UcharHexNumber" use="optional"/>
 <attribute name="themeShade" type="ST_UcharHexNumber" use="optional"/>
 <attribute name="sz" type="ST_EighthPointMeasure" use="optional"/>
 <attribute name="space" type="ST_PointMeasure" use="optional"/>
 <attribute name="shadow" type="ST_OnOff" use="optional"/>
 <attribute name="frame" type="ST_OnOff" use="optional"/>
</complexType>
```

2.15.2.36 saveSmartTagsAsXml (Save Smart Tag Data in XML Property Bag)

This element specifies that the information pertaining to all smart tags () in the current document shall be saved into a separate XML-based property bag at the head of the web page when this WordprocessingML document is saved as a web page.

[*Rationale:* This setting is typically used when saving documents known to contain smart tags as web pages, in order to allow the smart tag data within the web page to be processed as a separate XML document by a separate parser, even though the actual HTML content of the resulting web page cannot be parsed by an XML-based parser. *end rationale*]

If this element is omitted, then the smart tag data of this document shall not be saved into a separate XML-compliant property bag within the HTML output when this document is saved as a web page.

[*Example:* Consider a WordprocessingML document which contains the following content:

Stock symbol: MSFT

Date: 7/4/2006

This document might typically write out the following HTML content:

<p>Stock symbol: <st1:stockticker>MSFT</st1:stockticker></p>

<p>Date: <st1:date ls="trans" Month="7" Day="4"  
Year="2006">7/4/2006</st1:date></p>

However, if the WordprocessingML document also contains the following content within the web settings part:

```
<w:webSettings>
 <w:saveSmartTagsAsXml w:val="true" />
</w:webSettings>
```

The saveSmartTagsAsXml element specifies that all smart tags in the document shall also be saved into an XML property bag at the header of the file, for example:

```
<head>
...
<xml>
 <o:DocumentSmartTags>
 <st1:stockticker>MSFT</st1:stockticker>
 <st1:date ls="trans" Month="7" Day="4" Year="2006">7/4/2006</st1:date>
 </o:DocumentSmartTags>
</xml>
...
</head>
```

This header information is in addition to the normal HTML output. *end example]*

Parent Elements
webSettings (§2.15.2.44)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.2.37 scrollbar (Scrollbar Display Option)

This element specifies when a scrollbar shall be visible for the contents of the current frame. When this element is set, the val attribute determines exactly when the scrollbar shall be visible. This property is analogous to the scrolling attribute on the frame element in HTML.

If this element is omitted, the scrollbar shall only be displayed when the contents of the frame exceed the visible space for the frame (i.e. when the scrollbar is needed to display all of the content).

[Example: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
...
<w:frameset>
...
 <w:frame>
 <w:name w:val="Frame 2" />
 <w:scrollbar w:val="auto" />
 </w:frame>
...
</w:frameset>
```

</w:frameset>

The scrollbar element has a val attribute of auto, which specifies that the frame shall only display a scrollbar when it is needed to display all of its content. *end example*]

Parent Elements
frame (§2.15.2.16)

Attributes	Description
val (Scrollbar Display Option Value)	<p>Specifies the criteria under which a scrollbar shall be displayed along with the contents of this frameset, as defined by the simple type referenced below.</p> <p>[<i>Example</i>: Consider a frameset definition within a WordprocessingML document which defines the following scrollbar visibility setting:</p> <pre>&lt;w:frame&gt;   &lt;w:scrollbar w:val="on" /&gt;   ... &lt;/w:frame&gt;</pre> <p>The val attribute value of on specifies that the scrollbar shall always be displayed, even when it is not needed (i.e. when it would be displayed disabled). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FrameScrollbar simple type (§2.18.36).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FrameScrollbar">
 <attribute name="val" type="ST_FrameScrollbar" use="required"/>
</complexType>
```

2.15.2.38 sourceFileName (Source File for Frame)

This element specifies the ID for the relationship which specifies the source file for a single frame within a frameset document.

The relationship referenced by this element's id attribute shall exist in the relationship part item for the Web Settings part, or this document shall be considered non-conformant. Also, the type of the relationship referenced by this element's id attribute shall be <http://schemas.openxmlformats.org/officeDocument/2006/relationships/frame>, or this document shall be considered non-conformant.

If this element is omitted, then no source file is present for the current frame, and one may be created dynamically as needed to display content within the frame.

1 [Example: Consider a WordprocessingML document which serves as the frameset container for a frameset  
2 consisting of the following three frames:

3  
4 The frameset properties for this document are specified by the following WordprocessingML within the web  
5 page settings:

```
6 <w:frameset>
7 ...
8 <w:frameset>
9 ...
10 <w:frame>
11 <w:name w:val="Frame 2" />
12 <w:sourceFileName r:id="rId5" />
13 </w:frame>
14 ...
15 </w:frameset>
16 </w:frameset>
```

17 The sourceFileName element specifies that the contents of this frame shall be the contents of the file targeted  
18 by the relationship with ID rId5 in the web settings part's relationship part item. *end example]*

Parent Elements
frame (§2.15.2.16)

Attributes	Description
id (Relationship to Part)	Specifies the relationship ID to a specified part.

Attributes	Description
Namespace: .../officeDocument /2006/relationships	<p>The specified relationship shall match the type required by the parent element:</p> <ul style="list-style-type: none"><li>• http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element</li><li>• http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element</li><li>• http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements</li><li>• http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element</li></ul> <p>[Example: Consider an XML element which has the following id attribute:</p> <p>&lt;... r:id="rId10" /&gt;</p> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Rel">
3 <attribute ref="r:id" use="required"/>
4 </complexType>
```

5 2.15.2.39 sz (Frame Size)

6 This element specifies the size for a single frame within a frameset.

7 This size shall be interpreted based on the contents of the frameLayout element (§2.15.2.17) for the parent  
8 frameset, as follows:

- 9
- If the val attribute on that element is cols, then this element specifies the width of the frame
  - If the val attribute on that element is rows, then this element specifies the height of the frame
- 10

11 Once the axis of this measurement has been established using the criteria above, the actual value of the  
12 measurement shall be determined by the following:

- 13
- If the val attribute ends in a asterisk (\*), then this measurement is a relative measurement (relative to all other frames in this frameset).
  - If the val attribute ends in a percentage symbol (%), then this measurement is a percentage of the height and/or width of the parent window, respectively.
  - Otherwise, the value of the val attribute specifies the size of the frame in pixels. This measurement shall be interpreted in the context of the pixelsPerInch element (§2.15.2.33) to determine the width of the resulting measurement in inches.
- 14  
15  
16  
17  
18  
19

- 1
- If this element is omitted, then no information shall be implied about the size of the current frame.
- 2
- [*Example:* Consider a frameset consisting of the following three frames:

- 3
- 
- 4
- The following properties define the presentation of the top frame within this frameset:

5

<w:frameset>

6

...

7

<w:frame>

8

<w:sz w:val="300" />

9

<w:name w:val="Frame 1" />

10

</w:frame>

11

...

12

<w:pixelsPerInch w:val="150" />

13

</w:frameset>

- 14
- The sz element's val attribute specifies that the size of this frame is 300 - which translates to a height of exactly
- 15
- 300 pixels tall. In addition, this document specifies that the intended number of pixels per inch for this
- 16
- measurement is 150, resulting in a 2" tall frame height. *end example*]

Parent Elements
frame (§2.15.2.16)

Attributes	Description
val (String Value)	Specifies that its contents will contain a string.

Attributes	Description
	<p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt;   ... &lt;/w:sdtPr&gt;</pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_String">
3 <attribute name="val" type="ST_String" use="required"/>
4 </complexType>
```

5 2.15.2.40 sz (Nested Frameset Size)

6 This element specifies the size for a frameset that has been nested within another frameset. If this size appears  
7 on a root frameset, then it may be ignored and the main frameset shall encompass the entire window.

8 This size shall be interpreted based on the contents of the frameLayout element (§2.15.2.17) for the parent  
9 frameset (not the current nested frameset), as follows:

- 10 • If the val attribute on that element is cols, then this element specifies the width of the frameset  
11 • If the val attribute on that element is rows, then this element specifies the height of the frameset

12 Once the axis of this measurement has been established using the criteria above, the actual value of the  
13 measurement shall be determined by the following:

- 14 • If the val attribute ends in an asterisk (\*), then this measurement is a relative measurement (relative to  
15 all other frames in this frameset).

- If the val attribute ends in a percentage symbol (%), then this measurement is a percentage of the height and/or width of the parent frameset, respectively.
- Otherwise, the value of the val attribute specifies the size of the frameset in pixels. This measurement shall be interpreted in the context of the pixelsPerInch element (§2.15.2.33) to determine the width of the resulting measurement in inches.

If this element is omitted, then no information shall be implied about the size of the current frameset.

[Example: Consider a nested frameset defined as follows:

```
<w:frameset>
...
<w:frameset>
 <w:sz w:val="50%" />
 ...
</w:frameset>
...
<w:pixelsPerInch w:val="150" />
</w:frameset>
```

The sz element's val attribute specifies that the size of this nested frameset is 50% - which translates to a width of fifty percent of the width of the parent frameset's height. *end example]*

Parent Elements
frameset (§2.15.2.18); frameset (§2.15.2.19)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt; ...</pre>

Attributes	Description
	<p><code>&lt;/w:sdtPr&gt;</code></p> <p>In this case, the decimal number in the <code>val</code> attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
 <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

#### 2.15.2.41 `targetScreenSz` (Target Screen Size for Web Page)

This element specifies the ideal minimum target screen size (width by height, specified in pixels) on which web pages generated when saving this document will be displayed. This setting may be used to optimize the output of web pages produced from this document.

If this element is omitted, then the target screen size for web pages produced from this document shall be assumed to be 800x600.

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
 <w:targetScreenSz w:val="1600x1200" />
</w:webSettings>
```

The `targetScreenSz` element's `val` attribute has a value of 1600x1200, which specifies that a target screen size of 1600 by 1200 pixels shall be assumed when saving this document as a web page. *end example*

Parent Elements
webSettings (§2.15.2.44)

Attributes	Description
val (Target Screen Size Value)	<p>Specifies the target screen size for web pages produced by this document, as defined by the simple type referenced below.</p> <p>[<i>Example:</i> Consider a WordprocessingML document which contains the following content within the web settings part:</p> <pre>&lt;w:webSettings&gt;   &lt;w:targetScreenSz w:val="1024x768" /&gt;</pre>

Attributes	Description
	<p><code>&lt;/w:webSettings&gt;</code></p> <p>The <code>val</code> attribute has a value of 1024x768, which specifies that a target screen size of 1024 by 768 pixels shall be assumed when saving this document as a web page. <i>end example</i></p> <p>The possible values for this attribute are defined by the <code>ST_TargetScreenSz</code> simple type (§2.18.93).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TargetScreenSz">
3 <attribute name="val" type="ST_TargetScreenSz" use="required"/>
4 </complexType>
```

5 **2.15.2.42**      **top (Top Border for HTML div)**

6 This element specifies the border which shall be displayed at the top of the boundaries of the current HTML `div`

7 object.

8 If this element is omitted, then this HTML `div` object shall not have a top border.

9 [Example: Consider a simple HTML document defined as follows:

```
10 <html>
11 <body>
12 <div style=" border-left-style:solid; border-right-style:groove; border-
13 right-width:1px; border-top-style:dashed; border-top-width:3px; border-bottom-
14 style:outset; border-bottom-width:3px">
15 <p>paragraph of text</p>
16 </div>
17 </body>
18 </html>
```

19 This HTML would therefore normally appear as follows (image scaled appropriately):

20

21 Now, when this document is saved in the WordprocessingML format, the information stored on the `div`

22 elements is stored in the web setting part as follows:

```
1 <w:divs>
2 <w:div w:id="1785730240">
3 <w:divBdr>
4 <w:top w:val="dashed" w:sz="18" w:space="7" w:color="auto" />
5 <w:left w:val="single" w:sz="24" w:space="4" w:color="auto" />
6 <w:bottom w:val="outset" w:sz="18" w:color="auto" />
7 <w:right w:val="threeDEngrave" w:sz="6" w:color="auto" />
8 </w:divBdr>
9 </w:div>
10 </w:divs>
```

11 The top element specifies border information about the top border for the single HTML div structure in the  
12 document; in this case, a 2.25 point bottom border of type dashed. The initial 3 pixel border was converted to  
13 2.25 points using the following logic:

$$3\text{px} * \frac{1 \text{ inch}}{96 \text{ px}} * \frac{576 \text{ eighth points}}{1 \text{ inch}} = 18 \text{ eighth points (2.25 points)}$$

14 *end example]*

15

Parent Elements	
divBdr (§2.15.2.7)	

Attributes	Description
color (Border Color)	<p>Specifies the color for this border.</p> <p>This color may either be presented as a hex value (in RRGGBB format), or auto to allow a consumer to automatically determine the border color as appropriate.</p> <p>[Example: Consider a border color with value auto, as follows:</p> <div>&lt;w:bottom ... w:color="auto"/&gt;</div> <p>This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. <i>end example]</i></p> <p>If the border style (the val attribute) specifies the use of an art border, this attribute is ignored. As well, if the border specifies the use of a theme color via the themeColor attribute, this value is superseded by the theme color value.</p> <p>The possible values for this attribute are defined by the ST_HexColor simple type (§2.18.43).</p>
frame (Create	Specifies whether the specified border should be modified to create a frame effect by

Attributes	Description
Frame Effect)	<p>reversing the border's appearance from the edge nearest the text to the edge furthest from the text.</p> <p>If this attribute is omitted, then the border is not given any frame effect.</p> <p>[<i>Example</i>: Consider a bottom border which shall appear with a frame effect, which is specified in the following WordprocessingML:</p> <pre data-bbox="451 533 951 562">&lt;w:bottom w:frame="true" ... /&gt;</pre> <p>This frame's val is true, indicating that the border frame effect shall be applied. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
shadow (Border Shadow)	<p>Specifies whether this border should be modified to create the appearance of a shadow.</p> <p>For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the right and top borders, this is accomplished by moving the order down and to the right of its original location.</p> <p>If this attribute is omitted, then the border is not given the shadow effect.</p> <p>[<i>Example</i>: Consider a top border which shall appear with a shadow effect, resulting in the following WordprocessingML:</p> <pre data-bbox="451 1150 967 1180">&lt;w:bottom w:shadow="true" ... /&gt;</pre> <p>This frame's val is true, indicating that the shadow effect shall be applied to the border. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
space (Border Spacing Measurement)	<p>Specifies the spacing offset that shall be used to place this border on the parent object.</p> <p>When a document has a page border that is relative to the page edges (using a value of page in the offsetFrom attribute on pgBorders (§2.6.10)), it shall specify the distance between the edge of the page and the beginning of this border in points.</p> <p>When a document has a page border that is relative to the text extents (using a value of text in the offsetFrom attribute on pgBorders (§2.6.10)), or any other border type, it shall specify the distance between the edge of the object and the beginning of this border in points.</p> <p>[<i>Example</i>: Consider a document with a set of page borders all specified to appear 24 points from the edge of the page. The resulting WordprocessingML would be as follows:</p>

Attributes	Description
	<pre>&lt;w:pgBorders w:offsetFrom="page"&gt;   &lt;w:bottom ... w:space="24"/&gt; &lt;/w:pgBorders&gt;</pre> <p>The offsetFrom attribute specifies that the space value will provide the offset of the page border from the page edge, and the value of the space attribute specifies that the page offset shall be 24 points. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PointMeasure simple type (§2.18.75).</p>
sz (Border Width)	<p>Specifies the width of the current border.</p> <p>If the border style (val attribute) specifies a line border, the width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.</p> <p>If the border style (val attribute) specifies an art border, the width of this border is specified in measurements of points, with a minimum value of one and a maximum value of 31. Any values outside this range may be reassigned to a more appropriate value.</p> <p>[<i>Example:</i> Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top w:val="dashed" w:sz="24" .../&gt; &lt;w:left w:val="dashed" w:sz="24" .../&gt; &lt;w:bottom w:val="dashed" w:sz="24" .../&gt; &lt;w:right w:val="dashed" w:sz="24" .../&gt;</pre> <p>The border style is specified using the val attribute, and because that border style is a line border (dashed), the sz attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_EighthPointMeasure simple type (§2.18.27).</p>
themeColor (Border Theme Color)	<p>Specifies a theme color to be applied to the current border.</p> <p>The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows color information to be set centrally in the document.</p> <p>[<i>Example:</i> Consider a set of borders configured to use the accent2 theme color, resulting in the following WordprocessingML markup:</p> <pre>&lt;w:top ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt;</pre>

Attributes	Description
	<pre> &lt;w:bottom ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:left ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; &lt;w:right ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" /&gt; </pre> <p>The borders have a color with an RGB value of FFA8A0, however, because the themeColor attribute is specified, that value is ignored in favor of the accent2 theme color specified for this document. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_ThemeColor simple type (§2.18.104).</p>
<b>themeShade</b> (Border Theme Color Shade)	<p>Specifies the shade value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeShade is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The themeShade value is stored as a hex encoding of the shade value (from 0–255) applied to the current border.</p> <p>[<i>Example</i>: Consider a shade of 40% applied to a border in a document. This shade is calculated as follows:</p> $  \begin{aligned}  S_{xml} &= 0.4 * 255 \\  &= 102 \\  &= 66(hex)  \end{aligned}  $ <p>The resulting themeShade value in the file format would be 66. <i>end example</i></p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * \text{Shade}_{\text{percentage}}$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example</i>: Consider a document with a background using the accent2 theme color, whose RGB value (in RRGGBB hex format) is C0504D.</p> <p>The equivalent HSL color value would be <math>\left(\frac{1}{360}, 0.48, 0.53\right)</math>.</p>

Attributes	Description
	<p>Applying the shade formula with a shade percentage of 75% to the luminance, we get:</p> $L' = 0.53 * 0.75$ $= 0.39698$ <p>Taking the resulting HSL color value of <math>\left(\frac{1}{360}, 0.48, 0.39698\right)</math> and converting back to RGB, we get 943634.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre>&lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="943634" w:themeColor="accent2"   w:themeShade="BF"/&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
themeTint (Border Theme Color Tint)	<p>Specifies the tint value applied to the supplied theme color (if any) for this border instance.</p> <p>If the themeTint is supplied, then it is applied to the RGB value of the theme color (from the theme part) to determine the final color applied to this border.</p> <p>The themeTint value is stored as a hex encoding of the tint value (from 0–255) applied to the current border.</p> <p>[<i>Example:</i> Consider a tint of 60% applied to a border in a document. This tint is calculated as follows:</p> $T_{xml} = 0.6 * 255$ $= 153$ $= 99(hex)$ <p>The resulting themeTint value in the file format would be 99. <i>end example]</i></p> <p>Given an RGB color defined as three hex values in RRGGBB format, the shade is applied as follows:</p> <ul style="list-style-type: none"> <li>• Convert the color to the HSL color format (values from 0 to 1)</li> <li>• Modify the luminance factor as follows:</li> </ul> $L' = L * Tint_{pct} + (1 - Tint_{pct})$ <ul style="list-style-type: none"> <li>• Convert the resultant HSL color to RGB</li> </ul> <p>[<i>Example:</i> Consider a document with a background using the accent2 theme color,</p>

Attributes	Description
	<p>whose RGB value (in RRGGBB hex format) is 4F81BD.</p> <p>The equivalent HSL color value would be <math>\left(\frac{213}{360}, 0.45, 0.53\right)</math>.</p> <p>Applying the tint formula with a tint percentage of 60% to the luminance, we get:</p> $L' = 0.53 * 0.6 + (1 - .6)$ $= 0.71$ <p>Taking the resulting HSL color value of <math>\left(\frac{213}{360}, 0.45, 0.71\right)</math> and converting back to RGB, we get 95B3D7.</p> <p>This transformed value can be seen in the resulting background's color attribute:</p> <pre>&lt;w:top w:val="single" w:sz="4" w:space="24"   w:color="95B3D7" w:themeColor="accent2"   w:themeTint="99"/&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_UcharHexNumber simple type (§2.18.106).</p>
val (Border Style)	<p>Specifies the style of border used on this object.</p> <p>This border can either be an art border (a repeated image along the borders - only valid for page borders) or a line border (a line format repeated along the borders) - see the simple type definition for a description of each border style.</p> <p>[<i>Example:</i> Consider a left border resulting in the following WordprocessingML:</p> <pre>&lt;w:left w:val="single" .../&gt;</pre> <p>This border's val is single, indicating that the border style is a single line. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Border simple type (§2.18.4).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
 <attribute name="val" type="ST_Border" use="required"/>
 <attribute name="color" type="ST_HexColor" use="optional"/>
 <attribute name="themeColor" type="ST_ThemeColor" use="optional"/>
 <attribute name="themeTint" type="ST_UcharHexNumber" use="optional"/>
 <attribute name="themeShade" type="ST_UcharHexNumber" use="optional"/>
 <attribute name="sz" type="ST_EighthPointMeasure" use="optional"/>
 <attribute name="space" type="ST_PointMeasure" use="optional"/>
 <attribute name="shadow" type="ST_OnOff" use="optional"/>
 <attribute name="frame" type="ST_OnOff" use="optional"/>
</complexType>
```

2.15.2.43 w (Frameset Splitter Width)

This element specifies the width of the splitters within the frameset in this WordprocessingML document. This element shall only be honored on the root frameset for this document, and may be ignored for all nested framesets in this document.

If this element is omitted, then the default width of the splitters in this document shall be 4.5 points (90 twentieths of a point) wide. If the noBorder element (§2.15.2.30) is also specified, then this element shall be ignored and no splitters shall be displayed.

[Example: Consider a frameset consisting of the following three frames:

The following properties define the presentation of the splitter bars within this frameset:

```
1 <w:frameset>
2 <w:framesetSplitbar>
3 <w:w w:val="200" />
4 <w:color w:val="0000FF" />
5 </w:framesetSplitbar>
6 ...
7 </w:frameset>
```

8 The w element's val attribute specifies that the splitter shall be 10 points (200 twentieths of a point) wide when  
9 the contents of this document are displayed. *end example*]

Parent Elements
framesetSplitbar (§2.15.2.20)

10

Attributes	Description
val (Measurement in Twentieths of a Point)	<p>Specifies a positive measurement value, specified in twentieths of a point. This value is interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML element with a val attribute containing a positive measurement in twentieths of a point:</p> <pre>&lt;w:... w:val="720" /&gt;</pre> <p>The val attribute has a value of 720, specifying that this measurement value is 720 twentieths of a point (0.5"). This value is interpreted by the parent element as needed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§2.18.105).</p>

11 The following XML Schema fragment defines the contents of this element:

```
12 <complexType name="CT_TwipsMeasure">
13 <attribute name="val" type="ST_TwipsMeasure" use="required"/>
14 </complexType>
```

15 **2.15.2.44 webSettings (Web Page Settings)**

16 This element specifies the set of web page settings that have been specified for a single WordprocessingML  
17 document. This element is the root element for the Web Settings part within a WordprocessingML document.

18 [*Example:* Consider the following WordprocessingML fragment for the web page settings in a  
19 WordprocessingML document:

```

1 <w:webSettings>
2 <w:frameset>
3 ...
4 </w:frameset>
5 <w:doNotUseLongFileNames w:val="true" />
6 </w:webSettings>

```

The webSettings element contains all of the web page settings for this document. In this case, the web page settings specified for this document are: a frameset defined using the frameset element (§2.15.2.18); and a setting specifying that when this file is saved as a web page, all resulting files shall not exceed 8.3 characters in length using the doNotUseLongFileNames element (§2.15.2.13). *end example*

Parent Elements
Root element of WordprocessingML Web Settings part

Child Elements	Subclause
allowPNG (Allow PNG as Graphic Format)	§2.15.2.1
divs (Information about HTML div Elements)	§2.15.2.8
doNotOrganizeInFolder (Do Not Place Supporting Files in Subdirectory)	§2.15.2.10
doNotRelyOnCSS (Do Not Rely on CSS for Font Face Formatting)	§2.15.2.11
doNotSaveAsSingleFile (Recommend Web Page Format over Single File Web Page Format)	§2.15.2.12
doNotUseLongFileNames (Do Not Use File Names Longer than 8.3 Characters)	§2.15.2.13
encoding (Output Encoding When Saving as Web Page)	§2.15.2.14
frameset (Root Frameset Definition)	§2.15.2.18
optimizeForBrowser (Disable Features Not Supported by Target Web Browser)	§2.15.2.32
pixelsPerInch (Pixels per Inch for Graphics/Images)	§2.15.2.33
relyOnVML (Utilize VML When Saving as Web Page)	§2.15.2.34
saveSmartTagsAsXml (Save Smart Tag Data in XML Property Bag)	§2.15.2.36
targetScreenSz (Target Screen Size for Web Page)	§2.15.2.41

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebSettings">
 <sequence>
 <element name="frameset" type="CT_Frameset" minOccurs="0"/>
 <element name="divs" type="CT_Divs" minOccurs="0"/>
 <element name="encoding" type="CT_String" minOccurs="0"/>
 <element name="optimizeForBrowser" type="CT_OnOff" minOccurs="0"/>
 <element name="relyOnVML" type="CT_OnOff" minOccurs="0"/>
 <element name="allowPNG" type="CT_OnOff" minOccurs="0"/>
 <element name="doNotRelyOnCSS" type="CT_OnOff" minOccurs="0"/>
 <element name="doNotSaveAsSingleFile" type="CT_OnOff" minOccurs="0"/>
 <element name="doNotOrganizeInFolder" type="CT_OnOff" minOccurs="0"/>
 <element name="doNotUseLongFileNames" type="CT_OnOff" minOccurs="0"/>
 <element name="pixelsPerInch" type="CT_DecimalNumber" minOccurs="0"/>
 <element name="targetScreenSz" type="CT_TargetScreenSz" minOccurs="0"/>
 <element name="saveSmartTagsAsXml" type="CT_OnOff" minOccurs="0"/>
 </sequence>
</complexType>
```

### 2.15.3 Compatibility Settings

The last group of settings stored in WordprocessingML is compatibility settings. *Compatibility Settings* are optional settings used to preserve visual fidelity of documents created in earlier word processing applications. Some of these settings provide affordance for specific behaviors, described in detail below; and others simply instruct applications to mimic the behavior of an existing word processing application.

If compatibility settings are needed, they are stored in the Document Settings part.

It is important to note that all compatibility settings are optional in nature - applications may freely ignore all behaviors described within this section and these settings should not be added unless compatibility is specifically needed in one or more cases. The compatibility settings are provided for backward compatibility with documents created in legacy applications. As such, a number of the settings reference specific applications and specific versions of those applications. This is solely for backward compatibility reasons, and any of those settings are ignorable.

[*Example:* Consider the following WordprocessingML fragment for the compatibility settings in a WordprocessingML document:

```
<w:settings>
 ...
 <w:compat>
 <w:noTabHangInd />
 </w:compat>
</w:settings>
```

The compat element contains all of the document settings for this document. In this case, the single setting applied is the suppression of a tab stop when using a hanging indent using the noTabHangInd element (§2.15.3.37). *end example*]

### 2.15.3.1 `adjustLineHeightInTable` (Add Document Grid Line Pitch To Lines in Table Cells)

This element specifies whether a document grid defined using the `docGrid` element (§2.6.5) that specifies a line grid (manually adding additional pitch to each line in the section) shall also be applied to lines within table cells in this section.

Typically, when additional line pitch is added to all lines in a section via the document grid, it is not applied to text in tables. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that additional line pitch shall be added to lines in table cells.

*[Example: Consider a WordprocessingML document with a single section, whose document grid is defined such that 25.9 points of additional line pitch are added to each line in the section, as follows:*

```
<w:docGrid w:type="lines" w:linePitch="518"/>
```

If text was entered into this section, the default behavior would have line pitch only added to lines which are not in a table cell:

This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.

<p>This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.</p>
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

This section has a character grid. This section has a character grid. This section has a character grid.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:adjustLineHeightInTable />
</w:compat>
```

Then all lines in this document would have the line pitch from the document grid added to them, resulting in the following output:

This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.

This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid. This section has a character grid.

This section has a character grid. This section has a character grid. This section has a character grid.

2 *end example]*

Parent Elements
compat (§2.15.3.9)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <div><p>&lt;w:... w:val="off"/&gt;</p></div> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_OnOff">
6 <attribute name="val" type="ST_OnOff"/>
7 </complexType>
```

2.15.3.2 alignTablesRowByRow (Align Table Rows Independently)

This element specifies whether applications shall align each row within a table independently based on the alignment setting of the jc element (§2.4.22) when displaying the contents of a table in a WordprocessingML document.

When the justification of a table using the jc element is typically applied, that alignment is applied to the contents of the table (the table is centered, left justified, or right-aligned), and then individual rows are laid out based on the resulting table's position. This element, when present with a val attribute value of true (or equivalent), specifies that each table row shall be independently aligned based on the table alignment setting, ignoring the placement of all other rows.

[Example: Consider a WordprocessingML document with a single centered table, whose second row is defined such that one-half of an inch is left before the row begins, as follows:

```
<w:tbl>
 <w:tblPr>
 <w:jc w:val="center" />
 </w:tblPr>
 <w:tr>
 ...
 </w:tr>
 <w:tr>
 <w:trPr>
 <w:gridBefore w:val="1" />
 <w:wBefore w:w="720" w:type="dxa" />
 </w:trPr>
 ...
 </w:tr>
 <w:tr>
 ...
 </w:tr>
</w:tbl>
```

The default presentation would have the entire table centered, then the second row indented beyond that by 720 points:

However, if this compatibility setting is turned on:

```
1 <w:compat>
2 <w:alignTablesRowByRow />
3 </w:compat>
```

4 Then that second row would instead be centered on the page independently of the other table rows, resulting in  
5 the following output:

6  
7 In this case, the wBefore element's value is ignored, since the row was centered on the line as a row, and there  
8 is no table to be indented relative to. *end example*]

Parent Elements
compat (§2.15.3.9)

9

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

10 The following XML Schema fragment defines the contents of this element:

```
11 <complexType name="CT_OnOff">
12 <attribute name="val" type="ST_OnOff"/>
13 </complexType>
```

14 **2.15.3.3 allowSpaceOfSameStyleInTable (Allow Contextual Spacing of Paragraphs in Tables)**

15 This element specifies whether the suppression of additional space (contextual spacing) defined using the  
16 contextualSpacing element (§2.3.1.9) shall be applied to paragraphs contained within tables.

Typically, the rules for the removal of additional paragraph spacing via the contextualSpacing element are applied to all paragraphs in a WordprocessingML document. This element, when present with a val attribute value of true (or equivalent), specifies that this setting shall always be ignored for paragraphs in table cells (and additional spacing shall be allowed).

[Example: Consider a WordprocessingML document with a default paragraph style with additional spacing after and contextual spacing set, as follows:

```
<w:style w:name="Normal" w:default="1">
...
<w:pPr>
 <w:spacing w:after="200" />
 <w:contextualSpacing />
</w:pPr>
</w:style>
```

The default presentation would have the spacing suppressed between all paragraphs, since they are all of the default paragraph style defined above (contextual spacing applies):

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. You can also format text directly by using the other controls on the Home tab. Most controls offer a choice of using the look from the current theme or using a format that you specify directly.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:allowSpaceOfSameStyleInTable />
</w:compat>
```

Then the paragraphs in the table will never have their spacing suppressed, resulting in the following output:

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p>&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. end example]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.4 applyBreakingRules (Use Legacy Ethiopic and Amharic Line Breaking Rules)

This element specifies whether applications shall use a legacy set of line breaking rules when determining line breaks for text consisting of Ethiopic and/or Amharic characters.

Typically, when line breaking this text, applications should allow line breaks to occur after a character between the UTF-16 (hexadecimal) values 0x1361 and 0x1368 when those characters appear in the document's content. This element, when present with a val attribute value of true (or equivalent), specifies that when a line break would occur after a character between the UTF-16 hexadecimal) values 0x1361 and 0x1368, the line break shall occur before all instances of these characters (i.e. no break opportunity shall be afforded after a character in this range).

[Example: Consider a WordprocessingML document with a series of Ethopic characters in this range. The default presentation would have any line breaks pushed before or after these characters, ensuring that the characters remain together on a single line.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:applyBreakingRules />
</w:compat>
```

Then a line break opportunity shall be afforded at any point in a range of these characters, as needed. end example]

Parent Elements

compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre>

Attributes	Description
	The val attribute explicitly declares that the property is turned off. <i>end example</i>  The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.5 autofitToFirstFixedWidthCell (Allow Table Columns To Exceed Preferred Widths of**  
6 **Constituent Cells)**

7 This element specifies that when performing an AutoFit on a table in a WordprocessingML document in order to  
8 display it, applications shall alter that logic slightly in order to mimic the behavior of a previous word processing  
9 application.

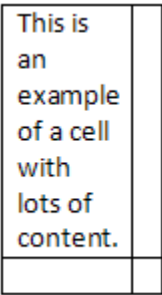

10 Normally, the AutoFit behavior of a table is as is described in the associated simple type. This element, when  
11 present with a val attribute value of true (or equivalent), specifies that this logic shall be changed as follows:

- 12 • If the width of a grid column in a table has been set by a preferred table cell width, then that column's  
13 width may be enlarged by the content of cells which themselves do not have a preferred width (in  
14 contrast, the normal logic never allows the content of cells to override a preferred width on a grid  
15 column).

16 [Example: Consider a WordprocessingML table with only one preferred cell width, a width of 720 points on the  
17 second cell in the first column, as follows:

```
1 <w:tbl>
2 <w:tr>
3 <w:tc>
4 <w:p/>
5 </w:tc>
6 <w:tc>
7 <w:p/>
8 </w:tc>
9 </w:tr>
10 <w:tr>
11 <w:tc>
12 <w:tcPr>
13 <w:tcW w:w="720" w:type="dxa" />
14 </w:tcPr>
15 <w:p/>
16 </w:tc>
17 <w:tc>
18 <w:p/>
19 </w:tc>
20 </w:tr>
21 </w:tbl>
```

22 The default presentation would have the first column constrained to 720 points by the preferred width of the  
23 second cell in the first column:

This is an example of a cell with lots of content.	

24  
25 However, if this compatibility setting is turned on:

```
26 <w:compat>
27 <w:autoFitToFirstFixedWidthCell />
28 </w:compat>
```

29 Then the column would be resized proportionally based on the content (ignoring the preferred width in that  
30 row), resulting in the following output:

This is an example of a cell with lots of content.	

*end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.3.6 autoSpaceLikeWord95 (Emulate Word 95 Full-Width Character Spacing)

This element specifies that applications shall emulate the behavior of a previously existing word processing application (Microsoft Word 95) when determining the spacing between full-width East Asian characters in a document's content.

[Guidance: To faithfully replicate this behavior, applications must imitate the behavior of that application, which involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated due to issues with its output, and is maintained only for compatibility with existing documents from that application. *end guidance]*

1 Typically, applications shall not perform this compatibility. This element, when present with a `val` attribute value  
2 of `true` (or equivalent), specifies that applications shall attempt to mimic that existing word processing  
3 application in this regard.

4 *[Example: Consider a WordprocessingML document with a series of full-width East Asian characters.*

5 If this compatibility setting is turned on:

```
6 <w:compat>
7 <w:autoSpaceLikeWord95 />
8 </w:compat>
```

9 Then applications should mimic the behavior of Microsoft Word 95 when determining the space between those  
10 characters, as needed. *end example]*

14 <attribute name="val" type="ST_OnOff"/>
15 </complexType>
```

16 **2.15.3.7**      **balanceSingleByteDoubleByteWidth (Balance Single Byte and Double Byte**  
17 **Characters)**

18 This element specifies whether applications shall balance the width of Single Byte Character Set characters and  
19 Double Byte Character Set characters when rendering WordprocessingML documents. Specifically, this element

specifies to adjust the fixed pitch fonts' half-width space character and full-width space character to attain a 1 to 2 ratio.

[*Note*: This element is used with East Asian content. Layout and line breaking for East Asian text is dependent on the character width. Half width characters (or Hankaku characters) are one half of an em wide, and full width characters (or Zenkaku characters) are one em wide. Legacy encoding often used a single byte to encode half-width characters and two bytes to encode full width characters. *end note*]

Typically, no adjustment is done on any character when it is displayed as part of a WordprocessingML document. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that character sizes shall be adjusted as needed to meet the 1:2 ratio described above.

[*Example*: Consider a WordprocessingML document with both SBCS and DBCS characters. The default presentation would have the text displayed as follows:

言葉が example 生ま

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:balanceSingleByteDoubleByteWidth />
</w:compat>
```

Then this character-level adjustment must be performed, resulting in the following output:

言葉が example 生ま

This adjustment is usually very minute in nature, therefore the result is better illustrated by showing how the characters after the English text were pushed out due to the width balancing of that text:

言葉が example 生ま

*end example*]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

6 **2.15.3.8**      **cachedColBalance (Use Cached Paragraph Information for Column Balancing)**

7 This element specifies whether applications shall incorrectly calculate the height of a paragraph for the purposes  
8 of column balancing when rendering WordprocessingML documents. Specifically, this element specifies that  
9 when a paragraph's lines have differing heights, an application shall treat this paragraph as though it had only  
10 one line equaling the full paragraph height, regardless of the actual number of lines in the paragraph.

11 [*Guidance:* It is recommended that applications not intentionally replicate this behavior as it was deprecated  
12 due to issues with its output, and is maintained only for compatibility with existing documents from a legacy  
13 application. *end guidance*]

14 Typically, lines are correctly measured for their height when balancing columns as part of a WordprocessingML  
15 document. This element, when present with a val attribute value of true (or equivalent), specifies that  
16 applications shall perform the incorrect calculation in the conditions described above.

17 [*Example:* Consider a WordprocessingML document with two columns of text which shall be balanced.

18 If this compatibility setting is turned on:

```
<w:compat>
 <w:cachedColBalance />
</w:compat>
```

Then applications should perform the calculation described above to balance the columns, as needed. *end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.9 compat (Compatibility Settings)

This element specifies a set of optional compatibility options for the current document.

All settings in this section are optional, but some are very commonly used by different languages, and those which are typically used are as follows:

For Thai, Lao, Khmer, Tibetan, and Armenian:

- The applyBreakingRules setting (§2.15.3.4)

For East Asian languages:

- The adjustLineHeightInTable setting (§2.15.3.1)

- The balanceSingleByteDoubleByteWidth setting (§2.15.3.7)
- The doNotExpandShiftReturn setting (§2.15.3.15)
- The doNotLeaveBackslashAlone setting (§2.15.3.16)
- The spaceForUL setting (§2.15.3.43)
- The ulTrailSpace setting (§2.15.3.55)

[*Example:* Consider a WordprocessingML document with a series of compatibility settings:

```
<w:settings>
 <w:compat>
 ...
 </w:compat>
</w:settings>
```

The compat element specifies the set of compatibility settings for a document. *end example*]

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
adjustLineHeightInTable (Add Document Grid Line Pitch To Lines in Table Cells)	§2.15.3.1
alignTablesRowByRow (Align Table Rows Independently)	§2.15.3.2
allowSpaceOfSameStyleInTable (Allow Contextual Spacing of Paragraphs in Tables)	§2.15.3.3
applyBreakingRules (Use Legacy Ethiopic and Amharic Line Breaking Rules)	§2.15.3.4
autofitToFirstFixedWidthCell (Allow Table Columns To Exceed Preferred Widths of Constituent Cells)	§2.15.3.5
autoSpaceLikeWord95 (Emulate Word 95 Full-Width Character Spacing)	§2.15.3.6
balanceSingleByteDoubleByteWidth (Balance Single Byte and Double Byte Characters)	§2.15.3.7
cachedColBalance (Use Cached Paragraph Information for Column Balancing)	§2.15.3.8
convMailMergeEsc (Treat Backslash Quotation Delimiter as Two Quotation Marks)	§2.15.3.10
displayHangulFixedWidth (Always Use Fixed Width for Hangul Characters)	§2.15.3.11
doNotAutofitConstrainedTables (Do Not AutoFit Tables To Fit Next To Wrapped Objects)	§2.15.3.12
doNotBreakConstrainedForcedTable (Don't Break Table Rows Around Floating Tables)	§2.15.3.13
doNotBreakWrappedTables (Do Not Allow Floating Tables To Break Across Pages)	§2.15.3.14
doNotExpandShiftReturn (Don't Justify Lines Ending in Soft Line Break)	§2.15.3.15
doNotLeaveBackslashAlone (Convert Backslash To Yen Sign When Entered)	§2.15.3.16
doNotSnapToGridInCell (Do Not Snap to Document Grid in Table Cells with Objects)	§2.15.3.17
doNotSuppressIndentation (Do Not Ignore Floating Objects When Calculating Paragraph Indentation)	§2.15.3.18

Child Elements	Subclause
doNotSuppressParagraphBorders (Do Not Suppress Paragraph Borders Next To Frames)	§2.15.3.19
doNotUseEastAsianBreakRules (Do Not Compress Compressible Characters When Using Document Grid)	§2.15.3.20
doNotUseHTMLParagraphAutoSpacing (Use Fixed Paragraph Spacing for HTML Auto Setting)	§2.15.3.21
doNotUseIndentAsNumberingTabStop (Ignore Hanging Indent When Creating Tab Stop After Numbering)	§2.15.3.22
doNotVertAlignCellWithSp (Don't Vertically Align Cells Containing Floating Objects)	§2.15.3.23
doNotVertAlignInTxbx (Ignore Vertical Alignment in Textboxes)	§2.15.3.24
doNotWrapTextWithPunct (Do Not Allow Hanging Punctuation With Character Grid)	§2.15.3.25
footnoteLayoutLikeWW8 (Emulate Word 6.x/95/97 Footnote Placement)	§2.15.3.26
forgetLastTabAlignment (Ignore Width of Last Tab Stop When Aligning Paragraph If It Is Not Left Aligned)	§2.15.3.27
growAutofit (Allow Tables to AutoFit Into Page Margins)	§2.15.3.28
layoutRawTableWidth (Ignore Space Before Table When Deciding If Table Should Wrap Floating Object)	§2.15.3.29
layoutTableRowsApart (Allow Table Rows to Wrap Inline Objects Independently)	§2.15.3.30
lineWrapLikeWord6 (Emulate Word 6.0 Line Wrapping for East Asian Text)	§2.15.3.31
mwSmallCaps (Emulate Word 5.x for the Macintosh Small Caps Formatting)	§2.15.3.32
noColumnBalance (Do Not Balance Text Columns within a Section)	§2.15.3.33
noExtraLineSpacing (Do Not Center Content on Lines With Exact Line Height)	§2.15.3.34
noLeading (Do Not Add Leading Between Lines of Text)	§2.15.3.35
noSpaceRaiseLower (Do Not Increase Line Height for Raised/Lowered Text)	§2.15.3.36
noTabHangInd (Do Not Create Custom Tab Stop for Hanging Indent)	§2.15.3.37
printBodyTextBeforeHeader (Print Body Text before Header/Footer Contents)	§2.15.3.38
printColBlack (Print Colors as Black And White without Dithering)	§2.15.3.39
selectFldWithFirstOrLastChar (Select Field When First or Last Character Is Selected)	§2.15.3.40
shapeLayoutLikeWW8 (Emulate Word 97 Text Wrapping Around Floating Objects)	§2.15.3.41
showBreaksInFrames (Display Page/Column Breaks Present in Frames)	§2.15.3.42
spaceForUL (Add Additional Space Below Baseline For Underlined East Asian Text)	§2.15.3.43
spacingInWholePoints (Only Expand/Condense Text By Whole Points)	§2.15.3.44
splitPgBreakAndParaMark (Always Move Paragraph Mark to Page after a Page Break)	§2.15.3.45
subFontBySize (Increase Priority Of Font Size During Font Substitution)	§2.15.3.46
suppressBottomSpacing (Ignore Exact Line Height for Last Line on Page)	§2.15.3.47
suppressSpacingAtTopOfPage (Ignore Minimum Line Height for First Line on Page)	§2.15.3.48
suppressSpBfAfterPgBrk (Do Not Use Space Before On First Line After a Page Break)	§2.15.3.49

Child Elements	Subclause
suppressTopSpacing (Ignore Minimum and Exact Line Height for First Line on Page)	§2.15.3.50
suppressTopSpacingWP (Emulate WordPerfect 5.x Line Spacing)	§2.15.3.51
swapBordersFacingPages (Swap Paragraph Borders on Odd Numbered Pages)	§2.15.3.52
truncateFontHeightsLikeWP6 (Emulate WordPerfect 6.x Font Height Calculation)	§2.15.3.53
ulTrailSpace (Underline All Trailing Spaces)	§2.15.3.55
underlineTabInNumList (Underline Following Character Following Numbering)	§2.15.3.56
useAltKinsokuLineBreakRules (Use Alternate Set of East Asian Line Breaking Rules)	§2.15.3.57
useAnsiKerningPairs (Use ANSI Kerning Pairs from Fonts)	§2.15.3.58
useFELayout (Do Not Bypass East Asian/Complex Script Layout Code)	§2.15.3.59
useNormalStyleForList (Do Not Automatically Apply List Paragraph Style To Bulleted/Numbered Text)	§2.15.3.60
usePrinterMetrics (Use Printer Metrics To Display Documents)	§2.15.3.61
useSingleBorderforContiguousCells (Use Simplified Rules For Table Border Conflicts)	§2.15.3.62
useWord2002TableStyleRules (Emulate Word 2002 Table Style Rules)	§2.15.3.63
useWord97LineBreakRules (Emulate Word 97 East Asian Line Breaking)	§2.15.3.64
wpJustification (Emulate WordPerfect 6.x Paragraph Justification)	§2.15.3.65
wpSpaceWidth (Space width)	§2.15.3.66
wrapTrailSpaces (Line Wrap Trailing Spaces)	§2.15.3.67

17 </complexType>
```

18    2.15.3.10       convMailMergeEsc (Treat Backslash Quotation Delimiter as Two Quotation Marks)

19    This element specifies whether applications should perform a conversion of the contents of a mail merge data  
20    source when reading those contents in order to perform a mail merge operation with their contents.

21    Typically, the contents of a mail merge data source are read in exactly as specified when performing a mail  
22    merge with the contents of a data source. This element, when present with a val attribute value of true (or  
23    equivalent), specifies that applications shall interpret delimiters composed of a backslash and quotation mark  
24    (\\") as two quotation marks (""), within external data sources to be connected to via a mail merge.

25    [Example: Consider a WordprocessingML document with the following content in its data source:

26       This is a \\\"test\\\".

27    The default presentation would have the resulting merged data read in just as it appears:

28       This is a \\\"test\\\".

29    However, if this compatibility setting is turned on:

```
30 <w:compat>
31 <w:convMailMergeEsc />
32 </w:compat>
```

33    Then instances of a backslash and quotation mark would be converted, resulting in the following output:

34       This is a \"test\".

35    end example]

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

6 2.15.3.11 displayHangulFixedWidth (Always Use Fixed Width for Hangul Characters)

7 This element specifies whether applications should assume that all characters in the Hangul Syllables Unicode  
8 sub range (character values between 0xAC00 and 0xD7FF) are of a single fixed width or shall use the characters  
9 widths defined by the font in use (typical for a proportional width font).

10 Typically, applications shall retrieve the character width for any character in a document from the associated  
11 font, allowing each character to be of its own width (a proportional width character). This element, when  
12 present with a val attribute value of true (or equivalent), specifies that applications shall instead assume a  
13 single fixed width for all characters in the Hangul Syllables sub range, by reading the width of Unicode character  
14 0x4E00 from the associated font and using that width for all Hangul characters (or, if that character is not  
15 present, the next available character in the font).

16 [Example: Consider a WordprocessingML document with three Hangul characters:

17

18 The default presentation would have each of those characters using the widths defined by the font (the  
19 highlighting indicates that each character has its own width):

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:displayHangulFixedWidth />
</w:compat>
```

Then all three characters are forced to the fixed width of character 0x4E00 from the font (or, in this case, the next available character), resulting in the characters in the font being forced to that fixed width, which results in the following output:

Notice from the highlighting that the characters have been compressed to the width of the single character and displayed at that fixed width. *end example*]

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p>

Attributes	Description
	<p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.12 doNotAutofitConstrainedTables (Do Not AutoFit Tables To Fit Next To Wrapped**  
6 **Objects)**

7 This element specifies whether applications shall allow tables to be resized to the remaining available line width  
8 when they are using the AutoFit algorithm and part of that line is filled by a shape with a wrapping type with a  
9 value of square or tight.

10 Typically, a table which is AutoFit and has a preferred width shall have its width reduced in order to allow a  
11 floating shape to wrap around its contents within the document, as that shape simply reduces the width of the  
12 line and the AutoFit algorithm applies to the remaining line width. This element, when present with a val  
13 attribute value of true (or equivalent), specifies that tables shall never have any preferred width overridden to  
14 allow them to wrap around that floating object, and shall instead be pushed to the next full width line in the  
15 document to be displayed.

16 [*Example:* Consider a WordprocessingML document with a floating shape centered in the document, followed by  
17 a table with preferred cell widths of 2.22", as follows:

18  
19 The default presentation of this document overrides the preferred cell widths to force the table to fit on the line  
20 next to the floating shape with tight wrapping.

1 However, if this compatibility setting is turned on:

```
2 <w:compat>
3 <w:dontAutofitConstrainedTables />
4 </w:compat>
```

5 Then that table is not resized, so it cannot fit and must be pushed to the next full width line, resulting in the  
6 following output:

This is some text.

This is some text.

7 This is some text.

8 *end example]*

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p>&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.3.13 doNotBreakConstrainedForcedTable (Don't Break Table Rows Around Floating Tables)

This element specifies whether applications shall allow a table row to be split in two when its contents are displayed under the following circumstances:

- The table row exceeds one page in height (it must be split into two pages)
- The table row would need to be split in order to accommodate a floating table also on the page (tables which have been set to floating using the `tblpPr` element (§2.4.54))

Typically, assuming the `cantSplit` property (§2.4.6) is not set, a table row which cannot fit on one single page shall be split as needed around any floating table on a page, in order to allow its contents to be fully displayed across two or more pages. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that table rows which exceed one page in height shall never be split around floating tables in the document, and shall instead be displayed on the first page below the floating table, even if that means that part of the table row is clipped by the edge of the page.

[*Example:* Consider a WordprocessingML document with a long single table row which must be split across two separate pages in the document, in order to accommodate a floating table anchored in the footer, as follows:

[illegible]

The default presentation of this document forces that row to be split as needed around that floating table.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:dontBreakConstrainedForcedTable />
</w:compat>
```

1 Then that table row is never split around the floating table, so it is always placed below that floating table on the  
2 page, and allowed to flow off the page as needed, resulting in the following output:

3  
4 This example, while extreme, shows how the row is placed below the floating table, rather than breaking around  
5 it. *end example]*

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

7 The following XML Schema fragment defines the contents of this element:

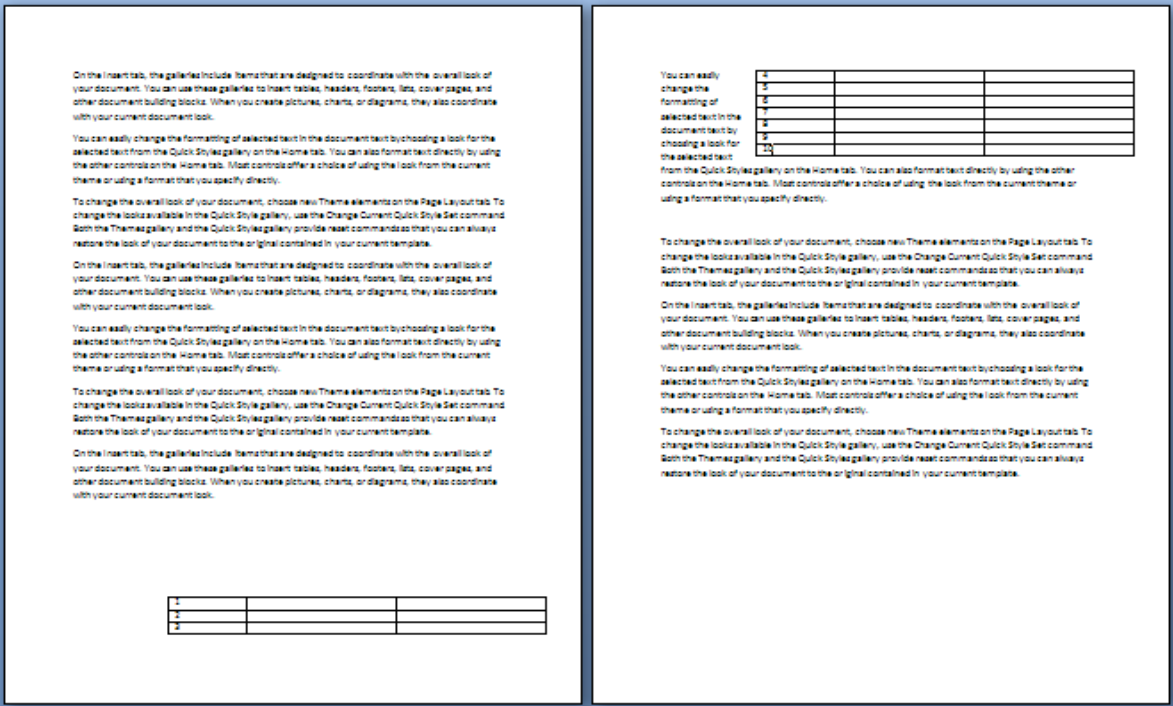

```
8 <complexType name="CT_OnOff">
9 <attribute name="val" type="ST_OnOff"/>
10 </complexType>
```

2.15.3.14 doNotBreakWrappedTables (Do Not Allow Floating Tables To Break Across Pages)

This element specifies whether applications shall allow tables which have been set to floating using the tblpPr element (§2.4.54) shall be allowed to break across multiple pages when needed.

Typically, a table whose contents cannot all be displayed on one page is broken as needed across multiple pages in order to preserve the location of the table (just as a paragraph of multiple lines is broken across pages as needed). This element, when present with a val attribute value of true (or equivalent), specifies that floating tables shall never be broken across pages, and shall instead be put on the first page by adjusting the starting position of the table as needed to fit on that single page.

[Example: Consider a WordprocessingML document with a floating table positioned at the bottom of a page , as follows:

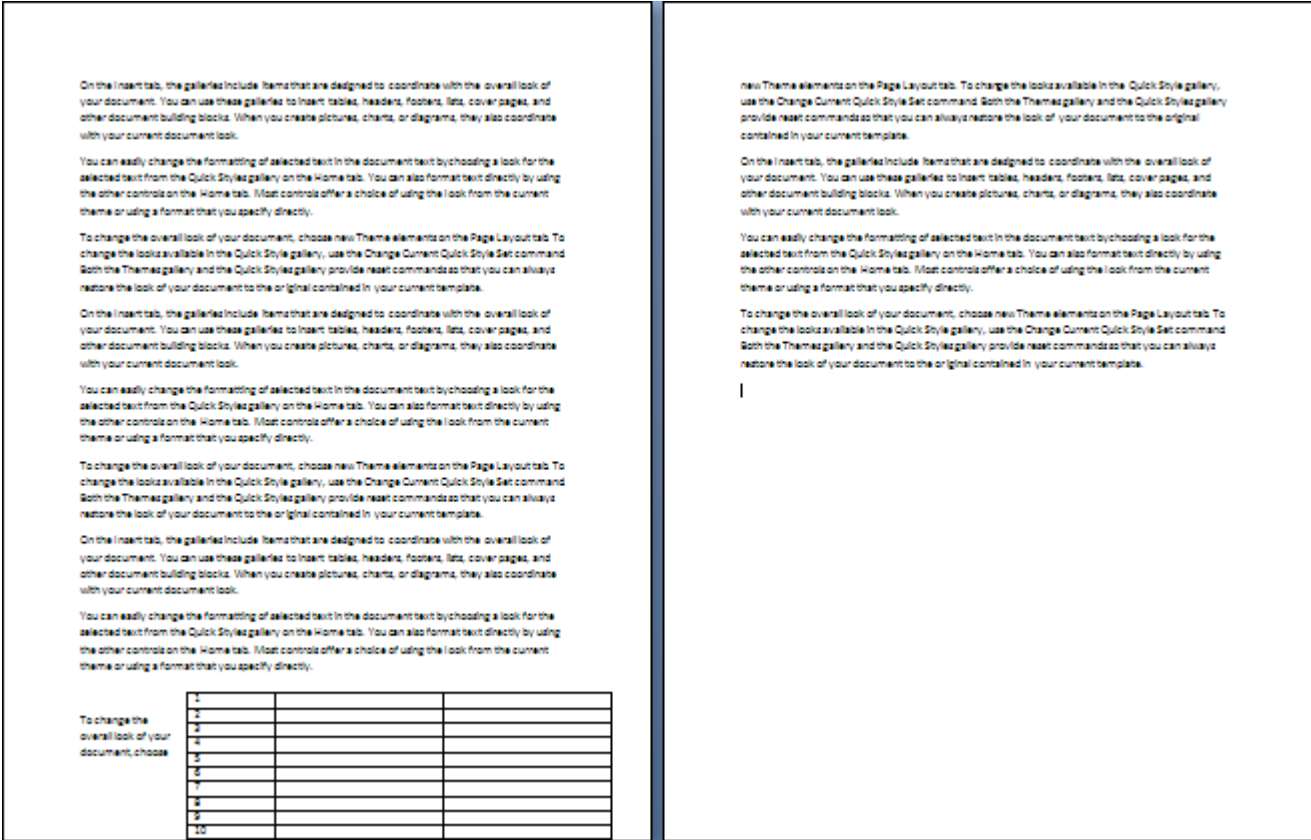

The default presentation of this document results in that table being broken across two pages of content.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:dontBreakWrappedTables />
</w:compat>
```

Then that table is not broken across the page boundary, so it must be moved further up on the first page to accommodate its entire size, resulting in the following output:

- 1
- 2 Notice that the table now flows into the page margins in order to keep it on one page. *end example*

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p>&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.15 doNotExpandShiftReturn (Don't Justify Lines Ending in Soft Line Break)

This element specifies whether applications should fully justify the contents of incomplete lines which end in a soft line break when the parent paragraph is fully justified using the jc element (§2.3.1.13).

Typically, applications shall fully justify all lines in a paragraph when that setting is specified using the jc element except for the last line in the paragraph (the line ending with the paragraph mark). This element, when present with a val attribute value of true (or equivalent), specifies that any line which ends in a soft line break shall also not be fully justified when the paragraph specifies that setting.

[Example: Consider a WordprocessingML document with a paragraph whose first single line consists of East Asian characters followed by a soft paragraph mark. The default presentation would have the contents of that line fully justified:

ホルン金管楽器もそうであるように、チェンバロ(16～18世紀ごろ用いられた鍵盤楽器。後に発達してピアノになった。)

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:doNotExpandShiftReturn />
</w:compat>
```

Then this line is not fully justified, as it ends with a soft line break, resulting in the following output:

ホルン金管楽器もそうであるように、チェンバロ(16～18世紀ごろ用いられた鍵盤楽器。後に発達してピアノになった。)

end example]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p>

Attributes	Description
	<p>[<i>Example:</i> For example, consider the following on/off property:</p> <p><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.16 doNotLeaveBackslashAlone (Convert Backslash To Yen Sign When Entered)**

6 This element specifies whether applications should automatically convert the backslash character into the yen  
7 character when it is added through user keyboard input.

8 Typically, no automatic conversion of one character to another is done when characters are entered by the user.  
9 This element, when present with a val attribute value of true (or equivalent), specifies that all entries of the  
10 backslash (\) character shall automatically be converted to a yen symbol (¥) when the former is entered.

11 [*Example:* Consider a WordprocessingML document where the user types the following:

12 Hello \ world.

13 The default presentation would have exactly that:

14 Hello \ world.

15 However, if this compatibility setting is turned on:

```
16 <w:compat>
17 <w:doNotLeaveBackslashAlone />
18 </w:compat>
```

19 Then the backslash would be converted, resulting in the following output:

20 Hello ¥ world.

21 *end example*]

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>

```

### 5 2.15.3.17 doNotSnapToGridInCell (Do Not Snap to Document Grid in Table Cells with Objects)

6 This element specifies whether a document grid defined using the docGrid element (§2.6.5) shall be applied to  
7 the contents of table cells in that section which also contain floating objects defined using the Vector Markup  
8 Language syntax. Note that the floating object must be part of the cell, and simply not displayed over the cell  
9 due to its anchoring relative to another part of the document.

10 Typically, if a floating object is present in a table cell, then that setting shall have no impact on whether East  
11 Asian text in that cell is snapped to the document grid (as text is always snapped to the grid). This element,  
12 when present with a val attribute value of true (or equivalent), specifies that whenever a floating object  
13 defined using VML is present in a table cell, that the cell's contents shall not be snapped to the document grid.

14 [Example: Consider a WordprocessingML document consisting of a single section, whose document grid settings  
15 specify that each page shall be exactly 10 characters wide, as follows:

```

16 <w:sectPr>
17 <w:docGrid w:type="snapToChars" w:charSpace="146636" />
18 </w:sectPr>

```

19 If this document contains a table with a single cell, containing some text and a single shape defined using the  
20 Vector Markup Language syntax, the contents of the cell are still snapped to the 10 characters per line character  
21 grid, as follows:

ト	リ	ス	タ	ン	ト	リ	ス	タ	ン
ト	リ	ス	タ	ン					ン
リ	ス	タ	ン	ト					リ
ス	タ	ン	ト	リ					ス
タ	ン				タ	ン	ト	リ	ス
タ	ン								

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:doNotSnapToGridInCell />
</w:compat>
```

Then the presence of a floating object in each cell shall result in the document grid setting being ignored, resulting in the following output:

ト	リ	ス	タ	ン	ト	リ	ス	タ	ン
ト	リ	ス	タ	ン	ン				ト
リ	ス	タ	ン	ト	ト				リ
ス	タ	ン	ト	リ	リ				ス
タ	ン	ト	リ	ス	タ	ン	ト	リ	ス
タ	ン								

The additional character pitch was still added to each character on the line, but those characters are no longer snapped to the document grid. *end example*]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre>

Attributes	Description
	The val attribute explicitly declares that the property is turned off. <i>end example</i>
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.3.18 doNotSuppressIndentation (Do Not Ignore Floating Objects When Calculating Paragraph Indentation)**

This element specifies whether applications should ignore the presence of floating objects when calculating the starting position of paragraphs which are wrapped around floating objects defined using the Vector Markup Language (VML) syntax.

Typically, the presence of a floating object on the same line or lines as a paragraph shall only affect the text when the floating object occurs where that text would normally be presented. [*Example*: Text at a 1" indentation would only be displaced by a floating object that appears at that position and not one that appears from 0" to 0.5" on the same line. *end example*].

This element, when present with a val attribute value of true (or equivalent), specifies that floating objects shall always impact paragraphs on the same line in two ways:

- If the paragraph is not numbered, then it shall tightly wrap any floating object which precedes it on the same line, ignoring its own indentation settings. [*Example*: A paragraph with a 1" left indent shall tightly wrap a floating object which appears at only 0.25" on the same line. *end example*]
- If the paragraph is numbered using the numPr element (§2.3.1.19), then it shall calculate and use its full indent relative to the edge of the floating object, not relative to the edge of the page. [*Example*: A numbered paragraph with a 1" left indent shall appear 1.5" into the page if it is preceded by a floating object which appears at 0.5" on the same line. *end example*]

[*Example*: Consider a WordprocessingML document with a narrow floating object at 0.5" on the page, surrounded by both numbered and unnumbered paragraphs.

The default presentation would have no impact on the paragraphs based on that floating object, since two two do not intersect:

One

Two

Three

Four

Five

1

1. One

2. Two

3. Three

4. Four

5. Five

2

3 However, if this compatibility setting is turned on:

4 <w:compat>  
5 <w:doNotSuppressIndentation />  
6 </w:compat>

7 Then the two alternate rules defined above would apply, resulting in the following output:

One

Two

Three

Four

Five

8

1. One

2. Two

3. Three

4. Four

5. Five

end example]

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

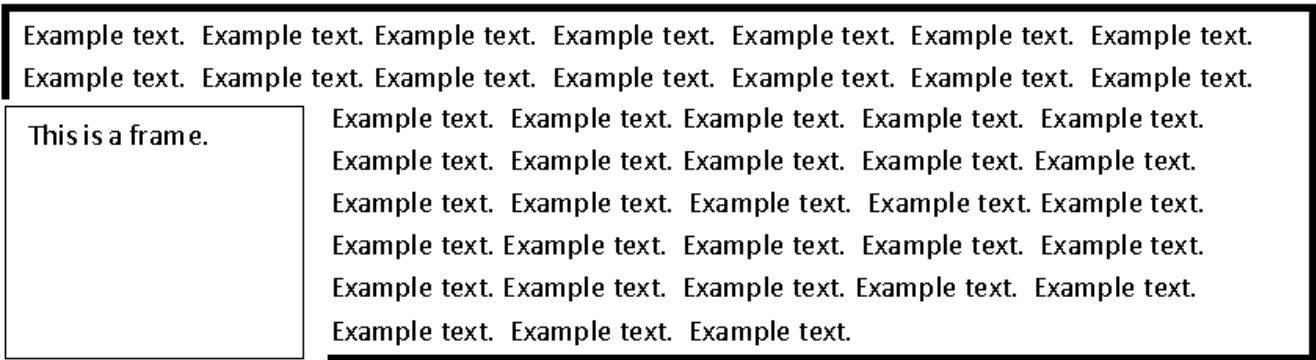

2.15.3.19 doNotSuppressParagraphBorders (Do Not Suppress Paragraph Borders Next To Frames)

This element specifies whether applications should suppress paragraph borders defined using the pBdr element (§2.3.1.24) when those borders would be displayed next to the contents of paragraphs which have been defined as frames using the framePr element (§2.3.1.11).

Typically, when a paragraph's borders appear next to a frame, those borders are suppressed to avoid having two borders in close proximity. This element, when present with a val attribute value of true (or equivalent), specifies that those borders shall not be suppressed.

[Example: Consider a WordprocessingML document with a paragraph with a paragraph border that is bounded on its bottom let side by a text frame.

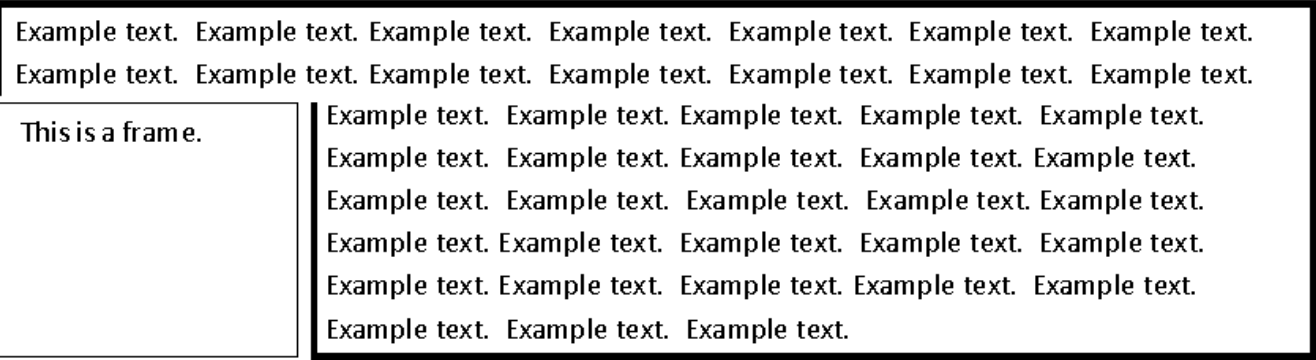

The default presentation would suppress the borders which intersect the frame (in this case, the right border of lines three through eight):

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:doNotSuppressParagraphBorders />
</w:compat>
```

Then no border suppression shall take place, resulting in the following output:

*end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.20 doNotUseEastAsianBreakRules (Do Not Compress Compressible Characters When**  
6 **Using Document Grid)**

7 This element specifies whether applications should compress characters with identical compression rules when  
8 the document grid has been defined using the docGrid element (§2.6.5). *Compression rules* refer to the  
9 additional bearing on the left and/or right side of a typical character, which can be compressed as needed  
10 without modifying the actual width of the character (its breadth).

11 Typically, punctuation characters with an identical set of compression rules are compressed when the contents  
12 of a document are displayed. This element, when present with a val attribute value of true (or equivalent),  
13 specifies that if a document grid is defined for the current section, compression shall never be performed on any  
14 character - all compressible characters shall be individually snapped to the document grid.

15 [Example: Consider a WordprocessingML document with a document grid set to allow 10 characters per line:

```
16 <w:sectPr>
17 <w:docGrid w:type="snapToChars" w:charSpace="146636" ... />
18 </w:sectPr>
```

19 The default presentation would allow characters with identical compression rules to compress and utilize a  
20 single slot on the document grid (notice that the four parenthesis on the first line are combined since they can  
21 be compressed identically, while the two parenthesis with different compression on line two are not):

あ あ あ あ ) ) ) ) v あ あ あ あ  
あ あ あ あ a あ あ ) (

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:useEastAsianBreakRules />
</w:compat>
```

Then no character with compression is compressed and instead are snapped to the grid individually, resulting in the following output:

あ あ あ あ ) ) ) ) v あ  
あ あ あ あ あ あ あ a あ あ )  
(

*end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

#### 5 2.15.3.21 doNotUseHTMLParagraphAutoSpacing (Use Fixed Paragraph Spacing for HTML 6 Auto Setting)

7 This element specifies whether applications should use a fixed definition when interpreting automatic paragraph  
8 spacing defined by a value of `true` (or equivalent) on the `beforeAutospacing` and/or `afterAutospacing`  
9 attributes on the `spacing` element (§2.3.1.33).

10 Typically, applications shall interpret these settings to match the behavior of most HTML user agents, mimicking  
11 the default spacing above and below an HTML `p` element without additional spacing information. This element,  
12 when present with a `val` attribute value of `true` (or equivalent), specifies that those two attributes shall result in  
13 the following settings for each value:

- 14 • `beforeAutospacing` = 5 points of spacing before
- 15 • `afterAutospacing` = 10 points of spacing after

16 [Example: Consider a WordprocessingML document with a three paragraphs using HTML autospacing, as  
17 follows:

```

1 <w:p>
2 <w:pPr>
3 <w:spacing w:beforeAutospacing="true" w:afterAutospacing="true" />
4 </w:pPr>
5 <w:r>
6 <w:t>Paragraph One</w:t>
7 </w:r>
8 </w:p>
9 <w:p>
10 <w:pPr>
11 <w:spacing w:beforeAutospacing="true" w:afterAutospacing="true" />
12 </w:pPr>
13 <w:r>
14 <w:t>Paragraph Two</w:t>
15 </w:r>
16 </w:p>
17 <w:p>
18 <w:pPr>
19 <w:spacing w:beforeAutospacing="true" w:afterAutospacing="true" />
20 </w:pPr>
21 <w:r>
22 <w:t>Paragraph Three</w:t>
23 </w:r>
24 </w:p>

```

The default presentation would result in output designed to match that of all common HTML user agents:

Paragraph One.

Paragraph Two.

Paragraph Three.

However, if this compatibility setting is turned on:

```

28 <w:compat>
29 <w:doNotUseHTMLParagraphAutoSpacing />
30 </w:compat>

```

Then the paragraphs will have exact spacing of 5 points before and 10 points after, resulting in the following output:

Paragraph One.

Paragraph Two.

Paragraph Three.

Notice that the paragraphs are more condensed in the second example. *end example*]

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

<pre>&lt;complexType name="CT_OnOff"&gt;   &lt;attribute name="val" type="ST_OnOff"/&gt; &lt;/complexType&gt;</pre>
---------------------------------------------------------------------------------------------------------------------

2.15.3.22 doNotUseIndentAsNumberingTabStop (Ignore Hanging Indent When Creating Tab Stop After Numbering)

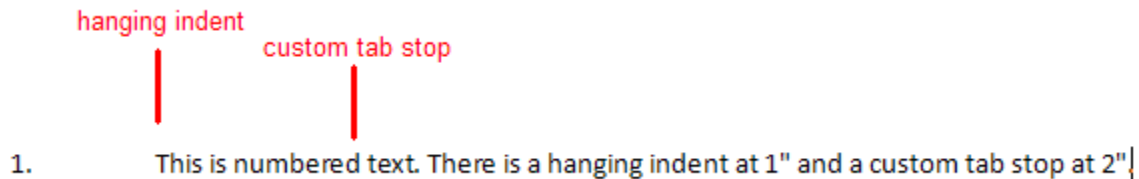

This element specifies whether applications shall use the custom tab stop generated by the hanging indent (if any) when advancing the text after the numbering for a numbered paragraph.

Typically, a hanging indent on a paragraph creates a virtual custom tab stop at that location, and therefore a tab added after the numbering on a numbered paragraph by the suff element (§2.9.30) shall advance to that tab stop, so that the text of the numbered paragraph begins at that location. This element, when present with a val attribute value of true (or equivalent), specifies that a tab stop added as the suffix to the numbering of a numbered paragraph shall ignore that virtual custom tab stop and shall instead advance to the next real tab stop (custom or automatic) on the current line.

[Example: Consider a WordprocessingML document with numbering, whose first level of numbering specifies a tab stop suffix, a hanging indent at 1", and a custom tab stop at 2":

```
<w:abstractNum w:numId="0">
 ...
 <w:lvl w:ilvl="0">
 <w:suff w:val="tab" />
 <w:pPr>
 <w:ind w:left="1440" w:hanging="1440" />
 <w:tabs>
 <w:tab w:val="2880" />
 </w:tabs>
 </w:pPr>
 </w:lvl>
</w:abstractNum>
```

The default presentation of this document results in the tab stop generated by the numbering advancing to the virtual tab stop generated by the hanging indent at 1", as follows:

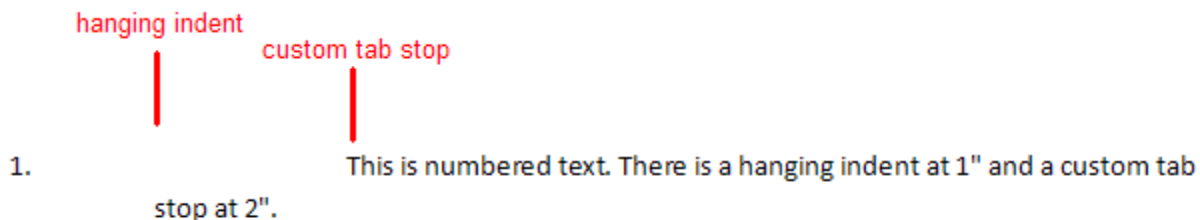

1. This is numbered text. There is a hanging indent at 1" and a custom tab stop at 2"|

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:dontUseIndentAsNumberingTabStop />
</w:compat>
```

Then that tab suffix ignores the virtual tab stop of the hanging indent, so it must advance to the next custom tab stop on the line (at 2"), resulting in the following output:

1. This is numbered text. There is a hanging indent at 1" and a custom tab stop at 2".

end example]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

6 2.15.3.23 doNotVertAlignCellWithSp (Don't Vertically Align Cells Containing Floating  
7 Objects)

8 This element specifies whether applications shall vertically align the contents of a table cell, even when the  
9 contents of that table cell include one or more floating objects defined using the Vector Markup Language  
10 syntax. Note that the floating object must be part of the cell, and simply not displayed over the cell due to its  
11 anchoring relative to another part of the document.

12 Typically, if the alignment of a table cell in a WordprocessingML document is specified, then the entire contents  
13 of that cell are aligned as specified [*Example:* The entire contents of the cell are centered vertically and moved  
14 right-aligned horizontally at that point. *end example*]. This element, when present with a val attribute value of  
15 true (or equivalent), specifies that whenever a floating object defined using VML is present in a table cell, that  
16 no vertical alignment shall be applied to the contents of that cell, and the contents of the cell shall instead  
17 always be top aligned to the cell's contents.

18 [*Example:* Consider a WordprocessingML table with two cells, each containing some text and a single shape  
19 defined using the Vector Markup Language syntax. The first cell is vertically aligned to the bottom of the cell,  
20 and the second cell is vertically aligned to the center of the cell.

- 1 The default presentation of this document results in each cell (including the extents of the floating objects)
- 2 being vertically aligned as specified, as follows:

- 3
- 4 However, if this compatibility setting is turned on:

```

5 <w:compat>
6 <w:dontVertAlignCellWithSp />
7 </w:compat>

```

- 8 Then the presence of a floating object in each cell shall result in the vertical alignment setting being ignored
- 9 (each vertical alignment shall be top-aligned relative to the cell), resulting in the following output:

1  
2 *end example]*

Parent Elements
compat (§2.15.3.9)

3

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.3.24 doNotVertAlignInTxbx (Ignore Vertical Alignment in Textboxes)

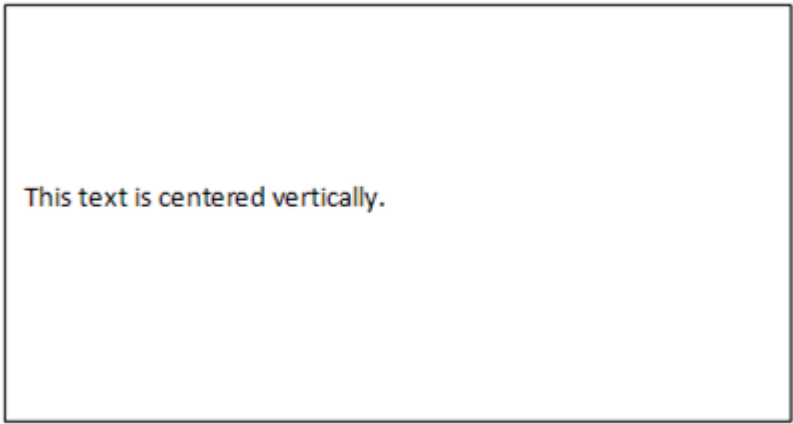

This element specifies whether applications shall allow text within text boxes to be vertically aligned when the `v-text-anchor` property is set within the parent VML shape.

Typically, if when the `v-text-anchor` property is set within the parent VML shape, then based on the value of that property, the text is top, center, or bottom aligned appropriately. This element, when present with a `val` attribute value of `true` (or equivalent), specifies that the property shall be ignored, and instead the contents of the table shall always be top-aligned.

[Example: Consider a WordprocessingML table with a single center-aligned text box:

```
<v:shape id="_x0000_s1026" type="#_x0000_t202" style="v-text-anchor:middle">
 <v:textbox>
 <w:txbxContent>
 <w:p>
 <w:r>
 <w:t>This text is centered vertically.</w:t>
 </w:r>
 </w:p>
 </w:txbxContent>
 </v:textbox>
</v:shape>
```

The default presentation of this document results in the contents of the text box being center aligned, as follows:

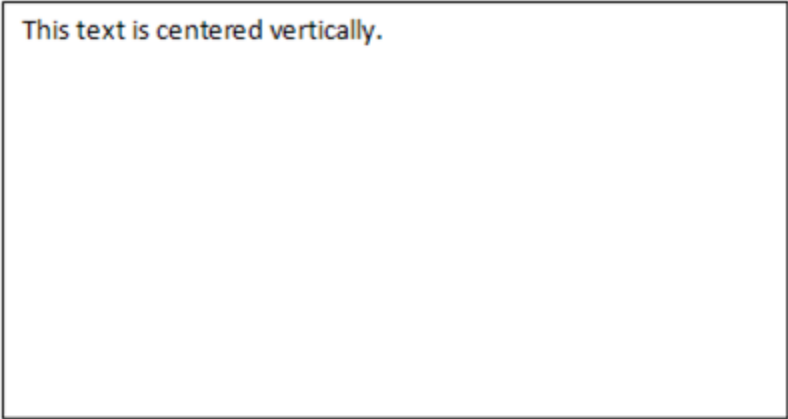

This text is centered vertically.

1 However, if this compatibility setting is turned on:

```
2 <w:compat>
3 <w:doNotVertAlignInTxbx />
4 </w:compat>
```

5 Then the text shall always be top aligned, regardless of the -text-anchor property, resulting in the following  
6 output:

7  
8 *end example]*

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.3.25 doNotWrapTextWithPunct (Do Not Allow Hanging Punctuation With Character Grid)

This element specifies whether applications shall allow hanging punctuation when:

- The overflowPunct element (§2.3.1.21) is turned on for a paragraph
- A document grid is defined using the docGrid element (§2.6.5) which defines the number of characters per line

Typically, paragraphs which allow hanging punctuation shall allow the number of characters on a line as specified by the document grid to be exceeded by one in order to allow for hanging punctuation. This element, when present with a val attribute value of true (or equivalent), specifies that the document grid shall never be exceeded for hanging punctuation.

[Example: Consider a WordprocessingML document with a document grid set to allow 10 characters per line:

```
<w:sectPr>
 <w:docGrid w:type="snapToChars" w:charSpace="146636" ... />
</w:sectPr>
```

If the eleventh character on the line was a punctuation character, the default presentation would allow that character to behave as hanging punctuation on the first line:

“ 言 葉 が 言 葉 が 言 葉 が ”

言 葉 が 言 葉

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:wrapTextWithPunct />
</w:compat>
```

Then the character grid cannot be exceeded even for the hanging punctuation, resulting in the following output:

“ 言 葉 が 言 葉 が 言 葉  
が ” 言 葉 が 言 葉

The hanging punctuation was disallowed, moving it (and the character before it, since that character cannot begin a line) to the following line. *end example*]

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.26 footnoteLayoutLikeWW8 (Emulate Word 6.x/95/97 Footnote Placement)

This element specifies that applications shall emulate the behavior of a previously existing word processing application (Microsoft Word 6.x/95/97) when determining the placement of the contents of footnotes relative to the page on which the footnote reference occurs. This emulation typically involves some and/or all of the footnote being inappropriately placed on the page following the footnote reference.

[*Guidance:* To faithfully replicate this behavior, applications must imitate the behavior of that application, which involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated

1 due to issues with its output, and is maintained only for compatibility with existing documents from that  
2 application. *end guidance*]

3 Typically, applications shall not perform this compatibility. This element, when present with a val attribute value  
4 of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing  
5 application in this regard.

6 [Example: Consider a WordprocessingML document with a series of footnotes.

7 If this compatibility setting is turned on:

8     <w:compat>  
9         <w:footnoteLayoutLikeWW8 />  
10     </w:compat>

11 Then applications should mimic the behavior of Microsoft Word 6.x/95/97 when determining the placement of  
12 those footnotes on the displayed page, as needed. *end example*]

14 The following XML Schema fragment defines the contents of this element:

15 <complexType name="CT_OnOff"> 16     <attribute name="val" type="ST_OnOff"/> 17 </complexType>
---------------------------------------------------------------------------------------------------------

### 2.15.3.27 `forgetLastTabAlignment` (Ignore Width of Last Tab Stop When Aligning Paragraph If It Is Not Left Aligned)

This element specifies how applications should handle the final tab stop on a line when aligning the contents of a paragraph as specified by the `jc` element (§2.3.1.13) in the paragraph's properties.

Typically, aligning the contents of a paragraph involves the following:

- Determining the layout of that line before the alignment (including all tab stops)
- Aligning the resulting contents of the line

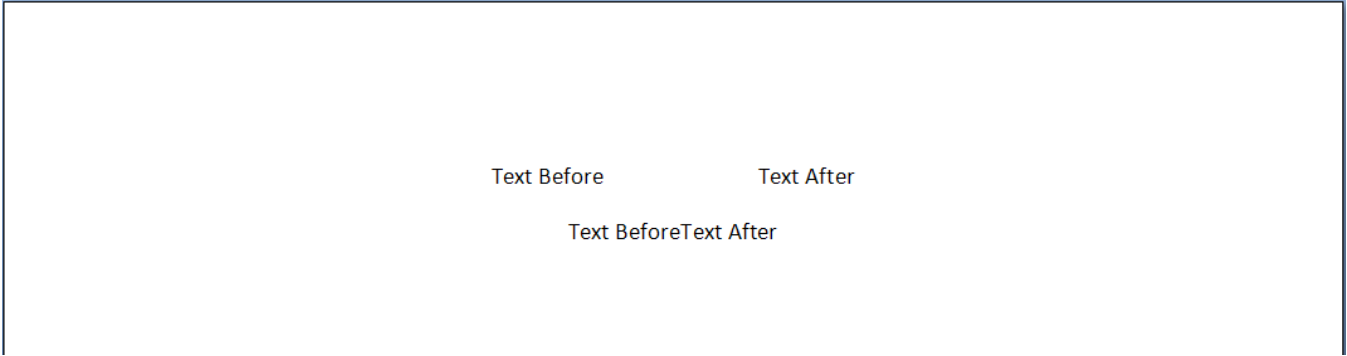

This is done to ensure that tab stops on a line do not change when the contents of the paragraph are aligned (i.e. the tab stops should not have to take into account the paragraph alignment).

This element, when present with a `val` attribute value of `true` (or equivalent), specifies that applications shall ignore the additional line width generated by the last tab stop (and only the last tab stop) when the alignment of the tab stop as defined by the `val` attribute on the `tab` element (§2.3.1.37) is not `left` (or `bar`, which as defined by this Office Open XML Standard, is not a tab stop per se) when determining the width of the line. The resulting full line shall then be aligned at the position where the line would have been aligned without that tab stop.

[*Example:* Consider a WordprocessingML document with two center aligned paragraphs of text - the first also containing a centered tab stop positioned at 2":

```
<w:p>
 <w:pPr>
 <w:tabs>
 <w:tab w:val="center" w:pos="2880" />
 </w:tabs>
 <w:jc w:val="center" />
 </w:pPr>
 <w:r>
 <w:t>Text Before</w:t>
 <w:tab/>
 <w:t>Text After</w:t>
 </w:r>
</w:p>
<w:p>
 <w:pPr>
 <w:jc w:val="center" />
 </w:pPr>
 <w:r>
 <w:t>Text BeforeText After</w:t>
 </w:r>
</w:p>
```

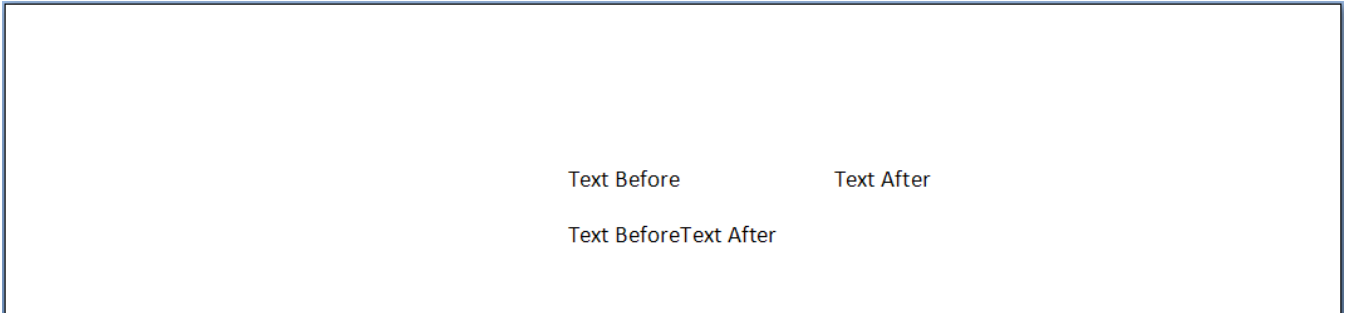

1 The default presentation would determine the full width of each line including the tab stops, finally aligning the  
2 resulting text to the center position as requested by the jc element:

4 However, if this compatibility setting is turned on:

```
5 <w:compat>
6 <w:forgetLastTabAlignment />
7 </w:compat>
```

8 Then the width added to the line by the last tab is ignored when centering the paragraph because that tab is a  
9 center aligned tab stop, resulting in the following output:

11 In the resulting output, the starting location of both lines is at the same place on the page, as the resulting width  
12 of both lines is identical when the tab stop is removed from the line width calculation. *end example*]

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.  A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	<p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.3.28 growAutofit (Allow Tables to AutoFit Into Page Margins)**

This element specifies whether applications shall allow a table which is using the AutoFit table layout algorithm to extend beyond the margins of the page if the minimum width of each table cell would result in an overall table width which is wider than those page margins.

Typically, if a table is using the AutoFit layout algorithm, then based on the definition of that logic, each column in the table shall be increased to the minimum width of its contents (e.g. the longest non-breaking run of text contained within it and/or the width of an inline image contained in one of its cells) until the overall width of the table reaches that of the text extents on the page, at which point text shall be broken and images shall be clipped as needed to maintain the width of the table at the page width (i.e. the page width is an immutable maximum width for the table). This element, when present with a val attribute value of true (or equivalent), specifies that the minimum width of the cells shall not be constrained by the page width, and instead the table shall be allowed to extend into the page margins as needed in order to meet the minimum widths of each of its cells.

[*Example:* Consider a WordprocessingML table with three cells in each row. If the contents of each cell in that first row each contain a long non-breaking string (such that the minimum widths of each cell's contents exceed the page width), then the rules for table AutoFit specify that each cell must be broken proportionally when the overall width of the table reaches the page width.

The default presentation of this document results in each cell being broken as needed to maintain the table width, as follows:

veryverylongnonbreakingstringin thistable	veryverylongnonbreakingstringin thistable	veryverylongnonbreakingstringin thistable

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:growAutofit />
</w:compat>
```

Then the presence of those long non-breaking strings (and the resulting large minimum widths for each table cell) shall result in a table width which is then allowed to override the page margins, resulting in the following output:

veryverylongnonbreakingstringinthis table	veryverylongnonbreakingstringinthis table	veryverylongnonbreakingstringin this table

The resulting table is clipped by the edge of the page on its right side, but the minimum widths of each cell are maintained as defined by the long non-breaking string contents of each. *end example*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p>&lt;w:... w:val="off"/&gt;</p>

Attributes	Description
	The val attribute explicitly declares that the property is turned off. <i>end example]</i>  The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.29 layoutRawTableWidth (Ignore Space Before Table When Deciding If Table Should**  
6 **Wrap Floating Object)**

7 This element specifies how tables which have been indented from the margin using the tblInd element (§2.4.48)  
8 shall be wrapped around floating objects defined using the Vector Markup Language (VML) syntax.

9 Typically, when a table is positioned next to a floating object, the table shall only remain next to the object if it  
10 can fit in the remaining space on the line when considering the full width needed for the table: the space before  
11 the table, plus the width of the table. This element, when present with a val attribute value of true (or  
12 equivalent), specifies that the calculation determining whether the table shall fit next to the object shall not  
13 include the space before the table, even if that means that the table is actually clipped by the object.

14 [Example: Consider a WordprocessingML document with a floating VML shape using square wrapping, next to a  
15 table which has been indented one inch from the left margin:

```
16 <w:tbl>
17 <w:tblPr>
18 <w:tblInd w:w="1440" w:type="dxa" />
19 </w:tblPr>
20 ...
21 </w:tbl>
```

22 The resulting presentation would place the table next to the object:

1 If this object is then moved to the left, such that it would clip the table, the default presentation would have the  
2 entire table moved below the shape, since it does not fit in the remaining space on the line:

3  
4 However, if this compatibility setting is turned on:

```
5 <w:compat>
6 <w:layoutRawTableWidth />
7 </w:compat>
```

8 Then the determination to move the table is done ignoring the spaced needed before the table, resulting in the  
9 following output:

10  
11 The resulting table is clipped behind the object, as the fit calculation ignores the space needed before the table.  
12 *end example]*

Parent Elements	
compat (§2.15.3.9)	

Attributes	Description

2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.30 layoutTableRowsApart (Allow Table Rows to Wrap Inline Objects Independently)**

6 This element specifies whether tables which are wrapping around floating objects defined using the Vector  
7 Markup Language (VML) syntax shall wrap around the object as a whole, or if each table row shall individually  
8 wrap the object as needed (causing a more stuttered, yet tighter, wrapping of the object).

9 Typically, when a table wraps around a floating object, the table must wrap the object as a unit (i.e. the whole  
10 table square wraps the object). This element, when present with a val attribute value of true (or equivalent),  
11 specifies that wrapping is applied to each row in the table one by one, even if its means that each row has a  
12 different resulting position with respect to the table.

13 [Example: Consider a WordprocessingML document with a floating VML shape using square wrapping.

14 The default presentation would have the entire table wrapping around that shape:

On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.

- 1
- 2 However, if this compatibility setting is turned on:
- 3 <w:compat>
- 4 <w:layoutTableRowsApart />
- 5 </w:compat>
- 6 Then each row would wrap around the shape one by one, resulting in the following output:

```

### 2.15.3.31 lineWrapLikeWord6 (Emulate Word 6.0 Line Wrapping for East Asian Text)

This element specifies that applications shall emulate the behavior of a previously existing word processing application (Microsoft Word 6.0) when determining the whitespace compression of the final character on each line in the document. This emulation typically results in characters ending a line that may be compressed on the right being compressed on the right irrespective to whether the compression will allow another character to be included on the given line or not.

[*Guidance:* To faithfully replicate this behavior, applications must imitate the behavior of that application, which involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated due to issues with its output, and is maintained only for compatibility with existing documents from that application. *end guidance*]

Typically, applications shall not perform this compatibility. This element, when present with a val attribute value of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing application in this regard.

[*Example:* Consider a WordprocessingML document with East Asian text.

If this compatibility setting is turned on:

```
<w:compat>
 <w:lineWrapLikeWord6 />
</w:compat>
```

1 Then applications should mimic the behavior of Microsoft Word 6.0 when determining the character  
2 compression of those characters at the end of each line on the displayed page, as needed. *end example*]

-----------------------------------------------------------------------------------------------------------------------------

8 **2.15.3.32 mwSmallCaps (Emulate Word 5.x for the Macintosh Small Caps Formatting)**

9 This element specifies that applications shall emulate the behavior of a previously existing word processing  
10 application (Microsoft Word 5.x for the Macintosh) when determining the resulting formatting when the  
11 smallCaps element (§2.3.2.31) is applied to runs of text within this WordprocessingML document. This  
12 emulation typically results in small caps which are smaller than typical small caps at most font sizes.

13 [*Guidance:* To faithfully replicate this behavior, applications must imitate the behavior of that application, which  
14 involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML  
15 Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those  
16 applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated  
17 due to issues with its output, and is maintained only for compatibility with existing documents from that  
18 application. *end guidance*]

19 Typically, applications shall not perform this compatibility. This element, when present with a val attribute value  
20 of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing  
21 application in this regard.

1 [Example: Consider a WordprocessingML document with small caps on its text contents.

2 If this compatibility setting is turned on:

3 <w:compat>  
4 <w:mwSmallCaps />  
5 </w:compat>

6 Then applications should mimic the behavior of Microsoft Word 5.x for the Macintosh when determining the  
7 formatting for small caps of characters which specify this formatting, as needed.

8 As an example of the typical differences, the output of a normal small caps implementation (in black) and one  
9 intended to replicate Word 5.x for the Macintosh (in red) are displayed below for several font sizes:

SMALL CAPS.

SMALL CAPS.

12

Parent Elements	
compat (§2.15.3.9)	

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="padding-left: 40px;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.33 noColumnBalance (Do Not Balance Text Columns within a Section)**

6 This element specifies whether the contents of sections with multiple columns defined using the cols element  
7 (§2.6.4) should automatically be balanced. In terms of column layout, *balancing* is the act of attempting to  
8 ensure that the number of lines in each column is equivalent (rather than completely filling one column before  
9 populating the next).

10 Typically, column balancing is automatically performed on the contents of sections with multiple columns. This  
11 element, when present with a val attribute value of true (or equivalent), specifies that column balancing shall  
12 not occur, and each column shall be filled individually until the end of the current page, until all text has been  
13 displayed, even if this means one or more columns are unused.

14 [Example: Consider a WordprocessingML document with an initial section with three columns, defined by the  
15 following section properties:

```
16 <w:sectPr>
17 <w:cols w:num="3" w:space="720" />
18 </w:sectPr>
```

19 The default presentation would have the text in that section balanced between those three columns:

This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in

a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.

This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three

columns. This is some text in  
a section of three columns.

This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns. This is some  
text in a section of three  
columns. This is some text in  
a section of three columns.  
This is some text in a section  
of three columns. This is  
some text in a section of  
three columns.

This is text in a section with one column. This is text in a section with one column. This is text in a section with one column. This is text in a section with one column. This is text in a section with one column. This is text in a section with one column.

1

2 However, if this compatibility setting is turned on:

```
3 <w:compat>
4 <w:noColumnBalance />
5 </w:compat>
```

6 Then the columns are not balanced, and the contents of the section are used to fill each column to the bottom  
7 of the current page in succession, resulting in the following output:

[illegible]

The next section is now forced to begin on the next page, as the columns on page one extend to the bottom of that page. *end example*]

```

**2.15.3.34 noExtraLineSpacing (Do Not Center Content on Lines With Exact Line Height)**

This element specifies whether an exact line height using the spacing element (§2.3.1.33) in the paragraph’s properties, each line shall not be automatically centered within the given amount of line spacing.

Typically, if the exact amount of spacing allotted to a line via the paragraph properties exceeds the amount of space required by that line, then the line of text shall be automatically centered when the text of the document is displayed. This element, when present with a val attribute value of true (or equivalent), specifies that all additional spacing shall instead be placed below the normal layout of the line of text.

[Example: Consider a WordprocessingML document with a line with an exact height of 32 points:

```
<w:p>
 <w:pPr>
 <w:spacing w:line="640" w:lineRule="exact" />
 </w:pPr>
 <w:r>
 <w:t>This is text on a line that's exactly 32 points high.</w:t>
 </w:r>
</w:p>
```

The default presentation would have the resulting text centered on that line:

This is text

This is text on a line that’s exactly 32 points high.

This is text.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:noExtraLineSpacing />
</w:compat>
```

Then all line spacing is added after the text, resulting in the following output:

This is text

This is text on a line that’s exactly 32 points high.

This is text.

*end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

<pre>&lt;complexType name="CT_OnOff"&gt;   &lt;attribute name="val" type="ST_OnOff"/&gt; &lt;/complexType&gt;</pre>
---------------------------------------------------------------------------------------------------------------------

2.15.3.35 noLeading (Do Not Add Leading Between Lines of Text)

This element specifies whether the additional leading specified by the current font face shall be added between each line of text when that text is displayed. *Leading* refers to the additional spacing requested by a particular font in order to ensure that letters on subsequent lines do not display in a fashion where they are positioned too closely together.

Typically, leading should be added as specified by the associated font. This element, when present with a val attribute value of true (or equivalent), specifies that the additional leading specified by the font shall never be output when the text is displayed.

1 [Example: Consider a WordprocessingML document with three lines of text. The default presentation would  
2 have the text displayed as follows:

**EXAMPLE TEXT**

Some text.  
Some text.  
Some text.

3  
4 However, if this compatibility setting is turned on:

```
<w:compat>
 <w:noLeading />
</w:compat>
```

8 Then no leading is added between lines, resulting in the following output:

**EXAMPLE TEXT**

Some text.  
Some text.  
Some text.

9  
10 This adjustment is usually very minute in nature; therefore the result is better illustrated by showing how the  
11 characters were pushed out due to the leading added to that text:

**EXAMPLE TEXT**

Some text.  
Some text.  
Some text.

12  
13 *end example]*

Parent Elements	
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	<p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.36 noSpaceRaiseLower (Do Not Increase Line Height for Raised/Lowered Text)**

6 This element specifies whether the height which is allotted to any given line of text when the contents of this  
7 document are displayed shall include additional spacing in order to ensure that all raised and/or lowered text  
8 can be fully displayed.

9 Typically, any extra space needed is added to the line to prevent raised and lowered text from being truncated  
10 or hidden. This element, when present with a val attribute value of true (or equivalent), specifies that the  
11 height of the line shall be determined solely by the spacing settings on the parent paragraph, and any  
12 raised/lowered text shall just be clipped if it exceeds that space.

13 [Example: Consider a WordprocessingML document with both raised and lowered text. The default presentation  
14 would have that text visible:

This is text.

This is text – a lowered word, a raised word.

This is text.

15

16 However, if this compatibility setting is turned on:

```
1 <w:compat>
2 <w:noSpaceRaiseLower />
3 </w:compat>
```

4 Then no additional space should be added to the line height, resulting in the following output:

5     This is text.

6     This is text – a lowered     , a raised "word".

7     This is text.

8     *end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="padding-left: 40px;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_OnOff">
10 <attribute name="val" type="ST_OnOff"/>
11 </complexType>
```

12 **2.15.3.37 noTabHangInd (Do Not Create Custom Tab Stop for Hanging Indent)**

13 This element specifies whether applications should always create a hanging indent as a custom tab stop when  
14 handling tabs within the contents of a WordprocessingML paragraph. The  
15 dontUseIndentAsNumberingTabStop element (§2.15.3.22) specifies if this tab stop shall be used in the case of  
16 a tab added as the suffix to numbering in a numbered paragraph, while this element handles the same

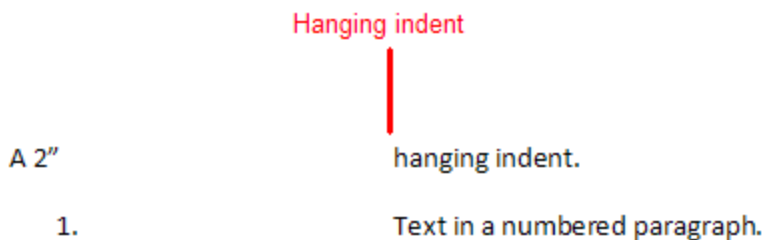

functionality in the generic case (i.e. this element, when set, renders that setting irrelevant as the tab stop is never used).

Typically, the hanging indent on a paragraph shall be treated as a custom tab stop location within that paragraph, allowing the first tab on the first line in the paragraph to advance to the location of the hanging indent. This element, when present with a val attribute value of true (or equivalent), specifies that no custom tab stop shall be created for a hanging indent on a line under any circumstances.

[Example: Consider a WordprocessingML document with two paragraphs (the second numbered, the first not), each with a 2" hanging indent defined as follows (assume the numbering suffix - not shown - is a tab character):

```
<w:p>
 <w:pPr>
 <w:ind w:left="2880" w:hanging="2880" />
 </w:pPr>
 <w:r>
 <w:t>A 2"</w:t>
 <w:tab/>
 <w:t>hanging indent</w:t>
 </w:r>
</w:p>
<w:p>
 <w:pPr>
 <w:numPr>
 <w:ilvl w:val="0" />
 <w:numId w:val="1" />
 </w:numPr>
 <w:ind w:left="2880" w:hanging="2880" />
 </w:pPr>
 <w:t>Text in a numbered paragraph.</w:t>
</w:p>
```

The default presentation would have both the numbering and the tab in the regular paragraph advancing to the 2" custom tab stop generated by the hanging indent:

A 2" hanging indent.

1. Text in a numbered paragraph.

However, if this compatibility setting is turned on:

```
1 <w:compat>
2 <w:noTabHangInd />
3 </w:compat>
```

4 Then no tab stop exists at 2", and therefore the tab stops must advance to the location of the next automatic  
5 tab stop for this document (which is set to occur every 0.5"), resulting in the following output:

6

7 *end example]*

11 <attribute name="val" type="ST_OnOff"/>
12 </complexType>
```

2.15.3.38 `printBodyTextBeforeHeader` (Print Body Text before Header/Footer Contents)

This element specifies the order in which the contents of the main document story and any headers and/or footers shall be sent to the printer.

Typically, the contents of a document are sent to the printer as follows:

- First, the contents of headers/footers are sent to the printer
- Finally, the contents of the main document story are sent to the printer

This element, when present with a `val` attribute value of `true` (or equivalent), specifies that this order shall be reversed, and that the body text shall be sent to the printer before any header/footer text. This reversal allows for the processing of PostScript codes in the text layer in the same order as afforded by some legacy word processing applications.

[*Example:* Consider a WordprocessingML document which is printed. The default resulting print order is the headers and footers for each page, followed by the page contents.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:printBodyTextBeforeHeader />
</w:compat>
```

Then this order shall be reversed, and the page contents shall be printed before the corresponding header and/or footer for each page. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.3.39 printColBlack (Print Colors as Black And White without Dithering)

This element specifies the way in which colored text and/or objects shall be handled when printed to a printer whose printer settings indicate that it can only handle black and white text.

Typically, the contents of a colored document are sent to a black and white printer using grayscale (different shades of gray) to represent each of the possible colors. This element, when present with a val attribute value of true (or equivalent), specifies that colors will not be printed as mapped shades of grey, but rather exclusively in solid black and white. This setting prevents the fuzzy look that may occur when gray or blue content is dithered. *Dithering* is the process by which colors are simulated using various patterns of black dots on a white background

[*Example:* Consider a WordprocessingML document which is printed to a black and white printer. The default resulting printed content is typically dithered to appear in the appropriate shade of grayscale text.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:printColBlack />
</w:compat>
```

Then the page contents shall be printed as exclusively black or exclusively white text as needed, and no grayscale output shall occur. *end example*]

This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_OnOff">
5 <attribute name="val" type="ST_OnOff"/>
6 </complexType>
```

7 **2.15.3.41 shapeLayoutLikeWW8 (Emulate Word 97 Text Wrapping Around Floating Objects)**

8 This element specifies that applications shall emulate the behavior of a previously existing word processing  
9 application (Microsoft Word 97) when determining how to wrap text around floating objects using  
10 topAndBottom wrapping defined using the Vector Markup Language (VML) syntax. This emulation typically  
11 results in the wrapping above and below the object allowing the text to wrap more tightly around the object  
12 (text wraps more tightly around the object than it normally would).

13 [Guidance: To faithfully replicate this behavior, applications must imitate the behavior of that application, which  
14 involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML  
15 Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those  
16 applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated  
17 due to issues with its output, and is maintained only for compatibility with existing documents from that  
18 application. *end guidance]*

19 Typically, applications shall not perform this compatibility. This element, when present with a val attribute value  
20 of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing  
21 application in this regard.

1 [Example: Consider a WordprocessingML document with a floating shape using top and bottom wrapping.

2 If this compatibility setting is turned on:

```
3 <w:compat>
4 <w:shapeLayoutLikeWW8 />
5 </w:compat>
```

6 Then applications should mimic the behavior of Microsoft Word 97 when determining the way in which text  
7 wraps around that object, as needed. *end example*

```
10 <complexType name="CT_OnOff">
11 <attribute name="val" type="ST_OnOff"/>
12 </complexType>
```

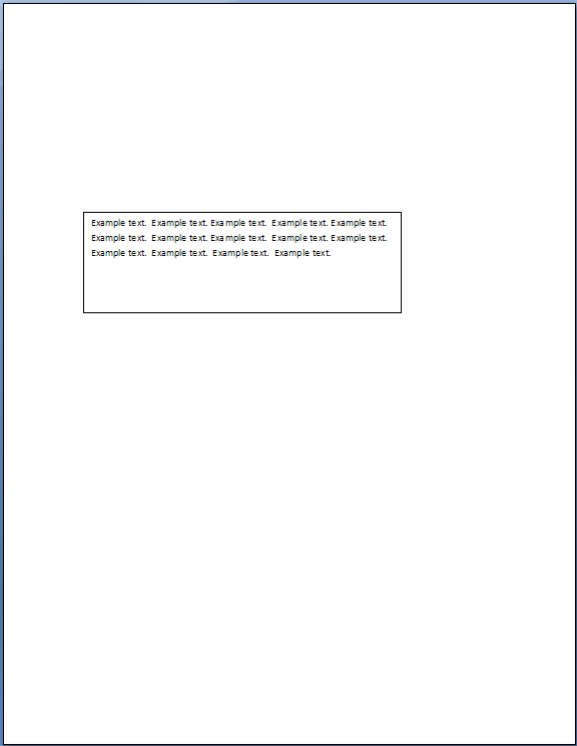

13 **2.15.3.42 showBreaksInFrames (Display Page/Column Breaks Present in Frames)**

14 This element specifies whether applications should honor the presence of page and/or column breaks which are  
15 present within the contents of paragraphs which have been defined as frames using the framePr element  
16 (§2.3.1.11).

17 Typically, breaks within frames shall be ignored and shall have no effect on the display of the paragraph in which  
18 they are contained. This element, when present with a val attribute value of true (or equivalent), specifies that  
19 rather than completely ignoring these breaks, applications should display the break and move the remaining  
20 frame content, and all subsequent text, to the next page and/or column, as needed.

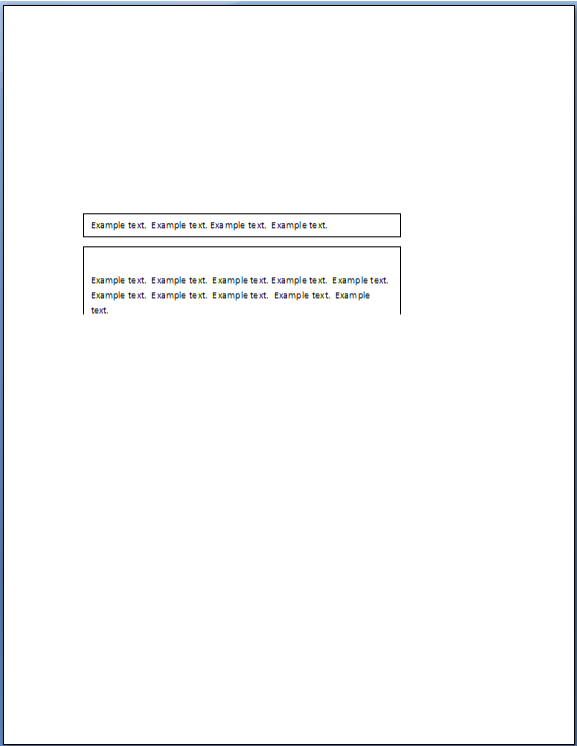

1 [Example: Consider a WordprocessingML document with a paragraph contained within a text frame:

2

3 The default presentation would display the page break inline in the frame (breaking the frame into two) but

4 would not actually break the page:

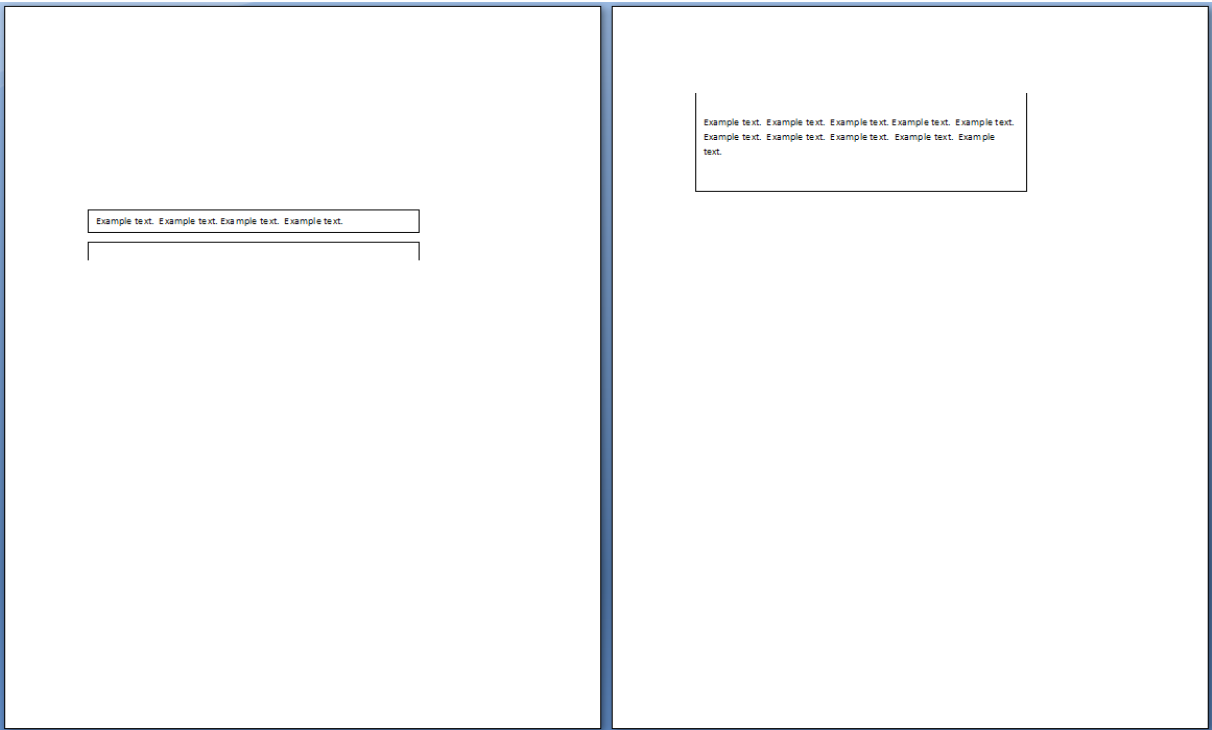

5

1 However, if this compatibility setting is turned on:

```
2 <w:compat>
3 <w:showBreaksInFrames />
4 </w:compat>
```

5 Then the page breaks will be used even though they are present in the frame, breaking the page and resulting in  
6 the following output:

8 *end example]*

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.3.43 spaceForUL (Add Additional Space Below Baseline For Underlined East Asian Text)

This element specifies whether East Asian content in a WordprocessingML document which has been underlined using the u element shall have additional descent added to the properties of the font in order to ensure that there is adequate spacing between the characters in the font and the underlining applied to the text.

Typically, no adjustments are made to the contents of text runs containing East Asian text which have been underlined. This element, when present with a val attribute value of true (or equivalent), specifies that whenever the following conditions are met:

- The text run contains East Asian characters
- The text run is not using baseline font alignment as defined by the textAlignment property

That the larger of the following two values will be added to the descent property of that font in order to provide additional padding between the text characters and the underline:

- 3 percent of the font size
- 40 twentieths of a point (31 twentieths of a point for Japanese text)

[*Example:* Consider a WordprocessingML document consisting of a single run of underlined Japanese text, as follows:

```
<w:p>
 <w:r>
 <w:rPr>
 <w:u w:type="double" />
 </w:rPr>
 <w:t>クリスマス</w:t>
 </w:r>
</w:p>
```

If this document is displayed, then the text is laid out along with the underline, as follows:

クリスタ

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:spaceForUL />
</w:compat>
```

Then the additional descent specified using the logic above is added to the text, resulting in the following output:

クリスタ

*end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.3.44 spacingInWholePoints (Only Expand/Condense Text By Whole Points)

This element specifies how applications should apply text expansion/compression defined using the spacing element (§2.3.2.33) within a set of run properties.

Typically, as defined in the spacing element, text within runs in a WordprocessingML document may be expanded or compressed in increments of twentieths of a point. This element, when present with a val attribute value of true (or equivalent), specifies that the expansion and compression of text shall only be performed in increments of points. Any value which is not equal to an expansion or compression of a whole point shall be rounded down to the nearest whole point when the text is expanded/compressed within the WordprocessingML document.

*[Example: Consider a WordprocessingML document with three paragraphs of text, each expanded by a varying amount, as follows:*

```
<w:p>
 ...
 <w:r>
 <w:t>This is text.</w:t>
 </w:r>
</w:p>
<w:p>
 ...
 <w:r>
 <w:rPr>
 <w:spacing w:val="20" />
 </w:rPr>
 <w:t>This is text.</w:t>
 </w:r>
</w:p>
<w:p>
 ...
 <w:r>
 <w:rPr>
 <w:spacing w:val="36" />
 </w:rPr>
 <w:t>This is text.</w:t>
 </w:r>
</w:p>
```

1 The default presentation would have each run of text expanded exactly as requested:

2  
3  
4     Regular Text:                 This is text.  
5  
6     Text expanded by 1 point:     This is text.  
7  
8     Text expanded by 1.8 points:   This is text.

9 However, if this compatibility setting is turned on:

10     <w:compat>  
11         <w:spacingInWholePoints />  
12     </w:compat>

Then the third line - with an expansion of 1.8 points - would instead be rounded down to the nearest whole number of points when expanded, resulting in the following output:

Regular Text:                 This is text.  
Text expanded by 1 point:     This is text.  
Text expanded by 1.8 points:   This is text.

In the resulting output, the second and third lines are identical, as the third line has a next expansion of exactly one point. *end example*]

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;">&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.3.45 splitPgBreakAndParaMark (Always Move Paragraph Mark to Page after a Page Break)**

This element specifies whether a page break shall automatically complete the line on which it appears, moving the end of the paragraph to a new line on the next page, or if it shall behave as true run-level content within its current paragraph.

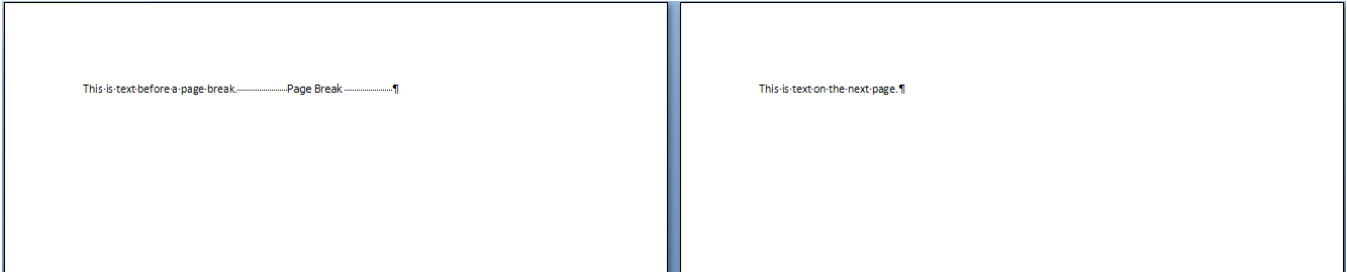

Typically, a page break defined using the br element (§2.3.3.1) is treated as run-level content, which means that although it delimits the end of the page, if there is no content after it within the current paragraph, that the paragraph shall also end on that page. This element, when present with a val attribute value of true (or equivalent), specifies that a page break shall always immediately end the current page, moving the paragraph mark which delimits the end of its parent paragraph to a new line on the next page.

Note that this setting only affects the case where there is no run-level content after the page break within the paragraph - if any further run content appears in the paragraph it shall appear on subsequent lines on the next page.

[Example: Consider a WordprocessingML document with two paragraphs of content - the first ending with a page break:

```
<w:p>
 <w:r>
 <w:t>This is text before a page break.</w:t>
 <w:br w:type="page" />
 </w:r>
</w:p>
<w:p>
 <w:r>
 <w:t>This is text on the next page.</w:t>
 </w:r>
</w:p>
```

The default presentation would have the text content This is text on the next page. as the first line of the second page, as there is no run content after the page break in paragraph one, and therefore no need for a new line on page two (in this image, a graphical illustration of the pilcrow and the page break have been added for clarity):

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:splitPgBreakAndParaMark />
</w:compat>
```

Then even though it is followed by no additional content, the page break shall immediately end the first page, pushing the end of the first paragraph onto the first line of the second page, resulting in the following output:

*end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.46 subFontBySize (Increase Priority Of Font Size During Font Substitution)

This element specifies whether applications shall increase the priority of font size when performing font substitution in a WordprocessingML document. *Font substitution* is the process by which an application determines which font to use in place of a font that is referenced by a document, but is not available to the application trying to display the document.

Typically, applications may perform font substitution using any mechanism available. This element, when present with a val attribute value of true (or equivalent), specifies that finding a font with a similar font size shall have increased precedence when doing font substitution for this document.

[Example: Consider a WordprocessingML document with a series of characters in an unavailable font. The default presentation would use any method used by the application to perform that font substitution.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:subFontBySize />
</w:compat>
```

Then font size shall take precedence when performing font substitution for this document, as needed. *end example]*

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

#### 2.15.3.47 suppressBottomSpacing (Ignore Exact Line Height for Last Line on Page)

This element specifies whether an exact line height specified using the spacing element (§2.3.1.33) with a lineRule attribute value of exact shall be ignored for the last line on each page.

Typically, if an exact line height has been specified using the spacing element, then all lines within that paragraph have the necessary line spacing added to them in order to meet this constraint. This element, when present with a val attribute value of true (or equivalent), specifies that no additional spacing shall be added below the last line on each page as a result of these line spacing requirements - a line shall be placed on the bottom of the page if its characters fit on that page ignoring the necessary space after.

[*Example:* Consider a WordprocessingML document whose first paragraph has a line spacing setting requiring exactly 48 points of space per line:

```
<w:p>
 <w:pPr>
 <w:spacing w:line="960 w:lineRule="exact" />
 </w:pPr>
 ...
</w:p>
```

The default presentation would have the necessary amount of space added between each line such that all lines in the paragraph are centered within 48 points of spacing:

<p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p> <p>This is example text. This is example text. This is example text. This is example text.</p>
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The first line from the following page was moved on the first page, as without being subjected to the line height constraint, it is possible to fit it at the bottom of the first page. *end example*]

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p>&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.48 suppressSpacingAtTopOfPage (Ignore Minimum Line Height for First Line on Page)**

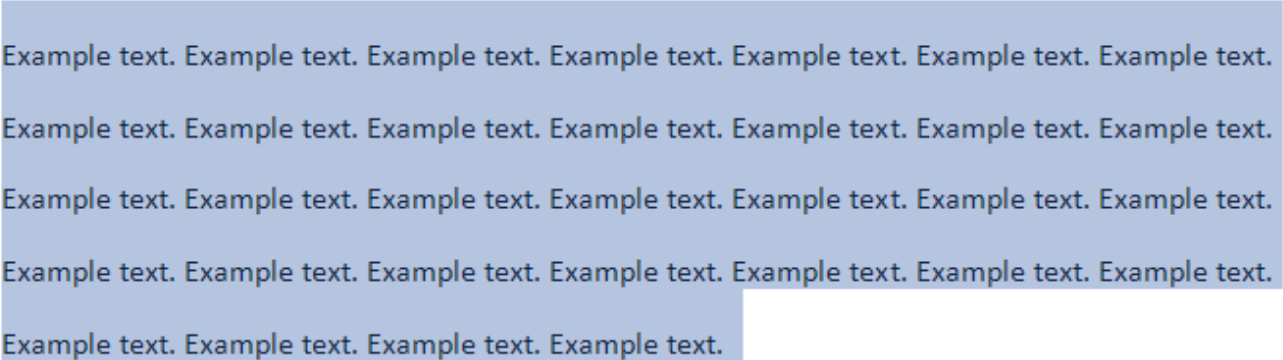

6 This element specifies whether the minimum line height specified using the spacing element (§2.3.1.33) with a  
7 lineRule attribute value of atLeast shall be ignored for the first line on each page.

8 Typically, if a minimum line height has been specified using the spacing element, then all lines within that  
9 paragraph have the necessary line spacing added to them in order to meet this constraint. This element, when  
10 present with a val attribute value of true (or equivalent), specifies that no additional spacing shall be added  
11 above the first line on each page as a result of this line spacing requirements - the top of the text characters on  
12 the first line shall be at the top edge of the page.

13 [Example: Consider a WordprocessingML document whose first paragraph has a line spacing setting requiring at  
14 least 25 points of space per line:

```
15 <w:p>
16 <w:pPr>
17 <w:spacing w:line="500" w:lineRule="atLeast" />
18 </w:pPr>
19 ...
20 </w:p>
```

21 The default presentation would have the necessary amount of space added between each line such that all lines  
22 in the paragraph are centered within 25 points of spacing (highlighting has been added to the image below in  
23 order to illustrate the additional spacing above the first line):

1 However, if this compatibility setting is turned on:

```
2 <w:compat>
3 <w:suppressSpacingAtTopOfPage />
4 </w:compat>
```

5 Then no additional line spacing shall be added above the first line on the page (although all other lines are  
6 unaffected), resulting in the following output:

7  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text.

8 However, if this line spacing constraint was exactly 25 points, then this setting would have no effect:

9  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.  
Example text. Example text. Example text. Example text. Example text. Example text. Example text.

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p>

Attributes	Description
	<p>A value of <code>off</code>, <code>0</code>, or <code>false</code> specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The <code>val</code> attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_OnOff</code> simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.3.49 suppressSpBfAfterPgBrk (Do Not Use Space Before On First Line After a Page Break)**

This element specifies that applications should not postpone any before paragraph spacing to the first line containing content after a page break.

Typically, a page break defined using the `br` element (§2.3.3.1) is treated as run-level content, which means that although it delimits the end of the page, if there is no content after it within the current paragraph, that the paragraph shall also end on that page. However, in the case where there is additional run-level content within the same paragraph, that content, although part of the same paragraph as the page break, is displayed on the following page.

This leads to a situation where the only run content on the page with the page break is the break itself, with all subsequent content on the following page. In this case, applications shall apply the value specified by the spacing element's `before` attribute to the first line on the new page (since it is ostensibly the only page with content in that paragraph).

This element, when present with a `val` attribute value of `true` (or equivalent), specifies the paragraph before spacing shall not be 'postponed' in this way - if the line with the page break has no content, then the spacing element's `before` attribute is simply ignored.

[*Example:* Consider a WordprocessingML document whose first paragraph specifies that it shall be preceded by 50 points of additional spacing:

```

1 <w:p>
2 <w:pPr>
3 <w:spacing w:before="1000" />
4 </w:pPr>
5 <w:r>
6 <w:br w:type="page" />
7 <w:t>This is sample text with 50 points before formatting.</w:t>
8 </w:r>
9 </w:p>

```

The default presentation would have the necessary amount of space added to the first line on the second page, as the page break was not preceded by any run content (highlighting has been added to the image below in order to illustrate the additional spacing above the first line):

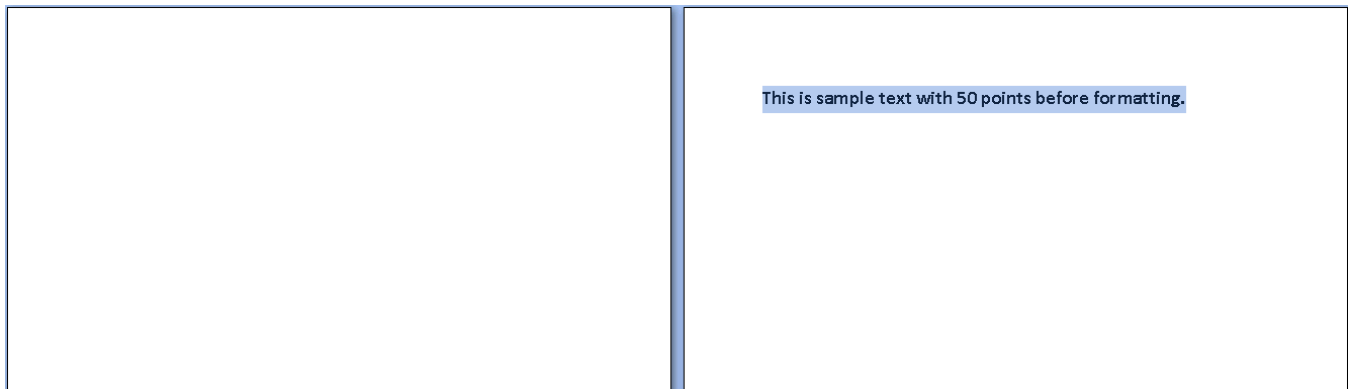

However, if this compatibility setting is turned on:

```

15 <w:compat>
16 <w:suppressSpBfAfterPgBrk />
17 </w:compat>

```

Then the spacing shall not be added above the first line on the page (it is essentially ignored), resulting in the following output:

*end example]*

```

6 2.15.3.50 suppressTopSpacing (Ignore Minimum and Exact Line Height for First Line on  
7 Page)

8 This element specifies whether the minimum line height specified using the spacing element (§2.3.1.33) with a  
9 lineRule attribute value of atLeast or exact shall be ignored for the first line on each page.

10 Typically, if a minimum or exact line height has been specified using the spacing element, then all lines within  
11 that paragraph have the necessary line spacing added to them in order to meet this constraint. This element,  
12 when present with a val attribute value of true (or equivalent), specifies that no additional spacing shall be  
13 added above the first line on each page as a result of these line spacing requirements - the top of the text  
14 characters on the first line shall be at the top edge of the page.

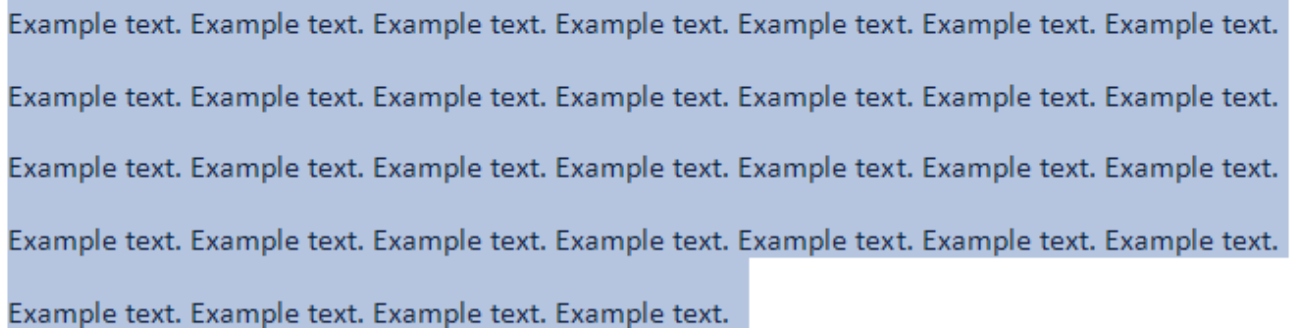

15 [Example: Consider a WordprocessingML document whose first paragraph has a line spacing setting requiring  
16 exactly 25 points of space per line:

```

1 <w:p>
2 <w:pPr>
3 <w:spacing w:line="500" w:lineRule="exact" />
4 </w:pPr>
5 ...
6 </w:p>

```

The default presentation would have the necessary amount of space added between each line such that all lines in the paragraph are centered within 25 points of spacing (highlighting has been added to the image below in order to illustrate the additional spacing above the first line):

Example text. Example text. Example text. Example text. Example text. Example text. Example text.

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <p style="padding-left: 40px;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <code>&lt;complexType name="CT_OnOff"&gt;</code>
4 <code>  &lt;attribute name="val" type="ST_OnOff"/&gt;</code>
5 <code>&lt;/complexType&gt;</code>

6 2.15.3.51 suppressTopSpacingWP (Emulate WordPerfect 5.x Line Spacing)

7 This element specifies that applications shall emulate the behavior of a previously existing word processing  
8 application (WordPerfect 5.x) when determining the resulting spacing between lines in a paragraph using the  
9 spacing element (§2.3.1.33). This emulation typically results in line spacing which is reduced from its normal  
10 size.

11 [*Guidance:* To faithfully replicate this behavior, applications must imitate the behavior of that application, which  
12 involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML  
13 Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those  
14 applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated  
15 due to issues with its output, and is maintained only for compatibility with existing documents from that  
16 application. *end guidance*]

17 Typically, applications shall not perform this compatibility. This element, when present with a val attribute value  
18 of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing  
19 application in this regard.

20 [*Example:* Consider a WordprocessingML document with triple line spacing defined using the spacing element:

```
<w:pPr>
 <w:spacing w:line="720" w:lineRule="auto" />
</w:pPr>
```

If this compatibility setting is turned on:

```
<w:compat>
 <w:suppressTopSpacingWP />
</w:compat>
```

Then applications should mimic the behavior of WordPerfect 5.x when determining the resulting spacing between each line with additional line spacing, as needed.

As an example of the difference, the output of a normal pairing of triple spaced paragraphs (in black) and one intended to replicate WordPerfect 5.x (in red) is displayed below:

~~On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. You can use these galleries to insert tables, headers, footers, lists, cover pages, and other document building blocks. When you create pictures, charts, or diagrams, they also coordinate with your current document look.~~

~~You can easily change the formatting of selected text in the document text by choosing a look for the selected text from the Quick Styles gallery on the Home tab. You can also format text directly by using the other controls on the Home tab. Most controls offer a choice of using the look from the current theme or using a format that you specify directly.~~

*end example]*

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.52**      **swapBordersFacingPages (Swap Paragraph Borders on Odd Numbered Pages)**

6 This element specifies whether left and right paragraph borders defined under the pBdr element (§2.3.1.24)  
7 shall be swapped under conditions where it is possible that the those pages are intended to be used to create a  
8 book-like publication.

9 Typically, no changes shall be made to the positions of paragraph borders defined under the pBdr element - a  
10 right border is always on the right, and a left border is always on the left. This element, when present with a val  
11 attribute value of true (or equivalent), specifies that under the two following conditions:

- 12 • The margins in this document are mirrored using the mirrorMargins element (§2.15.1.57)
- 13 • The header/footers in this document are different on even and odd numbered pages using the  
14 evenAndOddHeaders element (§2.10.1)

15 That paragraph borders on odd-numbered pages will be swapped - that is, left borders shall be displayed on the  
16 right and right borders shall be displayed on the left.

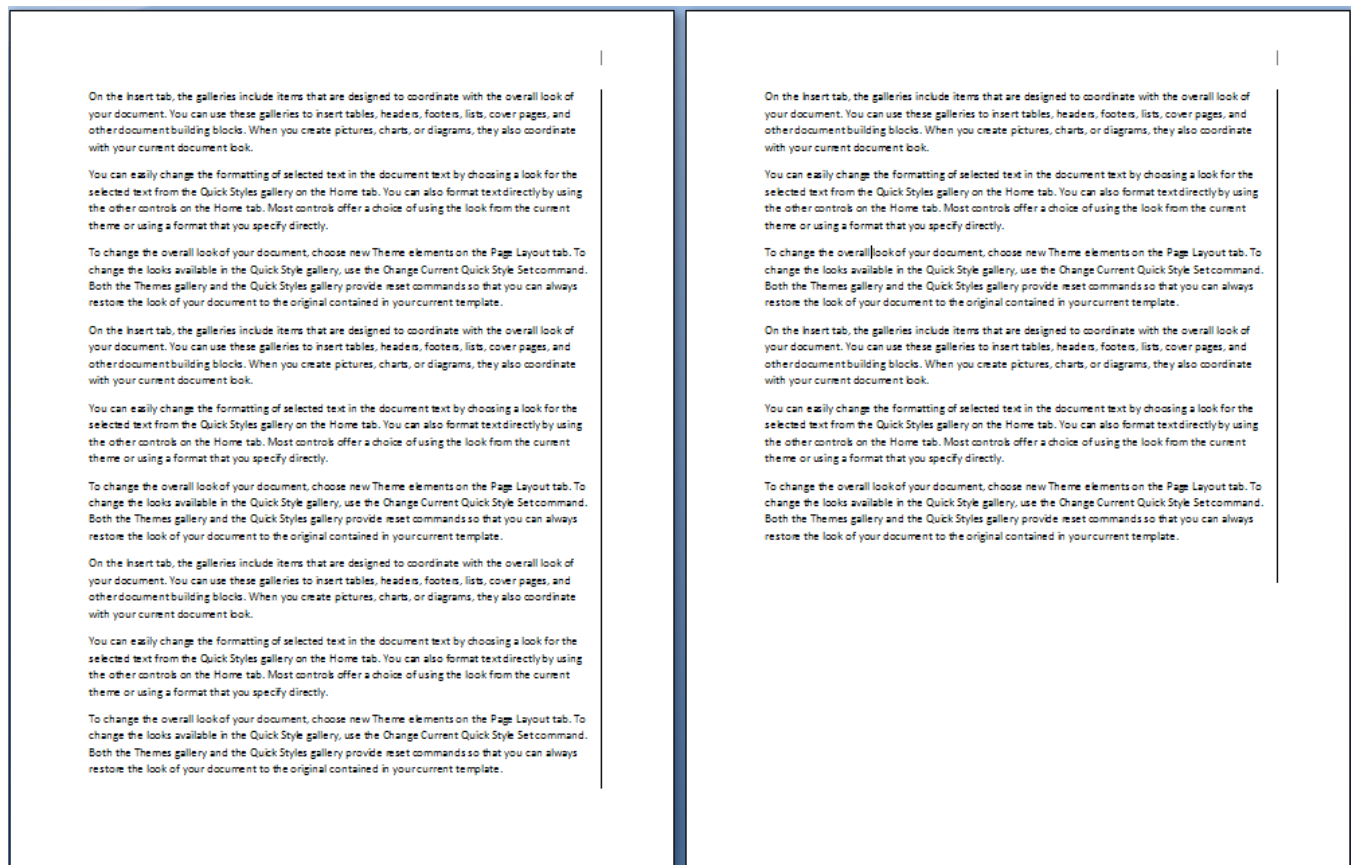

17 [Example: Consider a WordprocessingML document for which the mirrorMargins element is present, and  
18 whose default paragraph style includes a paragraph border to be displayed on the right side of each paragraph:

```

1 <w:style w:type="paragraph" w:default="1" w:styleId="Normal" >
2 ...
3 <w:pPr>
4 <w:pBdr>
5 <w:right w:val="single" w:color="auto" />
6 </w:pBdr>
7 ...
8 </w:pPr>
9 </w:style>

```

If a two-page document is created using this default paragraph style, then all paragraphs will have a border on the right side, as follows:

However, if this compatibility setting is turned on:

```

14 <w:compat>
15 <w:swapBordersFacingPages />
16 </w:compat>

```

Then the borders on the first page (being an odd-numbered page) shall be swapped, resulting in the following output:

<p>On the Insert tab, the galleries include items that are designed to coordinate with the overall look of your document. The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.15.3.53 truncateFontHeightsLikeWP6 (Emulate WordPerfect 6.x Font Height Calculation)

This element specifies that applications shall emulate the behavior of a previously existing word processing application (WordPerfect 6.x) when determining the character height for characters in a font. This emulation typically results slightly truncated character heights.

[*Guidance*: To faithfully replicate this behavior, applications must imitate the behavior of that application, which involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated due to issues with its output, and is maintained only for compatibility with existing documents from that application. *end guidance*]

Typically, applications shall not perform this compatibility. This element, when present with a val attribute value of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing application in this regard.

[*Example*: Consider a WordprocessingML document.

If this compatibility setting is turned on:

```
<w:compat>
 <w:truncateFontHeightsLikeWP6 />
</w:compat>
```

Then applications should mimic the behavior of WordPerfect 6.x when determining the height of characters, as needed.

As an example of the difference, the output of a normal pairing of triple spaced paragraphs (in black) and one intended to replicate WordPerfect 6.x (in red) is displayed below:

Example text.	16
Example text.	14
Example text.	12
Example text.	11
Example text.	10
Example text.	9
Example text.	8

end example]

The following XML Schema fragment defines the contents of this element:

<complexType name="CT_OnOff"> <attribute name="val" type="ST_OnOff"/> </complexType>
--------------------------------------------------------------------------------------------

2.15.3.54 uiCompat97To2003 (Disable Features Incompatible With Earlier Word Processing Formats)

Disable UI functionality that is not compatible with Word97-2003

Parent Elements
settings (§2.15.1.78)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.55 ulTrailSpace (Underline All Trailing Spaces)

This element specifies whether applications shall display underlining beneath all trailing spaces in the contents of a line when those contents are underlined. *Trailing spaces* are all space characters which are not followed by non-space characters on the same line.

Typically, applications do not display underlining on all trailing spaces which have the underline property applied to them. This element, when present with a val attribute value of true (or equivalent), specifies that all characters with underline applied, including trailing spaces, shall display underlining if it is applied to that content.

[Example: Consider a WordprocessingML document with the following line of Latin alphabetical character and punctuation, trailed by a series of spaces:

```
1 <w:r>
2 <w:rPr>
3 <w:u w:val="single"/>
4 </w:rPr>
5 <w:t>Example text. Example text. Example text. Example text. Example text.
6 </w:t>
7 </w:r>
```

8 The default presentation would have no underlining on those trailing spaces:

9 Example text. Example text. Example text. Example text. Example text.

10 However, if this compatibility setting is turned on:

```
11 <w:compat>
12 <w:ulTrailSpace />
13 </w:compat>
```

14 Then all trailing spaces would be underlined, resulting in the following output:

15 Example text. Example text. Example text. Example text. Example text.

16 *end example]*

17

Parent Elements

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;">&lt;w:... w:val="off"/&gt;</p> <p>The val attribute explicitly declares that the property is turned off. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

**2.15.3.56 underlineTabInNumList (Underline Following Character Following Numbering)**

This element specifies whether applications shall underline the character following the numbering defined using the suff element (§2.9.30) when both the numbering itself and the first letter of the corresponding numbered paragraph is underlined.

Typically, the tab or space character generated between numbering and the corresponding paragraph of text is never formatted, since it is automatically generated by the suff element. This element, when present with a val attribute value of true (or equivalent), specifies that the tab or space shall tab or space shall be underlined the same way as the numbering symbol itself in the following conditions:

- The numbering is underlined
- The first character of the paragraph is underlined

[Example: Consider a WordprocessingML document with two numbered paragraphs: one with underlined text and the other without. The default presentation would have the tab characters free of underlining in both cases:

1. Example Text

2. Example Text

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:underlineTabInNumList />
</w:compat>
```

Then the second paragraph meets the criteria defined above for having the suffix character underlined, resulting in the following output:

1. Example Text

2. Example Text

*end example]*

**Parent Elements**

compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <p style="text-align: center;"><code>&lt;w:... w:val="off"/&gt;</code></p> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 2.15.3.57 useAltKinsokuLineBreakRules (Use Alternate Set of East Asian Line Breaking  
6 Rules)

7 This element specifies an alternate set of characters which may be used to determine which characters can  
8 begin and/or end a line when kinsoku line breaking rules are enabled using the kinsoku element (§2.3.1.16).

9 Typically, the characters used to determine which characters shall not end a line are those listed by the kinsoku  
10 element in the paragraph properties subclause of this document. This element, when present with a val  
11 attribute value of true (or equivalent), specifies that the following settings shall be used instead (for brevity,  
12 only those settings which are different are listed below):

13 Chinese (Simplified)

- 14 • Cannot start a line:
- 15 !),.,:;?]]~·-||"....、。〃々>》」』】〕！" ' ) , . : ; ? ] ` | } ~ ¢
- 16 • Cannot end a line:
- 17 ([{·““ < 《 「 『 【 { [ ( . [ { £ ¥

18 Chinese (Traditional)

- 19 • Cannot start a line:
- 20 !),.,:;?]]¢—”•.....’-、。>》」』】〕”：|| { ~~~~~~?)) ! ) , . : ; ? | }、

1 Korean

- Cannot end a line:

3 ([\{£¥“ < 《 ∟ ∏ 【 ∽ \$ ( [ { W

4    *[Example: Consider a line of text in a WordprocessingML document within a paragraph marked as Chinese*  
5    *(Simplified) which begins with a % symbol, as follows:*

6 %...

7 Typically, the kinsoku settings for Chinese (Simplified) do not allow this character to begin a line, so the  
8 character before that symbol would be moved down onto this line:

9      **[%** . . .

10 However, if this compatibility setting is turned on:

```
11 <w:compat>
12 <w:useAltKinsokuLineBreakRules />
13 </w:compat>
```

14 Then the alternate kinsoku rules are in place, which do not prevent the % character from beginning the new line,  
15 resulting in the following output:

16 % . . .

17 *end example]*

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[<i>Example:</i> For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

### 5 2.15.3.58 useAnsiKerningPairs (Use ANSI Kerning Pairs from Fonts)

6 This element specifies whether applications shall use the ANSI or Unicode kerning pair information from fonts  
7 stored in the document when displaying those characters within the document's contents.

8 Typically, applications shall use the Unicode kerning pair information in order to determine all possible kerning  
9 pairs in the fonts in use. This element, when present with a val attribute value of true (or equivalent), specifies  
10 that the ANSI kerning information shall be used instead.

11 *[Example: Consider a WordprocessingML document with text that contains one or more kerning pairs.*

12 If this compatibility setting is turned on:

```
13 <w:compat>
14 <w:useAnsiKerningPairs />
15 </w:compat>
```

16 Then the ANSI kerning pairs are used in place of the Unicode kerning pairs, potentially resulting in different line  
17 breaks.

18 *end example]*

```
2 <complexType name="CT_OnOff">
3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

### 5 2.15.3.59 useFELayout (Do Not Bypass East Asian/Complex Script Layout Code)

6 This element specifies that applications shall not bypass code relating to the layout of East Asian and/or  
7 Complex Script characters when presenting this document.

8 *[Guidance:* Previous word processing applications relied on this flag to determine whether to perform functions  
9 which allow for the correct layout of East Asian and Complex Script text. Although current applications no longer  
10 rely on this flag (as they should correctly use the Unicode subranges and code pages of the text in use), this flag  
11 should be output in order to ensure that files with this content can be viewed correctly in previous word  
12 processors. *end guidance]*

13 *[Example:* Consider a WordprocessingML document with East Asian text.

14 If this compatibility setting is turned on:

```
15 <w:compat>
16 <w:useFELayout />
17 </w:compat>
```

18 Then the flag is set telling previous applications that East Asian content is present, and they should display the  
19 document accordingly. *end example]*

Parent Elements
compat (§2.15.3.9)

3 <attribute name="val" type="ST_OnOff"/>
4 </complexType>
```

5 **2.15.3.60 useNormalStyleForList (Do Not Automatically Apply List Paragraph Style To**  
6 **Bulleted/Numbered Text)**

7 This element specifies whether applications shall automatically apply the paragraph style with the styleId  
8 attribute ListParagraph when numbering is applied to a paragraph currently formatted using the default  
9 paragraph style.

10 Typically, when a paragraph is formatted using the default paragraph style, and numbering is subsequently  
11 applied, the paragraph style with the styleId attribute ListParagraph when numbering is applied to ensure  
12 that paragraph properties are appropriate for a numbered paragraph. This element, when present with a val  
13 attribute value of true (or equivalent), specifies that no alternate paragraph style shall ever be applied

14 [*Example:* Consider a WordprocessingML document with five unnumbered paragraphs:

Example text.

Example text.

Example text.

Example text.

Example text.

15

16 If numbering is applied to the three center paragraphs, the default presentation would have the ListParagraph  
17 style applied as well:

Example text.

- Example text.
- Example text.
- Example text.

Example text.

1

2 However, if this compatibility setting is turned on:

```
3 <w:compat>
4 <w:useNormalStyleForList />
5 </w:compat>
```

6 Then the new paragraph style shall not be applied, resulting in the following output:

Example text.

- Example text.
- Example text.
- Example text.

Example text.

7

8 *end example]*

</complexType>
```

### 2.15.3.61 usePrinterMetrics (Use Printer Metrics To Display Documents)

This element specifies whether applications shall use the printer metrics of the currently active printer when determining how to display the contents of a WordprocessingML document. *Printer metrics* are printer-specific settings which can be queried to tell an application how and where text shall be displayed on a printed page.

Typically, applications display the content of a document in a device independent manner - the application is therefore not changing the layout of a document based on the currently attached printer, and instead shall dictate to the printer where characters shall be presented on the page when printed. This element, when present with a val attribute value of true (or equivalent), specifies that the metrics of the current printer shall be used to display the document instead.

Specifically, when this setting is enabled, the printer metrics are used to determine the number of pixels per logical inch along the screen width and height. This should then be used to compute the pixel height of the fonts requested when displaying the document, as well as to scale between any logical units within the document (e.g. drawing object sizes) to the appropriate device units. Those units would then need to be scaled back into screen units for final display to a screen, but not scaled again when displayed to a printer.

[*Note:* On the Windows platform, you can use the GetDeviceCaps function to retrieve device-specific information for the specified printer. For this specific setting, you can use GetDeviceCaps(hdc, LOGPIXELSX) and GetDeviceCaps(hdc, LOGPIXELSY) with a printer DC to retrieve the number of pixels per logical inch along the screen width and height. With this, you can then use those DPI metrics to compute a pixel value for the font request in the LOGFONT structure (the LOGFONT structure defines the attributes of a font). A common formula to do this is  $S_{px} = S_{pts} * \frac{LOGPIXELSY}{72}$ . *end note*]

[*Example:* Consider a WordprocessingML document. The default shall use device-independent layout to present the contents of the page.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:usePrinterMetrics />
</w:compat>
```

1 Then the printer metrics of the current active printer shall be used to determine the display of the contents of  
2 the document instead, as needed. *end example*]

7 </complexType>
```

8 **2.15.3.62 useSingleBorderforContiguousCells (Use Simplified Rules For Table Border**  
9 **Conflicts)**

10 This element specifies whether applications should use an alternate simplified algorithm when handling conflicts  
11 between adjacent table borders within a table.

12 Typically, the conflicts between two adjacent table borders are handled using the conflict resolution algorithm  
13 defined in §2.4.38 of this Office Open XML Standard. This element, when present with a val attribute value of  
14 true (or equivalent), specifies that rather than using that algorithm to determine the outcome of the conflict to  
15 two adjacent borders, that the following logic shall be used instead:

- 16 • Cell borders shall supersede table borders
- 17 • Cell borders to the right shall supersede cell borders to the left (i.e. the rightmost border wins in  
18 conflicts between vertical borders)
- 19 • Cell borders below shall supersede cell borders above (i.e. the bottommost border wins in conflicts  
20 between horizontal borders)

[Example: Consider a WordprocessingML document with cell and table borders defined as follows. In the image below, 0.1" of padding has been added between each cell temporarily to clearly illustrate the borders on each cell and on the table:

The default presentation would have the border conflicts resolved using the algorithm defined by this Office Open XML Standard, resulting in the following table:

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:useSingleBorderForContiguousCells />
</w:compat>
```

Then the simplified table algorithm above shall be used instead (bottom and right cell borders always win), resulting in the following output:

end example]

7 The following XML Schema fragment defines the contents of this element:

```
8 <complexType name="CT_OnOff">
9 <attribute name="val" type="ST_OnOff"/>
10 </complexType>
```

11 **2.15.3.65 wpJustification (Emulate WordPerfect 6.x Paragraph Justification)**

12 This element specifies that applications shall emulate the behavior of a previously existing word processing  
13 application (WordPerfect 6.x) when performing full paragraph justification using a val attribute value of both on  
14 the jc element (§2.3.1.13). This alternate justification method involves biasing towards compressing rather than  
15 expanding spaces when needed to justify a line.

16 [*Guidance:* To faithfully replicate this behavior, applications must imitate the behavior of that application, which  
17 involves many possible behaviors and cannot be faithfully placed into narrative for this Office Open XML  
18 Standard. If applications wish to match this behavior, they must utilize and duplicate the output of those  
19 applications. It is recommended that applications not intentionally replicate this behavior as it was deprecated  
20 due to issues with its output, and is maintained only for compatibility with existing documents from that  
21 application. *end guidance*]

1 Typically, applications shall not perform this compatibility. This element, when present with a val attribute value  
2 of true (or equivalent), specifies that applications shall attempt to mimic that existing word processing  
3 application in this regard.

4 [Example: Consider a WordprocessingML document with one or more paragraphs using full paragraph  
5 justification:

```
6 <w:p>
7 <w:pPr>
8 <w:jc w:val="both" />
9 </w:pPr>
10 ...
11 </w:p>
```

12 If this compatibility setting is turned on:

```
13 <w:compat>
14 <w:wpJustification />
15 </w:compat>
```

16 Then applications should mimic the behavior of WordPerfect 6.x when performing full justification on text in  
17 these paragraphs. *end example*]

18

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.66 wpSpaceWidth (Space width)

Set the width of a space like WordPerfect 5.x.

Parent Elements
compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.15.3.67 wrapTrailSpaces (Line Wrap Trailing Spaces)

This element specifies whether applications shall perform line wrapping on trailing spaces in the contents of a line when displaying in it a paragraph. *Trailing spaces* are all space characters which are not followed by non-space characters on the same line.

Typically, applications do not line wrap trailing spaces, instead allowing an unbounded number of trailing spaces on a line, with the next non-space character starting at the first character position on the next line. This element, when present with a val attribute value of true (or equivalent), specifies that all characters, including trailing spaces, shall be line wrapped normally.

[*Example:* Consider a WordprocessingML document with the following paragraph of text, including a long interstitial of spaces which become trailing spaces when the paragraph is displayed:

```
<w:r>
 <w:t> This is some text followed by a long number of trailing spaces.

 And some more text.</w:t>
</w:r>
```

The default presentation would not wrap those trailing spaces, so the text at the end of the run would begin at the first character position on the second line:

This is some text followed by a long number of trailing spaces.  
And some more text.

However, if this compatibility setting is turned on:

```
<w:compat>
 <w:wrapTrailSpaces />
</w:compat>
```

Then all trailing spaces would be handled as regular characters when line wrapping, resulting in the following output:

This is some text followed by a long number of trailing spaces.  
And some more text.

*end example]*

Parent Elements

compat (§2.15.3.9)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre data-bbox="451 604 743 636">&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

## 2.16 Fields & Hyperlinks

Most text in a word processing document is static; that is, unless it is directly changed as the result of editing, its contents remain the same, no matter how the rest of the document might change. However, certain useful pieces of information can change value over the life of a document. Consider the case of a reference to a page number, as in "For more information on this topic, see page 56." Clearly, hard coding the page number as 56 means that that number will need to be manually replaced as the document's size or layout is changed. Even a simple change to any margin, line spacing, or font size can invalid such references.

Fields provide a mechanism for placeholders, such as page reference numbers, that can be added to a document such that those placeholders are replaced by their corresponding values when the document is rendered for display or print. Other applications for fields include, but are not limited to, automatic numbering of tables and figures, document creation and current date and time, document author information, and the computation of totals for a table column.

A *field* is a set of codes that instructs a WordprocessingML consumer to insert text, graphics, page numbers, and other material into a document automatically. [Example: The DATE field causes the current date to be inserted. *end example*] The text or graphics inserted into a document when a consumer carries out a field's codes is referred to as the *field result* for that field. The act of carrying out a field's codes is referred to as a *field update*. As to how or when any field is updated is outside the scope of this Office Open XML Standard.

### 2.16.1 Syntax

The general syntax of a field is as follows:

*field:**field-type* [ *instruction* ]*field-type:**date-and-time**document-automation**document-information**equations-and-formulas**index-and-tables**links-and-references**mail-merge**numbering**user-information**form-field**date-and-time:*

CREATEDATE | DATE | EDITTIME | PRINTDATE | SAVEDATE | TIME

*document-automation:*

COMPARE | DOCVARIABLE | GOTOBUTTON | IF | MACROBUTTON | PRINT

*document-information:*AUTHOR | COMMENTS | DOCPROPERTY | FILENAME | FILESIZE | INFO  
| KEYWORDS | LASTSAVEDBY | NUMCHARS | NUMPAGES | NUMWORDS | SUBJECT  
| TEMPLATE | TITLE*equations-and-formulas:*= *formula* | ADVANCE | EQ | SYMBOL*index-and-tables:*

INDEX | RD | TA | TC | TOA | TOC | XE

*links-and-references:*AUTOTEXT | AUTOTEXTLIST | BIBLIOGRAPHY | CITATION | HYPERLINK |  
INCLUDEPICTURE | INCLUDETEXT  
| LINK | NOTEREF | PAGEREF | QUOTE | REF | STYLEREF*mail-merge:*ADDRESSBLOCK | ASK | COMPARE | DATABASE | FILLIN | GREETINGLINE | IF  
| MERGEFIELD | MERGEREC | MERGESEQ | NEXT | NEXTIF | SET | SKIPIF*numbering:*AUTONUM | AUTONUMLGL | AUTONUMOUT | BARCODE | LISTNUM | PAGE | REVNUM  
| SECTION | SECTIONPAGES | SEQ*user-information:*

USERADDRESS | USERINITIALS | USERNAME

*form-field:*

FORMCHECKBOX | FORMDROPDOWN | FORMTEXT

*instruction:**field**field-argument**switches**field-argument switches**switches field-argument*

*field-argument:*

[ " ] *text* [ " ]

*switches:*

*switch*

*switch switches*

*switch:*

*formatting-switch*

*field-specific-switch*

*formatting-switch:*

*date-and-time-formatting-switch*

*numeric-formatting-switch*

*general-formatting-switch*

*field-specific-switch:*

\ *field-switch-character* [ *field-argument* ]

*field-switch-character:*

!

*one or two Latin letters*

*formula* is discussed in §2.16.3, and *formatting-switches* are discussed in §2.16.4.

If the *text* in a *field-argument* contains white space, the delimiting double-quote characters shall be present; otherwise, they are optional. To include a double-quote character in *text*, it shall be preceded with a backslash (\). [Example: The field argument "\"name\"" results in the argument's actually being "name". *end example*] To include a backslash character in *text*, it shall be preceded with another backslash (\). [Example: File system pathnames on some systems use a backslash as a directory separator, as in the field

INCLUDETEXT "E:\\ReadMe.txt"

in which case, each such separator needs to be preceded with a backslash, as shown above. *end example*]

Arbitrary amount of white space can occur before the first token, after the last token, and between successive tokens, including no white space at all.

[Example: Here are examples of some fields:

DATE

DATE \@ "dddd, MMMM dd, yyyy"

DATE \@ "dddd, MMMM dd, yyyy" \h

The field result of all three is today's date: The first field uses some implementation-defined format and the Gregorian calendar; the second field uses the specified format and the Gregorian calendar; and the third field uses the specified format and the Hijri lunar calendar. When rendered in a US-English context on December 31, 2005, the results of these fields were as follows:

12/31/2005

Saturday, December 31, 2005

AsSabt, Thou1 Ki'dah 30, 1426

*end example]*

Except for = *formula*, the terminals of *field-type* are alphabetic tokens [*Example*: Some field-type names are ASK, COMMENTS, NEXT, and SET. *end example*]. These tokens are called *field-type names*. Field-type names are case-insensitive. [*Example*: The field-type names DATE, Date, dAtE, and date are equivalent. *end example*]

*field-switch-characters* are case-insensitive. [*Example*: \b and \B are equivalent. *end example*]

There is no ordering of *switch* entries in *switches*.

## 2.16.2 XML representation

Fields shall be implemented in XML using either of two approaches:

- As a *simple field implementation*, using the fldSimple element, or
- As a *complex field implementation*, using a set of runs involving the fldChar and instrText elements.

For a simple field implementation, only one element, fldSimple, shall be used, in which case, its instr attribute shall contain a *field*, and the body of the element shall contain the most recently updated field result. [*Example*: Here is the corresponding XML for a simple field implementation of DATE:

```
<w:r>
 <w:fldSimple w:instr="DATE"> 12/31/2005 </w:fldSimple>
</w:r>
```

*end example]*

For a complex field implementation, a set of runs shall be used with each run containing, in sequence, the following elements:

- fldChar with attribute fldCharType value begin,
- One or more instrText elements, which, collectively, contain a complete *field*,
- Optionally,
  - fldChar with attribute fldCharType value separate, which separates the field from its field result,
  - Any number of runs and paragraphs that contains the most recently updated field result, and
- fldChar with attribute fldCharType value end.

[*Note*: Fields that are for display purposes only have no need to, and do not, store a field result. *end note*][*Example*: Here is the corresponding XML for a complex field implementation of DATE:

```
<w:r>
 <w:fldChar w:fldCharType="begin"/>
</w:r>
```

```

1 <w:r>
2 <w:instrText xml:space="preserve"> DATE </w:instrText>
3 </w:r>
4 <w:r>
5 <w:fldChar w:fldCharType="separate"/>
6 </w:r>
7 <w:r>
8 <w:t>12/31/2005</w:t>
9 </w:r>
10 <w:r>
11 <w:fldChar w:fldCharType="end"/>
12 </w:r>

```

end example]

[Note: Every simple field implementation for a given field has a corresponding complex field implementation. However, not every complex field implementation has a corresponding simple field implementation. If some characters in a *field* have different run properties than others, that field must be implemented using multiple runs, and that requires that complex field implementation be used. For an example, see §2.16.4.3, where the first letter of a DATE field is made bold, underlined, and red, while the other letters have none of these properties. end note]

As shown in §2.16.1, the *instruction* of one *field* can be another *field*, allowing fields to nest. In such cases, the XML run sequence for the inner field is defined at the point of reference for that inner field, inside the outer field's XML run sequence. [Example: Consider the following sentence:

It's IF DATE \@ "M-d" <>"1-1" "not " new year's day.

The IF field contains the nested field DATE \@ "M-d". When updated, on January 1 of any year, the result sentence is "It's new year's day." On all other days of the year, the resulting sentence is "It's not new year's day."

Here is one way of writing the corresponding XML:

```

27 <w:r>
28 <w:t xml:space="preserve">It's </w:t>
29 </w:r>
30 <w:r ...>
31 <w:fldChar w:fldCharType="begin"/>
32 </w:r>
33 <w:r>
34 <w:instrText xml:space="preserve">IF </w:instrText>
35 </w:r>
36 <w:r>
37 <w:fldChar w:fldCharType="begin"/>
38 </w:r>

```

```

1 <w:r>
2 <w:instrText xml:space="preserve"> DATE \@ "M-d" </w:instrText>
3 </w:r>
4 <w:r>
5 <w:fldChar w:fldCharType="separate"/>
6 </w:r>
7 <w:r ...>
8 <w:instrText>1-4</w:instrText>
9 </w:r>
10 <w:r>
11 <w:fldChar w:fldCharType="end"/>
12 </w:r>
13 <w:r>
14 <w:instrText><>"1-1" "not "</w:instrText>
15 </w:r>
16 <w:r ...>
17 <w:fldChar w:fldCharType="separate"/>
18 </w:r>
19 <w:r ...>
20 <w:t xml:space="preserve">not </w:t>
21 </w:r>
22 <w:r ...>
23 <w:fldChar w:fldCharType="end"/>
24 </w:r>
25 <w:r>
26 <w:t>new year's day!</w:t>
27 </w:r>

```

28 *end example]*

### 29 **2.16.3 Formulas and expressions**

30 A field instruction can involve a calculation via a *formula*:

```

31 formula:
32 expression

```

33 where *expression* can be an arbitrary complex arithmetic expression involving constants (§2.16.3.1), bookmarks  
34 that refer to *expressions* (§2.16.3.2), arithmetic and logical operators (§2.16.3.3), functions (§2.16.3.4), values of  
35 cells in a table (§2.16.3.5), and *fields* that result in a single value. *expression* can contain grouping parentheses to  
36 document the default precedence or to override it.

37 All arithmetic terms in an *expression* are real numbers. Infinities and NaN (Not-a-Number) are not supported.  
38 [*Example*: In the expression 1/3, although the operands appear to be integers, they are, in fact real numbers,  
39 and the result is 0.33. *end example]*

### 2.16.3.1 Constants

A constant has the following form:

*constant:*

*number*

*number:*

*whole-number-part* [ *.* ]

*. fractional-part*

*whole-number-part . fractional-part*

*whole-number-part:*

*series of one or more decimal digits*

*fractional-part:*

*series of one or more decimal digits*

[*Example:* Here are some constants: 1234, 1234.560, 1234., and .1234. Exponents are not supported. *end example*]

### 2.16.3.2 Bookmarks

Any arbitrary piece of text and/or graphics in a WordprocessingML document can be assigned a name, called a *bookmark*. If a bookmark references text that represents an *expression*, that bookmark's name can be used as an operand in another *expression*. If a whole field is bookmarked, its bookmark name can also be used as an operand in an *expression*. [*Example:* Given that X is a bookmark for the text 4, Y is a bookmark for the text 2, and Result is a bookmark for the following field:

=X + Y

the field

=Result \* 10

has the result 60. *end example*]

### 2.16.3.3 Operators

The *operators* permitted in *expression* are:

Operators		
Operator	Description	Precedence
-	Unary minus	highest
^	Powers and roots	
*	Multiplication	
/	Division	
%	Percentage	
+	Addition	

Operators		
-	Subtraction	
=	Equal to	
<>	Not equal to	
<	Less than	lowest
<=	Less than or equal to	
>	Greater than	
>=	Greater than or equal to	

Operators in *expression* having the same precedence associate left-to-right.

[*Example:* Given that X is a bookmark for the text 4, and Y is a bookmark for the text 2, the field

$$=(( -1 + X^2) * 3 - Y)/2$$

produces the result 21.5. *end example*]

The equality, inequality, and relational operators yield 1 for true and 0 for false. An expression with value 0 tests logically false while one with any non-zero value tests true.

#### 2.16.3.4 Functions

A *function* is a predefined procedure that computes and returns a result. Functions defined below with a parameter list of *list* accept two or more arguments separated by commas (,) or semicolons (;). As to which separator is permitted, is defined by the document's listSeparator (§2.15.1.56) element. Arguments to functions can be constants, formulas, or bookmark names that refer to constants or formulas. The functions AVERAGE, COUNT, MAX, MIN, PRODUCT, and SUM can also accept references to table cells as arguments. In the context of a table cell, functions taking a *list* also accept a single argument that designates a named-list of contiguous cells (§2.16.3.5). Function names are not case-sensitive, and white space can occur between a function's name and its argument list, if any.

The functions supported are as follows:

Functions	
Function	Description
ABS( <i>x</i> )	Returns the absolute value of <i>x</i> .
AND( <i>x</i> , <i>y</i> )	Returns 1 if the logical expressions <i>x</i> and <i>y</i> are both true; otherwise, it returns 0.
AVERAGE( <i>list</i> )	Returns the average value of the items in <i>list</i> .
COUNT( <i>list</i> )	Returns the number of items in <i>list</i> .
DEFINED( <i>x</i> )	Returns 1 if the expression <i>x</i> is well formed; otherwise, it returns 0.

Functions	
FALSE	Returns 0.
INT( <i>x</i> )	Returns the value of the integer part of <i>x</i> .
MAX( <i>list</i> )	Returns the largest value in <i>list</i> .
MIN( <i>list</i> )	Returns the smallest value in <i>list</i> .
MOD( <i>x</i> , <i>y</i> )	Returns the value $x - ny$ , for some integer $n$ such that, if $y$ is nonzero, the result has the same sign as $x$ and magnitude less than the magnitude of $y$ . If $y$ is zero, a diagnostic shall be issued. ( $y$ need not be a whole number.) [Example: MOD(21,5) results in 1 MOD(21,-5) results in -1 MOD(-21,5) results in -1 MOD(-21,-5) results in 1  end example]
NOT( <i>x</i> )	Returns 0 if the logical expression $x$ is true, or 1 if the expression is false.
OR( <i>x</i> , <i>y</i> )	Returns 1 if either or both logical expressions $x$ and $y$ are true; otherwise, it returns 0.
PRODUCT( <i>list</i> )	Returns the result of multiplying together all members in <i>list</i> .
ROUND( <i>x</i> , <i>y</i> )	Returns the value of $x$ rounded to the specified number of decimal places indicated by floor( $y$ ), where floor has the mathematical meaning. If $y$ is negative, any fractional part is discarded and the integer part of the value is rounded to the corresponding power of 10.
SIGN( <i>x</i> )	Returns 1 if $x$ is positive; returns 0 if $x$ is zero; and returns -1 if $x$ is negative.
SUM( <i>list</i> )	Returns the sum of the items in <i>list</i> .
TRUE	Returns 1.

### 2.16.3.5 Table cell references

Items in a WordprocessingML table are organized into rows and columns with the box formed by the intersection of a row and column being called a *cell*. Cells have names such as A1, A2, B1, B2, and so on, with the letter representing a column and the number representing a row. The cell at the top-left corner of each table is named A1. Column letters are not case-sensitive.

A *cell reference* shall be one of the following:

- The name of a cell.
- A comma-separated set of cell names.
- A cell range where a colon (:) is used to separate the first and last cells in a designated range of cells that has a contiguous rectangular shape. Specifying a row or column's name only as the first and last cell in a

range, selects that whole row or column, regardless of the number of rows and columns the table has now or might have in the future.

An *expression* inside a table's cell can have operands that are references to other cells in that table.

[*Example:* Consider a table with three rows (1, 2, and 3) and two columns (A and B):

A1 + B1	Returns the sum of the contents of cells A1 and B1.
SUM(A1, B2, A3)	Returns the sum of the contents of the list of cells.
SUM(B1:B3)	Returns the sum of the contents of all cells between B1 and B3, inclusive.
SUM(B:B)	Returns the sum of the contents of all cells in column B (even if new rows are added later).
SUM(A1:B2)	Returns the sum of the contents of all (four) cells in the rectangular grid delimited by A1 and B2, inclusive.
SUM(1:1, 2:2)	Returns the sum of the contents of all cells in rows 1 and 2.

*end example]*

When used in a table cell, the functions taking a *list* argument can have a single argument of ABOVE, BELOW, LEFT, or RIGHT, spelled in any case combination. Such lists designate, respectively, all the cells above, below, to the left of, or to the right of that cell. However, the designated range terminates if a cell with blank or non-numeric contents is reached, except that if the first cell is blank, it is treated as containing 0. [*Example:* Given the following table:

12	=COUNT(BELOW)	
	10	
2	20	=SUM(LEFT)
3	xxx	
=AVERAGE(ABOVE)	40	

AVERAGE(ABOVE) results in 2.5, the average of cells A4 and A3; COUNT(BELOW) results in 2, B2 and B3; and SUM(LEFT) results in 22, the sum of B3 and A3. *end example]*

An *expression* used outside a table or in a cell of one table can refer to cells in a second table by making a bookmark to that second table and qualifying cell names in that table by their table name using the form

(*tableBookmarkName cellReference*)

[*Example:* Given that Table1 is a bookmark for a 3x2 table, =SUM(Table1 A1:A3) book results in the sum of column A's cells. *end example]*

## 2.16.4 Field formatting

The result of a field has a *format*, either by default or because that field contains a *formatting-switch*. There are three kinds of field formatting: date and time (§2.16.4.1), numeric (§2.16.4.2), and general (§2.16.4.3).

### 2.16.4.1 Date and time formatting

*date-and-time-formatting-switch*:  
 \@ [ " ] *switch-argument* [ " ]

A *date-and-time-formatting-switch* specifies the format of a date or time result. [Note: This switch is sometimes called a *picture switch* because it allows the use of symbols to represent the format of the field result. *end note*] If the result of a field is not a date or time, this switch has no effect.

Quotation marks are required around *switch-argument* if it contains white space; otherwise, they are optional.

If no *date-and-time-formatting-switch* is present, a date or time result is formatted in an implementation-defined manner.

A date and time *switch-argument* is made up of a series of *picture items*.

Date and Time Formatting Picture Items	
Picture Item	Description
d	Formats the day of( the week or day of the month as a number without a leading 0 for single-digit days.
dd	Formats the day of the week or day of the month as a number with a leading 0 for single-digit days.
ddd	Formats the day of the week or month in its abbreviated form according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.
dddd	Formats the day of the week as its full name according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.
M	Formats the month as a number without a leading 0 for single-digit months.
MM	Formats the month as a number with a leading 0 for single-digit months.
MMM	Formats the month in its abbreviated form according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.
MMMM	Formats the month as its full name according to the language specified by the lang element (§2.3.2.18) on the run containing the field instructions.
yy	Formats the year as two digits with a leading 0 for years 0–9.
yyyy	Formats the year as four digits.

In the following time formats, a lowercase h indicates that time is based on a 12-hour clock, while uppercase H indicates time is based on a 24-hour clock.

1

Time Formatting Picture Items	
Picture Item	Description
h or H	Formats the hour without a leading 0 for single-digit hours.
hh or HH	Formats the hour with a leading 0 for single-digit hours.
m	Formats the minutes without a leading 0 for single-digit minutes.
mm	Formats the minutes with a leading 0 for single-digit minutes.
am/pm or AM/PM	Formats using an am/AM or pm/PM suffix.

2

Miscellaneous Formatting Picture Items	
Picture Item	Description
Other character	Includes the specified character in the result at that position. [ <i>Note</i> : Commonly used characters are colon (:), hyphen (-), asterisk (*), slash (/), and space. <i>end note</i> ]
'text'	Includes <i>text</i> in the result.
`numbered-item`	Includes, in Arabic numerals, the number of the preceding item numbered as a caption or resulting from a SEQ field (§2.16.5.63). <i>numbered-item</i> shall be the same name as <i>identifier</i> in that SEQ field.

3

4 [Example: When updated in a US-English context on the date and time shown below, the following fields  
5 produced these results:

DATE \@ "M/d/yyyy"	1/3/2006
DATE \@ "dddd, MMMM dd, yyyy"	Tuesday, January 03, 2006
DATE \@ "MMMM d, yyyy"	January 3, 2006
DATE \@ "M/d/yy"	1/3/06

end example]

#### 2.16.4.2 Numeric formatting

*numeric-formatting-switch*:

\# [ " ] *switch-argument* [ " ]

A *numeric-formatting-switch* specifies the format of a numeric result. If the result of a field is not a number, this switch has no effect.

Quotation marks are required around *switch-argument* if it contains white space; otherwise, they are optional.

If no *numeric-formatting-switch* is present, a numeric result is formatted without leading spaces or trailing fractional zeros. If the result is negative, a leading minus sign is present. If the result is a whole number, no radix point is present.

A numeric *switch-argument* is made up of a series of *picture items*.

Numeric Formatting Picture Items	
Picture Item	Description
0	Specifies the requisite numeric positions to display in the result. If the result does not include a digit in that position, 0 is displayed. [Example: In a US-English context, =4+5 \# 00.00 displays "09.00". end example]
#	Specifies the requisite numeric positions to display in the result. If the result does not include a digit in that position, a space is displayed. Extra fractional digits are rounded off. [Example: =9+6 \# \$\$\$\$ displays "\$ 15". end example]
x	Drops digits to the left of the x placeholder. If the placeholder is to the right of the decimal point, the result is rounded to that place. [Example: In a US-English context, =111053+111439 \# x## displays "492", =1/8 \# 0.00x displays "0.125", and =3/4 \# .x displays ".8". end example]
.	Indicates the radix-point position. [Example: In a US-English context, =95.4 \# \$###.00 displays "\$ 95.40. end example] The radix-point

Numeric Formatting Picture Items	
	character displayed is locale-specific.
,	Separates groups of three digits. [Example: In a US-English context, =2456800 \# \$#,###,### displays "2,456,800". end example] The separator character displayed is locale-specific.
-	Prepends a minus sign to a negative result, or prepends a space if the result is positive or 0. [Example: =80-90 \# -## displays "-10", while =90-80 \# -## displays " 80". end example]
+	Prepends a plus sign to a positive result, a minus sign to a negative result, or a space if the result is 0. [Example: =90-80 \# +## displays "+10", and =80-90 \# +## displays "-10". end example]
Other character	Includes the specified character in the result at that position. [Example: =33 \# ##% displays "33%". end example]
'text'	Includes text in the result. [Example: In a US-English context, if Price is a bookmark for 26.5, =Price*15% \# "##0.00 'is the sales tax'" displays "\$ 3.98 is the sales tax". end example]
`numbered-item`	Includes, in Arabic numerals, the number of the preceding item numbered as a caption or resulting from a SEQ field (§2.16.5.63). <i>numbered-item</i> shall be the same name as <i>identifier</i> in that SEQ field. [Example: =SUM(A1:D4) \# "##0.00 'is the total of Table' `table`" displays "456.34 is the total of Table 2". end example]
<i>positive-result ; negative-result</i>	Specifies different sets of picture items for positive and negative results. A zero value uses the positive picture. [Example: =Sales95 \# \$#,##0.00; - \$#,##0.00 displays that bookmark's positive values using \$#,##0.00, and it's negative values using - \$#,##0.00. end example]
<i>positive-result ; negative-result ; zero-result</i>	Specifies different sets of picture items for positive, negative, and zero results. [Example: =Sales95 \# \$#,##0.00; - \$#,##0.00; \$0 displays that bookmark's positive values using \$#,##0.00, it's negative values using - \$#,##0.00, and its zero values using \$0. end example]

### 2.16.4.3 General formatting

*general-formatting-switch*:

\\* [ " ] *switch-argument* [ " ]

A *general-formatting-switch* specifies a variety of formats for a numeric or text result. If the result type of a field does not correspond to the format specified, this switch has no effect.

Quotation marks are required around *switch-argument* if it contains white space; otherwise, they are optional.

A *switch-argument* is made up of a series of *picture items*.

General Formatting Switch Arguments	
Switch Argument	Description
AIUEO	Formats a numeric result using hiragana characters in the traditional a-i-u-e-o

General Formatting Switch Arguments	
	order. [Example: 1 \* AIUEO results in ア. end example] Corresponds to an ST_NumberFormat enumeration value of aiueo.
ALPHABETIC	Formats a numeric result as one or more occurrences of an uppercase alphabetic Latin character. Value 1 results in the letter A, value 2 results in the letter B, and so on up to value 26, which results in the letter Z. For values greater than 26, 26 is repeatedly subtracted from the value until the result is 26 or less. The result value determines which letter to use, and the same letter is repeated for each time 26 was subtracted from the original value. [Example: =54 \* ALPHABETIC results in "BBB" as subtracting 26 from 54 two times, results in the value 2, which is represented by the letter B. end example]
alphabetic	Formats a numeric result as one or more occurrences of an lowercase alphabetic Latin character. Value 1 results in the letter a, value 2 results in the letter b, and so on up to value 26, which results in the letter z. For values greater than 26, 26 is repeatedly subtracted from the value until the result is 26 or less. The result value determines which letter to use, and the same letter is repeated for each time 26 was subtracted from the original value. [Example: =52 \* alphabetic results in "zz" as subtracting 26 from 52 one time, results in the value 26, which is represented by the letter z.. end example]
Arabic	Formats a numeric result using Arabic cardinal numerals. [Example: For page 123, PAGE \* Arabic results in "123". end example] Corresponds to an ST_NumberFormat enumeration value of decimal.
ARABICABJAD	Formats a numeric result using ascending Abjad numerals. [Example: 12 \* ARABICABJAD results in ١٢. end example] Corresponds to an ST_NumberFormat enumeration value of arabicAbjad.
ARABICALPHA	Formats a numeric result using characters in the Arabic alphabet. [Example: 12 \* ARABICABJAD results in ١٢. end example] Corresponds to an ST_NumberFormat enumeration value of arabicAlpha.
ArabicDash	Formats a numeric result using Arabic cardinal numerals, with a prefix of "-" and a suffix of "-". [Example: For page 123, PAGE \* ArabicDash results in "- 123 -". end example] Corresponds to an ST_NumberFormat enumeration value of numberInDash.
BAHTTEXT	Formats a numeric result using the given Thai style. [Example: 1 \* BAHTTEXT results in หนึ่งบาทถ้วน. end example]
Caps	Capitalizes the first letter of each word. [Example: USERNAME "mary smith" \* Caps results in "Mary Smith", whereas USERNAME "marysmith" \* Caps results in "Marysmith". end example]
CardText	Formats a numeric result as lowercase cardinal text. [Example: For page 123, PAGE \* CardText results in "one hundred twenty-three". end example] Corresponds to an ST_NumberFormat enumeration value of cardinalText.
CHARFORMAT	See the discussion following this table.
CHINESENUM1	Formats a numeric result using ascending numbers from the Chinese counting system. [Example: 10 \* CHINESENUM1 results in 十. end example]

General Formatting Switch Arguments	
	Corresponds to an ST_NumberFormat enumeration value of chineseCounting.
CHINESENUM2	<p>Formats a numeric result using sequential numbers from the Chinese simplified legal format. [Example: 123 \* CHINESENUM2 results in 壹佰貳拾叁. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chineseLegalSimplified.</p>
CHINESENUM3	<p>Formats a numeric result using sequential numbers from the Chinese counting thousand system. [Example: 10 \* CHINESENUM3 results in 一百二十三. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chineseCountingThousand.</p>
CHOSUNG	<p>Formats a numeric result using sequential numbers from the Korean Chosung format. [Example: 1 \* CHOSUNG results in ㄱ. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of chosung.</p>
CIRCLENUM	<p>Formats a numeric result using decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character for numbers in the range 1–20. For non-negative numbers outside this range, formats them as with ARABIC. [Example: 12 \* CIRCLENUM results in ⑫. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedCircle.</p>
DBCHAR	<p>Formats a numeric result using double-byte Arabic numbering. [Example: 123 \* DBCHAR results in ١٢٣. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of decimalFullWidth.</p>
DBNUM1	<p>Formats a numeric result using sequential digital ideographs, using the appropriate character. [Example: 12 \* DBNUM1 results in 一二. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of ideographDigital.</p>
DBNUM2	<p>Formats a numeric result using sequential numbers from the Korean counting system. [Example: 12 \* DBNUM2 results in 십이. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of koreanCounting.</p>
DBNUM3	<p>Formats a numeric result using sequential numbers from the Japanese legal counting system. [Example: 12 \* DBNUM3 results in 壱拾貳. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of japaneseLegal1.</p>
DBNUM4	<p>Formats a numeric result using sequential numbers from the Japanese digital ten thousand counting system. [Example: 12 \* DBNUM4 results in 一二. end example]</p> <p>Corresponds to an ST_NumberFormat enumeration value of japaneseDigitalTenThousand.</p>
DollarText	<p>Formats a numeric result in the following form:</p> <p><i>integer-part-as-cardinal-text</i> and <i>nn/100</i></p>

General Formatting Switch Arguments	
	The fractional part is rounded to two decimal places, <i>nn</i> , and is formatted using Arabic cardinal numerals. [Example: =1234.567 \* DollarText results in "one thousand two hundred thirty-four and 57/100". end example]
FirstCap	Capitalizes the first letter of the first word. [Example: USERNAME "mary smith" \* FirstCap results in "Mary smith". end example]
GANADA	Formats a numeric result using sequential numbers from the Korean Ganada format. [Example: 12 \* GANADA results in E٢. end example] Corresponds to an ST_NumberFormat enumeration value of ganada.
GB1	Formats a numeric result using decimal numbering followed by a period, using the enclosed alphanumeric glyph character. [Example: 12 \* GB1 results in 12. end example] Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedFullstop.
GB2	Formats a numeric result using decimal numbering enclosed in parenthesis, using the enclosed alphanumeric glyph character. [Example: 12 \* GB2 results in (12). end example] Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedParen.
GB3	Formats a numeric result using decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 11, the numbers may be replaced with non-enclosed equivalents. [Example: 12 \* GB3 results in 12. end example] Corresponds to an ST_NumberFormat enumeration value of decimalEnclosedCircleChinese.
GB4	Formats a numeric result using decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 11, the numbers may be replaced with non-enclosed equivalents. [Example: 12 \* GB4 results in 12. end example] Corresponds to an ST_NumberFormat enumeration value of ideographEnclosedCircle.
HEBREW1	Formats a numeric result using Hebrew numerals. [Example: 123 \* HEBREW1 results in 123. end example] Corresponds to an ST_NumberFormat enumeration value of hebrew1.
HEBREW2	Formats a numeric result using the Hebrew alphabet. [Example: 123 \* HEBREW2 results in 123. end example] Corresponds to an ST_NumberFormat enumeration value of hebrew2.
Hex	Formats the numeric result using uppercase hexadecimal digits. [Example: For page 355, PAGE \* Hex results in "FF". end example] Corresponds to an ST_NumberFormat enumeration value of hex.
HINDIARABIC	Formats a numeric result using Hindi numbers. [Example: 123 \* HINDIARABIC results in 123. end example] Corresponds to an ST_NumberFormat enumeration value of hindiNumbers.

General Formatting Switch Arguments	
HINDICARDTEXT	Formats a numeric result using sequential numbers from the Hindi counting system. [Example: 123 \* HINDICARDTEXT results in एक □□□□□. end example] Corresponds to an ST_NumberFormat enumeration value of hindiCounting.
HINDILETTER1	Formats a numeric result using Hindi vowels. [Example: 123 \* HINDILETTER1 results in ओओओ . end example] Corresponds to an ST_NumberFormat enumeration value of hindiVowels.
HINDILETTER2	Formats a numeric result using Hindi consonants. [Example: 123 \* HINDILETTER2 results in ओओओओओओओ . end example] Corresponds to an ST_NumberFormat enumeration value of hindiConsonants.
IROHA	Formats a numeric result using the Japanese iroha. [Example: 12 \* IROHA results in オ. end example] Corresponds to an ST_NumberFormat enumeration value of iroha.
KANJINUM1	Formats a numeric result using a Japanese style using sequential digital ideographs, using the appropriate character. [Example: 12 \* KANJINUM1 results in 一二. end example]
KANJINUM2	Formats a numeric result using the Japanese counting system. [Example: 12 \* KANJINUM2 results in 十二. end example] Corresponds to an ST_NumberFormat enumeration value of japaneseCounting.
KANJINUM3	Formats a numeric result using the Japanese legal counting system. [Example: 12 \* KANJINUM3 results in 壹拾貳. end example]
Lower	All letters are lowercase. [Example: USERNAME "Mary Smith" \* Lower results in "mary smith". end example]
MERGEFORMAT	See the discussion following this table.
Ordinal	Formats a numeric result using lowercase ordinal Arabic numerals. [Example: =32 \* Ordinal results in "32nd". end example] Corresponds to an ST_NumberFormat enumeration value of ordinal.
OrdText	Formats a numeric result as lowercase ordinal text. Apart from being used to round off the whole number part, the fractional part is not used. [Example: =1234.567 \* OrdText results in "one thousand two hundred thirty-fifth". end example] Corresponds to an ST_NumberFormat enumeration value of ordinalText.
Roman	Formats a numeric result using uppercase Roman numerals. [Example: For page 123, PAGE \* Roman results in "CXXIII". end example] Corresponds to an ST_NumberFormat enumeration value of upperRoman.
roman	Formats a numeric result using lowercase Roman numerals. [Example: For page 123, PAGE \* roman results in "cxxiii". end example] Corresponds to an ST_NumberFormat enumeration value of lowerRoman.
SBCHAR	Formats a numeric result using single-byte Arabic numbering. [Example: 123 \* SBCHAR results in 123. end example]

General Formatting Switch Arguments	
	Corresponds to an ST_NumberFormat enumeration value of decimalHalfWidth.
THAIARABIC	Formats a numeric result using Thai numbers. [Example: 123 \* THAIARABIC results in ๑๒๓. end example] Corresponds to an ST_NumberFormat enumeration value of thaiNumbers.
THAICARDTEXT	Formats a numeric result using sequential numbers from the Thai counting system. [Example: 123 \* THAICARDTEXT results in หนึ่งร้อยยี่สิบสาม. end example] Corresponds to an ST_NumberFormat enumeration value of thaiCounting.
THAILETTER	Formats a numeric result using Thai letters. [Example: 123 \* THAILETTER results in ซี่ซี่. end example] Corresponds to an ST_NumberFormat enumeration value of thaiLetters.
Upper	All letters are uppercase. [Example: USERNAME "Mary Smith" \* Upper results in "MARY SMITH". end example]
VIETCARDTEXT	Formats a numeric result using Vietnamese numerals. [Example: 12 \* VIETCARDTEXT results in mười hai. end example] Corresponds to an ST_NumberFormat enumeration value of vietnameseCounting.
ZODIAC1	Formats a numeric result using sequential numerical traditional ideographs. [Example: 1 \* ZODIAC1 results in 甲. end example] Corresponds to an ST_NumberFormat enumeration value of ideographTraditional.
ZODIAC2	Formats a numeric result using sequential zodiac ideographs. [Example: 1 \* ZODIAC2 results in 子. end example] Corresponds to an ST_NumberFormat enumeration value of ideographZodiac.
ZODIAC3	Formats a numeric result using sequential traditional zodiac ideographs. [Example: 1 \* ZODIAC3 results in 甲子. end example] Corresponds to an ST_NumberFormat enumeration value of ideographZodiacTraditional.

1

2 The general formatting switch argument CHARFORMAT is used to set the visual appearance of a field's value by  
3 setting the first run in that field's *field-type* name to the desired state using any of the elements that can be  
4 directly nested inside the run property element, rPr. [Example: In a US-English context, on January 4, 2006, the  
5 field DATE \\* CHARFORMAT results in "1/4/2006". However, if the D in DATE is made bold, the field  
6 **DATE** \\* CHARFORMAT results in "**1/4/2006**". If that D is made italic, the field DATE \\* CHARFORMAT results  
7 in "1/4/2006". If that D is made bold, underlined, and red, the field **DATE** \\* CHARFORMAT results in  
8 "**1/4/2006**".

9 The XML for the bold, underlined, red case is as follows:

```

1 <w:r>
2 <w:fldChar w:fldCharType="begin"/>
3 </w:r>
4 <w:r>
5 <w:instrText xml:space="preserve"> </w:instrText>
6 </w:r>
7 <w:r ...>
8 <w:rPr>
9 <w:b/>
10 <w:color w:val="ED1C24"/>
11 <w:u w:val="single"/>
12 </w:rPr>
13 <w:instrText>D</w:instrText>
14 </w:r>
15 <w:r>
16 <w:instrText xml:space="preserve">ATE </w:instrText>
17 </w:r>
18 <w:r>
19 <w:fldChar w:fldCharType="separate"/>
20 </w:r>
21 <w:r ...>
22 <w:rPr>
23 <w:b/>
24 <w:color w:val="ED1C24"/>
25 <w:u w:val="single"/>
26 </w:rPr>
27 <w:t>1/4/2006</w:t>
28 </w:r>
29 <w:r>
30 <w:fldChar w:fldCharType="end"/>
31 </w:r>

```

*end example]*

If a format specified directly in the first run of a field's *field-type* name conflicts with a general formatting switch, the general formatting switch is ignored. [*Example:* If the first run is set in small caps and the switch \\* Lower is also used, that switch is ignored. *end example]*

The general formatting switch argument MERGEFORMAT is used to apply formatting directly to part of a result such that when that result is updated, the formatting is preserved. The formatting is expressed in XML using an rPr element on the run that contains the most recently updated field result. [*Example:* Consider the following field:

```
TIME \@ "HH:mm:ss" * MERGEFORMAT
```

When it is updated, the result might be 12:22:27, for example. If the seconds part of the displayed field result is underlined, as in 12:22:27, when that field is next updated, the seconds underlining is preserved. If MERGEFORMAT is omitted, the rPr element on the run that contains the most recently updated field result is ignored.

The XML generated for this is:

```
<w:r>
 <w:fldChar w:fldCharType="begin"/>
</w:r>
<w:r>
 <w:instrText xml:space="preserve"> TIME \@ "HH:mm:ss" * MERGEFORMAT
</w:instrText>
</w:r>
<w:r>
 <w:fldChar w:fldCharType="separate"/>
</w:r>
<w:r ...>
 <w:t>17:02:</w:t>
</w:r>
<w:r ...>
 <w:rPr>
 <w:u w:val="single"/>
 </w:rPr>
 <w:t>32</w:t>
</w:r>
<w:r>
 <w:fldChar w:fldCharType="end"/>
</w:r>
```

*end example]*

## 2.16.5 Field definitions

The set of fields is divided into the following functional categories:

Category	Description	Fields
Date and Time	Inserts the current date and/or time, or date and/or time of some kind of event.	CREATEDATE (§2.16.5.16), DATE (§2.16.5.18), EDITTIME (§2.16.5.21), PRINTDATE (§2.16.5.54), SAVEDATE (§2.16.5.60), TIME (§2.16.5.72)
Document Automation	Compares values and takes action based on outcome, run macros, and sends a code to a printer.	COMPARE (§2.16.5.15), DOCVARIABLE (§2.16.5.20), GOTOBUTTON (§2.16.5.29), IF (§2.16.5.32), MACROBUTTON (§2.16.5.41), PRINT (§2.16.5.53)

Category	Description	Fields
Document Information	Inserts or stores information about the document.	AUTHOR (§2.16.5.4), COMMENTS (§2.16.5.14), DOCPROPERTY (§2.16.5.19), FILENAME (§2.16.5.23), FILESIZE (§2.16.5.24), INFO (§2.16.5.36), KEYWORDS (§2.16.5.37), LASTSAVEDBY (§2.16.5.38), NUMCHARS (§2.16.5.48), NUMPAGES (§2.16.5.49), NUMWORDS (§2.16.5.50), SUBJECT (§2.16.5.67), TEMPLATE (§2.16.5.71), TITLE (§2.16.5.73)
Equations and Formulas	Defines formulas and calculates results; inserts symbols.	= <i>formula</i> (§2.16.3), ADVANCE (§2.16.5.2), EQ (§2.16.5.22), SYMBOL (§2.16.5.68)
Form Fields	Allows the insertion of form fields.	FORMCHECKBOX (§2.16.5.26), FORMDROPDOWN (§2.16.5.27), FORMTEXT (§2.16.5.28)
Index and Tables	Defines entries for, and builds, a table of contents, table of figures, and table of authorities.	INDEX (§2.16.5.35), RD (§2.16.5.57), TA (§2.16.5.69), TC (§2.16.5.70), TOA (§2.16.5.74), TOC (§2.16.5.75), XE (§2.16.5.79)
Links and References	Inserts information from another place in the same document, from a different document or file, or from an AutoText entry.	AUTOTEXT (§2.16.5.8), AUTOTEXTLIST (§2.16.5.9), BIBLIOGRAPHY (§2.16.5.11), CITATION (§2.16.5.13) HYPERLINK (§2.16.5.31), INCLUDEPICTURE (§2.16.5.33), INCLUDETTEXT (§2.16.5.34), LINK (§2.16.5.39), NOTEREF (§2.16.5.47), PAGEREF (§2.16.5.52), QUOTE (§2.16.5.56), REF (§2.16.5.58), STYLEREF (§2.16.5.66)
Mail Merge	Defines information that is to be used in a mail merge.	ADDRESSBLOCK (§2.16.5.1), ASK (§2.16.5.3), COMPARE (§2.16.5.15), DATABASE (§2.16.5.17), FILLIN (§2.16.5.25), GREETINGLINE (§2.16.5.30), IF (§2.16.5.32), MERGEFIELD (§2.16.5.42), MERGEREC (§2.16.5.43), MERGESEQ (§2.16.5.44), NEXT (§2.16.5.45), NEXTIF (§2.16.5.46), SET (§2.16.5.64), SKIPIF (§2.16.5.65)
Numbering	Specifies numbering for document items such as sections and pages; also bar codes.	AUTONUM (§2.16.5.5), AUTONUMLGL (§2.16.5.6), AUTONUMOUT (§2.16.5.7), BARCODE (§2.16.5.10), LISTNUM (§2.16.5.40), PAGE (§2.16.5.51), REVNUM (§2.16.5.59), SECTION (§2.16.5.61), SECTIONPAGES (§2.16.5.62), SEQ (§2.16.5.63)

Category	Description	Fields
User Information	Stores or inserts the name, initials, or address of the document user.	USERADDRESS (§2.16.5.76), USERINITIALS (§2.16.5.77), USERNAME (§2.16.5.78)

### 2.16.5.1 ADDRESSBLOCK

#### Syntax:

ADDRESSBLOCK [ *switches* ]

**Description:** Inserts a mail merge address block.

**Field Value:** The address block.

**Switches:** Zero or more of the following *field-specific-switches*.

\c <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies whether to include the name of the country/region: a value of 0 causes the country/region to be omitted; a value of 1 causes it to be included, and a value of 2 causes country/region to be included, but only if it is different from the value for \e.
\d	Specifies that the address is to be formatted according to the country/region of the recipient. If this switch is not used, then addresses are formatted according to some implementation-specific preference.
\e <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies which country/region to exclude from the address block. [ <i>Note:</i> This is useful when your mailing contains a mix of domestic and international recipients. <i>end note</i> ] To exclude the names of more than one country or region, use a \e switch for each one.
\f <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the name and address format by providing a template of merge-field placeholders.
\l <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the language ID used to format the address. The default is to use the language ID of the first character of the document.

### 2.16.5.2 ADVANCE

#### Syntax:

ADVANCE [ *switches* ]

**Description:** Moves the starting point of text that follows the field to the right or left, up or down, or to a specific horizontal or vertical position. The switches used by this field can cause text to overlap. Text will not display if it is moved to the previous or next page, or beyond the print margins of the current page.

**Field Value:** None.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\d <i>field-argument</i></code>	Moves the text that follows the field down by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\l <i>field-argument</i></code>	Moves the text that follows the field left by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\r <i>field-argument</i></code>	Moves the text that follows the field right by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\u <i>field-argument</i></code>	Moves the text that follows the field up by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\x <i>field-argument</i></code>	Moves the text that follows the field the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> from the left edge of the column, frame, or text box.
<code>\y <i>field-argument</i></code>	Moves the text that follows the field the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . This shift is the vertical position relative to the page. The entire line of text that contains the field is moved. This switch is ignored if it specifies a location outside the page margins or if the switch is used inside any of the following: table, text box, footnote, endnote, annotation, header, or footer.

[Example: When the following fields are updated:

XX ADVANCE \u 6 XX ADVANCE \d 12 XX ADVANCE \l 20 + ADVANCE \x 150 ZZ

The results are:

XX<sup>XX</sup>  
XX+ X ZZ

end example]

### 2.16.5.3 ASK

#### Syntax:

ASK *field-argument-1* *field-argument-2* [ *switches* ]

*field-argument-1:*  
*field-argument*

*field-argument-2:*  
*field-argument*

**Description:** Prompts the user to enter information and assigns the bookmark designated by *field-argument-1* to represent the user's response. *text* in *field-argument-2* specifies the prompt text, which is displayed in a dialog box. The prompt is displayed each time the ASK field is updated. A response remains assigned to the bookmark until a new response is entered.

**Field Value:** None.

1 **Switches:** Zero or more of the following *field-specific-switches*.

\d <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a default response if one is not entered. If no default response is specified, the most recent response is used. To specify a blank entry as the default, <i>field-argument</i> shall be "".
\o	When used in a mail merge main document, this causes the display of the prompt once instead of each time a new data record is merged. The same response is inserted in each resulting merged document.

2

3 [Example: When the following fields are updated and "John" is entered as the response,

4 ASK AskResponse "What is your first name?"

5 Hello REF AskResponse.

6 the result is

7 Hello John.

8 *end example*]

#### 9 2.16.5.4 AUTHOR

10 **Syntax:**

11 AUTHOR [ *field-argument* ] [ *switch* ]

12 **Description:** Retrieves, and optionally sets, the document author's name, as recorded in the Creator element of  
 13 the Core File Properties part or, if *field-argument* is present, the name specified by *text* in *field-argument*.  
 14 Specifying a *field-argument* shall change Creator to *text*.

15 **Field Value:** The document author's name.

16 **Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or  
 17 \\* Upper.

18 [Example: Consider the case in which the Creator element is as follows:

19 <Creator>William Jones</Creator>

20 and the following field is updated:

21 AUTHOR

22 The result is:

23 William Jones

Updating the following field:

AUTHOR "Tony Caruso"

causes the Creator element to take on the specified value. *end example*

#### 2.16.5.5 AUTONUM

##### Syntax:

AUTONUM [ *switches* ]

**Description:** In paragraphs formatted with one of the nine built-in heading styles, paragraph numbering restarts at 1 in each successive heading level. If headings that contain AUTONUM fields are followed by body text paragraphs that also contain AUTONUM fields, the paragraph numbering of the body text is restarted at 1 after each heading. If the headings don't contain AUTONUM fields, body text paragraphs that contain AUTONUM fields are numbered in a continuous, sequential series throughout the document. [*Note:* This field is supported for legacy reasons, It is recommended that LISTNUM (§2.16.5.40) be used instead. *end note*]

The XML generated for a complex field implementation shall not have the optional field value stored.

**Field Value:** A new paragraph number in ascending sequential order.

**Switches:** Zero or one of the *general-formatting-switches*, or zero or more of the following *field-specific-switches*.

<code>\s <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the separator character to be used. If \s is omitted, a period (.) is used.
---------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------

[*Example:* When the following fields are updated:

AUTONUM

AUTONUM \\* Arabic \s :

AUTONUM \\* alphabetic \s " "xxx

AUTONUM \\* ROMAN

AUTONUM \\* OrdText

The results are:

1.

2:

c xxx

IV.

fifth.

*end example*

## 2.16.5.6 AUTONUMLGL

### Syntax:

AUTONUMLGL [ *switches* ]

**Description:** For legal and technical publications, use the nine built-in heading styles to format headings in the document, and then insert an AUTONUMLGL field at the beginning of each heading paragraph. The numbers reflect the heading levels that correspond to the heading styles. If an AUTONUMLGL field is inserted in paragraphs of body text paragraphs not formatted with built-in heading styles, the number of the preceding heading is included in the paragraph number. [*Note:* This field is supported for legacy reasons, It is recommended that LISTNUM (§2.16.5.40) be used instead. *end note*]

This field only makes sense in terms of multi-level headings. Given the following headings:

Heading 1

Heading 2

Heading 2

Heading 1

this field allows

1. Heading 1

1.1. Heading 2

1.2. Heading 2

2. Heading 1

At each level, the numbering sequence does two things—it increments specific to that level, and it includes the value from the previous level.

The XML generated for a complex field implementation shall not have the optional field value stored.

**Field Value:** A new paragraph number in ascending sequential order.

**Switches:** Zero or one of the *general-formatting-switches*, or zero or more of the following *field-specific-switches*.

\e	Removes the trailing separator (period).
\s <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the separator character to be used. If \s is omitted, a period (.) is used.

[*Example:* When the following fields are updated:

1       AUTONUMLGL  
 2       AUTONUMLGL \\* Arabic \s :  
 3       AUTONUMLGL \\* alphabetic \s " "xxx  
 4       AUTONUMLGL \\* ROMAN  
 5       AUTONUMLGL \e xxx

6       The results are:

7       1.  
 8       2:  
 9       C xxx  
 10       IV.  
 11       5xxx

12      *end example]*

### 13      2.16.5.7        AUTONUMOUT

#### 14      **Syntax:**

15       AUTONUMOUT

16      **Description:** Use the nine built-in heading styles to format headings in the document, and then insert an  
 17      AUTONUMOUT field at the beginning of each heading paragraph. The numbers reflect the heading levels that  
 18      correspond to the heading styles. [*Note:* This field is supported for legacy reasons, It is recommended that  
 19      LISTNUM (§2.16.5.40) be used instead. *end note*]

20      The XML generated for a complex field implementation shall not have the optional field value stored.

21      This field allows the numbering to be incremented based on the heading level. Given the following:

22      {AutoNumOut} Heading 1  
 23      {AutoNumOut} Heading 2  
 24      {AutoNumOut} Heading 2  
 25      {AutoNumOut} Heading 1

26      results in

27      I. Heading 1  
 28      A. Heading 2  
 29      B. Heading 2  
 30      II. Heading 1

31      **Field Value:** A paragraph number.

32      **Switches:** None.

33      [*Example:* When the following fields are updated:

AUTONUMOUT

AUTONUMOUT

The results are:

1.

2.

*end example]*

#### 2.16.5.8 AUTOTEXT

##### Syntax:

AUTOTEXT *field-argument*

**Description:** Inserts the AutoText entry whose name is specified by *text* in *field-argument*.

Regarding XML generation, the field result is the value of the autotext. [*Note:* This can be arbitrarily complex and involve VML *end note*]

**Field Value:** The specified AutoText entry.

**Switches:** None.

[*Example:* Assuming the following entries are defined with values of current page number, salutation, and a notice:

AUTOTEXT "- PAGE -"

AUTOTEXT "Yours truly,"

AUTOTEXT Confidential

when evaluated, they might produce the following results.

- 13 -

Yours truly,

CONFIDENTIAL

*end example]*

#### 2.16.5.9 AUTOTEXTLIST

##### Syntax:

AUTOTEXTLIST *field-argument* [ *switches* ]

**Description:** Creates a shortcut menu based on AutoText entries in the active template. The list can vary based on the styles applied to the AutoText entries. *text* in *field-argument* is inserted into the document.

A complex field XML implementation shall be used, and the *field-argument* text shall be placed in one or more runs between the separate and end parts of the fldChar element.

**Field Value:** *text* in *field-argument*.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\s <i>field-argument</i></code>	Specifies that the list is to contain entries based on the style specified by <i>text</i> in this switch's <i>field-argument</i> . Without this switch, entries of the current paragraph style appear. If there are no entries for the current style, all entries appear. The style can be a paragraph style or a character style.
<code>\t <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the text to show in the ScreenTip.

[*Example:* The field:

```
{ AUTOTEXTLIST "List of salutations" \s Salutation \t "Choose a salutation" }
```

causes the following to be displayed: In the document, the Salutation list; in the ScreenTip, Choose a salutation, and on the shortcut menu, the list of entries whose style is Salutation.

*end example]*

#### 2.16.5.10 BARCODE

**Syntax:**

`BARCODE field-argument [ switch ]`

**Description:** Produces a postal bar code is a machine-readable form of address used by the U.S. Postal Service. The barcode is in the form of either a POSTNET delivery-point bar code or a Facing Identification Mark (FIM). *text* in *field-argument* can be either a postal address or a bookmark name. In the case of a postal address, all that is needed is a 5-digit or 9-digit ZIP code; the rest of the address is superfluous.

**Field Value:** A postal bar code.

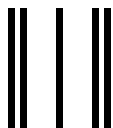

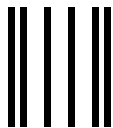

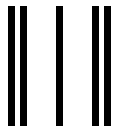

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\b</code>	Indicates that <i>text</i> in <i>field-argument</i> is the name of a bookmark.
<code>\f <i>field-argument</i></code>	Inserts a Facing Identification Mark (FIM). <i>text</i> in this switch's <i>field-argument</i> shall be either "A" (courtesy reply mark) or "C" (business reply mark).
<code>\u</code>	Indicates that <i>text</i> in <i>field-argument</i> is a U.S. postal address.

[*Example:* Consider the case in which PostalAddress is the name of a bookmark for the text "2051 Swans Neck Way, Reston VA 20191". When the following fields are updated:

1       BARCODE 20191  
2       BARCODE 20191 \u  
3       BARCODE 20191-4023 \u  
4       BARCODE "2051 Swans Neck Way, Reston VA 20191" \u  
5       BARCODE "2051 Swans Neck Way, Reston VA 20191" \f A  
6       BARCODE 20191 \f C  
7       BARCODE PostalAddress \b \f A

8       The results are:

9         
10         
11         
12         
13         
14         
15       

16       *end example]*

### 17       2.16.5.11       BIBLIOGRAPHY

#### 18       Syntax:

19       BIBLIOGRAPHY [ *switch* ]

20       **Description:** Retrieves and displays the contents of the document's Bibliography part in the bibliographic style  
21       specified within the SelectedStyle attribute of the Sources (§7.6.2.60) element of the Bibliography part.

22       **Field Value:** The formatted bibliographic data for all sources in the current document.

23       **Switches:** The following *field-specific-switch*.

\1 <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies the locale that shall be used in to format the bibliographic sources in the document that do not specify a locale
--------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	using the LCID (§7.6.2.39) element.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the locale that shall be used to filter the bibliographic data to only the sources in the document that have a value matching <i>field-argument</i> in the LCID (§7.6.2.39) element.
<code>\m <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies that only the source with a Tag (§7.6.2.65) element value matching <i>field-argument</i> shall be displayed in the bibliography.

[*Example:* Consider a document with bibliographic data for this Office Open XML Standard:

Author: Ecma International

Title: Office Open XML Document Interchange Specification

Year: 2006

Month: October

the following field is updated:

BIBLIOGRAPHY /1 1033

The result for MLA is:

Ecma International. Office Open XML Document Interchange Specification. October 2006.

And for APA:

Ecma International. (2006, October). Office Open XML Document Interchange Specification.

*end example]*

#### 2.16.5.12 BIDIOUTLINE

##### Syntax:

BIDIOUTLINE

**Description:** Sets the output as being right-to-left. This field is like AUTONUMOUT (§2.16.5.7), except for differences in Arabic/Hebrew numbering [*Example:* For Heading 2, BIDIOUTLINE results in ٢, while AUTONUMOUT results in A. *end example]*

**Field Value:** A paragraph number.

**Switches:** None.

#### 2.16.5.13 CITATION

##### Syntax:

CITATION *field-argument* [ *switch* ]

**Description:** Displays the contents of the Source (§7.6.2.59) element with a Tag (§7.6.2.65) element value matching *field-argument* using the bibliographic style specified within the SelectedStyle attribute of the Sources (§7.6.2.60) element of the Bibliography part.

**Field Value:** The comments relating to the current document.

**Switches:** The following *field-specific-switch*.

<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the locale which shall be used in conjunction with the specified bibliographic style to format the citation in the document.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the prefix which shall be prepended to the citation.
<code>\s <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the suffix which shall be appended to the citation.
<code>\p <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the page number associated with the citation.
<code>\v <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the volume number associated with the citation.
<code>\n</code>	Specifies that the author information shall be suppressed from the citation.
<code>\t</code>	Specifies that the title information shall be suppressed from the citation.
<code>\y</code>	Specifies that the year information shall be suppressed from the citation.
<code>\m <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the Tag (§7.6.2.65) element value for another source to be included in this citation's field result.

[*Example:* Consider a case with bibliographic data for this Office Open XML Standard:

Tag: Ecma01

Author: Ecma International

Title: Office Open XML Document Interchange Specification

Year: 2006

Month: October

the following field is updated:

CITATION Ecma01 /l 1033

The result for MLA is:

(Ecma International)

And for APA:

(Ecma International, 2006)

*end example]*

#### 2.16.5.14 COMMENTS

##### Syntax:

COMMENTS [ *field-argument* ] [ *switch* ]

**Description:** Retrieves, and optionally sets, the comments relating to the current document, as recorded in the Description element of the Core File Properties part or, if *field-argument* is present, the comments specified by *text* in *field-argument*. Specifying a field-argument shall change Description to *text*.

**Field Value:** The comments relating to the current document.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper.

[*Example:* Consider the case in which the Description element is as follows:

<Description>Once upon a time, in a land far, far away ...</Description>

and the following field is updated:

COMMENTS

The result is:

Once upon a time, in a land far, far away ...

Updating the following field:

COMMENTS "I came, I saw, I was not impressed."

causes the Description element to take on the specified value. *end example]*

#### 2.16.5.15 COMPARE

##### Syntax:

COMPARE Expression-1 Operator Expression-2

Expression-1:

expression

Expression-2:

expression

**Description:** Compares the values designated by *Expression-1* and *Expression-2* using the operator designated by *Operator*. [Note: This field can be used to create compound logical comparisons with AND and OR functions in a formula, and then by using the result of the formula in an IF field. *end note*]

*Operator* can be any one of the six relational and equality operators specified for *operator* (§2.16.3.3).

If *Operator* is = or <>, *Expression-2* can contain a question mark (?) to represent any single character, or an asterisk (\*) to represent any string of characters. The expression shall be enclosed in quotation marks so that it is compared as a character string. If an asterisk is used in *Expression-2*, the portion of *Expression-1* that corresponds to the asterisk, plus any remaining characters in *Expression-2*, shall NOT exceed 128 characters.

**Field Value:** 1 if the comparison is true, or 0 if the comparison is false.

**Switches:** None.

[Example: Consider the case in which the IF field in the following example is inserted into a mail merge main document. The COMPARE fields examine the data fields CustomerNumber and CustomerRating as each data record is merged. The OR function of the formula returns the value 1 if at least one of the data fields indicates poor credit, in which case the first text in quotation marks is printed:

```
{ IF { = OR ({ COMPARE { MERGEFIELD CustomerNumber } >= 4 },
 { COMPARE { MERGEFIELD CustomerRating } <= 9 }) } = 1
 "Credit not acceptable" "Credit acceptable" }
```

The following COMPARE field results in the value 1 if any value in the PostalCode data field is the range 98500–98599:

```
{ COMPARE "{ MERGEFIELD PostalCode }" = "985*" }
```

*end example*]

#### 2.16.5.16 CREATEDATE

**Syntax:**

*CREATEDATE* [ switches ]

**Description:** Retrieves the date and time at which the document was created, as recorded in the DateCreated element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined.

**Field Value:** The date and time at which the document was created.

**Switches:** Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

\h	Use the Hijri/Lunar calendar.
\s	Use the Saka Era calendar.

[*Example*: Consider the case in which the DateCreated element is as follows:

```
<DateCreated>2006-01-05T03:31:00Z</DateCreated>
```

and the following fields are updated in a US-English context that is UTC -5:

CREATEDATE

CREATEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"

CREATEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \h

CREATEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \s

the results are:

1/4/2006 10:31:00 PM

Wednesday, January 04, 2006 22:31:00

AlArbia'a, Thoul Hijjah 04, 1426 22:31:00

Budhavara, Pausa 14, 1927 22:31:00

*end example]*

#### 2.16.5.17 DATABASE

##### Syntax:

*DATABASE* [ switches ]

**Description:** Inserts the results of a database query into a WordprocessingML table. If the number of columns is 62 or more, the field inserts the results of a query in columns separated by tabs. The DATABASE field contains all the information needed to connect to a database and perform an SQL query. Each time the field is updated, the database is queried again.

**Field Value:** The results of a database query as a WordprocessingML table.

**Switches:** Zero or more of the following *field-specific-switches*.

\b <i>field-argument</i>	<p>The <i>text</i> in this switch's <i>field-argument</i> specifies which attributes of the format set by the \l switch are to be applied to the table. If the \l switch is blank, the \b switch value shall be 16 (AutoFit). <i>text</i> can have a value that is the bitwise-or of any combination of the following:</p> <ul style="list-style-type: none"> <li>0, None</li> <li>1, Borders</li> <li>2, Shading</li> <li>4, Font</li> <li>8, Color</li> <li>16, AutoFit</li> <li>32, Heading Rows</li> <li>64, Last Row</li> </ul>
--------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

	128, First Column 256, Last Column
<code>\c <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies a connection to the data.
<code>\d <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the complete path and file name of the database. Used for all database queries except a query to an SQL database table using ODBC.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the integral record number of the first data record to insert
<code>\h</code>	Inserts the field names from the database as column headings in the resulting table.
<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the format that is to be applied to the result of the database query. If this switch is used and the <code>\b</code> switch doesn't specify the table attributes, an unformatted table is inserted.
<code>\o <i>field-argument</i></code>	Inserts data at the beginning of a merge. By adding the <code>\o</code> switch to the database field, it will only get the data for the database field at the beginning of a merge instead of once for each record merged. This is a performance optimization and should only be used when the database field doesn't rely on record specific information to gather.
<code>\s <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies a set of SQL instructions. Each quotation mark in the instructions shall be preceded by a backslash (\).
<code>\t <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the integral record number of the last data record to insert.

1

2 [Example: The following field results from a query to a database through ODBC:

3 { DATABASE \d "C:\\Data\\Sales93.mdb" \c "DSN=MS Access Database;  
4 DBQ=C:\\Data\\Sales93.mdb; FIL=RedISAM"  
5 \s "select \* from \"Customer List\"\" \f "2445" \t "2486" \l "2"

6 end example]

## 7 2.16.5.18 DATE

### 8 Syntax:

9 *DATE* [ switches ]

10 **Description:** Retrieves the current date and time. By default, the Gregorian calendar is used, and the *date-and-*  
11 *time-formatting-switch* used is implementation-defined.

**Field Value:** The current date and time.

**Switches:** Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

\h	Use the Hijri/Lunar calendar.
\l	If no <i>date-and-time-formatting-switch</i> is used, the date shall use the date format last used by the hosting application when inserting a new DATE field.
\s	Use the Saka Era calendar.

[*Example:* Consider the case in which the following fields are updated in a US-English context on the given date and time:

DATE

DATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"

DATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \h

DATE \@ "dddd, MMMM dd, yyyy HH:mm:ss" \s

the results are:

1/5/2006

Thursday, January 05, 2006 19:09:01

AlKhamis, Thoul Hijjah 05, 1426 19:09:01

Bruhaspathivara, Pausa 15, 1927 19:09:01

*end example]*

[*Note:* For some *date-and-time-formatting-switches*, the DATE and TIME (§2.16.5.72) fields can produce the same result. *end note]*

## 2.16.5.19 DOCPROPERTY

**Syntax:**

*DOCPROPERTY docprop-category [ field-argument ] [ switches ]*

docprop-category:

*AUTHOR | BYTES | CATEGORY | CHARACTERS | CHARACTERSWITHSPACES*

*| COMMENTS | COMPANY | CREATETIME | HYPERLINKBASE | KEYWORDS*

*| LASTPRINTED / LASTSAVEDBY | LASTSAVEDTIME | LINES | MANAGER*

*| NAMEOFAPPLICATION | ODMADOCID | PAGES | PARAGRAPHS | REVISIONNUMBER*

*| SECURITY | SUBJECT | TEMPLATE | TITLE | TOTALEDITINGTIME | WORDS*

**Description:** Retrieves the indicated document information. For some combinations of DOCPROPERTY and *docprop-category*, there is an equivalent field, in which case, the description for the combination can be obtained from that field. For those combinations not having an equivalent field, the description is shown

- 1 directly. When used directly, some of the equivalent fields allow the value of the designated property to be  
 2 changed. However, when the corresponding DOCPROPERTY field is used, such values shall not be changed. This  
 3 is indicated in the following table by "Read-only operation."

docprop-category	Corresponding Field	Description
AUTHOR	AUTHOR (§2.16.5.4)	<b>Read-only operation.</b>
BYTES	FILESIZE (§2.16.5.24)	
CATEGORY	No equivalent	The contents of the Category element of the Core File Properties part.
CHARACTERS	NUMCHARS (§2.16.5.48)	
CHARACTERSWITHSPACES	No equivalent	<b>Like NUMCHARS, but includes all white space characters as well.</b>
COMMENTS	COMMENTS (§2.16.5.11)	<b>Read-only operation.</b>
COMPANY	No equivalent	The contents of the Company element of the Application-Defined File Properties part.
CREATETIME	CREATEDATE (§2.16.5.16)	
HYPERLINKBASE	No equivalent	The contents of the HyperlinkBase element of the Application-Defined File Properties part.
KEYWORDS	No equivalent	The contents of the Keywords element of the Core File Properties part.
LASTPRINTED	PRINTDATE (§2.16.5.54)	
LASTSAVEDBY	LASTSAVEDBY (§2.16.5.38)	
LASTSAVEDTIME	SAVEDATE (§2.16.5.60)	
LINES	No equivalent	The contents of the Lines element of the Application-Defined File Properties part.
MANAGER	No equivalent	The contents of the Manager element of the Application-Defined File

docprop-category	Corresponding Field	Description
		Properties part.
NAMEOFAPPLICATION	No equivalent	The contents of the Application element of the Application-Defined File Properties part.
ODMADOCID		
PAGES	NUMPAGES (§2.16.5.49)	
PARAGRAPHS	No equivalent	The contents of the Paragraphs element of the Application-Defined File Properties part.
REVISIONNUMBER	REVNUM (§2.16.5.59)	
SECURITY	No equivalent	The contents of the DocSecurity element of the Application-Defined File Properties part.
SUBJECT	SUBJECT (§2.16.5.67)	<b>Read-only operation.</b>
TEMPLATE	TEMPLATE (§2.16.5.71)	
TITLE	TITLE (§2.16.5.73)	<b>Read-only operation.</b>
TOTALEDITINGTIME	EDITTIME (§2.16.5.21)	
WORDS	No equivalent	The contents of the Words element of the Application-Defined File Properties part.

1

2 **Field Value:** The indicated document information.3 **2.16.5.20 DOCVARIABLE**4 **Syntax:**5 *DOCVARIABLE* field-argument

6 **Description:** Inserts the string assigned to the document variable designated by *text* in *field-argument*. Each  
7 WordprocessingML document has a collection of variables. This field is used to access and display the contents  
8 of docVar (§2.15.1.30) elements in the Document Settings part.

9 **Field Value:** The value of the specified document variable.10 **Switches:** None.

### 2.16.5.21 EDITTIME

#### Syntax:

*EDITTIME* [ switch ]

**Description:** Retrieves the total editing time, in minutes, since the document was created, as recorded in the TotalTime element of the Application-Defined File Properties part. By default, the *numeric-formatting-switch* or *general-formatting-switch* used is implementation-defined.

**Field Value:** The total editing time, in minutes.

**Switches:** Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[Example: Consider the case in which the TotalTime element is as follows:

```
<TotalTime>930</TotalTime>
```

and the following fields are updated in a US-English context:

```
EDITTIME
```

```
EDITTIME * OrdText
```

```

### 2.16.5.22 EQ

#### Syntax:

*EQ* eq-primary-switch [ switches ] ( [ eq-argument-list ] )

*eq-argument-list* is a list of arguments separated using a separator character. For implementations using a period (.) as the radix point, the separator character is a comma (,). For implementations using a comma (,) as the radix point, the separator character is a semicolon (;).

**Description:** Computes the specified mathematical equation.

**Field Value:** The result of the specified mathematical equation. [Note: The result of an EQ field can be used as an argument in another EQ field's *eq-argument-list*. end note]

**Switches:** One of the following *eq-primary-switches*: \a, \b, \d, \f, \i, \l, \o, \r, \s, and \x. Each of these switches has one or more subswitches, as shown below.

- 1  $\backslash a$  produces an array using the argument values in *eq-argument-list* (which are in row-major order) and the  
 2 *field-specific-switches* below:

$\backslash ac$	Alignment is centered in each array column.
$\backslash al$	Alignment is left in each array column.
$\backslash ar$	Alignment is right in each array column.
$\backslash co$ <i>field-argument</i>	The number of columns in the array is specified by <i>text</i> in this switch's <i>field-argument</i> . In the absence of this switch, the number is 1.
$\backslash hs$ <i>field-argument</i>	Adds the integral number of points of horizontal spacing specified by <i>text</i> in this switch's <i>field-argument</i> between columns.
$\backslash vs$ <i>field-argument</i>	Adds the integral number of points of vertical spacing specified by <i>text</i> in this switch's <i>field-argument</i> between lines.

- 3  
 4  $\backslash b$  brackets the single element in *eq-argument-list* in a size appropriate for that element. The default form of  
 5 brackets is parentheses. The *field-specific-switches* below may be used:

$\backslash bc$ $\backslash char$	Uses the character designated by <i>char</i> as both the left and right bracket character. However, if <i>char</i> is {, [, (, or <, that character is used for the left bracket, and }, ], ), or >, respectively, is used for right bracket.
$\backslash lc$ $\backslash char$	Uses the character designated by <i>char</i> as the left bracket character.
$\backslash rc$ $\backslash char$	Uses the character designated by <i>char</i> as the right bracket character.

- 6  
 7  $\backslash d$  Controls where the next character following the EQ field is drawn (that is, the displacement). *eq-argument-*  
 8 *list* shall have no arguments. The *field-specific-switches* below may be used:

$\backslash ba$ <i>field-argument</i>	Draws to the left (backward) the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
$\backslash fo$ <i>field-argument</i>	Draws to the right (forward) the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
$\backslash li$	Underlines the space up to the next character.

- 9  
 10  $\backslash f$  Creates a fraction with the first argument as numerator and the second argument as denominator, centered  
 11 above and below the division line, respectively. *eq-argument-list* shall have exactly two arguments. There are no  
 12 *field-specific-switches* for this switch.

- 13  $\backslash i$  Creates an integral using the specified or default symbol and three elements. The first argument is the lower  
 14 limit, the second is the upper limit, and the third is the integrand. *eq-argument-list* shall have exactly three  
 15 arguments. The *field-specific-switches* below may be used:

$\backslash fc$ $\backslash char$	Uses the character designated by <i>char</i> as the fixed-height character for
-----------------------------------	--------------------------------------------------------------------------------

	the symbol.
<code>\in</code>	Uses an inline format with the limits displayed to the right of the symbol instead of above and below it.
<code>\pr</code>	Uses the symbol Capital pi and creates a product.
<code>\su</code>	Uses the symbol Capital sigma and creates a summation.
<code>\vc \char</code>	Uses the character designated by <i>char</i> as the variable-height character for the symbol. The symbol matches the height of the third argument.

1

2 `\lf` Creates a list from an arbitrary number of arguments. There are no *field-specific-switches* for this switch.

3 `\o` Using an arbitrary number of arguments, displays each successive argument on top of the previous one. Each  
 4 character is displayed within an invisible character box, with the switches being available to align the boxes on  
 5 top of one another. The *field-specific-switches* below may be used:

<code>\ac</code>	Alignment character box center (the default).
<code>\al</code>	Alignment character box left.
<code>\ar</code>	Alignment character box right.

6

7 `\r` Creates a radical. *eq-argument-list* shall have either one or two arguments. If it has one argument, the result  
 8 is the square root of that argument. If it has two arguments, the result is the *n*th root of the second argument,  
 9 where *n* is the first argument. There are no *field-specific-switches* for this switch.

10 `\s` Creates a subscript or superscript. One or more arguments are permitted. If more than one element is  
 11 specified, the elements are stacked and left-aligned. The *field-specific-switches* below may be used:

<code>\ai field-argument</code>	Adds space above a line in a paragraph by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . The default is 2 points.
<code>\di field-argument</code>	Adds space below a line in a paragraph by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\do field-argument</code>	Moves a single argument below the adjacent text by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> . The default is 2 points.
<code>\up field-argument</code>	Moves a single argument above the adjacent text by the integral number of points specified by <i>text</i> in this switch's <i>field-argument</i> .

12

13 `\x` Creates one or more border segments around a single argument. By default, all four borders are added. *eq-*  
 14 *argument-list* shall have no arguments. The *field-specific-switches* below may be used:

<code>\bo</code>	Draws a horizontal border below the argument.
<code>\le</code>	Draws a vertical border to the left of the argument.

<code>\ri</code>	Draws a vertical border to the right of the argument.
<code>\to</code>	Draws a horizontal border above the argument.

1

2 *[Example: When the following fields are updated:*3  $\text{EQ} \backslash a \backslash co 2 \backslash ac \backslash hs 10 ( 1000, 20, A, \text{Sunday} )$ 4  $\text{EQ} \backslash b \backslash bc \backslash | ( -100 ) \text{EQ} \backslash b \backslash bc \backslash | ( \sqrt[3]{a + b} )$ 5  $xx \text{EQ} \backslash d \backslash fo 20 ( ) xx \text{EQ} \backslash d \backslash fo 30 \backslash li ( )xx$ 6  $\text{EQ} \backslash f ( 1, 32 ) \text{EQ} \backslash f ( 7, 64 )$ 7  $\text{EQ} \backslash i ( 0, \infty, x ) \text{EQ} \backslash i \backslash su \backslash in ( 0, 10, x ) \text{EQ} \backslash i \backslash pr \backslash in ( 0, 5, x )$ 8  $\text{EQ} \backslash i \backslash fc \backslash \{ ( 0, 5, \backslash f ( x, 0.34 ) ) \text{EQ} \backslash i \backslash vc \backslash \{ ( 0, 5, \backslash f ( x, 0.34 ) )$ 9  $\text{EQ} \backslash l ( 0, 10 )$ 10  $\text{EQ} \backslash b \backslash lc \backslash [ \backslash rc \backslash ) ( \backslash l ( 0, 10 ) )$ 11  $\text{EQ} \backslash o ( 0, 0, 0 ) \text{EQ} \backslash o ( 0, + ) \text{EQ} \backslash o \backslash ar ( 0, |, \_ )$ 12  $\text{EQ} \backslash r ( 2 ) \text{EQ} \backslash r ( 2, x )$ 13  $a \text{EQ} \backslash s \backslash up ( 2 ) + b \text{EQ} \backslash s \backslash up ( 2 )$ 14  $a \text{EQ} \backslash x ( + ) b \text{EQ} \backslash x \backslash to \backslash le ( + ) b \text{EQ} \backslash x \backslash bo \backslash ri ( + ) b$ 

15 The results are:

16 
$$\begin{array}{cc} 1000 & 20 \\ A & \text{Sunday} \end{array}$$
17 
$$\left| -100 \right| \left| \sqrt[3]{a + b} \right|$$
18  $xx \quad xx \rule{1cm}{0.4pt} xx$ 19 
$$\frac{1}{32} \frac{7}{64}$$
20 
$$\int_0^{\infty} x \sum_0^{10x} \prod_0^{5x}$$
21 
$$\left\{ \frac{x}{0.34} \right\}_0^5 \left\{ \frac{x}{0.34} \right\}_0^5$$
22  $0, 10$ 23  $[0, 10)$

1  
2  $\mathbf{0}$   $\theta$   $\varnothing$

3  $\sqrt{2}$   $\sqrt[2]{x}$   
4

5  $a^2 + b^2$

6  
7  $a\boxed{+}b$   $a\overline{+}b$   $a\underline{+}b$

8 *end example]*

9 **2.16.5.23** **FILENAME**

10 **Syntax:**

11 `FILENAME [ switch ]`

12 **Description:** Retrieves the name of the current document as stored on disk.

13 **Field Value:** The name of the current document.

14 **Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or  
15 \\* Upper, and zero or one of the following *field-specific-switches*.

\p	Include the full file path name.
----	----------------------------------

16 [*Example:* Consider the case in which the following fields are updated:

17 `FILENAME \* Upper`

18 `FILENAME \p`

19 the results might be:

20 `FIELD DEMO SUITE.DOCX`

21 `E:\Std\OOXML\Fields\Field Demo Suite.docx`

22 *end example]*

23 **2.16.5.24** **FILESIZE**

24 **Syntax:**

25 `FILESIZE [ switches ]`

26 **Description:** Retrieves the size of the current document in bytes. [*Note:* This information is not stored inside the  
27 document's XML. It needs to be obtained from the file system. *end note*]

28 **Field Value:** The size of the current document in bytes.

**Switches:** Zero or one *numeric-formatting-switch* or *general-formatting-switch* and zero or one of the following *field-specific-switches*.

\k	Round to the nearest kilobyte.
\m	Round to the nearest megabyte.

[Example: Consider the case in the document's size is 4,660,736 bytes and the following fields are updated:

FILESIZE \# #,##0

FILESIZE \k

FILESIZE \m

the results are:

4,660,736

4661

5

*end example]*

#### 2.16.5.25 FILLIN

##### Syntax:

FILLIN [ *field-argument* ] [ *switch* ]

**Description:** Prompts the user to enter text. *text* in *field-argument* contains the prompt. The prompt is displayed each time the field is updated. When a new document is created based on a template containing FILLIN fields, those fields are updated automatically.

**Field Value:** The user's response.

**Switches:** Zero or more of the following *field-specific-switches*.

\d <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a default response if one is not entered. If no default response is specified, the most recent response is used. To specify a blank entry as the default, <i>field-argument</i> shall be "".
\o	When used in a mail merge main document, this causes the display of the prompt once instead of each time a new data record is merged. The same response is inserted in each resulting merged document.

[Example: The following FILLIN field helps the user fill in the correct information by displaying the patient name from the current data record:

FILLIN "Please enter the appointment time for MERGEFIELD PatientName :"

*end example]*

#### 2.16.5.26 FORMCHECKBOX

##### Syntax:

*FORMCHECKBOX*

**Description:** Inserts a check box style form field which, when the editing of form fields is enabled using the documentProtection element (§2.15.1.28), can be checked and unchecked. An instance of this field shall be accompanied by a use of the ffData element (§2.16.17) which contains the form field's properties.

**Field Value:** A check box based on the properties of the ffData element (§2.16.17).

**Switches:** None.

*[Example: Consider the following fields:*

FORMCHECKBOX

Assuming the appropriate properties are used in the child XML elements of the field, a check box is displayed.

*end example]*

#### 2.16.5.27 FORMDROPDOWN

##### Syntax:

*FORMDROPDOWN*

**Description:** Inserts a drop-down list style form field which, when the editing of form fields is enabled using the documentProtection element (§2.15.1.28), can be used to select an entry in the list. An instance of this field shall be accompanied by a use of the ffData element (§2.16.17) which contains the form field's properties.

**Field Value:** A drop-down list based on the properties of the ffData element (§2.16.17).

**Switches:** None.

*[Example: Consider the following fields:*

FORMDROPDOWN

Assuming the appropriate properties are used in the child XML elements of the field, a drop-down list is displayed.

*end example]*

#### 2.16.5.28 FORMTEXT

##### Syntax:

**FORMTEXT**

**Description:** Inserts a text box style form field which, when the editing of form fields is enabled using the documentProtection element (§2.15.1.28), can be typed into. An instance of this field shall be accompanied by a use of the ffData element (§2.16.17) which contains the form field's properties.

**Field Value:** A text box based on the properties of the ffData element (§2.16.17).

**Switches:** None.

[*Example:* Consider the following fields:

**FORMTEXT**

Assuming the appropriate properties are used in the child XML elements of the field, a text box is displayed.

*end example]*

**2.16.5.29 GOTOBUTTON****Syntax:**

**GOTOBUTTON** *field-argument-1 field-argument-2*

*field-argument-1:*

*expression*

*field-argument-2:*

*expression*

**Description:** Inserts a jump command, such that when it is activated, the insertion point of the document is moved to the location specified by *text* in *field-argument-1*. *text* can be a bookmark, a page number, or some other item (as described below). The page number can be a reference resulting from a REF field. The other items that can be locations are:

<b>a</b> <i>n</i>	annotation
<b>f</b> <i>n</i>	footnote
<b>l</b> <i>n</i>	line
<b>p</b> <i>n</i>	page
<b>s</b> <i>n</i>	section

where *n* is an integer that designates the *n*th occurrence of the corresponding item (which is not necessarily the item numbered *n*).

*text* in *field-argument-2* is the text or graphic "button" that appears in the document, such that it can be selected to activate the jump. [Note: The BOOKMARK and INCLUDEPICTURE fields make for some interesting button possibilities. *end note*] The text or graphic shall appear on one line in the field result; otherwise, an error occurs.

**Field Value:** None.

**Switches:** None.

[*Example:* Consider the following fields:

GOTOBUTTON MyBookmark Dest

GOTOBUTTON p3 Page

GOTOBUTTON "f 2" Footnote

When the Dest "button" is activated, the insertion point becomes the location marked by MyBookmark. When Page is activated, the insertion point becomes the beginning of the third page. When Footnote is activated, the insertion point becomes the marker of the second footnote, at the place it is used in the document, not in any footnote list.

*end example]*

### 2.16.5.30 GREETINGLINE

**Syntax:**

GREETINGLINE [ *switches* ]

**Description:** Inserts a mail merge greeting line.

**Field Value:** The greeting line.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\c <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the text to include in the merge field if the name field in the data source is blank.
<code>\c <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the format of the name included in the field.
<code>\l <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the language ID used to format the name. it defaults to the language ID of the first character of the document.

### 2.16.5.31 HYPERLINK

**Syntax:**

HYPERLINK *field-argument* [ *switches* ]

**Description:** When selected, causes control to jump to the location specified by *text* in *field-argument*. That location can be a bookmark or a URL.

**Field Value:** None.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\l <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies a location in the file, such as a bookmark, where this hyperlink will jump.
<code>\m</code>	Appends coordinates to a hyperlink for a server-side image map.
<code>\n</code>	Causes the destination site to be opened in a new window.
<code>\o <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the ScreenTip text for the hyperlink.
<code>\t <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the target to which the link should be redirected. Use this switch to link from a frames page to a page that you want to appear outside of the frames page. The permitted values for <i>text</i> are: <ul style="list-style-type: none"> <li>• <code>_top</code>, whole page (the default)</li> <li>• <code>_self</code>, same frame</li> <li>• <code>_blank</code>, new window</li> <li>• <code>_parent</code>, parent frame</li> </ul>

[Example:

HYPERLINK http://www.cnu.edu/

HYPERLINK "E:\\ReadMe.txt"

end example]

### 2.16.5.32 IF

#### Syntax:

IF *Expression-1* *Operator* *Expression-2* *field-argument-1* *field-argument-2*

*Expression-1:*  
*expression*

*Expression-2:*  
*expression*

*field-argument-1:*  
*expression*

*field-argument-2:*  
*expression*

**Description:** Compares the values designated by *Expression-1* and *Expression-2* using the operator designated by *Operator*.

*Operator* can be any one of the six relational and equality operators specified for *operator* (§2.16.3.3).

If *Operator* is = or <>, *Expression-2* can contain a question mark (?) to represent any single character, or an asterisk (\*) to represent any string of characters. The expression shall be enclosed in quotation marks so that it is compared as a character string. If an asterisk is used in *Expression-2*, the portion of *Expression-1* that corresponds to the asterisk, plus any remaining characters in *Expression-2*, shall NOT exceed 128 characters.

**Field Value:** *field-argument-1* if the comparison is true; otherwise, *field-argument-2*.

**Switches:** None.

[*Example:* The following example specifies that if the customer order is greater than or equal to 100 units, the result is "Thanks"; but if the customer order is fewer than 100 units, the result is "The minimum order is 100 units":

```
{IF order >= 100 "Thanks" "The minimum order is 100 units" }
```

For other examples, see §2.16.2, and the COMPARE field (§2.16.5.15) and the QUOTE field (§2.16.5.55). *end example]*

### 2.16.5.33 INCLUDEPICTURE

**Syntax:**

```
INCLUDEPICTURE field-argument [switches]
```

**Description:** Retrieves the picture contained in the document named by *field-argument*. If *field-argument* contains white space, it shall be enclosed in double quotes. If *field-argument* contains any backslash characters, each one shall be preceded directly by another backslash character.

**Field Value:** The specified picture.

**Switches:** Zero or more of the following *field-specific-switches*.

\c <i>field-argument</i>	If <i>text</i> in this switch's <i>field-argument</i> identifies the graphics filter to be used.
\d	Reduce the file size by not storing graphics data with the document.

[*Example:*

```
INCLUDEPICTURE "G:\\Photos\\Ellen in Oslo.jpg"
```

*end example]*

### 2.16.5.34 INCLUDETEXT

**Syntax:**

```
INCLUDETEXT field-argument-1 [field-argument-2] [switches]
```

*field-argument-1:*

*field-argument*

*field-argument-2:*

*field-argument*

**Description:** Inserts all or part of the text and graphics contained in the document named by *field-argument-1*. If the document is a WordprocessingML document, the portion marked by the optional bookmark *field-argument-2* is inserted. If no such bookmark is specified here, the whole document is inserted. If the document is an XML file, the fragment referred to by an XPath expression in the \x switch is inserted. If no such switch is specified, the whole XML file is inserted.

If *field-argument-1* contains white space, it shall be enclosed in double quotes. If *field-argument-1* contains any backslash characters, each one shall be preceded directly by another backslash character.

**Field Value:** The specified text and graphics.

**Switches:** Zero or more of the following *field-specific-switches*.

\!	Prevents this field from being updated unless all fields in the inserted text are first updated in their original document.
\c <i>field-argument</i>	Specifies that the file specified by <i>field-argument-2</i> shall be processed by a document filter whose name matches the corresponding <i>field-argument</i> value. Possible <i>field-argument</i> values are implementation-defined.
\n <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a namespace mapping for XPath queries. This switch is required if the \x switch refers to an element by name in an XML file that declares a namespace.
\t <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies an XSLT for formatting XML data.
\x <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies the XPath for returning a fragment of data in an XML file.

[Example: The following field inserts the portion of the WordprocessingML document referred to by the bookmark Summary:

```
INCLUDETEXT "C:\\Winword\\Port Development RFP" Summary
```

The following field inserts the Name element of the XML document Resume.xml and applies the XSLT Display.xsl to it:

```
INCLUDETEXT "C:\\Resume.xml" \n xmlns:a=\"resume-schema\"
\t "C:\\display.xsl" \x a:Resume/a:Name
```

end example]

### 2.16.5.35 INDEX

**Syntax:**

```
INDEX [switches]
```

- 1 **Description:** Builds an index using the index entries specified by XE fields (§2.16.5.79), and inserts that index at  
 2 this place in the document. Each index entry and subentry is a separate paragraph unless the \r switch is used,  
 3 in which case, an index entry and all its subentries together make up a paragraph.
- 4 **Field Value:** The index.
- 5 **Switches:** Zero or more of the following *field-specific-switches*.

\b <i>field-argument</i>	Builds an index for the portion of the document marked by the bookmark indicated by <i>text</i> in this switch's <i>field-argument</i> .
\c <i>field-argument</i>	Builds an index having the number of columns per page specified by <i>text</i> in this switch's <i>field-argument</i> . That number can be 1–4. Without this switch, the number of columns is 1.
\d <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate sequence numbers and page numbers when the \s switch is used. By default, a hyphen (-) is used.
\e <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate an index entry and its first page number. By default, a comma (,) and space sequence is used. If <i>text</i> contains a horizontal tab character, the page number list is right justified in the column.
\f <i>field-argument</i>	Builds an index using only those entries having the entry type (§2.16.5.79) specified by <i>text</i> in this switch's <i>field-argument</i> . Without this switch, all entries included.
\g <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate the start and end of a page range. By default, an en dash is used.
\h <i>field-argument</i>	Builds an index such that the <i>text</i> in this switch's <i>field-argument</i> occurs as a heading—formatted with the Index Heading style—at the start of each set of entries for any given letter. If the first letter in <i>text</i> is A or a, that letter is replaced with the corresponding letter for each letter set. To replace the default heading with a blank line, use a space as <i>text</i> . [Example:  end example]
\k <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate an index entry and its cross reference (as produced by an XE entry (§2.16.5.79) having a \t switch). By default, a period (.) and space sequence is used. [Example:

	<p>The quick brown fox { XE "fox" } jumps over the lazy dog. The quick brown fox jumps over the lazy dog. The quick brown fox jumps over the lazy dog. The quick brown fox { XE "quick brown fox" \t "See Fox" } jumps over the lazy dog. The quick brown fox jumps over the lazy dog.</p> <p>{ INDEX \k &lt;test&gt; \c "1" \z "1033" }</p> <p>fox, 1</p> <p>quick brown fox &lt;test&gt; See Fox</p> <p><i>end example]</i></p>
\l <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that is used to separate two page numbers in a page number list. By default, a comma (,) and space sequence is used.
\p <i>field-argument</i>	Builds an index using only those entries whose first letter is in the range of letters specified by <i>text</i> in this switch's <i>field-argument</i> . The letter range has the form <i>startLetter-endLetter</i> . If <i>startLetter</i> is !, entries whose first character is not a letter, are also included, as are the letters starting from A. The letters in the range can be either upper- or lowercase.
\r	Runs subentries into the same line as the main entry. Colons (:) separate main entries from subentries; semicolons (;) separate subentries.
\s <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> is used as a sequence name, and the sequence number is included along with the page number, these numbers being separated by a hyphen (-), by default. Use the \d switch to specify a separator character other than the default.
\y	Enables the use of yomi text for index entries.
\z <i>field-argument</i>	The <i>text</i> in this switch's <i>field-argument</i> is specifies the language ID used to generate the index as defined in the ST_LangCode (§2.18.52) simple type.

#### 5 2.16.5.36 INFO

6 **Syntax:**

7 INFO info-category [ *field-argument* ] [ *switches* ]

8 *info-category:*

9 AUTHOR | COMMENTS | CREATEDATE | EDITTIME | FILENAME | FILESIZE |  
10 | KEYWORDS | LASTSAVEDBY | NUMCHARS | NUMPAGES | NUMWORDS | PRINTDATE  
11 | REVNUM | SAVEDATE | SUBJECT | TEMPLATE | TITLE

12 A field of this kind is treated as if INFO was omitted and *info-category* was a *field-type name*.

#### 13 2.16.5.37 KEYWORDS

14 **Syntax:**

15 KEYWORDS [ *field-argument* ] [ *switch* ]

16 **Description:** Retrieves, and optionally sets, the document's keywords, as recorded in the Keywords element of  
17 the Core File Properties part or, if *field-argument* is present, the subject specified by *text* in *field-argument*.  
18 Specifying a *field-argument* shall change Keywords to *text*. The Keywords element contains a string of text  
19 whose format and semantics is unspecified by this Office Open XML Standard.

20 **Field Value:** The document's keywords

21 **Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or  
22 \\* Upper.

23 [*Example:* Consider the case in which the Keywords element is as follows:

24 <Keywords>switch, field, syntax</Keywords>

25 and the following field is updated:

26 KEYWORDS

27 The result is:

28 switch, field, syntax

29 Updating the following field:

30 KEYWORDS "field, formatting, switch, syntax"

causes the Subject element to take on the given value. *end example*]

### 2.16.5.38 LASTSAVEDBY

#### Syntax:

LASTSAVEDBY [ *switch* ]

**Description:** Retrieves the name of the user who last modified and saved the current document, as recorded in the LastModifiedBy element of the Core File Properties part.

**Field Value:** The name of the user who last modified and saved the current document.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper.

[*Example:* Consider the case in which the LastModifiedBy element is as follows:

```
<LastModifiedBy>Elizabeth Martin</LastModifiedBy>
```

and the following field is updated:

```
LASTSAVEDBY * Upper
```

the result might be:

```
ELIZABETH MARTIN
```

*end example*]

### 2.16.5.39 LINK

#### Syntax:

LINK *field-argument-1* *field-argument-2* [ *field-argument-3* ] [ *switches* ]

*field-argument-1:*  
*field-argument*

*field-argument-2:*  
*field-argument*

*field-argument-3:*  
*field-argument*

**Description:** For information copied from another application, this field links that information to its original source file using OLE. The application type of the link information is specified by *field-argument-1*. The name and location of the source file is specified by *field-argument-2*. *field-argument-3* specifies the portion of the source file that's being linked. [*Example:* If the source file is a SpreadsheetML document, the reference might be to a cell reference or a named range. For a WordprocessingML document, it might be a bookmark. *end example*]

**Field Value:** None.

1 **Switches:** Zero or more of the following *field-specific-switches*.

\a	Causes this field to be updated automatically.
\b	Inserts the linked object as a bitmap.
\d	Don't store the graphic data with the document, thus reducing the file size.
\f <i>field-argument</i>	Causes the linked object to update its formatting in a particular way, according to the integral value of <i>text</i> in this switch's <i>field-argument</i> . The possible values are: <ul style="list-style-type: none"> <li>• 0 Maintain the formatting of the source file</li> <li>• 1 Not supported</li> <li>• 2 Match the formatting of the destination document</li> <li>• 3 Not supported</li> <li>• 4 Maintain the formatting of the source file, if the source file is a SpreadsheetML workbook</li> <li>• 5 Match the formatting of the destination document, if the source file is a SpreadsheetML workbook</li> </ul>
\h	Inserts the linked object as HTML format text.
\p	Inserts the linked object as a picture.
\r	Inserts the linked object in rich-text format (RTF).
\t	Inserts the linked object in text-only format.
\u	Inserts the linked object as Unicode text.

2

3 [Example: The following example inserts a range of cells from a SpreadsheetML worksheet. The \a switch  
4 ensures that the information is updated in the WordprocessingML document whenever the worksheet is  
5 changed:

6 { LINK Excel.Sheet.8 "C:\\My Documents\\Profits.xls"  
7 "Sheet1!R1C1:R4C4" \a \p }

8 *end example]*

#### 9 2.16.5.40 LISTNUM

10 **Syntax:**

11 LISTNUM [ *field-argument* ] [ *switches* ]

12 **Description:** Computes the next integral number from the current or a specific series, or a specific number from  
13 the next or specific series. This field can be used anywhere in a paragraph, not just at its start. A LISTNUM field  
14 can be incorporated into numbering from a simple or outline-numbered list. *text* in *field-argument* is used to  
15 associates a LISTNUM field with a specific list. To emulate the behavior of the AUTONUM (§2.16.5.5),  
16 AUTONUMLGL (§2.16.5.6), and AUTONUMOUT (§2.16.5.7) fields, use the list names NumberDefault,  
17 LegalDefault, and OutlineDefault names, respectively. By default, the NumberFormat list is used.

1 The XML generated for a complex field implementation shall not have the optional field value stored.

2 There are nine levels of list, and, assuming \s 1 for each, the result style used for each is as follows:

1	1)	4	(1)	7	1.
2	a)	5	(a)	8	a.
3	iii)	6	(iii)	9	iii.

3

4 **Field Value:** The next integral number from the current or a specific series, or a specific number from the next or  
5 specific series.

6 **Switches:** Zero or more of the following *field-specific-switches*.

\l <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> is an integer that specifies the level in the list, overriding the default behavior of the field. If \l is omitted, for a new series, the default value is 3; otherwise, the current level is continued.
\s <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> is an integer that specifies the starting value for this field. If \s is omitted, for a new series, the default value is 1; otherwise, the current series numbering is continued.

7

8 [Example: When the following fields are updated:

9 We need to perform the following functions: LISTNUM NumberDefault \l 3 \s 1 Get  
10 approval for the project. LISTNUM Arrange for funding. LISTNUM Hire staff.

11 The results are:

12 We need to perform the following functions: i) Get approval for the  
13 project. ii) Arrange for funding. iii) Hire staff.

14 When the following fields are updated:

15 LISTNUM NumberDefault \l 3 \s 1  
16 LISTNUM  
17 LISTNUM NumberDefault  
18 LISTNUM NumberDefault \s 3  
19 LISTNUM  
20 LISTNUM NumberDefault \l 1  
21 LISTNUM  
22 LISTNUM NumberDefault \l 1 \s 1

```

1 LISTNUM LegalDefault \l 1 \s 1
2 LISTNUM LegalDefault
3 LISTNUM LegalDefault \l 1
4 LISTNUM LegalDefault \s 4
5 LISTNUM LegalDefault

```

6 The results are:

```

7 i)
8 ii)
9 iii)
10 iii)
11 iv)
12 2)
13 3)
14 1)
15 1.1.1.
16 1.1.2.
17 2.
18 2.1.4.
19 2.1.5.

```

20 *end example]*

#### 21 2.16.5.41 [MACROBUTTON](#)

##### 22 **Syntax:**

```

23 MACROBUTTON field-argument-1 field-argument-2
24 field-argument-1:
25 field-argument
26 field-argument-2:
27 field-argument

```

28 **Description:** Allows the macro or command designated by *text* in *field-argument-1* to be run. *text* in *field-*  
29 *argument-2* designates the text or graphic to appear as the "button" that is selected to run the macro or  
30 command.

31 **Field Value:** *field-argument-2*.

32 **Switches:** None.

#### 33 2.16.5.42 [MERGEFIELD](#)

##### 34 **Syntax:**

```

35 MERGEFIELD field-argument [switch]

```

**Description:** Retrieves the name of a data field designated by *text* in *field-argument* within the merge characters in a mail merge main document. When the main document is merged with the selected data source, information from the specified data field is inserted in place of the merge field.

The name designated by *text* shall match exactly the field name in the header record.

**Field Value:** The name of a data field designated by *text* in *field-argument*.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\b <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the text to be inserted before the MERGEFIELD field if the field is not blank.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> specifies the text to be inserted after the MERGEFIELD field if the field is not blank.
<code>\m</code>	Specifies that the MERGEFIELD field is a mapped field.
<code>\v</code>	Enables character conversion for vertical formatting.

[*Example:* Placing the following three MERGEFIELD fields together and using the \f switch ensures that the three fields have spaces between them, but only if the designated field information is present in the data source.

```
MERGEFIELD CoutesyTitle \f " " MERGEFIELD FirstName \f " "
MERGEFIELD LastName
```

*end example]*

#### 2.16.5.43 MERGEREC

##### Syntax:

*MERGEREC*

**Description:** Results in «MERGEREC». Use this in a mail merge to print the number of the corresponding merged data record in each resulting merged document. The number reflects the sequential order of the data records that were selected and possibly sorted for merging with the active main document. It does not indicate the actual order of the records as they occur in the physical data source. [*Note:* A personnel database might contain thousands of records. However, to send a form letter to employees who've reached their five-year anniversary with your company, you'd select as your data source only the records of those five-year employees, a much smaller set of records. To print a physical record number, you must include a record number field in the data source and insert the corresponding merge field in the main document. *end note]*

**Field Value:** «MERGEREC».

**Switches:** None.

[*Example:* The following example uses a MERGEREC field inside a formula to create unique invoice numbers. When the main document is merged with the data source, the number resulting from the MERGEREC field is added to the numbers representing the date and time the invoices are printed.

Invoice Number: = { PRINTDATE \@ "MMddyyyyHHmm" + MERGEREC }

The result might be:

Invoice Number for record 12, printed on Feb. 13, 2003 at 9:46:  
02132003094612

*end example]*

#### 2.16.5.44 MERGESEQ

##### Syntax:

*MERGESEQ*

**Description:** Counts the number of data records that were successfully merged with the main document. Merged records are numbered starting from 1 each time documents are merged. [*Note:* The number might be different from the value inserted by the MERGEREC field. *end note]*

**Field Value:** The number of data records that were successfully merged with the main document.

**Switches:** None.

[*Example:* Consider the case in which only records 10–25 are merged. The MERGESEQ number corresponding to the first data record merged is 1, even though the MERGEREC number for that data record is 10. *end example]*

#### 2.16.5.45 NEXT

##### Syntax:

*NEXT*

**Description:** Merges the next data record into the current resulting merged document, rather than starting a new merged document. [*Note:* This field is used when setting up a mailing label and envelope main document during a mail merge. *end note]*

**Field Value:** None.

**Switches:** None.

[*Example:* The following fields print three sets of names and phone numbers in each resulting merged document:

MERGEFIELD Name MERGEFIELD Phone  
NEXT MERGEFIELD Name MERGEFIELD Phone  
NEXT MERGEFIELD Name MERGEFIELD Phone

end example]

#### 2.16.5.46 NEXTIF

##### Syntax:

NEXTIF *Expression-1* *Operator* *Expression-2*

*Expression-1:*  
*expression*

*Expression-2:*  
*expression*

**Description:** Compares the values designated by *Expression-1* and *Expression-2* using the operator designated by *Operator*. If the comparison is true, the next data record is merged into the current merge document. (Merge fields that follow the NEXTIF in the main document are replaced by values from the next data record rather than the current data record.) If the comparison is false, the next data record is merged into a new merge document.

*Operator* can be any one of the six relational and equality operators specified for *operator* (§2.16.3.3).

A NEXTIF fields shall NOT be used in a footnote, an endnote, annotation, a header, a footer, or a data source. A NEXTIF field shall NOT be nested within any field.

**Field Value:** None.

**Switches:** None.

#### 2.16.5.47 NOTEREF

##### Syntax:

NOTEREF *field-argument* [ *switches* ]

**Description:** Inserts the mark of the footnote or endnote that is marked by the bookmark specified by *text* in *field-argument*.

**Field Value:** The mark of the footnote or endnote.

**Switches:** Zero or more of the following *field-specific-switches*.

\f	For a footnote, inserts the reference mark with the same character formatting as the Footnote Reference style. For an endnote, inserts the reference mark with the same character formatting as the Endnote Reference style.
\h	Inserts a hyperlink to the bookmarked endnote or footnote.
\p	Inserts the relative position of the footnote or endnote. If the NOTEREF field occurs before the bookmark, the result is "below". If the NOTEREF field occurs after the bookmark, the result is "above".

[*Example*: Consider the case in which a bookmark called F10 marks the footnote of interest. When the field

... (see note { NOTEREF F10 } ).

is updated, the result might be:

... (see note 5).

*end example*]

#### 2.16.5.48 NUMCHARS

##### Syntax:

NUMCHARS [ *switch* ]

**Description:** Retrieves the number of characters in the current document, as recorded in the Characters element of the Application-Defined File Properties part.

**Field Value:** The number of characters in the current document.

**Switches:** Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[*Example*: Consider the case in the document has 6,183 words and the following fields are updated:

NUMCHARS

NUMCHARS \# #,##0

the results are:

6183

6,183

*end example*]

#### 2.16.5.49 NUMPAGES

##### Syntax:

NUMPAGES [ *switch* ]

**Description:** Retrieves the number of pages in the current document, as recorded in the Pages element of the Application-Defined File Properties part.

**Field Value:** The number of pages in the current document.

**Switches:** Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[*Example*: Consider the case in the document has 19 pages and the following fields are updated:

NUMPAGES \# #,##0

NUMPAGES \\* OrdText

the results are:

19

nineteenth

*end example]*

#### 2.16.5.50 NUMWORDS

##### Syntax:

NUMWORDS [ *switch* ]

**Description:** Retrieves the number of words in the current document, as recorded in the Words element of the Application-Defined File Properties part.

**Field Value:** The number of words in the current document.

**Switches:** Zero or one *numeric-formatting-switch* or *general-formatting-switch*.

[*Example:* Consider the case in the document has 1,243 words and the following fields are updated:

NUMWORDS

NUMWORDS \# #,##0

the results are:

1243

1,243

*end example]*

#### 2.16.5.51 PAGE

##### Syntax:

PAGE [ *switches* ]

**Description:** Retrieves the number of the current page.

**Field Value:** The number of the current page.

**Switches:** Zero or more *general-formatting-switches*.

[*Example:* When the current page number is 19 and the following fields are updated:

PAGE

PAGE \\* ArabicDash

PAGE \\* ALPHABETIC

PAGE \\* roman

the results are:

19  
- 19 -  
S  
xix

*end example]*

#### 2.16.5.52 PAGeref

##### Syntax:

PAGeref *field-argument* [ *switches* ]

**Description:** Inserts the number of the page containing the bookmark specified by *text* in *field-argument* for a cross-reference.

**Field Value:** The number of the page containing the bookmark.

**Switches:** Zero or one of the *general-formatting-switches*, zero or one of the *numeric-formatting-switches*, and zero or more of the following *field-specific-switches*.

\h	Creates a hyperlink to the bookmarked paragraph.
\p	Causes the field to display its position relative to the source bookmark. If the PAGeref field is on the same page as the bookmark, it omits "on page #" and returns "above" or "below" only. If the PAGeref field is not on the same page as the bookmark, the string "on page #" is used.

[*Example:* Consider the case in which a bookmark called Worldpop1990 marks the table containing figures for 1990. When the field

The world population in 1991 was 5 billion; for 1990 figures,  
see the table { PAGeref Worldpop1990 \p }.

is updated, the position of the table is inserted in place of the field. The result is one of the following::

... see the table above.  
... see the table below.  
... see the table on page 27.

*end example]*

#### 2.16.5.53 PRINT

##### Syntax:

PRINT *field-argument* [ *switches* ]

**Description:** Sends the printer-specific control code characters specified by *text* in *field-argument* to the selected printer.

**Field Value:** None.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\p</code> <i>field-argument-1</i> <i>field-argument-2</i>	<p>Allows PostScript strings to be sent to the printer as native PostScript codes. PostScript commands embedded in the document are carried out in the order in which they are inserted.</p> <p>The y-coordinate space used for PostScript commands is as follows: The graphics origin (0,0) is in the lower-left corner of the page, and the positive directions are up and to the right. PostScript drawing instructions take place within a drawing rectangle. The graphics origin is translated to the lower-left corner of the drawing rectangle.</p> <p><i>text</i> in this switch's <i>field-argument-1</i> defines the drawing rectangle on which the subsequent PostScript instructions operate.</p> <p><i>text</i> in this switch's <i>field-argument-2</i> contains the PostScript instructions.</p>
--------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

2.16.5.54 PRINTDATE

**Syntax:**

PRINTDATE [ *switches* ]

**Description:** Retrieves the date and time on which the document was last printed, as recorded in the LastPrinted element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined. For a document that has never been printed, the date and time corresponds to 0000-00-00T00:00:00 local time and each text component is XXX.

**Field Value:** The date and time on which the document was last printed.

**Switches:** Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

<code>\h</code>	Use the Hijri/Lunar calendar.
<code>\s</code>	Use the Saka Era calendar.

[Example: Consider the case in which the LastPrinted element is as follows:

<LastPrinted>2006-01-06T19:58:00Z</LastPrinted>

and the following fields are updated in a US-English context that is UTC -5:

PRINTDATE  
PRINTDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"

the results are:

1/6/2006 2:58:00 PM

Friday, January 06, 2006 14:58:00

For a document that has never been printed, the result is:

0/0/0000 0:00:00 AM

XXX, XXX 00, 0000 00:00:00

*end example]*

#### 2.16.5.55 PRIVATE

##### Syntax:

PRIVATE

**Description:** Provides a private storage area. This field is used to store data for documents converted from other file formats. The field contains data needed for converting a document back to its original file format.

A PRIVATE field is formatted as hidden text.

**Field Value:** None.

**Switches:** None.

#### 2.16.5.56 QUOTE

##### Syntax:

QUOTE *field-argument*

**Description:** Retrieves the text specified by *text* in *field-argument*. This text can include any other fields except AUTONUM, AUTONUMLGL, AUTONUMOUT, and SYMBOL.

**Field Value:** The specified text.

**Switches:** One or more of the *date-and-time-formatting-switch*, *general-formatting-switch*, or *date-and-time-formatting-switches*, depending on the type of *field-argument*.

[*Example:* When the current month is January and the following field is updated:

Last month was QUOTE IF DATE \@ "M" = 1 "12" "= DATE \@ "M" - 1"/1/2000 \@ "MMMM".

the result is:

Last month was December.

*end example]*

## 2.16.5.57 RD

**Syntax:**

RD *field-argument* [ *switch* ]

**Description:** *field-argument* identifies a file to include when creating a table of contents, a table of authorities, or an index using a TOC (§2.16.5.75), TOA (§2.16.5.74), or INDEX field (§2.16.5.35). RD fields that reference a series of files must be in the same order as the files in the final document. If the location includes a long file name containing spaces, *field-argument* shall contain delimiting quotes. A single backslash in the file path shall be preceded directly by a backslash.

For a complex field implementation in XML the optional field-value storage is not needed.

**Field Value:** None.

**Switches:** One of the following *field-specific-switches*:

\p	Indicates that the path is relative to the current document.
----	--------------------------------------------------------------

[*Example:* The following fields inserted into one document create a table of contents that includes entries from the three referenced documents:

```
{ TOC }
{ RD C:\\Manual\\Chapters\\Chapter1.doc }
{ RD C:\\Manual\\Chapters\\Chapter2.doc }
{ RD C:\\Manual\\Chapters\\Chapter3.doc }
```

*end example]*

## 2.16.5.58 REF

**Syntax:**

[ REF ] *field-argument* [ *switches* ]

**Description:** Inserts the text or graphics represented by the bookmark specified by *text* in *field-argument*. The bookmark shall be defined in the current document. Provided the bookmark name is not exactly the same as a field name, the REF prefix can be omitted. If the text marked by the bookmark contains a paragraph mark, the text preceding the REF field assumes the formatting of the paragraph in the bookmark.

**Field Value:** The specified text or graphics.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper, and zero or one of the following *field-specific-switches*.

\d <i>field-argument</i>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that is used to separate sequence numbers and page numbers.
\f	Increments footnote, endnote, and annotation numbers that are marked by the bookmark, and inserts the corresponding footnote,

	endnote, and comment text.
\h	Creates a hyperlink to the bookmarked paragraph.
\n	For a referenced paragraph, causes the field result to have the entire paragraph number without trailing periods. No information about prior levels is displayed unless it is included as part of the current level.
\p	Causes the field result to contain the position relative to the source bookmark using the word "above" or "below." If the REF field appears in the document before the bookmark, it evaluates to "below". If the REF field appears after the bookmark, it evaluates to "above". If the REF field appears within the bookmark, an error is returned. This switch can also be used in conjunction with the \n, \r, and \w switches, in which case, "above" or "below" is appended to the end of the field result.
\r	Inserts the entire paragraph number of the bookmarked paragraph in relative context—or relative to its position in the numbering scheme —without trailing periods.
\t	Causes the REF field to suppress non-delimiter or non-numerical text when used in conjunction with the \n, \r, or \w switch.
\w	Inserts the paragraph number of the bookmarked paragraph in full context from anywhere in the document.

[*Example:* The following field

```
REF _Ref116788778 \r \h
```

makes a hyperlink reference. This kind of field is commonly used, to indicate forward references within a document. *end example*]

#### 2.16.5.59 REVNUM

##### **Syntax:**

```
REVNUM
```

**Description:** Retrieves the document's revision number (which indicates the number of times the document has been saved), as recorded in the Revision element of the Core File Properties part.

**Field Value:** The document's revision number.

**Switches:** None.

[*Example:* Consider the case in which the Revision element is as follows:

```
<Revision>11</Revision>
```

and the following field is updated:

REVNUM

The result is:

11

*end example]*

## 2.16.5.60 SAVEDATE

### Syntax:

SAVEDATE [ *switches* ]

**Description:** Retrieves the date and time on which the document was last saved, as recorded in the DateModified element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined. For a document that has never been saved, the date and time corresponds to 0000-00-00T00:00:00 local time and each text component is XXX.

**Field Value:** The date and time on which the document was last saved.

**Switches:** Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switches*.

\h	Use the Hijri/Lunar calendar.
\s	Use the Saka Era calendar.

[*Example:* Consider the case in which the DateModified element is as follows:

<DateModified>2006-01-06T20:15:00Z</DateModified>

and the following fields are updated in a US-English context that is UTC -5:

SAVEDATE

SAVEDATE \@ "dddd, MMMM dd, yyyy HH:mm:ss"

the results are:

1/6/2006 3:15:00 PM

Friday, January 06, 2006 15:15:00

For a document that has never been saved, the result is:

0/0/0000 0:00:00 AM

XXX, XXX 00, 0000 00:00:00

*end example]*

### 2.16.5.61 SECTION

**Syntax:**

SECTION [ *switches* ]

**Description:** Retrieves the number of the current section.

**Field Value:** The number of the current section.

**Switches:** Zero or more *general-formatting-switches*.

[*Example:* When the current section number is 19 and the following fields are updated:

SECTION

SECTION \\* ArabicDash

SECTION \\* ALPHABETIC

SECTION \\* roman

the results are:

19

- 19 -

S

xix

*end example]*

### 2.16.5.62 SECTIONPAGES

**Syntax:**

SECTIONPAGES [ *switches* ]

**Description:** Retrieves the number of the current page within the current section.

**Field Value:** The number of the current page within the current section.

**Switches:** Zero or more *general-formatting-switches*.

[*Example:* When the current page number within the current section is 19 and the following fields are updated:

SECTIONPAGES

SECTIONPAGES \\* ArabicDash

SECTIONPAGES \\* ALPHABETIC

SECTIONPAGES \\* roman

the results are:

19

- 19 -

S

xix

*end example]*

### 2.16.5.63 SEQ

#### Syntax:

SEQ *identifier* [*field-argument*] [*switches*]

**Description:** Sequentially numbers chapters, tables, figures, and other user-defined lists of items in a document. If an item and its SEQ field are added, deleted, or moved, updating the remaining SEQ fields in the document reflects the new sequence. A SEQ field in a header, footer, annotation, or footnote shall NOT affect the sequence numbering that results from SEQ fields in the document text.

[*Note:* The LISTNUM field also produces automatic numbering and may be a better alternative when creating a complex numbered list. *end note]*

*identifier* is the name assigned to the series of items that are to be numbered. [*Example:* *identifier* might be Equation, Figure, Table, or Thing, as the user deems appropriate for a caption. *end example]* *identifier* shall start with a Latin letter and shall consist of no more than 40 Latin letters, Arabic digits, and underscores. (See the TOC field (§2.16.5.75) switches \c and \s for uses of *identifier*.)

*text* in *field-argument* specifies a bookmark name that refers to an item elsewhere in the document rather than in the current location.

**Field Value:** The next number in the sequence.

**Switches:** Zero or one of the *numeric-formatting-switches*, or zero or more of the following *field-specific-switches*. If no *numeric-formatting-switch* is present, \\* Arabic is used.

\c	Repeats the closest preceding sequence number. [ <i>Note:</i> This is useful for inserting chapter numbers in headers or footers. <i>end note]</i>
\h	Hides the field result unless a <i>general-formatting-switch</i> is also present. [ <i>Note:</i> This switch can be used to refer to a SEQ field in a cross-reference without printing the number. <i>end note]</i>
\n	Inserts the next sequence number for the specified item. This is the default.
\r <i>field-argument</i>	Resets the sequence number to the integer number specified by <i>text</i> in this switch's <i>field-argument</i> .
\s <i>field-argument</i>	Resets the sequence number to the built-in (integer) heading level specified by <i>text</i> in this switch's <i>field-argument</i> .

[Example: When the following fields are updated:

```
SEQ Figure
SEQ Figure * roman
SEQ Figure \n
SEQ Figure \c : ...
SEQ Figure \h : ...
SEQ Figure
SEQ Figure \r 1
SEQ Figure
```

the results are:

```
Figure 1
Figure ii
Figure 3
Figure 3: ...
Figure : ...
Figure 5
Figure 10
Figure 11
```

*end example]*

#### 2.16.5.64 SET

##### Syntax:

SET *field-argument-1 field-argument-2*

*field-argument-1:*  
*field-argument*

*field-argument-2:*  
*field-argument*

**Description:** Defines the bookmark name specified by *field-argument-1* to represent the information specified by *field-argument-2*.

**Field Value:** None.

**Switches:** None.

[Example: Consider the following:

```
SET EnteredBy "Paul Smith"
SET UnitCost 25.00
SET Quantity FILLIN "Enter number of items ordered:"
SET SalesTax 10%
```

```

1 SET TotalCost = (UnitCost * Quantity) + ((UnitCost * Quantity) * SalesTax)
2 Total cost: TotalCost \# "$#0.00"
3 Thank you for your order,
4 EnteredBy

```

*end example]*

#### 2.16.5.65 SKIPIF

##### Syntax:

*SKIP Expression-1 Operator Expression-2*

*Expression-1:*

*expression*

*Expression-2:*

*expression*

**Description:** Compares the values designated by *Expression-1* and *Expression-2* using the operator designated by *Operator*. If the comparison is true, SKIPIF cancels the current merge document, moves to the next in the data source, and starts a new merge document. If the comparison is false, the current merge document is continued.

*Operator* can be any one of the six relational and equality operators specified for *operator* (§2.16.3.3).

**Field Value:** None.

**Switches:** None.

[*Example:* Inserted into a mail merge main document, the following field examines the contents of the Order field for the current data record. If the field contains a number less than 100, no merged document is produced for that data record.

```
SKIPIF MERGEFIELD Order < 100
```

*end example]*

#### 2.16.5.66 STYLeref

##### Syntax:

*STYLeref field-argument [ switches ]*

**Description:** Inserts the nearest piece of text prior to this field that is formatted by the style whose name is specified by *text* in *field-argument*. The style can be a paragraph style or a character style.

When this field is used in a header or footer, it results in the first or the last text formatted with the specified style on the current page, allowing for dictionary-style headers or footers.

The location at which a STYLeref field is inserted determines the direction searched for the style, as follows:

- In document text, by default, the search goes backward from the STYLeref field. If the style isn't found, the search goes forward from the STYLeref field.
- In footnotes, annotations, and endnotes, the search goes backward from the footnote, annotation, or endnote reference mark. If the style isn't found, the search goes forward from the reference mark.
- In headers and footers in a printed document, the search is applied to the current page, by default, from top to bottom, for the specified style. If the style isn't found, the search goes from the top of the page to the beginning of the document, and then from the bottom of the page to the end of the document. If the \l switch is used, the search goes from the bottom of the page to the beginning and then to the end of the document.
- In headers and footers in an electronic document, the search goes on in the section that contains the STYLeref field, from the beginning, for the specified style. If the style isn't found, the search goes from the end of the section to the end of the document.

**Field Value:** The nearest piece of text prior to this field that is formatted by the style whose name is specified by *text* in *field-argument*.

**Switches:** Zero or more of the following *field-specific-switches*.

\l	Inserts the nearest text following the field.
\n	Inserts the paragraph number of the referenced paragraph exactly as it appears in the document.
\p	Inserts the relative position of the referenced paragraph as being "above" or "below".
\r	Inserts the paragraph number of the referenced paragraph exactly in relative context.
\t	When used with the \n, \r, or \w switch, causes non-delimiter and non-numerical text to be suppressed.
\w	Inserts the paragraph number of the referenced paragraph in full context, from anywhere in the document.

[*Example:* When the following field is inserted in a header, it displays the contents of the first paragraph formatted with the style "Heading 3" on the current page:

On this page: { STYLeref "Heading 3" }

To print the first and last names that appear on each page in a membership directory, for example, apply a character style called Last Name to each member's last name. Then insert the following fields in the header:

{ STYLeref "Last Name" } — { STYLeref "Last Name" \l }

*end example]*

### 2.16.5.67 SUBJECT

#### Syntax:

SUBJECT [ *field-argument* ] [ *switch* ]

**Description:** Retrieves, and optionally sets, the document's subject, as recorded in the Subject element of the Core File Properties part or, if *field-argument* is present, the subject specified by *text* in *field-argument*. Specifying a *field-argument* shall change Subject to *text*.

**Field Value:** The document's subject.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper.

[*Example:* Consider the case in which the Title element is as follows:

<Subject>A specification for fields</Subject>

and the following field is updated:

SUBJECT

The result is:

A specification for fields

Updating the following field:

SUBJECT "A specification for WordprocessingML Fields"

causes the Subject element to take on the given value. *end example*]

### 2.16.5.68 SYMBOL

#### Syntax:

SYMBOL *field-argument* [ *switches* ]

**Description:** Retrieves the character whose code point value is specified in decimal or hexadecimal (by using a leading 0x or 0X) by *text* in *field-argument*. The formatting switches over ride any formatting applied directly to the result.

The XML generated for a complex field implementation shall not have the optional field value stored.

**Field Value:** The specified character.

**Switches:** Zero or more of the following *field-specific-switches*.

\a	Interprets <i>text</i> in <i>field-argument</i> as the value of an ANSI character.
\f <i>field-argument</i>	Interprets <i>text</i> in the switch's <i>field-argument</i> as the name of the font from

	which the character whose value is specified by <i>text</i> in the field's <i>field-argument</i> . By default, the font used is that for the current text run.
\h	Inserts the symbol without affecting the line spacing of the paragraph. If large symbols are inserted with this switch, text above the symbol may be overwritten.
\j	Interprets <i>text</i> in <i>field-argument</i> as the value of a SHIFT-JIS character.
\s <i>field-argument</i>	Interprets <i>text</i> in the switch's <i>field-argument</i> as the integral font size in points.
\u	Interprets <i>text</i> in <i>field-argument</i> as the value of a Unicode character.

1

2 [Example: Consider the case in which the following fields are updated:

3 SYMBOL 65  
4 SYMBOL 66 \a  
5 SYMBOL 67 \u  
6 SYMBOL 0x20ac \u  
7 SYMBOL 68  
8 SYMBOL 68 \f Symbol  
9 SYMBOL 40 \f Wingdings \s 24

10 the results are:

11 A  
12 B  
13 C  
14 €  
15 D  
16 Δ  
17 ☎

18 end example]

19 2.16.5.69 TA

20 Syntax:

21 TA [ switches ]

22 **Description:** Defines the text and page number for a table of authorities entry, which is used by a TOA field  
23 (\$2.16.5.74).

24 **Field Value:** None.

25 **Switches:** Zero or one of the following *field-specific-switches*.

<code>\b</code>	Applies bold formatting to the page number for the entry. If the table of authorities style for the entry already has bold formatting, <code>\b</code> removes it.
<code>\c <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the integral entry category, which is a number that corresponds to the order of categories. The number determines how citations are grouped in tables of authorities. If <code>\c</code> is omitted, category 1 is the default.
<code>\i</code>	Applies italic formatting to the page number for the entry. If the table of authorities' style for the entry already has italic formatting, <code>\i</code> removes it.
<code>\l <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> defines the long citation for the entry.
<code>\r <i>field-argument</i></code>	Inserts as the entry's page number the range of pages marked by the bookmark specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\s <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> defines the short citation for the entry.

[Example: Given the following fields occurring on page 2:

```
TA \l "Hotels v. Leisure Time" \c 2
TA \l "Baldwin v. Alberti, 58 Wn. 2d 243 (1961)"
\s "Baldwin v. Alberti" \c 1 \b
```

the table of authorities produced by INDEX \e "tab" \c "1" \z "1033" is:

Cases

Baldwin v. Alberti, 58 Wn. 2d 243 (1961)..... 2

Statutes

Hotels v. Leisure Time..... 2

*end example]*

## 2.16.5.70 TC

### Syntax:

TC *field-argument* [ *switches* ]

**Description:** Defines the text and page number for a table of contents (including a table of figures) entry, which is used by a TOC field (§2.16.5.75). The text of the entry is *text* in *field-argument*.

**Field Value:** None.

**Switches:** Zero or one of the following *field-specific-switches*.

<code>\f</code> <i>field-argument</i>	The type of items collected in a particular contents list. Use a unique Type identifier (typically a letter from A-Z) for each type of list. For example, to build a list of illustrations, mark each illustration with a field such as TC "Illustration 1" \f i , where i indicates only illustration entries.  If no type is specified, the entry is listed in a table of contents.
<code>\l</code> <i>field-argument</i>	The level of the TC entry. [Example: The field TC "Entering Data" \l 4 marks a level-4 entry, and applies the built-in style TOC 4 to that entry in the table of contents. end example]  If no level is specified, level 1 is assumed.
<code>\n</code>	Omits the page number for the entry.

#### 2.16.5.71 TEMPLATE

##### Syntax:

TEMPLATE [ *switch* ]

**Description:** Retrieves the disk file name of the template used by the current document.

**Field Value:** The disk file name of the template used by the current document.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper, and zero or one of the following *field-specific-switches*.

<code>\p</code>	Include the full file path name.
-----------------	----------------------------------

[Example: Consider the case in which the following fields are updated:

TEMPLATE \\* Upper

TEMPLATE \p

the results might be:

NORMAL.DOTM

C:\Templates\Normal.dotm

end example]

#### 2.16.5.72 TIME

##### Syntax:

TIME [ *switch* ]

**Description:** Retrieves the current date and time. The Gregorian calendar is always used. By default, the *date-and-time-formatting-switch* used is implementation-defined.

**Field Value:** The current date and time.

**Switches:** Zero or one *date-and-time-formatting-switch*.

[*Example:* Consider the case in which the following fields are updated on the given date and time:

TIME

TIME \@ "dddd, MMMM dd, yyyy HH:mm:ss"

the results are:

1:59 PM

Friday, January 06, 2006 13:59:421/5/2006

*end example]*

[*Note:* For some *date-and-time-formatting-switches*, the DATE (§2.16.5.18) and TIME fields can produce the same result. *end note]*

### 2.16.5.73 TITLE

**Syntax:**

TITLE [ *field-argument* ] [ *switch* ]

**Description:** Retrieves, and optionally sets, the document's title, as recorded in the Title element of the Core File Properties part or, if *field-argument* is present, the name specified by *text* in *field-argument*. Specifying a *field-argument* shall change Title to *text*.

**Field Value:** The document's title.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper.

[*Example:* Consider the case in which the Title element is as follows:

<Title>My Life's Story</Title>

and the following field is updated:

TITLE

The result is:

My Life's Story

Updating the following field:

TITLE "My Life, the Fantasy" \\* Upper

causes the Title element to take on the value My Life, the Fantasy while the result is:

1 MY LIFE THE FANTASY

2 *end example]*

### 3 2.16.5.74 TOA

#### 4 **Syntax:**

5 TOA [ *switches* ]

6 **Description:** Builds a table of authorities (that is, a list of the references in a legal document, such as references  
7 to cases, statutes, and rules, along with the numbers of the pages on which the references appear) using the  
8 entries specified by TA fields (§2.16.5.69).

9 **Field Value:** The table of authorities.

10 **Switches:** Zero or more of the following *field-specific-switches*.

<code>\b <i>field-argument</i></code>	Includes entries only from the portion of the document marked by the bookmark specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\c <i>field-argument</i></code>	<i>Includes the entries whose integral category is that specified by text in this switch's field-argument.</i>
<code>\d <i>field-argument</i></code>	Used in conjunction with \s to specify the character sequence that separates the sequence numbers and page numbers. If \d is omitted, a hyphen (-) is used.
<code>\e <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that separates a table of authorities entry and its page number. If \e is not specified, a tab stop with leader dots is used.
<code>\f</code>	Removes the formatting of the entry text in the document from the entry in the table of authorities.
<code>\g <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that separates the pages in a page range. If \g is omitted, an en dash (–) is used.
<code>\h</code>	Includes the category heading for the entries in a table of authorities.
<code>\l <i>field-argument</i></code>	<i>text</i> in this switch's <i>field-argument</i> specifies the character sequence that separates multiple page references. If \l is omitted, a comma (,) and space are used.
<code>\p</code>	Replaces five or more different page references to the same authority with "passim", which is used to indicate that a word or passage occurs frequently in the work cited.
<code>\s <i>field-argument</i></code>	Includes a case or section number before the page number. The entry shall be numbered with a SEQ field (§2.16.5.63), and <i>text</i> in this switch's <i>field-argument</i> shall match the identifier in the SEQ field.

[Example: See TA (§2.16.5.69). *end example*]

## 2.16.5.75 TOC

### Syntax:

TOC [ *switches* ]

**Description:** Builds a table of contents (which can also be a table of figures) using the entries specified by TC fields (§2.16.5.70), their heading levels, and specified styles, and inserts that table at this place in the document. Each table entry is a separate paragraph.

**Field Value:** The table of contents.

**Switches:** Zero or more of the following *field-specific-switches*.

<code>\a <i>field-argument</i></code>	Includes captioned items, but omits caption labels and numbers. The identifier designated by <i>text</i> in this switch's <i>field-argument</i> corresponds to the caption label. Use <code>\c</code> to build a table of captions with labels and numbers.
<code>\b <i>field-argument</i></code>	Includes entries only from the portion of the document marked by the bookmark named by <i>text</i> in this switch's <i>field-argument</i> .
<code>\c <i>field-argument</i></code>	Includes figures, tables, charts, and other items that are numbered by a SEQ field (§2.16.5.63). The sequence identifier designated by <i>text</i> in this switch's <i>field-argument</i> , which corresponds to the caption label, shall match the identifier in the corresponding SEQ field.
<code>\d <i>field-argument</i></code>	When used with <code>\s</code> , the <i>text</i> in this switch's <i>field-argument</i> defines the separator between sequence and page numbers. The default separator is a hyphen (-).
<code>\f <i>field-argument</i></code>	Includes only those TC fields whose identifier exactly matches the <i>text</i> in this switch's <i>field-argument</i> (which is typically a letter).
<code>\h</code>	Makes the table of contents entries hyperlinks.
<code>\l <i>field-argument</i></code>	Includes TC fields that assign entries to one of the levels specified by <i>text</i> in this switch's <i>field-argument</i> as a range having the form <i>startLevel-endLevel</i> , where <i>startLevel</i> and <i>endLevel</i> are integers, and <i>startLevel</i> has a value equal-to or less-than <i>endLevel</i> . TC fields that assign entries to lower levels are skipped.
<code>\n <i>field-argument</i></code>	Without <i>field-argument</i> , omits page numbers from the table of contents. Page numbers are omitted from all levels unless a range of entry levels is specified by <i>text</i> in this switch's <i>field-argument</i> . A range is specified as for <code>\l</code> .
<code>\o <i>field-argument</i></code>	Uses paragraphs formatted with all or the specified range of built-in heading styles. Headings in a style range are specified by <i>text</i> in this switch's <i>field-argument</i> using the notation specified as for <code>\l</code> , where each integer corresponds to the style with a style ID of

	HeadingX (e.g. 1 corresponds to <code>Heading1</code> ). If no heading range is specified, all heading levels used in the document are listed.
<code>\p field-argument</code>	<i>text</i> in this switch's <i>field-argument</i> specifies a sequence of characters that separate an entry and its page number. The default is a tab with leader dots.
<code>\s field-argument</code>	For entries numbered with a SEQ field (§2.16.5.63), adds a prefix to the page number. The prefix depends on the type of entry. <i>text</i> in this switch's <i>field-argument</i> shall match the identifier in the SEQ field.
<code>\t field-argument</code>	Uses paragraphs formatted with styles other than the built-in heading styles. <i>text</i> in this switch's <i>field-argument</i> specifies those styles as a set of comma-separated doublets, with each doublet being a comma-separated set of style name and table of content level. <code>\t</code> can be combined with <code>\o</code> .
<code>\u</code>	Uses the applied paragraph outline level.
<code>\w</code>	Preserves tab entries within table entries.
<code>\x</code>	Preserves newline characters within table entries.
<code>\z</code>	Hides tab leader and page numbers in Web layout view.

1

2 [Example: The index produced using the corresponding set of index entries and the field TOC `\o "3-3" \h`  
3 `\z \t "Heading 1,1,Heading 2,2,Appendix 1,1,Appendix 2,2,Unnumbered Heading,1"` is:

15	<i>end example]</i>	

### 2.16.5.76 USERADDRESS

#### Syntax:

USERADDRESS [ *field-argument* ] [ *switch* ]

**Description:** Retrieves the current user's postal address or, if *field-argument* is present, the address specified by *text* in *field-argument*. Specifying a field-argument shall not change the address of the current user.

**Field Value:** A postal address.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper.

[*Example:* Given the current user's address, the following fields:

USERADDRESS

USERADDRESS "10 Top Secret Lane, Chiswick" \\* Upper

produce results of:

114 Rue du Rhône

CH-1204 Geneva

Switzerland

10 TOP SECRET LANE, CHISWICK

*end example*]

### 2.16.5.77 USERINITIALS

#### Syntax:

USERINITIALS [ *field-argument* ] [ *switch* ]

**Description:** Retrieves the current user's initials or, if *field-argument* is present, the initials specified by *text* in *field-argument*. Specifying a field-argument shall not change the initials of the current user.

**Field Value:** The set of initials.

**Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or \\* Upper.

[*Example:* Given a current user with initials "DW", the following fields:

USERNAME \\* Lower

USERNAME "JaJ"

USERNAME "jaj" \\* Upper

produce results of:

1 dw  
2 JaJ  
3 JAJ

4 *end example]*

#### 5 2.16.5.78 USERNAME

##### 6 **Syntax:**

7 USERNAME [ *field-argument* ] [ *switch* ]

8 **Description:** Retrieves the current user's name or, if *field-argument* is present, the name specified by *text* in  
9 *field-argument*. Specifying a field-argument shall not change the name of the current user.

10 **Field Value:** The name.

11 **Switches:** One of the following *general-formatting-switches*: \\* Caps, \\* FirstCap, \\* Lower, or  
12 \\* Upper.

13 [Example: Given a current user of "David Williams", the following fields:

14 USERNAME \\* Lower  
15 USERNAME "John Jones"  
16 USERNAME "Mary Smith" \\* Upper

17 produce results of:

18 david williams  
19 John Jones  
20 MARY SMITH

21 *end example]*

#### 22 2.16.5.79 XE

##### 23 **Syntax:**

24 XE *field-argument* [ *switches* ]

25 **Description:** Defines the text and page number for an index entry, which is used by an INDEX field (§2.16.5.35).  
26 The text of the entry is *text* in *field-argument*. To indicate a subentry, the main entry text and the subentry text  
27 shall be separated by a colon (:). Subentries beyond one level are permitted.

28 **Field Value:** None.

29 **Switches:** Zero or one of the following *field-specific-switches*.

\b	Applies bold formatting to the entry's page number. However, if the index style for that entry is already bold, this switch removes
----	-------------------------------------------------------------------------------------------------------------------------------------

	that formatting for that entry.
<code>\f <i>field-argument</i></code>	The <i>text</i> in this switch's <i>field-argument</i> defines an index entry type. If an INDEX field has the same <code>\f</code> switch and <i>field-argument</i> , this entry is included in the resulting index; otherwise, it is excluded.
<code>\i</code>	Applies italic formatting to the entry's page number. However, if the index style for that entry is already italic, this switch removes that formatting for that entry.
<code>\r <i>field-argument</i></code>	Instead of the entry's page number, uses the range of pages marked by the bookmark specified by <i>text</i> in this switch's <i>field-argument</i> .
<code>\t <i>field-argument</i></code>	Uses <i>text</i> from <i>field-argument</i> in place of a page number. [Note: Useful for "See ..." or "See also ..." entries. <i>end note</i> ]
<code>\y <i>field-argument</i></code>	Specifies that the <i>text</i> from <i>field-argument</i> defines the yomi (first phonetic character for sorting indexes) for the index entry.

1

2 [Example: Given the following fields spread over a series of pages, and a multi-page bookmark called

3 OOXMLPageRange:

4 XE "Office Open XML" \b

5 XE "syntax" \f "Introduction"

6 XE "behavior:implementation-defined" \b

7 XE "Office Open XML" \i

8 XE "behavior:implementation-defined:documenting" \b

9 XE "grammar" \f "Introduction" \b

10 XE "Office Open XML"

11 XE "item: package-relationship" \t "See package-relationship item"

12 XE "XML" \r OOXMLPageRange

13 XE "grammar" \f "Introduction"

14 XE "production" \f "Introduction"

15 the index produced by INDEX \e "tab" \c "1" \z "1033" is:

16 behavior

17 implementation-defined ..... **2**

18 documenting ..... **3**

19 item

20 package-relationship ..... See package-relationship item

21 Office Open XML ..... **2, 3, 4**

1 XML ..... 1–4

2 and that produced by INDEX \f "Introduction" \e "tab" \c "1" \z "1033" is:

3 grammar ..... 3, 5

4 production ..... 5

5 syntax ..... 2

6 *end example]*

## 7 **2.16.6 calcOnExit (Recalculate Fields When Current Field Is Modified)**

8 This element specifies that the current contents of all fields within the current WordprocessingML document  
 9 shall be recalculated from their field codes when the contents of the parent form field are modified. [*Note*: It is  
 10 at the discretion of an application to determine the scope of a single modification, for example, when the user  
 11 moves the insertion point in a user interface, or after each keystroke, etc. *end note*]

12 If this element is omitted, then modification of the contents of the current field shall not result in all fields in the  
 13 current document being recalculated.

14 [*Example*: Consider the following WordprocessingML fragment for the contents of two fields in a document:

```

15 <w:bookmarkStart w:name="Text1" ... />
16 <w:fldSimple w:instr="FORMFIELDTEXT">
17 <w:ffData>
18 <w:calcOnExit/>
19 ...
20 </w:ffData>
21 <w:r>
22 <w:t>1</w:t>
23 </w:r>
24 </w:fldSimple>
25 <w:bookmarkEnd w:name="Text1" ... />
26 <w:fldSimple w:instr="=Text1+10">
27 <w:r>
28 <w:t>11</w:t>
29 </w:r>
30 </w:fldSimple>

```

31 The first field above (the text form field) has a current value of 1, but also has the calcOnExit element present  
 32 (therefore inheriting its default attribute value of true). This means that if the value of this form field is changed  
 33 to 10, that all fields in the document shall automatically be updated, resulting in the second field's value being  
 34 automatically changed to 20. *end example]*

Parent Elements
ffData (§2.16.17)

1

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

## 6 2.16.7 checkBox (Checkbox Form Field Properties)

7 This element specifies a set of properties which shall be associated with the parent FORMCHECKBOX checkbox  
8 form field (§2.16.5.26) within the document.

9 If the parent form field is not a checkbox (i.e. its field code does not have a value of FORMCHECKBOX), then these  
10 properties may be ignored.

11 [Example: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
12 <w:ffData>
13 <w:checkBox>
14 <w:size w:val="20" />
15 <w:checked w:val="true" />
16 </w:checkBox>
17 </w:ffData>
```

18 The checkBox element specifies that it contains a set of properties for the parent checkbox form field. In this  
19 case, these properties specify that the size of the checkbox shall be exactly 10 points via the size element

(§2.16.30), and that the current state of the checkbox shall be checked via the checked element (§2.16.8). *end example]*

Parent Elements
ffData (§2.16.17)

Child Elements	Subclause
checked (Checkbox Form Field State)	§2.16.8
default (Default Checkbox Form Field State)	§2.16.12
size (Checkbox Form Field Size)	§2.16.30
sizeAuto (Automatically Size Form Field)	§2.16.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFCheckBox">
 <sequence>
 <choice>
 <element name="size" type="CT_HpsMeasure"/>
 <element name="sizeAuto" type="CT_OnOff"/>
 </choice>
 <element name="default" type="CT_OnOff" minOccurs="0"/>
 <element name="checked" type="CT_OnOff" minOccurs="0"/>
 </sequence>
</complexType>
```

## 2.16.8 checked (Checkbox Form Field State)

This element specifies the current state for a checkbox form field. This value shall be used to specify the current value for a checkbox as explicitly chosen for that checkbox, as opposed its default value, which is specified using the default element (§2.16.12).

If this element is omitted, then the parent form field checkbox has no state, and its state shall be determined based on the value of the default element in the checkbox form field properties.

[*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
 <w:checkBox>
 <w:checked w:val="true" />
 </w:checkBox>
</w:ffData>
```

The checked element specifies that the current state of the checkbox is checked (via an attribute value of true). *end example]*

Parent Elements
-----------------

1

Parent Elements
checkBox (§2.16.7)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

## 6 2.16.9 ddList (Drop-Down List Form Field Properties)

7 This element specifies a set of properties which shall be associated with the parent FORMDROPDOWN drop-down  
8 list form field (§2.16.5.27) within the document.

9 If the parent form field is not a drop-down list (i.e. its field code does not have a value of FORMDROPDOWN), then  
10 these properties may be ignored.

11 [Example: Consider the following WordprocessingML fragment for the properties of a drop-down list form field:

```
12 <w:ffData>
13 <w:ddList>
14 <w:listEntry w:val="One" />
15 <w:listEntry w:val="Two" />
16 <w:listEntry w:val="Three" />
17 </w:ddList>
18 </w:ffData>
```

The ddList element specifies that it contains a set of properties for the parent drop-down list form field. In this case, these properties specify that the drop-down list shall contain three entries of One, Two, and Three via the listEntry elements (§2.16.26). *end example*

Parent Elements
ffData (§2.16.17)

Child Elements	Subclause
default (Default Drop-Down List Item Index)	§2.16.11
listEntry (Drop-Down List Entry)	§2.16.26
result (Drop-Down List Selection)	§2.16.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFDDLlist">
 <sequence>
 <element name="result" type="CT_DecimalNumber" minOccurs="0"/>
 <element name="default" type="CT_DecimalNumber" minOccurs="0"/>
 <element name="listEntry" type="CT_String" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 2.16.10 default (Default Text Box Form Field String)

This element specifies the default string for the parent text box form field. This string is the content which shall be displayed in the document story within this form field if its current run contents are empty (i.e. there is not actual content within the text box). If the type (§2.16.34) of the current form field is calculation, then this string shall hold the calculation to be performed.

If this element is omitted, then the current text box form field shall not have a default value.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
 <w:ffData>
 <w:textInput>
 <w:default w:val="No content."/>
 </w:textInput>
 </w:ffData>
</w:fldSimple>
```

The default element specifies the default value of the text box form field to be No content. Since the form field does not contain any value, this is the content which shall be displayed when the contents of the form field are displayed by an application. *end example*

Parent Elements
textInput (§2.16.33)

1

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt;   ... &lt;/w:sdtPr&gt;</pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <complexType name="CT_String">
4 <attribute name="val" type="ST_String" use="required"/>
5 </complexType>

6 **2.16.11 default (Default Drop-Down List Item Index)**

7 This element specifies the zero-based index of the default entry for the parent drop-down list form field. This  
8 index value is the value within the drop-down list which shall be displayed in the document story within this  
9 form field if no element is selected (i.e. the result element (§2.16.29) is omitted).

10 If this element is omitted, then the current drop-down list form field shall have a default value of 0 (its first  
11 entry). If the attribute value references an index value which does not exist (i.e. a negative number or a number  
12 that exceeds the number of items in the drop-down list), then this value may be ignored and the current drop-  
13 down list form field shall have a default value of 0 (its first entry).

[*Example:* Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
 <w:ffData>
 <w:ddList>
 <w:default w:val="1" />
 <w:listEntry w:val="One" />
 <w:listEntry w:val="Two" />
 <w:listEntry w:val="Three" />
 </w:ddList>
 </w:ffData>
</w:fldSimple>
```

The default element specifies the index of the default value of the drop-down list form field to be 1. Since the form field does not contain a result element, this is the index of the content which shall be displayed when the contents of the form field are displayed by an application. In this case, the resulting default value text is Two. *end example]*

#### Parent Elements

ddList (§2.16.9)

#### Attributes

#### Description

val (Decimal Number Value)

Specifies that the contents of this attribute will contain a decimal number.

The contents of this decimal number are interpreted based on the context of the parent XML element.

[*Example:* Consider the following numeric WordprocessingML property of type ST\_DecimalNumber:

```
<w:... w:val="1512645511" />
```

The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. *end example]*

The possible values for this attribute are defined by the ST\_DecimalNumber simple type (§2.18.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DecimalNumber">
 <attribute name="val" type="ST_DecimalNumber" use="required"/>
</complexType>
```

2.16.12 default (Default Checkbox Form Field State)

This element specifies the default checkbox state for the parent checkbox form field. This value determines the checkbox state when its current run contents are empty (i.e. there is not actual content within the drop-down list).

If this element is omitted, then the current checkbox form field shall have a default value of 0 (unchecked).

[Example: Consider the following WordprocessingML fragment for a checkbox list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
 <w:ffData>
 <w:checkBox>
 <w:default w:val="true" />
 </w:checkBox>
 </w:ffData>
</w:fldSimple>
```

The default element specifies the default state of the checkbox form field to be true. Since the form field does not contain any run content, this is the state which shall be displayed when the contents of the form field are displayed by an application. end example]

Parent Elements
checkBox (§2.16.7)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. end example]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
 <attribute name="val" type="ST_OnOff"/>
</complexType>
```

### 2.16.13 delInstrText (Deleted Field Code)

This element specifies that this run contains deleted field codes (§2.16.5) within a complex field in the document. The delInstrText element shall be used for all runs containing field codes which are part of a region of text that is contained in a deleted region using the del element (§2.13.5.12).

If this element is not contained within a del element, then the document is invalid. If this element is contained within a run which is not part of a complex field's field codes, then it should be handled as regular deleted text.

[Example: Consider a complex field within a WordprocessingML document which was changed from a text box form field to a checkbox form field with revision tracking enabled. This field would therefore be represented as follows:

```
<w:fldchar w:type="begin" />
<w:ins>
 <w:r>
 <w:instrText>FORMCHECKBOX</w:instrText>
 </w:r>
 <w:del>
 <w:r>
 <w:delInstrText>FORMFIELDTEXT</w:delInstrText>
 </w:r>
 </w:del>
<w:fldChar w:type="seperate" />
...
<w:fldChar w:type="end" />
```

The deleted field code is contained in a delInstrText node, while the inserted (and current) field code is contained in an instrText node. *end example*

Parent Elements
r (§7.1.2.87); r (§2.3.2.23)

Attributes	Description
space (Content Contains Significant Whitespace)	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.
Namespace:	[Example: Consider the following run contained within a WordprocessingML document:

Attributes	Description
http://www.w3.org/XML/1998/namespace	<p data-bbox="456 254 1062 348"> <code>&lt;w:r&gt;</code>  <code>  &lt;w:t&gt;significant whitespace  &lt;/w:t&gt;</code>  <code>&lt;/w:r&gt;</code> </p> <p data-bbox="415 390 1468 489">Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. <i>end example</i>]</p> <p data-bbox="415 531 1365 558">The possible values for this attribute are defined by the <code>type</code> in the <code>namespace</code>.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Text">
 <simpleContent>
 <extension base="ST_String">
 <attribute ref="xml:space" use="optional"/>
 </extension>
 </simpleContent>
</complexType>

```

#### 2.16.14 enabled (Form Field Enabled)

This element specifies whether the parent form field shall behave as though it is enabled or disabled when it is displayed in the document. This setting shall have no effect on the behavior of this form field unless the document's Settings part specifies that the documentProtection element for the current document is in a state allowing the filling in of form fields.

If this element is omitted, then the parent form field shall be in its enabled state when the document settings specify that the document allows the filling-in of form fields.

[Example: Consider the following WordprocessingML fragment for a text box form field:

```

<w:fldSimple w:instr="FORMTEXT">
 <w:ffData>
 <w:enabled w:val="false"/>
 <w:textInput>
 ...
 </w:textInput>
 </w:ffData>
</w:fldSimple>

```

The enabled element specifies that the state of the current text box form field is disabled; therefore this text box shall not be editable within the current document even when the state of the documentProtection element specifically allows the editing of form fields. *end example*]

#### Parent Elements

Parent Elements
ffData (§2.16.17)

1

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OnOff">
4 <attribute name="val" type="ST_OnOff"/>
5 </complexType>
```

## 6 2.16.15 entryMacro (Script Function to Execute on Form Field Entry)

7 This element specifies a subroutine in a scripting language which should be executed when the when the run  
8 contents of the parent form field are entered. The language and location of this subroutine may be determined  
9 using any method desired by an application. [Note: It is at the discretion of an application to determine the  
10 scope and timing of "entering" a form field, for example, when the user moves the insertion point in a user  
11 interface or upon each operation by an application without a user interface, etc. *end note*]

12 If this element is omitted, then no subroutine shall be associated with entering the run contents of the parent  
13 form field. If this element specifies a macro which cannot be located or is not supported by an application, then  
14 its value may be ignored, but shall not be lost upon resaving the file.

15 [Example: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
16 <w:ffData>
17 <w:entryMacro w:val="TestEntryFunction" />
18 <w:checkBox>
19 ...
20 </w:checkBox>
21 </w:ffData>
```

- 1 The entryMacro element specifies that any application which processes this file should attempt to locate and  
 2 execute a scripting subroutine called TestEntryFunction when the contents of the checkbox are entered. If  
 3 this subroutine cannot be located or executed, then this setting is silently ignored. *end example*]

Parent Elements
ffData (§2.16.17)

4

Attributes	Description
val (Name of Script Function)	<p>Specifies the name of a single scripting subroutine which shall be associated with the parent element. Its use is specifies based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for the properties of a form field:</p> <pre>&lt;w:ffData&gt;   &lt;w:exitMacro w:val="HelloWorld" /&gt; &lt;/w:ffData&gt;</pre> <p>The val attribute specifies that a script function called HelloWorld shall be used in the context of the parent element; in this case, to execute when the field is exited. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_MacroName simple type (§2.18.58).</p>

- 5 The following XML Schema fragment defines the contents of this element:

```
6 <complexType name="CT_MacroName">
7 <attribute name="val" use="required" type="ST_MacroName"/>
8 </complexType>
```

## 9 2.16.16 exitMacro (Script Function to Execute on Form Field Exit)

- 10 This element specifies a subroutine in a scripting language which should be executed when the when the run  
 11 contents of the parent form field are exited. The language and location of this subroutine may be determined  
 12 using any method desired by an application. [*Note:* It is at the discretion of an application to determine the  
 13 scope and timing of "exiting" a form field, for example, when the user moves the insertion point in a user  
 14 interface or upon each operation by an application without a user interface, etc. *end note*]

- 15 If this element is omitted, then no subroutine shall be associated with exiting the run contents of the parent  
 16 form field. If this element specifies a macro which cannot be located or is not supported by an application, then  
 17 its value may be ignored, but shall not be lost upon resaving the file.

- 18 [*Example:* Consider the following WordprocessingML fragment for the properties of a form field:

```

1 <w:ffData>
2 <w:exitMacro w:val="TestExitFunction" />
3 </w:ffData>

```

The exitMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called TestExitFunction when the contents of the form field are exited. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*

Parent Elements
ffData (§2.16.17)

Attributes	Description
val (Name of Script Function)	<p>Specifies the name of a single scripting subroutine which shall be associated with the parent element. Its use is specifies based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for the properties of a form field:</p> <pre>           &lt;w:ffData&gt;             &lt;w:exitMacro w:val="HelloWorld" /&gt;           &lt;/w:ffData&gt; </pre> <p>The val attribute specifies that a script function called HelloWorld shall be used in the context of the parent element; in this case, to execute when the field is exited. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_MacroName simple type (§2.18.58).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MacroName">
 <attribute name="val" use="required" type="ST_MacroName"/>
</complexType>

```

## 2.16.17 ffData (Form Field Properties)

This element specifies a set of properties which shall be associated with the parent form field within the document. This form field may be of any of the following types (with the associated field codes in parentheses):

- Checkbox (FORMCHECKBOX)
- Drop-down List (FORMDROPDOWN)
- Text box (FORMTEXT)

If this element is present and the field codes for the document do not specify a form field of one of these types, then the document shall be considered invalid.

If this element is omitted, then the properties associated with the parent form field shall be determined based on their default values.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
 <w:ffData>
 <w:name w:val="TextTextBox" />
 <w:enabled w:val="false"/>
 <w:textInput>
 <w:maxLength w:val="10" />
 </w:textInput>
 </w:ffData>
</w:fldSimple>
```

The ffData element specifies the set of properties for this text box form field; in this example, a form field name of TestTextBox via the name element (§2.16.28), a disabled state via the enabled element (§2.16.14), and a maximum character length of 10 characters via the maxLength element (§2.16.27). *end example*

 </choice>
 </choice>
</complexType>
```

### 2.16.18 fldChar (Complex Field Character)

This element specifies the presence of a complex field character at the current location in the parent run. A *complex field character* is a special character which delimits the start and end of a complex field or separates its field codes from its current field result.

A complex field is defined via the use of the two required complex field characters: a *start character*, which specifies the beginning of a complex field within the document content; and an *end character*, which specifies the end of a complex field. This syntax allows multiple fields to be embedded (or "nested") within each other in a document.

As well, because a complex field may specify both its field codes and its current result within the document, these two items are separated by the optional *separator character*, which defines the end of the field codes and the beginning of the field contents. The omission of this character shall be used to specify that the contents of the field are entirely field codes (i.e. the field has no result).

[Example: Consider the following complex field definition within a WordprocessingML document:

```
<w:fldChar w:type="start" />
<w:r>
 <w:instrText>AUTHOR</w:instrText>
</w:r>
<w:fldChar w:type="separate" />
<w:r>
 <w:t>Rex Jaeschke</w:t>
</w:r>
<w:fldChar w:type="end" />
```

The three fldChar elements specify:

- The beginning of the field, using the type attribute value of start
- The separator between the field codes and the current field results, using the type attribute value of separate
- The end of the field, using the type attribute value of end

*end example]*

If a complex field character is located in an inappropriate location in a WordprocessingML document, then its presence shall be ignored and no field shall be present in the resulting document when displayed. Also, if a complex field is not closed before the end of a document story, then no field shall be generated and each individual run shall be processed as if the field characters did not exist (i.e. the contents of all field code run content shall not be displayed, and the field results shall be displayed as literal text).

[*Example:* Consider the following WordprocessingML document:

```
<w:body>
 <w:p>
 <w:fldChar w:type="start" />
 <w:r>
 <w:instrText>AUTHOR</w:instrText>
 </w:r>
 <w:fldChar w:type="separate" />
 <w:r>
 <w:t>Rex Jaeschke</w:t>
 </w:r>
 </w:p>
</w:body>
```

The complex field is technically incorrect since no end character exists in the main document story. The resulting content shall be interpreted as though no field characters exist, resulting in only the literal text Rex Jaeschke being displayed in the document. *end example]*

numberingChange (Previous Numbering Field Properties)	§2.13.5.29

Attributes	Description
------------	-------------

Attributes	Description
dirty (Field Result Invalidated)	<p>Specifies that this field has been flagged by an application to indicate that its current results are invalid (stale) due to other modifications made to the document, and these contents should be updated before they are displayed if this functionality is supported by the next processing application.</p> <p>[<i>Rationale</i>: This functionality allows applications with limited subsets of the full functionality of this Office Open XML Standard to process Word Open XML documents without needing to understand and update all fields based on the semantics for their field codes.</p> <p>For example, an application can add a new paragraph and flag the table of contents as dirty, without needing to understand anything about how to recalculate that field's content. <i>end rationale</i>]</p> <p>If this attribute is omitted, then its value shall be assumed to be false. If the type of the current field character is not start, then his setting may be ignored.</p> <p>[<i>Example</i>: Consider the following WordprocessingML for a complex field:</p> <pre>&lt;w:fldChar w:type="start" w:dirty="true"/&gt; &lt;w:r&gt;   &lt;w:instrText&gt;TOC /l 1-3&lt;/w:instrText&gt; &lt;/w:r&gt; &lt;w:fldChar w:type="separate"/&gt; ...</pre> <p>The dirty attribute value of true specifies that the contents of this field are no longer current based on the contents of the document, and should be recalculated whenever an application with this functionality reads the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
fldCharType (Field Character Type)	<p>Specifies the type of the current complex field character in the document.</p> <p>[<i>Example</i>: Consider the following WordprocessingML for a complex field character:</p> <pre>... &lt;w:fldChar w:type="separate" /&gt; ...</pre> <p>The type attribute value of separate specifies that this is a complex field separator character; therefore it is being used to separate the field codes from the field contents in a complex field. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FldCharType simple type (§2.18.33).</p>
fldLock (Field	<p>Specifies that the parent complex field shall not have its field result recalculated, even if</p>

Attributes	Description
Should Not Be Recalculated)	<p>an application attempts to recalculate the results of all fields in the document or a recalculation is explicitly requested.</p> <p>If this attribute is omitted, then its value shall be assumed to be false. If the type of the current field character is not start, then his setting may be ignored.</p> <p>[<i>Example:</i> Consider the following WordprocessingML for a complex field:</p> <pre>&lt;w:fldChar w:type="start" w:fldLock="true"/&gt; ... &lt;w:fldChar w:type="separate"/&gt; &lt;w:r&gt;   &lt;w:t&gt;field result&lt;/w:t&gt; &lt;/w:r&gt; &lt;w:fldChar w:type="end" /&gt;</pre> <p>The fldLock attribute value of true specifies that the contents of this field shall remain field result regardless of the actual result of the current field codes. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FldChar">
 <choice>
 <element name="fldData" type="CT_Text" minOccurs="0" maxOccurs="1"/>
 <element name="ffData" type="CT_FFData" minOccurs="0" maxOccurs="1"/>
 <element name="numberingChange" type="CT_TrackChangeNumbering" minOccurs="0"/>
 </choice>
 <attribute name="fldCharType" type="ST_FldCharType" use="required"/>
 <attribute name="fldLock" type="ST_OnOff"/>
 <attribute name="dirty" type="ST_OnOff"/>
</complexType>
```

### 2.16.19 fldData (Custom Field Data)

This element specifies custom field data which shall be associated with the parent field. No information or semantics are applied to the contents of this data by this Office Open XML Standard, and therefore this field may be used as desired to store additional application-specific data with the field. However, applications should not lose the contents of this custom data if they do not understand or utilize it (i.e. the information should continue to be saved with the file).

If this element is omitted, then no custom field data is stored with the parent field. If the type attribute of the current field character is not start, then his setting may be ignored.

[*Example:* Consider the following WordprocessingML fragment for a complex field:

1     <w:fldChar w:type="start">  
2         <w:fldData xml:space="preserve">///3645ERKJHE</w:fldData>  
3     </w:fldChar>  
4     <w:r>  
5         <w:instrText>PRIVATE</w:instrText>  
6     </w:r>  
7     <w:fldChar w:type="separate" />  
8     ...

9     The fldData element contains custom data stored with this PRIVATE field (§2.16.5.55), the contents of which are  
10    determined by a hosting application. *end example*

Parent Elements
<a href="#">fldChar (§2.16.18)</a>

11

Attributes	Description
space (Content Contains Significant Whitespace)  Namespace: <a href="http://www.w3.org/XML/1998/namespace">http://www.w3.org/XML/1998/namespace</a>	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>[<i>Example</i>: Consider the following run contained within a WordprocessingML document:</p> <pre>&lt;w:r&gt;   &lt;w:t&gt;significant whitespace  &lt;/w:t&gt; &lt;/w:r&gt;</pre> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>type</code> in the <code>namespace</code>.</p>

12    The following XML Schema fragment defines the contents of this element:

```
13 <complexType name="CT_Text">
14 <simpleContent>
15 <extension base="ST_String">
16 <attribute ref="xml:space" use="optional"/>
17 </extension>
18 </simpleContent>
19 </complexType>
```

20    **2.16.20    fldData (Custom Field Data)**

21    This element specifies custom field data which shall be associated with the parent field. No information or  
22    semantics are applied to the contents of this data by this Office Open XML Standard, and therefore this field  
23    may be used as desired to store additional application-specific data with the field. However, applications should

not lose the contents of this custom data if they do not understand or utilize it (i.e. the information should continue to be saved with the file).

If this element is omitted, then no custom field data is stored with the parent field.

[*Example:* Consider the following WordprocessingML fragment for a simple field:

```
<w:fldSimple w:instr="PRIVATE">
 <w:fldData xml:space="preserve">///3645ERKJHE</w:fldData>
</w:fldSimple>
```

The fldData element contains custom data stored with this PRIVATE field (§2.16.5.55), the contents of which are determined by a hosting application. *end example*]

Parent Elements
fldSimple (§2.16.21)

Attributes	Description
space (Content Contains Significant Whitespace)  Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>[<i>Example:</i> Consider the following run contained within a WordprocessingML document:</p> <pre>&lt;w:r&gt;   &lt;w:t&gt;significant whitespace  &lt;/w:t&gt; &lt;/w:r&gt;</pre> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the type in the namespace.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
 <simpleContent>
 <extension base="ST_String">
 <attribute ref="xml:space" use="optional"/>
 </extension>
 </simpleContent>
</complexType>
```

### 2.16.21 fldSimple (Simple Field)

This element specifies the presence of a simple field at the current location in the document. The semantics of this field are defined via its field codes (§2.16.5).

[Example: Consider the following WordprocessingML fragment for a simple field:

```
<w:fldSimple w:instr="FILENAME">
 <w:r>
 <w:t>Example Document.docx</w:t>
 </w:r>
</w:fldSimple>
```

The fldSimple element defines a FILENAME field (§2.16.5.23) using the simple field syntax. The current field result for the field is Example Document.docx. *end example*]

1

Attributes	Description
dirty (Field Result Invalidated)	<p>Specifies that this field has been flagged by an application to indicate that its current results are invalid (stale) due to other modifications made to the document, and these contents should be updated before they are displayed if this functionality is supported by the next processing application.</p> <p>[<i>Rationale:</i> This functionality allows applications with limited subsets of the full functionality of this Office Open XML Standard to process Word Open XML documents without needing to understand and update all fields based on the semantics for their field codes.</p> <p>For example, an application can add a new paragraph and flag the table of contents as dirty, without needing to understand anything about how to recalculate that field's content. <i>end rationale</i>]</p> <p>If this attribute is omitted, then its value shall be assumed to be false.</p> <p>[<i>Example:</i> Consider the following WordprocessingML for a simple field:</p> <pre>&lt;w:fldSimple w:instr="AUTHOR" w:dirty="true"/&gt;</pre> <p>The dirty attribute value of true specifies that the contents of this field are no longer current based on the contents of the document, and should be recalculated whenever an application with this functionality reads the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
fldLock (Field Should Not Be Recalculated)	<p>Specifies that the parent field shall not have its field result recalculated, even if an application attempts to recalculate the results of all fields in the document or a recalculation is explicitly requested.</p>

Attributes	Description
	<p>If this attribute is omitted, then its value shall be assumed to be false.</p> <p>[Example: Consider the following WordprocessingML for a simple field:</p> <pre>&lt;w:fldSimple w:instr="AUTHOR" w:fldLock="true"&gt;   &lt;w:r&gt;     &lt;w:t&gt;Rex Jaeschke&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:fldSimple&gt;</pre> <p>The fldLock attribute value of true specifies that the contents of this field shall remain Rex Jaeschke regardless of the actual result of the current field codes. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
instr (Field Codes)	<p>Specifies the field codes for the simple field. The possible field codes are defined in §2.16.5.</p> <p>[Example: Consider the following WordprocessingML for a simple field:</p> <pre>&lt;w:fldSimple w:instr="AUTHOR" w:fldLock="true"&gt;   &lt;w:r&gt;     &lt;w:t&gt;Rex Jaeschke&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:fldSimple&gt;</pre> <p>The instr attribute specifies the field codes for this simple field to be AUTHOR. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SimpleField">
 <sequence>
 <element name="fldData" type="CT_Text" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_PContent" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="instr" type="ST_String" use="required"/>
 <attribute name="fldLock" type="ST_OnOff"/>
 <attribute name="dirty" type="ST_OnOff"/>
</complexType>
```

## 2.16.22 format (Text Box Form Field Formatting)

This element specifies the field formatting which shall be applied to the contents of the parent form field whenever those contents are modified. The type of formatting which is applied to the field depends on the value of its type element (§2.16.34), as follows:

- When the type is equal to `currentDate`, `currentTime`, or `date`, a date formatting string using the syntax defined in §2.16.4.1
- When the type is equal to `calculated` or `number`, a number formatting string using the syntax defined in §2.16.4.2
- When the type is equal to `regular`, a text formatting string defined as follows:

Argument	Description
Uppercase	All letters are uppercase. [ <i>Example: Mary Smith results in MARY SMITH. end example</i> ]
Lowercase	All letters are lowercase. [ <i>Example: Mary Smith results in mary smith. end example</i> ]
First capital	Capitalizes the first letter of the first word. [ <i>Example: Mary Smith results in Mary smith. end example</i> ]
Title case	Capitalizes the first letter of each word. [ <i>Example: Mary Smith results in Mary Smith. end example</i> ]

[*Example: Consider the following WordprocessingML fragment for the properties of a text box form field:*

```
<w:ffData>
 <w:textInput>
 <w:type w:val="number" />
 <w:maxLength w:val="4" />
 <w:format w:val="0.00" />
 </w:textInput>
</w:ffData>
```

The format element specifies the field formatting which is applied to the input to the field (in this case, a grouping of number formatting picture items as the type element specifies a value of `number`). If a value of 8 was entered into this field, the formatted result would be `8.00`. *end example*]

Parent Elements
textInput (§2.16.33)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[<i>Example: Consider the following WordprocessingML fragment:</i></p>

Attributes	Description
	<pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt;   ... &lt;/w:sdtPr&gt;</pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_String">
3 <attribute name="val" type="ST_String" use="required"/>
4 </complexType>
```

5 **2.16.23 helpText (Associated Help Text)**

6 This element specifies optional help text which shall be associated with the parent form field. The method or  
7 user interface by which this help text may be surfaced is not defined by this Office Open XML Standard.

8 If this element is omitted, then no help text shall be associated with the current form field.

9 [Example: Consider the following WordprocessingML fragment for a drop-down list form field:

```
10 <w:fldSimple w:instr="FORMDROPDOWN">
11 <w:ffData>
12 <w:helpText w:type="text" w:val="Example help text." />
13 <w:ddList>
14 ...
15 </w:ddList>
16 </w:ffData>
17 </w:fldSimple>
```

18 The helpText element specifies the help text for the parent form field - in this case, literal help text consisting of  
19 the string Example help text. *end example*

**Parent Elements**

Parent Elements
ffData (§2.16.17)

1

Attributes	Description
type (Help Text Type)	<p>Specifies the type of help text which is specified by this element, defined by the simple type below.</p> <p>If this attribute is omitted, then its value shall be assumed to be text.</p> <p>[Example: Consider the following WordprocessingML fragment for a form field:</p> <pre>&lt;w:ffData&gt;   &lt;w:helpText w:type="text" w:val="Example help text." /&gt; &lt;/w:ffData&gt;</pre> <p>The type attribute has a value of text, which specifies that the text in the val attribute is the literal help text for this form field. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_InfoTextType simple type (§2.18.49).</p>
val (Help Text Value)	<p>Specifies the help text for the current form field. Based on the value of the type attribute, the contents of this field shall be interpreted as follows:</p> <ul style="list-style-type: none"> <li>When the type attribute value is text, contains the literal help text for the form field.</li> <li>When the type attribute value is autoText, contains the name of a glossary document entry which contains the help text for the form field.</li> </ul> <p>[Example: Consider the following WordprocessingML fragment for a form field:</p> <pre>&lt;w:ffData&gt;   &lt;w:helpText w:type="autoText" w:val="HelpText" /&gt; &lt;/w:ffData&gt;</pre> <p>The text in the val attribute is the name of a glossary document entry containing the help text for this form field, since the type attribute has a value of autoText. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FFHelpTextVal simple type (§2.18.29).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_FFHelpText">
4 <attribute name="type" type="ST_InfoTextType"/>
5 <attribute name="val" type="ST_FFHelpTextVal"/>
6 </complexType>
```

## 2.16.24 hyperlink (Hyperlink)

This element specifies the presence of a hyperlink at the current location in the document.

[*Example:* Consider the following WordprocessingML fragment for a hyperlink:

```
<w:hyperlink r:id="rId10">
 <w:r>
 <w:t>Click here</w:t>
 </w:r>
</w:hyperlink>
```

The hyperlink element defines a hyperlink whose display text is `Click here`, and whose target is specified by the relationship with an `Id` attribute value of `rId10`. *end example*]

### Parent Elements

sdt (Inline-Level Structured Document Tag)	§2.5.2.29
smartTag (Inline-Level Smart Tag)	§2.5.1.9
subDoc (Anchor for Subdocument Location)	§2.17.2.1

1

Attributes	Description
anchor (Hyperlink Anchor)	<p>Specifies the name of a bookmark in the current document which shall be the target of this hyperlink.</p> <p>If this attribute is omitted, then the default behavior shall be to navigate to the start of the document. If a hyperlink target is also specified using the r:id attribute, then this attribute shall be ignored. If no bookmark exists in the current document with the given bookmark name, then the default behavior shall be to navigate to the start of the document.</p> <p>[Example: Consider the following WordprocessingML fragment for a hyperlink:</p> <pre>&lt;w:hyperlink w:anchor="chapter3"&gt;   &lt;w:r&gt;     &lt;w:t&gt;Go to Chapter Three&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:hyperlink&gt;</pre> <p>The anchor attribute specifies that the target of the current hyperlink shall be the text contained within the bookmark chapter3 within the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
docLocation (Location in Target Document)	<p>Specifies a location in the target of the hyperlink that has no bookmarks. The method by which the contents of this attribute are linked to document text is outside the scope of this Office Open XML Standard.</p>

Attributes	Description
	<p>If this attribute is omitted, then no location shall be associated with the parent hyperlink. If the anchor attribute is also specified, then this attribute may be ignored when the hyperlink is invoked.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p> <pre>&lt;w:hyperlink r:id="rId9" w:docLocation="table"&gt;   &lt;w:r&gt;     &lt;w:t&gt;Click Here&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:hyperlink&gt;</pre> <p>The docLocation attribute specifies that the target of the current hyperlink shall be a region targeted by the string <code>table</code> within the target document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>
history (Add To Viewed Hyperlinks)	<p>Specifies whether the target of the parent hyperlink (as specified via the <code>r:id</code> attribute) shall be added to a list of viewed hyperlinks when it is invoked.</p> <p>If this attribute is omitted, then its value shall be assumed to be false.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p> <pre>&lt;w:hyperlink r:id="rId9" w:history="true"&gt;   &lt;w:r&gt;     &lt;w:t&gt;http://example.com&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:hyperlink&gt;</pre> <p>The history attribute value of <code>true</code> specifies that the target of the current hyperlink shall be added to a list of visited hyperlinks when invoked within the document. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>
id (Hyperlink Target)  Namespace: .../officeDocument /2006/relationships	<p>Specifies the ID of the relationship whose target shall be used as the target for this hyperlink.</p> <p>If this attribute is omitted, then there shall be no external hyperlink target for the current hyperlink - a location in the current document may still be target via the anchor attribute. If this attribute exists, it shall supersede the value in the anchor attribute.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p> <pre>&lt;w:hyperlink r:id="rId9"&gt;   &lt;w:r&gt;     &lt;w:t&gt;http://example.com&lt;/w:t&gt;   &lt;/w:r&gt;</pre>

Attributes	Description												
	<p data-bbox="451 247 678 281">&lt;/w:hyperlink&gt;</p> <p data-bbox="414 317 1437 457">The id attribute value of rId9 specifies that relationship in the associated relationship part item with a corresponding Id attribute value shall be navigated to when this hyperlink is invoked. For example, if the following XML is present in the associated relationship part item:</p> <pre data-bbox="451 495 1109 630"> &lt;Relationships xmlns="..."&gt;   &lt;Relationship Id="rId9" Mode="External"     Target=http://www.contoso.com /&gt; &lt;/Relationships&gt; </pre> <p data-bbox="414 667 1437 737">The target of this hyperlink would therefore be the target of relationship rId9 - in this case, <code>http://www.contoso.com</code>. <i>end example</i>]</p> <p data-bbox="414 774 1450 844">The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>												
tgtFrame (Hyperlink Target Frame)	<p data-bbox="414 856 1469 926">Specifies a frame within the parent HTML frameset for the target of the parent hyperlink when one exists. All values specified by this element shall be handled as follows:</p> <table data-bbox="414 961 1205 1822"> <tr> <th data-bbox="418 968 810 1014">Value</th><th data-bbox="810 968 1205 1014">Description</th></tr> <tr> <td data-bbox="418 1014 810 1129">_top</td><td data-bbox="810 1014 1205 1129">Open hyperlink target in the full region of the current window.</td></tr> <tr> <td data-bbox="418 1129 810 1245">_self</td><td data-bbox="810 1129 1205 1245">Open hyperlink target in the same frame as the hyperlink appears.</td></tr> <tr> <td data-bbox="418 1245 810 1402">_parent</td><td data-bbox="810 1245 1205 1402">Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.</td></tr> <tr> <td data-bbox="418 1402 810 1486">_blank</td><td data-bbox="810 1402 1205 1486">Open hyperlink target in a new window.</td></tr> <tr> <td data-bbox="418 1486 810 1822">all other values</td><td data-bbox="810 1486 1205 1822"> <p data-bbox="820 1499 1193 1671">Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame.</p> <p data-bbox="820 1709 1174 1814">If this string does not begin with an alphabetic character, it shall be ignored.</p> </td></tr> </table> <p data-bbox="414 1860 1464 1894">If this attribute is omitted, then no target frame information shall be associated with the</p>	Value	Description	_top	Open hyperlink target in the full region of the current window.	_self	Open hyperlink target in the same frame as the hyperlink appears.	_parent	Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.	_blank	Open hyperlink target in a new window.	all other values	<p data-bbox="820 1499 1193 1671">Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame.</p> <p data-bbox="820 1709 1174 1814">If this string does not begin with an alphabetic character, it shall be ignored.</p>
Value	Description												
_top	Open hyperlink target in the full region of the current window.												
_self	Open hyperlink target in the same frame as the hyperlink appears.												
_parent	Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.												
_blank	Open hyperlink target in a new window.												
all other values	<p data-bbox="820 1499 1193 1671">Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame.</p> <p data-bbox="820 1709 1174 1814">If this string does not begin with an alphabetic character, it shall be ignored.</p>												

Attributes	Description
	<p>parent hyperlink. If the current document is not part of a frameset, then this information may be ignored.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p> <pre>&lt;w:hyperlink r:id="rId9" w:tgtFrame="_top"&gt;   &lt;w:r&gt;     &lt;w:t&gt;http://example.com&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:hyperlink&gt;</pre> <p>The <code>tgtFrame</code> attribute value of <code>_top</code> specifies that the target of this hyperlink shall be displayed in the full extents of the current window. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (§2.18.89).</p>
tooltip (Associated String)	<p>Specifies a string which may be surfaced in a user interface as associated with the parent hyperlink. The method by which this string is surfaced by an application is outside the scope of this Office Open XML Standard.</p> <p>If this attribute is omitted, then no associated string shall be linked to the parent hyperlink in the document.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for a hyperlink:</p> <pre>&lt;w:hyperlink r:id="rId9" w:tooltip="Click here!"&gt;   &lt;w:r&gt;     &lt;w:t&gt;http://example.com&lt;/w:t&gt;   &lt;/w:r&gt; &lt;/w:hyperlink&gt;</pre> <p>The <code>tooltip</code> attribute value specifies that the parent hyperlink has the associated string of <code>Click here!</code>, which may be used as desired. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the <code>ST_String</code> simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
 <group ref="EG_PContent" minOccurs="0" maxOccurs="unbounded"/>
 <attribute name="tgtFrame" type="ST_String" use="optional"/>
 <attribute name="tooltip" type="ST_String" use="optional"/>
 <attribute name="docLocation" type="ST_String" use="optional"/>
 <attribute name="history" type="ST_OnOff" use="optional"/>
 <attribute name="anchor" type="ST_String" use="optional"/>
 <attribute ref="r:id"/>
</complexType>
```

2.16.25 instrText (Field Code)

This element specifies that this run contains field codes (§2.16.5) within a complex field in the document.

If this element is contained within a run which is not part of a complex field's field codes, then it and its contents should be treated as regular text. If this element is contained within a del element, then the document is invalid.

[Example: Consider a complex checkbox field within a WordprocessingML. This field would be represented as follows:

```
<w:fldchar w:type="begin" />
<w:r>
 <w:instrText>FORMCHECKBOX</w:instrText>
</w:r>
<w:fldChar w:type="seperate" />
...
<w:fldChar w:type="end" />
```

The field code is contained in a instrText node which occurs within the field codes portion of the complex field (i.e. before the separator character). *end example*

Parent Elements
r (§7.1.2.87); r (§2.3.2.23)

Attributes	Description
space (Content Contains Significant Whitespace)  Namespace: http://www.w3.org/XML/1998/namespace	<p>Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.</p> <p>[Example: Consider the following run contained within a WordprocessingML document:</p> <pre>&lt;w:r&gt;   &lt;w:t&gt;significant whitespace  &lt;/w:t&gt; &lt;/w:r&gt;</pre> <p>Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. <i>end example</i></p> <p>The possible values for this attribute are defined by the type in the namespace.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
 <simpleContent>
 <extension base="ST_String">
 <attribute ref="xml:space" use="optional"/>
 </extension>
 </simpleContent>
</complexType>
```

### 2.16.26 listEntry (Drop-Down List Entry)

This element specifies the presence of a single drop-down list entry within the parent drop-down list form field in the document. The order of appearance of the series of listEntry elements in the WordprocessingML markup shall dictate the order of the entries in the drop-down list when it is displayed.

[Example: Consider the following WordprocessingML fragment for the properties of a drop-down list form field:

```
<w:ffData>
 <w:ddList>
 <w:listEntry w:val="One" />
 <w:listEntry w:val="Two" />
 <w:listEntry w:val="Three" />
 </w:ddList>
</w:ffData>
```

The three listEntry elements each specify one drop-down list entry for the parent drop-down list form field. In this case, these properties specify that the drop-down list shall contain three entries of One, Two, and Three in that order when displayed. *end example*]

Parent Elements
ddList (§2.16.9)

Attributes	Description
val (String Value)	<p>Specifies that its contents will contain a string.</p> <p>The contents of this string are interpreted based on the context of the parent XML element.</p> <p>[Example: Consider the following WordprocessingML fragment:</p> <pre>&lt;w:pPr&gt;   &lt;w:pStyle w:val="heading1" /&gt; &lt;/w:pPr&gt;</pre> <p>The value of the val attribute is the ID of the associated paragraph style's styleId.</p>

Attributes	Description
	<p>However, consider the following fragment:</p> <pre data-bbox="456 321 1078 449">&lt;w:sdtPr&gt;   &lt;w:alias w:val="SDT Title Example" /&gt;   ... &lt;/w:sdtPr&gt;</pre> <p>In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_String simple type (§2.18.89).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
 <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

### 2.16.27 maxLength (Text Box Form Field Maximum Length)

This element specifies the maximum length of text which should be allowed within the parent text box form field before any formatting specified by the format element (§2.16.22). If the current contents of this field exceed the specified value when the document is loaded, that violation shall not result in an error, but the application shall prevent the addition of any additional characters until the contents are brought below that limit.

If this element is omitted, then there shall be no limit on the number of characters in the parent text box form field.

[*Example:* Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
 <w:textInput>
 <w:type w:val="number" />
 <w:maxLength w:val="4" />
 <w:format w:val="0.00" />
 </w:textInput>
</w:ffData>
```

The maxLength element specifies that the contents of this form field should not be allowed to exceed four characters when edited by an application. *end example*]

Parent Elements
textInput (§2.16.33)

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <pre>&lt;w:... w:val="1512645511" /&gt;</pre> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_DecimalNumber">
3 <attribute name="val" type="ST_DecimalNumber" use="required"/>
4 </complexType>
```

## 5 2.16.28 name (Form Field Name)

6 This element specifies the name of the current form field.

7 [*Example:* Consider the following WordprocessingML fragment for a text box form field:

```
8 <w:fldSimple w:instr="FORMTEXT">
9 <w:ffData>
10 <w:name w:val="FirstName"/>
11 <w:textInput>
12 ...
13 </w:textInput>
14 </w:ffData>
15 </w:fldSimple>
```

16 The name element specifies that the name of the current form field is FirstName. *end example*]

Parent Elements
ffData (§2.16.17)

17

Attributes	Description
val (Form Field Name Value)	<p>Specifies the name of the form field.</p> <p>If this attribute is omitted, then the parent form field shall have no name.</p>

Attributes	Description
	<p>[<i>Example:</i> Consider the following WordprocessingML fragment for a form field:</p> <pre data-bbox="454 394 1031 489">&lt;w:ffData&gt;   &lt;w:name w:val="ExampleFieldName"/&gt; &lt;/w:ffData&gt;</pre> <p>The val attribute specifies that the name of the current form field is ExampleFieldName. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FFName simple type (§2.18.30).</p>

1 The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFName">
 <attribute name="val" type="ST_FFName"/>
</complexType>
```

## 5 2.16.29 result (Drop-Down List Selection)

6 This element specifies the zero-based index of the currently selected entry for the parent drop-down list form  
7 field.

8 If this element is omitted, then the current drop-down list form field shall have the selection specified by the  
9 value of the default element (§2.16.11). If the attribute value references an index value which does not exist  
10 (i.e. a negative number or a number that exceeds the number of items in the drop-down list), then this value  
11 may be ignored and the current drop-down list form field shall have the selection specified by the value of the  
12 default element.

13 [*Example:* Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
 <w:ffData>
 <w:ddList>
 <w:default w:val="1" />
 <w:result w:val="2" />
 <w:listEntry w:val="One" />
 <w:listEntry w:val="Two" />
 <w:listEntry w:val="Three" />
 </w:ddList>
 </w:ffData>
</w:fldSimple>
```

- 1 The result element specifies the index of the currently selected value of the drop-down list form field to be 2. In  
 2 this case, the resulting default value text is Three. *end example*]

3

Parent Elements
ddlList (§2.16.9)

Attributes	Description
val (Decimal Number Value)	<p>Specifies that the contents of this attribute will contain a decimal number.</p> <p>The contents of this decimal number are interpreted based on the context of the parent XML element.</p> <p>[<i>Example</i>: Consider the following numeric WordprocessingML property of type ST_DecimalNumber:</p> <pre>&lt;w:... w:val="1512645511" /&gt;</pre> <p>The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).</p>

- 4 The following XML Schema fragment defines the contents of this element:

```
5 <complexType name="CT_DecimalNumber">
6 <attribute name="val" type="ST_DecimalNumber" use="required"/>
7 </complexType>
```

### 8 2.16.30 size (Checkbox Form Field Size)

- 9 This element specifies the exact size for the parent checkbox form field. The resulting field shall be displayed in  
 10 this point size regardless of the size specified by the formatting of its corresponding content in the document via  
 11 the style hierarchy.

- 12 [*Example*: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
13 <w:ffData>
14 <w:checkBox>
15 <w:size w:val="20" />
16 <w:checked w:val="true" />
17 </w:checkBox>
18 </w:ffData>
```

- 19 The size element specifies that the checkbox shall be displayed in a ten point font size, regardless of the  
 20 formatting which would normally be applied to this text via the style hierarchy. *end example*]

Parent Elements
checkbox (\$2.16.7)

1

Attributes	Description
val (Half Point Measurement)	<p>Specifies a positive measurement specified in half-points (1/144 of an inch).</p> <p>The contents of this attribute value are interpreted based on the context of the parent XML element.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment:</p> <pre>&lt;w:rPr&gt;   &lt;w:sz w:val="28" /&gt; &lt;/w:rPr&gt;</pre> <p>The value of the val attribute is the font size of the run's contents.</p> <p>However, consider the following fragment:</p> <pre>&lt;w:rPr&gt;   &lt;w:kern w:val="30" /&gt; &lt;/w:rPr&gt;</pre> <p>In this case, the value in the val attribute is the minimum size for which font characters shall be automatically kerned.</p> <p>In each case, the value is interpreted in the context of the parent element. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_HpsMeasure simple type (§2.18.48).</p>

2 The following XML Schema fragment defines the contents of this element:

3 <complexType name="CT_HpsMeasure"> 4   <attribute name="val" type="ST_HpsMeasure" use="required"/> 5 </complexType>
-----------------------------------------------------------------------------------------------------------------------------

6 **2.16.31 sizeAuto (Automatically Size Form Field)**

7 This element specifies that the parent checkbox form field shall be formatted using the point size which is  
8 applied to its field characters via the style hierarchy.

9 [*Example:* Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
1 <w:r>
2 <w:rPr>
3 <w:sz w:val="40"/>
4 </w:rPr>
5 <w:fldChar w:type="begin">
6 <w:ffData>
7 <w:checkBox>
8 <w:sizeAuto />
9 <w:checked w:val="true" />
10 </w:checkBox>
11 </w:ffData>
12 </w:r>
13 ...
```

14 The sizeAuto element specifies that the checkbox shall be displayed in the point size of the formatting which  
15 would normally be applied to this text via the style hierarchy. In this case, this size is the twenty points specified  
16 via the direct formatting on the parent run. *end example*]

Parent Elements
checkBox (§2.16.7)

17

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

18 The following XML Schema fragment defines the contents of this element:

```
19 <complexType name="CT_OnOff">
20 <attribute name="val" type="ST_OnOff"/>
21 </complexType>
```

### 2.16.32 statusText (Associated Status Text)

This element specifies optional status text which shall be associated with the parent form field. The method or user interface by which this status text may be surfaced is not defined by this Office Open XML Standard.

If this element is omitted, then no status text shall be associated with the current form field.

[Example: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
 <w:ffData>
 <w:statusText w:type="text" w:val="Example status text." />
 <w:ddList>
 ...
 </w:ddList>
 </w:ffData>
</w:fldSimple>
```

The statusText element specifies the status text for the parent form field - in this case, literal text consisting of the string `Example status text.` *end example*]

#### Parent Elements

ffData (§2.16.17)

#### Attributes

#### Description

type (Status Text Type)

Specifies the type of status text which is specified by this element, defined by the simple type below.

If this attribute is omitted, then its value shall be assumed to be `text`.

[Example: Consider the following WordprocessingML fragment for a form field:

```
<w:ffData>
 <w:statusText w:type="text" w:val="Example status text." />
</w:ffData>
```

The type attribute has a value of `text`, which specifies that the text in the `val` attribute is the literal status text for this form field. *end example*]

The possible values for this attribute are defined by the `ST_InfoTextType` simple type (§2.18.49).

val (Status Text Value)

Specifies the status text for the current form field. Based on the value of the type attribute, the contents of this field shall be interpreted as follows:

- When the type attribute value is `text`, contains the literal status text for the form field.

Attributes	Description
	<ul style="list-style-type: none"> <li>When the type attribute value is autoText, contains the name of a glossary document entry which contains the status text for the form field.</li> </ul> <p>[Example: Consider the following WordprocessingML fragment for a form field:</p> <pre>&lt;w:ffData&gt;   &lt;w:statusText w:type="autoText" w:val="MyStatusText" /&gt; &lt;/w:ffData&gt;</pre> <p>The text in the val attribute is the name of a glossary document entry containing the status text for this form field, since the type attribute has a value of autoText. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_FFStatusTextVal simple type (§2.18.31).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_FFStatusText">
3 <attribute name="type" type="ST_InfoTextType"/>
4 <attribute name="val" type="ST_FFStatusTextVal"/>
5 </complexType>
```

### 6 2.16.33 textInput (Text Box Form Field Properties)

7 This element specifies a set of properties which shall be associated with the parent FORMTEXT text box form field  
8 (§2.16.5.28) within the document.

9 If the parent form field is not a text box (i.e. its field code does not have a value of FORMTEXT), then these  
10 properties may be ignored.

11 [Example: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
12 <w:ffData>
13 <w:textInput>
14 <w:maxLength w:val="4" />
15 <w:type w:val="number" />
16 </w:textInput>
17 </w:ffData>
```

18 The textInput element specifies that it contains a set of properties for the parent text box form field. In this  
19 case, these properties specify that the drop-down list shall contain no more than four characters via the  
20 maxLength element (§2.16.27), and that its contents shall contain a number via the type element (§2.16.34).  
21 *end example*

#### Parent Elements

Parent Elements
ffData (§2.16.17)

Child Elements	Subclause
default (Default Text Box Form Field String)	§2.16.10
format (Text Box Form Field Formatting)	§2.16.22
maxLength (Text Box Form Field Maximum Length)	§2.16.27
type (Text Box Form Field Type)	§2.16.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFTextInput">
 <sequence>
 <element name="type" type="CT_FFTextType" minOccurs="0"/>
 <element name="default" type="CT_String" minOccurs="0"/>
 <element name="maxLength" type="CT_DecimalNumber" minOccurs="0"/>
 <element name="format" type="CT_String" minOccurs="0"/>
 </sequence>
</complexType>
```

### 2.16.34 type (Text Box Form Field Type)

This element specifies the type of the contents of the current text box form field. This element shall not be used to prevent the successful loading of any contents in the field, but shall be used to parse the formatting specified in the format element (§2.16.22) and should be used to prevent the addition of illegal content when its contents are edited by an application.

If this element is omitted, then its default value shall be assumed to be regular.

[Example: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
 <w:textInput>
 <w:type w:val="number" />
 <w:maxLength w:val="4" />
 <w:format w:val="0.00" />
 </w:textInput>
</w:ffData>
```

The type element specifies that the contents of this form field should be handled as a number by an application.  
*end example]*

Parent Elements
textInput (§2.16.33)

Attributes	Description
val (Text Box Form Field Type Values)	<p>Specifies the type of the text box form field, as defined by the simple type referenced below.</p> <p>[<i>Example:</i> Consider the following WordprocessingML fragment for the properties of a text box form field:</p> <pre data-bbox="451 464 1000 632">&lt;w:ffData&gt;   &lt;w:textInput&gt;     &lt;w:type w:val="currentDate" /&gt;   &lt;/w:textInput&gt; &lt;/w:ffData&gt;</pre> <p>The val attribute value of currentDate specifies that the contents of this form field should be the current date when the field is updated. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_FFTextType simple type (§2.18.32).</p>

1 The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFTextType">
 <attribute name="val" type="ST_FFTextType" use="required"/>
</complexType>
```

## 5 2.17 Miscellaneous Topics

6 This section covers topics not covered elsewhere within the WordprocessingML documentation.

### 7 2.17.1 Text Box Content

8 All VML-based drawing objects (except for connectors) support the addition of rich WordprocessingML content  
9 within their extents. When WordprocessingML contents have been added to a VML drawing object, the resulting  
10 text is contained within a *text box*.

11 When WordprocessingML content is contained within a text box, it is allowed within the object by specifying the  
12 VML textbox element (§6.1.2.22), which contains within it a single txbxContent element that contains all of the  
13 desired WordprocessingML content.

#### 14 2.17.1.1 txbxContent (Rich Text Box Content Container)

15 This element specifies that its contents shall be any rich WordprocessingML content, and that this content is the  
16 rich contents of a drawing object defined using the Vector Markup Language (VML) syntax (§6.1).

17 If this element contains within any of its contents any of the following content, then the document shall be  
18 considered non-conformant:

- 19 • References to other WordprocessingML document stories (comments, footnotes, endnotes)
- 20 • Additional txbxContent elements (as part of nested VML objects)

- 1 [Example: Consider a WordprocessingML document consisting of a single VML shape element (§6.1.2.19) (in this  
 2 case, a star) that contains within it some WordprocessingML content:

- 3  
 4 That drawing object now contains a text box, and so uses the syntax for that text box:

```

5 <v:shape id="_x0000_s1026" type="#_x0000_t12" style="...">
6 <v:textbox>
7 <w:txbxContent>
8 <w:p>
9 <w:pPr>
10 <w:jc w:val="center"/>
11 </w:pPr>
12 <w:r>
13 <w:t>Rich WordprocessingML content!</w:t>
14 </w:r>
15 </w:p>
16 </w:txbxContent>
17 </v:textbox>
18 </v:shape>
```

- 19 The txbxContent element is the container for the WordprocessingML contained within the text box inside that  
 20 shape - once inside this element any content (subject to the restrictions defined above) may be used. *end*  
 21 *example]*

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TxbxContent">
 <group ref="EG_BlockLevelElts" minOccurs="1" maxOccurs="unbounded"/>
</complexType>
```

## 2.17.2 Subdocuments

Within a WordprocessingML document, it is sometimes necessary to break a large document into two or more separate WordprocessingML document files, allowing each of these files to be distributed, edited, and handled independently.

[*Example:* A book might consist of five chapters, each edited by a separate author. The editor for the book would therefore desire to create six WordprocessingML documents - one for each author to work on their chapter, and a main document which collates the content of the five chapters appropriately. *end example*]

When a WordprocessingML document is comprised of other WordprocessingML documents in this way, the resulting documents are called a master document and its subdocuments.

- A *subdocument* is a WordprocessingML document - there is no specific information in a document which classifies it as such, other than that it is incorporated into another document.
- A *master document* is a document which incorporates one or more subdocuments (as well as optional WordprocessingML content) to create a larger document

[*Example:* Consider a WordprocessingML document which is being used to write a book:

# My Book

---

Once upon a time...

## Chapter One

It was a cold, stormy night...

## Chapter Two

Still cold...

To allow this document to be written by multiple authors, each chapter in the book is placed in a separate file (the sections highlighted in red below):

The result is three WordprocessingML documents:

- A master document (containing the title of the book, the first paragraph, and references to the subdocuments for each chapter)
- Two subdocuments (one for each chapter)

*end example]*

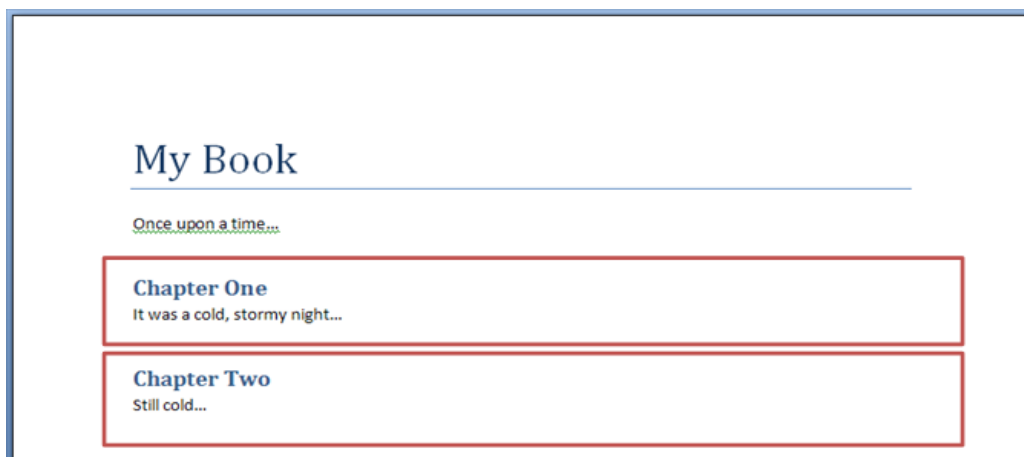

#### 2.17.2.1 subDoc (Anchor for Subdocument Location)

This element specifies a location within a master document for the insertion of the contents of a specified subdocument. The specified subdocument's contents should appear at the specified location within the master document as needed, but shall remain part of the separate file specified by the subdocument location. The location of the subdocument shall be specified by the relationship whose Id attribute matches the id attribute on this element.

If the relationship type of the relationship specified by this element is not <http://schemas.openxmlformats.org/officeDocument/2006/subDocument>, is not present, or does not have a TargetMode attribute value of External, then the document shall be considered non-conformant.

[*Example:* Consider a book consisting of three chapters, two of which have been divided into subdocuments as follows (the red rectangle indicates the bounds of each subdocument's contents):

The resulting master document would consist of its own WordprocessingML content as well as subdocument anchors in the appropriate locations:

```
<w:body>
 <w:p>
 ...
 <w:r>
 <w:t>My Book</w:t>
 </w:r>
 </w:p>
 <w:p>
 <w:r>
 <w:t>Once upon a time...</w:t>
 </w:r>
 </w:p>
 <w:subDoc r:id="subDocRel1" />
 <w:subDoc r:id="subDocRel2" />
 <w:sectPr>
 ...
 </w:sectPr>
</w:body>
```

The two subDoc elements specify that the subdocuments targeted by the relationships with an ID of subDocRel1 and subDocRel2 shall be imported in that order after the content of the first two paragraphs of content. Examining the contents of the corresponding relationship part item, we can see the targets for those relationships:

```

1 <Relationships ... >
2 ...
3 <Relationship Id="subDocRel1" TargetMode="External"
4 Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/subDoc
5 ument" Target="Chapter1.docx" />
6 <Relationship Id="subDocRel2" TargetMode="External"
7 Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/subDoc
8 ument" Target="Chapter2.docx" />
9 ...
10 </Relationships>

```

The corresponding relationship part item shows that the two files to be imported are located in the same location as the current file and name Chapter1.docx and Chapter2.docx respectively. *end example*]

Parent Elements
customXml (§2.5.1.5); fldSimple (§2.16.21); hyperlink (§2.16.24); p (§2.3.1.22); sdtContent (§2.5.2.35); smartTag (§2.5.1.9)

13

Attributes	Description
id (Relationship to Part)	Specifies the relationship ID to a specified part.
Namespace: .../officeDocument/2006/relationships	<p>The specified relationship shall match the type required by the parent element:</p> <ul style="list-style-type: none"> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements</li> <li>http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element</li> </ul> <p>[Example: Consider an XML element which has the following id attribute:</p> <pre>&lt;... r:id="rId10" /&gt;</pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rel">
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 2.17.3 External Content Import

When generating WordprocessingML documents, it is sometimes necessary to include existing document content (henceforth called *external content*) within the document. External content in a document is typically included because it was stored in a format other than the WordprocessingML format defined by this Office Open XML Standard.

In order to facilitate the inclusion of such content without requiring its conversion as a prerequisite to its inclusion in a document, WordprocessingML includes the facility for applications to implement the import of external content in any format as part of a WordprocessingML document. This functionality, called external content import, allows the inclusion of content of an arbitrary content type within the WordprocessingML package, which shall then be opened and merged into the main document when the package is consumed by applications which understand that content type.

[*Example:* Consider a WordprocessingML document which is being created based on the following existing HTML content:

```
<html ... >
 <body style="margin-left:200px;margin-top:50px">
 <p>Paragraph one.</p>
 <blockquote style="border:5px solid #00FFFF">Paragraph in a
blockquote.</blockquote>
 <p>Paragraph two.</p>
 </body>
</html>
```

This content could be converted to its WordprocessingML equivalents using the XML syntax defined by this Office Open XML Standard, or a more basic tool can use the external content import to include the HTML document within a WordprocessingML package, allowing a subsequent consumer of that content to import the resulting HTML. When the resulting WordprocessingML package is opened, the HTML document shall be read (if it is an alternate format understood by the consuming application) and migrated into the appropriate location in the main WordprocessingML document. *end example*]

#### 2.17.3.1 altChunk (Anchor for Imported External Content)

This element specifies a location within a document for the insertion of the contents of a specified file containing external content to be imported into the main WordprocessingML document. The specified file's contents should appear at the specified location within the document, and may henceforth be emitted as regular WordprocessingML without distinction to its origin. The location of the external content to be imported shall be specified by the relationship whose Id attribute matches the id attribute on this element.

If the relationship type of the relationship specified by this element is not `http://schemas.openxmlformats.org/officeDocument/2006/afChunk`, is not present, or does not have a `TargetMode` attribute value of `Internal`, then the document shall be considered non-conformant. If an application cannot process external content of the content type specified by the targeted part, then it should ignore the specified alternate content but continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[*Example:* Consider a WordprocessingML document consisting of contents which shall be imported from the following HTML document:

```
<html ... >
 <body style="margin-left:200px;margin-top:50px">
 <p>Paragraph one.</p>
 <blockquote style="border:5px solid #00FFFF">Paragraph in a
blockquote.</blockquote>
 <p>Paragraph two.</p>
 </body>
</html>
```

The resulting WordprocessingML host document would consist of its own WordprocessingML content as well as an external content import anchor in the appropriate location:

```
<w:body>
 <w:altChunk r:id="altChunk1" />
 <w:p/>
 <w:sectPr>
 ...
 </w:sectPr>
</w:body>
```

The `altChunk` element specifies that the external content targeted by the relationship with an ID of `altChunk1` shall be imported at the beginning of the document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships ... >
 ...
 <Relationship Id="altChunk1" TargetMode="Internal"
Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/afChun
k" Target="import.htm" />
 ...
</Relationships>
```

The corresponding relationship part item shows that the file to be imported is located next to the main document and is named `import.htm`. *end example*

Parent Elements
body (§2.2.2); comment (§2.13.4.2); docPartBody (§2.12.6); endnote (§2.11.2); footnote (§2.11.10); ftr (§2.10.3); hdr (§2.10.4); tc (§2.4.62); txbxContent (§2.17.1.1)

Child Elements	Subclause
altChunkPr (External Content Import Properties)	§2.17.3.2

Attributes	Description
<b>id</b> (Relationship to Part)  Namespace: .../officeDocument /2006/relationships	<p>Specifies the relationship ID to a specified part containing alternate content for import.</p> <p>If the specified relationship does not match the type required by the parent element, then this document shall be considered to be invalid.</p> <p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre>&lt;... r:id="rId10" /&gt;</pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AltChunk">
 <sequence>
 <element name="altChunkPr" type="CT_AltChunkPr" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="optional"/>
</complexType>
```

### 2.17.3.2 altChunkPr (External Content Import Properties)

This element specifies the set of properties which shall be applied to the import of the external content specified by the parent altChunk element. Within this Office Open XML Standard, only one property is specified.

[*Example:* Consider a WordprocessingML document consisting of contents which contains an external content import anchor in the appropriate location:

```

1 <w:body>
2 <w:altChunk r:id="altChunk1">
3 <w:altChunkPr>
4 <w:matchSrc w:val="false" />
5 </w:altChunkPr>
6 </w:altChunk>
7 <w:p/>
8 <w:sectPr>
9 ...
10 </w:sectPr>
11 </w:body>

```

The altChunkPr element specifies the set of properties applied to the external content import when importing the specified content. *end example*]

Parent Elements
altChunk (§2.17.3.1)

Child Elements	Subclause
matchSrc (Keep Source Formatting on Import)	§2.17.3.3

The following XML Schema fragment defines the contents of this element:

```

16 <complexType name="CT_AltChunkPr">
17 <sequence>
18 <element name="matchSrc" type="CT_OnOff" minOccurs="0" maxOccurs="1"/>
19 </sequence>
20 </complexType>

```

### 2.17.3.3 matchSrc (Keep Source Formatting on Import)

This element specifies if any style definitions present in the imported content shall be overridden by identical styles present in the host WordprocessingML document. If this element's val attribute is true, then any style exists in both the imported content and main document shall be maintained on the imported content by redefining the style name and/or ID as needed. Conversely, if this element's val attribute is false, any style which exists in both the imported content and main document shall apply the style form the main document in place of the style in the imported content.

If this element is omitted, then styles from the main document shall override identical styles from the imported content.

[*Example:* Consider a WordprocessingML document consisting of contents which contains an external content import anchor in the appropriate location:

```

1 <w:body>
2 <w:altChunk r:id="altChunk1">
3 <w:altChunkPr>
4 <w:matchSrc w:val="true" />
5 </w:altChunkPr>
6 </w:altChunk>
7 <w:p/>
8 <w:sectPr>
9 ...
10 </w:sectPr>
11 </w:body>

```

The matchSrc element has a val attribute value of true, which specifies that conflicting styles shall be maintained when importing the specified content. For example, if the **Heading 1** style was defined in both places, then applications shall ensure that the resulting document does not lose either instance of its formatting as appropriate. *end example*]

Parent Elements
altChunkPr (§2.17.3.2)

Attributes	Description
val (On/Off Value)	<p>Specifies a binary value for the property defined by the parent XML element.</p> <p>A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.</p> <p>A value of off, 0, or false specifies that the property shall be explicitly turned off.</p> <p>[Example: For example, consider the following on/off property:</p> <pre>&lt;w:... w:val="off"/&gt;</pre> <p>The val attribute explicitly declares that the property is turned off. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).</p>

The following XML Schema fragment defines the contents of this element:

```

18 <complexType name="CT_OnOff">
19 <attribute name="val" type="ST_OnOff"/>
20 </complexType>

```

## 2.17.4 Roundtripping Alternate Content

Office Open XML defines a mechanism for the storage of content which is not defined by this Office Open XML Standard, for example extensions developed by future software applications which leverage the Open XML formats. This mechanism allows for the storage of a series of alternative representations of content, of which the consuming application should use the first alternative whose requirements are met.

*[Example: Consider an application which creates a new paragraph property intended to make the colors of its text change colors randomly when it is displayed. This functionality is not defined in this Office Open XML Standard, and so the application might choose to create an alternative representation setting a different manual color on each character for clients which do not understand this extension using an AlternateContent block as follows:*

```
<ve:AlternateContent xmlns:ve="...">
 <ve:Choice Requires="colors" xmlns:colors="urn:randomTextColors">
 <w:p>
 <w:pPr>
 <colors:random colors:val="true" />
 </w:pPr>
 <w:r>
 <w:t>Random colors!</w:t>
 </w:r>
 </w:p>
 </ve:Choice>
 <ve:Fallback>
 <w:p>
 <w:r>
 <w:rPr>
 <w:color w:val="FF0000" />
 </w:rPr>
 <w:t>R</w:t>
 </w:r>
 <w:r>
 <w:rPr>
 <w:color w:val="00FF00" />
 </w:rPr>
 <w:t>a</w:t>
 </w:r>
 ...
 </w:p>
 </ve:Fallback>
</ve:AlternateContent>
```

The Choice element that requires the new color extensions uses the random element in its namespace, and the Fallback element allows clients that do not support this namespace to see an appropriate alternative representation. *end example*]

These alternate content blocks may occur at any location within a WordprocessingML document, and applications shall handle and process them appropriately (taking the appropriate choice).

However, WordprocessingML does not explicitly define a set of locations where applications shall attempt to store and roundtrip all non-taken choices whenever possible. This behavior is therefore application-defined.

[*Example:* If an application does not understand the colors extension, the resulting file (if alternate choices are to be preserved would appear as follows:

```
<ve:AlternateContent xmlns:ve="...">
 <ve:Choice Requires="colors" xmlns:colors="urn:randomTextColors">
 ...
 </ve:Choice>
 <ve:Fallback>
 ...
 </ve:Fallback>
</ve:AlternateContent>
```

The file would then appear as follows after the choice is processed:

```
<w:p>
 <w:r>
 <w:rPr>
 <w:color w:val="FF0000" />
 </w:rPr>
 <w:t>R</w:t>
 </w:r>
 <w:r>
 <w:rPr>
 <w:color w:val="00FF00" />
 </w:rPr>
 <w:t>a</w:t>
 </w:r>
 ...
</w:p>
```

The state of the alternate choices (preserved or not) is dependent on the application hosting the file. Preserving the content involves storing each non-taken choice while the file is being edited, and writing out the file with an AlternateContent block when it is resaved. *end example*]

## 2.18 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/wordprocessingml/2006/main> namespace.

### 2.18.1 ST\_AlgorithmClass (Cryptographic Algorithm Classes)

This simple type specifies the possible classes of cryptographic algorithm used by protection. [*Note*: The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. *end note*]

[*Example*: Consider a WordprocessingML document with the following information stored in one of its protection elements:

```
<w:... w:cryptAlgorithmClass="hash"
 w:cryptAlgorithmType="typeAny"
 w:cryptAlgorithmSid="1"
 w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hash (Hashing)	Specifies that the algorithm is a hashing function, which creates a hash value for user-supplied input that is very difficult to reverse-engineer.

#### Referenced By

documentProtection@cryptAlgorithmClass (§2.15.1.28); writeProtection@cryptAlgorithmClass (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgorithmClass">
 <restriction base="xsd:string">
 <enumeration value="hash"/>
 </restriction>
</simpleType>
```

### 2.18.2 ST\_AlgorithmType (Cryptographic Algorithm Types)

This simple type specifies the possible values for the type of cryptographic algorithm used by protection. [*Note*: The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. *end note*]

[*Example:* Consider a WordprocessingML document with the following information stored in one of its protection elements:

```
<w:... w:cryptAlgorithmClass="hash"
 w:cryptAlgorithmType="typeAny"
 w:cryptAlgorithmSid="1"
 w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm may have been used for the password. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
typeAny (Any Type)	Specifies that any type of cryptographic algorithm type may be used.

#### Referenced By

documentProtection@cryptAlgorithmType (§2.15.1.28); writeProtection@cryptAlgorithmType (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgType">
 <restriction base="xsd:string">
 <enumeration value="typeAny"/>
 </restriction>
</simpleType>
```

### 2.18.3 ST\_AnnotationVMerge (Table Cell Vertical Merge Revision Type)

This simple type specifies the possible values for the vertical merge setting which applied to a table cell by a cell merge (or split) revision.

[*Example:* Consider a two row by two column table in which the cells in the second column are merged, and this change is tracked as a revision. The annotation on the last cell in the table would appear as follows:

```
<w:tc>
 <w:tcPr>
 <w:cellMerge ... w:vmerge="cont" />
 </w:tcPr>
 ...
</w:tc>
```

The vmerge attribute value of cont specifies that the revision on the table cell resulted in it being merged with the previous set of vertically merged cells above it (whether that was one cell or many). *end example]*

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
cont (Vertically Merged Cell)	Specifies that the revision resulted in this cell being vertically merged with the cell above it.
rest (Vertically Split Cell)	Specifies that the revision resulted in this cell being vertically split from the one above it.

3

Referenced By
cellMerge@vMerge (§2.13.5.3); cellMerge@vMergeOrig (§2.13.5.3)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_AnnotationVMerge">
6 <restriction base="xsd:string">
7 <enumeration value="cont"/>
8 <enumeration value="rest"/>
9 </restriction>
10 </simpleType>
```

#### 11 2.18.4 ST\_Border (Border Styles)

12 This simple type specifies the types of borders which can be specified for WordprocessingML objects which have  
13 a border.

14 Borders can be separated into two types:

- 15 • *Line borders*, which specify a pattern to be used when drawing a line around the specified object.
- 16 • *Art borders*, which specify a repeated image to be used when drawing a border around the specified  
17 object.

18 Line borders may be specified on any object which allows a border, however, art borders may only be used as a  
19 border at the page level - the borders under the pgBorders element (§2.6.10).

20 [Example: Consider a left border resulting in the following WordprocessingML:

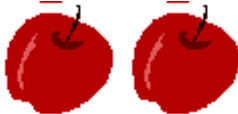

```
21 <w:left w:val="single" .../>
```

22 This border's val is single, indicating that the border style is a single line border. *end example*]

23 This simple type's contents are a restriction of the XML Schema string datatype.

24 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
apples (Apples Art Border)	<p>Specifies an art border consisting of a repeated image of an apple, as follows (showing two repetitions):</p> 
archedScallops (Arched Scallops Art Border)	<p>Specifies an art border consisting of a repeated image of a shell pattern, as follows (showing two repetitions):</p> 
babyPacifier (Baby Pacifier Art Border)	<p>Specifies an art border consisting of a repeated image of a baby pacifier, as follows (showing two repetitions):</p> 
babyRattle (Baby Rattle Art Border)	<p>Specifies an art border consisting of a repeated image of a baby rattle, as follows (showing two repetitions):</p> 
balloons3Colors (Three Color Balloons Art Border)	<p>Specifies an art border consisting of a repeated image of a set of balloons, as follows (showing two repetitions):</p> 
balloonsHotAir (Hot Air Balloons Art Border)	<p>Specifies an art border consisting of a repeated image of a hot air balloon, as follows (showing two repetitions):</p> 
basicBlackDashes (Black Dash Art Border)	<p>Specifies an art border consisting of a repeating image of a black and white background.</p>

Enumeration Value	Description
	<p>If the border is on the left or right, this image is as follows (repeated twice):</p>  <p>If the border is on the top or bottom, this image is as follows (repeated twice):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
basicBlackDots (Black Dot Art Border)	<p>Specifies an art border consisting of a repeating image of a black dot on a white background.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
basicBlackSquares (Black Square Art Border)	<p>Specifies an art border consisting of a repeating image of a black and white background.</p> <p>If the border is on the left or right, this image is as follows (repeated twice):</p>  <p>If the border is on the top or bottom, this image is as follows (repeated twice):</p>

Enumeration Value	Description
	<p>■ ■</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> <p>■</p>
basicThinLines (Thin Line Art Border)	<p>Specifies an art border consisting of a repeating image of a black and white background.</p> <p>If the border is on the left or right, this image is as follows:</p> <p>  </p> <p>If the border is on the top or bottom, this image is as follows:</p> <p>==</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> <p>└</p>
basicWhiteDashes (White Dash Art Border)	<p>Specifies an art border consisting of a repeating image of a black and white background.</p> <p>If the border is on the left or right, this image is as follows (repeated twice):</p> <p>□ □</p> <p>If the border is on the top or bottom, this image is as follows (repeated twice):</p> <p>□ □</p> <p>At any corner where two borders of this type intersect,</p>

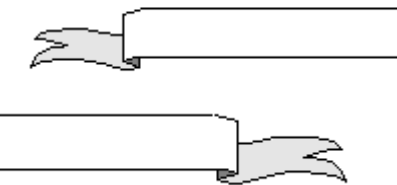

Enumeration Value	Description
	<p>the intersection shall use the following image, rotated appropriately:</p> 
<p>basicWhiteDots (White Dot Art Border)</p>	<p>Specifies an art border consisting of a repeating image of a white dot on a black background.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
<p>basicWhiteSquares (White Square Art Border)</p>	<p>Specifies an art border consisting of a repeating image of a black and white background.</p> <p>If the border is on the left or right, this image is as follows (repeated twice):</p>  <p>If the border is on the top or bottom, this image is as follows (repeated twice):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
<p>basicWideInline (Wide Inline Art Border)</p>	<p>Specifies an art border consisting of a repeating image of a black and white background.</p>

Enumeration Value	Description
	<p>If the border is on the left or right, this image is as follows (showing for the left, flipped horizontally for the right border):</p>  <p>If the border is on the top or bottom, this image is as follows (showing for the top, flipped vertically for the bottom border):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
basicWideMidline (Wide Midline Art Border)	<p>Specifies an art border consisting of a repeating image of a black and white background.</p> <p>If the border is on the left or right, this image is as follows (showing for the left, flipped horizontally for the right border):</p>  <p>If the border is on the top or bottom, this image is as follows (showing for the top, flipped vertically for the bottom border):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
basicWideOutline (Wide Outline Art Border)	Specifies an art border consisting of a repeating image

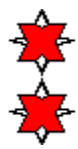

Enumeration Value	Description
	<p>of a black and white background.</p> <p>If the border is on the left or right, this image is as follows (showing for the left, flipped horizontally for the right border):</p>  <p>If the border is on the top or bottom, this image is as follows (showing for the top, flipped vertically for the bottom border):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
bats (Bats Art Border)	<p>Specifies an art border consisting of a repeated image of bats, as follows (showing two repetitions):</p> 
birds (Birds Art Border)	<p>Specifies an art border consisting of repeating images of birds.</p> <p>If the border is on the left or right, no border is displayed.</p> <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p> 
birdsFlight (Birds Flying Art Border)	<p>Specifies an art border consisting of a repeated image of birds flying, as follows (showing two repetitions):</p>

Enumeration Value	Description
	
cabins (Cabin Art Border)	<p>Specifies an art border consisting of a repeated image of a cabin, as follows (showing two repetitions):</p> 
cakeSlice (Cake Art Border)	<p>Specifies an art border consisting of a repeated image of a piece of cake, as follows (showing two repetitions):</p> 
candyCorn (Candy Corn Art Border)	<p>Specifies an art border consisting of a repeated image of candy corn, as follows (showing two repetitions):</p> 
celticKnotwork (Knot Work Art Border)	<p>Specifies an art border consisting of a repeated image of a knot work pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
certificateBanner (Certificate Banner Art Border)	<p>Specifies an art border consisting of a banner.</p>

Enumeration Value	Description
	<p>If the border is on the left or right, no border is displayed.</p> <p>If the border is on the top, this image is as follows (showing each end):</p>  <p>If this border is on the bottom, then the ends shall be flipped vertically.</p>
chainLink (Chain Link Art Border)	<p>Specifies an art border consisting of a repeating image of a chain link pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p> 
champagneBottle (Champagne Bottle Art Border)	<p>Specifies an art border consisting of a repeated image of a champagne bottle, as follows (showing two repetitions):</p> 
checkedBarBlack (Black and White Bar Art Border)	<p>Specifies an art border consisting of repeating images of a compass.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions on the left, the right would be flipped horizontally):</p>

Enumeration Value	Description
	 <p>If the border is on the top or bottom, this image is as follows (showing two repetitions on top, the bottom would be flipped vertically):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
checkedBarColor (Color Checked Bar Art Border)	<p>Specifies an art border consisting of a repeating image of a colored pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
checkered (Checkerboard Art Border)	<p>Specifies an art border consisting of a repeated image of a checkerboard, as follows (showing two repetitions):</p> 
christmasTree (Christmas Tree Art Border)	<p>Specifies an art border consisting of a repeated image of a Christmas tree, as follows (showing two</p>

Enumeration Value	Description
	<p>repetitions):</p> 
circlesLines (Circles And Lines Art Border)	<p>Specifies an art border consisting of repeating images of lines and circles.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
circlesRectangles (Circles and Rectangles Art Border)	<p>Specifies an art border consisting of a repeated image of a rectangular pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 

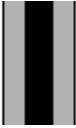

Enumeration Value	Description
classicalWave (Wave Art Border)	<p>Specifies an art border consisting of a repeated image of a wave, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
clocks (Clocks Art Border)	<p>Specifies an art border consisting of a repeated image of a clock, as follows (showing two repetitions):</p> 
compass (Compass Art Border)	<p>Specifies an art border consisting of repeating images of a compass.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
confetti (Confetti Art Border)	<p>Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions):</p>

Enumeration Value	Description
	
confettiGrays (Confetti Art Border)	<p>Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions):</p> 
confettiOutline (Confetti Art Border)	<p>Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions):</p> 
confettiStreamers (Confetti Streamers Art Border)	<p>Specifies an art border consisting of a repeated image of confetti streamers, as follows (showing two repetitions):</p> 
confettiWhite (Confetti Art Border)	<p>Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions):</p> 
cornerTriangles (Corner Triangle Art Border)	<p>Specifies an art border consisting of a repeated image of a line as follows:</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
couponCutoutDashes (Dashed Line Art Border)	<p>Specifies an art border consisting of a dashed line, as follows:</p>  <p>As well, this art border shall be rotated such that the</p>

Enumeration Value	Description
	<p>bottom of the image above is always nearest the text extents.</p> <p>If the top border is of this type, the border shall use the following image in the top left corner:</p> 
couponCutoutDots (Dotted Line Art Border)	<p>Specifies an art border consisting of a dotted line, as follows:</p> <p>• • • •</p> <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>If the top border is of this type, the border shall use the following image in the top left corner:</p>  <p>If the bottom border is of this type, the border shall use the following image in the bottom right corner:</p> 
crazyMaze (Maze Art Border)	<p>Specifies an art border consisting of a repeated image of a maze-like pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 

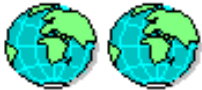

Enumeration Value	Description
creaturesButterfly (Butterfly Art Border)	<p>Specifies an art border consisting of a repeated image of a butterfly, as follows (showing two repetitions):</p> 
creaturesFish (Fish Art Border)	<p>Specifies an art border consisting of a repeated image of a fish, as follows (showing two repetitions):</p> 
creaturesInsects (Insects Art Border)	<p>Specifies an art border consisting of repeating images of insects.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
creaturesLadyBug (Ladybug Art Border)	<p>Specifies an art border consisting of a repeated image of a ladybug, as follows (showing two repetitions):</p> 
crossStitch (Cross-stitch Art Border)	<p>Specifies an art border consisting of repeating images of a cross-stitch pattern, as follows (showing two repetitions):</p> 

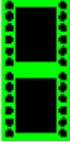

Enumeration Value	Description
cup (Cupid Art Border)	<p>Specifies an art border consisting of a repeated image of Cupid, as follows (showing two repetitions):</p> 
dashDotStroked (Dash Dot Strokes Line Border)	<p>Specifies a line border consisting of a line with a series of alternating thin and thick strokes around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
dashed (Dashed Line Border)	<p>Specifies a line border consisting of a dashed line around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
dashSmallGap (Dashed Line Border)	<p>Specifies a line border consisting of a dashed line with small gaps around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
decoArch (Archway Art Border)	<p>Specifies an art border consisting of repeating images of an archway.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>

Enumeration Value	Description
	 <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
decoArchColor (Color Archway Art Border)	<p>Specifies an art border consisting of repeating images of a color archway.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
decoBlocks (Blocks Art Border)	<p>Specifies an art border consisting of repeating images of a series of blocks.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as</p>

Enumeration Value	Description
	<p>follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly:</p> 
diamondsGray (Gray Diamond Art Border)	<p>Specifies an art border consisting of a repeated image of diamonds, as follows (showing two repetitions):</p> 
dotDash (Dot Dash Line Border)	<p>Specifies a line border consisting of a alternating dotted and dashed line around the parent object.</p> <p>[Example:</p> <p>-----</p> <p>end example]</p>
dotDotDash (Dot Dot Dash Line Border)	<p>Specifies a line border consisting of a alternating dotted, dotted, dashed line around the parent object.</p> <p>[Example:</p> <p>-----</p> <p>end example]</p>
dotted (Dotted Line Border)	<p>Specifies a line border consisting of a dotted line around the parent object.</p> <p>[Example:</p> <p>.....</p> <p>end example]</p>
double (Double Line Border)	<p>Specifies a line border consisting of a double line around the parent object.</p>

Enumeration Value	Description
	<p>[Example:</p> <hr/> <p>end example]</p>
doubleD (Double D Art Border)	<p>Specifies an art border consisting of repeating images of a pattern.</p> <p>If the border is on the left, this image is as follows (showing two repetitions):</p>  <p>If the border is on the right, this image is rotated as follows (showing two repetitions):</p>  <p>If the border is on the top, this image is rotated as follows (showing two repetitions):</p>  <p>If the border is on the bottom, this image is rotated as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
doubleDiamonds (Diamond Art Border)	<p>Specifies an art border consisting of a repeated image of a series of diamonds, as follows (showing two repetitions):</p> 

Enumeration Value	Description
doubleWave (Double Wave Line Border)	<p>Specifies a line border consisting of a double wavy line around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
earth1 (Earth Art Border)	<p>Specifies an art border consisting of a repeated image of Earth, as follows (showing two repetitions):</p> 
earth2 (Earth Art Border)	<p>Specifies an art border consisting of a repeated image of Earth, as follows (showing two repetitions):</p> 
eclipsingSquares1 (Shadowed Square Art Border)	<p>Specifies an art border consisting of a repeated image of a shadowed square, as follows (showing two repetitions):</p> 
eclipsingSquares2 (Shadowed Square Art Border)	<p>Specifies an art border consisting of a repeated image of a shadowed square, as follows (showing two repetitions):</p> 
eggsBlack (Painted Egg Art Border)	<p>Specifies an art border consisting of a repeated image of a painted egg, as follows (showing two repetitions):</p> 
fans (Fans Art Border)	<p>Specifies an art border consisting of a repeated image of fans, as follows (showing two repetitions):</p>

Enumeration Value	Description
	
film (Film Reel Art Border)	<p>Specifies an art border consisting of repeating images of a film reel.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
firecrackers (Firecracker Art Border)	<p>Specifies an art border consisting of a repeated image of a firecracker, as follows (showing two repetitions):</p> 
flowersBlockPrint (Flowers Art Border)	<p>Specifies an art border consisting of a repeated image of flowers, as follows (showing two repetitions):</p> 
flowersDaisies (Daisy Art Border)	<p>Specifies an art border consisting of a repeated image of a daisy, as follows (showing two repetitions):</p> 
flowersModern1 (Flowers Art Border)	<p>Specifies an art border consisting of a repeated image</p>

Enumeration Value	Description
	<p>of flowers, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p>
flowersModern2 (Flowers Art Border)	<p>Specifies an art border consisting of a repeated image of flowers, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p>
flowersPansy (Pansy Art Border)	<p>Specifies an art border consisting of a repeated image of a pansy, as follows (showing two repetitions):</p> 
flowersRedRose (Red Rose Art Border)	<p>Specifies an art border consisting of a repeated image of a red rose, as follows (showing two repetitions):</p> 
flowersRoses (Roses Art Border)	<p>Specifies an art border consisting of a repeated image of a rose, as follows (showing two repetitions):</p> 
flowersTeacup (Flowers in a Teacup Art Border)	<p>Specifies an art border consisting of a repeated image of flowers in a teacup, as follows (showing two repetitions):</p> 
flowersTiny (Small Flower Art Border)	<p>Specifies an art border consisting of a repeated image</p>

Enumeration Value	Description
	<p>of small flowers, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p>
gems (Gems Art Border)	<p>Specifies an art border consisting of a repeated image of a square pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image (shown from the left side - this image shall be flipped horizontally for the right side):</p> 
gingerbreadMan (Gingerbread Man Art Border)	<p>Specifies an art border consisting of a repeated image of a gingerbread man, as follows (showing two repetitions):</p> 
gradient (Triangle Gradient Art Border)	<p>Specifies an art border consisting of a repeated image of a triangle with a gradient pattern as follows (showing two repetitions):</p> 
handmade1 (Handmade Art Border)	<p>Specifies an art border consisting of an image with a handmade appearance.</p> <p>On the top (bottom is flipped vertically), this image shall be a stretched version of the following:</p>

Enumeration Value	Description
	 <p>On the left (right is flipped horizontally), this image shall be a stretched version of the following:</p> 
handmade2 (Handmade Art Border)	<p>Specifies an art border consisting of an image with a handmade appearance.</p> <p>On the top (bottom is flipped vertically), this image shall be a stretched version of the following:</p>  <p>On the left (right is flipped horizontally), this image shall be a stretched version of the following:</p>

Enumeration Value	Description
	
heartBalloon (Heart-Shaped Balloon Art Border)	<p>Specifies an art border consisting of a repeated image of a heart-shaped balloon, as follows (showing two repetitions):</p> 
heartGray (Gray Heart Art Border)	<p>Specifies an art border consisting of a repeated image of a heart, as follows (showing two repetitions):</p> 
hearts (Hearts Art Border)	<p>Specifies an art border consisting of a repeated image of hearts, as follows (showing two repetitions):</p> 
heebieJeebies (Pattern Art Border)	<p>Specifies an art border consisting of a repeated image</p>

Enumeration Value	Description
	<p>of a pattern as follows (showing two repetitions):</p> 
holly (Holly Art Border)	<p>Specifies an art border consisting of a repeated image of holly, as follows (showing two repetitions):</p> 
houseFunky (House Art Border)	<p>Specifies an art border consisting of a repeated image of a house, as follows (showing two repetitions):</p> 
hypnotic (Circular Art Border)	<p>Specifies an art border consisting of a repeated image of a series of circles, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
iceCreamCones (Ice Cream Cone Art Border)	<p>Specifies an art border consisting of a repeated image of an ice cream cone, as follows (showing two repetitions):</p> 
inset (Inset Line Border)	<p>Specifies a line border consisting of an inset set of lines around the parent object.</p> <p>[Example:</p> 

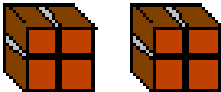

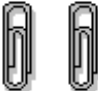

Enumeration Value	Description
	<i>end example]</i>
lightBulb (Light Bulb Art Border)	<p>Specifies an art border consisting of a repeated image of a light bulb as follows (showing two repetitions):</p> 
lightning1 (Lightning Art Border)	<p>Specifies an art border consisting of a repeated image of lightning, as follows (showing two repetitions):</p> 
lightning2 (Lightning Art Border)	<p>Specifies an art border consisting of a repeated image of a lightning pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
mapleLeaf (Maple Leaf Art Border)	<p>Specifies an art border consisting of a repeated image of a black and white image of a maple leaf, as follows (showing two repetitions):</p> 
mapleMuffins (Muffin Art Border)	<p>Specifies an art border consisting of a repeated image of a muffin, as follows (showing two repetitions):</p>

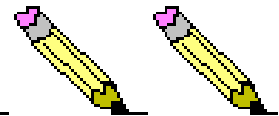

Enumeration Value	Description
	
mapPins (Map Pins Art Border)	<p>Specifies an art border consisting of a repeated image of a map pin, as follows (showing two repetitions):</p> 
marquee (Marquee Art Border)	<p>Specifies an art border consisting of a repeated image of a pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
marqueeToothed (Marquee Art Border)	<p>Specifies an art border consisting of a repeated image of a pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
moons (Moon Art Border)	<p>Specifies an art border consisting of repeating images of phases of the moon.</p> <p>If the border is on the top, this image is as follows (showing two repetitions):</p> 

Enumeration Value	Description
	<p>If the border is on the left, this image is as follows (showing two repetitions):</p>  <p>If the border is on the right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the bottom, this image is as follows (showing two repetitions):</p>  <p>At the top-left corner where two borders of this type intersect, the intersection shall use the following image:</p>  <p>At the top-right corner where two borders of this type intersect, the intersection shall use the following image:</p>  <p>At the bottom-left corner where two borders of this type intersect, the intersection shall use the following image:</p>  <p>At the bottom-right corner where two borders of this type intersect, the intersection shall use the following image:</p> 

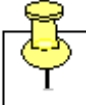

Enumeration Value	Description
	<p>type intersect, the intersection shall use the following image:</p> 
mosaic (Mosaic Art Border)	<p>Specifies an art border consisting of a repeated image of a mosaic pattern, as follows (showing two repetitions):</p> 
musicNotes (Musical Note Art Border)	<p>Specifies an art border consisting of a repeated image of a musical note, as follows (showing two repetitions):</p> 
nil (No Border)	<p>Specifies that no border shall be applied to the current item.</p>
none (No Border)	<p>Specifies that no border shall be applied to the current item.</p>
northwest (Patterned Art Border)	<p>Specifies an art border consisting of a repeated image of a pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
outset (Outset Line Border)	<p>Specifies a line border consisting of an outset set of lines around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
ovals (Oval Art Border)	<p>Specifies an art border consisting of a repeated image</p>

Enumeration Value	Description
	<p>of a series of ovals, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
packages (Package Art Border)	<p>Specifies an art border consisting of a repeated image of a package, as follows (showing two repetitions):</p> 
palmsBlack (Black Palm Tree Art Border)	<p>Specifies an art border consisting of a repeated image of a black and white palm tree, as follows (showing two repetitions):</p> 
palmsColor (Color Palm Tree Art Border)	<p>Specifies an art border consisting of a repeated image of a color palm tree, as follows (showing two repetitions):</p> 
paperClips (Paper Clip Art Border)	<p>Specifies an art border consisting of a repeated image of a paper clip, as follows (showing two repetitions):</p> 

Enumeration Value	Description
papyrus (Papyrus Art Border)	<p>Specifies an art border consisting of repeating images of ovals and an art corner.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
partyFavor (Party Favor Art Border)	<p>Specifies an art border consisting of a repeated image of a party favor, as follows (showing two repetitions):</p> 
partyGlass (Party Glass Art Border)	<p>Specifies an art border consisting of a repeated image of a party glass, as follows (showing two repetitions):</p> 
pencils (Pencils Art Border)	<p>Specifies an art border consisting of a repeated image of a pencil, as follows (showing two repetitions):</p> 

Enumeration Value	Description
people (Character Art Border)	<p>Specifies an art border consisting of a repeated image of a character, as follows (showing two repetitions):</p> 
peopleHats (Character With Hat Art Border)	<p>Specifies an art border consisting of a repeated image of a character with a hat, as follows (showing two repetitions):</p> 
peopleWaving (Waving Character Border)	<p>Specifies an art border consisting of a repeated image of a character waving, as follows (showing two repetitions):</p> 
poinsettias (Poinsettia Art Border)	<p>Specifies an art border consisting of a repeated image of a poinsettia, as follows (showing two repetitions):</p> 
postageStamp (Postage Stamp Art Border)	<p>Specifies an art border consisting of repeating images of a stamp-like pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
pumpkin1 (Pumpkin Art Border)	<p>Specifies an art border consisting of a repeated image of a pumpkin, as follows (showing two repetitions):</p>

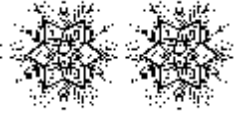

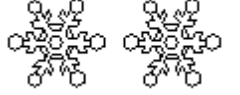

Enumeration Value	Description
	
pushPinNote1 (Push Pin Art Border)	<p>Specifies an art border consisting of a black line, as follows:</p> <hr data-bbox="824 506 1008 512"/> <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>If the top border is of this type, the border shall use the following image in the top left corner:</p> 
pushPinNote2 (Push Pin Art Border)	<p>Specifies an art border consisting of a repeated image of a black line.</p> <p>If the border is on the top, left or right, then the image is as follows (showing two repetitions):</p> <hr data-bbox="824 1104 1008 1110"/> <p>If the border is on the bottom, then the image is as follows (showing two repetitions):</p>  <p>If the top border is of this type, the border shall use the following image in the top left corner:</p> 
pyramids (Pyramid Art Border)	<p>Specifies an art border consisting of repeating images of a pyramid pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the</p>

Enumeration Value	Description
	<p>bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
pyramidsAbove (Pyramid Art Border)	<p>Specifies an art border consisting of a repeated image of a pyramid viewed from above, as follows (showing two repetitions):</p> 
quadrants (Quadrants Art Border)	<p>Specifies an art border consisting of a repeating image of a colored pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
rings (Rings Art Border)	<p>Specifies an art border consisting of a repeated image of a ring, as follows (showing two repetitions):</p> 
safari (Safari Art Border)	<p>Specifies an art border consisting of a repeated image of a print pattern, as follows (showing two repetitions):</p>

Enumeration Value	Description
	
sawtooth (Saw tooth Art Border)	<p>Specifies an art border consisting of repeating images of a saw tooth pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
sawtoothGray (Gray Saw tooth Art Border)	<p>Specifies an art border consisting of repeating images of a saw tooth pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
scaredCat (Scared Cat Art Border)	<p>Specifies an art border consisting of a repeated image of a frightened cat, as follows (showing two repetitions):</p> 
seattle (Umbrella Art Border)	<p>Specifies an art border consisting of a repeated image</p>

Enumeration Value	Description
	<p>of an umbrella, as follows (showing two repetitions):</p> 
shadowedSquares (Shadowed Squares Art Border)	<p>Specifies an art border consisting of a repeated image of squares with a drop shadow, as follows (showing two repetitions):</p> 
sharksTeeth (Shark Tooth Art Border)	<p>Specifies an art border consisting of a repeating image of a shark tooth pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions on the top, the bottom shall be rotated 180 degrees):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the left and right border.</p>
shorebirdTracks (Bird Tracks Art Border)	<p>Specifies an art border consisting of a repeated image of bird tracks, as follows</p>  <p>As well, this art border shall be rotated such that the bottom of each image is always nearest the text extents.</p>
single (Single Line Border)	<p>Specifies a line border consisting of a single line around the parent object.</p> <p>[Example:</p> 

Enumeration Value	Description
	end example]
skyrocket (Rocket Art Border)	<p>Specifies an art border consisting of a repeated image of a rocket, as follows (showing two repetitions):</p> 
snowflakeFancy (Snowflake Art Border)	<p>Specifies an art border consisting of a repeated image of a snowflake, as follows (showing two repetitions):</p> 
snowflakes (Snowflake Art Border)	<p>Specifies an art border consisting of a repeated image of a snowflake, as follows (showing two repetitions):</p> 
sombrero (Sombrero Art Border)	<p>Specifies an art border consisting of a repeated image of a sombrero, as follows (showing two repetitions):</p> 
southwest (Southwest-themed Art Border)	<p>Specifies an art border consisting of a repeated image of a pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
stars (Stars Art Border)	<p>Specifies an art border consisting of a repeated image of stars, as follows (showing two repetitions):</p>

Enumeration Value	Description
	
stars3d (3-D Stars Art Border)	<p>Specifies an art border consisting of a repeated image of three-dimensional stars, as follows (showing two repetitions):</p> 
starsBlack (Stars Art Border)	<p>Specifies an art border consisting of a repeated image of black stars, as follows (showing three repetitions):</p> 
starsShadowed (Stars With Shadows Art Border)	<p>Specifies an art border consisting of a repeated image of stars with a shadow effect, as follows (showing two repetitions):</p> 
starsTop (Stars On Top Art Border)	<p>Specifies an art border consisting of repeating images of stars on the top of the page.</p> <p>If the border is on the left or right, no border is displayed.</p> <p>If the border is on the top, this image is as follows:</p>  <p>If the border is on the bottom, this image is as follows:</p> 
sun (Sun Art Border)	<p>Specifies an art border consisting of a repeated image of the sun, as follows (showing two repetitions):</p> 
swirligig (Whirligig Art Border)	<p>Specifies an art border consisting of a repeated image as follows (showing two repetitions):</p>

Enumeration Value	Description
	
thick (Single Line Border)	<p>Specifies a line border consisting of a single line around the parent object.</p> <p>[Example:</p> <hr/> <p>end example]</p>
thickThinLargeGap (Thick, Thin Line Border)	<p>Specifies a line border consisting of a thick line contained within a thin line with a large sized intermediate gap around the parent object.</p> <p>[Example:</p> <hr style="border-top: 3px double black;"/> <p>end example]</p>
thickThinMediumGap (Thick, Thin Line Border)	<p>Specifies a line border consisting of a thick line contained within a thin line with a medium sized intermediate gap around the parent object.</p> <p>[Example:</p> <hr style="border-top: 3px double black;"/> <p>end example]</p>
thickThinSmallGap (Thick, Thin Line Border)	<p>Specifies a line border consisting of a thick line contained within a thin line with a small intermediate gap around the parent object.</p> <p>[Example:</p> <hr style="border-top: 3px double black;"/> <p>end example]</p>
thinThickLargeGap (Thin, Thick Line Border)	<p>Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a large sized intermediate gap between each around the parent object.</p> <p>[Example:</p> <hr style="border-top: 3px double black;"/> <p>end example]</p>

Enumeration Value	Description
	<i>end example]</i>
thinThickMediumGap (Thin, Thick Line Border)	<p>Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a medium sized intermediate gap between each around the parent object.</p> <p>[Example:</p>  <p><i>end example]</i></p>
thinThickSmallGap (Thin, Thick Line Border)	<p>Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a small intermediate gap between each around the parent object.</p> <p>[Example:</p>  <p><i>end example]</i></p>
thinThickThinLargeGap (Thin, Thick, Thin Line Border)	<p>Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a large sized intermediate gap around the parent object.</p> <p>[Example:</p>  <p><i>end example]</i></p>
thinThickThinMediumGap (Thin, Thick, Thin Line Border)	<p>Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a medium sized intermediate gap around the parent object.</p> <p>[Example:</p>  <p><i>end example]</i></p>

Enumeration Value	Description
thinThickThinSmallGap (Thin, Thick, Thin Line Border)	<p>Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a small intermediate gap around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
threeDEmboss (3D Embossed Line Border)	<p>Specifies a line border consisting of three staged gradient lines around the parent object, getting darker towards the object.</p> <p>[Example:</p>  <p>end example]</p>
threeDEngrave (3D Engraved Line Border)	<p>Specifies a line border consisting of three staged gradient lines around the parent object, getting darker away from the object.</p> <p>[Example:</p>  <p>end example]</p>
tornPaper (Torn Paper Art Border)	<p>Specifies an art border consisting of repeating images of stars on the top of the page.</p> <p>If the border is on the left or right, no border is displayed.</p> <p>If the border is on the top or bottom, this image is as follows (shown on top, flipped vertically on bottom):</p> 
tornPaperBlack (Black Torn Paper Art Border)	<p>Specifies an art border consisting of an image with a torn appearance.</p> <p>On the top (bottom border shall be flipped vertically),</p>

Enumeration Value	Description
	<p>this image shall be a stretched version of the following:</p>  <p>On the left (the right side shall be flipped horizontally), this image shall be a stretched version of the following:</p> 
trees (Tree Art Border)	<p>Specifies an art border consisting of a repeated image of a tree, as follows (showing two repetitions):</p> 
triangleParty (Triangle Art Border)	<p>Specifies an art border consisting of a repeated image of triangles, as follows (showing two repetitions):</p>

Enumeration Value	Description
	
triangles (Triangles Art Border)	<p>Specifies an art border consisting of a repeating image of a triangle pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions on the left, the right shall be rotated 180 degrees):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions on the top, the bottom shall be rotated 180 degrees):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
tribal1 (Tribal Art Border One)	<p>Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
tribal2 (Tribal Art Border Two)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	<p>of a tribal pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
tribal3 (Tribal Art Border Three)	<p>Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
tribal4 (Tribal Art Border Four)	<p>Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
tribal5 (Tribal Art Border Five)	Specifies an art border consisting of a repeating image

Enumeration Value	Description
	<p>of a tribal pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
tribal6 (Tribal Art Border Six)	<p>Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):</p>  <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
triple (Triple Line Border)	<p>Specifies a line border consisting of a triple line around the parent object.</p> <p><i>[Example:</i></p>  <p><i>end example]</i></p>
twistedLines1 (Twisted Lines Art Border)	<p>Specifies an art border consisting of a repeated image of twisted lines, as follows (showing two repetitions):</p> 

Enumeration Value	Description
	<p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
twistedLines2 (Twisted Lines Art Border)	<p>Specifies an art border consisting of a repeated image of twisted lines, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
vine (Vine Art Border)	<p>Specifies an art border consisting of a repeating image of a vine pattern.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p>

Enumeration Value	Description
	 <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
wave (Wavy Line Border)	<p>Specifies a line border consisting of a wavy line around the parent object.</p> <p>[Example:</p>  <p>end example]</p>
waveline (Wavy Line Art Border)	<p>Specifies an art border consisting of a repeated image of wavy lines, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
weavingAngles (Weaving Angles Art Border)	<p>Specifies an art border consisting of a repeated image of weaving angles, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p>

Enumeration Value	Description
	<p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
weavingBraid (Weaving Braid Art Border)	<p>Speci Specifies an art border consisting of repeating images of a weaving pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 
weavingRibbon (Weaving Ribbon Art Border)	<p>Specifies an art border consisting of repeating images of a weaving ribbon, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly:</p> 
weavingStrips (Weaving Strips Art Border)	<p>Specifies an art border consisting of repeating images of weaving strips, as follows (showing two repetitions):</p> 

Enumeration Value	Description
	<p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly:</p> 
whiteFlowers (White Flowers Art Border)	<p>Specifies an art border consisting of a repeating image of white flowers.</p> <p>If the border is on the left or right, this image is as follows (showing two repetitions):</p>  <p>If the border is on the top or bottom, this image is as follows (showing two repetitions):</p> 
woodwork (Woodwork Art Border)	<p>Specifies an art border consisting of repeating images of a woodwork pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image:</p> 

Enumeration Value	Description
xIllusions (Crisscross Art Border)	<p>Specifies an art border consisting of repeating images of a crisscross pattern, as follows (showing two repetitions):</p> 
zanyTriangles (Triangle Art Border)	<p>Specifies an art border consisting of repeating images of a triangle pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:</p> 
zigZag (Zigzag Art Border)	<p>Specifies an art border consisting of repeating images of a zigzag pattern, as follows (showing two repetitions):</p>  <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly:</p> 
zigZagStitch (Zigzag stitch)	<p>Specifies an art border consisting of a repeating image of a zigzag pattern, as follows (showing two repetitions):</p>

Enumeration Value	Description
	 <p>As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.</p> <p>At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly:</p>

### 2.18.5 ST\_BrClear (Line Break Text Wrapping Restart Location)

This simple type specifies the set of possible restart locations which may be used as to determine the next available line when a break's type attribute has a value of textWrapping. This property only affects the restart location when the current run is being displayed on a line which does not span the full text extents due to the presence of a floating object (see enumeration values for details).

[*Example:* Consider a text wrapping break character which should force the restart location to the next line which spans the full width of the text extents of the page (there are no floating objects which interrupt the line).

This line break is of type textWrapping, since it shall only advance to the next line, but the clear value shall specify that this restart location shall ignore all lines which are not of the full line width by specifying a value of all, as follows:

`<w:br w:type="textWrapping" w:clear="all" />`

This break shall therefore not use the next available line, but rather the next available line ignoring all lines which do not span the full text width. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (Restart On Next Full Line)	<p>Specifies that the text wrapping break shall advance the text to the next line in the WordprocessingML document which spans the full width of the line (i.e. the next line which is not interrupted by any floating objects when those objects are positioned on the page at display time.</p> <p>[<i>Note</i>: This setting is typically used to place a single line of text next to a floating object for use as a caption. <i>end note</i>]</p>
left (Restart In Next Text Region When In Leftmost Position)	<p>Specifies that the text wrapping break shall behave as follows:</p> <p>If this line is broken into multiple regions (a floating object in the center of the page has text wrapping on both sides:</p> <ul style="list-style-type: none"> <li>• If this is the leftmost region of text flow on this line, advance the text to the next position on the line</li> <li>• Otherwise, treat this as a text wrapping break of type <code>all</code>.</li> </ul> <p>If this line is not broken into multiple regions, then treat this break as a text wrapping break of type <code>none</code>.</p> <p>If the parent paragraph is right to left, then these behaviors are also reversed.</p> <p>[<i>Note</i>: This break type is used to control the text wrapping on the left side of a floating image without preventing text from appearing on the opposite side. <i>end note</i>]</p>
none (Restart On Next Line)	<p>Specifies that the text wrapping break shall advance the text to the next line in the WordprocessingML document, regardless of its position left to right or the presence of any floating objects which intersect with the line,</p>

Enumeration Value	Description
	This is the setting for a typical line break in a document.
right (Restart In Next Text Region When In Rightmost Position)	<p>Specifies that the text wrapping break shall behave as follows:</p> <p>If this line is broken into multiple regions (a floating object in the center of the page has text wrapping on both sides:</p> <ul style="list-style-type: none"><li>• If this is the rightmost region of text flow on this line, advance the text to the next position on the next line</li><li>• Otherwise, treat this as a text wrapping break of type all.</li></ul> <p>If this line is not broken into multiple regions, then treat this break as a text wrapping break of type none.</p> <p>If the parent paragraph is right to left, then these behaviors are also reversed.</p> <p>[Note: This break type is used to control the text wrapping on the right side of a floating image without preventing text from appearing on the opposite side. <i>end note</i>]</p>

2.18.6 ST\_BrType (Break Types)

This simple type specifies the possible types of break characters in a WordprocessingML document. The break type determines the next location where text shall be placed after this manual break is applied to the text contents (see enumeration values for details).

[*Example*: Consider a manual break which shall advance the text to the next text column in the document, rather than just the next available line. This break would therefore be specified as follows:

```
<w:br w:type="column"/>
```

The type attribute specifies a value of `column`, which means that the break shall force the next character in the document to be restarted on the next line in a new text column in the document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
column (Column Break)	<p>Specifies that the current break shall restart itself on the next column available on the current page when the document is displayed in page view.</p> <p>If the current section is not divided into columns, or the column break occurs in the last column on the current page when displayed, then the restart location for text shall be the next page in the document.</p>
page (Page Break)	<p>Specifies that the current break shall restart itself on the next page of the document when the document is displayed in page view.</p> <p>Page breaks shall be ignored when present in frames unless the <code>showBreaksInFrames</code> element (§2.15.3.42) is present in the document's compatibility settings.</p>
textWrapping (Line Break)	<p>Specifies that the current break shall restart itself on the next line in the document when the document is displayed in page view.</p> <p>The determine of the next line shall be done subject to the value of the <code>clear</code> attribute on the specified break character.</p>

#### Referenced By

`br@type` (§2.3.3.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BrType">
 <restriction base="xsd:string">
 <enumeration value="page"/>
 <enumeration value="column"/>
 <enumeration value="textWrapping"/>
 </restriction>
</simpleType>
```

### 2.18.7 ST\_CalendarType (Calendar Types)

This simple type specifies the possible types of calendars which may be used within the context of a WordprocessingML document.

[*Example:* Consider the following structured document tag properties:

```
<w:sdtPr>
 <w:date w:fullDate="01-01-2006T06:30:00Z">
 <w:calendar w:val="gregorian"/>
 </w:date>
</w:sdtPr>
```

The calendar element specifies that the calendar type for a calendar which may be displayed in the document shall be the Gregorian calendar format (*gregorian*). *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
gregorian (Gregorian)	Specifies that the Gregorian calendar shall be used. This calendar may be localized into the appropriate language as desired.
gregorianXlitEnglish (Gregorian transliterated English)	Specifies that the Gregorian transliterated English calendar shall be used.
gregorianXlitFrench (Gregorian transliterated French)	Specifies that the Gregorian transliterated French calendar shall be used.
hebrew (Hebrew)	Specifies that the Hebrew lunar calendar shall be used.
hijri (Hijri)	Specifies that the Hijri lunar calendar shall be used.
japan (Japanese Emperor Era)	Specifies that the Japanese Emperor Era calendar shall be used.
korea (Korean Tangun Era)	Specifies that the Korean Tangun Era calendar shall be used.
saka (Saka Era)	Specifies that the Saka Era calendar shall be used.
taiwan (Taiwan)	Specifies that the Taiwanese calendar shall be used.

Enumeration Value	Description
thai (Thai)	Specifies that the Thai calendar shall be used.

Referenced By
calendar@val (§2.5.2.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalendarType">
 <restriction base="xsd:string">
 <enumeration value="gregorian"/>
 <enumeration value="hijri"/>
 <enumeration value="hebrew"/>
 <enumeration value="taiwan"/>
 <enumeration value="japan"/>
 <enumeration value="thai"/>
 <enumeration value="korea"/>
 <enumeration value="saka"/>
 <enumeration value="gregorianXlitEnglish"/>
 <enumeration value="gregorianXlitFrench"/>
 </restriction>
</simpleType>
```

2.18.8 ST\_CaptionPos (Automatic Caption Positioning Values)

This simple type specifies the possible values may be used for the position of an automatically inserted caption on an object within this document. These values specify the position a given caption shall be take relative to the object it is used to label.

[Example: Consider a WordprocessingML document which should have all automatically inserted captions placed below the objects they are captioning, for example:

This requirement is specified using the following WordprocessingML in the document settings:

```
<w:captions>
 <w:caption w:name="Table" w:pos="below" w:numFmt="decimal" />
</w:captions>
```

The pos attribute has a value of below, specifying that the caption shall be placed below the newly inserted objects. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
above (Position Caption Above Object)	Specifies that an automatically inserted caption shall be positioned above the object that it is used to label.
below (Position Caption Below Object)	Specifies that an automatically inserted caption shall be positioned below the object that it is used to label.
left (Position Caption Left Of Object)	Specifies that an automatically inserted caption shall be positioned to the left of the object that it is used to label (the position where text typed immediately before the object would appear).
right (Position Caption Right Of Object)	Specifies that an automatically inserted caption shall be positioned to the right of the object that it is used to label (the position where text typed immediately after the object would appear).

#### Referenced By

caption@pos (§2.15.1.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CaptionPos">
 <restriction base="xsd:string">
 <enumeration value="above"/>
 <enumeration value="below"/>
 <enumeration value="left"/>
 <enumeration value="right"/>
 </restriction>
</simpleType>
```

### 2.18.9 ST\_ChapterSep (Chapter Separator Types)

This simple type specifies the character which shall be used to separate the chapter number from the page number for page numbers in a given section, when chapter numbers are being displayed.

[*Example*: Consider a section in a document in which the chapter shall be separated from the page number using a colon character. This constraint would be specified using the following WordprocessingML:

```
<w:pgNumType w:chapSep="colon" chapStyle="1" />
```

The chapSep attribute declares that the chapter and page number shall be separated by a colon (e.g. 1:1 for chapter one, page one). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
colon (Colon Chapter Separator)	Specifies that a colon character shall be used to separate the chapter number from the page number when page numbers are displayed.  [ <i>Example</i> : 1:1 for page one, section one. <i>end example</i> ]
emDash (Em Dash Chapter Separator)	Specifies that an em dash character shall be used to separate the chapter number from the page number when page numbers are displayed.  [ <i>Example</i> : 1—1 for page one, section one. <i>end example</i> ]
enDash (En Dash Chapter Separator)	Specifies that an en dash character shall be used to separate the chapter number from the page number when page numbers are displayed.  [ <i>Example</i> : 1–1 for page one, section one. <i>end example</i> ]
hyphen (Hyphen Chapter Separator)	Specifies that a non-breaking hyphen character shall be used to separate the chapter number from the page number when page numbers are displayed.  [ <i>Example</i> : 1-1 for page one, section one. <i>end example</i> ]
period (Period Chapter Separator)	Specifies that a period character shall be used to separate the chapter number from the page number when page numbers are displayed.  [ <i>Example</i> : 1.1 for page one, section one. <i>end example</i> ]

8

```
<simpleType name="ST_ChapterSep">
 <restriction base="xsd:string">
 <enumeration value="hyphen"/>
 <enumeration value="period"/>
 <enumeration value="colon"/>
 <enumeration value="emDash"/>
 <enumeration value="enDash"/>
 </restriction>
</simpleType>
```

**2.18.10 ST\_CharacterSpacing (Character-Level Whitespace Compression Settings)**

This simple type specifies the possible ways in which full-width characters in the current WordprocessingML document may be compressed to remove additional whitespace when the contents of this document are displayed, specifically by specifying the set(s) of characters which may be compressed to remove additional whitespace.

[Example: Consider the WordprocessingML below:

```
<w:characterSpacingControl w:val="dontCompress" />
```

The characterSpacingControl element has a val attribute value of dontCompress, which specifies that no character compression shall be applied to any character when the document is displayed. end example]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
compressPunctuation (Compress Whitespace From Punctuation Characters)	Specifies that only whitespace characters shall have whitespace compression applied to them.
compressPunctuationAndJapaneseKana (Compress Whitespace From Both Japanese Kana And Punctuation Characters)	Specifies that whitespace and Japanese kana characters shall have whitespace compression applied to them.
doNotCompress (Do Not Compress Whitespace)	Specifies that characters shall not have whitespace compression applied to them.

Referenced By
characterSpacingControl@val (§2.15.1.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CharacterSpacing">
 <restriction base="xsd:string">
 <enumeration value="doNotCompress"/>
 <enumeration value="compressPunctuation"/>
 <enumeration value="compressPunctuationAndJapaneseKana"/>
 </restriction>
</simpleType>
```

### 2.18.11 ST\_Cnf (Conditional Formatting Bitmask)

This simple type specifies the format for the set of conditional formatting properties that have been applied to this object.

These properties are expressed using a string serialization of a binary bitmask for each of the following properties (reading from the first character position right):

- First Row - Is this the first row of the table?
- Last Row - Is this the last row of the table?
- First Column - Does this belong to the first column of the table?
- Last Column - Does this belong to the last column of the table?
- Band 1 Vertical - Does this belong to a column which should receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered columns (e.g. 1,3,5,...)
- Band 2 Vertical - Does this belong to a column which should receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered columns (e.g. 2,4,6...)
- Band 1 Horizontal - Does this receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered rows (e.g. 1,3,5,...)
- Band 2 Horizontal - Does this receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered rows (e.g. 2,4,6...)
- NE Cell - Is this part of the top-right corner of the table?
- NW Cell - Is this part of the top-left corner of the table?
- SE Cell - Is this part of the bottom-right corner of the table?
- SW Cell - Is this part of the bottom-left corner of the table?

For each of these properties, a value of 1 in the specified character position in the string means that the value is true, a value of 0 means false. All values must be specified.

*[Example:* Consider a paragraph in the top right corner of a table with a table style applied. This paragraph would need to specify the following WordprocessingML:

```
<w:p>
 <w:pPr>
 <w:cnfStyle w:val="101000000100" />
```

```

1 ...
2 </w:pPr>
3 ...
4 </w:p>

```

This paragraph specifies that it has the conditional properties from the table style for the first column, first row, and the NW corner of the parent table by setting the appropriate bits in the val attribute. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 12 characters.
- This simple type's contents must match the following regular expression pattern: [01]\*.

Referenced By
cnfStyle@val (§2.3.1.8); cnfStyle@val (§2.4.7); cnfStyle@val (§2.4.8)

13 <length value="12"/>
14 <pattern value="[01]*"/>
15 </restriction>
16 </simpleType>
17

```

## 2.18.12 ST\_ColorSchemeIndex (Theme Color Reference)

This simple type specifies the possible set of theme color stored in the document's Theme part which can be referenced by document content. This reference is used to map the use of the theme colors in the ST\_ThemeColor enumeration to the theme colors in the theme part.

[*Example:* Consider a WordprocessingML document that shall have references to the theme color accent1 mapped to the theme color lt1 as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:

```
<w:clrSchemeMapping w:accent1="light1" />
```

The accent1 attribute has a value of light1, specifying that uses of the theme color value accent1 shall be mapped to the theme color lt1. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent 1 Theme Color Reference)	Specifies a reference to the accent1 theme color in the

Enumeration Value	Description
	document's Theme part.
accent2 (Accent 2 Theme Color Reference)	Specifies a reference to the accent2 theme color in the document's Theme part.
accent3 (Accent 3 Theme Color Reference)	Specifies a reference to the accent3 theme color in the document's Theme part.
accent4 (Accent4 Theme Color Reference)	Specifies a reference to the accent4 theme color in the document's Theme part.
accent5 (Accent5 Theme Color Reference)	Specifies a reference to the accent5 theme color in the document's Theme part.
accent6 (Accent 6 Theme Color Reference)	Specifies a reference to the accent6 theme color in the document's Theme part.
dark1 (Dark 1 Theme Color Reference)	Specifies a reference to the dk1 theme color in the document's Theme part.
dark2 (Dark 2 Theme Color Reference)	Specifies a reference to the dk2 theme color in the document's Theme part.
followedHyperlink (Followed Hyperlink Theme Color Reference)	Specifies a reference to the folHlink theme color in the document's Theme part.
hyperlink (Hyperlink Theme Color Reference)	Specifies a reference to the hlink theme color in the document's Theme part.
light1 (Light 1 Theme Color Reference)	Specifies a reference to the lt1 theme color in the document's Theme part.
light2 (Light 2 Theme Color Reference)	Specifies a reference to the lt2 theme color in the document's Theme part.

 <enumeration value="accent6"/>
 <enumeration value="hyperlink"/>
 <enumeration value="followedHyperlink"/>
 </restriction>
</simpleType>
```

### 2.18.13 ST\_CombineBrackets (Two Lines in One Enclosing Character Type)

This simple type specifies the type of bracket character which shall be used to enclose the two lines in one text within the current run when displayed

[Example: Consider a paragraph with the text two lines in one, which shall be displayed within a single logical line in the document and enclosed in curly brackets. This constraint would be specified as follows in the WordprocessingML:

```
<w:r>
 <w:rPr>
 <w:eastAsianLayout w:id="1" w:combine="on" w:combineBrackets="curly"/>
 </w:rPr>
 <w:t>two lines in one</w:t>
</w:r>
```

The resulting text would be displayed on two sub lines within the other text on this line and enclosed within curly brackets when displayed. end example]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
angle (Angle Brackets)	Specifies that angle bracket characters shall be used to enclose the contents of the current run's two lines in one text.  [Example: <...> end example]
curly (Curly Brackets)	Specifies that curly bracket characters shall be used to

Enumeration Value	Description
	enclose the contents of the current run's two lines in one text. <i>[Example: {...} end example]</i>
none (No Enclosing Brackets)	Specifies that no characters shall be used to enclose the contents of the current run's two lines in one text.
round (Round Brackets)	Specifies that round bracket characters shall be used to enclose the contents of the current run's two lines in one text. <i>[Example: (...) end example]</i>
square (Square Brackets)	Specifies that square bracket characters shall be used to enclose the contents of the current run's two lines in one text. <i>[Example: [...] end example]</i>

4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="round"/>
7 <enumeration value="square"/>
8 <enumeration value="angle"/>
9 <enumeration value="curly"/>
10 </restriction>
11 </simpleType>

```

## 12 2.18.14 ST\_CryptProv (Cryptographic Provider Types)

13 This simple type specifies the possible types of cryptographic providers which may be used.

14 *[Example: Consider a WordprocessingML document with the following information stored in one of its*  
15 *protection elements:*

```

16 <w:... w:cryptProviderType="rsaAES"
17 w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />

```

18 The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type shall be an  
19 Advanced Encryption Standard provider. *end example*

20 This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
rsaAES (AES Provider)	Specifies that the provider shall support the Advanced Encryption Algorithm standard.
rsaFull (Any Provider)	Specifies that any suitable provider shall be used.

#### Referenced By

documentProtection@cryptProviderType (§2.15.1.28); writeProtection@cryptProviderType (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CryptProv">
 <restriction base="xsd:string">
 <enumeration value="rsaAES"/>
 <enumeration value="rsaFull"/>
 </restriction>
</simpleType>
```

### 2.18.15 ST\_DateTime (Standard Date and Time Storage Format)

This simple type specifies that its contents will contain a date in the standard XML Schema `xsd:dateTime` format, whose contents are interpreted based on the context of the parent XML element.

[*Example:* Consider the following WordprocessingML fragment:

```
<w:date w:realDate="01-01-2006T12:00:00Z">
 ...
</w:date>
```

In this case, the date in the `realDate` attribute is the full date associated with the parent date picker structured document. In every case, the value of this type is interpreted in the context of the parent element or attribute.

*end example]*

This simple type's contents are a restriction of the XML Schema `dateTime` datatype.

#### Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DateTime">
 <restriction base="xsd:dateTime"/>
</simpleType>
```

### 2.18.16 ST\_DecimalNumber (Decimal Number Value)

This simple type specifies that its contents will contain a whole decimal number (positive or negative), whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following WordprocessingML fragment:

```
<w:pPr>
 <w:divId w:val="1512645511" />
</w:pPr>
```

The value of the val attribute is the ID of the associated HTML div.

However, consider the following fragment:

```
<w:ilvl w:val="1">
 ...
</w:ilvl>
```

In this case, the decimal number in the val attribute is the ID of the associated numbering level. In each case, the value is interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

```

2 <simpleType name="ST_DecimalNumber">
3 <restriction base="xsd:integer"/>
4 </simpleType>

```

## 5 2.18.17 ST\_DisplacedByCustomXml (Location of Custom XML Markup Displacing 6 an Annotation)

7 This simple type specifies the possible values for the location of a single custom XML element's start and/or end  
8 tag relative to the location of an annotation tag in document order. This enumeration shall be used to specify  
9 that the parent annotation's placement shall be directly linked with the location of the physical presentation of a  
10 custom XML element in the document.

11 *[Example: Consider a paragraph with block level custom XML markup and two comment anchor annotations*  
12 *(one before and one after the custom XML element's physical representation), as follows:*

Since all three of these items are around the entire paragraph, they are stored outside of the paragraph. However, in order to ensure that their relative positions are stored correctly, any annotation which shall be displaced by the physical custom XML element specifies this information, resulting in the following WordprocessingML:

```
<w:commentRangeStart w:id="0" />
<w:commentRangeStart w:id="1" w:displaced byCustomXml="next" />
<w:customXml w:element="spec" ... />
<w:p>
...
</w:p>
```

The `displacedByCustomXml` attribute specifies that even though all three of these items are around the paragraph and will be moved inside the paragraph to be represented physically, the comment with ID 0 shall be inside the custom XML, but the comment with ID 1 shall be displaced to stay outside of the relative location of the next custom XML element (the `spec` element). *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
next (Displaced by Next Custom XML Markup Tag)	<p>Specifies that this annotation anchor shall be displaced by the physical representation of the next element of custom XML markup in the document.</p> <p>If no custom XML markup exists in the same paragraph and after this anchor, then this setting shall be ignored.</p>
prev (Displaced by Previous Custom XML Markup Tag)	<p>Specifies that this annotation anchor shall be displaced by the physical representation of the previous element of custom XML markup in the document.</p> <p>If no custom XML markup exists in the same paragraph and directly before this anchor, then this setting shall be ignored.</p>

 <enumeration value="next"/>
 <enumeration value="prev"/>
 </restriction>
</simpleType>
```

### 2.18.18 ST\_DocGrid (Document Grid Types)

Specifies the type of the current document grid, which defines the grid behavior.

The grid can define a grid which snaps all East Asian characters to grid positions, but leaves Latin text with its default spacing; a grid which adds the specified character pitch to all characters on each row; or a grid which affects only the line pitch for the current section.

[*Example:* Consider the document discussed above with the document grid defined to allow 20 characters per line, and 20 lines per page by snapping characters to the grid as follows:

This document has a type attribute of type ST\_DocGrid and value snapToChars, which specifies that the grid shall force East Asian characters to fit 20 to a line. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
default (No Document Grid)	Specifies that no document grid shall be applied to the contents of the current section in the document.
lines (Line Grid Only)	Specifies that the parent section shall have additional line pitch added to each line within it (as specified on the docGrid element (§2.6.5)) in order to maintain the specified number of lines per page.
linesAndChars (Line and Character Grid)	<p>Specifies that the parent section shall have both the additional line pitch and character pitch added to each line and character within it (as specified on the docGrid element (§2.6.5)) in order to maintain a specific number of lines per page and characters per line.</p> <p>When this value is set, the input specified via the user interface may be allowed in exact number of line/character pitch units.</p>
snapToChars (Character Grid Only)	<p>Specifies that the parent section shall have both the additional line pitch and character pitch added to each line and character within it (as specified on the docGrid element (§2.6.5)) in order to maintain a specific number of lines per page and characters per line.</p> <p>When this value is set, the input specified via the user interface may be restricted to the number of lines per page and characters per line, with the consumer or producer translating this information based on the current font data to get the resulting line and character pitch values</p>

Referenced By
docGrid@type (§2.6.5)

- 3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_DocGrid">
5 <restriction base="xsd:string">
6 <enumeration value="default"/>
7 <enumeration value="lines"/>
8 <enumeration value="linesAndChars"/>
9 <enumeration value="snapToChars"/>
10 </restriction>
11 </simpleType>

```

## 2.18.19 ST\_DocPartBehavior (Insertion Behavior Types)

This simple type specifies the possible sets of behaviors which may be applied to the contents of a single glossary document entry (§2.12.5) when it is added to the main document story of a WordprocessingML document.

[*Example:* Consider the WordprocessingML fragment for a glossary document entry containing a single run, defined as follows:

```
<w:docPart>
 <w:docPartPr>
 <w:behaviors>
 <w:behavior w:val="p"/>
 </w:behavior>
 ...
 </w:docPartPr>
 <w:docPartBody>
 <w:p>
 <w:r>
 <w:t>Sample entry.</w:t>
 </w:r>
 </w:p>
 </w:docPartBody>
</w:docPart>
```

The behavior element of type ST\_DocPartBehavior has a value of p, which specifies that the contents of the parent glossary document entry shall be inserted in their own paragraph when they are added to the contents of a document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
content (Insert Content At Specified Location)	<p>Specifies that when the glossary document entry is inserted into the main document contents of the document, it shall be inserted normally as defined above.</p> <p>This includes ensuring that the final paragraph which is included in the part is not inserted, and its run content is added to the paragraph into which the current part is being inserted.</p>
p (Ensure Entry Is In New Paragraph)	Specifies that the glossary document entry shall be added into its own unique paragraph, by failing to remove the last paragraph from the entry's contents

Enumeration Value	Description
	when they are added to the document.
pg (Ensure Entry Is On New Page)	Specifies that the glossary document entry shall be added into its own new page, by preceding the entry with a blank paragraph whose only content is a page break character.

Referenced By
behavior@val (§2.12.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocPartBehavior">
 <restriction base="xsd:string">
 <enumeration value="content"/>
 <enumeration value="p"/>
 <enumeration value="pg"/>
 </restriction>
</simpleType>
```

### 2.18.20 ST\_DocPartGallery (Entry Gallery Types)

This simple type specifies possible settings for the predefined gallery into which a glossary document part shall be classified. This classification, although its enumeration values may be interpreted to imply semantics around the contents of the parent glossary document entry, shall only be used to classify and sort this entry (via an application or a user interface).

[*Example:* Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
 <w:category>
 <w:gallery w:val="coverPg" />
 <w:name w:val="Internal Memo Covers" />
 </w:category>
 ...
</w:docPartPr>
```

The gallery element with a value of coverPg specifies that the gallery categorization applied to the current entry, for the purposes of classification or user interface sorting, puts this entry into the Cover Pages classification. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
any (All Galleries)	Specifies that this glossary document entry shall be associated with all possible gallery classification values.
autoTxt (AutoText Gallery)	Specifies that this glossary document entry shall be associated with the AutoText gallery classification.
bib (Bibliography Gallery)	Specifies that this glossary document entry shall be associated with the Bibliography gallery classification.
coverPg (Cover Page Gallery)	Specifies that this glossary document entry shall be associated with the Cover Page gallery classification.
custAutoTxt (Custom AutoText Gallery)	Specifies that this glossary document entry shall be associated with the Custom AutoText gallery classification.
custBib (Custom Bibliography Gallery)	Specifies that this glossary document entry shall be associated with the Custom Bibliography gallery classification.
custCoverPg (Custom Cover Page Gallery)	Specifies that this glossary document entry shall be associated with the Custom Cover Page gallery classification.
custEq (Custom Equation Gallery)	Specifies that this glossary document entry shall be associated with the Custom Equation gallery classification.
custFtrs (Custom Footer Gallery)	Specifies that this glossary document entry shall be associated with the Custom Footer gallery classification.
custHdrs (Custom Header Gallery)	Specifies that this glossary document entry shall be associated with the Custom Header gallery classification.
custom1 (Custom 1 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 1 gallery classification.
custom2 (Custom 2 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 2 gallery classification.
custom3 (Custom 3 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 3 gallery classification.
custom4 (Custom 4 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 4 gallery classification.
custom5 (Custom 5 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 5 gallery classification.
custPgNum (Custom Page Number Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number gallery classification.

Enumeration Value	Description
custPgNumB (Custom Page Number At Bottom Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Bottom gallery classification.
custPgNumMargins (Custom Page Number At Margins Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Margins gallery classification.
custPgNumT (Custom Page Number At Top Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Top gallery classification.
custQuickParts (Custom Quick Parts Gallery)	Specifies that this glossary document entry shall be associated with the Custom Quick Parts gallery classification.
custTblOfContents (Custom Table of Contents Gallery)	Specifies that this glossary document entry shall be associated with the Custom Table of Contents gallery classification.
custTbls (Custom Table Gallery)	Specifies that this glossary document entry shall be associated with the Custom Tables gallery classification.
custTextBox (Custom Text Box Gallery)	Specifies that this glossary document entry shall be associated with the Custom Text Box gallery classification.
custWatermarks (Custom Watermark Gallery)	Specifies that this glossary document entry shall be associated with the Custom Watermark gallery classification.
default (No Gallery Classification)	Specifies that this glossary document entry shall not have a gallery classification.
docParts (Document Parts Gallery)	Specifies that this glossary document entry shall be associated with the Document Parts gallery classification.
eq (Equations Gallery)	Specifies that this glossary document entry shall be associated with the Equations gallery classification.
fters (Footers Gallery)	Specifies that this glossary document entry shall be associated with the Footers gallery classification.
hdrs (Headers Gallery)	Specifies that this glossary document entry shall be associated with the Headers gallery classification.
pgNum (Page Numbers Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers gallery classification.
pgNumB (Page Numbers At Bottom Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Bottom gallery classification.

Enumeration Value	Description
pgNumMargins (Page Numbers At Margins Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Margins gallery classification.
pgNumT (Page Numbers At Top Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Top gallery classification.
placeholder (Structured Document Tag Placeholder Text Gallery)	Specifies that this glossary document entry shall be associated with the Structured Document Tag Placeholder Text gallery classification.
tblOfContents (Table of Contents Gallery)	Specifies that this glossary document entry shall be associated with the Table of Contents gallery classification.
tbls (Table Gallery)	Specifies that this glossary document entry shall be associated with the Tables gallery classification.
txtBox (Text Box Gallery)	Specifies that this glossary document entry shall be associated with the Text Box gallery classification.
watermarks (Watermark Gallery)	Specifies that this glossary document entry shall be associated with the Watermark gallery classification.

 </restriction>
</simpleType>
```

### 2.18.21 ST\_DocPartType (Entry Types)

This simple type specifies the possible types which may be applied to the properties of a single glossary document entry (§2.12.5). Each of these types may, based on their values, influence the visibility and behavior of the parent glossary document entry.

[Example: Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```

1 <w:docPartPr>
2 <w:types>
3 <w:type w:val="bbPlcHdr" />
4 </w:types>
5 ...
6 </w:docPartPr>

```

The type element with a value of bbPlcHdr specifies that the parent glossary document entry shall be treated as if it was the placeholder text for one or more structured document tags in the document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoExp (Automatically Replace Name With Content)	Specifies that the type of the current glossary document entry shall allow the entry to be automatically inserted into the document whenever its name is entered into an application.
bbPlcHdr (Structured Document Tag Placeholder Text)	Specifies that the type of the current glossary document entry shall be structured document tag placeholder text.
formFld (Form Field Help Text)	Specifies that the type of the current glossary document entry shall be form field help text.
none (No Type)	Specifies no type information for the current glossary document entry.
normal (Normal)	Specifies that the type of the current glossary document entry shall be normal (i.e. a regular glossary document entry).
speller (AutoCorrect Entry)	Specifies that the type of the current glossary document entry shall be associated with the spelling and grammar tools.
toolbar (AutoText User Interface Entry)	Specifies that the type of the current glossary document entry shall be associated with a special grouping of entries associated with a single piece of user interface.

Referenced By
type@val (§2.12.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocPartType">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="normal"/>
 <enumeration value="autoExp"/>
 <enumeration value="toolbar"/>
 <enumeration value="speller"/>
 <enumeration value="formFld"/>
 <enumeration value="bbPlcHdr"/>
 </restriction>
</simpleType>
```

### 2.18.22 ST\_DocProtect (Document Protection Types)

This simple type specifies the possible set of editing restrictions which may be enforced on a given WordprocessingML document.

[*Example:* Consider a WordprocessingML document that contains the following WordprocessingML specifying that hosting applications shall enforce read-only protection for a given document:

```
<w:documentProtection w:edit="readOnly" w:enforcement="1" />
```

The edit attribute has a value of readOnly and an enforcement attribute with a value of 1, specifying that read-only document protection shall be enforced on the given document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
comments (Allow Editing of Comments)	Specifies that the edits made to this document shall be restricted to: <ul style="list-style-type: none"> <li>The insertion and deletion of comments within the document</li> <li>The editing of regions delimited by range permissions which match the editing rights of the user account which is performing the editing.</li> </ul>
forms (Allow Editing of Form Fields)	Specifies that the edits made to this document shall be restricted to: <ul style="list-style-type: none"> <li>The editing of form fields in sections where the formProt element (§2.6.6) has a value of true.</li> <li>No restrictions in sections where the formProt element has a value of false.</li> </ul>
none (No Editing Restrictions)	Specifies that no editing restrictions have been applied to the document.

Enumeration Value	Description
readOnly (Allow No Editing)	Specifies that the edits made to this document shall be restricted to: <ul style="list-style-type: none"> <li>The editing of regions delimited by range permissions which match the editing rights of the user account which is performing the editing.</li> </ul>
trackedChanges (Allow Editing With Revision Tracking)	Specifies that the edits made to this document shall be tracked as revisions. This value shall imply the presence of the trackRevisions element (§2.15.1.90), and applications shall not allow that element's state to be changed to false.

1

documentProtection@edit (§2.15.1.28)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_DocProtect">
4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="readOnly"/>
7 <enumeration value="comments"/>
8 <enumeration value="trackedChanges"/>
9 <enumeration value="forms"/>
10 </restriction>
11 </simpleType>
```

### 12 2.18.23 ST\_DocType (Document Classification Values)

13 This simple type specifies the possible classifications may be used for a WordprocessingML document.

14 [Example: Consider a set of WordprocessingML documents which should be classified as 'letters'. This  
15 classification would be specified using the following WordprocessingML in the document settings of these  
16 documents:

```
17 <w:documentType w:val="letter" />
```

18 The documentType element's val attribute is equal to letter, specifying that the hosting application shall  
19 apply the behaviors it has specified for letters to the given WordprocessingML document. *end example*]

20 This simple type's contents are a restriction of the XML Schema string datatype.

21 The following are possible enumeration values for this type:

Enumeration Value	Description
eMail (E-Mail Message)	Specifies that this document shall be classified as an e-

Enumeration Value	Description
	mail message.
letter (Letter)	Specifies that this document shall be classified as a letter.
notSpecified (Default Document)	Specifies that this document shall be classified as a default document.

1

Referenced By
documentType@val (§2.15.1.29)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_DocType">
4 <restriction base="xsd:string">
5 <enumeration value="notSpecified"/>
6 <enumeration value="letter"/>
7 <enumeration value="eMail"/>
8 </restriction>
9 </simpleType>
```

#### 10 2.18.24 ST\_DropCap (Text Frame Drop Cap Location)

11 This simple type specifies the location which shall be used to position a drop cap text frame when the contents  
12 of that text frame are displayed in the anchor paragraph at display time.

13 [Note: Although a drop cap is simply a text frame, the values of this simple type are used to determine how the  
14 cap should be positioned relative to the following non-frame paragraph in relative terms (see enumeration  
15 values), rather than relying on absolute sizing. *end note*]

16 [Example: Consider the following paragraph containing a text frame which should be positioned as a drop cap:

```

17 <w:p>
18 <w:pPr>
19 <w:framePr w:dropCap="margin" w:lines="3" w:hSpace="432" w:wrap="around"
20 w:vAnchor="text" w:hAnchor="page" />
21 </w:pPr>
22 <w:r>
23 <w:t>A</w:t>
24 </w:r>
25 </w:p>
```

26 The dropCap attribute specifies a value of margin, so this drop cap will be placed outside of the text margin  
27 before the start of the current text. *end example*]

28 This simple type's contents are a restriction of the XML Schema string datatype.

1 The following are possible enumeration values for this type:

Enumeration Value	Description
drop (Drop Cap Inside Margin)	Specifies that the drop cap text frame shall be positioned inside the text margin on the anchor paragraph when this text frame is displayed in the document.
margin (Drop Cap Outside Margin)	Specifies that the drop cap text frame shall be positioned outside of the text margin on the anchor paragraph when this text frame is displayed in the document.
none (Not Drop Cap)	Specifies that this text frame is not a drop cap text frame.

```

4 <simpleType name="ST_DropCap">
5 <restriction base="xsd:string">
6 <enumeration value="none"/>
7 <enumeration value="drop"/>
8 <enumeration value="margin"/>
9 </restriction>
10 </simpleType>

```

## 11 2.18.25 ST\_EdGrp (Range Permission Editing Group)

12 This simple type specifies the set of possible aliases (or editing groups) which may be used as aliases to  
 13 determine if the current user shall be allowed to edit a single range defined by a range permission within a  
 14 document. This mechanism simply provides a set of predefined editing groups which may be associated with  
 15 user accounts by applications in any desired manner.

16 *[Example: Consider a range permission defined as follows:*

```

17 <w:permStart w:id="0" w:edGrp="editors" ... />
18 ...
19 <w:permEnd w:id="0" />

```

20 The edGrp attribute value of editors specifies that only user(s) who the current application associates with the  
 21 editors group shall be allowed to edit the contents between the start and end markers when document  
 22 protection is being enforced. *end example]*

23 This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
administrators (Administrator Group)	Specifies that users associated with the Administrators group shall be allowed to edit range permissions using this editing group when document protection is enabled.
contributors (Contributors Group)	Specifies that users associated with the Contributors group shall be allowed to edit range permissions using this editing group when document protection is enabled.
current (Current Group)	Specifies that users associated with the Current group shall be allowed to edit range permissions using this editing group when document protection is enabled.
editors (Editors Group)	Specifies that users associated with the Editors group shall be allowed to edit range permissions using this editing group when document protection is enabled.
everyone (All Users Have Editing Permissions)	Specifies that all users that open the document shall be allowed to edit range permissions using this editing group when document protection is enabled.
none (No Users Have Editing Permissions)	Specifies that none of the users that open the document shall be allowed to edit range permissions using this editing group when document protection is enabled.
owners (Owners Group)	Specifies that users associated with the Owners group shall be allowed to edit range permissions using this editing group when document protection is enabled.

2

Referenced By
permStart@edGrp (§2.13.7.2)

- 3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_EdGrp">
5 <restriction base="xsd:string">
6 <enumeration value="none"/>
7 <enumeration value="everyone"/>
8 <enumeration value="administrators"/>
9 <enumeration value="contributors"/>
10 <enumeration value="editors"/>
11 <enumeration value="owners"/>
12 <enumeration value="current"/>
13 </restriction>
14 </simpleType>

```

## 2.18.26 ST\_EdnPos (Endnote Positioning Location)

This simple type specifies the possible positions of endnotes in a document.

[*Example:* Consider a document in which endnotes shall be positioned at the end of the section. The section properties for this section shall be declared as follows:

```
<w:settings>
 <w:endnotePr>
 <w:pos w:val="endSect" />
 </w:endnotePr>
 ...
</w:settings>
```

The val attribute is endSect, therefore the position of endnotes is specified to be at the end of the section. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
docEnd (Endnotes Positioned at End of Document)	Specifies that all endnotes shall be placed at the end of the current document, regardless of which section they are referenced within.
sectEnd (Endnotes Positioned at End of Section)	Specifies that endnotes shall be placed at the end of the section in which they are referenced.  An endnote which is never referenced is never displayed.

### Referenced By

pos@val (§2.11.22)

 <enumeration value="sectEnd"/>
 <enumeration value="docEnd"/>
 </restriction>
</simpleType>
```

## 2.18.27 ST\_EighthPointMeasure (Measurement in Eighths of a Point)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in eighths of a point (equivalent to 1/576th of an inch).

- The contents of this measurement are interpreted based on the context of the parent XML element.
- [*Example*: Consider an attribute value of 24 whose type is ST\_EighthPointMeasure. This attribute value specifies a size in eighths of a point (24 eighths of a point = 3 points). *end example*]
- This simple type's contents are a restriction of the ST\_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
bar@sz (§2.3.1.4); bdr@sz (§2.3.2.3); between@sz (§2.3.1.5); bottom@sz (§2.6.2); bottom@sz (§2.4.3); bottom@sz (§2.4.4); bottom@sz (§2.15.2.4); bottom@sz (§2.3.1.7); insideH@sz (§2.4.17); insideH@sz (§2.4.18); insideV@sz (§2.4.19); insideV@sz (§2.4.20); left@sz (§2.15.2.21); left@sz (§2.4.24); left@sz (§2.6.7); left@sz (§2.3.1.17); left@sz (§2.4.27); right@sz (§2.3.1.28); right@sz (§2.4.30); right@sz (§2.6.15); right@sz (§2.15.2.35); right@sz (§2.4.32); tl2br@sz (§2.4.70); top@sz (§2.4.71); top@sz (§2.3.1.42); top@sz (§2.15.2.42); top@sz (§2.4.74); top@sz (§2.6.21); tr2bl@sz (§2.4.76)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EighthPointMeasure">
 <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

## 2.18.28 ST\_Em (Emphasis Mark Type)

This simple type specifies possible types of emphasis marks which may be displayed for each non-space character in a run. This character is rendered above or below the character glyph as specified by enumeration values.

[*Example*: Consider a run of text which shall have a dot underneath each character as an emphasis mark. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
 <w:em w:val="dot"/>
</w:rPr>
```

This run explicitly declares that the emphasis mark type is dot, so the contents of this run will have a dot emphasis mark above each character. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
circle (Circle Emphasis Mark Above Characters)	Specifies that the emphasis mark is a circle character which shall be rendered above each character in this run using Unicode character 0x02DA when the language of the text is not Traditional Chinese.  For that language Unicode character 0x3002 shall be

Enumeration Value	Description
	used instead, positioned beneath the characters.
comma (Comma Emphasis Mark Above Characters)	Specifies that the emphasis mark is a comma character which shall be rendered above each character in this run, using Unicode character 0x3001.
dot (Dot Emphasis Mark Above Characters)	<p>Specifies that the emphasis mark is a dot character which shall be rendered above each character in this run using Unicode character 0x02D9 whenever the language of the text is not Japanese, Simplified Chinese, or Traditional Chinese.</p> <p>For those three languages, the emphasis mark shall be rendered as follows:</p> <ul style="list-style-type: none"> <li>Japanese = Unicode character 0xFF0E (dot beneath characters)</li> <li>Simplified Chinese = Unicode character 0xFF0E (dot beneath characters)</li> <li>Traditional Chinese = Unicode character 0x2027</li> </ul>
none (No Emphasis Mark)	Specifies that there shall be no emphasis mark for any character in this run.
underDot (Dot Emphasis Mark Below Characters)	Specifies that the emphasis mark is a dot character which shall be rendered below each character in this run using Unicode character 0xFF0E.

1

Referenced By
em@val (§2.3.2.10)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Em">
4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="dot"/>
7 <enumeration value="comma"/>
8 <enumeration value="circle"/>
9 <enumeration value="underDot"/>
10 </restriction>
11 </simpleType>
```

## 12 2.18.29 ST\_FFHelpTextVal (Help Text Value)

13 This simple type specifies the format of optional help text which may be associated with the parent form field.

14 [Example: Consider the following WordprocessingML fragment for a drop-down list form field:

```

1 <w:fldSimple w:instr="FORMDROPDOWN">
2 <w:ffData>
3 <w:helpText w:type="text" w:val="Example help text." />
4 <w:ddList>
5 ...
6 </w:ddList>
7 </w:ffData>
8 </w:fldSimple>

```

The helpText element specifies the help text for the parent form field - in this case, literal help text consisting of the string `Example help text.` *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 256 characters.

Referenced By
helpText@val (§2.16.23)

The following XML Schema fragment defines the contents of this simple type:

```

15 <simpleType name="ST_FFHelpTextVal">
16 <restriction base="xsd:string">
17 <maxLength value="256"/>
18 </restriction>
19 </simpleType>

```

### 2.18.30 ST\_FFName (Form Field Name Value)

This simple type specifies the format of the name which may be associated with the parent form field.

[*Example:* Consider the following WordprocessingML fragment for a text box form field:

```

23 <w:fldSimple w:instr="FORMTEXT">
24 <w:ffData>
25 <w:name w:val="FirstName"/>
26 <w:textInput>
27 ...
28 </w:textInput>
29 </w:ffData>
30 </w:fldSimple>

```

The name element specifies that the name of the current form field is `FirstName`. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 65 characters.

Referenced By
name@val (§2.16.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFName">
 <restriction base="xsd:string">
 <maxLength value="65"/>
 </restriction>
</simpleType>
```

### 2.18.31 ST\_FFStatusTextVal (Status Text Value)

This simple type specifies the format of optional status text which may be associated with the parent form field.

[Example: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
 <w:ffData>
 <w:statusText w:type="text" w:val="Example status text." />
 <w:ddList>
 ...
 </w:ddList>
 </w:ffData>
</w:fldSimple>
```

The statusText element specifies the status text for the parent form field - in this case, literal text consisting of the string `Example status text.` *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 140 characters.

Referenced By
statusText@val (§2.16.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFStatusTextVal">
 <restriction base="xsd:string">
 <maxLength value="140"/>
 </restriction>
</simpleType>
```

2.18.32 ST\_FFTextType (Text Box Form Field Type Values)

This simple type specifies the possible types of the contents of a text box form field.

[Example: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
 <w:textInput>
 <w:type w:val="number" />
 <w:maxLength w:val="4" />
 <w:format w:val="0.00" />
 </w:textInput>
</w:ffData>
```

The type element specifies that the contents of this form field should be handled as a number by an application.  
*end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
calculated (Field Calculation)	Specifies that the contents of this text box form field shall be the result of the field calculation specified by the corresponding default element (§2.16.10).  This field should not be directly editable when the editing of form fields is enabled.
currentDate (Current Date Display)	Specifies that the contents of this text box form field shall be the current date when the field is updated.
currentTime (Current Time Display)	Specifies that the contents of this text box form field shall be the current time when the field is updated.
date (Date)	Specifies that the contents of this text box form field shall be treated as a date.
number (Number)	Specifies that the contents of this text box form field shall be treated as a number value.
regular (Text Box)	Specifies that this text form field is a plain text field (no additional content restrictions).

Referenced By

type@val (§2.16.34)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFTextType">
 <restriction base="xsd:string">
 <enumeration value="regular"/>
 <enumeration value="number"/>
 <enumeration value="date"/>
 <enumeration value="currentTime"/>
 <enumeration value="currentDate"/>
 <enumeration value="calculated"/>
 </restriction>
</simpleType>
```

### 2.18.33 ST\_FldCharType (Complex Field Character Type)

This simple type specifies the possible values for the type of a single complex field character in the document.

[Example: Consider the following WordprocessingML for a complex field character:

```
...
<w:fldChar w:type="separate" />
...
```

The type attribute value of `separate` specifies that this is a complex field separator character; therefore it is being used to separate the field codes from the field contents in a complex field. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
begin (Start Character)	Specifies that the character is a start character, which defines the start of a complex field.
end (End Character)	Specifies that the character is an end character, which defines the end of a complex field.
separate (Separator Character)	Specifies that the character is a separator character, which defines the end of the field codes and the start of the field result for a complex field.

#### Referenced By

fldChar@fldCharType (§2.16.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FldCharType">
 <restriction base="xsd:string">
 <enumeration value="begin"/>
 <enumeration value="separate"/>
 <enumeration value="end"/>
 </restriction>
</simpleType>
```

### 2.18.34 ST\_FontFamily (Font Family Value)

This simple type specifies possible values for the font family of a font.

[*Example:* Consider the following information stored for a single font:

```
<w:font w:name="Calibri">
 <w:family w:val="swiss" />
 ...
</w:font>
```

The family element specifies via its val attribute value of *swiss* that this font is part of the Swiss family. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (No Font Family)	Specifies that information about a font's font family does not exist.
decorative (Novelty Font)	Specifies the Novelty font family.
modern (Monospace Font)	Specifies a monospace font with or without serifs (monospace fonts are usually modern).
roman (Proportional Font With Serifs)	Specifies a proportional font with serifs.
script (Script Font)	Specifies a script font designed to mimic the appearance of handwriting.
swiss (Proportional Font Without Serifs)	Specifies a proportional font without serifs.

#### Referenced By

family@val (§2.8.2.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FontFamily">
 <restriction base="xsd:string">
 <enumeration value="decorative"/>
 <enumeration value="modern"/>
 <enumeration value="roman"/>
 <enumeration value="script"/>
 <enumeration value="swiss"/>
 <enumeration value="auto"/>
 </restriction>
</simpleType>
```

### 2.18.35 ST\_FrameLayout (Frameset Layout Order)

This simple type specifies the possible order in which the frames (and nested framesets) in a frameset may be displayed. When a frameset is created, it can only contain frames which are stacked in one direction:

- Vertically (one on top of another)
- Horizontally (one next to another)

[Example: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:

The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
 <w:frameLayout w:val="rows" />
 <w:frame>
 ...
 </w:frame>
```

```
<w:frameset>
 <w:frameLayout w:val="cols" />
 <w:frame>
 ...
 </w:frame>
 <w:frame>
 ...
 </w:frame>
</w:frameset>
</w:frameset>
```

The frameLayout element specifies that the outer frameset is consists of the single frame and the child frameset stacked vertically, and an inner nested frameset consisting of two frames stacked horizontally. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cols (Stack Frames Horizontally)	Specifies that the frames in the frameset shall be stacked horizontally next to each other in left to right order.
none (Do Not Stack Frames)	Specifies that no frames shall be shown in the frameset.
rows (Stack Frames Vertically)	Specifies that the frames in the frameset shall be stacked vertically next to each other in top to bottom order.

Referenced By
frameLayout@val (§2.15.2.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FrameLayout">
 <restriction base="xsd:string">
 <enumeration value="rows"/>
 <enumeration value="cols"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

**2.18.36 ST\_FrameScrollbar (Frame Scrollbar Visibility)**

This simple type specifies the possible settings for when a scrollbar shall be visible for the contents of the current frame.

1 [Example: Consider a WordprocessingML document which serves as the frameset container for a frameset  
2 consisting of the following three frames:

3  
4 The frameset properties for this document are specified by the following WordprocessingML within the web  
5 page settings:

```
6 <w:frameset>
7 ...
8 <w:frameset>
9 ...
10 <w:frame>
11 <w:name w:val="Frame 2" />
12 <w:scrollbar w:val="auto" />
13 </w:frame>
14 ...
15 </w:frameset>
16 </w:frameset>
```

17 The scrollbar element has a val attribute of auto, which specifies that the frame shall only display a scrollbar  
18 when it is needed to display all of its content. *end example*]

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Show Scrollbar As Needed)	Specifies that the scrollbar for a frame shall automatically be hidden and/or displayed as needed based on the length of the contents.

Enumeration Value	Description
off (Never Show Scrollbar)	Specifies that the scrollbar for a frame shall always be hidden.
on (Always Show Scrollbar)	Specifies that the scrollbar for a frame shall always be displayed (even when not needed).

Referenced By
scrollbar@val (§2.15.2.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FrameScrollbar">
 <restriction base="xsd:string">
 <enumeration value="on"/>
 <enumeration value="off"/>
 <enumeration value="auto"/>
 </restriction>
</simpleType>
```

2.18.37 ST\_FtnEdn (Footnote or Endnote Type)

This simple type specifies the possible types of footnotes and endnotes which may be specified in a WordprocessingML document.

[Example: Consider a document with a single footnote at the bottom of the first page. This footnote shall be separated from the text by the separator footnote (the footnote explicitly used to separate text from the footnote list (circled in red below):

This footnote type would be declared as follows in the WordprocessingML:

```
<w:footnote w:type="separator" w:id="0">
```

...  
</w:footnote>

In this example, the footnote has a type value of separator, specifies when this footnote shall be used. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuationNotice (Continuation Notice Separator)	Specifies that this footnote or endnote is a continuation notice footnote or endnote.  <i>Continuation notice footnotes and endnotes</i> are used when the footnotes or endnotes exceed the length allowed on a single page. When this happens, this footnote or endnote shall be placed on the bottom of each page where the note shall continue to indicate that fact to the reader.
continuationSeparator (Continuation Separator)	Specifies that this footnote or endnote is a continuation separator footnote or endnote.  <i>Continuation separator footnotes and endnotes</i> are used when the footnotes or endnotes exceed the length allowed on a single page. When this happens, this footnote or endnote shall be placed between the main text contents and the continued footnotes/endnotes on all subsequent pages of the document.
normal (Normal Footnote/Endnote)	Specifies that this footnote or endnote is a normal footnote or endnote, and can be referenced by main document content.
separator (Separator)	Specifies that this footnote or endnote is a separator footnote or endnote.  <i>Separator footnotes and endnotes</i> are used to indicate the separation between the main document's content and the footnotes or endnotes to indicate that fact to the reader.

#### Referenced By

endnote@type (§2.11.2); footnote@type (§2.11.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FtnEdn">
 <restriction base="xsd:string">
 <enumeration value="normal"/>
 <enumeration value="separator"/>
 <enumeration value="continuationSeparator"/>
 <enumeration value="continuationNotice"/>
 </restriction>
</simpleType>
```

### 2.18.38 ST\_FtnPos (Footnote Positioning Location)

This simple type specifies the position of footnotes in the document.

[*Example:* Consider a document in which footnotes shall be positioned beneath their text. The footnote properties for this document shall be declared as follows:

```
<w:sectPr>
 <w:footnotePr>
 <w:pos w:val="beneathText" />
 </w:footnotePr>
 ...
</w:sectPr>
```

The val attribute is beneathText, therefore the position of footnotes is specified to be beneath the page's text.  
*end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
beneathText (Footnotes Positioned Beneath Text)	Specifies that footnotes shall be displayed immediately after the last line of text on the page on which the note reference mark appears.
docEnd (Footnotes Positioned At End of Document)	Specifies that all footnotes shall be placed at the end of the current document, regardless of which section they are referenced within.
pageBottom (Footnotes Positioned at Page Bottom)	Specifies that footnotes shall be displayed at the bottom margin of the page on which the note reference mark appears.
sectEnd (Footnotes Positioned At End of Section)	Specifies that all footnotes shall be placed at the end of the section in which they are referenced.  A footnote which is never referenced is never displayed.

Referenced By
pos@val (§2.11.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FtnPos">
 <restriction base="xsd:string">
 <enumeration value="pageBottom"/>
 <enumeration value="beneathText"/>
 <enumeration value="sectEnd"/>
 <enumeration value="docEnd"/>
 </restriction>
</simpleType>
```

### 2.18.39 ST\_Guid (128-Bit GUID)

This simple type specifies that its values shall be a 128-bit globally unique identifier (GUID) value.

[*Example:* Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
 ...
 <w:guid w:val="{00000000-5BD2-4BC8-9F70-7020E1357FB2}" />
 ...
</w:docPartPr>
```

The guid element specifies that the unique identifier associated with the parent entry shall be {00000000-5BD2-4BC8-9F70-7020E1357FB2}. This value may be used as needed by an application, for example, to uniquely identify a part regardless of its name. *end example*

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: `\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}`.

Referenced By
embedBold@fontKey (§2.8.2.3); embedBoldItalic@fontKey (§2.8.2.4); embedItalic@fontKey (§2.8.2.5); embedRegular@fontKey (§2.8.2.6); guid@val (§2.12.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
 <restriction base="xsd:token">
 <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}" />
 </restriction>
</simpleType>
```

## 2.18.40 ST\_HAnchor (Horizontal Anchor Location)

This simple type specifies the horizontal position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final horizontal position of the object in the document.

[*Example:* Consider a text frame which should be positioned one inch to the right of its column in a left-to-right document. This text frame would be specified using the following WordprocessingML:

```
<w:pPr>
 <w:framePr ... w:x="1440" w:hAnchor="margin" />
</w:pPr>
```

These frame horizontal anchor properties specify that they are relative to the anchor paragraph's margin (the text margin excluding any indents). *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
margin (Relative To Margin)	Specifies that the parent object shall be horizontally anchored to the text margins.  This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the text margin.
page (Relative to Page)	Specifies that the parent object shall be horizontally anchored to the page edge.  This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the page.
text (Relative to Text Extents)	Specifies that the parent object shall be horizontally anchored to the text extents.  This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the text in the anchor paragraph (including text indentations on that paragraph within the text margins).

### Referenced By

 <enumeration value="text"/>
 <enumeration value="margin"/>
 <enumeration value="page"/>
 </restriction>
</simpleType>
```

#### 2.18.41 ST\_HdrFtr (Header or Footer Type)

This simple type specifies the possible types of headers and footers which may be specified for a given header or footer reference in a document. This value determines the page(s) on which the current header or footer shall be displayed.

[*Example:* Consider a WordprocessingML section which specifies the following header reference:

```
<w:headerReference r:id="rId10" w:type="first" />
```

The resulting section shall use the specified header part for the first page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default Header or Footer)	<p>Specifies that this header or footer shall appear on every page in this section which is not overridden with a specific even or first page header/footer.</p> <p>In a section with all three types specified, this type shall be used on all odd numbered pages (counting from the first page in the section, not the section numbering).</p>
even (Even Numbered Pages Only)	<p>Specifies that this header or footer shall appear on all even numbered pages in this section (counting from the first page in the section, not the section numbering).</p> <p>The appearance of this header or footer is contingent on the setting of the evenAndOddHeaders element (§2.10.1).</p>
first (First Page Only)	<p>Specifies that this header or footer shall appear on the first page in this section.</p> <p>The appearance of this header or footer is contingent on the setting of the titlePg element (§2.10.6).</p>

Referenced By
footerReference@type (§2.10.2); headerReference@type (§2.10.5)

```
<simpleType name="ST_HdrFtr">
 <restriction base="xsd:string">
 <enumeration value="even"/>
 <enumeration value="default"/>
 <enumeration value="first"/>
 </restriction>
</simpleType>
```

## 2.18.42 ST\_HeightRule (Height Rule)

This simple type specifies the logic which shall be used to calculate the height of the parent object when it is displayed in the document.

[*Example:* Consider the following table row:

```
<w:trPr>
 <w:trHeight w:hRule="atLeast" w:val="2189" />
</w:trPr>
```

The val attribute specifies a value of 2189 twentieths of a point, so this table row will be a minimum of 2189 twentieths of a point high regardless of its contents, since its hRule value is set to atLeast. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
atLeast (Minimum Height)	Specifies that the height of the parent object shall be at least the value specified, but may be expanded to fit its content as needed.
auto (Determine Height Based On Contents)	Specifies that the height of the parent object shall be automatically determined by the size of its contents, with no predetermined minimum or maximum size.
exact (Exact Height)	Specifies that the height of the parent object shall be exactly the value specified, regardless of the size of the contents of the object.  If the contents are too large for the specified height, then they shall be clipped.

 <enumeration value="auto"/>
 <enumeration value="exact"/>
 <enumeration value="atLeast"/>
 </restriction>
</simpleType>
```

### 2.18.43 ST\_HexColor (Color Value)

This simple type specifies that its contents will contain one of the following:

- A color values in RRGGBB format (ST\_HexColorRGB)
- The enumeration value auto (ST\_HexColorAuto)

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider a border color with value auto, as follows:

```
<w:bottom ... w:color="auto"/>
```

This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. *end example*]

This simple type is defined as a union of the following types:

- TheST\_HexColorAuto simple type (§2.18.44).
- TheST\_HexColorRGB simple type (§2.18.45).

Referenced By
background@color (§2.2.1); bar@color (§2.3.1.4); bdr@color (§2.3.2.3); between@color (§2.3.1.5); bottom@color (§2.6.2); bottom@color (§2.4.3); bottom@color (§2.4.4); bottom@color (§2.15.2.4); bottom@color (§2.3.1.7); color@val (§2.3.2.5); color@val (§2.15.2.5); insideH@color (§2.4.17); insideH@color (§2.4.18); insideV@color (§2.4.19); insideV@color (§2.4.20); left@color (§2.15.2.21); left@color (§2.4.24); left@color (§2.6.7); left@color (§2.3.1.17); left@color (§2.4.27); right@color (§2.3.1.28); right@color (§2.4.30); right@color (§2.6.15); right@color (§2.15.2.35); right@color (§2.4.32); shd@color (§2.3.2.30); shd@color (§2.4.33); shd@color (§2.4.34); shd@color (§2.4.35); shd@color (§2.3.1.31); shd@fill (§2.3.2.30); shd@fill (§2.4.33); shd@fill (§2.4.34); shd@fill (§2.4.35); shd@fill (§2.3.1.31); tl2br@color (§2.4.70); top@color (§2.4.71); top@color (§2.3.1.42); top@color (§2.15.2.42); top@color (§2.4.74); top@color (§2.6.21); tr2bl@color (§2.4.76); u@color (§2.3.2.38)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexColor">
 <union memberTypes="ST_HexColorAuto ST_HexColorRGB"/>
</simpleType>
```

#### 2.18.44 ST\_HexColorAuto ('Automatic' Color Value)

This simple type specifies that its contents will contain the enumeration value auto. This value shall be used to specify an automatically determined color value, the meaning of which is interpreted based on the context of the parent XML element.

[*Example:* Consider a border color with value auto, as follows:

```
<w:bottom ... w:color="auto"/>
```

This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Determined Color)	Specifies that the color value may automatically be defined when this document is processed, based on the display context.

#### Referenced By

ST\_HexColor (§2.18.43)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexColorAuto">
 <restriction base="xsd:string">
 <enumeration value="auto"/>
 </restriction>
</simpleType>
```

#### 2.18.45 ST\_HexColorRGB (Hexadecimal Color Value)

This simple type specifies that its contents shall contain a color value in RRGGBB hexadecimal format. This specifies that each of the red, green, and blue color values form 0-255 will be encoded as a two-digit hexadecimal number.

[*Example:* Consider a color defined as follows:

Red: 122

Green: 23

Blue: 209

The resulting RRGGBB value would be 7A17D1, as each color is transformed into its hexadecimal equivalent. *end example]*

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 3 characters.

Referenced By
ST_HexColor (§2.18.43)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexColorRGB">
 <restriction base="xsd:hexBinary">
 <length value="3" fixed="true"/>
 </restriction>
</simpleType>
```

#### 2.18.46 ST\_HighlightColor (Text Highlight Colors)

This simple type specifies the possible values for highlighting colors which may be applied as a background behind the contents of a text run.

[*Example:* Consider a run within a paragraph which has yellow text highlighting using the highlight element. This formatting is specified using the following WordprocessingML:

```
<w:rPr>
 <w:highlight w:val="yellow" />
</w:rPr>
```

The resulting run would have yellow highlighting visible over its contents. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
black (Black Highlighting Color)	Specifies that the text highlighting color for this run shall be black.  The hexadecimal RGB value for this setting shall be 000000.
blue (Blue Highlighting Color)	Specifies that the text highlighting color for this run shall be blue.

Enumeration Value	Description
	The hexadecimal RGB value for this setting shall be 0000FF.
cyan (Cyan Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be cyan.</p> <p>The hexadecimal RGB value for this setting shall be 00FFFF.</p>
darkBlue (Dark Blue Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark blue.</p> <p>The hexadecimal RGB value for this setting shall be 000080.</p>
darkCyan (Dark Cyan Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark cyan.</p> <p>The hexadecimal RGB value for this setting shall be 008080.</p>
darkGray (Dark Gray Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark gray.</p> <p>The hexadecimal RGB value for this setting shall be 808080.</p>
darkGreen (Dark Green Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark green.</p> <p>The hexadecimal RGB value for this setting shall be 008000.</p>
darkMagenta (Dark Magenta Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark magenta.</p> <p>The hexadecimal RGB value for this setting shall be 800080.</p>
darkRed (Dark Red Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark red.</p> <p>The hexadecimal RGB value for this setting shall be 800000.</p>
darkYellow (Dark Yellow Highlighting Color)	<p>Specifies that the text highlighting color for this run shall be dark cyan.</p> <p>The hexadecimal RGB value for this setting shall be 808000.</p>

Enumeration Value	Description
green (Green Highlighting Color)	Specifies that the text highlighting color for this run shall be green.  The hexadecimal RGB value for this setting shall be 00FF00.
lightGray (Light Gray Highlighting Color)	Specifies that the text highlighting color for this run shall be light gray.  The hexadecimal RGB value for this setting shall be C0C0C0.
magenta (Magenta Highlighting Color)	Specifies that the text highlighting color for this run shall be magenta.  The hexadecimal RGB value for this setting shall be FF00FF.
none (No Text Highlighting)	Specifies that this text run shall have no text highlighting applied to its contents.
red (Red Highlighting Color)	Specifies that the text highlighting color for this run shall be red.  The hexadecimal RGB value for this setting shall be FF0000.
white (White Highlighting Color)	Specifies that the text highlighting color for this run shall be white.  The hexadecimal RGB value for this setting shall be FFFFFFFF.
yellow (Yellow Highlighting Color)	Specifies that the text highlighting color for this run shall be yellow.  The hexadecimal RGB value for this setting shall be FFFF00.

 <enumeration value="white"/>
 <enumeration value="darkBlue"/>
 <enumeration value="darkCyan"/>
 <enumeration value="darkGreen"/>
 <enumeration value="darkMagenta"/>
 <enumeration value="darkRed"/>
 <enumeration value="darkYellow"/>
 <enumeration value="darkGray"/>
 <enumeration value="lightGray"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

## 2.18.47 ST\_Hint (Font Type Hint)

Specifies the font type which shall be used to format any ambiguous characters in the current run.

There are certain characters which are not explicitly stored in the document, and may be mapped into multiple categories of the four mentioned above. This attribute shall be used to arbitrate that conflict, and determine how ambiguities in this run shall be handled. *[Note: This is primarily used to handle the formatting on the paragraph mark glyph, and other characters that are not stored as text in the WordprocessingML document. end note]*

*[Example: Consider the run representing the paragraph mark glyph, which is not stored as a physical character. Since this could therefore be formatted with any of the fonts specified for the run, this ambiguity is resolved using the following WordprocessingML:*

```
<w:pPr>
 <w:rPr>
 <w:rFonts w:hint="eastAsia" />
 </w:rPr>
</w:pPr>
```

The hint attribute specifies that the run shall use the eastAsia font (theme or not, whichever is in use for East Asian text) as applied for this run. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cs (Complex Script Font)	Specifies that the font hint for this text run shall be to use the Complex Script font defined on the run via the style hierarchy.
default (High ANSI Font)	Specifies that the font hint for this text run shall be to use the High ANSI font defined on the run via the style hierarchy.
eastAsia (East Asian Font)	Specifies that the font hint for this text run shall be to use the East Asian font defined on the run via the style hierarchy.

6 <enumeration value="eastAsia"/>
7 <enumeration value="cs"/>
8 </restriction>
9 </simpleType>
```

#### 10 2.18.48 ST\_HpsMeasure (Measurement in Half-Points)

11 This simple type specifies that its contents will contain a positive whole number, whose contents consist of a  
 12 measurement in half-points (equivalent to 1/144th of an inch).

13 The contents of this measurement are interpreted based on the context of the parent XML element.

14 *[Example: Consider an attribute value of 72 whose type is ST\_HpsMeasure. This attribute value specifies a size*  
 15 *of one-half of an inch or 36 points (72 halves of a point = 36 points = 0.5 inches). end example]*

16 This simple type's contents are a restriction of the ST\_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
hps@val (§2.3.3.10); hpsBaseText@val (§2.3.3.11); hpsRaise@val (§2.3.3.12); kern@val (§2.3.2.17); size@val (§2.16.30); sz@val (§2.3.2.36); szCs@val (§2.3.2.37)

17 The following XML Schema fragment defines the contents of this simple type:

```

18 <simpleType name="ST_HpsMeasure">
19 <restriction base="ST_UnsignedDecimalNumber"/>
20 </simpleType>
```

## 2.18.49 ST\_InfoTextType (Help or Status Text Type)

This simple type specifies the possible values for the type of help or status text which may be associated with a form field.

[*Example:* Consider the following WordprocessingML fragment for a form field:

```
<w:ffData>
 <w:helpText w:type="text" w:val="Example help text." />
</w:ffData>
```

The type attribute has a value of text, which specifies that the text in the val attribute is the literal help text for this form field. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoText (Glossary Document Entry)	Specifies that the value specified by the parent XML element's val attribute shall be interpreted as the name of a glossary document entry whose contents contain the help or status text.
text (Literal Text)	Specifies that the value specified by the parent XML element's val attribute shall be interpreted as the literal text for the help or status text.

### Referenced By

helpText@type (§2.16.23); statusText@type (§2.16.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_InfoTextType">
 <restriction base="xsd:string">
 <enumeration value="text"/>
 <enumeration value="autoText"/>
 </restriction>
</simpleType>
```

## 2.18.50 ST\_Jc (Horizontal Alignment Type)

This simple type specifies all types of alignment which are available to be applied to objects in a WordprocessingML document.

[*Example:* Consider a paragraph which is right aligned. This requirement would be specified as follows in the WordprocessingML markup:

```

1 <w:pPr>
2 <w:jc w:val="right" />
3 </w:pPr>

```

4 The val attribute's value of `right` specifies that the content shall be right aligned on the page. *end example*

5 This simple type's contents are a restriction of the XML Schema string datatype.

6 The following are possible enumeration values for this type:

Enumeration Value	Description
both (Justified)	<p>Specifies that the text shall be justified between both of the text margins in the document.</p> <p>The lowKashida setting shall also be applied to Arabic text when this setting is applied.</p> <p>This type of justification shall only affect the inter-word spacing on each line, and not the inter-character spacing between each word when justifying its contents.</p>
center (Align Center)	<p>Specifies that the text shall be centered on the line between both of the text margins in the document.</p>
distribute (Distribute All Characters Equally)	<p>Specifies that the text shall be justified between both of the text margins in the document.</p> <p>This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line.</p>
highKashida (Widest Kashida Length)	<p>Specifies that the kashida length for text in the current paragraph shall be extended to its widest possible length.</p> <p>This setting only affects <i>kashidas</i>, which are special characters used to extend the joiner between two Arabic characters. [Note: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. <i>end note</i>]</p> <p>[Example: The following example illustrates each type of kashida:</p>

Enumeration Value	Description
	<p>Low:                      هذا إمتيحيان</p> <p>Medium:                      هذا إمتيحيان</p> <p>High:                      هذا إمتيحيان</p> <p><i>end example]</i></p>
left (Align Left)	Specifies that the text shall be aligned on the left text margin in the document.
lowKashida (Low Kashida Length)	<p>Specifies that the kashida length for text in the current paragraph shall be extended to a slightly longer length. This setting shall also be applied to Arabic text when the both setting is applied.</p> <p>This setting only affects <i>kashidas</i>, which are special characters used to extend the joiner between two Arabic characters. [Note: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. <i>end note]</i></p> <p>[Example: The following example illustrates each type of kashida:</p> <p>Low:                      هذا إمتيحيان</p> <p>Medium:                      هذا إمتيحيان</p> <p>High:                      هذا إمتيحيان</p> <p><i>end example]</i></p>
mediumKashida (Medium Kashida Length)	<p>Specifies that the kashida length for text in the current paragraph shall be extended to a medium length determined by the consumer.</p> <p>This setting only affects <i>kashidas</i>, which are special characters used to extend the joiner between two Arabic characters. [Note: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. <i>end note]</i></p> <p>[Example: The following example illustrates each type of kashida:</p>

Enumeration Value	Description
	<p>Low:                      هذا إمتيحيان</p> <p>Medium:                      هذا إمتيحيان</p> <p>High:                      هذا إمتيحيان</p> <p><i>end example]</i></p>
numTab (Align to List Tab)	<p>Specifies that the text shall be aligned to the list tab, which is the tab stop after the numbering for the current paragraph.</p> <p>If the current paragraph has no numbering, this setting has no effect.</p> <p>[<i>Note:</i> This justification style is used for backwards compatibility with earlier word processors, and should be deprecated in favor of hanging paragraph indentation. <i>end note]</i></p>
right (Align Right)	<p>Specifies that the text shall be aligned on the right text margin in the document.</p>
thaiDistribute (Thai Language Justification)	<p>Specifies that the text shall be justified with an optimization for Thai.</p> <p>This type of justification shall affect both the inter-word spacing on each line, and the inter-character spacing between each word when justifying its contents, unlike both justification. This difference is created in that the inter-character space is increased slightly in order to ensure that the additional space created by the justification is reduced.</p> <p>[<i>Note:</i> This setting is different from justification in that the reduction in inter-character spacing would be inappropriate in Western languages. <i>end note]</i></p>

```

### 2.18.51 ST\_Lang (Language Reference)

This simple type specifies that its contents will contain one of the following:

- A hexadecimal language code (ST\_LangCode)
- An *ISO 639-1* letter code plus a dash plus an *ISO 3166-1 alpha-2* letter code (ST\_String)

The contents of this language are interpreted based on the context of the parent XML element.

[*Example:* Consider a language code defined as follows :

```
<w:lang w:val="en-CA" />
```

This language is therefore specified as English (en) and Canada (CA), resulting in use of the English (Canada) language setting. *end example]*

This simple type is defined as a union of the following types:

- TheST\_LangCode simple type (§2.18.52).
- TheST\_String simple type (§2.18.89).

Referenced By

1 The contents of this language are interpreted based on the context of the parent XML element.

2 *[Example: Consider a language code defined as follows :*

3 `<w:lang w:val="1033" />`

4 This language is therefore specified as English (U.S.) which maps to a hexadecimal language setting of 1033. *end*  
5 *example]*

6 This simple type's contents are a restriction of the XML Schema hexBinary datatype.

7 This simple type also specifies the following restrictions:

- 8 • This simple type's contents must have a length of exactly 2 characters.

## Referenced By

ST\_Lang (§2.18.51)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LangCode">
 <restriction base="xsd:hexBinary">
 <length value="2" fixed="true"/>
 </restriction>
</simpleType>
```

### 2.18.53 ST\_LevelSuffix (Content Between Numbering Symbol and Paragraph Text)

This simple type specifies the types of content which shall be possible between a given numbering level's text and the text of every numbered paragraph which references that numbering level.

[*Example:* Consider the numbered paragraph below:

#### 1. Test

In this example, a space exists between the numbering symbol 1. and the numbered paragraph text Test. The space would be specified in WordprocessingML as follows:

```
<w:lvl w:ilvl="0">
 ...
 <w:suff w:val="space" />
 ...
</w:lvl>
```

The suff element with an attribute value of space specifies that the character between the numbering's level text and the paragraph text shall be a space. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
nothing (Nothing Between Numbering and Text)	Specifies that no character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.
space (Space Between Numbering and Text)	Specifies that a space character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.
tab (Tab Between Numbering and Text)	Specifies that a tab character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered

Enumeration Value	Description
	paragraph.  This tab shall follow normal tab stop rules to determine its length.

1

Referenced By
suff@val (§2.9.30)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_LevelSuffix">
4 <restriction base="xsd:string">
5 <enumeration value="tab"/>
6 <enumeration value="space"/>
7 <enumeration value="nothing"/>
8 </restriction>
9 </simpleType>
```

## 10 2.18.54 ST\_LineNumberRestart (Line Numbering Restart Position)

11 This simple type specifies when the line numbering in the parent section shall be reset to its restart value. The  
 12 line numbering increments for each line (even if the line number itself is not displayed) until it reaches the  
 13 restart point specified by this element.

14 [Example: Consider the line numbering used on each page of this document, which specifies that line numbering  
 15 shall restart at the top of each new page. This line numbering setting would be defined using the following  
 16 WordprocessingML:

```
17 <w:lnNumType w:restart="newPage" ... />
```

18 The restart attribute is of type ST\_LineNumberRestart, and a value of newPage specifies that the line numbers  
 19 shall restart at the top of each page to the value specified by the start attribute. In this case, newPage is the  
 20 default, so this value could have been omitted entirely. *end example*]

21 This simple type's contents are a restriction of the XML Schema string datatype.

22 The following are possible enumeration values for this type:

Enumeration Value	Description
continuous (Continue Line Numbering From Previous Section)	Specifies that line numbering for the parent section shall continue from the line numbering from the end of the previous section, if any.
newPage (Restart Line Numbering on Each Page)	Specifies that line numbering for the parent section shall restart to the starting value whenever a new page is displayed.

Enumeration Value	Description
newSection (Restart Line Numbering for Each Section)	Specifies that line numbering for the parent section shall restart to the starting value whenever the parent begins.

1

Referenced By
lnNumType@restart (§2.6.8)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_LineNumberRestart">
4 <restriction base="xsd:string">
5 <enumeration value="newPage"/>
6 <enumeration value="newSection"/>
7 <enumeration value="continuous"/>
8 </restriction>
9 </simpleType>
```

## 10 2.18.55 ST\_LineSpacingRule (Line Spacing Rule)

11 This simple type specifies the logic which shall be used to calculate the line spacing of the parent object when it  
12 is displayed in the document.

13 [Example: Consider the following WordprocessingML paragraph:

```

14 <w:pPr>
15 <w:spacing w:line="276" w:lineRule="auto" />
16 </w:pPr>
```

17 This paragraph specifies that the spacing in each line should be automatically calculated using 1.15 times (276  
18 divided by 240) the normal single spacing calculation. *end example*

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
atLeast (Minimum Line Height)	Specifies that the height of the line shall be at least the value specified, but may be expanded to fit its content as needed.
auto (Automatically Determined Line Height)	Specifies that the line spacing of the parent object shall be automatically determined by the size of its contents, with no predetermined minimum or maximum size.
exact (Exact Line Height)	Specifies that the height of the line shall be exactly the value specified, regardless of the size of the contents

Enumeration Value	Description
	of the contents.  If the contents are too large for the specified height, then they shall be clipped as necessary.

1

Referenced By
spacing@lineRule (§2.3.1.33)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_LineSpacingRule">
4 <restriction base="xsd:string">
5 <enumeration value="auto"/>
6 <enumeration value="exact"/>
7 <enumeration value="atLeast"/>
8 </restriction>
9 </simpleType>
```

## 10 2.18.56 ST\_Lock (Locking Types)

11 This simple type specifies the possible set of locking behaviors which may be applied to the contents of the  
12 parent structured document tag when the contents of this documents are edited by an application (whether  
13 through a user interface or directly).

14 [Example: Consider the following plain text structured document tag:

```

15 <w:sdt>
16 <w:sdtPr>
17 <w:lock w:val="sdtLocked"/>
18 ...
19 <w:text/>
20 </w:sdtPr>
21 ...
22 </w:sdt>
```

23 This plain text structured document tag's properties contain a lock element, specifying locking behaviors for the  
24 structured document tag. Since the locking val attribute value is sdtLocked, this locking setting shall specify  
25 that the contents of the structured document tag may be edited, but the structured document tag itself shall  
26 not be deleted from the document. *end example]*

27 This simple type's contents are a restriction of the XML Schema string datatype.

28 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
contentLocked (Contents Cannot Be Edited At Runtime)	Specifies that the editing restriction applied to the parent structured document tag shall be as follows: <ul style="list-style-type: none"> <li>This structured document tag's contents shall not be editable</li> <li>This structured document tag may be deleted in its entirety (but only entirely, no sub portion of it may be deleted)</li> </ul>
sdtContentLocked (Contents Cannot Be Edited At Runtime And SDT Cannot Be Deleted)	Specifies that the editing restriction applied to the parent structured document tag shall be as follows: <ul style="list-style-type: none"> <li>This structured document tag's contents shall not be editable</li> <li>This structured document tag shall not be deleted in its entirety</li> </ul>
sdtLocked (SDT Cannot Be Deleted)	Specifies that the editing restriction applied to the parent structured document tag shall be as follows: <ul style="list-style-type: none"> <li>This structured document tag's contents shall be editable</li> <li>This structured document tag shall not be deleted in its entirety</li> </ul>
unlocked (No Locking)	Specifies that no special locking behaviors shall be applied to the parent structured document tag.  The default behaviors as specified on the lock element (§2.5.2.22) shall be used.

#### Referenced By

lock@val (§2.5.2.22)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_Lock">
 <restriction base="xsd:string">
 <enumeration value="sdtLocked"/>
 <enumeration value="contentLocked"/>
 <enumeration value="unlocked"/>
 <enumeration value="sdtContentLocked"/>
 </restriction>
</simpleType>

```

### 2.18.57 ST\_LongHexNumber (Four Digit Hexadecimal Number Value)

This simple type specifies a number value specified as a four octet (eight digit) hexadecimal number), whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following value for a node of type ST\_LongHexNumber: 00BE2C6C.

This value is valid, as it contains four hexadecimal octets, each an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 4 characters.

#### Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LongHexNumber">
 <restriction base="xsd:hexBinary">
 <length value="4"/>
 </restriction>
</simpleType>
```

### 2.18.58 ST\_MacroName (Script Subroutine Name Value)

This simple type specifies a subroutine in a scripting language which may be executed based on the context of the parent XML element. The language and location of this subroutine may be determined using any method desired by an application.

[*Example*: Consider the following WordprocessingML fragment for the properties of a form field:

```
<w:ffData>
 <w:exitMacro w:val="TestExitFunction" />
</w:ffData>
```

The exitMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called TestExitFunction when the contents of the form field are exited. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 33 characters.

Referenced By
entryMacro@val (§2.16.15); exitMacro@val (§2.16.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MacroName">
 <restriction base="xsd:string">
 <maxLength value="33"/>
 </restriction>
</simpleType>
```

### 2.18.59 ST\_MailMergeDataType (Mail Merge Data Source Type Values)

This simple type specifies the possible values for the types of external data sources to be connected to via the Dynamic Data Exchange (DDE) system (such as a spreadsheet or database), or the alternative method of data access if the Dynamic Data Exchange system is not used. This setting is purely a suggestion of the data source access mechanism which shall be used, and may be ignored in favor of an alternative mechanism if one is present.

[*Example:* Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:dataType w:val="odbc" />
```

The dataType element's val attribute is equal to odbc, specifying that the given merged WordprocessingML document has been connected to an external data source via the Open Database Connectivity interface. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
database (Database Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database via the Dynamic Data Exchange (DDE) system.
native (Office Data Source Object Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source via the Office Data Source Object (ODSO) interface.
odbc (Open Database Connectivity Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source via the Open Database Connectivity interface.
query (Query Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source using an external query tool.

Enumeration Value	Description
spreadsheet (Spreadsheet Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database via the Dynamic Data Exchange (DDE) system.
textFile (Text File Data Source)	Specifies that a given merged WordprocessingML document has been connected to a text file via the Dynamic Data Exchange (DDE) system.

1

Referenced By
dataType@val (§2.14.10)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_MailMergeDataType">
4 <restriction base="xsd:string">
5 <enumeration value="textFile"/>
6 <enumeration value="database"/>
7 <enumeration value="spreadsheet"/>
8 <enumeration value="query"/>
9 <enumeration value="odbc"/>
10 <enumeration value="native"/>
11 </restriction>
12 </simpleType>

```

### 13 2.18.60 ST\_MailMergeDest (Merged Document Destination Types)

14 This simple type specifies the possible results which may be generated when a mail merge is carried out on a  
15 given WordprocessingML source document. In other words, this element is used to specify what is to be done  
16 with the merged documents that result from populating the fields within a given merged WordprocessingML  
17 document with data from the specified external data source.

18 [Example: Consider a WordprocessingML source document containing the following WordprocessingML:

```

19 <w:mailMerge>
20 <w:destination w:val="newDocument" />
21 ...
22 </w:mailMerge>

```

23 The destination element's val attribute is set to newDocument, specifying that when the mail merge is carried  
24 out, the source document shall be used to generate a specified number of new documents, which may be  
25 handled as appropriate. *end example*

26 This simple type's contents are a restriction of the XML Schema string datatype.

27 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
email (Send Merged Documents as E-mail Messages)	Specifies that conforming hosting applications shall generate emails using the documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.
fax (Send Merged Documents as Faxes)	Specifies that conforming hosting applications shall generate faxes using the documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.
newDocument (Send Merged Documents to New Documents)	Specifies that conforming hosting applications shall generate new documents by populating the fields within a given merged WordprocessingML document with data from the specified external data source.
printer (Send Merged Documents to Printer)	Specifies that conforming hosting applications shall print the documents that result from populating the fields within a given merged WordprocessingML document with external data from the specified external data source.

1

Referenced By
destination@val (§2.14.11)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_MailMergeDest">
4 <restriction base="xsd:string">
5 <enumeration value="newDocument"/>
6 <enumeration value="printer"/>
7 <enumeration value="email"/>
8 <enumeration value="fax"/>
9 </restriction>
10 </simpleType>
```

### 11 2.18.61 ST\_MailMergeDocType (Source Document Types)

12 This simple types specifies the possible types for a given WordprocessingML source document.

13 [Example: Consider the WordprocessingML below:

```

14 <w:mailMerge>
15 <w:mainDocumentType w:val="formLetters" />
16 ...
17 </w:mailMerge>
```

In this example, the source document is of the `formLetters` type, as specified by the `mainDocumentType` element's `val` attribute being equal to `formLetters`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
catalog (Catalog Source Document)	Specifies that the mail merge source document is of the catalog type.
email (E-Mail Source Document)	Specifies that the mail merge source document is of the e-mail message type.
envelopes (Envelope Source Document)	Specifies that the mail merge source document is of the envelope type.
fax (Fax Source Document)	Specifies that the mail merge source document is of the fax type.
formLetters (Form Letter Source Document)	Specifies that the mail merge source document is of the form letter type.
mailingLabels (Mailing Label Source Document)	Specifies that the mail merge source document is of the mailing label type.

Referenced By
<code>mainDocumentType@val</code> (§2.14.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MailMergeDocType">
 <restriction base="xsd:string">
 <enumeration value="catalog"/>
 <enumeration value="envelopes"/>
 <enumeration value="mailingLabels"/>
 <enumeration value="formLetters"/>
 <enumeration value="email"/>
 <enumeration value="fax"/>
 </restriction>
</simpleType>
```

### 2.18.62 ST\_MailMergeOdsoFMDFieldType (Merge Field Mapping Types)

This simple types specifies the possible types used to indicate if a given mail merge field has been mapped to a column in the given external data source.

[*Example:* Consider the WordprocessingML below:

```

1 <w:odso>
2 ...
3 <w:fieldMapData>
4 <w:type w:val="dbColumn" />
5 <w:name w:val="Country" />
6 <w:mappedName w:val="Country or Region" />
7 <w:column w:val="9" />
8 ...
9 </w:fieldMapData>
10 </w:odso>

```

In this example, the country column within the given external data source shall be mapped to the mail merge field Country or Region, as specified by the type element's val attribute being equal to dbColumn. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dbColumn (Field Mapping to Data Source Column)	Specifies that the mail merge field has been mapped to a column in the given external data source.
null (Field Not Mapped)	Specifies that the mail merge field has not been mapped to a column in the given external data source.

#### Referenced By

type@val (§2.14.32)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_MailMergeOdsoFMDFieldType">
 <restriction base="xsd:string">
 <enumeration value="null"/>
 <enumeration value="dbColumn"/>
 </restriction>
</simpleType>

```

### 2.18.63 ST\_MailMergeSourceType (Mail Merge ODSO Data Source Types)

This simple type specifies the type of external data source to be connected to via as part of the ODSO connection information for this mail merge. This setting is purely a suggestion of the data source type which is being used for this mail merge, and may be ignored in favor of an alternative mechanism if one is present.

[*Example:* Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:type w:val="database" />
```

- 1 The type element's val attribute is equal to database, specifying that the given merged WordprocessingML
- 2 document has been connected to an external data source via the ODSO settings, and that the resulting data
- 3 source was a database. *end example*]
- 4 This simple type's contents are a restriction of the XML Schema string datatype.
- 5 The following are possible enumeration values for this type:

Enumeration Value	Description
addressBook (Address Book Data Source)	Specifies that a given merged WordprocessingML document has been connected to an address book of contacts.
database (Database Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database.
document1 (Alternate Document Format Data Source)	Specifies that a given merged WordprocessingML document has been connected to another document format supported by the producing application. The format of this document is application-defined and outside the scope of this Office Open XML Standard.
document2 (Alternate Document Format Data Source Two)	Specifies that a given merged WordprocessingML document has been connected to another document format supported by the producing application. The format of this document is application-defined and outside the scope of this Office Open XML Standard.
email (E-Mail Program Data Source)	Specifies that a given merged WordprocessingML document has been connected to an e-mail application.
legacy (Legacy Document Format Data Source)	Specifies that a given merged WordprocessingML document has been connected to a legacy document format supported by the producing application. The format of this legacy document is application-defined and outside the scope of this Office Open XML Standard.
master (Aggregate Data Source)	Specifies that a given merged WordprocessingML document has been connected to a data source which aggregates other data sources.
native (Native Data Source)	Specifies that a given merged WordprocessingML document has been connected to another document format native to the producing application. The format of this document is application-defined and outside the scope of this Office Open XML Standard.
text (Text File Data Source)	Specifies that a given merged WordprocessingML document has been connected to a text file.

Referenced By
type@val (§2.14.33)

1 The following XML Schema fragment defines the contents of this simple type:

```
2 <simpleType name="ST_MailMergeSourceType">
3 <restriction base="xsd:string">
4 <enumeration value="database"/>
5 <enumeration value="addressBook"/>
6 <enumeration value="document1"/>
7 <enumeration value="document2"/>
8 <enumeration value="text"/>
9 <enumeration value="email"/>
10 <enumeration value="native"/>
11 <enumeration value="legacy"/>
12 <enumeration value="master"/>
13 </restriction>
14 </simpleType>
```

15 **2.18.64 ST\_Merge (Merged Cell Type)**

16 This element specifies the way in which a cell shall be included in a merged group of cells (horizontally or  
17 vertically) within the parent table.

18 *[Example: Consider a table with three rows and two columns with the last column completely vertically merged:*

19

20 The second cell in the first row starts a vertical merge that is completed in the last cell, resulting in the following  
21 WordprocessingML:

```
1 <w:tbl>
2 ...
3 <w:tr>
4 <w:tc>
5 ...
6 </w:tc>
7 <w:tc>
8 ...
9 </w:tc>
10 <w:tc>
11 <w:tcPr>
12 <w:vmerge w:val="restart"/>
13 </w:tcPr>
14 ...
15 </w:tc>
16 </w:tr>
17 <w:tr>
18 <w:tc>
19 ...
20 </w:tc>
21 <w:tc>
22 ...
23 </w:tc>
24 <w:tc>
25 <w:tcPr>
26 <w:vmerge w:val="continue"/>
27 </w:tcPr>
28 ...
29 </w:tc>
30 </w:tr>
```

1       <w:tr>  
2           <w:tc>  
3           ...  
4       </w:tc>  
5       <w:tc>  
6       ...  
7       </w:tc>  
8       <w:tc>  
9           <w:tcPr>  
10            <w:vmerge w:val="continue"/>  
11           </w:tcPr>  
12           ...  
13       </w:tc>  
14    </w:tr>  
15 </w:tbl>

16   The val attribute of type ST\_Merge on the vmerge element defines the cells which are vertically merged, and  
17   how each cell is merged together. *end example*]

18   This simple type's contents are a restriction of the XML Schema string datatype.

19   The following are possible enumeration values for this type:

Enumeration Value	Description
continue (Continue Merged Region)	<p>Specifies that the current cell continues a previously existing merged group of cells in the parent table.</p> <p>If the previous cell in the document (horizontally or vertically) does not either begin or continue a set of merged cells, then this value shall be ignored (i.e. a group of merged cells must start with a merge whose ST_Merge value is restart).</p>
restart (Start/Restart Merged Region)	<p>Specifies that the current cell starts (or restarts) a group of merged cells in the parent table.</p> <p>After this value, all following cells which have a value of continue shall be merged into this merged cell group.</p>

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Merge">
 <restriction base="xsd:string">
 <enumeration value="continue"/>
 <enumeration value="restart"/>
 </restriction>
</simpleType>
```

### 2.18.65 ST\_MultiLevelType (Numbering Definition Type)

This simple type specifies the possible types of numbering which may be defined by a given abstract numbering type. This information shall only be used by a consumer to determine user interface behaviors for this numbering definition, and shall not be used to limit the behavior of the list (i.e. a list with multiple levels marked as `singleLevel` shall not be prevented from using levels 2 through 9).

[*Example:* Consider the WordprocessingML below:

```
<w:abstractNum w:abstractNumId="8">
 ...
 <w:multiLevelType w:val="singleLevel" />
 ...
</w:abstractNum>
```

This abstract numbering definition is specified to be of the `singleLevel` type by the `multiLevelType` element.  
*end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hybridMultilevel (Hybrid Multilevel Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a multiple levels, each of a potentially different type (bullets vs. level text).
multilevel (Multilevel Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a multiple levels, each of the same type (bullets vs. level text).
singleLevel (Single Level Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a single level only.

#### Referenced By

multiLevelType@val (§2.9.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MultiLevelType">
 <restriction base="xsd:string">
 <enumeration value="singleLevel"/>
 <enumeration value="multilevel"/>
 <enumeration value="hybridMultilevel"/>
 </restriction>
</simpleType>
```

## 2.18.66 ST\_NumberFormat (Numbering Format)

This simple type specifies the numbering format which shall be used for a group of automatically numbered objects,

*[Example: A value of lowerLetter for page numbering indicates that a consumer shall use lowercase letters for each page in this section: a,b,c... end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aiueo (AIUEO Order Hiragana)	Specifies that the sequence shall consist of hiragana characters in the traditional a-i-u-e-o order. <i>[Example: あ, い, う. end example]</i>
aiueoFullWidth (Full-Width AIUEO Order Hiragana)	Specifies that the sequence shall consist of full-width hiragana characters in the traditional a-i-u-e-o order. <i>[Example: ア, イ, ウ end example]</i>
arabicAbjad (Arabic Abjad Numerals)	Specifies that the sequence shall consist of ascending Abjad numerals. <i>[Example: أ, ب, ج. end example]</i>
arabicAlpha (Arabic Alphabet)	Specifies that the sequence shall consist of characters in the Arabic alphabet. <i>[Example: أ, ب, ت. end example]</i>
bullet (Bullet)	Specifies that the sequence shall consist of bullet characters. <i>[Example: ●. end example]</i>
cardinalText (Cardinal Text)	Specifies that the sequence shall consist of cardinal text of the run language. <i>[Example: one, two, three. end example]</i>

Enumeration Value	Description
chicago (Chicago Manual of Style)	<p>Specifies that the sequence shall consist of characters as defined in the Chicago Manual of Style.</p> <p><i>[Example: *, †, ‡. end example]</i></p>
chineseCounting (Chinese Counting System)	<p>Specifies that the sequence shall consist of ascending numbers from the Chinese counting system.</p> <p><i>[Example: 一, 二, 三, 四 end example]</i></p>
chineseCountingThousand (Chinese Counting Thousand System)	<p>Specifies that the sequence shall consist of sequential numbers from the Chinese counting thousand system.</p> <p><i>[Example: 一, 二..., 九-〇 end example]</i></p>
chineseLegalSimplified (Chinese Legal Simplified Format)	<p>Specifies that the sequence shall consist of sequential numbers from the Chinese simplified legal format.</p> <p><i>[Example: 壹..., 肆伍 end example]</i></p>
chosung (Korean Chosung Numbering)	<p>Specifies that the sequence shall consist of sequential numbers from the Korean Chosung format.</p> <p><i>[Example: ㄱ, ㄴ, ... end example]</i></p>
decimal (Decimal Numbers)	<p>Specifies that the sequence shall consist of decimal numbering.</p> <p><i>[Example: 1, 2, 3, ... , 9, 10, 11. end example]</i></p>
decimalEnclosedCircle (Decimal Numbers Enclosed in a Circle)	<p>Specifies that the sequence shall consist of decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character.</p> <p>Once the specified sequence reaches 21, the numbers may be replaced with non-enclosed equivalents.</p> <p><i>[Example: ①②③.. end example]</i></p>
decimalEnclosedCircleChinese (Decimal Numbers Enclosed in a Circle)	<p>Specifies that the sequence shall consist of decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character.</p> <p>Once the specified sequence reaches 11, the numbers may be replaced with non-enclosed equivalents.</p> <p><i>[Example: ①②③.. end example]</i></p>
decimalEnclosedFullstop (Decimal Numbers Followed by a Period)	<p>Specifies that the sequence shall consist of decimal numbering followed by a period, using the enclosed alphanumeric glyph character.</p>

Enumeration Value	Description
	<p>Once the specified sequence reaches 21, the numbers may be replaced with non-enclosed equivalents.</p> <p><i>[Example: 1, 2, 3... end example]</i></p>
decimalEnclosedParen (Decimal Numbers Enclosed in Parenthesis)	<p>Specifies that the sequence shall consist of decimal numbering enclosed in parenthesis, using the enclosed alphanumeric glyph character.</p> <p>Once the specified sequence reaches 21, the numbers may be replaced with non-enclosed equivalents.</p> <p><i>[Example: (1)(2)(3)... end example]</i></p>
decimalFullWidth (Double Byte Arabic Numerals)	<p>Specifies that the sequence shall consist of double-byte Arabic numbering.</p> <p><i>[Example: ١ ٢ ٣. end example]</i></p>
decimalFullWidth2 (Double Byte Arabic Numerals Alternate)	<p>Specifies that the sequence shall consist of an alternative set of double-byte Arabic numbering, if one exists in the run font.</p> <p><i>[Example: ١ ٢ ٣. end example]</i></p>
decimalHalfWidth (Single Byte Arabic Numerals)	<p>Specifies that the sequence shall consist of single-byte Arabic numbering.</p> <p><i>[Example: ١, ٢, ٣. end example]</i></p>
decimalZero (Initial Zero Arabic Numerals)	<p>Specifies that the sequence shall consist of Arabic numbering with a zero added to numbers one through nine.</p> <p><i>[Example: 01, 02, 03, ..., 09, 10. end example]</i></p>
ganada (Korean Ganada Numbering)	<p>Specifies that the sequence shall consist of sequential numbers from the Korean Ganada format.</p> <p><i>[Example: 가, 나, ... end example]</i></p>
hebrew1 (Hebrew Numerals)	<p>Specifies that the sequence shall consist of Hebrew numerals.</p> <p><i>[Example: א, ב, ג, ... , י, יא end example]</i></p>
hebrew2 (Hebrew Alphabet)	<p>Specifies that the sequence shall consist of the Hebrew alphabet.</p>

Enumeration Value	Description
	[Example: ४, ५, ६, ... end example]
hex (Hexadecimal Numbering)	Specifies that the sequence shall consist of hexadecimal numbering.  [Example: 1, 2, 3, ... , 9, A, B. end example]
hindiConsonants (Hindi Consonants)	Specifies that the sequence shall consist of Hindi consonants.  [Example: अ, आ, इ, . end example]
hindiCounting (Hindi Counting System)	Specifies that the sequence shall consist of sequential numbers from the Hindi counting system.  [Example: एक, दो, तीन, ... end example]
hindiNumbers (Hindi Numbers)	Specifies that the sequence shall consist of Hindi numbers.  [Example: १, २, ३, ... end example]
hindiVowels (Hindi Vowels)	Specifies that the sequence shall consist of Hindi vowels.  [Example: क, ख, ग, . end example]
ideographDigital (Ideographs)	Specifies that the sequence shall consist of sequential numerical ideographs enclosed in a circle, using the appropriate character.  [Example: 一, 二, 三, 四 end example]
ideographEnclosedCircle (Ideographs Enclosed in a Circle)	Specifies that the sequence shall consist of sequential numerical ideographs enclosed in a circle, using the appropriate character.  Once the specified sequence reaches 11, the numbers may be replaced with non-enclosed equivalents.  [Example: ①, ②, ③, ... end example]
ideographLegalTraditional (Traditional Legal Ideograph Format)	Specifies that the sequence shall consist of sequential numerical traditional legal ideographs.  [Example: 壹貳參... end example]
ideographTraditional (Traditional Ideograph Format)	Specifies that the sequence shall consist of sequential numerical traditional ideographs.

Enumeration Value	Description
	[Example: 甲乙丙... end example]
ideographZodiac (Zodiac Ideograph Format)	Specifies that the sequence shall consist of sequential zodiac ideographs.  [Example: 子丑寅... end example]
ideographZodiacTraditional (Traditional Zodiac Ideograph Format)	Specifies that the sequence shall consist of sequential traditional zodiac ideographs.  [Example: 甲子乙丑寅卯... end example]
iroha (Iroha Ordered Katakana)	Specifies that the sequence shall consist of the iroha.  [Example: ア, イ, ウ, ... end example]
irohaFullWidth (Full-Width Iroha Ordered Katakana)	Specifies that the sequence shall consist of the full-width forms of the iroha.  [Example: ア, イ, ウ, ... end example]
japaneseCounting (Japanese Counting System)	Specifies that the sequence shall consist of sequential numbers from the Japanese counting system.  [Example: 一, 二, ..., 九, 十, 十一... end example]
japaneseDigitalTenThousand (Japanese Digital Ten Thousand Counting System)	Specifies that the sequence shall consist of sequential numbers from the Japanese digital ten thousand counting system.  [Example: 一, 二, ..., 九, 一〇... end example]
japaneseLegal (Japanese Legal Numbering)	Specifies that the sequence shall consist of sequential numbers from the Japanese legal counting system.  [Example: 壱, 弐, 参, ... end example]
koreanCounting (Korean Counting System)	Specifies that the sequence shall consist of sequential numbers from the Korean counting system.  [Example: 일, 이, ... end example]
koreanDigital (Korean Digital Counting System)	Specifies that the sequence shall consist of sequential numbers from the Korean digital counting system.  [Example: 일, 이, ... end example]
koreanDigital2 (Korean Digital Counting System Alternate)	Specifies that the sequence shall consist of sequential numbers from the Korean digital counting system.  [Example: 일, 이, ... end example]

Enumeration Value	Description
koreanLegal (Korean Legal Numbering)	<p>Specifies that the sequence shall consist of sequential numbers from the Korean legal numbering system.</p> <p>[Example: 하나, 둘, ... end example]</p>
lowerLetter (Lowercase Latin Alphabet)	<p>Specifies that the sequence shall consist of the letters of the Latin alphabet in lower case.</p> <p>[Example: a, b, c. end example]</p>
lowerRoman (Lowercase Roman Numerals)	<p>Specifies that the sequence shall consist of lowercase roman numerals.</p> <p>[Example: i, ii, iii. end example]</p>
none (No Numbering)	<p>Specifies that the sequence shall not display any numbering.</p>
numberInDash (Number With Dashes)	<p>Specifies that the sequence shall consist of the Arabic numbering surrounded by dash characters.</p> <p>[Example: - 1 -, - 2 -, - 3 -. end example]</p>
ordinal (Ordinal)	<p>Specifies that the sequence shall consist of ordinals of the run language.</p> <p>[Example: 1st, 2nd, 3rd. end example]</p>
ordinalText (Ordinal Text)	<p>Specifies that the sequence shall consist of ordinal text of the run language.</p> <p>[Example: first, second, third. end example]</p>
russianLower (Lowercase Russian Alphabet)	<p>Specifies that the sequence shall consist of the letters of the Russian alphabet in lower case.</p> <p>[Example: а, б, в. end example]</p>
russianUpper (Uppercase Russian Alphabet)	<p>Specifies that the sequence shall consist of the letters of the Russian alphabet in upper case.</p> <p>[Example: А, Б, В. end example]</p>
taiwaneseCounting (Taiwanese Counting System)	<p>Specifies that the sequence shall consist of sequential numbers from the Taiwanese counting system.</p> <p>[Example: 一, 二, ..., 九, 十 end example]</p>
taiwaneseCountingThousand (Taiwanese Counting Thousand System)	<p>Specifies that the sequence shall consist of sequential numbers from the Taiwanese counting thousand system.</p>

Enumeration Value	Description
	<i>[Example: 一, 二, ..., 九, 一〇 end example]</i>
taiwaneseDigital (Taiwanese Digital Counting System)	Specifies that the sequence shall consist of sequential numbers from the Taiwanese digital counting system.  <i>[Example: 一, 二, ..., 九, 一〇 end example]</i>
thaiCounting (Thai Counting System)	Specifies that the sequence shall consist of sequential numbers from the Thai counting system.  <i>[Example: หนึ่ง, สอง, สาม. end example]</i>
thaiLetters (Thai Letters)	Specifies that the sequence shall consist of Thai letters.  <i>[Example: ก, ข, ค. end example]</i>
thaiNumbers (Thai Numerals)	Specifies that the sequence shall consist of Thai numerals.  <i>[Example: ๒, ๓, ๔. end example]</i>
upperLetter (Uppercase Latin Alphabet)	Specifies that the sequence shall consist of the letters of the Latin alphabet in upper case.  <i>[Example: A, B, C. end example]</i>
upperRoman (Uppercase Roman Numerals)	Specifies that the sequence shall consist of uppercase roman numerals.  <i>[Example: I, II, III. end example]</i>
vietnameseCounting (Vietnamese Numerals)	Specifies that the sequence shall consist of Vietnamese numerals.  <i>[Example: một, hai, ba. end example]</i>

2.18.67 ST\_OnOff (On/Off Value)

This simple type specifies a set of values for any binary (on or off) property defined in a WordprocessingML document.

A value of on, 1, or true specifies that the property shall be turned on. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of off, 0, or false specifies that the property shall be explicitly turned off.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
0 (False)	Specifies that the binary state of this property is off (parent property is explicitly not applied).
1 (True)	Specifies that the binary state of this property is on (parent property is explicitly applied).
false (False)	Specifies that the binary state of this property is off (parent property is explicitly not applied).
off (False)	Specifies that the binary state of this property is off (parent property is explicitly not applied).
on (True)	Specifies that the binary state of this property is on (parent property is explicitly applied).
true (True)	Specifies that the binary state of this property is on (parent property is explicitly applied).

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OnOff">
 <restriction base="xsd:string">
 <enumeration value="true"/>
 <enumeration value="false"/>
 <enumeration value="on"/>
 <enumeration value="off"/>
 <enumeration value="0"/>
 <enumeration value="1"/>
 </restriction>
</simpleType>
```

## 2.18.68 ST\_PageBorderDisplay (Page Border Display Options)

This simple type specifies the pages in the parent section on which the page border shall be printed.

[*Example:* Consider a section in a document for which the page border shall only be printed on the first page.

This setting is specified using the following WordprocessingML:

```
<w:pgBorders w:display="firstPage">
 ...
</w:pgBorders>
```

The display attribute with a value of `firstPage` specifies that only the first page shall display the page border defined for this section. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allPages (Display Page Border on All Pages)	Specifies that the page border shall be displayed on all pages in the parent section.

Enumeration Value	Description
firstPage (Display Page Border on First Page)	Specifies that the page border shall be displayed on only the first page in the parent section.
notFirstPage (Display Page Border on All Pages Except First)	Specifies that the page border shall be displayed on only the first page in the parent section.

1

Referenced By
pgBorders@display (§2.6.10)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_PageBorderDisplay">
4 <restriction base="xsd:string">
5 <enumeration value="allPages"/>
6 <enumeration value="firstPage"/>
7 <enumeration value="notFirstPage"/>
8 </restriction>
9 </simpleType>

```

## 10 2.18.69 ST\_PageBorderOffset (Page Border Positioning Base)

11 This simple type specifies how the relative positioning of the page borders shall be calculated.

12 If the value of this attribute is text, then the space attribute on each page border shall be interpreted as the  
13 distance from the text margins that shall be left before the page border.

14 [Example: Consider the following WordprocessingML fragment:

```

15 <w:pgBorders w:offsetFrom="page">
16 <w:top w:val="dashed" w:space="24" />
17 <w:left w:val="dashed" w:space="24" />
18 <w:bottom w:val="dashed" w:space="24"/>
19 <w:right w:val="dashed" w:space="24"/>
20 </w:pgBorders>

```

21 This fragment specifies that the page borders shall be indented 24 points from the page extents.

22 This is distinct from the following fragment with identical space attribute values:

```

23 <w:pgBorders w:offsetFrom="text">
24 <w:top w:val="dashed" w:space="24" />
25 <w:left w:val="dashed" w:space="24" />
26 <w:bottom w:val="dashed" w:space="24"/>
27 <w:right w:val="dashed" w:space="24"/>
28 </w:pgBorders>

```

In this case, the page borders will be offset by 24 points, but in this case, that offset will be calculated relative to the text margins. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
page (Page Border Is Positioned Relative to Page Edges)	Specifies that the space attribute on each page border shall be interpreted as the distance from the edge of the page that shall be left before the page border.
text (Page Border Is Positioned Relative to Text Extents)	Specifies that the space attribute on each page border shall be interpreted as the distance from the edge of the text extents (text margins) that shall be left before the page border..

Referenced By
pgBorders@offsetFrom (§2.6.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageBorderOffset">
 <restriction base="xsd:string">
 <enumeration value="page"/>
 <enumeration value="text"/>
 </restriction>
</simpleType>
```

### 2.18.70 ST\_PageBorderZOrder (Page Border Z-Order)

This simple type specifies whether the page border is positioned above or below intersecting texts and objects in this document.

[*Example:* Consider a document in which the page border shall be displayed below any intersecting text as follows:

This setting is specified by setting the value of an attribute with to back, which specifies that the page border shall be displayed behind all intersecting text and objects. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
back (Page Border Behind Text)	Specifies that the page border shall be rendered beneath any text or object which intersects it - effectively placing it at the lowest z-order on the page.
front (Page Border Ahead of Text)	Specifies that the page border shall be rendered above any text or object which intersects it - effectively placing it at the highest z-order on the page.

1

Referenced By
pgBorders@zOrder (§2.6.10)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_PageBorderZOrder">
4 <restriction base="xsd:string">
5 <enumeration value="front"/>
6 <enumeration value="back"/>
7 </restriction>
8 </simpleType>
```

### 9 2.18.71 ST\_PageOrientation (Page Orientation)

10 This simple type specifies the orientation of all pages in the parent section. This information is used to  
 11 determine the actual paper size to use when printing the file.

12 [*Example*: Pages 11" wide by 8.5" long in landscape mode use 8.5"x11" paper, because the width and height are  
 13 reversed for pages in this landscape section with respect to the printed page. *end example*]

14 [*Example*: Consider the following WordprocessingML:

15 `<w:pgSz w:w="15840" w:h="12240" w:orient="landscape" />`

16 Although the page width is 11", and page height is 8.5", according to the w and h attributes, because the orient  
 17 attribute is set to landscape, pages in this section are printed on 8.5x11" paper in landscape mode. *end*  
 18 *example*]

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
landscape (Landscape Mode)	Specifies that pages in this section shall be printed in landscape mode, which prints the page contents with a 90 degree rotation with respect to the normal page orientation.
portrait (Portrait Mode)	Specifies that pages in this section shall be printed in

Enumeration Value	Description
	portrait mode.

1

Referenced By
pgSz@orient (§2.6.13)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_PageOrientation">
4 <restriction base="xsd:string">
5 <enumeration value="portrait"/>
6 <enumeration value="landscape"/>
7 </restriction>
8 </simpleType>
```

### 9 2.18.72 ST\_Panose (Panose-1 Number)

10 This simple type specifies a number consisting of 10 hexadecimal digits which defines the Panose-1 classification  
11 number a font.

12 [*Example:* Consider the following information stored for a single font:

```

13 <w:font w:name="Times New Roman">
14 <w:panose1 w:val="02020603050405020304" />
15 ...
16 </w:font>
```

17 The panose1 element specifies its Panose-1 number via its val attribute value of 02020603050405020304. *end*  
18 *example]*

19 This simple type's contents are a restriction of the XML Schema hexBinary datatype.

20 This simple type also specifies the following restrictions:

- 21 • This simple type's contents must have a length of exactly 10 characters.

Referenced By
panose1@val (§2.8.2.13)

22 The following XML Schema fragment defines the contents of this simple type:

```

23 <simpleType name="ST_Panose">
24 <restriction base="xsd:hexBinary">
25 <length value="10"/>
26 </restriction>
27 </simpleType>
```

### 2.18.73 ST\_Pitch (Font Pitch Value)

This simple type specifies the possible values for the font pitch of a font.

[*Example:* Consider the following information stored for a single font:

```
<w:font w:name="Courier New">
 <w:pitch w:val="fixed" />
 ...
</w:font>
```

The pitch element specifies via its val attribute value of *fixed* that this is a fixed width font. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default)	Specifies that no information is available about the pitch of a font.
fixed (Fixed Width)	Specifies that this is a fixed width font.
variable (Proportional Width)	Specifies that this is a proportional width font.

#### Referenced By

pitch@val (§2.8.2.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Pitch">
 <restriction base="xsd:string">
 <enumeration value="fixed"/>
 <enumeration value="variable"/>
 <enumeration value="default"/>
 </restriction>
</simpleType>
```

### 2.18.74 ST\_PixelsMeasure (Measurement in Pixels)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in pixels.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of 96 whose type is ST\_PixelsMeasure. This attribute value specifies a size of 96 pixels (one inch on a 96 pixels per inch display). *end example*]

This simple type's contents are a restriction of the ST\_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
marH@val (§2.15.2.24); marW@val (§2.15.2.28); readModeInkLockDown@h (§2.15.1.66); readModeInkLockDown@w (§2.15.1.66)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PixelsMeasure">
 <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

### 2.18.75 ST\_PointMeasure (Measurement in Points)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in points (equivalent to 1/72nd of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of 24 whose type is ST\_PointMeasure. This attribute value specifies a size in points (24 points = 1/3 of an inch). *end example*]

This simple type's contents are a restriction of the ST\_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PointMeasure">
 <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

### 2.18.76 ST\_Proof (Proofing State Values)

This simple type specifies the values which may be used to indicate the status of a given hosting application's grammar and spell checking when a given WordprocessingML document was last saved.

[*Example:* Consider a WordprocessingML document that is saved by a hosting application whose grammar checking engine had completed checking the grammar in the given WordprocessingML document, but whose spell checking engine had not completed checking the spelling in the given WordprocessingML document. In this instance, the following WordprocessingML shall be written in the document settings:

```
<w:proofState w:spelling="dirty" w:grammar="clean" />
```

The proofState element's attributes spelling and grammar have the ST\_Proof simple type enumeration values dirty and clean respectively, specifying that the hosting application's spell checking engine had not completed checking the spelling of the document, and that the hosting application's grammar checking engine had completed checking the grammar of the document, when the WordprocessingML document was last saved. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clean (Check Completed)	Specifies that the given proofing engine completed checking the document when it was last saved.
dirty (Check Not Completed)	Specifies that the given proofing engine did not complete checking the document when it was last saved.

Referenced By
proofState@grammar (§2.15.1.65); proofState@spelling (§2.15.1.65)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Proof">
 <restriction base="xsd:string">
 <enumeration value="clean"/>
 <enumeration value="dirty"/>
 </restriction>
</simpleType>
```

### 2.18.77 ST\_ProofErr (Proofing Error Type)

This simple type specifies the possible values for the types of proofing error markers which can appear in the contents of a WordprocessingML document to indicate the last known state of any spell- and grammar-checking performed on the contents of this document.

*[Example:* Consider the following paragraph consisting of two misspelled words, where the second word has been explicitly flagged as not being a spelling error. This paragraph would consist of the following WordprocessingML markup:

1       <w:p>  
2        <w:proofErr w:val="spellStart"/>  
3        <w:r>  
4         <w:t>erqwt</w:t>  
5       </w:r>  
6       <w:proofErr w:val="spellEnd"/>  
7       <w:r>  
8         <w:t xml:space="preserve"> werewr</w:t>  
9       </w:r>  
10      </w:p>

11   The proofErr elements with a val attribute value of spellStart and spellEnd, respectively delimit the start  
12   and end the content in this paragraph which is stored as a spelling error. Since the second word is not included  
13   in that range, it is not stored as a spelling error. *end example]*

14   This simple type's contents are a restriction of the XML Schema string datatype.

15   The following are possible enumeration values for this type:

Enumeration Value	Description
gramEnd (End of Region Marked as Grammatical Error)	Specifies that this proofing error marker shall indicate the start of a region to be marked as a grammatical error in the document.
gramStart (Start of Region Marked as Grammatical Error)	Specifies that this proofing error marker shall indicate the end of a region to be marked as a grammatical error in the document.
spellEnd (End of Region Marked as Spelling Error)	Specifies that this proofing error marker shall indicate the end of a region to be marked as a spelling error in the document.
spellStart (Start of Region Marked as Spelling Error)	Specifies that this proofing error marker shall indicate the start of a region to be marked as a spelling error in the document.

16

Referenced By
proofErr@type (§2.13.8.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ProofErr">
 <restriction base="xsd:string">
 <enumeration value="spellStart"/>
 <enumeration value="spellEnd"/>
 <enumeration value="gramStart"/>
 <enumeration value="gramEnd"/>
 </restriction>
</simpleType>
```

### 2.18.78 ST\_PTabAlignment (Absolute Position Tab Alignment)

This simple type specifies the alignment of an absolutely positioned tab character in a document. This alignment value determines the position on the line to which this absolute tab shall advance, as well as the alignment of the text entered after the alignment tab character position.

[*Example:* Consider a positional tab stop in a WordprocessingML document who shall move to the left edge of the text margins and whose subsequent text should be left aligned. This positional tab stop would be defined as follows:

```
<w:ptab w:alignment="left" w:relativeTo="margin" ... />
```

The alignment attribute has a value of `left`, which specifies that this custom tab stop shall align on the left edge of the line relative to the text margin. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center)	Specifies that the positional tab should be center aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be center aligned.
left (Left)	Specifies that the positional tab should be left aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be left aligned.
right (Right)	Specifies that the positional tab should be right aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be right aligned.

#### Referenced By

ptab@alignment (§2.3.3.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PTabAlignment">
 <restriction base="xsd:string">
 <enumeration value="left"/>
 <enumeration value="center"/>
 <enumeration value="right"/>
 </restriction>
</simpleType>
```

### 2.18.79 ST\_PTabLeader (Absolute Position Tab Leader Character)

This simple type specifies the characters which may be used to fill in the space created by a positional tab. This character shall be repeated as required to completely fill the tab spacing generated by the positional tab character.

*[Example:* Consider a positional tab stop which should be preceded by a sequence of underscore characters, as follows:

\_\_\_\_\_Text at the positional tab stop

This tab stop would have a leader attribute value of `underscore`, indicating that the tab stop shall be preceded by underscore characters as needed to fill the tab spacing. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dot (Dot Leader Character)	Specifies that the leader character for this positional tab stop shall be a dot.  <i>[Example:</i>  ..... Text at absolute tab.  <i>end example]</i>
hyphen (Hyphen Leader Character)	Specifies that the leader character for this positional tab stop shall be a hyphen.  <i>[Example:</i>  ----- Text at absolute tab.  <i>end example]</i>
middleDot (Centered Dot Leader Character)	Specifies that the leader character for this positional tab stop shall be a centered dot.

Enumeration Value	Description
	<i>[Example:</i>  ..... Text at absolute tab.  <i>end example]</i>
none (No Leader Character)	Specifies that there shall be no leader character for this positional tab.  <i>[Example:</i>  Text at absolute tab.  <i>end example]</i>
underscore (Underscore Leader Character)	Specifies that the leader character for this positional tab stop shall be an underscore.  <i>[Example:</i>  _____ Text at absolute tab.  <i>end example]</i>

Referenced By

ptab@leader (§2.3.3.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PTabLeader">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="dot"/>
 <enumeration value="hyphen"/>
 <enumeration value="underscore"/>
 <enumeration value="middleDot"/>
 </restriction>
</simpleType>
```

2.18.80 ST\_PTabRelativeTo (Absolute Position Tab Positioning Base)

Specifies the possible extents which may be used to calculate the absolute positioning of this positional tab character.

*[Example:* Consider a positional tab stop in a WordprocessingML document that should have a resulting position that is centered on the text margins, ignoring both any custom tab stops and any text indents on the paragraph. This positional tab stop would be defined as follows:

`<w:ptab w:relativeTo="margin" ... />`

The relativeTo attribute specifies that this absolute position tab stop shall be relative to the margin. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
indent (Relative To Indents)	Specifies that the absolute positioning of the tab shall be relative to the indents.
margin (Relative To Text Margins)	Specifies that the absolute positioning of the tab shall be relative to the margins.

#### Referenced By

ptab@relativeTo (§2.3.3.22)

```
<simpleType name="ST_PTabRelativeTo">
 <restriction base="xsd:string">
 <enumeration value="margin"/>
 <enumeration value="indent"/>
 </restriction>
</simpleType>
```

### 2.18.81 ST\_RestartNumber (Footnote/Endnote Numbering Restart Locations)

This simple type specifies the possible values for when the automatic numbering of footnotes or endnotes shall be restarted.

[*Example:* Consider a WordprocessingML document where the numbering for its endnotes shall be restarted after each section shall be restarted after each page. This setting is represented by the following WordprocessingML:

```
<w:footnotePr>
 ...
 <w:numRestart w:val="eachSect" />
 ...
</w:footnotePr>
```

The val attribute value of eachSect specifies that numbering shall be restarted after each section. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuous (Continue Numbering From Previous Section)	Specifies that the numbering of footnotes or endnotes shall continue from the previous section in the document.
eachPage (Restart Numbering On Each Page)	Specifies that the numbering of footnotes or endnotes shall be restarted to its starting value for each unique page in the document.
eachSect (Restart Numbering For Each Section)	Specifies that the numbering of footnotes or endnotes shall be restarted to its starting value for each unique section in the document.

1

Referenced By
numRestart@val (§2.11.19)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_RestartNumber">
4 <restriction base="xsd:string">
5 <enumeration value="continuous"/>
6 <enumeration value="eachSect"/>
7 <enumeration value="eachPage"/>
8 </restriction>
9 </simpleType>
```

## 10 2.18.82 ST\_RubyAlign (Phonetic Guide Text Alignment)

11 This simple type specifies the possible alignment settings which may be used to determine the placement of  
12 phonetic guide text with respect to the base text when this phonetic guide is displayed.

13 [Example: Consider a run of phonetic guide text which shall have the ruby text positioned to the far left of the  
14 base text. This constraint is specified using the following WordprocessingML:

```

15 <w:rubyPr>
16 ...
17 <w:rubyAlign w:val="left"/>
18 ...
19 </w:rubyPr>
```

20 The rubyAlign property is left for the phonetic guide, so the ruby text will be displayed on the left side of the  
21 base text. *end example*]

22 This simple type's contents are a restriction of the XML Schema string datatype.

23 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
center (Center)	<p>Specifies that the phonetic guide text shall be centered with respect to the base text in this document.</p> <p><i>[Example:</i></p> <p style="text-align: center;">guide text</p> <p>this is a test center</p> <p><i>end example]</i></p>
distributeLetter (Distribute All Characters)	<p>Specifies that the phonetic guide text shall be distributed with respect to the base text in this document.</p> <p>This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line.</p> <p><i>[Example:</i></p> <p style="text-align: center;">g u i d e t e x t</p> <p>a test distribute letter</p> <p><i>end example]</i></p>
distributeSpace (Distribute all Characters w/ Additional Space On Either Side)	<p>Specifies that the phonetic guide text shall be distributed with respect to the base text in this document, with additional space added to the guide text to ensure it is indented with respect to the base text.</p> <p>This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line. As well, an additional space is added before and after the guide text to ensure it is indented with respect to the base text.</p> <p><i>[Example:</i></p> <p style="text-align: center;">g u i d e t e x t</p> <p>a test distribute space</p> <p><i>end example]</i></p>

Enumeration Value	Description
left (Left Aligned)	<p>Specifies that the phonetic guide text shall be left aligned with respect to the base text in this document.</p> <p>[Example:</p> <div><small>guide text</small> this is a test left</div> <p>end example]</p>
right (Right Aligned)	<p>Specifies that the phonetic guide text shall be right aligned with respect to the base text in this document.</p> <p>[Example:</p> <div><small>guide text</small> this is a test right</div> <p>end example]</p>
rightVertical (Vertically Aligned to Right of Base Text)	<p>Specifies that the phonetic guide text shall be right aligned with respect to the base text in this document, and shall always be displayed vertically and to the right of the base text, regardless of the alignment of the base text.</p> <p>[Example:</p> <div>this is a test right vertical <small>guide text</small></div> <p>end example]</p>

rubyAlign@val (§2.3.3.25)

2 The following XML Schema fragment defines the contents of this simple type:

```
3 <simpleType name="ST_RubyAlign">
4 <restriction base="xsd:string">
5 <enumeration value="center"/>
6 <enumeration value="distributeLetter"/>
7 <enumeration value="distributeSpace"/>
8 <enumeration value="left"/>
9 <enumeration value="right"/>
10 <enumeration value="rightVertical"/>
11 </restriction>
12 </simpleType>
```

### 2.18.83 ST\_SdtDateMappingType (Date Storage Format Types)

This simple type specifies then possible types of translations which may be performed on the displayed date in a date picker structured document tag when the current contents are saved into the associated custom XML data via the dataBinding element (§2.5.2.6).

[*Example:* Consider the following date picker structured document tag:

```
<w:sdt>
 <w:sdtPr>
 <w:date w:fullDate="01-01-2006T06:30:00Z">
 <w:storeMappedDateAs w:val="text"/>
 ...
 </w:date>
</w:sdtPr>
<w:sdtContent>
 <w:r>
 <w:t>January 1</w:t>
 </w:r>
</w:sdtContent>
</w:sdt>
```

The value of the storeMappedDateAs element's attribute value is text, therefore the current run contents shall be sent to the mapped XML element without any translation (in this case, the value shall be January 1). *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
date (XML Schema Date Format)	Specifies that the date specified in the parent date picker structured document tag shall be converted to the xsd:date format when stored in a mapped XML element.
dateTime (XML Schema DateTime Format)	Specifies that the date specified in the parent date picker structured document tag shall be converted to the xsd:dateTime format when stored in a mapped XML element.
text (Same As Display)	Specifies that no translation shall be performed on the displayed date when stored in a mapped XML element - the mapped contents shall be the same as the displayed contents.

## Referenced By

storeMappedDataAs@val (§2.5.2.39)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SdtDateMappingType">
 <restriction base="xsd:string">
 <enumeration value="text"/>
 <enumeration value="date"/>
 <enumeration value="dateTime"/>
 </restriction>
</simpleType>
```

## 2.18.84 ST\_SectionMark (Section Type)

Specifies the type of the current section.

[*Example:* Consider a section that shall start on the next page in the document. The WordprocessingML specifying this would look like:

```
<w:sectPr>
 ...
 <w:type w:val="nextPage"/>
</w:sectPr>
```

The nextPage value specifies that this section starts on the next page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuous (Continuous Section Break)	Specifies a continuous section break, which begin the new section on the following paragraph. This means that continuous section breaks might not specify certain page-level section properties, since they must be inherited from the following section. These breaks, however, can specify other section properties, such as line numbering and footnote/endnote settings.
evenPage (Even Page Section Break)	Specifies an even page section break, which begins the new section on the next even-numbered page, leaving the next odd page blank if necessary.
nextColumn (Column Section Break)	Specifies a column section break, which begins the new section on the following column on the page.
nextPage (Next Page Section Break)	Specifies a next page section break, which begins the new section on the following page.
oddPage (Odd Page Section Break)	Specifies an odd page section break, which begins the

Enumeration Value	Description
	new section on the next odd-numbered page, leaving the next even page blank if necessary.

type@val (§2.6.22)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_SectionMark">
4 <restriction base="xsd:string">
5 <enumeration value="nextPage"/>
6 <enumeration value="nextColumn"/>
7 <enumeration value="continuous"/>
8 <enumeration value="evenPage"/>
9 <enumeration value="oddPage"/>
10 </restriction>
11 </simpleType>
```

## 12 2.18.85 ST\_Shd (Shading Patterns)

13 This simple type specifies the pattern which shall be used to lay the pattern color over the background color for  
14 a shading.

15 This pattern consists of a mask which is applied over the background shading color to get the locations where  
16 the pattern color should be shown. Each of these possible masks are shown in the enumeration values located  
17 below. In each example, black has been used as the fill color, and white has been used as the pattern color.

18 [Example: Consider a shaded paragraph which uses a 10 percent foreground fill, resulting in the following  
19 WordprocessingML:

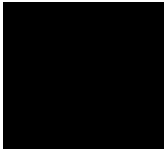

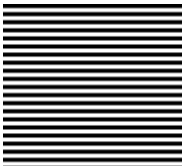

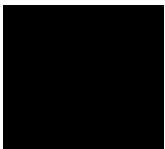

20 <w:shd w:val="pct10" .../>

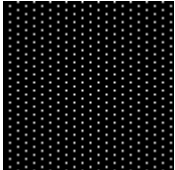

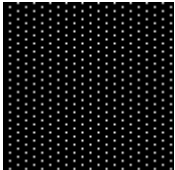

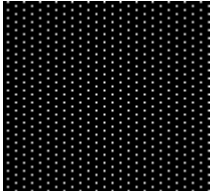

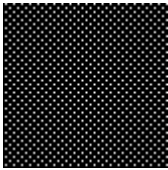

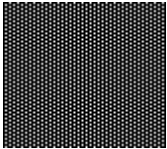

21 This shading val is pct10, indicating that the border style is a 10 percent foreground fill mask. *end example*]

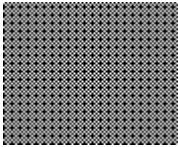

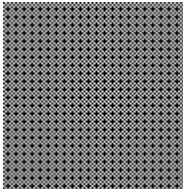

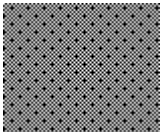

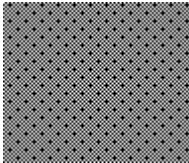

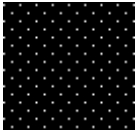

22 This simple type's contents are a restriction of the XML Schema string datatype.

23 The following are possible enumeration values for this type:

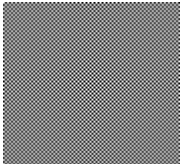

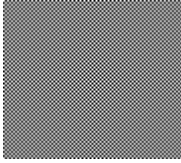

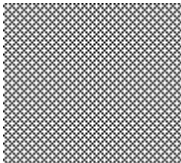

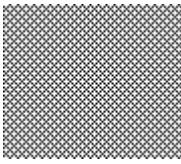

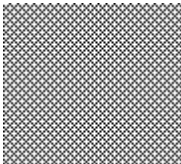

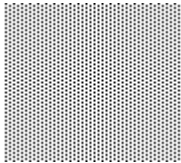

Enumeration Value	Description
clear (No Pattern)	Specifies that there shall be no pattern used on the current shaded region (i.e. the pattern shall be a complete fill with the background color), as follows:

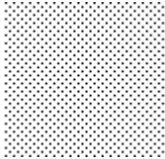

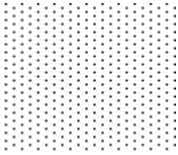

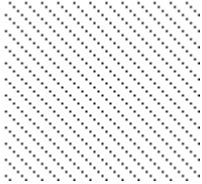

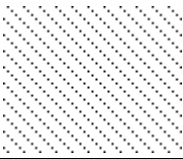

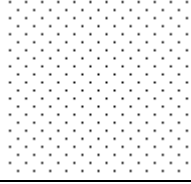

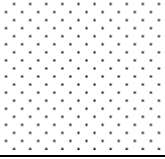

Enumeration Value	Description
	
diagCross (Diagonal Cross Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of diagonal crosses, as follows:</p> 
diagStripe (Diagonal Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of diagonal stripes, as follows:</p> 
horzCross (Horizontal Cross Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of horizontal crosses, as follows:</p> 
horzStripe (Horizontal Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of horizontal stripes, as follows:</p> 
nil (No Pattern)	<p>Specifies that there shall be no pattern used on the current shaded region (i.e. the pattern shall be a complete fill with the background color), as follows:</p> 
pct10 (10% Fill Pattern)	<p>Specifies that the pattern used for the current shaded</p>

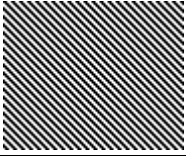

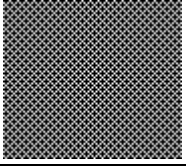

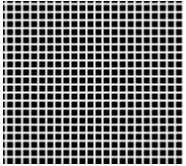

Enumeration Value	Description
	<p>region shall be a 10% fill pattern, as follows:</p> 
pct12 (12.5% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 12.5% fill pattern, as follows:</p> 
pct15 (15% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 15% fill pattern, as follows:</p> 
pct20 (20% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 20% fill pattern, as follows:</p> 
pct25 (25% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 25% fill pattern, as follows:</p> 
pct30 (30% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 30% fill pattern, as follows:</p>

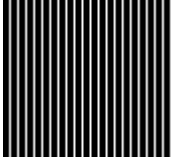

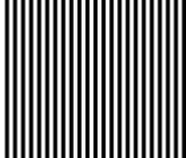

Enumeration Value	Description
	
pct35 (35% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 35% fill pattern, as follows:</p> 
pct37 (37.5% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 37.5% fill pattern, as follows:</p> 
pct40 (40% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 40% fill pattern, as follows:</p> 
pct45 (45% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 45% fill pattern, as follows:</p> 
pct5 (5% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 5% fill pattern, as follows:</p> 
pct50 (50% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 50% fill pattern, as follows:</p>

Enumeration Value	Description
	
pct55 (55% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 55% fill pattern, as follows:</p> 
pct60 (60% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 60% fill pattern, as follows:</p> 
pct62 (62.5% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 62.5% fill pattern, as follows:</p> 
pct65 (65% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 65% fill pattern, as follows:</p> 
pct70 (70% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 70% fill pattern, as follows:</p> 
pct75 (75% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 75% fill pattern, as follows:</p>

Enumeration Value	Description
	
pct80 (80% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 80% fill pattern, as follows:</p> 
pct85 (85% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 85% fill pattern, as follows:</p> 
pct87 (87.5% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 87.5% fill pattern, as follows:</p> 
pct90 (90% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 90% fill pattern, as follows:</p> 
pct95 (95% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 95% fill pattern, as follows:</p> 
reverseDiagStripe (Reverse Diagonal Stripe Pattern)	<p>Specifies that the pattern used on the current shaded</p>

Enumeration Value	Description
	<p>region shall be a series of reverse diagonal stripes, as follows:</p> 
solid (100% Fill Pattern)	<p>Specifies that the pattern used for the current shaded region shall be a 100% fill pattern, as follows:</p>
thinDiagCross (Thin Diagonal Cross Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of thin diagonal crosses, as follows:</p> 
thinDiagStripe (Thin Diagonal Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of thin diagonal stripes, as follows:</p> 
thinHorzCross (Thin Horizontal Cross Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of thin horizontal crosses, as follows:</p> 
thinHorzStripe (Thin Horizontal Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of thin horizontal stripes, as follows:</p>

Enumeration Value	Description
	
thinReverseDiagStripe (Thin Reverse Diagonal Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of thin reverse diagonal stripes, as follows:</p> 
thinVertStripe (Thin Vertical Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of thin vertical stripes, as follows:</p> 
vertStripe (Vertical Stripe Pattern)	<p>Specifies that the pattern used on the current shaded region shall be a series of vertical stripes, as follows:</p>

</simpleType>

```

#### 2.18.86 ST\_ShortHexNumber (Two Digit Hexadecimal Number Value)

This simple type specifies a number value specified as a two octet hexadecimal number), whose contents are interpreted based on the context of the parent XML element.

[Example: Consider the following value for a node of type ST\_ShortHexNumber: 2F6C.

This value is valid, as it contains two hexadecimal octets, each an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 2 characters.

Referenced By
stylePaneFormatFilter@val (§2.15.1.86); stylePaneSortMethod@val (§2.15.1.87); sym@char (§2.3.3.29); tblLook@val (§2.4.51); tblLook@val (§2.4.52)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ShortHexNumber">
 <restriction base="xsd:hexBinary">
 <length value="2"/>
 </restriction>
</simpleType>
```

## 2.18.87 ST\_SignedHpsMeasure (Signed Measurement in Half-Points)

This simple type specifies that its contents will contain a positive or negative whole number, whose contents consist of a measurement in half-points (equivalent to 1/144th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of -72 whose type is ST\_HpsMeasure. This attribute value specifies a size of negative one-half of an inch or -36 points (-72 halves of a point = -36 points = -0.5 inches). *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

Referenced By
position@val (§2.3.2.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SignedHpsMeasure">
 <restriction base="xsd:integer"/>
</simpleType>
```

## 2.18.88 ST\_SignedTwipsMeasure (Signed Measurement in Twentieths of a Point)

This simple type specifies that its contents will contain a positive or negative whole number, whose contents consist of a measurement in twentieths of a point (equivalent to 1/1440th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of 720 whose type is ST\_EighthPointMeasure. This attribute value specifies a size of one-half of an inch or 36 points (720 twentieths of a point = 36 points = 0.5 inches). *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

framePr@x (§2.3.1.11); framePr@y (§2.3.1.11); ind@left (§2.3.1.12); ind@right (§2.3.1.12); legacy@legacyIndent (§2.9.5); marBottom@val (§2.15.2.23); marLeft@val (§2.15.2.25); marRight@val (§2.15.2.26); marTop@val (§2.15.2.27); pgMar@bottom (§2.6.11); pgMar@top (§2.6.11); spacing@line (§2.3.1.33); spacing@val (§2.3.2.33); tab@pos (§2.3.1.37); tblpPr@tblpX (§2.4.54); tblpPr@tblpY (§2.4.54)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SignedTwipsMeasure">
 <restriction base="xsd:integer"/>
</simpleType>
```

## 2.18.89 ST\_String (String)

This simple type specifies that its contents will contain a string. The contents of this string are interpreted based on the context of the parent XML element.

[*Example:* Consider the following WordprocessingML fragment:

```
<w:pPr>
 <w:pStyle w:val="heading1" />
</w:pPr>
```

The value of the val attribute is the ID of the associated paragraph style's styleId. However, consider the following fragment:

```
<w:sdtPr>
 <w:alias w:val="SDT Title Example" />
 ...
</w:sdtPr>
```

In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is of type ST\_String, and therefore must be interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_String">
 <restriction base="xsd:string"/>
</simpleType>
```

## 2.18.90 ST\_StyleType (Style Types)

This simple type specifies the possible values for the types of style definitions defined within a WordprocessingML document. WordprocessingML supports six types of style definitions:

- Paragraph styles
- Character styles
- Table styles
- Numbering styles
- Linked styles (paragraph + character)
- Default paragraph + character properties

Each of the first four types corresponds to a different value below, and therefore defines the type of the current style. [Note: The last two types are unique in that they are not simply a style type: a linked style is a pairing of a character and paragraph style via the link element (§2.7.3.6); and the document default properties are defined via the docDefaults element (§2.7.4.1). *end note*]

[Example: Consider a style defined as follows:

```
<w:style w:type="paragraph" ... >
 <w:name w:val="My Paragraph Style"/>
 <w:rPr>
 <w:b/>
 </w:rPr>
</w:style>
```

The type attribute is of type ST\_StyleType, and its value of paragraph specifies that this style definition creates a paragraph style. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
character (Character Style)	Specifies that the parent style definition is a character style.
numbering (Numbering Style)	Specifies that the parent style definition is a numbering style.
paragraph (Paragraph Style)	Specifies that the parent style definition is a paragraph style.

Enumeration Value	Description
table (Table Style)	Specifies that the parent style definition is a table style.

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_StyleType">
4 <restriction base="xsd:string">
5 <enumeration value="paragraph"/>
6 <enumeration value="character"/>
7 <enumeration value="table"/>
8 <enumeration value="numbering"/>
9 </restriction>
10 </simpleType>

```

### 11 2.18.91 ST\_TabJc (Custom Tab Stop Type)

12 This simple type specifies the available types of custom tab stop, which determines the behavior of the tab stop  
13 and the alignment which shall be applied to text entered at the current custom tab stop.

14 [Example: Consider a custom tab stops at 1.5" in a WordprocessingML document. This tab stop would be  
15 contained within a tab element defining the tab stop as follows:

```
16 <w:tab w:val="left" w:pos="2160" />
```

17 The val attribute specifies that this custom tab stop shall align all text entered at its location to its left. *end*  
18 *example]*

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
bar (Bar Tab)	Specifies that the current tab is a bar tab. A <i>bar tab</i> is a tab which does not result in a custom tab stop in the parent paragraph (this tab stop location shall be skipped when positioning custom tab characters), but instead shall be used to draw a vertical line (or bar) at this location in the parent paragraph.
center (Centered Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is centered (i.e. all text runs following this tab stop and preceding the next tab stop shall be centered around the tab stop location).

Enumeration Value	Description
clear (No Tab Stop)	Specifies that the current tab stop is cleared and shall be removed and ignored when processing the contents of this document.
decimal (Decimal Tab)	<p>Specifies that the current tab stop shall result in a location in the document where all following text is aligned around the first decimal character in the following text runs.</p> <p>All text runs before the first decimal character shall be before the tab stop, all text runs after it shall be after the tab stop location.</p>
left (Left Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is left aligned (i.e. all text runs following this tab stop and preceding the next tab stop shall be left aligned with respect to the tab stop location).
num (List Tab)	<p>Specifies that the current tab is a list tab, which is the tab stop between the numbering and the paragraph contents in a numbered paragraph.</p> <p>[<i>Note</i>: This justification style is used for backwards compatibility with earlier word processors, and should be deprecated in favor of hanging paragraph indentation. <i>end note</i>]</p>
right (Right Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is right aligned (i.e. all text runs following this tab stop and preceding the next tab stop shall be right aligned with respect to the tab stop location).

1

Referenced By
tab@val (§2.3.1.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TabJc">
 <restriction base="xsd:string">
 <enumeration value="clear"/>
 <enumeration value="left"/>
 <enumeration value="center"/>
 <enumeration value="right"/>
 <enumeration value="decimal"/>
 <enumeration value="bar"/>
 <enumeration value="num"/>
 </restriction>
</simpleType>
```

### 2.18.92 ST\_TabTlc (Custom Tab Stop Leader Character)

This simple type specifies the characters which may be used to fill in the space created by a tab which ends at this custom tab stop. The chosen character shall be repeated as required to completely fill the tab spacing generated by the tab character.

[*Example:* Consider a tab stop which should be preceded by a sequence of underscore characters, as follows:

\_\_\_\_\_Text at the tab stop

This tab stop would have a leader attribute value of underscore, indicating that the tab stop shall be preceded by underscore characters as needed to fill the tab spacing. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dot (Dotted leader line)	<p>Specifies that the leader character for this custom tab stop shall be a dot.</p> <p>[<i>Example:</i></p> <p>.....Text at tab stop.</p> <p><i>end example</i>]</p>
heavy (Heavy solid leader line)	<p>Specifies that the leader character for this custom tab stop shall be a heavy solid line, or an underscore.</p> <p>[<i>Note:</i> This setting is used for backwards compatibility with earlier word processors, and should be deprecated in favor of other leader characters. It may be displayed using underscores if desired. <i>end note</i>]</p> <p>[<i>Example:</i></p>

Enumeration Value	Description
	<p>_____Text at tab stop.</p> <p><i>end example]</i></p>
hyphen (Dashed tab stop leader line)	<p>Specifies that the leader character for this custom tab stop shall be a hyphen.</p> <p>[Example:</p> <p>-----Text at tab stop.</p> <p><i>end example]</i></p>
middleDot (Middle dot leader line)	<p>Specifies that the leader character for this custom tab stop shall be a centered dot.</p> <p>[Example:</p> <p>.....Text at tab stop.</p> <p><i>end example]</i></p>
none (No tab stop leader)	<p>Specifies that there shall be no leader character for this custom tab.</p> <p>[Example:</p> <p>Text at tab stop.</p> <p><i>end example]</i></p>
underscore (Solid leader line)	<p>Specifies that the leader character for this custom tab stop shall be an underscore.</p> <p>[Example:</p> <p>_____Text at tab stop.</p> <p><i>end example]</i></p>

1

tab@leader (§2.3.1.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TabTlc">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="dot"/>
 <enumeration value="hyphen"/>
 <enumeration value="underscore"/>
 <enumeration value="heavy"/>
 <enumeration value="middleDot"/>
 </restriction>
</simpleType>
```

### 2.18.93 ST\_TargetScreenSz (Target Screen Sizes for Generated Web Pages)

This simple type specifies possible ideal minimum target screen sizes (width by height, specified in pixels) for which web pages generated may be optimized when saving this document as a web page.

[*Example:* Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
 <w:targetScreenSz w:val="1600x1200" />
</w:webSettings>
```

The targetScreenSz element's val attribute has a value of 1600x1200, which specifies that a target screen size of 1600 by 1200 pixels shall be assumed when saving this document as a web page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024x768 (Optimize for 1024x768)	Specifies that web pages produced from this document should be optimized for a screen size of 1024x768.
1152x882 (Optimize for 1152x882)	Specifies that web pages produced from this document should be optimized for a screen size of 1152x882.
1152x900 (Optimize for 1152x900)	Specifies that web pages produced from this document should be optimized for a screen size of 1152x900.
1280x1024 (Optimize for 1280x1024)	Specifies that web pages produced from this document should be optimized for a screen size of 1280x1024.
1600x1200 (Optimize for 1600x1200)	Specifies that web pages produced from this document should be optimized for a screen size of 1600x1200.

Enumeration Value	Description
1800x1440 (Optimize for 1800x1440)	Specifies that web pages produced from this document should be optimized for a screen size of 1800x1440.
1920x1200 (Optimize for 1920x1200)	Specifies that web pages produced from this document should be optimized for a screen size of 1920x1200.
544x376 (Optimize for 544x376)	Specifies that web pages produced from this document should be optimized for a screen size of 544x376.
640x480 (Optimize for 640x480)	Specifies that web pages produced from this document should be optimized for a screen size of 640x480.
720x512 (Optimize for 720x512)	Specifies that web pages produced from this document should be optimized for a screen size of 720x512.
800x600 (Optimize for 800x600)	Specifies that web pages produced from this document should be optimized for a screen size of 800x600.

15 <enumeration value="1920x1200"/>
16 </restriction>
17 </simpleType>

```

## 18 2.18.94 ST\_TblLayoutType (Table Layout Type)

19 This simple type defines the possible types of layout algorithms which may be used to lay out a table within a  
20 WordprocessingML document.

These algorithms are defined in the following paragraphs (noting, of course, that implementations are free to implement more efficient versions of each).

*Fixed Width Table Layout* - This method of table layout uses the preferred widths on the table items to generate the final sizing of the table, but does not change that size regardless of the contents of each table cell, hence the table is fixed width.

[*Guidance*: Although an application may choose to use a different process, this layout could be performed as follows:

- The table grid is used to create the set of shared columns in the table and their initial widths as defined in the tblGrid element (§2.4.44)
- The table's total width is defined based on the tblW property (§2.4.61) – if it is set to auto or nil, then the width is not yet determined and will be specified using the row and cell information.
- The first table row is read and the initial number of grid units before the row starts is skipped. The width of the skipped grid columns is set using the wBefore property (§2.4.83).
- The first cell is placed on the grid, and the width of the specified grid column span set by gridSpan (§2.4.13) is set based on the tcW property (§2.4.68).
- Each additional cell is placed on the grid.
- If at any stage, the preferred width requested for the cells exceeds the preferred width of the table, then each grid column is proportionally reduced in size to fit the table width.
- If the grid is exceeded (e.g. tblGrid specifies three grid columns, but the second cell has a gridSpan of three), the grid is dynamically increased with a default width for the new grid column.
- For each subsequent row, cells are placed on the grid, and each grid column is adjusted to be the maximum value of the requested widths (if the widths do not agree) by adding width to the last cell that ends with that grid column. Again, if at any point, the space requested for the cells exceeds the width of the table, then each grid column is proportionally reduced in size to fit the table width.

*end guidance*]

The resulting table shall be displayed regardless of its contents to the size requested.

*AutoFit Table Layout* - This method of table layout uses the preferred widths on the table items to generate the final sizing of the table, but then uses the contents of each cell to determine final column widths.

[*Guidance*: This layout may be performed in any manner available to an application, but one algorithm as follows may be used:

- Perform the steps above to lay out the fixed width version of the table.
- Calculate the minimum content width - the width of the cell's contents including all possible line breaking locations (or the cell's width, if the width of the content is smaller), and the maximum content width - the width of the cell's contents (assuming no line breaking not generated by explicit line breaks).
- The minimum and maximum content width of all cells that span a single grid column is the minimum and maximum content width of that column.

- For cells which span multiple grid columns, enlarge all cells which it spans as needed to meet that cell's minimum width.
- If any cell in a grid column has a preferred width, the first such width overrides the maximum width of the column's contents.
- Place the text in the cells in the table, respecting the minimum content width of each cell's content. If a cell's minimum content width exceeds the cell's current width, preferences are overridden as follows:
  - First, override the column widths by making all other grid columns proportionally smaller until each it at its minimum width. This cell may then grow to any width between its own minimum and maximum width.
  - Next, override the preferred table width until the table reaches the page width.
  - Finally, force a line break in each cell's contents as needed

*end guidance]*

[*Example:* Consider the following fixed width table, which makes extensive use of resized and merged cells on what is actually just a seven-column grid. (The arrows point to each (invisible) vertical line of the grid and the numbers refer to the grid columns):

Although the table is visually complex, the standard rules apply: the first cell in the table is simply a cell which spans four grid units horizontally, as specified in the `gridSpan` element, and whose preferred width is 2952 twentieths of a point, specified in the `tcW` element:

```
<w:tc>
 <w:tcPr>
 <w:tcW w:w="2952" w:type="dxa"/>
 <w:gridSpan w:val="4"/>
 </w:tcPr>
 <w:p/>
</w:tc>
```

Similarly, all cells indented from the start and end of the grid specify that indent using the `gridBefore` and `gridAfter` elements. For example, the XML for the second row in the table shows that that row starts three grid units into the table:

```
<w:tr>
 <w:trPr>
 <w:gridBefore w:val="3"/>
 <w:wBefore w:w="2748" w:type="dxa"/>
 </w:trPr>
 ...
</w:tr>
```

If we take this fixed width table and introduce a long string into the single cell in row three, we see that the presence of this text does not affect cell widths:

longtextstringwithnobreakingcharacters	

If we now turn on the AutoFit property, we see that the algorithm for this AutoFit table causes grid column two to increase in size, proportionally decreasing the other grid columns' size to accommodate the long non-breaking string in the last cell:

longtextstringwithnobreakingcharacters	

Each of the other grid columns was reduced, but since all columns are not at their minimum size, the table width is not increased even though the table is not yet at the page width. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autofit (AutoFit Table Layout)	Specifies that this table shall use an AutoFit table layout algorithm.

Enumeration Value	Description
fixed (Fixed Width Table Layout)	Specifies that this table shall use the fixed width table layout algorithm described above.

1

Referenced By
tblLayout@type (§2.4.49); tblLayout@type (§2.4.50)

2 The following XML Schema fragment defines the contents of this simple type:

```
3 <simpleType name="ST_TblLayoutType">
4 <restriction base="xsd:string">
5 <enumeration value="fixed"/>
6 <enumeration value="autofit"/>
7 </restriction>
8 </simpleType>
```

9 **2.18.95 ST\_TblOverlap (Table Overlap Setting)**

10 This simple type contains the possible settings for a floating table which shall be used to determine if the table  
11 can overlap with other floating tables when displayed in the document.

12 [Example: Consider two floating tables in a WordprocessingML document which overlap when displayed, as  
13 follows:

14

15 If either of these tables specifies that it shall not allow overlapping, using the following WordprocessingML:

```
16 <w:tblPr>
17 <w:tblOverlap w:val="never"/>
18 </w:tblPr>
```

19 The resulting tables shall not overlap, and must be adjusted at display time to prevent any overlapping, for  
20 example:

- 1
- 2 The value of never specifies that the specified table cannot overlap with other floating tables in the document.
- 3 *end example]*
- 4 This simple type's contents are a restriction of the XML Schema string datatype.
- 5 The following are possible enumeration values for this type:

Enumeration Value	Description
never (Floating Table Cannot Overlap)	<p>Specifies that the parent table, if floating, shall never be displayed in a state where it would be overlapping another floating table in the document.</p> <p>If two floating tables intersect and this option is set on either of them, then one or both tables shall be adjusted as needed to ensure that the table whose value is never is not overlapped when displayed.</p>
overlap (Floating Table Can Overlap)	<p>Specifies that the parent table, if floating, may be displayed in a state where it would be overlapping another floating table in the document.</p>

6

Referenced By
tblOverlap@val (§2.4.53)

- 7 The following XML Schema fragment defines the contents of this simple type:

```
8 <simpleType name="ST_TblOverlap">
9 <restriction base="xsd:string">
10 <enumeration value="never"/>
11 <enumeration value="overlap"/>
12 </restriction>
13 </simpleType>
```

## 2.18.96 ST\_TblStyleOverrideType (Conditional Table Style Formatting Types)

This simple type specifies possible values for the sections of the table to which the current conditional formatting properties shall be applied when this table style is used.

[*Example:* Consider a table style which contains conditional formatting, defined as follows:

```
<w:style w:type="table" ...>
 ...
 <w:tblStylePr w:type="lastRow">
 ...
 </w:tblStylePr>
</w:style>
```

The type attribute value of `lastRow` specifies that this set of conditional formatting properties shall be applied to the last row of the table only. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
band1Horz (Banded Row Conditional Formatting)	Specifies that the table formatting applies to odd numbered groupings of rows.
band1Vert (Banded Column Conditional Formatting)	Specifies that the table formatting applies to odd numbered groupings of columns.
band2Horz (Even Row Stripe Conditional Formatting)	Specifies that the table formatting applies to even numbered groupings of rows.
band2Vert (Even Column Stripe Conditional Formatting)	Specifies that the table formatting applies to even numbered groupings of columns.
firstCol (First Column Conditional Formatting)	Specifies that the table formatting applies to the first column.
firstRow (First Row Conditional Formatting)	Specifies that the table formatting applies to the first row.  Any subsequent row which has the <code>tblHeader</code> element present (§2.4.46) shall also use this conditional format.
lastCol (Last table column formatting)	Specifies that the table formatting applies to the last column.
lastRow (Last table row formatting)	Specifies that the table formatting applies to the last row.
neCell (Top right table cell formatting)	Specifies that the table formatting applies to the top right cell.
nwCell (Top left table cell formatting)	Specifies that the table formatting applies to the top

Enumeration Value	Description
	left cell.
seCell (Bottom right table cell formatting)	Specifies that the table formatting applies to the bottom right cell.
swCell (Bottom left table cell formatting)	Specifies that the table formatting applies to the bottom left cell.
wholeTable (Whole table formatting)	Specifies that the conditional formatting applies to the whole table.

17 <enumeration value="swCell"/>
18 </restriction>
19 </simpleType>

```

## 20 2.18.97 ST\_TblWidth (Table Width Units)

21 This simple type specifies the possible values for the units of the width property being defined by a specific table  
22 width property. These properties are used to define various properties of a table, including: cell spacing,  
23 preferred width, and table margins.

24 [Example: Consider a table with a table cell bottom cell spacing with a type of dxa, as follows:

```
25 <w:bottom ... w:type="dxa" />
```

26 This type shall therefore be used to interpret the width specified in the w attribute as a value in twentieths of a  
27 point. *end example*

28 This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Determined Width)	<p>Specifies that the value for the measurement of the current table width property in the parent table shall be automatically determined by the table layout algorithm when the table is displayed (this width can be adjusted as appropriate).</p> <p>If this value is inappropriate for the current measurement (i.e. this measurement is not affected by that algorithm), then this type and the associated value may be ignored.</p>
dxa (Width in Twentieths of a Point)	<p>Specifies that the value for the measurement of the current table width property in the parent table shall be interpreted as twentieths of a point (1/1440 of an inch).</p>
nil (No Width)	<p>Specifies that the current width is zero, regardless of any width value specified on the parent element.</p>
pct (Width in Fiftieths of a Percent)	<p>Specifies that the value for the measurement of the current table width property in the parent table shall be interpreted as fiftieths of a percent.</p> <p><i>[Example: 4975 = 99.5% end example]</i></p> <p>These percentages shall be calculated relative to the extents specified by the parent XML element.</p> <p>If this value is inappropriate for the current measurement (i.e. this measurement is not part of the width of the table), then this type and the associated value may be ignored.</p>

 <enumeration value="pct"/>
 <enumeration value="dxa"/>
 <enumeration value="auto"/>
 </restriction>
</simpleType>
```

## 2.18.98 ST\_TextAlignment (Vertical Text Alignment Types)

This simple type specifies the type of vertical alignment which shall be used to align the characters on each line in the parent object.

[*Example:* Consider a paragraph of text of different font sizes, as follows:

This is text of **various** sizes.

If the text on this paragraph shall be aligned based on the top point of the maximum character height, that requirement would be specified as follows in the WordprocessingML:

```
<w:pPr>
 <w:textAlignment w:val="top" />
</w:pPr>
```

The resulting text would be top aligned, as follows:

This is text of **various** sizes.

The characters are all aligned to the maximum character extent on the line. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Determine Alignment)	Specifies that all text in the parent object shall be aligned automatically when displayed.
baseline (Align Text at Baseline)	Specifies that all text in the parent object shall be aligned to the baseline of each character when displayed.

Enumeration Value	Description
bottom (Align Text at Bottom)	Specifies that all text in the parent object shall be aligned to the bottom of each character when displayed.
center (Align Text at Center)	Specifies that all text in the parent object shall be aligned to the center of each character when displayed.
top (Align Text at Top)	Specifies that all text in the parent object shall be aligned to the top of each character when displayed.

Referenced By
textAlignment@val (§2.3.1.39)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TextAlignment">
4 <restriction base="xsd:string">
5 <enumeration value="top"/>
6 <enumeration value="center"/>
7 <enumeration value="baseline"/>
8 <enumeration value="bottom"/>
9 <enumeration value="auto"/>
10 </restriction>
11 </simpleType>

```

## 12 2.18.99 ST\_TextboxTightWrap (Lines To Tight Wrap Within Text Box)

13 This simple type specifies the lines in the parent paragraph which shall allow the text to be tight wrapped to the  
14 paragraph (and not the containing text box) extents when displaying the document.

15 *[Example:* Consider a paragraph in a text box which meets the criteria specified above which shall allow  
16 wrapping to the text extents on its first line only. That requirement would be specified using the following  
17 WordprocessingML:

```

18 <w:pPr>
19 <w:textboxTightWrap w:val="firstLineOnly" />
20 </w:pPr>

```

21 The resulting paragraph would allow text to tightly wrap to the contents of its first line only. All other lines  
22 would wrap to the text box's extents. *end example]*

23 This simple type's contents are a restriction of the XML Schema string datatype.

24 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
allLines (Tight Wrap All Lines)	Specifies that all lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
firstAndLastLine (Tight Wrap First and Last Lines)	Specifies that only the first and last lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
firstLineOnly (Tight Wrap First Line)	Specifies that only the first line in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
lastLineOnly (Tight Wrap Last Line)	Specifies that only the last line in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
none (Do Not Tight Wrap)	Specifies that no lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.

```

3 <simpleType name="ST_TextboxTightWrap">
4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="allLines"/>
7 <enumeration value="firstAndLastLine"/>
8 <enumeration value="firstLineOnly"/>
9 <enumeration value="lastLineOnly"/>
10 </restriction>
11 </simpleType>
```

## 12 2.18.100 ST\_TextDirection (Text Flow Direction)

13 This simple type specifies the direction of the text flow for the parent object.

14 [Example: Consider an object in which text shall flow bottom to top vertically, and left to right horizontally. The  
15 btLr value in an element of type ST\_TextDirection specifies that the text flow shall go bottom to top, and left  
16 to right. *end example*]

17 This simple type's contents are a restriction of the XML Schema string datatype.

18 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
btLr (Bottom to Top, Left to Right)	<p>Specifies that text in the parent object shall flow from bottom to top vertically, then from left to right horizontally on the page.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p>
lrTb (Left to Right, Top to Bottom)	<p>Specifies that text in the parent object shall flow from left to right horizontally, then top to bottom vertically on the page.</p> <p>This means that horizontal lines are filled before the text expands vertically.</p>
lrTbV (Left to Right, Top to Bottom Rotated)	<p>Specifies that text in the parent object shall flow from left to right horizontally, then top to bottom vertically on the page.</p> <p>This means that horizontal lines are filled before the text expands vertically.</p> <p>This flow is also rotated such that any East Asian text shall be rotated 270 degrees when displayed on a page.</p>
tbLrV (Top to Bottom, Left to Right Rotated)	<p>Specifies that text in the parent object shall flow from top to bottom vertically, then left to right horizontally on the page.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p> <p>This flow is also rotated such that all text is rotated 90 degrees when displayed on a page.</p>
tbRl (Top to Bottom, Right to Left)	<p>Specifies that text in the parent object shall flow from right to left horizontally, then top to bottom vertically on the page.</p> <p>This means that horizontal lines are filled before the text expands vertically.</p>
tbRlV (Top to Bottom, Right to Left Rotated)	<p>Specifies that text in the parent object shall flow from top to bottom vertically, then right to left horizontally on the page.</p> <p>This means that vertical lines are filled before the text expands horizontally.</p>

Enumeration Value	Description
	This flow is also rotated such that all text is rotated 90 degrees when displayed on a page.

9 <enumeration value="tbRlV"/>
10 <enumeration value="tbLrV"/>
11 </restriction>
12 </simpleType>
```

### 13 2.18.101 ST\_TextEffect (Animated Text Effects)

14 This simple type specifies the possible types of animated text effect which may be applied to a text run when it  
15 is displayed..

16 [Example: Consider a run of text which shall have an animated text effect consisting of multiple colored flashing  
17 lights. This constraint is specified using the following WordprocessingML:

```

18 <w:rPr>
19 <w:effect w:val="lights"/>
20 </w:rPr>
```

21 This run explicitly declares a type of text effect, using the val property, of lights, so the contents of this run will  
22 have the animated lights text effect. *end example*]

23 This simple type's contents are a restriction of the XML Schema string datatype.

24 The following are possible enumeration values for this type:

Enumeration Value	Description
antsBlack (Black Dashed Line Animation)	Specifies that this text shall be surrounded by an animated black dashed line border.
antsRed (Marching Red Ants)	Specifies that this text shall be surrounded by an animated red dashed line border.
blinkBackground (Blinking Background Animation)	Specifies that this text shall be surrounded by a background color which alternates between black and

Enumeration Value	Description
	white.
lights (Colored Lights Animation)	Specifies that this text shall be surrounded by a border consisting of a series of colored lights, which constantly change colors in sequence.
none (No Animation)	Specifies that this text shall have no animated text effect.
shimmer (Shimmer Animation)	Specifies that this text shall be animated by alternating between normal and blurry states.
sparkle (Sparkling Lights Animation)	Specifies that this text shall have a background consisting of a random pattern of colored lights, which constantly change colors in sequence.

effect@val (§2.3.2.9)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TextEffect">
4 <restriction base="xsd:string">
5 <enumeration value="blinkBackground"/>
6 <enumeration value="lights"/>
7 <enumeration value="antsBlack"/>
8 <enumeration value="antsRed"/>
9 <enumeration value="shimmer"/>
10 <enumeration value="sparkle"/>
11 <enumeration value="none"/>
12 </restriction>
13 </simpleType>

```

#### 14 2.18.102 ST\_TextScale (Text Expansion/Compression Percentage)

15 This simple type specifies that the percentage by which the contents of a run shall be expanded or compressed  
16 with respect to its normal (100%) character width, with a minimum width of 1% and maximum width of 600%.

17 [Example: Consider a run of text which shall be compressed to 200% when displaying each character within the  
18 contents of the run. This constraint is specified using the following WordprocessingML:

```

19 <w:rPr>
20 <w:w w:val="50"/>
21 </w:rPr>

```

22 This run explicitly declares that the w value is 50, so the contents of this run will appear at 50% of their normal  
23 character width by compressing the width of each character. *end example]*

24 This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 600.

#### Referenced By

w@val (§2.3.2.41)

```
<simpleType name="ST_TextScale">
 <restriction base="xsd:integer">
 <minInclusive value="0"/>
 <maxInclusive value="600"/>
 </restriction>
</simpleType>
```

### 2.18.103 ST\_Theme (Theme Font)

This simple type specifies a theme font type which may be referenced as a theme font within the parent run properties. This theme font is a reference to one of the predefined theme fonts, located in the document's Theme part, which allows for font information to be set centrally in the document.

[*Example:* Consider a run of ASCII text which shall be displayed using the majorASCII theme font. This requirement would be specified as follows in the resulting WordprocessingML:

```
<w:rPr>
 <w:rFonts w:asciiTheme="majorAscii" />
</w:rPr>
```

The ascii attribute specifies that the run shall use the majorAscii theme font as defined in the document's themes part for all text in the ASCII range. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
majorAscii (Major ASCII Theme Font)	Specifies that the current font is a reference to the major theme font for the ASCII range.
majorBidi (Major Complex Script Theme Font)	Specifies that the current font is a reference to the major theme font for the Complex Script range.
majorEastAsia (Major East Asian Theme Font)	Specifies that the current font is a reference to the major theme font for the East Asian range.
majorHAnsi (Major High ANSI Theme Font)	Specifies that the current font is a reference to the major theme font for the High ANSI range.
minorAscii (Minor ASCII Theme Font)	Specifies that the current font is a reference to the

Enumeration Value	Description
	minor theme font for the ASCII range.
minorBidi (Minor Complex Script Theme Font)	Specifies that the current font is a reference to the minor theme font for the Complex Script range.
minorEastAsia (Minor East Asian Theme Font)	Specifies that the current font is a reference to the minor theme font for the East Asian range.
minorHAnsi (Minor High ANSI Theme Font)	Specifies that the current font is a reference to the minor theme font for the High ANSI range.

rFonts@asciiTheme (§2.3.2.24); rFonts@cstheme (§2.3.2.24); rFonts@eastAsiaTheme (§2.3.2.24); rFonts@hAnsiTheme (§2.3.2.24)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Theme">
4 <restriction base="xsd:string">
5 <enumeration value="majorEastAsia"/>
6 <enumeration value="majorBidi"/>
7 <enumeration value="majorAscii"/>
8 <enumeration value="majorHAnsi"/>
9 <enumeration value="minorEastAsia"/>
10 <enumeration value="minorBidi"/>
11 <enumeration value="minorAscii"/>
12 <enumeration value="minorHAnsi"/>
13 </restriction>
14 </simpleType>

```

### 15 2.18.104 ST\_ThemeColor (Theme Color)

16 This simple type specifies a theme color to be applied to the current object. The specified theme color is a  
 17 reference to one of the predefined theme colors, located in the document's Theme part, which allows color  
 18 information to be set centrally in the document.

19 [Example: Consider a set of borders configured to use the accent2 theme color, resulting in the following  
 20 WordprocessingML markup:

```

21 <w:top ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
22 <w:bottom ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
23 <w:left ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
24 <w:right ... w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />

```

25 The borders have a themeColor attribute of type ST\_ThemeColor that when specified, imports the accent2  
 26 theme color specified for this document. *end example*]

27 This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent 1 Theme Color)	Specifies that the color to be used shall be the accent1 theme color.
accent2 (Accent 2 Theme Color)	Specifies that the color to be used shall be the accent2 theme color.
accent3 (Accent 3 Theme Color)	Specifies that the color to be used shall be the accent3 theme color.
accent4 (Accent 4 Theme Color)	Specifies that the color to be used shall be the accent4 theme color.
accent5 (Accent 5 Theme Color)	Specifies that the color to be used shall be the accent5 theme color.
accent6 (Accent 6 Theme Color)	Specifies that the color to be used shall be the accent6 theme color.
background1 (Background 1 Theme Color)	Specifies that the color to be used shall be the background1 theme color.
background2 (Background 2 Theme Color)	Specifies that the color to be used shall be the background2 theme color.
dark1 (Dark 1 Theme Color)	Specifies that the color to be used shall be the dark1 theme color.
dark2 (Dark 2 Theme Color)	Specifies that the color to be used shall be the dark2 theme color.
followedHyperlink (Followed Hyperlink Theme Color)	Specifies that the color to be used shall be the followedHyperlink theme color.
hyperlink (Hyperlink Theme Color)	Specifies that the color to be used shall be the hyperlink theme color.
light1 (Light 1 Theme Color)	Specifies that the color to be used shall be the light1 theme color.
light2 (Light 2 Theme Color)	Specifies that the color to be used shall be the light1 theme color.
none (No Theme Color)	Specifies that no theme color shall be applied to the current object.
text1 (Text 1 Theme Color)	Specifies that the color to be used shall be the text1 theme color.
text2 (Text 2 Theme Color)	Specifies that the color to be used shall be the text2 theme color.

```

### 2.18.105 ST\_TwipsMeasure (Measurement in Twentieths of a Point)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in twentieths of a point (equivalent to 1/1440th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example:* Consider an attribute value of 720 whose type is ST\_TwipsMeasure. This attribute value specifies a size of one-half of an inch or 36 points (720 twentieths of a point = 36 points = 0.5 inches). *end example*]

This simple type's contents are a restriction of the ST\_UnsignedDecimalNumber simple type (§2.18.108).

## Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TwipsMeasure">
 <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

### 2.18.106 ST\_UcharHexNumber (Two Digit Hexadecimal Number Value)

This simple type specifies a number value specified as a two digit (one octet) hexadecimal number), whose contents are interpreted based on the context of the parent XML element.

[*Example:* Consider the following value for a node of type ST\_LongHexNumber: BE.

This value is valid, as it contains two hexadecimal digits, as an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 1 characters.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UcharHexNumber">
 <restriction base="xsd:hexBinary">
 <length value="1"/>
 </restriction>
</simpleType>
```

### 2.18.107 ST\_Underline (Underline Patterns)

This simple type specifies the types of patterns which may be used to create the underline applied beneath the text in a run.

[*Example:* Consider a run of text which shall have a double underline explicitly turned on for the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
 <w:u w:val="double"/>
</w:rPr>
```

The val of the underline on this run is double, so the style of the underline on this run shall be a double line. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dash (Dashed Underline)	Specifies an underline consisting of a dashed line beneath all characters in this run.

Enumeration Value	Description
	<p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
dashDotDotHeavy (Thick Dash-Dot-Dot Underline)	<p>Specifies an underline consisting of a series of thick dash, dot, dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
dashDotHeavy (Thick Dash-Dot Underline)	<p>Specifies an underline consisting of a series of thick dash, dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
dashedHeavy (Thick Dashed Underline)	<p>Specifies an underline consisting of a series of thick dashes beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
dashLong (Long Dashed Underline)	<p>Specifies an underline consisting of long dashed characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
dashLongHeavy (Thick Long Dashed Underline)	<p>Specifies an underline consisting of thick long dashed characters beneath all characters in this run.</p> <p>[Example:</p>

Enumeration Value	Description
	<p><u>Underline text.</u></p> <p><i>end example]</i></p>
dotDash (Dash-Dot Underline)	<p>Specifies an underline consisting of a series of dash, dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dotDotDash (Dash-Dot-Dot Underline)	<p>Specifies an underline consisting of a series of dash, dot, dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dotted (Dotted Underline)	<p>Specifies an underline consisting of a series of dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
dottedHeavy (Thick Dotted Underline)	<p>Specifies an underline consisting of a series of thick dot characters beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>
double (Double Underline)	<p>Specifies an underline consisting of two lines beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p><i>end example]</i></p>

Enumeration Value	Description
none (No Underline)	<p>Specifies no underline beneath this run.</p> <p>[Example:</p> <p>Underline text.</p> <p>end example]</p>
single (Single Underline)	<p>Specifies an underline consisting of a single line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
thick (Thick Underline)	<p>Specifies an underline consisting of a single thick line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
wave (Wave Underline)	<p>Specifies an underline consisting of a single wavy line beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
wavyDouble (Double Wave Underline)	<p>Specifies an underline consisting of a pair of wavy lines beneath all characters in this run.</p> <p>[Example:</p> <p><u>Underline text.</u></p> <p>end example]</p>
wavyHeavy (Heavy Wave Underline)	<p>Specifies an underline consisting of a single thick wavy line beneath all characters in this run.</p>

Enumeration Value	Description
	<i>[Example:</i>  <u>Underline text.</u>  <i>end example]</i>
words (Underline Non-Space Characters Only)	Specifies an underline consisting of a single line beneath all non-space characters in the run. There shall be no underline beneath any space character (breaking or non-breaking).  <i>[Example:</i>  <u>Underline text.</u>  <i>end example]</i>

 </restriction>
</simpleType>
```

### 2.18.108 ST\_UnsignedDecimalNumber (Unsigned Decimal Number Value)

This simple type specifies that its contents will contain a positive whole decimal number, whose contents are interpreted based on the context of the parent XML element.

[*Example:* Consider the following WordprocessingML fragment:

```
<w:pPr>
 <w:divId w:val="1512645511" />
</w:pPr>
```

The value of the val attribute is the ID of the associated HTML div.

However, consider the following fragment:

```
<w:ilvl w:val="1">
 ...
</w:ilvl>
```

In this case, the decimal number in the val attribute is the ID of the associated numbering level. In each case, the decimal number value is interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the XML Schema unsignedLong datatype.

Referenced By
ST_EighthPointMeasure (§2.18.27); ST_HpsMeasure (§2.18.48); ST_PixelsMeasure (§2.18.74); ST_PointMeasure (§2.18.75); ST_TwipsMeasure (§2.18.105)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnsignedDecimalNumber">
 <restriction base="xsd:unsignedLong"/>
</simpleType>
```

### 2.18.109 ST\_VAnchor (Vertical Anchor Location)

This simple type specifies the vertical position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final vertical position of the object in the document.

[*Example:* Consider a text frame which should be positioned one inch to the right of its column in a left-to-right document. This text frame would be specified using the following WordprocessingML:

```
<w:pPr>
 <w:framePr ... w:y="1440" w:vAnchor="page" />
</w:pPr>
```

These frame vertical anchor properties specify that they are relative to the anchor paragraph's page. *end example*]

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
margin (Relative To Margin)	Specifies that the parent object shall be vertically anchored to the text margins.  This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the text margin.
page (Relative To Page)	Specifies that the parent object shall be vertically anchored to the page edge.  This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the edge of the page.
text (Relative To Vertical Text Extents)	Specifies that the parent object shall be vertically anchored to the text extents.  This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the text in the anchor paragraph.

3

Referenced By

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_VAnchor">
6 <restriction base="xsd:string">
7 <enumeration value="text"/>
8 <enumeration value="margin"/>
9 <enumeration value="page"/>
10 </restriction>
11 </simpleType>
```

## 12 2.18.110 ST\_VerticalAlignRun (Vertical Positioning Location)

13 This simple type specifies possible values for the alignment of the contents of this run in relation to the default  
 14 appearance of the run's text. This allows the text to be repositioned as subscript or superscript without altering  
 15 the font size of the run properties.

16 *[Example:* Consider a run which shall be positioning as superscript when displaying its contents. This  
 17 requirement would be specified using the following WordprocessingML:

```

1 <w:rPr>
2 <w:vertAlign w:val="superscript" />
3 </w:rPr>

```

The resulting run is positioned as superscript, therefore it is rendered in a smaller size above the default baseline location for the contents of the run. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
baseline (Regular Vertical Positioning)	Specifies that the text in the parent run shall be located at the baseline and presented in the same size as surrounding text.
subscript (Subscript)	Specifies that this text should be subscript.  This setting shall lower the text in this run below the baseline and change it to a smaller size, if a smaller size is available.
superscript (Superscript)	Specifies that this text should be superscript.  This setting shall raise the text in this run above the baseline and change it to a smaller size, if a smaller size is available.

#### Referenced By

The following XML Schema fragment defines the contents of this simple type:

```

10 <simpleType name="ST_VerticalAlignRun">
11 <restriction base="xsd:string">
12 <enumeration value="baseline"/>
13 <enumeration value="superscript"/>
14 <enumeration value="subscript"/>
15 </restriction>
16 </simpleType>

```

### 2.18.111 ST\_VerticalJc (Vertical Alignment Type)

This simple type specifies the vertical alignment for text between the top and bottom margins of the parent container (page or table cell).

[*Example*: Consider a region where the text shall be vertically centered in the parent element. This would require a val value of center, in order to specify that all justification vertically shall be centered relative to the parent. For a section, this setting would be specified as follows:

```
<w:vAlign w:val="center" />
```

The val attribute of center specifies that the content is centered relative to its container . *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
both (Vertical Justification)	<p>Specifies that the text shall be vertically justified between the top and bottom margins of the parent object, by adding additional line spacing to each paragraph as required.</p> <p>This setting is only applied for the content of the section which is displayed on full pages. If the content does not use the full page (e.g. another section begins on the same page, or the document ends mid-page), then the value shall be ignored when rendering that page (returning to the default value of top)</p> <p>This value is only valid for page justification settings, and shall be ignored when specified on a table cell (returning to the default value of top).</p>
bottom (Align Bottom)	Specifies that the text shall be vertically aligned to the bottom margin of the parent object, by moving all text to the bottom text extent within the parent object as required.
center (Align Center)	Specifies that the text shall be vertically aligned to the center of the parent object..
top (Align Top)	Specifies that the text shall be vertically aligned to the top margin of the parent object, by moving all text to the top text extent within the parent object as required.

#### Referenced By

vAlign@val (§2.4.80); vAlign@val (§2.6.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalJc">
 <restriction base="xsd:string">
 <enumeration value="top"/>
 <enumeration value="center"/>
 <enumeration value="both"/>
 <enumeration value="bottom"/>
 </restriction>
</simpleType>
```

### 2.18.112 ST\_View (Document View Values)

This simple type defines the possible views which may be used to determine how WordprocessingML documents may be rendered when displayed by an application.

[*Example:* Consider a WordprocessingML document that shall be displayed on the screen in the same form as it will be printed. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:view w:val="print" />
```

The view element's val attribute is equal to print specifying that the given WordprocessingML document shall be rendered as it will be printed. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
masterPages (Master Document View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.  [ <i>Note:</i> This setting may be interpreted as functionally equivalent to the outline setting, as it only remains separate to support legacy applications. <i>end note</i> ]
none (Default View)	Specifies that a given WordprocessingML document shall be rendered in the default view of the application.
normal (Draft View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.
outline (Outline View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.
print (Print Layout View)	Specifies that this document shall be opened in a view that displays the document as it will print.

Enumeration Value	Description
web (Web Page View)	Specifies that a given WordprocessingML document shall be rendered in a view mimicking the way this document would be displayed in a web page.

1

Referenced By
view@val (§2.15.1.93)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_View">
4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="print"/>
7 <enumeration value="outline"/>
8 <enumeration value="masterPages"/>
9 <enumeration value="normal"/>
10 <enumeration value="web"/>
11 </restriction>
12 </simpleType>

```

### 13 2.18.113 ST\_Wrap (Text Wrapping around Text Frame Type)

14 This simple type specifies the type of text wrapping which shall be allowed around a text frame within a  
15 document.

16 [Example: Consider the following WordprocessingML fragment specifying a text frame:

```

17 <w:p>
18 <w:pPr>
19 <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
20 w:wrap="around" w:vAnchor="text" w:hAnchor="page" w:x="1643" w:y="73" />
21 </w:pPr>
22 <w:r>
23 <w:t>Text Frame Content.</w:t>
24 </w:r>
25 </w:p>

```

26 This wrap attribute on this text frame specifies that when the frame is rendered on the page, any non-text  
27 frame paragraphs which would normally flow onto the same lines shall be allowed to wrap around it. *end*  
28 *example]*

29 This simple type's contents are a restriction of the XML Schema string datatype.

30 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
around (Allow Text Wrapping Around Frame)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document.
auto (Default Text Wrapping Around Frame)	Specifies that text shall have the default application-defined behavior of the application displaying the WordprocessingML document with regard to the text wrapping displayed around the frame.
none (No Text Wrapping Around Frame)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this text frame.  Any text content shall therefore be placed on the next line following this text frame which does not intersect with the frame's extents.
notBeside (No Text Wrapping Beside Frame)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this text frame.  Any text content shall therefore be placed on the next line following this text frame which does not intersect with the frame's extents.
through (Through Text Wrapping Around Frame)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document.
tight (Tight Text Wrapping Around Frame)	Specifies that text shall be allowed to tightly wrap around the remaining space on each line around this text frame in the document.

1

Referenced By
framePr@wrap (§2.3.1.11)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Wrap">
4 <restriction base="xsd:string">
5 <enumeration value="auto"/>
6 <enumeration value="notBeside"/>
7 <enumeration value="around"/>
8 <enumeration value="tight"/>
9 <enumeration value="through"/>
10 <enumeration value="none"/>
11 </restriction>
12 </simpleType>

```

## 2.18.114 ST\_XAlign (Horizontal Alignment Location)

This simple type specifies the set of possible relative horizontal positions for the parent floating object. This relative position is specified relative to the horizontal anchor specified by the parent object.

[*Example:* Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
 <w:pPr>
 <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="text" w:hAnchor="page" w:xAlign="left" w:y="73" />
 </w:pPr>
 <w:r>
 <w:t>Text Frame Content.</w:t>
 </w:r>
</w:p>
```

This text frame specifies by the presence of the xAlign attribute to align the frame on the left side of the anchor object, in this case, the page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Centered Horizontally)	Specifies that the parent object shall be centered with respect to the anchor settings.  <i>[Example: Centered on the page horizontally. end example]</i>
inside (Inside)	Specifies that the parent object shall be inside of the anchor object.  <i>[Example: Inside the text margin horizontally. end example]</i>
left (Left Aligned Horizontally)	Specifies that the parent object shall be left aligned with respect to the anchor settings.  <i>[Example: Left aligned on the page horizontally. end example]</i>
outside (Outside)	Specifies that the parent object shall be outside of the anchor object.  <i>[Example: Outside the text margin horizontally. end example]</i>
right (Right Aligned Horizontally)	Specifies that the parent object shall be right aligned

Enumeration Value	Description
	with respect to the anchor settings.  <i>[Example: Right aligned on the page horizontally. end example]</i>

1

Referenced By
framePr@xAlign (§2.3.1.11); tblPr@tblpXSpec (§2.4.54)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_XAlign">
4 <restriction base="xsd:string">
5 <enumeration value="left"/>
6 <enumeration value="center"/>
7 <enumeration value="right"/>
8 <enumeration value="inside"/>
9 <enumeration value="outside"/>
10 </restriction>
11 </simpleType>

```

## 12 2.18.115 ST\_YAlign (Vertical Alignment Location)

13 This simple type specifies the set of possible relative vertical positions for the parent floating object. This relative  
14 position is specified relative to the vertical anchor specified by the parent object.

15 *[Example: Consider the following WordprocessingML fragment specifying a text frame:*

```

16 <w:p>
17 <w:pPr>
18 <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
19 w:wrap="around" w:vAnchor="margin" w:hAnchor="page" w:x="1643" w:y="73"
20 w:yAlign="center" />
21 </w:pPr>
22 <w:r>
23 <w:t>Text Frame Content.</w:t>
24 </w:r>
25 </w:p>

```

26 This text frame specifies by the presence of the yAlign attribute to vertically align the frame in the center of the  
27 anchor object, in this case, the margin. *end example]*

28 This simple type's contents are a restriction of the XML Schema string datatype.

29 The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
bottom (Bottom)	Specifies that the parent object shall be vertically aligned to the bottom edge of the anchor object .  <i>[Example: At the bottom of the current paragraph. end example]</i>
center (Centered Vertically)	Specifies that the parent object shall be vertically centered with respect to the anchor object.  <i>[Example: Centered on the page vertically. end example]</i>
inline (In line With Text)	Specifies that the parent object shall be vertically aligned in line with the surrounding text (i.e. shall not allow any text wrapping around it when positioned in the document.
inside (Inside Anchor Extents)	Specifies that the parent object shall be vertically aligned to the edge of the anchor object, and positioned inside that object.  <i>[Example: Inside the text margins vertically. end example]</i>
outside (Outside Anchor Extents)	Specifies that the parent object shall be vertically aligned to the edge of the anchor object, and positioned outside that object.  <i>[Example: Outside the text margins vertically. end example]</i>
top (Top)	Specifies that the parent object shall be vertically aligned to the top edge of the anchor object .  <i>[Example: At the top of the current paragraph. end example]</i>

1

Referenced By

 <enumeration value="outside"/>
 </restriction>
</simpleType>
```

### 2.18.116 ST\_Zoom (Magnification Preset Values)

This simple type specifies the type of magnification settings which may be applied to a given document on open.

[*Example:* Consider a WordprocessingML document that should be visible without any horizontal scrolling when it is displayed. This requirement would be specified using the following WordprocessingML:

```
<w:zoom w:val="bestFit" w:percent="90" />
```

The val attribute is equal to the value bestFit specifying that an application shall dynamically calculate the magnification needed such that the given document shall be visible on the horizontal plane of the document with no horizontal scrolling required to see any part of the WordprocessingML document's pages. *end example]*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bestFit (Display Page Width)	Specifies that the magnification setting shall be adjusted to ensure the width of the current page matches the available window width.
fullPage (Display One Full Page)	Specifies that the magnification setting shall be adjusted to ensure that one full page can be seen at a time.
none (No Preset Magnification)	Specifies that no preset magnification is present, and the last known cached setting shall be used.
textFit (Display Text Width)	Specifies that the magnification setting shall be adjusted to ensure the width of the text extents on the current page matches the available window width.

```

# 3. SpreadsheetML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising a SpreadsheetML document, as defined by Part 1 of this Office Open XML Standard.

## 3.1 Table of Contents

This subclause is informative.

<b>3.2 Workbook</b>	<b>1874</b>
3.2.1 bookViews (Workbook Views)	1875
3.2.2 calcPr (Calculation Properties)	1875
3.2.3 customWorkbookView (Custom Workbook View)	1879
3.2.4 customWorkbookViews (Custom Workbook Views)	1885
3.2.5 definedName (Defined Name)	1886
3.2.6 definedNames (Defined Names)	1891
3.2.7 ext (Extension)	1892
3.2.8 externalReference (External Reference)	1892
3.2.9 externalReferences (External References)	1893
3.2.10 extLst (Future Feature Data Storage Area)	1893
3.2.11 fileRecoveryPr (File Recovery Properties)	1894
3.2.12 fileSharing (File Sharing)	1895
3.2.13 fileVersion (File Version)	1897
3.2.14 functionGroup (Function Group)	1898
3.2.15 functionGroups (Function Groups)	1898
3.2.16 oleSize (Embedded Object Size)	1899
3.2.17 pivotCache (PivotCache)	1899
3.2.18 pivotCaches (PivotCaches)	1900
3.2.19 sheet (Sheet Information)	1900
3.2.20 sheets (Sheets)	1901
3.2.21 smartTagPr (Smart Tag Properties)	1902
3.2.22 smartTagType (Smart Tag Type)	1903
3.2.23 smartTagTypes (Smart Tag Types)	1904
3.2.24 webPublishing (Web Publishing Properties)	1904
3.2.25 webPublishObject (Web Publishing Object)	1906
3.2.26 webPublishObjects (Web Publish Objects)	1907
3.2.27 workbook (Workbook)	1908
3.2.28 workbookPr (Workbook Properties)	1910
3.2.29 workbookProtection (Workbook Protection)	1915
3.2.30 workbookView (Workbook View)	1923
<b>3.3 Worksheets</b>	<b>1926</b>
3.3.1 Worksheets	1926
3.3.1.1 autoFilter (AutoFilter Settings)	1926
3.3.1.2 brk (Break)	1927

1	3.3.1.3 c (Cell).....	1928
2	3.3.1.4 cellSmartTag (Cell Smart Tag) .....	1930
3	3.3.1.5 cellSmartTagPr (Smart Tag Properties) .....	1931
4	3.3.1.6 cellSmartTags (Cell Smart Tags) .....	1932
5	3.3.1.7 cellWatch (Cell Watch Item).....	1933
6	3.3.1.8 cellWatches (Cell Watch Items) .....	1933
7	3.3.1.9 cfRule (Conditional Formatting Rule) .....	1934
8	3.3.1.10 cfvo (Conditional Format Value Object).....	1936
9	3.3.1.11 chartsheet (Chart Sheet) .....	1938
10	3.3.1.12 col (Column Width & Formatting) .....	1939
11	3.3.1.13 colBreaks (Vertical Page Breaks) .....	1941
12	3.3.1.14 color (Data Bar Color).....	1942
13	3.3.1.15 colorScale (Color Scale) .....	1944
14	3.3.1.16 cols (Column Information) .....	1945
15	3.3.1.17 conditionalFormatting (Conditional Formatting) .....	1945
16	3.3.1.18 control (Embedded Control) .....	1946
17	3.3.1.19 controls (Embedded Controls) .....	1947
18	3.3.1.20 customPr (Custom Property).....	1947
19	3.3.1.21 customProperties (Custom Properties).....	1948
20	3.3.1.22 customSheetView (Custom Chart Sheet View) .....	1949
21	3.3.1.23 customSheetView (Custom Sheet View).....	1950
22	3.3.1.24 customSheetViews (Custom Chart Sheet Views) .....	1953
23	3.3.1.25 customSheetViews (Custom Sheet Views).....	1954
24	3.3.1.26 dataBar (Data Bar).....	1954
25	3.3.1.27 dataConsolidate (Data Consolidate) .....	1955
26	3.3.1.28 dataRef (Data Consolidation Reference).....	1957
27	3.3.1.29 dataRefs (Data Consolidation References).....	1957
28	3.3.1.30 dataValidation (Data Validation).....	1958
29	3.3.1.31 dataValidations (Data Validations).....	1960
30	3.3.1.32 dialogsheet (Dialog Sheet) .....	1962
31	3.3.1.33 dimension (Worksheet Dimensions) .....	1963
32	3.3.1.34 drawing (Drawing).....	1964
33	3.3.1.35 evenFooter (Even Page Footer).....	1964
34	3.3.1.36 evenHeader (Even Page Header) .....	1964
35	3.3.1.37 f (Formula).....	1967
36	3.3.1.38 firstFooter (First Page Footer) .....	1970
37	3.3.1.39 firstHeader (First Page Header).....	1970
38	3.3.1.40 formula (Formula) .....	1970
39	3.3.1.41 formula1 (Formula 1) .....	1971
40	3.3.1.42 formula2 (Formula 2) .....	1971
41	3.3.1.43 headerFooter (Header Footer Settings).....	1971
42	3.3.1.44 hyperlink (Hyperlink).....	1973
43	3.3.1.45 hyperlinks (Hyperlinks).....	1974
44	3.3.1.46 iconSet (Icon Set).....	1974
45	3.3.1.47 ignoredError (Ignored Error) .....	1976
46	3.3.1.48 ignoredErrors (Ignored Errors) .....	1977
47	3.3.1.49 inputCells (Input Cells) .....	1978
48	3.3.1.50 is (Rich Text Inline) .....	1979

1	3.3.1.51 legacyDrawing (Legacy Drawing Reference) .....	1980
2	3.3.1.52 legacyDrawingHF (Legacy Drawing Reference in Header Footer).....	1980
3	3.3.1.53 mergeCell (Merged Cell) .....	1981
4	3.3.1.54 mergeCells (Merge Cells) .....	1981
5	3.3.1.55 oddFooter (Odd Page Footer) .....	1982
6	3.3.1.56 oddHeader (Odd Header).....	1982
7	3.3.1.57 oleObject (Embedded Object).....	1983
8	3.3.1.58 oleObjects (Embedded Objects).....	1984
9	3.3.1.59 outlinePr (Outline Properties) .....	1984
10	3.3.1.60 pageMargins (Page Margins).....	1986
11	3.3.1.61 pageSetup (Page Setup Settings) .....	1987
12	3.3.1.62 pageSetup (Chart Sheet Page Setup) .....	1991
13	3.3.1.63 pageSetUpPr (Page Setup Properties).....	1994
14	3.3.1.64 pane (View Pane) .....	1994
15	3.3.1.65 picture (Background Image).....	1995
16	3.3.1.66 pivotArea (Pivot Area) .....	1996
17	3.3.1.67 pivotSelection (PivotTable Selection).....	1998
18	3.3.1.68 printOptions (Print Options) .....	2002
19	3.3.1.69 protectedRange (Protected Range).....	2003
20	3.3.1.70 protectedRanges (Protected Ranges) .....	2005
21	3.3.1.71 row (Row).....	2005
22	3.3.1.72 rowBreaks (Horizontal Page Breaks (Row)).....	2011
23	3.3.1.73 scenario (Scenario).....	2012
24	3.3.1.74 scenarios (Scenarios).....	2013
25	3.3.1.75 selection (Selection) .....	2015
26	3.3.1.76 sheetCalcPr (Sheet Calculation Properties).....	2016
27	3.3.1.77 sheetData (Sheet Data) .....	2016
28	3.3.1.78 sheetFormatPr (Sheet Format Properties).....	2016
29	3.3.1.79 sheetPr (Sheet Properties) .....	2018
30	3.3.1.80 sheetPr (Chart Sheet Properties) .....	2020
31	3.3.1.81 sheetProtection (Sheet Protection Options).....	2021
32	3.3.1.82 sheetProtection (Chart Sheet Protection).....	2023
33	3.3.1.83 sheetView (Worksheet View).....	2025
34	3.3.1.84 sheetView (Chart Sheet View).....	2029
35	3.3.1.85 sheetViews (Sheet Views) .....	2030
36	3.3.1.86 sheetViews (Chart Sheet Views) .....	2031
37	3.3.1.87 smartTags (Smart Tags) .....	2032
38	3.3.1.88 sortCondition (Sort Condition) .....	2033
39	3.3.1.89 sortState (Sort State).....	2034
40	3.3.1.90 tabColor (Sheet Tab Color).....	2035
41	3.3.1.91 tablePart (Table Part) .....	2037
42	3.3.1.92 tableParts (Table Parts) .....	2037
43	3.3.1.93 v (Cell Value).....	2038
44	3.3.1.94 webPublishItem (Web Publishing Item).....	2038
45	3.3.1.95 webPublishItems (Web Publishing Items).....	2040
46	3.3.1.96 worksheet (Worksheet).....	2041
47	3.3.2 AutoFilter Settings.....	2043
48	3.3.2.1 colorFilter (Color Filter Criteria) .....	2044

1	3.3.2.2	customFilter (Custom Filter Criteria).....	2044
2	3.3.2.3	customFilters (Custom Filters) .....	2045
3	3.3.2.4	dateGroupItem (Date Grouping).....	2046
4	3.3.2.5	dynamicFilter (Dynamic Filter) .....	2047
5	3.3.2.6	filter (Filter) .....	2048
6	3.3.2.7	filterColumn (AutoFilter Column).....	2049
7	3.3.2.8	filters (Filter Criteria).....	2050
8	3.3.2.9	iconFilter (Icon Filter) .....	2051
9	3.3.2.10	top10 (Top 10).....	2052
10	<b>3.4</b>	<b>Shared String Table .....</b>	<b>2053</b>
11	3.4.1	charset (Character Set).....	2054
12	3.4.2	outline (Outline) .....	2056
13	3.4.3	phoneticPr (Phonetic Properties).....	2056
14	3.4.4	r (Rich Text Run) .....	2058
15	3.4.5	rFont (Font) .....	2058
16	3.4.6	rPh (Phonetic Run).....	2059
17	3.4.7	rPr (Run Properties).....	2060
18	3.4.8	si (String Item) .....	2061
19	3.4.9	sst (Shared String Table).....	2062
20	3.4.10	strike (Strike Through) .....	2063
21	3.4.11	sz (Font Size) .....	2063
22	3.4.12	t (Text) .....	2064
23	3.4.13	u (Underline).....	2064
24	3.4.14	vertAlign (Vertical Alignment) .....	2064
25	<b>3.5</b>	<b>Tables.....</b>	<b>2065</b>
26	3.5.1	Tables.....	2066
27	3.5.1.1	calculatedColumnFormula (Calculated Column Formula) .....	2066
28	3.5.1.2	table (Table) .....	2067
29	3.5.1.3	tableColumn (Table Column) .....	2072
30	3.5.1.4	tableColumns (Table Columns) .....	2075
31	3.5.1.5	tableStyleInfo (Table Style) .....	2076
32	3.5.1.6	totalsRowFormula (Totals Row Formula).....	2077
33	3.5.1.7	xmlColumnPr (XML Column Properties) .....	2077
34	3.5.2	Single Cell Tables .....	2080
35	3.5.2.1	singleXmlCell (Table Properties) .....	2080
36	3.5.2.2	singleXmlCells (Single Cells) .....	2081
37	3.5.2.3	xmlCellPr (Cell Properties).....	2081
38	3.5.2.4	xmlPr (Column XML Properties).....	2082
39	<b>3.6</b>	<b>Calculation Chain .....</b>	<b>2084</b>
40	3.6.1	c (Cell).....	2086
41	3.6.2	calcChain (Calculation Chain Info) .....	2087
42	<b>3.7</b>	<b>Comments .....</b>	<b>2087</b>
43	3.7.1	author (Author) .....	2088
44	3.7.2	authors (Authors) .....	2089
45	3.7.3	comment (Comment) .....	2089

1	3.7.4 commentList (List of Comments) .....	2090
2	3.7.5 comments (Comments) .....	2090
3	3.7.6 text (Comment Text) .....	2091
4	<b>3.8 Styles.....</b>	<b>2092</b>
5	3.8.1 alignment (Alignment).....	2092
6	3.8.2 b (Bold) .....	2095
7	3.8.3 bgColor (Background Color) .....	2095
8	3.8.4 border (Border) .....	2097
9	3.8.5 borders (Borders) .....	2099
10	3.8.6 bottom (Bottom Border) .....	2100
11	3.8.7 cellStyle (Cell Style).....	2101
12	3.8.8 cellStyles (Cell Styles) .....	2106
13	3.8.9 cellStyleXfs (Formatting Records).....	2107
14	3.8.10 cellXfs (Cell Formats) .....	2108

20 **End of informative text.**21 

## 3.2 Workbook

22 This subclause describes the elements and simple types that comprise the workbook main definition.

23 A workbook is composed of book-level properties and a collection of 1 or more sheets. The sheets are the  
 24 central working surface for a spreadsheet application. The workbook part and corresponding properties  
 25 comprise data used to set application and workbook-level operational state. The workbook also serves to bind  
 26 all the sheets and child objects into an organized single file. The workbook properties include information about  
 27 what application last saved the file, where and how the windows of the workbook were positioned, and an  
 28 enumeration of the worksheets in the workbook.

29 It is important for the sake of simplicity to minimize the *required* set of workbook properties that must be  
 30 present to compose a valid workbook. Therefore these are the required data points for the smallest possible  
 31 (blank) workbook:

```

32 <workbook>
33 <sheets>
34 <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
35 </sheets>
36 </workbook>

```

37 Note that this workbook has a single sheet, named Sheet1. An Id for the sheet is required, and a relationship Id  
 38 pointing to the location of the sheet definition is also required. Sheet1 itself will be discussed in a separate  
 39 section.

### 3.2.1 bookViews (Workbook Views)

This element specifies the collection of workbook views. Each view can specifies a window position, filter options, and other configurations. There is no limit on the number of views that can be defined for a workbook.

[Example:

```
<bookViews>
 <workbookView showHorizontalScroll="0" showVerticalScroll="0"
 showSheetTabs="0" xWindow="120" yWindow="45" windowWidth="15135"
 windowHeight="8130" activeTab="2" autoFilterDateGrouping="0"/>
</bookViews>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
workbookView (Workbook View)	§3.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BookViews">
 <sequence>
 <element name="workbookView" type="CT_BookView" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.2.2 calcPr (Calculation Properties)

This element defines the collection of properties the application uses to record calculation status and details. Calculation is the process of computing formulas and then displaying the results as values in the cells that contain the formulas.

[Example:

```
<calcPr calcId="122211" calcMode="auto" refMode="R1C1" iterate="1"
 fullPrecision="0"/>
```

end example]

Parent Elements
workbook (§3.2.27)

Attributes	Description
------------	-------------

Attributes	Description
<b>calcCompleted</b> (Calc Completed)	<p>Specifies a boolean value that determines whether workbook data was recalculated before the workbook was saved.</p> <p>A value of on, 1, or true indicates recalculation was completed before save.</p> <p>A value of off, 0, or false indicates that recalculation was not completed before save.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>calcId</b> (Calculation Id)	<p>Specifies the version of the calculation engine used to calculate values in the workbook. When you open a workbook created in the current version, the application recalculates only the formulas that depend on cells that have changed. When you use open a workbook that was created in a earlier version of the application, all the formulas in the workbook— those that depend on cells that have changed and those that do not— are recalculated. This ensures that the workbook is fully optimized for the current application version.</p> <p>The value for calcID depends on the application. SpreadsheetML defaults form [version][build], where [version] refers to the version of the application, and [build] refers to the build of the application when the calculation engine changed.</p> <p>[Example:</p> <pre>&lt;calcPr calcId="122211"/&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
<b>calcMode</b> (Calculation Mode)	<p>Specifies when the application should calculate formulas in the workbook.</p> <p>The default value for this attribute is "auto."</p> <p>The possible values for this attribute are defined by the ST_CalcMode simple type (§3.18.4).</p>
<b>calcOnSave</b> (Calculate On Save)	<p>Specifies a boolean value that indicates whether the application will recalculate values when the workbook is saved.</p> <p>A value of on, 1, or true indicates recalculation will be performed when the workbook is saved.</p> <p>A value of off, 0, or false indicates recalculation will not be performed when the workbook is saved.</p>

Attributes	Description
	<p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
concurrentCalc (Concurrent Calculations)	<p>Specifies a boolean value that indicates whether concurrent calculation processes are enabled for this workbook.</p> <p>A value of on, 1, or true indicates concurrent calculations are enabled in this workbook.</p> <p>A value of off, 0, or false indicates concurrent calculations are not enabled.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
concurrentManual Count (Concurrent Thread Manual Count)	<p>Specifies the count of concurrent calculation processes manually set by the user. If omitted, the count is set automatically by the application.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
forceFullCalc (Force Full Calculation)	<p>Specifies a boolean value that indicates whether the application will perform a full recalculation when one was not indicated by other calculation properties. This attribute allows the application to expose mechanisms in the user interface that give users the ability to trigger when full recalculations take place.</p> <p>A value of on, 1, or true indicates the application will perform a full recalculation of workbook.</p> <p>A value of off, 0, or false indicates the application will not perform a full recalculation when the workbook.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fullCalcOnLoad (Full Calculation On Load)	<p>Specifies a boolean value that indicates whether the application shall perform a full recalculation when the workbook is opened. After load and successful calculation, the application should set this value to false. The application should set this value to true when cell formulas or values are modified by another process while the application has the workbook opened.</p> <p>A value of on, 1, or true indicates the application will perform a full recalculation of workbook values when the workbook is opened.</p> <p>A value of off, 0, or false indicates the application will not perform a full recalculation when the workbook is opened.</p> <p>Note: If manual calcMode is true, then a full recalculation will not be performed on load, even when this attribute is set.</p>

Attributes	Description
	<p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fullPrecision (Full Precision Calculation)	<p>Specifies a boolean that indicates the precision the application will use when performing calculations in the workbook. Full precision means that the application uses the entire value(s) stored in cells referenced by the formula to perform the calculation. For example, if two cells each contain the value 10.005 and the cells are formatted to display values in currency format, the value \$10.01 is displayed in each cell. If you add the two cells together, the result is \$20.01 because the application adds the stored values 10.005 and 10.005, not the displayed values. You can change the precision of calculations so that the application uses the displayed value instead of the stored value when it recalculates formulas.</p> <p>For the above example, if fullPrecision is false, then the result shall be \$20.02, because each cell shows \$10.01, so those are the values to be added. Furthermore, when fullPrecision is false, the calculated value as displayed shall be saved to file.</p> <p>A value of on, 1, or true indicates the application uses the stored values of the referenced cells when performing calculations.</p> <p>A value of off, 0, or false indicates the application uses the display values of the referenced cells when performing calculations.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
iterate (Calculation Iteration)	<p>Specifies a boolean value that indicates whether the application should attempt to calculate formulas that contain circular references. A circular reference is a formula that refers to the cell— either directly or indirectly— that contains the formula. If a formula refers back to one of its own cells, you must determine how many times the formula should recalculate.</p> <p>A value of on, 1, or true indicates the application should attempt to calculate circular references. The calculation engine will perform iterative iterateCount calculations to before stopping.</p> <p>A value of off, 0, or false indicates that the application should not attempt to calculate formulas with circular references. The calculation engine will stop on the first iteration when it encounters a circular references.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
iterateCount (Iteration Count)	<p>Specifies the number of iterations the calculation engine will attempt when calculating a workbook with circular references, when iterate is true.</p> <p>The default value for this attribute is 100.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iterateDelta (Iterative Calculation Delta)	<p>Specifies a double that contains the maximum change for iterative calculations. The application stops calculating after iterateCount iterations or after all values in the circular reference change by less than iterateDelta between iterations, whichever comes first.</p> <p>The default value for this attribute is "0.001"</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
refMode (Reference Mode)	<p>Specifies the reference style for this workbook. Instead of using letters for columns and numbers for rows ("A1"), this options enables using numbers for both rows and columns. Cells are then referred to in this format: R1C1.</p> <p>The default value for this attribute is "A1."</p> <p>The possible values for this attribute are defined by the ST_RefMode simple type (§3.18.66).</p>

1 The following XML Schema fragment defines the contents of this element:

```

### 17 3.2.3 customWorkbookView (Custom Workbook View)

18 This element specifies a single custom workbook view. A custom workbook view consists of a set of display and  
19 print settings that you can name and apply to a workbook. You can create more than one view of the same  
20 workbook without saving separate copies of the workbook. Custom workbook views are created by the end-user  
21 via tools in the application user interface.

Parent Elements
customWorkbookViews (§3.2.4)

1

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

2

Attributes	Description
activeSheetId (Active Sheet in Book View)	<p>Specifies the sheetId of a sheet in the workbook that is the active sheet in this book view. Corresponds to a sheetId of a sheet in the sheets collection.</p> <p>This attribute is required.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
autoUpdate (Auto Update)	<p>Specifies a boolean value that indicates that this application will automatically update changes at the interval specified by the mergeInterval attribute. This is only applicable for shared workbooks.</p> <p>A value of on, 1, or true indicates the application will update changes at the interval specified in the mergeInterval attribute.</p> <p>A value of off, 0, or false indicates the application will update changes whenever the workbook is saved by the user.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
changesSavedWin (Changes Saved Win)	<p>Specifies a boolean value that indicates that when conflicts are found, the changes being saved always take precedence. This is only applicable for shared workbooks in automatic refresh mode.</p> <p>A value of on, 1, or true indicates that changes being saved take precedence when conflicts in data are found in a shared workbook.</p> <p>A value of off, 0, or false indicates that changes being saved do not take precedence over other changes if conflicts are found in a shared workbook.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
guid (Custom View GUID)	<p>Specifies a globally unique identifier (GUID) for this custom view</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
includeHiddenRowCol (Include Hidden)	<p>Specifies a boolean value that indicates whether to include hidden rows, columns, and filter settings in this custom view.</p>

Attributes	Description
Rows & Columns)	<p>A value of on, 1, or true indicates that hidden rows, columns, and filter settings are included in this custom view.</p> <p>A value of off, 0, or false indicates that hidden rows, columns, and filter settings are not included.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
includePrintSettings (Include Print Settings)	<p>Specifies a boolean value that indicates whether to include print settings in this custom view.</p> <p>A value of on, 1, or true indicates that print settings are included in this custom view.</p> <p>A value of off, 0, or false indicates print settings are not included in this custom view.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
maximized (Maximized)	<p>Specifies a boolean value that indicates whether the book window is maximized.</p> <p>A value of on, 1, or true indicates the workbook window is maximized.</p> <p>A value of off, 0, or false indicates the workbook window is not maximized.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
mergeInterval (Merge Interval)	<p>Automatic update interval (in minutes). Only applicable for shared workbooks in automatic refresh mode.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
minimized (Minimized)	<p>Specifies a boolean value that indicates whether the workbook window is minimized.</p> <p>A value of on, 1, or true indicates the workbook window is minimized.</p> <p>A value of off, 0, or false indicates the workbook window is not minimized.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
name (Custom View)	Specifies the name of the custom view.

Attributes	Description
Name)	<p>This attribute is required.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
onlySync (Only Synch)	<p>Specifies a boolean value that indicates, during automatic refresh, the current user's changes will not be saved. The workbook will only be updated with other users' changes. Only applicable for shared workbooks in automatic refresh mode.</p> <p>A value of on, 1, or true indicates the current user's changes will not be saved during automatic refresh.</p> <p>A value of off, 0, or false indicates the current user's will be saved during automatic refresh.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
personalView (Personal View)	<p>Specifies a boolean value that indicates that this custom view is a personal view for a shared workbook user. Only applicable for shared workbooks. Personal views allow each user of a shared workbook to store their individual print and filter settings.</p> <p>A value of on, 1, or true indicates this custom view is a personal view for a shared workbook user.</p> <p>A value of off, 0, or false indicates this view is not a personal view.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showComments (Show Comments)	<p>Specifies how comments are displayed in this custom view</p> <p>The possible values for this attribute are defined by the ST_Comments simple type (§3.18.15).</p>
showFormulaBar (Show Formula Bar)	<p>Specifies a boolean value that indicates whether to display the formula bar in the application user interface.</p> <p>A value of on, 1, or true indicates the formula bar is shown in the user interface.</p> <p>A value of off, 0, or false indicates the formula bar is not shown in the user interface.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
showHorizontalScroll (Show Horizontal Scroll)	<p>Specifies a boolean value that indicates whether to display the horizontal scroll bar in the user interface.</p> <p>A value of on, 1, or true indicates that the horizontal scrollbar is shown.</p> <p>A value of off, 0, or false indicates that the horizontal scrollbar is not shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showObjects (Show Objects)	<p>Specifies how objects are displayed in this custom view.</p> <p>The default value for this attribute is "all."</p> <p>The possible values for this attribute are defined by the ST_Objects simple type (§3.18.50).</p>
showSheetTabs (Show Sheet Tabs)	<p>Specifies a boolean value that indicates whether to display the sheet tabs in the user interface.</p> <p>A value of on, 1, or true indicates that sheet tabs shall be shown.</p> <p>A value of off, 0, or false indicates that sheet tabs shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showStatusbar (Show Status Bar)	<p>Specifies a boolean value that indicates whether to display the status bar in the user interface.</p> <p>A value of on, 1, or true indicates that the status bar is shown.</p> <p>A value of off, 0, or false indicates the status bar is not shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showVerticalScroll (Show Vertical Scroll)	<p>Specifies a boolean value that indicates whether to display the vertical scroll bar.</p> <p>A value of on, 1, or true indicates the vertical scrollbar shall be shown.</p> <p>A value of off, 0, or false indicates the vertical scrollbar shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
tabRatio (Sheet Tab Ratio)	<p>Specifies the ratio between the workbook tabs bar and the horizontal scroll bar. tabRatio is assumed to be out of 1000 of the horizontal window width.</p> <p>The default value for this attribute is 600.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
windowHeight (Window Height)	<p>Specifies the height of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
windowWidth (Window Width)	<p>Specifies the width of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
xWindow (Top Left Corner (X Coordinate))	<p>Specifies the X coordinate for the upper left corner of the book window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
yWindow (Top Left Corner (Y Coordinate))	<p>Specifies the Y coordinate for the upper left corner of the book window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomWorkbookView">
 <sequence>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="autoUpdate" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="mergeInterval" type="xsd:unsignedInt" use="optional"/>
 <attribute name="changesSavedWin" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="onlySync" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="personalView" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="includePrintSettings" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="includeHiddenRowCol" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="maximized" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="minimized" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showHorizontalScroll" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showVerticalScroll" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showSheetTabs" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="xWindow" type="xsd:int" use="optional" default="0"/>
 <attribute name="yWindow" type="xsd:int" use="optional" default="0"/>
 <attribute name="windowWidth" type="xsd:unsignedInt" use="required"/>
 <attribute name="windowHeight" type="xsd:unsignedInt" use="required"/>
 <attribute name="tabRatio" type="xsd:unsignedInt" use="optional" default="600"/>
 <attribute name="activeSheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="showFormulaBar" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showStatusbar" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showComments" type="ST_Comments" use="optional" default="commIndicator"/>
 <attribute name="showObjects" type="ST_Objects" use="optional" default="all"/>
</complexType>
```

### 3.2.4 customWorkbookViews (Custom Workbook Views)

This element defines the collection of custom workbook views that are defined for this workbook. There is no limit on the number of custom views that a user can create. Users create custom views when there is more than one way of viewing the workbook. Each view on the workbook data might be complex and time consuming to set up. Naming and persisting view settings enables the user to switch between the views easily.

[Example:

```
<customWorkbookViews>
 <customWorkbookView name="CustomView"
 guid="{CE6681F1-E999-414D-8446-68A031534B57}" maximized="1" xWindow="1"
 yWindow="1" windowWidth="1024" windowHeight="547" activeSheetId="1"/>
</customWorkbookViews>
```

end example]

#### Parent Elements

workbook (§3.2.27)

1

Child Elements	Subclause
customWorkbookView (Custom Workbook View)	§3.2.3

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_CustomWorkbookViews">
4 <sequence>
5 <element name="customWorkbookView" minOccurs="1" maxOccurs="unbounded"
6 type="CT_CustomWorkbookView"/>
7 </sequence>
8 </complexType>

```

### 9 3.2.5 definedName (Defined Name)

10 This element defines the defined names that are defined within this workbook. Defined names are descriptive  
 11 text that is used to represents a cell, range of cells, formula, or constant value. Use easy-to-understand names,  
 12 such as Products, to refer to hard to understand ranges, such as Sales!C20:C30.

13 A defined name in a formula can make it easier to understand the purpose of the formula. For example, the  
 14 formula =SUM(FirstQuarterSales) might be easier to identify than =SUM(C20:C30).

15 Names are available to any sheet. For example, if the name ProjectedSales refers to the range A20:A30 on the  
 16 first worksheet in a workbook, you can use the name ProjectedSales on any other sheet in the same workbook  
 17 to refer to range A20:A30 on the first worksheet.

18 Names can also be used to represent formulas or values that do not change (constants). For example, you can  
 19 use the name SalesTax to represent the sales tax amount (such as 6.2 percent) applied to sales transactions.

20 You can also link to a defined name in another workbook, or define a name that refers to cells in another  
 21 workbook. For example, the formula =SUM(Sales.xls!ProjectedSales) refers to the named range ProjectedSales  
 22 in the workbook named Sales.

23 A compliant producer or consumer will consider a defined name in the range A1-XFD1048576 to be invalid.

24 All other names outside this range can be defined as names and will override a cell reference if an ambiguity  
 25 exists.

26 For clarification: LOG10 is always a cell reference, LOG10() is always formula, LOGO1000 can be a defined name  
 27 that overrides a cell reference.

Parent Elements
definedNames (§3.2.6)

28

Attributes	Description
------------	-------------

Attributes	Description
comment (Comment)	<p>Specifies the comment the user provided when the name was created.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
customMenu (Custom Menu Text)	<p>Specifies custom menu text for the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
description (Description)	<p>Specifies description text for the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
function (Function)	<p>Specifies a boolean value that indicates that the defined name refers to a user-defined function. This attribute is used when there is an add-in or other code project associated with the file.</p> <p>A value of on, 1, or true indicates the name refers to a function.</p> <p>A value of off, 0, or false indicates the name does not refer to a function.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
functionGroupId (Function Group Id)	<p>Specifies the function group index if the defined name refers to a function. The function group defines the general category for the function. This attribute is used when there is an add-in or other code project associated with the file.</p> <p>The following functionGroupIds are defined in SpreadsheetML for applications that support the association of an add-in or code project for their workbook:</p> <ul style="list-style-type: none"> <li>• 1 Financial</li> <li>• 2 Date and Time</li> <li>• 3 Math and Trig</li> <li>• 4 Statistical</li> <li>• 5 Lookup and Reference</li> <li>• 6 Database</li> <li>• 7 Text</li> <li>• 8 Logical</li> <li>• 9 Information</li> <li>• 10 Commands</li> <li>• 11 Customizing</li> <li>• 12 Macro Control</li> <li>• 13 DDE / External</li> <li>• 14 User Defined</li> <li>• 15 Engineering</li> </ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>16 Cube</li> </ul> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
help (Help)	<p>Specifies the help topic to display for this defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
hidden (Hidden Name)	<p>Specifies a boolean value that indicates whether the defined name is hidden in the user interface.</p> <p>A value of on, 1, or true indicates the name is hidden.</p> <p>A value of off, 0, or false indicates the name is not hidden.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
localSheetId (Local Name Sheet Id)	<p>Specifies the sheet index in this workbook where data from an external reference is displayed.</p> <p>In the following example, the defined name refers to a range whose data source is an external database called "Northwind_Database":</p> <p>[Example:  <code>&lt;definedName name="Northwind_Database" localSheetId="2"&gt;Sheet5!\$A\$1:\$T\$47&lt;/definedName&gt;</code>  end example]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
name (Defined Name)	<p>Specifies the name that will appear in the user interface for the defined name. This attribute is required. The following built-in names are defined in this SpreadsheetML specification:</p> <p><b>Print</b></p> <ul style="list-style-type: none"> <li>_xlnm.Print_Area: this defined name specifies the workbook's print area.</li> <li>_xlnm.Print_Titles: this defined name specifies the row(s) or column(s) to repeat at the top of each printed page.</li> </ul> <p><b>Filter &amp; Advanced Filter</b></p> <ul style="list-style-type: none"> <li>_xlnm.Criteria: this defined name refers to a range containing the criteria values to be used in applying an advanced filter to a range of data.</li> <li>_xlnm._FilterDatabase: can be one of the following <ul style="list-style-type: none"> <li>a. this defined name refers to a range to which an advanced filter has been applied. This represents the source data range, unfiltered.</li> </ul> </li> </ul>

Attributes	Description
	<p>b. This defined name refers to a range to which an AutoFilter has been applied.</p> <ul style="list-style-type: none"> <li>• <code>_xlnm.Extract</code>: this defined name refers to the range containing the filtered output values resulting from applying an advanced filter criteria to a source range.</li> </ul> <p><b>Miscellaneous</b></p> <ul style="list-style-type: none"> <li>• <code>_xlnm.Consolidate_Area</code>: the defined name refers to a consolidation area.</li> <li>• <code>_xlnm.Database</code>: the range specified in the defined name is from a database data source.</li> <li>• <code>_xlnm.Sheet_Title</code>: the defined name refers to a sheet title.</li> </ul> <p>Built-in names reserved by SpreadsheetML begin with "<code>_xlnm.</code>". End users shall not use this string for custom names in the user interface.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§3.18.96).</p>
publishToServer (Publish To Server)	<p>Specifies a boolean value that indicates whether the defined name is included in the version of the workbook that is published to or rendered on a Web or application server.</p> <p>A value of on, 1, or true indicates the name shall be published.</p> <p>A value of off, 0, or false indicates the name shall not be published.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
shortcutKey (Shortcut Key)	<p>Specifies the keyboard shortcut for the defined name.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§3.18.96).</p>
statusBar (Status Bar)	<p>Specifies text that is displayed on the application status bar when the user places focus on the defined name.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§3.18.96).</p>
vbProcedure (Procedure)	<p>Specified a boolean value that indicates whether the defined name is related to an external function, command, or other executable code.</p> <p>A value of on, 1, or true indicates the name is related to an external function, command, or other executable code, and the loading application can optionally decide whether to load and/or execute the commands.</p> <p>A value of off, 0, or false indicates the name does not refer to an external function, command, or other executable code.</p>

Attributes	Description
	<p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
workbookParameter (Workbook Parameter (Server))	<p>Specifies a boolean value that indicates that the name is used as a workbook parameter on a version of the workbook that is published to or rendered on a Web or application server.</p> <p>A value of on, 1, or true indicates is a workbook parameter on the application server.</p> <p>A value of off, 0, or false indicates is not a workbook parameter on the application server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
xlm (External Function)	<p>Specifies a boolean value that indicates whether the defined name is related to an external function, command, or other executable code.</p> <p>A value of on, 1, or true indicates the name is related to an external function, command, or other executable code, and the loading application can optionally decide whether to load and/or execute the commands.</p> <p>A value of off, 0, or false indicates the name does not refer to an external function, command, or other executable code.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefinedName">
 <simpleContent>
 <extension base="ST_Formula">
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="comment" type="ST_Xstring" use="optional"/>
 <attribute name="customMenu" type="ST_Xstring" use="optional"/>

 </extension>
 </simpleContent>
</complexType>
```

3.2.6 definedNames (Defined Names)

This element defines the collection of defined names for this workbook. Defined names are descriptive names to represent cells, ranges of cells, formulas, or constant values. Defined names can be used to represent a range on any worksheet.

[Example:

```
<definedNames>
 <definedName name="NamedFormula"
 comment="Comment text for defined name.">SUM(Sheet3!B2:B9)</definedName>
 <definedName name="NamedRange">Sheet3!A1:C12</definedName>
 <definedName name="NamedRangeFromExternalReference" localSheetId="2"
 hidden="1">Sheet5!A1:T47</definedName>
</definedNames>
```

end example]

Parent Elements

definedName (Defined Name)	§3.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefinedNames">
 <sequence>
 <element name="definedName" type="CT_DefinedName" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.2.7 ext (Extension)

Each ext element contains extensions to the standard SpreadsheetML feature set.

Parent Elements
extLst (§3.2.10)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (URI)	A token to identify version and application information for this particular extension.  The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extension">
 <sequence>
 <any processContents="lax"/>
 </sequence>
 <attribute name="uri" type="xsd:token"/>
</complexType>
```

### 3.2.8 externalReference (External Reference)

This element defines an external reference that stores data for workbook elements.

Parent Elements
externalReferences (§3.2.9)

Attributes	Description
id (Relationship Id)  Namespace: .../officeDocument /2006/relationshi	Specifies a unique identifier that is used to identify a relationship to another part in the file. Relationship identifiers link the element definition with the part where data for the element is stored.  The possible values for this attribute are defined by the ST_RelationshipId simple type

Attributes	Description
ps	(§7.8.2.1).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_ExternalReference">
3 <attribute ref="r:id" use="required"/>
4 </complexType>
```

### 5 3.2.9 externalReferences (External References)

6 This element defines the collection of external references for this workbook.

Parent Elements
workbook (§3.2.27)

7

Child Elements	Subclause
externalReference (External Reference)	§3.2.8

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_ExternalReferences">
10 <sequence>
11 <element name="externalReference" type="CT_ExternalReference" minOccurs="1"
12 maxOccurs="unbounded"/>
13 </sequence>
14 </complexType>
```

### 15 3.2.10 extLst (Future Feature Data Storage Area)

16 This element defines flexible storage extensions for implementing applications.

Parent Elements
autoFilter (§3.3.1.1); bk (§3.9.2); c (§3.3.1.3); cacheField (§3.10.1.3); cacheHierarchy (§3.10.1.6); cacheSource (§3.10.1.7); calcChain (§3.6.2); calculatedItem (§3.10.1.8); calculatedMember (§3.10.1.10); cellStyle (§3.8.7); cfRule (§3.3.1.9); cfvo (§3.3.1.10); chartsheet (§3.3.1.11); comments (§3.7.5); conditionalFormat (§3.10.1.18); conditionalFormatting (§3.3.1.17); connection (§3.13.1); customSheetView (§3.3.1.23); customWorkbookView (§3.2.3); dataField (§3.10.1.22); dialogsheet (§3.3.1.32); dxf (§3.8.14); externalLink (§3.14.8); filter (§3.10.1.33); filterColumn (§3.3.2.7); format (§3.10.1.35); futureMetadata (§3.9.4); groupLevel (§3.10.1.39); header (§3.11.1.1); ignoredErrors (§3.3.1.48); metadata (§3.9.8); nc (§3.11.1.3); ndxf (§3.11.1.4); oc (§3.11.1.5); odxf (§3.11.1.6); pageField (§3.10.1.62); pivotArea (§3.3.1.66); pivotCacheDefinition (§3.10.1.67); pivotCacheRecords (§3.10.1.68); pivotField (§3.10.1.69); pivotHierarchy (§3.10.1.72); pivotTableDefinition (§3.10.1.73); queryTable (§3.12.2); queryTableField (§3.12.4); queryTableRefresh (§3.12.6); rcc (§3.11.1.9); rdn (§3.11.1.13); reference (§3.10.2.1); rfmt (§3.11.1.17); row (§3.3.1.71); rsnm (§3.11.1.22); sheetView (§3.3.1.84); sheetView (§3.3.1.83); sheetViews (§3.3.1.86); sheetViews (§3.3.1.85); singleXmlCell (§3.5.2.1); sortState (§3.3.1.89); sst (§3.4.9); styleSheet (§3.8.39); table (§3.5.1.2); tableColumn (§3.5.1.3); tupleCache (§3.10.1.94); userInfo (§3.11.2.1); volTypes (§3.15.6); workbook (§3.2.27); workbookView (§3.2.30); worksheet (§3.3.1.96); xf (§3.8.45); xmlCellPr (§3.5.2.3); xmlColumnPr (§3.5.1.7);

Parent Elements
xmlPr (§3.5.2.4)

Child Elements	Subclause
ext (Extension)	§3.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionList">
 <sequence>
 <group ref="EG_ExtensionList" minOccurs="0"/>
 </sequence>
</complexType>
```

### 3.2.11 fileRecoveryPr (File Recovery Properties)

This element defines properties that track the state of the workbook file, such as whether the file was saved during a crash, or whether it should be opened in auto-recover mode.

Parent Elements
workbook (§3.2.27)

Attributes	Description
autoRecover (Auto Recover)	<p>Specifies a boolean value that indicates whether the file is mark for auto-recovery. Applications typically mark files for auto-recover following a crash.</p> <p>A value of on, 1, or true indicates the file is marked for auto-recover.</p> <p>A value of off, 0, or false indicates the file is not marked for auto-recover.</p> <p>The default value for this attribute is /false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
crashSave (Crash Save)	<p>Specifies a boolean value that indicates whether the application last saved the workbook file after a crash.</p> <p>A value of on, 1, or true indicates the workbook was last saved after a crash.</p> <p>A value of off, 0, or false indicates was not last saved as part of a crash.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dataExtractLoad	Specifies a boolean value that indicates whether the application last opened the

Attributes	Description
(Data Extract Load)	<p>workbook for data recovery.</p> <p>A value of on, 1, or true indicates the workbook was last opened for data recovery.</p> <p>A value of off, 0, or false indicates was not last opened for data recovery.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
repairLoad (Repair Load)	<p>Specifies a boolean value that indicates whether the application last opened the workbook in safe or repair mode.</p> <p>A value of on, 1, or true indicates the workbook was last opened in safe or repair mode.</p> <p>A value of off, 0, or false indicates the workbook was last opened without problems.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_FileRecoveryPr">
3 <attribute name="autoRecover" type="xsd:boolean" use="optional" default="true"/>
4 <attribute name="crashSave" type="xsd:boolean" use="optional" default="false"/>
5 <attribute name="dataExtractLoad" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="repairLoad" type="xsd:boolean" use="optional" default="false"/>
7 </complexType>

```

### 8 3.2.12 fileSharing (File Sharing)

9 This element tracks file sharing File sharing settings for the workbook.

Parent Elements
workbook (§3.2.27)

10

Attributes	Description
readOnlyRecommended (Read Only Recommended)	<p>Specifies a boolean value that indicates on open, whether the application alerts the user that the file be marked as read-only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
reservationPassword (Write Reservation Password)	<p>Specifies the hash of the password required for editing this workbook. This hash is optional and may be ignored. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionsPassword attribute of §3.2.29.</p>

Attributes	Description
	<p>The resulting value is hashed using the algorithm defined below.</p> <p>[Note: An example algorithm to hash the user input into the value stored is as follows:</p> <pre> // Function Input: //   szPassword: NULL terminated C-Style string //   cchPassword: The number of characters in szPassword (not //               including the NULL terminator) WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {     WORD wPasswordHash;     const CHAR *pch;      wPasswordHash = 0;      if (cchPassword &gt; 0)     {         pch = &amp;szPassword[cchPassword];         while (pch-- != szPassword)         {             wPasswordHash = ((wPasswordHash &gt;&gt; 14) &amp; 0x01)   ((wPasswordHash &lt;&lt; 1) &amp; 0x7fff);             wPasswordHash ^= *pch;         }         wPasswordHash ^= (0x8000   ('N' &lt;&lt; 8)   'K');     }      return(wPasswordHash); } end note] </pre> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).</p>
userName (User Name)	<p>Specifies the username of the person with write reservation for this workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_FileSharing">
3 <attribute name="readOnlyRecommended" type="xsd:boolean" use="optional" default="false"/>
4 <attribute name="userName" type="ST_Xstring"/>
5 <attribute name="reservationPassword" type="ST_UnsignedShortHex"/>
6 </complexType>

```

3.2.13 fileVersion (File Version)

This element defines properties that track which version of the application accessed the data and source code contained in the file.

Parent Elements
workbook (§3.2.27)

Attributes	Description
appName (Application Name)	<p>Specifies the application name. When saving, applications can write their appName value and optionally write lastEdited and lowestEdited attributes to track the version of the application that performed those actions. When opening the workbook, applications can examine the value of appName and decide how to interpret the lastEdited, lowestEdited, and rupBuild attributes.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
codeName (Code Name)	<p>Specifies the GUID that identifies the code project that is associated with the workbook.</p> <p>[Note: the primary use of this attribute is to track the version of the compiled code.]</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
lastEdited (Last Edited Version)	<p>Specifies the version of the application that last saved the workbook. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
lowestEdited (Lowest Edited Version)	<p>Specifies the earliest version of the application that saved the workbook. This value is reset any time an application that can read all data in the file saves the file. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
rupBuild (Build Version)	<p>Specifies the incremental public release of the application. For example, betas, service packs, and versions.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FileVersion">
 <attribute name="appName" type="xsd:string" use="optional"/>
 <attribute name="lastEdited" type="xsd:string" use="optional"/>
 <attribute name="lowestEdited" type="xsd:string" use="optional"/>
 <attribute name="rupBuild" type="xsd:string" use="optional"/>
 <attribute name="codeName" type="ST_Guid" use="optional"/>
</complexType>
```

### 3.2.14 functionGroup (Function Group)

This element represents a single function group.

Parent Elements
functionGroups (§3.2.15)

Attributes	Description
name (Name)	Specifies the name of the function group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FunctionGroup">
 <attribute name="name" type="ST_Xstring"/>
</complexType>
```

### 3.2.15 functionGroups (Function Groups)

This element defines the collection of function groups for the workbook.

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
functionGroup (Function Group)	§3.2.14

Attributes	Description
builtInGroupCount (Built-in Function Group Count)	Specifies the count of built-in function groups that the application provides in this workbook.  The default value for this attribute is 16.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FunctionGroups">
 <sequence maxOccurs="unbounded">
 <element name="functionGroup" type="CT_FunctionGroup" minOccurs="0"/>
 </sequence>
 <attribute name="builtInGroupCount" type="xsd:unsignedInt" default="16" use="optional"/>
</complexType>
```

### 3.2.16 oleSize (Embedded Object Size)

This element defines the embedded object server for this workbook.

Parent Elements
-----------------

workbook (§3.2.27)
--------------------

Attributes	Description
------------	-------------

ref (Reference)	Specifies the reference for the embedded object.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
-----------------	--------------------------------------------------------------------------------------------------------------------------------------------------

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleSize">
 <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

### 3.2.17 pivotCache (PivotCache)

This element represents a cache of data for pivot tables and formulas in the workbook.

Parent Elements
-----------------

pivotCaches (§3.2.18)
-----------------------

Attributes	Description
------------	-------------

cacheId (PivotCache Id)	Specifies the unique identifier for the pivot cache for this workbook in the pivot cache part.  This attribute is required.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Relationship Id)  Namespace: .../officeDocument	Specifies the identifier to a pivot cache definition part where cached data is stored.  This attribute is required.

Attributes	Description
/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCache">
 <attribute name="cacheId" type="xsd:unsignedInt" use="required"/>
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 3.2.18 pivotCaches (PivotCaches)

This element enumerates pivot cache definition parts used by pivot tables and formulas in this workbook.

*[Example:*

```
<pivotCaches>
 <pivotCache cacheId="4" r:id="rId8"/>
</pivotCaches>
```

*end example]*

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
pivotCache (PivotCache)	§3.2.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCaches">
 <sequence>
 <element name="pivotCache" type="CT_PivotCache" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.2.19 sheet (Sheet Information)

This element defines a sheet in this workbook. Sheet data is stored in a separate part.

Parent Elements
sheets (§3.2.20)

Attributes	Description
id (Relationship Id)	Specifies the identifier of the sheet part where the definition for this sheet is stored.

Attributes	Description
Namespace: .../officeDocument /2006/relationships	This attribute is required.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sheet Name)	Specifies the name of the sheet. This name must be unique.  This attribute is required.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sheetId (Sheet Tab Id)	Specifies the internal identifier for the sheet. This identifier must be unique.  This attribute is required.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
state (Visible State)	Specifies the visible state of this sheet.  The default value for this attribute is "visible."  The possible values for this attribute are defined by the ST_SheetState simple type (§3.18.70).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Sheet">
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="state" type="ST_SheetState" use="optional" default="visible"/>
 <attribute ref="r:id" use="required"/>
</complexType>

```

### 3.2.20 sheets (Sheets)

This element represents the collection of sheets in the workbook. There are different types of sheets you can create in SpreadsheetML. The most common sheet type is a worksheet; also called a spreadsheet. A worksheet is the primary document that you use in SpreadsheetML to store and work with data. A worksheet consists of cells that are organized into columns and rows.

Some workbooks might have a modular design where there is one sheet for data and another worksheet for each type of analysis. In a complex modular system, you might have dozens of sheets, each dedicated to a specific task.

[Example:

```
<sheets>
 <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
 <sheet name="Sheet2" sheetId="2" r:id="rId2"/>
 <sheet name="Sheet5" sheetId="3" r:id="rId3"/>
 <sheet name="Chart1" sheetId="4" type="chartsheet" r:id="rId4"/>
</sheets>
```

*end example]*

Parent Elements

workbook (§3.2.27)

Child Elements

Subclause

sheet (Sheet Information)

§3.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sheets">
 <sequence>
 <element name="sheet" type="CT_Sheet" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

3.2.21 smartTagPr (Smart Tag Properties)

This element defines a collection of smart tag properties that determine smart tag behavior in the workbook.

*[Example:*

```
<smartTagPr embed="1" show="noIndicator"/>
```

*end example]*

Parent Elements

workbook (§3.2.27)

Attributes

Description

embed (Embed SmartTags)

Specifies a boolean value that indicates whether the application saves smart tags with the workbook. Smart tag information is saved both in the workbook part and the sheet parts.

A value of on, 1, or true indicates the application saves smart tags with the workbook.

Attributes	Description
	<p>A value of off, 0, or false indicates the application does not save smart tags with the workbook.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
show (Show Smart Tags)	<p>Specifies how the application displays smart tags in the user interface.</p> <p>The default value for this attribute is "all."</p> <p>The possible values for this attribute are defined by the ST_SmartTagShow simple type (§3.18.73).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_SmartTagPr">
3 <attribute name="embed" type="xsd:boolean" use="optional" default="false"/>
4 <attribute name="show" type="ST_SmartTagShow" use="optional" default="all"/>
5 </complexType>
```

### 6 3.2.22 smartTagType (Smart Tag Type)

7 This element represents a smart tag in the workbook.

Parent Elements
smartTagTypes (§3.2.23)

8

Attributes	Description
name (Name)	<p>Specifies the element name used for a smart tag that is used by the application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
namespaceUri (SmartTag Namespace URI)	<p>Specifies the namespace Uniform Resource Identifier (URI) for a smart tag used by the application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
url (Smart Tag URL)	<p>Specifies the URL for a smart tag provided by the smart tag provider in the application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTagType">
 <attribute name="namespaceUri" type="ST_Xstring" use="optional"/>
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="url" type="ST_Xstring" use="optional"/>
</complexType>
```

### 3.2.23 smartTagTypes (Smart Tag Types)

This element defines the collection of smart tag types in the workbook. Smart tags represent data that is recognized and labeled as a particular type. For example, a person's name or address can be recognized and labeled with a smart tag.

[Example:

```
<smartTagTypes>
 <smartTagType namespaceUri="urn:schemas-openxmlformats-org:office:smartrags"
 name="date"/>
</smartTagTypes>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
smartTagType (Smart Tag Type)	§3.2.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTagTypes">
 <sequence>
 <element name="smartTagType" type="CT_SmartTagType" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.2.24 webPublishing (Web Publishing Properties)

This element defines properties that relate to publishing this workbook to the Web.

Parent Elements
workbook (§3.2.27)

Attributes	Description
allowPng (Allow PNG)	Specifies a boolean value that indicates whether the application saves images in the PNG (Portable Network Graphics) graphic format.

Attributes	Description
	<p>A value of on, 1, or true indicates the application supports PNG .</p> <p>A value of off, 0, or false indicates does not support PNG.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
codePage (Code Page)	<p>Specifies the encoding the application will use when a Web page is saved. A code is table that relates the binary character codes used by a program to keys on the keyboard or to the appearance of characters on the display. Code pages are a means of providing support for the languages used in different countries.</p> <p>[<i>Note:</i> There are a number of code page technologies. One example of potential values can be found at:  <a href="http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WindowsBestFit/">http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WindowsBestFit/</a> <i>end note</i>]</p> <p>The default value for this attribute is the workbook's encoding.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
css (Use CSS)	<p>Specifies a boolean value that indicates whether the application will use Cascading Style Sheet (CSS) for font formatting on Web pages.</p> <p>A value of on, 1, or true indicates the application will use CSS for font formats in Web pages.</p> <p>A value of off, 0, or false indicates the application will not use CSS for font formats.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dpi (DPI)	<p>Specifies the DPI (defined as the number of pixels per inch) that will be used to display images in Web pages. The specified DPI affects the size of graphics relative to the size of text on the screen.</p> <p>The default value for this attribute is 96.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
longFileNames (Enable Long File Names)	<p>Specifies a boolean value that indicates whether the application allows file names longer than 8 characters for Web pages.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
targetScreenSize (Target Screen Size)	<p>Specifies the screen size on which Web pages will be displayed. The specified screen size might affect the size and layout of images on web pages.</p> <p>The default value of this attribute is "800x600."</p> <p>The possible values for this attribute are defined by the ST_TargetScreenSize simple type (§3.18.81).</p>
thicket (Thicket)	<p>Specifies a boolean value that indicates that the application stores supporting files such as bullets, background textures, and graphics in a separate folder from the Web page</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
vml (VML in Browsers)	<p>Specifies a boolean value that indicates whether the application uses VML (Vector Markup Language) to display graphics in Web browsers</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_WebPublishing">
3 <attribute name="css" type="xsd:boolean" use="optional" default="true"/>
4 <attribute name="thicket" type="xsd:boolean" use="optional" default="true"/>
5 <attribute name="longFileNames" type="xsd:boolean" use="optional" default="true"/>
6 <attribute name="vml" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="allowPng" type="xsd:boolean" use="optional" default="false"/>
8 <attribute name="targetScreenSize" type="ST_TargetScreenSize" use="optional" default="800x600"/>
9 <attribute name="dpi" type="xsd:unsignedInt" use="optional" default="96"/>
10 <attribute name="codePage" type="xsd:unsignedInt" use="optional"/>
11 </complexType>

```

### 12 3.2.25 webPublishObject (Web Publishing Object)

13 This element defines a single Web publishing object for the workbook. This element tracks basic information  
14 about an object in the workbook, such as a named range, that is published to the Web.

Parent Elements
webPublishObjects (§3.2.26)

15

Attributes	Description
autoRepublish (Auto Republish)	<p>Specifies a boolean value that indicates whether the object specified in sourceObject will be automatically published every time the workbook is saved.</p> <p>A value of on, 1, or true indicates the application will publish the sourceObject when the workbook is saved.</p> <p>A value of off, 0, or false indicates the application will not publish the sourceObject</p>

Attributes	Description
	<p>when the workbook is saved.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
destinationFile (Destination File)	<p>Specifies the destination file name to which the sourceObject will be published.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
divId (Div Id)	<p>Specifies the destination bookmark (div id) for the published object.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
id (Id)	<p>Specifies the number, in "nnnnn" format, used in generated div id, in style id's, token filenames, and other variables.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
sourceObject (Source Object)	<p>Specifies the named range to be published. If omitted, the entire workbook is published.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
title (Title)	<p>Specifies the title of the published item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_WebPublishObject">
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="divId" type="ST_Xstring" use="required"/>
 <attribute name="sourceObject" type="ST_Xstring" use="optional"/>
 <attribute name="destinationFile" type="ST_Xstring" use="required"/>
 <attribute name="title" type="ST_Xstring" use="optional"/>
 <attribute name="autoRepublish" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.2.26 webPublishObjects (Web Publish Objects)

This element defines the collection of Web publishing objects in the workbook.

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
webPublishObject (Web Publishing Object)	§3.2.25

Attributes	Description
count (Count)	Specifies the number of items in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishObjects">
 <sequence>
 <element name="webPublishObject" type="CT_WebPublishObject" minOccurs="1"
 maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.2.27 workbook (Workbook)

This element is the root part of the workbook in SpreadsheetML. It defines the structure of the workbook:

- **Sheets:** represents the collection of worksheets in the workbook. The worksheet is the primary document that you use to store and work with data.
- **Views:** SpreadsheetML defines a collection of Workbook views that define basic window dimensions and position of the workbook. It also defines a collection of Custom Workbook Views that allow the end-user to define a series of rich views on their workbook data. Users can create more than one view of the same workbook without saving separate copies of the workbook.
- **Properties:** the workbook has several property collection that store basic workbook settings, such as the date system to use, file protection settings, calculation settings, and smart tag behaviors.
- **Names:** represent descriptive that represent cells, ranges of cells, formulas, or constant values.

[Example:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<workbook xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/5/main"
 xmlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships">
 <fileVersion lastEdited="4" lowestEdited="4" rupBuild="4017"/>
 <workbookPr date1904="1" vbName="ThisWorkbook" defaultThemeVersion="123820"/>
 <bookViews>
 <workbookView xWindow="120" yWindow="45" windowWidth="15135"
 windowHeight="7650" activeTab="4"/>
 </bookViews>
```

```

1 <sheets>
2 <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
3 <sheet name="Sheet2" sheetId="2" r:id="rId2"/>
4 <sheet name="Sheet5" sheetId="3" r:id="rId3"/>
5 <sheet name="Chart1" sheetId="4" type="chartsheet" r:id="rId4"/>
6 </sheets>
7 <definedNames>
8 <definedName name="MyDefinedName">Sheet3!A1:C12</definedName>
9 </definedNames>
10 <calcPr calcId="122211" calcMode="autoNoTable" refMode="R1C1" iterate="1"
11 fullPrecision="0"/>
12 <customWorkbookViews>
13 <customWorkbookView name="CustomView1"
14 guid="{CE6681F1-E999-414D-8446-68A031534B57}" maximized="1" xWindow="1"
15 yWindow="1" windowWidth="1024" windowHeight="547" activeSheetId="1"/>
16 </customWorkbookViews>
17 <pivotCaches>
18 <pivotCache cacheId="0" r:id="rId8"/>
19 </pivotCaches>
20 <smartTagPr embed="1" show="noIndicator"/>
21 <smartTagTypes>
22 <smartTagType namespaceUri="urn:schemas-openxmlformats-org:office:smartrags"
23 name="date"/>
24 </smartTagTypes>
25 <webPublishing codePage="1252"/>
26 </workbook>

```

*end example]*

### 26 3.2.28 workbookPr (Workbook Properties)

27 This element defines a collection of workbook properties.

28 *[Example:*

```

1 <workbookPr date1904="1" showObjects="none" saveExternalLinkValues="0"
2 defaultThemeVersion="123820"/>
3 end example]

```

Parent Elements
workbook (§3.2.27)

4

Attributes	Description
allowRefreshQuery (Allow Refresh Query)	<p>Specifies a boolean value that indicates whether the application will refresh query table in this workbook.</p> <p>A value of on, 1, or true indicates the application will refresh query tables when the workbook is loaded.</p> <p>A value of off, 0, or false indicates the application will not refresh query tables.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
autoCompressPictures (Auto Compress Pictures)	<p>Specifies a boolean value that indicates the application automatically compressed pictures in the workbook.</p> <p>A value of on, 1, or true indicates the application automatically compresses pictures of the workbook. When a picture is compressed, the application:</p> <ul style="list-style-type: none"> <li>• Reduces resolution (to 96 dots per inch (dpi) for Web and 200 dpi for print), and unnecessary information is discarded.</li> <li>• Discards extra information. For example, when a picture has been cropped or resized, the "hidden" parts of the picture are stored in the file.</li> <li>• Compress the picture, if possible.</li> </ul> <p>A value of off, 0, or false indicates the application does not compress pictures in this workbook.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
backupFile (Create Backup File)	<p>Specifies a boolean value that indicates whether the application creates a backup of the workbook on save.</p> <p>A value of on, 1, or true indicates the application creates a backup of the workbook on save.</p> <p>A value of off, 0, or false indicates the application does not create a backup.</p>

Attributes	Description
	<p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
checkCompatibility (Check Compatibility On Save)	<p>Specifies a boolean value that indicates whether the application checks for compatibility when saving this workbook to older file formats.</p> <p>A value of on, 1, or true indicates the application performs a compatibility check when saving to legacy binary formats.</p> <p>A value of off, 0, or false indicates the application does not perform a compatibility check when saving to legacy binary formats.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
codeName (Code Name)	<p>Specifies the codename of the application that created this workbook. Use this attribute to track file content in incremental releases of the application.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
date1904 (Date 1904)	<p>Specifies a boolean value that indicates whether the date systems used in the workbook starts in 1904.</p> <p>A value of on, 1, or true indicates the date system starts in 1904.</p> <p>A value of off, 0, or false indicates the workbook uses the 1900 date system, where 1/1/1900 is the first day in the system.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
defaultThemeVersion (Default Theme Version)	<p>Specifies the default version of themes to apply in the workbook.</p> <p>The value for defaultThemeVersion depends on the application. SpreadsheetML defaults to the form [version][build], where [version] refers to the version of the application, and [build] refers to the build of the application when the themes in the user interface changed.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
filterPrivacy (Filter Privacy)	<p>Specifies a boolean value that indicates whether the application has been inspected the workbook for personally identifying information (PII). If this flag is set, the application warns the user any time the user performs do an action that will insert PII into the document. For example, inserting a comment might inserts the user's name.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates the application will warn the user when they insert PII into the workbook.</p> <p>A value of off, 0, or false indicates the application will not warn the user when they insert PII into the workbook; the workbook has not been inspected for PII.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hidePivotFieldList (Hide Pivot Field List)	<p>Specifies a boolean value that indicates whether a list of fields is shown for pivot tables in the application user interface.</p> <p>A value of on, 1, or true indicates a list of fields is show for pivot tables.</p> <p>A value of off, 0, or false indicates a list of fields is not shown for pivot tables.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
promptedSolutions (Prompted Solutions)	<p>Specifies a boolean value that indicates whether the user has received an alert to load Smart Document components.</p> <p>A value of on, 1, or true indicates the user received an alert to load SmartDoc.</p> <p>A value of off, 0, or false indicates the user did not receive an alert.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
publishItems (Publish Items)	<p>Specifies a boolean value that indicates whether the publish the workbook or workbook items to the application server.</p> <p>A value of on, 1, or true indicates that workbook items are published.</p> <p>A value of off, 0, or false indicates that the workbook is published.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
refreshAllConnections (Refresh all Connections on Open)	<p>Specifies a boolean value that indicates whether the workbok shall refresh all the connections to data sources during load.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
<b>saveExternalLinkValues (Save External Link Values)</b>	<p>Specifies a boolean value that indicates whether the application will cache values retrieved from other workbooks via an externally linking formula. Data is cached at save.</p> <p>A value of on, 1, or true indicates data from externally linked formulas is cached. A supporting part is written out containing a cached cell table from the external workbook.</p> <p>A value of off, 0, or false indicates data from externally linked formulas is not cached.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>showBorderUnselectedTables (Show Border Unselected Table)</b>	<p>Specifies a boolean value that indicates whether a border is drawn around unselected tables in the workbook.</p> <p>A value of on, 1, or true indicates borders are drawn around unselected tables.</p> <p>A value of off, 0, or false indicates borders are not drawn around unselected tables.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>showInkAnnotation (Show Ink Annotations)</b>	<p>Specifies a boolean value that indicates whether the book shows ink annotations.</p> <p>A value of on, 1, or true indicates that ink annotations are shown in the workbook.</p> <p>A value of off, 0, or false indicates that ink annotations are not shown in the workbook.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>showObjects (Show Objects)</b>	<p>Specifies how the application shows embedded objects in the workbook.</p> <p>This attribute is optional.</p> <p>The default value for this attribute is "all."</p> <p>The possible values for this attribute are defined by the ST_Objects simple type (§3.18.50).</p>
<b>showPivotChartFilter (Show Pivot Chart Filter)</b>	<p>Specifies a boolean value that indicates whether filtering options are shown for pivot charts in the workbook.</p> <p>A value of on, 1, or true indicates filtering options shall be shown for pivot charts.</p> <p>A value of off, 0, or false indicates filtering options shall not be shown.</p>

Attributes	Description
	<p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
updateLinks (Update Links Behavior)	<p>Specifies how the application updates external links when the workbook is opened.</p> <p>The default value for this attribute is userSet.</p> <p>The possible values for this attribute are defined by the ST_UpdateLinks simple type (§3.18.88).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_WorkbookPr">
 <attribute name="date1904" type="xsd:boolean" use="optional" default="false"/>

</complexType>

```

### 3.2.29 workbookProtection (Workbook Protection)

This element specifies options for protecting data in the workbook. Applications may use workbook protection to prevent anyone from accidentally changing, moving, or deleting important data. This protection may be ignored by applications which choose not to support this optional protection mechanism.

[Note: Worksheet or workbook element protection should not be confused with file security. It is not meant to make your workbook safe from unintentional modification, and cannot protect it from malicious modification. end note]

Parent Elements
workbook (§3.2.27)

Attributes	Description
------------	-------------

Attributes	Description																								
lockRevision (Lock Revisions)	<p>Specifies a boolean value that indicates whether the workbook is locked for revisions.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																								
lockStructure (Lock Structure)	<p>Specifies a boolean value that indicates whether structure of workbook is locked.</p> <p>A value of on, 1, or true indicates the structure of the workbook is locked. Worksheets in the workbook can't be moved, deleted, hidden, unhidden, or renamed, and new worksheets can't be inserted.</p> <p>A value of off, 0, or false indicates the structure of the workbook is not locked.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																								
lockWindows (Lock Windows)	<p>Specifies a boolean value that indicates whether the windows that comprise the workbook are locked.</p> <p>A value of on, 1, or true indicates the workbook windows are locked. Windows are the same size and position each time the workbook is opened.</p> <p>A value of off, 0, or false indicates the workbook windows are not locked.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																								
revisionsPassword (Revisions Password)	<p>Specifies the hash of the password required for unlocking revisions in this workbook. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the following logic:</p> <p>For SpreadsheetML password hash purposes, Unicode UTF-16 input code points are converted to an “ansi” single or double byte code page from the following list:</p> <table><tr><td>874</td><td>windows-874</td><td>ANSI/OEM Thai (same as 28605, ISO 8859-15); Thai (Windows)</td></tr><tr><td>932</td><td>shift_jis</td><td>ANSI/OEM Japanese; Japanese (Shift-JIS)</td></tr><tr><td>936</td><td>gb2312</td><td>ANSI/OEM Simplified Chinese (PRC, Singapore); Chinese Simplified (GB2312)</td></tr><tr><td>949</td><td>ks_c_5601-1987</td><td>ANSI/OEM Korean (Unified Hangul Code)</td></tr><tr><td>950</td><td>big5</td><td>ANSI/OEM Traditional Chinese (Taiwan; Hong Kong SAR, PRC); Chinese Traditional (Big5)</td></tr><tr><td>1250</td><td>windows-1250</td><td>ANSI Central European; Central European (Windows)</td></tr><tr><td>1251</td><td>windows-1251</td><td>ANSI Cyrillic; Cyrillic (Windows)</td></tr><tr><td>1252</td><td>windows-1252</td><td>ANSI Latin 1; Western European (Windows)</td></tr></table>	874	windows-874	ANSI/OEM Thai (same as 28605, ISO 8859-15); Thai (Windows)	932	shift_jis	ANSI/OEM Japanese; Japanese (Shift-JIS)	936	gb2312	ANSI/OEM Simplified Chinese (PRC, Singapore); Chinese Simplified (GB2312)	949	ks_c_5601-1987	ANSI/OEM Korean (Unified Hangul Code)	950	big5	ANSI/OEM Traditional Chinese (Taiwan; Hong Kong SAR, PRC); Chinese Traditional (Big5)	1250	windows-1250	ANSI Central European; Central European (Windows)	1251	windows-1251	ANSI Cyrillic; Cyrillic (Windows)	1252	windows-1252	ANSI Latin 1; Western European (Windows)
874	windows-874	ANSI/OEM Thai (same as 28605, ISO 8859-15); Thai (Windows)																							
932	shift_jis	ANSI/OEM Japanese; Japanese (Shift-JIS)																							
936	gb2312	ANSI/OEM Simplified Chinese (PRC, Singapore); Chinese Simplified (GB2312)																							
949	ks_c_5601-1987	ANSI/OEM Korean (Unified Hangul Code)																							
950	big5	ANSI/OEM Traditional Chinese (Taiwan; Hong Kong SAR, PRC); Chinese Traditional (Big5)																							
1250	windows-1250	ANSI Central European; Central European (Windows)																							
1251	windows-1251	ANSI Cyrillic; Cyrillic (Windows)																							
1252	windows-1252	ANSI Latin 1; Western European (Windows)																							

Attributes	Description		
	1253	windows-1253	ANSI Greek; Greek (Windows)
	1254	windows-1254	ANSI Turkish; Turkish (Windows)
	1255	windows-1255	ANSI Hebrew; Hebrew (Windows)
	1256	windows-1256	ANSI Arabic; Arabic (Windows)
	1257	windows-1257	ANSI Baltic; Baltic (Windows)
	1258	windows-1258	ANSI/OEM Vietnamese; Vietnamese (Windows)
<p>Code points with no representation in the target code page are replaced with Unicode character 0x3f (?).</p> <p>The necessary mapping tables can be found at the following location:  <a href="http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WindowsBestFit/">http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WindowsBestFit/</a> .</p> <p>Code pages 932, 936, 949, and 950 are “Double Byte” code pages. The remainder of the “ANSI” code pages supported by windows are “Single Byte” code pages.</p> <p>For single byte code pages each Unicode code point is replaced by a single byte or 0x3f if an appropriate character doesn’t exist in the code page.</p> <p>For double byte code pages, each Unicode code point is replaced by either a single byte, or a two byte sequence, depending on the input character, or 0x3f if an appropriate character doesn’t exist in the code page. In our tables the target is a single byte sequence if the most significant byte is 0x00, otherwise it is a double byte sequence, with the lead byte being the most significant byte.</p> <p>To convert, first check if conversion is being done to a single or double byte code page and load the appropriate WCTABLE code page table.</p> <p>For each input WCHAR, look up the code point in the WCTABLE. There are 3 possibilities: Not found, single byte, or double byte.</p> <p>If the input WCHAR is not found, append 0x3f and continue to the next WCHAR.  If the result is a single byte, check to make sure the entry in the MBTABLE matches the input. If it matches, append the single byte to the output. If it does not match, append 0x3f to the output.</p> <p>If the result is a double byte, check to make sure the entry in the DBCSEENTRY table for the appropriate lead byte matches the input WCHAR. If it matches, append the lead byte and trail byte to the output. If it does not match, append 0x3f to the output.</p> <p>The following pseudocode describes how this conversion should be done:</p> <pre> int WideCharToMultiByte(WCHAR* wszInput, byte* szOutput) { </pre>			

Attributes	Description
	<pre> // Remember output start so we can return length byte* szOutputStart = szOutput;  // Ask the system for the current ANSI code page, which // on windows is a system setting. int iCodePage = GetCurrentAnsiCodePage();  // Load Code Page Tables // This will depend on how the code pages are represented on // the target machine. TABLECLASS represents some abstract // representation of this structure here. TABLECLASS pTables = LoadCodePageTables(iCodePage);  bool bDoubleByte = false; if (iCodePage == 932        iCodePage == 936        iCodePage == 949        iCodePage == 950)     bDoubleByte = true;  while (*wszInput != 0) {     if (bDoubleByte)         szOutput = AppendDoubleByte(pTables, *wszInput, szOutput);     else         szOutput = AppendSingleByte(pTables, *wszInput, szOutput);      // Read next input WCHAR     wszInput++; }  // Null terminate the output *szOutput = 0;  // Return output length return szOutput - szOutputStart; }  byte* AppendSingleByte(TABLECLASS pTables, WCHAR wcIn, byte* szOutput) {     // Look up byte that we want to append.     byte bOut = pTables-&gt;LookUpSingleByte(wcIn);      // Make sure that bOut matches the input, otherwise use ? </pre>

Attributes	Description
	<pre> // (ie: no best fit behavior allowed) if (wcIn != pTables-&gt;LookupWideChar(bOut))     bOut = 0x3f;  *szOutput = bOut; szOutput++; return szOutput; }  byte* AppendDoubleByte(TABLECLASS pTables, WCHAR wcIn, byte* szOutput) {     // Look up bytes that we want to append.     UINT16 bytesOut = pTables-&gt;LookupDoubleByte(wcIn);      // See if it is a single or double byte sequence     if (bytesOut &amp; 0xFF00)     {         // It is a double byte sequence         // Make sure that bytesOut matches the input, otherwise use ?         // (ie: no best fit behavior allowed)         if (wcIn != pTables-&gt;LookupWideChar(bytesOut))         {             // Use ?, it will be added below             bytesOut = 0x003f;         }         else         {             // It matched, use the lead byte we found             // trail byte will be added below             *szOutput = bytesOut &gt;&gt; 8;             szOutput++;         }     }     else     {         // It is a single byte sequence         // Make sure that bytesOut matches the input, otherwise use ?         // (ie: no best fit behavior allowed)         if (wcIn != pTables-&gt;LookupWideChar(bytesOut &amp; 0xFF))             bytesOut = 0x003f;     }      // Add the single or trail byte     *szOutput = bytesOut &amp; 0xFF;     szOutput++; </pre>

Attributes	Description
	<pre>         return szOutput;     }      class pTables     {         // Construction depends on how you choose to store &amp; load         the         // table files          byte LookUpSingleByte(WCHAR wcIn)         {             // How you access the table depends on your storage             mechanism.             // Look up the line in WCTABLE where the first column             matches wcIn,             // and then return the byte value from the second             column.             if (exists WCTABLE{wcIn})                 return WCTABLE{wcIn}.SecondColumn;              // If it doesn't exist, return ?             return 0x3f;         }          UINT16 LookUpDoubleByte(WCHAR wcIn)         {             // How you access the table depends on your storage             mechanism.             // Look up the line in WCTABLE where the first column             matches wcIn,             // and then return the double byte value from the             second column.             if (exists WCTABLE{wcIn})                 return WCTABLE{wcIn}.SecondColumn;              // If it doesn't exist, return ?             return 0x003f;         }          // Overload that looks up wide chars from single byte code         points.         WCHAR LookUpWideChar(byte bIn)         {             // How you access the table depends on your storage             mechanism.             // Look up the line in MBTABLE where the first column             matches bIn,             // and then return the WCHAR value from the second </pre>

Attributes	Description
	<pre> column.     if (exists MBTABLE{bIn})         return MBTABLE{bIn}.SecondColumn;      // If it doesn't exist, return ?     return 0x003f; }  // Overload that looks up wide chars from double byte code points WCHAR LookUpWideChar(UINT16 bytesIn) {     // How you access the table depends on your storage mechanism.     // First find the DBCSTABLE where the LeadByte matches     // the lead (most significant) input byte.     if (exists DBCSTABLE{bytesIn &gt;&gt; 8})     {         DbcTable = DBCSTABLE{bytesIn &gt;&gt; 8};          // Look up the line in DbcTable where the first column         // matches the input trail (least significant) byte,         // and then return the WCHAR value from the second column.         if (exists DbcTable{bytesIn &amp; 0xFF})             return DbcTable{bytesIn &amp; 0xFF}.SecondColumn;     }      // Either the lead byte table or specific trail byte     // doesn't exist in the table, return ?     return 0x003f; } } </pre> <p>The resulting value is hashed using the algorithm defined below.</p> <p>[Note: An example algorithm to hash the resulting single-byte user input into the value stored is as follows:</p> <pre> // Function Input: //   szPassword: NULL terminated C-Style string //   cchPassword: The number of characters in szPassword (not including the NULL terminator) WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {     WORD wPasswordHash;     const CHAR *pch; </pre>

Attributes	Description
	<pre> wPasswordHash = 0;  if (cchPassword &gt; 0) {     pch = &amp;szPassword[cchPassword];     while (pch-- != szPassword)     {         wPasswordHash = ((wPasswordHash &gt;&gt; 14) &amp; 0x01)   ((wPasswordHash &lt;&lt; 1) &amp; 0x7fff);         wPasswordHash ^= *pch;     }     wPasswordHash ^= (0x8000   ('N' &lt;&lt; 8)   'K'); }  return(wPasswordHash); } end note]  The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87). </pre>
workbookPassword (Workbook Password)	<p>Specifies the hash of the password required for unlocking revisions in this workbook. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the following logic:</p> <p>For SpreadsheetML password hash purposes, Unicode UTF-16 input code points are converted to an “ansi” single or double byte code page using the logic defined in the preceding revisionsPassword attribute.</p> <p>The resulting value is hashed using the algorithm defined below.</p> <p>[Note: An example algorithm to hash the user input into the value stored is as follows:</p> <pre> // Function Input: //   szPassword: NULL terminated C-Style string //   cchPassword: The number of characters in szPassword (not including the NULL terminator) WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {     WORD wPasswordHash;     const CHAR *pch;      wPasswordHash = 0;      if (cchPassword &gt; 0)     {         pch = &amp;szPassword[cchPassword];         while (pch-- != szPassword) </pre>

Attributes	Description
	<pre>         {             wPasswordHash = ((wPasswordHash &gt;&gt; 14) &amp; 0x01)   ((wPasswordHash &lt;&lt; 1) &amp; 0x7fff);             wPasswordHash ^= *pch;         }         wPasswordHash ^= (0x8000   ('N' &lt;&lt; 8)   'K');     }      return(wPasswordHash); } end note] </pre> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_WorkbookProtection">
3 <attribute name="workbookPassword" type="ST_UnsignedShortHex" use="optional"/>
4 <attribute name="revisionsPassword" type="ST_UnsignedShortHex" use="optional"/>
5 <attribute name="lockStructure" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="lockWindows" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="lockRevision" type="xsd:boolean" use="optional" default="false"/>
8 </complexType>

```

### 9 3.2.30 workbookView (Workbook View)

10 This element specifies a single Workbook view.

11 Units for window widths and other dimensions are expressed in twips. Twip measurements are portable  
 12 between different display resolutions. The formula is (screen pixels) \* (20 \* 72) / (logical device dpi), where  
 13 the logical device dpi can be different for x and y coordinates.

Parent Elements
bookViews (§3.2.1)

14

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

15

Attributes	Description
activeTab (Active Sheet Index)	<p>Specifies an unsignedInt that contains the index to the active sheet in this book view.</p> <p>The default value for this attribute is 0.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
autoFilterDateGrouping (AutoFilter Date Grouping)	<p>Specifies a boolean value that indicates whether to group dates when presenting the user with filtering options in the user interface.</p> <p>A value of on, 1, or true indicates that dates are grouped.</p> <p>A value of off, 0, or false indicates that dates are not grouped.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
firstSheet (First Sheet)	<p>Specifies the index to the first sheet in this book view.</p> <p>The default value for this attribute is 0.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
minimized (Minimized)	<p>Specifies a boolean value that indicates whether the book window is minimized.</p> <p>A value of on, 1, or true indicates the book window is minimized.</p> <p>A value of off, 0, or false indicates the book window is not minimized.</p> <p>The default value for this attribute is false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showHorizontalScroll (Show Horizontal Scroll)	<p>Specifies a boolean value that indicates whether to display the horizontal scroll bar in the user interface.</p> <p>A value of on, 1, or true indicates that the horizontal scrollbar shall be shown.</p> <p>A value of off, 0, or false indicates that the horizontal scrollbar shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showSheetTabs (Show Sheet Tabs)	<p>Specifies a boolean value that indicates whether to display the sheet tabs in the user interface.</p> <p>A value of on, 1, or true indicates that sheet tabs shall be shown.</p> <p>A value of off, 0, or false indicates that sheet tabs shall not be shown.</p>

Attributes	Description
	<p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showVerticalScroll (Show Vertical Scroll)	<p>Specifies a boolean value that indicates whether to display the vertical scroll bar.</p> <p>A value of on, 1, or true indicates the vertical scrollbar shall be shown.</p> <p>A value of off, 0, or false indicates the vertical scrollbar shall not be shown.</p> <p>The default value for this attribute is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
tabRatio (Sheet Tab Ratio)	<p>Specifies ratio between the workbook tabs bar and the horizontal scroll bar.</p> <p>The default value for this attribute is 600.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
visibility (Visibility)	<p>Specifies visible state of the book window.</p> <p>The default value for this attribute is "visible."</p> <p>The possible values for this attribute are defined by the ST_Visibility simple type (§3.18.91).</p>
windowHeight (Window Height)	<p>Specifies the height of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
windowWidth (Window Width)	<p>Specifies the width of the workbook window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
xWindow (Upper Left Corner (X Coordinate))	<p>Specifies the X coordinate for the upper left corner of the book window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
yWindow (Upper Left Corner (Y Coordinate))	<p>Specifies the Y coordinate for the upper left corner of the book window. The unit of measurement for this value is twips.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BookView">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="visibility" type="ST_Visibility" use="optional" default="visible"/>
 <attribute name="minimized" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showHorizontalScroll" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showVerticalScroll" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showSheetTabs" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="xWindow" type="xsd:int" use="optional"/>
 <attribute name="yWindow" type="xsd:int" use="optional"/>
 <attribute name="windowWidth" type="xsd:unsignedInt" use="optional"/>
 <attribute name="windowHeight" type="xsd:unsignedInt" use="optional"/>
 <attribute name="tabRatio" type="xsd:unsignedInt" use="optional" default="600"/>
 <attribute name="firstSheet" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="activeTab" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="autoFilterDateGrouping" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.3 Worksheets

Sheets are the central structures within a workbook, and are where the user does most of their spreadsheet work. The most common type of sheet is the worksheet, which is represented as a grid of cells. Worksheet cells can contain text, numbers, dates, and formulas. Cells can be formatted as well. Sheets often have Workbooks usually contain more than one sheet. To aid in the analysis of data and making informed decisions, spreadsheet applications often implement features and objects which help calculate, sort, filter, organize, and graphically display information. Since these features are often connected very tightly with the spreadsheet grid, these are also included in the sheet definition on disk.

Other types of sheets include chart sheets and dialog sheets.

Note that sheet information is organized into three main sections:

- Top-level sheet properties (everything before sheetData)
- The cell table (sheetData)
- Supporting sheet features (everything after sheetData)

#### 3.3.1 Worksheets

The following elements define a sheet and its contents:

##### 3.3.1.1 autoFilter (AutoFilter Settings)

AutoFilter temporarily hides rows based on a filter criteria, which is applied column by column to a table of data in the worksheet. This collection expresses AutoFilter settings.

*[Example: This example expresses a filter indicating to 'show only values greater than 0.5'. The filter is being applied to the range B3:E8, and the criteria is being applied to values in the column whose colId='1' (zero based*

column numbering, from left to right). Therefore any rows shall be hidden if the value in that particular column is less than or equal to 0.5.

```
<autoFilter ref="B3:E8">
 <filterColumn colId="1">
 <customFilters>
 <customFilter operator="greaterThan" val="0.5"/>
 </customFilters>
 </filterColumn>
</autoFilter>
```

*end example]*

Parent Elements
customSheetView (§3.3.1.23); filter (§3.10.1.33); table (§3.5.1.2); worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
filterColumn (AutoFilter Column)	§3.3.2.7
sortState (Sort State)	§3.3.1.89

Attributes	Description
ref (Cell or Range Reference)	Reference to the cell range to which the AutoFilter is applied.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AutoFilter">
 <sequence>
 <element name="filterColumn" minOccurs="0" maxOccurs="unbounded" type="CT_FilterColumn"/>
 <element name="sortState" minOccurs="0" maxOccurs="1" type="CT_SortState"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="ref" type="ST_Ref"/>
</complexType>
```

### 3.3.1.2 brk (Break)

Individual row or column breaks

Parent Elements
-----------------

Parent Elements
colBreaks (§3.3.1.13); rowBreaks (§3.3.1.72)

1

Attributes	Description
id (Id)	Zero-based row or column Id of the page break. Breaks occur above the specified row and left of the specified column.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
man (Manual Page Break)	Manual Break flag. '1' means the break is a manually inserted break.  The possible values for this attribute are defined by the XML Schema boolean datatype.
max (Maximum)	Zero-based index of end row or column of the break. For row breaks, specifies column index; for column breaks, specifies row index.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
min (Minimum)	Zero-based index of start row or column of the break. For row breaks, specifies column index; for column breaks, specifies row index.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pt (Pivot-Created Page Break)	Flag indicating that a PivotTable created this break.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Break">
4 <attribute name="id" type="xsd:unsignedInt" use="optional" default="0"/>
5 <attribute name="min" type="xsd:unsignedInt" use="optional" default="0"/>
6 <attribute name="max" type="xsd:unsignedInt" use="optional" default="0"/>
7 <attribute name="man" type="xsd:boolean" use="optional" default="false"/>
8 <attribute name="pt" type="xsd:boolean" use="optional" default="false"/>
9 </complexType>
```

10 **3.3.1.3**      **c (Cell)**

11 This collection represents a cell in the worksheet. Information about the cell's location (reference), value, data  
12 type, formatting, and formula is expressed here.

13 [Example: This example shows the information stored for a cell whose address in the grid is C6, whose style  
14 index is '6', and whose value metadata index is '15'. The cell contains a formula as well as a calculated result of  
15 that formula.

```
1 <c r="C6" s="1" vm="15">
2 <f>CUBEVALUE("xllextdat9 Adventure Works",C$5,$A6)</f>
3 <v>2838512.355</v>
4 </c>
```

5 *end example]*

6 While a cell can have a formula element *f* and a value element *v*, when the cell's type *t* is *inlineStr* then only  
7 the element *is* is allowed as a child element.

8 *[Example:*

9 Here is an example of expressing a string in the cell rather than using the shared string table.

```
10 <row r="1" spans="1:1">
11 <c r="A1" t="inlineStr">
12 <is><t>This is inline string example</t></is>
13 </c>
14 </row>
```

15 *end example]*

Parent Elements
row (§3.3.1.71)

16

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
f (Formula)	§3.3.1.37
is (Rich Text Inline)	§3.3.1.50
v (Cell Value)	§3.3.1.93

17

Attributes	Description
cm (Cell Metadata Index)	The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ph (Show Phonetic)	A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should

Attributes	Description
	only be used for East Asian languages.  The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Reference)	An A1 style reference to the location of this cell  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
s (Style Index)	The index of this cell's style. Style records are stored in the Styles Part.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
t (Cell Data Type)	An enumeration representing the cell's data type.  The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).
vm (Value Metadata Index)	The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell">
 <sequence>
 <element name="f" type="CT_CellFormula" minOccurs="0" maxOccurs="1"/>
 <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="is" type="CT_Rst" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="r" type="ST_CellRef" use="optional"/>
 <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="t" type="ST_CellType" use="optional" default="n"/>
 <attribute name="cm" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.4 cellSmartTag (Cell Smart Tag)

Single smart tag associated with a cell. There can be more than one cellSmartTag for a cell.

Parent Elements
cellSmartTags (§3.3.1.6)

Child Elements	Subclause
cellSmartTagPr (Smart Tag Properties)	§3.3.1.5

1

Attributes	Description
deleted (Deleted)	Boolean flag indicating that the application shouldn't display a particular smart tag in the cell, for example when the user has chosen to explicitly remove the Smart Tag by interacting with the application's user interface.  The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Smart Tag Type Index)	Book-level zero-based index of the smart tag type. This index references a <smartTagType> element in the <smartTagTypes> collection in the workbook start part.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xmlBased (XML Based)	Boolean flag indicating the Smart Tag recognition is triggered because the cell is associated with an XML map (schema-based semantic recognition), as contrasted with the more usual cell-content-based recognition type of smart tags.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_CellSmartTag">
4 <sequence>
5 <element name="cellSmartTagPr" minOccurs="0" maxOccurs="unbounded" type="CT_CellSmartTagPr"/>
6 </sequence>
7 <attribute name="type" type="xsd:unsignedInt" use="required"/>
8 <attribute name="deleted" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="xmlBased" type="xsd:boolean" use="optional" default="false"/>
10 </complexType>

```

11 

### 3.3.1.5 cellSmartTagPr (Smart Tag Properties)

12 Represents a single property of a smart tag in a cell; contains a key-value pair.

Parent Elements
cellSmartTag (§3.3.1.4)

13

Attributes	Description
key (Key Name)	Key name of a single property of a smart tag in a cell.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
val (Value)	String value of a single property of a smart tag in a cell.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_CellSmartTagPr">
3 <attribute name="key" type="ST_Xstring" use="required"/>
4 <attribute name="val" type="ST_Xstring" use="required"/>
5 </complexType>
```

6 **3.3.1.6 cellSmartTags (Cell Smart Tags)**

7 The element is used to label the cell with a smart tag. A cell may be determined to have semantic meaning and  
8 the cell containing this data can be labeled with a smart tag. The type of actions you can take depend on the  
9 semantic meaning of the data and the actions that the application decides to associate with that type of smart  
10 tag.

11 *[Example:* If you recently sent mail to "Chad Rothschiller", and you type the name into a cell on the worksheet,  
12 the name is recognized and given a smart tag with actions you can take including Send Mail, Schedule a Meeting,  
13 Open Contact, or Add to Contacts.

14 *end example]*

15 An application may decide that the smart tag indicators appear in the cell in the worksheet.

16 This collection represents a collection of smart tags on a cell.

17 *[Example:* This example expresses a smart tag associated with cell A1. The @type is used to associate this smart  
18 tag with a workbook-level smart tag type defined in the workbook start part.

```
19 <cellSmartTags r="A1">
20 <cellSmartTag type="0"/>
21 </cellSmartTags>
```

22 *end example]*

Parent Elements
smartTags (§3.3.1.87)

Child Elements	Subclause
cellSmartTag (Cell Smart Tag)	§3.3.1.4

Attributes	Description
r (Reference)	Reference to the cell that contains this set of smart tags.  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellSmartTags">
 <sequence>
 <element name="cellSmartTag" type="CT_CellSmartTag" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="r" type="ST_CellRef" use="required"/>
</complexType>
```

### 3.3.1.7 cellWatch (Cell Watch Item)

The watch window is a single UI location where the application user can keep track of certain cell formulas & values which they have chosen to be in the set of watched cells. This element expresses the cell address of a cell being watched. It is always a reference to a single cell.

Parent Elements
cellWatches (§3.3.1.8)

Attributes	Description
r (Reference)	Cell reference of the cell being watched.  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellWatch">
 <attribute name="r" type="ST_CellRef" use="required"/>
</complexType>
```

### 3.3.1.8 cellWatches (Cell Watch Items)

Collection of cells on this worksheet being watched in the 'watch window'.

[Example: In this example, cells B3 and B4 are being watched.

```
<cellWatches>
 <cellWatch r="B3"/>
 <cellWatch r="B4"/>
</cellWatches>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
cellWatch (Cell Watch Item)	§3.3.1.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellWatches">
 <sequence>
 <element name="cellWatch" type="CT_CellWatch" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.9 cfRule (Conditional Formatting Rule)

This collection represents a description of a conditional formatting rule.

*[Example:*

This example shows a conditional formatting rule highlighting cells whose values are greater than 0.5. Note that in this case the content of <formula> is a static value, but can also be a formula expression.

```
<conditionalFormatting sqref="E3:E9">
 <cfRule type="cellIs" dxid="0" priority="1" operator="greaterThan">
 <formula>0.5</formula>
 </cfRule>
</conditionalFormatting>
```

*end example]*

Only rules with a type value of expression support formula syntax.

Parent Elements
conditionalFormatting (§3.3.1.17)

Child Elements	Subclause
colorScale (Color Scale)	§3.3.1.15
dataBar (Data Bar)	§3.3.1.26
extLst (Future Feature Data Storage Area)	§3.2.10
formula (Formula)	§3.3.1.40
iconSet (Icon Set)	§3.3.1.46

Attributes	Description
aboveAverage (Above Or Below Average)	<p>Indicates whether the rule is an "above average" rule. '1' indicates 'above average'. Valid only for type = aboveAverage.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bottom (Bottom N)	<p>Indicates whether a "top/bottom n" rule is a "bottom n" rule. '1' indicates 'bottom'. Valid only for type = top10.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dxfld (Differential Formatting Id)	<p>This is an index to a dxf element in the Styles Part indicating which cell formatting to apply when the conditional formatting rule criteria is met.</p> <p>The possible values for this attribute are defined by the ST_Dxfld simple type (§3.18.26).</p>
equalAverage (Equal Average)	<p>Flag indicating whether the 'aboveAverage' and 'belowAverage' criteria is inclusive of the average itself, or exclusive of that value. '1' indicates to include the average value in the criteria. Valid only for type = aboveAverage.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
operator (Operator)	<p>The operator in a "cell value is" conditional formatting rule. Valid only when type = cellIs</p> <p>The possible values for this attribute are defined by the ST_ConditionalFormattingOperator simple type (§3.18.16).</p>
percent (Top 10 Percent)	<p>Indicates whether a "top/bottom n" rule is a "top/bottom n percent" rule. Valid only for type = top10.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
priority (Priority)	<p>The priority of this conditional formatting rule. This value is used to determine which format should be evaluated and rendered. Lower numeric values are higher priority than higher numeric values, where '1' is the highest priority.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
rank (Rank)	<p>The value of "n" in a "top/bottom n" conditional formatting rule. Valid only for type = top10.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
stdDev (StdDev)	<p>The number of standard deviations to include above or below the average in the conditional formatting rule. Valid only for type = aboveAverage. If a value is present for stdDev and the rule type = aboveAverage, then this rule is automatically an "above or below N standard deviations" rule.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.
stopIfTrue (Stop If True)	<p>If this flag is '1', no rules with lower priority may be applied over this rule, when this rule evaluates to true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
text (Text)	<p>The text value in a "text contains" conditional formatting rule. Valid only for type = containsText.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
timePeriod (Time Period)	<p>The applicable time period in a "date occurring..." conditional formatting rule. Valid only for type = timePeriod.</p> <p>The possible values for this attribute are defined by the ST_TimePeriod simple type (§3.18.82).</p>
type (Type)	<p>Type of conditional formatting rule.</p> <p>The possible values for this attribute are defined by the ST_CfType simple type (§3.18.13).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CfRule">
 <sequence>
 <element name="formula" type="ST_Formula" minOccurs="0" maxOccurs="3"/>
 <element name="colorScale" type="CT_ColorScale" minOccurs="0" maxOccurs="1"/>
 <element name="dataBar" type="CT_DataBar" minOccurs="0" maxOccurs="1"/>
 <element name="iconSet" type="CT_IconSet" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="type" type="ST_CfType"/>
 <attribute name="dxId" type="ST_DxfId" use="optional"/>
 <attribute name="priority" type="xsd:int" use="required"/>
 <attribute name="stopIfTrue" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="aboveAverage" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="percent" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="bottom" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="operator" type="ST_ConditionalFormattingOperator" use="optional"/>
 <attribute name="text" type="xsd:string" use="optional"/>
 <attribute name="timePeriod" type="ST_TimePeriod" use="optional"/>
 <attribute name="rank" type="xsd:unsignedInt" use="optional"/>
 <attribute name="stdDev" type="xsd:int" use="optional"/>
 <attribute name="equalAverage" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.3.1.10 cfvo (Conditional Format Value Object)

Describes the values of the interpolation points in a gradient scale.

1 [Example: This example demonstrates a color scale conditional formatting rule, which defines a color for the  
2 minimum value in the range of cell values, a color for the midpoint value, and a color for the maximum value in  
3 the in the range of cell values. Information is given about how to define the midpoint. In this case, it is the 50  
4 percent mark.

```
5 <colorScale>
6 <cfvo type="min" val="0"/>
7 <cfvo type="percent" val="50"/>
8 <cfvo type="max" val="0"/>
9 <color rgb="FFFF0000"/>
10 <color rgb="FFFFFF00"/>
11 <color rgb="FF00B050"/>
12 </colorScale>
```

13 The first <cfvo> element corresponds with the first <color> definition, and so on.

14 end example]

15

Parent Elements
colorScale (§3.3.1.15); dataBar (§3.3.1.26); iconSet (§3.3.1.46)

16

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
gte (Greater Than Or Equal)	For icon sets, determines whether this threshold value uses the greater than or equal to operator. '0' indicates 'greater than' is used instead of 'greater than or equal to'.  The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Type)	The type of this conditional formatting value object. For example 'min' and 'max' would be used (in conjunction with @val) to express the lower and upper values to be used in a gradient.  The possible values for this attribute are defined by the ST_CfvoType simple type (§3.18.14).
val (Value)	The value of this conditional formatting value object.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cfvo">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="type" type="ST_CfvoType" use="required"/>
 <attribute name="val" type="ST_Xstring" use="optional"/>
 <attribute name="gte" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.1.11 chartsheet (Chart Sheet)

This is the root element of Sheet Parts that are of type 'chartsheet'.

Parent Elements
Root element of SpreadsheetML Chartsheet part

Child Elements	Subclause
customSheetViews (Custom Chart Sheet Views)	§3.3.1.24
drawing (Drawing)	§3.3.1.34
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43
legacyDrawing (Legacy Drawing Reference)	§3.3.1.51
legacyDrawingHF (Legacy Drawing Reference in Header Footer)	§3.3.1.52
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Chart Sheet Page Setup)	§3.3.1.62
picture (Background Image)	§3.3.1.65
sheetPr (Chart Sheet Properties)	§3.3.1.80
sheetProtection (Chart Sheet Protection)	§3.3.1.82
sheetViews (Chart Sheet Views)	§3.3.1.86
webPublishItems (Web Publishing Items)	§3.3.1.95

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Chartsheet">
 <sequence>
 <element name="sheetPr" type="CT_ChartsheetPr" minOccurs="0" maxOccurs="1"/>
 <element name="sheetViews" type="CT_ChartsheetViews" minOccurs="1" maxOccurs="1"/>
 <element name="sheetProtection" type="CT_ChartsheetProtection" minOccurs="0" maxOccurs="1"/>
 <element name="customSheetViews" type="CT_CustomChartsheetViews" minOccurs="0" maxOccurs="1"/>
 <element name="pageMargins" minOccurs="0" type="CT_PageMargins"/>
 <element name="pageSetup" type="CT-CsPageSetup" minOccurs="0" maxOccurs="1"/>
 <element name="headerFooter" minOccurs="0" type="CT_HeaderFooter"/>
 <element name="drawing" type="CT_Drawing" minOccurs="1" maxOccurs="1"/>
 <element name="legacyDrawing" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
 <element name="legacyDrawingHF" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
 <element name="picture" type="CT_SheetBackgroundPicture" minOccurs="0" maxOccurs="1"/>
 <element name="webPublishItems" type="CT_WebPublishItems" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

3.3.1.12 col (Column Width & Formatting)

Defines column width and column formatting for one or more columns of the worksheet.

[Example: This example shows that column 5 (E) has width and style information applied.

```
<col min="5" max="5" width="9.140625" style="3"/>
```

end example]

Parent Elements
cols (§3.3.1.16)

Attributes	Description
bestFit (Best Fit Column Width)	Flag indicating if the specified column(s) is set to 'best fit'. 'Best fit' is set to true under these conditions: <ul style="list-style-type: none"><li>The column width has never been manually set by the user, AND</li><li>The column width is not the default width</li></ul> 'Best fit' means that when numbers are typed into a cell contained in a 'best fit' column, the column width should automatically resize to display the number. Note: In best fit cases, column width shall not be made smaller, only larger.  The possible values for this attribute are defined by the XML Schema boolean datatype.
collapsed (Collapsed)	Flag indicating if the outlining of the affected column(s) is in the collapsed state. See description of row collapsed and outlinePr element's summaryBelow and summaryRight attributes for detailed information.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
customWidth (Custom Width)	<p>Flag indicating that the column width for the affected column(s) is different from the default or has been manually set.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hidden (Hidden Columns)	<p>Flag indicating if the affected column(s) are hidden on this worksheet.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
max (Maximum Column)	<p>Last column affected by this 'column info' record.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
min (Minimum Column)	<p>First column affected by this 'column info' record.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
outlineLevel (Outline Level)	<p>Outline level of affected column(s). Range is 0 to 7. See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
phonetic (Show Phonetic Information)	<p>Flag indicating if the phonetic information should be displayed by default for the affected column(s) of the worksheet.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
style (Style)	<p>Default style for the affected column(s). Affects cells not yet allocated in the column(s). In other words, this style applies to new columns.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
width (Column Width)	<p>Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. There are 4 pixels of margin padding (two on each side), plus 1 pixel padding for the gridlines.</p> $\text{width} = \text{Truncate}([\{\text{Number of Characters}\} * \{\text{Maximum Digit Width}\} + \{5 \text{ pixel padding}\}] / \{\text{Maximum Digit Width}\} * 256) / 256$ <p>Using the Calibri font as an example, the maximum digit width of 11 point font size is 7 pixels (at 96 dpi). In fact, each digit is the same width for this font. Therefore if the cell width is 8 characters wide, the value of this attribute shall be <math>\text{Truncate}([8 * 7 + 5] / 7 * 256) / 256 = 8.7109375</math>.</p> <p>To translate the value of width in the file into the column width value at runtime</p>

Attributes	Description
	<p>(expressed in terms of pixels), use this calculation:</p> $= \text{Truncate}(((256 * \{\text{width}\} + \text{Truncate}(128/\{\text{Maximum Digit Width}\}))/256) * \{\text{Maximum Digit Width}\})$ <p>Using the same example as above, the calculation would be  <math>\text{Truncate}(((256 * 8.7109375 + \text{Truncate}(128/7))/256) * 7) = 61</math> pixels</p> <p>To translate from pixels to character width, use this calculation:  <math>= \text{Truncate}((\{\text{pixels}\} - 5) / \{\text{Maximum Digit Width}\} * 100 + 0.5) / 100</math></p> <p>Using the example above, the calculation would be <math>\text{Truncate}((61 - 5) / 7 * 100 + 0.5) / 100 = 8</math> characters.</p> <p>Note: when wide borders are applied, part of the left/right border shall overlap with the 2 pixel padding on each side. Wide borders do not affect the width calculation of the column.</p> <p>Note: When the sheet is in the mode to view formulas instead of values, the pixel width of the column is doubled.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Col">
3 <attribute name="min" type="xsd:unsignedInt" use="required"/>
4 <attribute name="max" type="xsd:unsignedInt" use="required"/>
5 <attribute name="width" type="xsd:double" use="optional"/>
6 <attribute name="style" type="xsd:unsignedInt" use="optional" default="0"/>
7 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
8 <attribute name="bestFit" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="customWidth" type="xsd:boolean" use="optional" default="false"/>
10 <attribute name="phonetic" type="xsd:boolean" use="optional" default="false"/>
11 <attribute name="outlineLevel" type="xsd:unsignedByte" use="optional" default="0"/>
12 <attribute name="collapsed" type="xsd:boolean" use="optional" default="false"/>
13 </complexType>

```

### 14 3.3.1.13 colBreaks (Vertical Page Breaks)

15 Vertical page break information used for print layout view, page layout view, drawing print breaks in normal  
16 view, and for printing the worksheet.

17 [Example:

18 In this example, a page break has been inserted at C3 (the break occurs left and above C3).

```
<colBreaks count="1" manualBreakCount="1">
 <brk id="2" max="1048575" man="1"/>
</colBreaks>
```

*end example]*

Parent Elements
customSheetView (§3.3.1.23); worksheet (§3.3.1.96)

Child Elements	Subclause
brk (Break)	§3.3.1.2

Attributes	Description
count (Page Break Count)	Number of breaks in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
manualBreakCount (Manual Break Count)	Number of manual breaks in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageBreak">
 <sequence>
 <element name="brk" type="CT_Break" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="manualBreakCount" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.3.1.14 color (Data Bar Color)

One of the colors associated with the data bar or color scale.

Note: the auto attribute is not used in the context of data bars.

Parent Elements
bottom (§3.8.6); colorScale (§3.3.1.15); dataBar (§3.3.1.26); diagonal (§3.8.13); font (§3.8.21); horizontal (§3.8.24); left (§3.8.27); mruColors (§3.8.28); right (§3.8.35); rPr (§3.4.7); stop (§3.8.38); top (§3.8.43); vertical (§3.8.44)

Attributes	Description
auto (Automatic)	<p>A boolean value indicating the color is automatic and system color dependent.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indexed (Index)	<p>Indexed color value. Only used for backwards compatibility. References a color in indexedColors.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rgb (Alpha Red Green Blue Color Value)	<p>Standard Alpha Red Green Blue color value (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
theme (Theme Color)	<p>Index into the &lt;clrScheme&gt; collection, referencing a particular &lt;sysClr&gt; or &lt;srgbClr&gt; value expressed in the Theme part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p>[Example:</p> <p>Here are some examples of how to apply tint to color:</p> <p><b>If (tint &lt; 0)</b>  <math>Lum' = Lum * (1.0 + tint)</math></p> <p>For example: Lum = 200; tint = -0.5; Darken 50%  <math>Lum' = 200 * (0.5) \Rightarrow 100</math></p> <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black)  <math>Lum' = 200 * (1.0 - 1.0) \Rightarrow 0</math></p> <p><b>If (tint &gt; 0)</b>  <math>Lum' = Lum * (1.0 - tint) + (HLSMAX - HLSMAX * (1.0 - tint))</math></p> <p>For example: Lum = 100; tint = 0.75; Lighten 75%</p>

Attributes	Description
	$\begin{aligned} \text{Lum}' &= 100 * (1-.75) + (\text{HLSMAX} - \text{HLSMAX}*(1-.75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white)</p> $\begin{aligned} \text{Lum}' &= 100 * (1-1) + (\text{HLSMAX} - \text{HLSMAX}*(1-1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Color">
3 <attribute name="auto" type="xsd:boolean" use="optional"/>
4 <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
5 <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
6 <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
7 <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
8 </complexType>
```

9 **3.3.1.15 colorScale (Color Scale)**

10 Describes a gradated color scale in this conditional formatting rule.

11 *[Example:*

```
12 <colorScale>
13 <cfvo type="min" val="0"/>
14 <cfvo type="max" val="0"/>
15 <color theme="5"/>
16 <color rgb="FFFFFFEF9C"/>
17 </colorScale>
```

18 *end example]*

Parent Elements
cfRule (§3.3.1.9)

19

Child Elements	Subclause
cfvo (Conditional Format Value Object)	§3.3.1.10
color (Data Bar Color)	§3.3.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorScale">
 <sequence>
 <element name="cfvo" type="CT_Cfvo" minOccurs="2" maxOccurs="unbounded"/>
 <element name="color" type="CT_Color" minOccurs="2" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.16 cols (Column Information)

Information about whole columns of the worksheet.

[Example:

This example shows that column 4 (D) has 'best fit' applied to it, which is also a custom width. Also, column 5 (E) is listed as having a custom width and a style applied at the column level (as opposed to the cell level).

```
<cols>
 <col min="4" max="4" width="12" bestFit="1" customWidth="1"/>
 <col min="5" max="5" width="9.140625" style="3"/>
</cols>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
col (Column Width & Formatting)	§3.3.1.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cols">
 <sequence>
 <element name="col" type="CT_Col" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.17 conditionalFormatting (Conditional Formatting)

A Conditional Format is a format, such as cell shading or font color, that a spreadsheet applicaiton can automatically apply to cells if a specified condition is true. This collection expresses conditional formatting rules applied to a particular cell or range.

[Example: This example applies a 'top10' rule to the cells C3:C8. The @dxfid references the formatting (defined in the styles part) to be applied to cells that match the criteria.

```

1 <conditionalFormatting sqref="C3:C8">
2 <cfRule type="top10" dxId="1" priority="3" rank="2"/>
3 </conditionalFormatting>

```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
cfRule (Conditional Formatting Rule)	§3.3.1.9
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
pivot (PivotTable Conditional Formatting)	Flag indicating if this is conditional formatting associated with a PivotTable. The possible values for this attribute are defined by the XML Schema boolean datatype.
sqref (Sequence of References)	Range over which these conditional formatting rules apply. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ConditionalFormatting">
 <sequence>
 <element name="cfRule" type="CT_CfRule" minOccurs="1" maxOccurs="unbounded"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="pivot" type="xsd:boolean" default="false"/>
 <attribute name="sqref" type="ST_Sqref"/>
</complexType>

```

### 3.3.1.18 control (Embedded Control)

A single embedded control.

Parent Elements
controls (§3.3.1.19)

Attributes	Description
id (Relationship Id) Namespace:	This relationship ID references an Embedded Control Data part which contains control-specific properties and state information about this particular embedded control.

Attributes	Description
.../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Control Name)	The code name of the control. The possible values for this attribute are defined by the XML Schema string datatype.
shapeId (Shape Id)	ID of the drawing shape in the Legacy Drawing part with which this control is associated. The drawing is used to draw the control in the sheet. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Control">
 <attribute name="shapeId" type="xsd:unsignedInt" use="required"/>
 <attribute ref="r:id" use="required"/>
 <attribute name="name" type="xsd:string" use="optional"/>
</complexType>
```

### 3.3.1.19 controls (Embedded Controls)

Worksheets can have embedded controls embedded in them. This collection is a listing of embedded controls in this worksheet. This collection is used to reference individual Embedded Control Data part definitions, enumerate the code name of each control, and reference drawing information used to draw the control.

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
control (Embedded Control)	§3.3.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Controls">
 <sequence>
 <element name="control" type="CT_Control" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.20 customPr (Custom Property)

The custom property element provides a mechanism to store name/value pairs of arbitrary user-defined data. The name is stored in the attribute name, the arbitrary data is stored in the binary part referenced by the relationshipId.

[Note: There is nothing in the binary part except the arbitrary data itself.]

Custom XML Data Properties provide a preferred mechanism for storing arbitrary data. The customPr supports legacy third-party document components, as well as those situations that have a stringent need for binary parts. *end note*

Parent Elements
customProperties (§3.3.1.21)

Attributes	Description
id (Relationship Id)  Namespace: .../officeDocument /2006/relationships	This relationship references the binary part containing the specified custom properties.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Custom Property Name)	Name of the custom property  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomProperty">
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 3.3.1.21 customProperties (Custom Properties)

This collection is used to reference binary parts containing arbitrary user-defined data.

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
customPr (Custom Property)	§3.3.1.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomProperties">
 <sequence>
 <element name="customPr" type="CT_CustomProperty" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.22 `customSheetView` (Custom Chart Sheet View)

This element defines custom view properties for chart sheets. See `customSheetView` (§3.3.1.23) for an example.

Parent Elements
<code>customSheetViews</code> (§3.3.1.24)

Child Elements	Subclause
<code>headerFooter</code> (Header Footer Settings)	§3.3.1.43
<code>pageMargins</code> (Page Margins)	§3.3.1.60
<code>pageSetup</code> (Chart Sheet Page Setup)	§3.3.1.62

Attributes	Description
<code>guid</code> (GUID)	<p>Unique identifier of this custom view</p> <p>The possible values for this attribute are defined by the <code>ST_Guid</code> simple type (§3.18.41).</p>
<code>scale</code> (Print Scale)	<p>Print scaling, representing percent values. Valid values range from 10 to 400. Horizontal &amp; Vertical scale together.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>The possible values for this attribute are defined by the XML Schema <code>unsignedInt</code> datatype.</p>
<code>state</code> (Visible State)	<p>Visibility state of the sheet.</p> <p>The possible values for this attribute are defined by the <code>ST_SheetState</code> simple type (§3.18.70).</p>
<code>zoomToFit</code> (Zoom To Fit)	<p>Flag indicating whether chart sheet is zoom to fit window.</p> <p>The possible values for this attribute are defined by the XML Schema <code>boolean</code> datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomChartsheetView">
 <sequence>
 <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
 <element name="pageSetup" type="CT_CsPageSetup" minOccurs="0" maxOccurs="1"/>
 <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="scale" type="xsd:unsignedInt" default="100"/>
 <attribute name="state" type="ST_SheetState" default="visible"/>
 <attribute name="zoomToFit" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.23 customSheetView (Custom Sheet View)

This collection stores information pertaining to one custom sheet view definition. A custom view is a collection of settings defining a particular view of the sheet. These views may be selected by the user for quick access to predefined views of the sheet.

[Example: This example indicates that there is both a horizontal and vertical split in the sheet view, and that the top left cell of the bottom right pane is F7. Page margin, print options, page setup, and header / footer information is also stored with this view.

```
<customSheetView guid="{F3A061A9-D5FD-4F9C-A7CD-483AD476BA25}"
 sizeWithWindow="0">
 <pane xSplit="5" ySplit="6" topLeftCell="F7"/>
 <selection/>
 <pageMargins left="0.7" right="0.7" top="0.75" bottom="0.75" header="0.3"
 footer="0.3"/>
 <printOptions gridLinesSet="0"/>
 <pageSetup paperSize="0" scale="0" orientation="portrait" printDriver="0"
 horizontalDpi="0" verticalDpi="0" copies="0"/>
 <headerFooter/>
</customSheetView>
```

end example]

Parent Elements
customSheetViews (§3.3.1.25)

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
colBreaks (Vertical Page Breaks)	§3.3.1.13
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43

Child Elements	Subclause
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Page Setup Settings)	§3.3.1.61
pane (View Pane)	§3.3.1.64
printOptions (Print Options)	§3.3.1.68
rowBreaks (Horizontal Page Breaks (Row))	§3.3.1.72
selection (Selection)	§3.3.1.75

1

Attributes	Description
colorId (Color Id)	<p>Index to the color value for the text in row/column headings and gridlines for this custom view. This is an 'index color value' (ICV) rather than rgb value.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
filter (Filtered List)	<p>Flag indicating whether the view contains a filtered range.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
filterUnique (Filter)	<p>Indicates whether an advanced filter has been applied, and the option to filter out duplicate records from the data list has been selected, in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fitToPage (Fit To Page)	<p>Flag indicating whether this view should be fit to page when printing this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
guid (GUID)	<p>Unique identifier of this custom view. This is used to ensure uniqueness. It is generated when the view is created. Must correspond to a customWorkbookView guid value in the workbook Start Part.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
hiddenColumns (Hidden Columns)	<p>Flag indicating that there is one or more hidden column(s) in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hiddenRows (Hidden Rows)	<p>Flag indicating that there is one or more hidden row(s) in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
outlineSymbols (Show Outline Symbols)	<p>Flag indicating whether outline symbols are displayed in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
printArea (Print Area Defined)	<p>Flag indicating whether a print area is defined as part of this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
scale (Print Scale)	<p>Print scaling for this custom view. Valid values range from 10 to 400.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
showAutoFilter (Show AutoFilter Drop Down Controls)	<p>Flag indicating whether the autofilter dropdown buttons are visible in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showFormulas (Show Formulas)	<p>Flag indicating whether formulas are shown in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showGridLines (Show Grid Lines)	<p>Flag indicating whether gridlines are shown in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showPageBreaks (Show Page Breaks)	<p>Flag indicating whether page breaks are shown in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showRowCol (Show Headers)	<p>Flag indicating whether row and column headers are shown in this custom view.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showRuler (Show Ruler)	<p>Flag indicating whether to show the ruler in this custom view. Only applicable if this Custom View is in Page Layout View.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
state (Visible State)	<p>Visibility state for this custom view.</p> <p>The possible values for this attribute are defined by the ST_SheetState simple type (§3.18.70).</p>
topLeftCell (Top Left Visible Cell)	<p>Location of the top left visible cell in the bottom right pane in this custom view (when in Left-to-Right mode).</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
view (View Type)	<p>Indicates the view type for this Custom View</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_SheetViewType simple type (§3.18.71).
zeroValues (Show Zero Values)	Flag indicating whether the window should display 0 (zero) values in this custom view.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomSheetView">
 <sequence>
 <element name="pane" type="CT_Pane" minOccurs="0" maxOccurs="1"/>
 <element name="selection" type="CT_Selection" minOccurs="0" maxOccurs="1"/>
 <element name="rowBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
 <element name="colBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
 <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
 <element name="printOptions" type="CT_PrintOptions" minOccurs="0" maxOccurs="1"/>
 <element name="pageSetup" type="CT_PageSetup" minOccurs="0" maxOccurs="1"/>
 <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 <element name="autoFilter" type="CT_AutoFilter" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="scale" type="xsd:unsignedInt" default="100"/>
 <attribute name="colorId" type="xsd:unsignedInt" default="64"/>
 <attribute name="showPageBreaks" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showFormulas" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showGridLines" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showRowCol" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="outlineSymbols" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="zeroValues" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="fitToPage" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="printArea" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="filter" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showAutoFilter" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="hiddenRows" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="hiddenColumns" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="state" type="ST_SheetState" default="visible"/>
 <attribute name="filterUnique" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="view" type="ST_SheetViewType" default="normal"/>
 <attribute name="showRuler" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="topLeftCell" type="ST_CellRef" use="optional"/>
</complexType>
```

3.3.1.24 customSheetViews (Custom Chart Sheet Views)

Collection of custom Chart Sheet View information.

Parent Elements
chartsheet (§3.3.1.11)

Child Elements	Subclause
customSheetView (Custom Chart Sheet View)	§3.3.1.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomChartsheetViews">
 <sequence>
 <element name="customSheetView" minOccurs="0" maxOccurs="unbounded"
 type="CT_CustomChartsheetView"/>
 </sequence>
</complexType>
```

### 3.3.1.25 customSheetViews (Custom Sheet Views)

This is a collection of custom sheet views.

Parent Elements
dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
customSheetView (Custom Sheet View)	§3.3.1.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomSheetViews">
 <sequence>
 <element name="customSheetView" minOccurs="1" maxOccurs="unbounded"
 type="CT_CustomSheetView"/>
 </sequence>
</complexType>
```

### 3.3.1.26 dataBar (Data Bar)

Describes a data bar conditional formatting rule.

*[Example:*

In this example a data bar conditional format is expressed, which spreads across all cell values in the cell range, and whose color is blue.

```
<dataBar>
 <cfvo type="min" val="0"/>
 <cfvo type="max" val="0"/>
 <color rgb="FF638EC6"/>
</dataBar>
```

*end example]*

The length of the data bar for any cell can be calculated as follows:

- 1 Data bar length =  $\text{minLength} + (\text{cell value} - \text{minimum value in the range}) / (\text{maximum value in the range} -$
- 2  $\text{minimum value in the range}) * (\text{maxLength} - \text{minLength}),$
- 3 where min and max length are a fixed percentage of the column width (by default, 10% and 90% respectively.)
- 4 The minimum difference in length (or increment amount) is 1 pixel.

Parent Elements
cfRule (§3.3.1.9)

5

Child Elements	Subclause
cfvo (Conditional Format Value Object)	§3.3.1.10
color (Data Bar Color)	§3.3.1.14

6

Attributes	Description
maxLength (Maximum Length)	The maximum length of the data bar, as a percentage of the cell width.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
minLength (Minimum Length)	The minimum length of the data bar, as a percentage of the cell width.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showValue (Show Values)	Indicates whether to show the values of the cells on which this data bar is applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.

- 7 The following XML Schema fragment defines the contents of this element:

8	<code>&lt;complexType name="CT_DataBar"&gt;</code>
9	<code>&lt;sequence&gt;</code>
10	<code>&lt;element name="cfvo" type="CT_Cfvo" minOccurs="2" maxOccurs="2"/&gt;</code>
11	<code>&lt;element name="color" type="CT_Color" minOccurs="1" maxOccurs="1"/&gt;</code>
12	<code>&lt;/sequence&gt;</code>
13	<code>&lt;attribute name="minLength" type="xsd:unsignedInt" use="optional" default="10"/&gt;</code>
14	<code>&lt;attribute name="maxLength" type="xsd:unsignedInt" use="optional" default="90"/&gt;</code>
15	<code>&lt;attribute name="showValue" type="xsd:boolean" use="optional" default="true"/&gt;</code>
16	<code>&lt;/complexType&gt;</code>

### 17 3.3.1.27 dataConsolidate (Data Consolidate)

- 18 Data consolidation settings. The dataRefs are the set of source ranges containing data to consolidate. The
- 19 function indicates the function that shall be used to consolidate the data.

20 [Example:

This example demonstrates consolidating the ranges A1:C1 and A3:C3 by using the 'count' function.

```
<dataConsolidate function="count">
 <dataRefs count="2">
 <dataRef ref="A1:C1" sheet="Sheet1"/>
 <dataRef ref="A3:C3" sheet="Sheet1"/>
 </dataRefs>
</dataConsolidate>
```

*end example]*

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
dataRefs (Data Consolidation References)	§3.3.1.29

Attributes	Description
function (Function Index)	Indicates which function to use when consolidating the ranges.  The possible values for this attribute are defined by the ST_DataConsolidateFunction simple type (§3.18.18).
leftLabels (Use Left Column Labels)	Use labels in left column. Both leftLabels and topLabels can be true at the same time.  The possible values for this attribute are defined by the XML Schema boolean datatype.
link (Link)	Create links to source data.  The possible values for this attribute are defined by the XML Schema boolean datatype.
topLabels (Labels In Top Row)	Use labels in top row. Both leftLabels and topLabels can be true at the same time.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataConsolidate">
 <sequence>
 <element name="dataRefs" type="CT_DataRefs" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="function" type="ST_DataConsolidateFunction" use="optional" default="sum"/>
 <attribute name="leftLabels" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="topLabels" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="link" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.3.1.28 dataRef (Data Consolidation Reference)

A single data consolidate reference. One dataRef shall use either name or sheet & ref, but not both on the same dataRef.

Parent Elements
dataRefs (§3.3.1.29)

Attributes	Description
id (relationship Id)  Namespace: .../officeDocument /2006/relationships	Used only when the source range is external to this workbook.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Named Range)	Named range, either in this workbook or the external workbook referenced by r:Id.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Cell range.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheet (Sheet Name)	Sheet name.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataRef">
 <attribute name="ref" type="ST_Ref" use="optional"/>
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="sheet" type="ST_Xstring" use="optional"/>
 <attribute ref="r:id" use="optional"/>
</complexType>
```

### 3.3.1.29 dataRefs (Data Consolidation References)

Data consolidate reference collection.

Parent Elements
dataConsolidate (§3.3.1.27)

Child Elements	Subclause
dataRef (Data Consolidation Reference)	§3.3.1.28

1

Attributes	Description
count (Data Consolidation Reference Count)	Count of data consolidate references.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_DataRefs">
4 <sequence>
5 <element name="dataRef" type="CT_DataRef" minOccurs="0" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
8 </complexType>

```

### 9 3.3.1.30 dataValidation (Data Validation)

10 A single item of data validation defined on a range of the worksheet.

Parent Elements
dataValidations (§3.3.1.31)

11

Child Elements	Subclause
formula1 (Formula 1)	§3.3.1.41
formula2 (Formula 2)	§3.3.1.42

12

Attributes	Description
allowBlank (Allow Blank)	A boolean value indicating whether the data validation treats empty or blank entries as valid. '1' means empty entries are OK and do not violate the validation constraints.  The possible values for this attribute are defined by the XML Schema boolean datatype.
error (Error Message)	Message text of error alert.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
errorStyle (Data Validation Error Style)	The style of error alert used for this data validation.  The possible values for this attribute are defined by the ST_DataValidationErrorStyle simple type (§3.18.19).
errorTitle (Error Alert Text)	Title bar text of error alert.  The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
imeMode (IME Mode Enforced)	<p>The IME (input method editor) mode enforced by this data validation. Only applies for these languages:</p> <ul style="list-style-type: none"> <li>• Chinese Simplified</li> <li>• Chinese Traditional</li> <li>• Japanese</li> <li>• Korean</li> </ul> <p>When imeMode is set, the input for the cell can be restricted to specific sets of characters, as specified by the value of imeMode. See the simple type referenced below for additional details.</p> <p>When imeMode is set but the application's language is not one of the languages listed above, then the default value is noControl.</p> <p>The possible values for this attribute are defined by the ST_DataValidationImeMode simple type (§3.18.20).</p>
operator (Operator)	<p>The relational operator used with this data validation.</p> <p>The possible values for this attribute are defined by the ST_DataValidationOperator simple type (§3.18.21).</p>
prompt (Input Prompt)	<p>Message text of input prompt.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
promptTitle (Prompt Title)	<p>Title bar text of input prompt.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
showDropDown (Show Drop Down)	<p>A boolean value indicating whether to display the dropdown combo box for a list type data validation.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showErrorMessage (Show Error Message)	<p>A boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showInputMessage (Show Input Message)	<p>A boolean value indicating whether to display the input prompt message.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sqref (Sequence of References)	<p>Range over which data validation is applied.</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).</p>

Attributes	Description
type (Data Validation Type)	<p>The type of data validation.</p> <p>The possible values for this attribute are defined by the ST_DataValidationType simple type (§3.18.22).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DataValidation">
 <sequence>
 <element name="formula1" type="ST_Formula" minOccurs="0" maxOccurs="1"/>
 <element name="formula2" type="ST_Formula" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="type" type="ST_DataValidationType" use="optional" default="none"/>
 <attribute name="errorStyle" type="ST_DataValidationErrorStyle" use="optional" default="stop"/>
 <attribute name="imeMode" type="ST_DataValidationImeMode" use="optional" default="noControl"/>
 <attribute name="operator" type="ST_DataValidationOperator" use="optional" default="between"/>
 <attribute name="allowBlank" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showDropDown" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showInputMessage" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showErrorMessage" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="errorTitle" type="ST_Xstring" use="optional"/>
 <attribute name="error" type="ST_Xstring" use="optional"/>
 <attribute name="promptTitle" type="ST_Xstring" use="optional"/>
 <attribute name="prompt" type="ST_Xstring" use="optional"/>
 <attribute name="sqref" type="ST_Sqref" use="required"/>
</complexType>

```

### 3.3.1.31 dataValidations (Data Validations)

This collection expresses all data validation information for cells in a sheet which have data validation features applied.

Data validation is used to specify constraints on the type of data that can be entered into a cell. Additional UI can be provided to help the user select valid values (e.g., a dropdown control on the cell or hover text when the cell is active), and to help the user understand why a particular entry was considered invalid (e.g., alerts and messages).

Various data types can be selected, and logical operators (e.g., greater than, less than, equal to, etc) can be used. Additionally, instead of specifying an explicit set of values that are valid, a cell or range reference may be used.

An input message can be specified to help the user know what kind of value is expected, and a warning message (and warning type) can be specified to alert the user when they've entered invalid data.

[Example:

```

1 <dataValidations count="1">
2 <dataValidation type="whole" errorStyle="warning" operator="greaterThan"
3 showInputMessage="1" showErrorMessage="1" errorTitle="Invalid Data"
4 error="The value must be a whole number greater than 0."
5 promptTitle="Whole Number"
6 prompt="Please enter a whole number greater than 0." sqref="A1">
7 <formula1>0</formula1>
8 </dataValidation>
9 </dataValidations>

```

*end example]*

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
dataValidation (Data Validation)	§3.3.1.30

Attributes	Description
count (Data Validation Item Count)	The expected number of data validation items for this worksheet.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
disablePrompts (Disable Prompts)	A boolean value indicating whether all input prompts for the worksheet are disabled.  The possible values for this attribute are defined by the XML Schema boolean datatype.
xWindow (Top Left Corner (X Coodrinate))	The x-coordinate (relative to window) of top-left corner of the data validation input prompt (textbox). This is per sheet, not per cell. Units in pixels.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
yWindow (Top Left Corner (Y Coordinate))	The y-coordinate (relative to window) of top-left corner of the data validation input prompt (textbox). This is per sheet, not per cell. Units in pixels.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataValidations">
 <sequence>
 <element name="dataValidation" type="CT_DataValidation" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="disablePrompts" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="xWindow" type="xsd:unsignedInt" use="optional"/>
 <attribute name="yWindow" type="xsd:unsignedInt" use="optional"/>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.3.1.32 dialogsheets (Dialog Sheet)

This is the root element for Sheet Parts of type 'dialogsheets'.

#### Parent Elements

Root element of SpreadsheetML Dialogsheet part

#### Child Elements

#### Subclause

customSheetViews (Custom Sheet Views)	§3.3.1.25
drawing (Drawing)	§3.3.1.34
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43
legacyDrawing (Legacy Drawing Reference)	§3.3.1.51
legacyDrawingHF (Legacy Drawing Reference in Header Footer)	§3.3.1.52
oleObjects (Embedded Objects)	§3.3.1.58
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Page Setup Settings)	§3.3.1.61
printOptions (Print Options)	§3.3.1.68
sheetFormatPr (Sheet Format Properties)	§3.3.1.78
sheetPr (Sheet Properties)	§3.3.1.79
sheetProtection (Sheet Protection Options)	§3.3.1.81
sheetViews (Sheet Views)	§3.3.1.85

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dialogsheet">
 <sequence>
 <element name="sheetPr" minOccurs="0" type="CT_SheetPr"/>
 <element name="sheetViews" minOccurs="0" type="CT_SheetViews"/>
 <element name="sheetFormatPr" minOccurs="0" type="CT_SheetFormatPr"/>
 <element name="sheetProtection" type="CT_SheetProtection" minOccurs="0" maxOccurs="1"/>
 <element name="customSheetViews" minOccurs="0" type="CT_CustomSheetViews"/>
 <element name="printOptions" minOccurs="0" type="CT_PrintOptions"/>
 <element name="pageMargins" minOccurs="0" type="CT_PageMargins"/>
 <element name="pageSetup" minOccurs="0" type="CT_PageSetup"/>
 <element name="headerFooter" minOccurs="0" type="CT_HeaderFooter"/>
 <element name="drawing" minOccurs="0" type="CT_Drawing"/>
 <element name="legacyDrawing" minOccurs="0" type="CT_LegacyDrawing"/>
 <element name="legacyDrawingHF" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
 <element name="oleObjects" type="CT_OleObjects" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
</complexType>
```

3.3.1.33 dimension (Worksheet Dimensions)

This element specifies the used range of the worksheet. It specifies the row and column bounds of used cells in the worksheet. This is optional and is not required. Used cells include cells with formulas, text content, and cell formatting. When an entire column is formatted, only the first cell in that column is considered used.

[Example:

<dimension ref="A1:C2"/>

end example]

Parent Elements

worksheet (§3.3.1.96)

Attributes	Description
ref (Reference)	The row and column bounds of all cells in this worksheet. Corresponds to the range that would contain all c elements written under sheetData. Does not support whole column or whole row reference notation.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetDimension">
 <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

### 3.3.1.34 drawing (Drawing)

This element indicates that the sheet contains drawing components built on the drawingML platform. The relationship Id references the part containing the drawingML definitions.

Parent Elements
chartsheet (§3.3.1.11); dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
id (Relationship id)	Relationship Id referencing a part containing drawingML definitions for this worksheet.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Drawing">
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 3.3.1.35 evenFooter (Even Page Footer)

Even page footer value. Corresponds to even printed pages. Even page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an even page's scope.

If no even footer is specified, then the odd footer's value is assumed for even page footers. See the evenHeader element (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

### 3.3.1.36 evenHeader (Even Page Header)

Even page header value. Corresponds to even printed pages. Even page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an even page's scope.

If no even header is specified, then odd header value is assumed for even page headers.

#### Header/Footer Formatting Syntax

There are a number of formatting codes that can be written inline with the actual header / footer text, which affect the formatting in the header or footer.

[Example:

This example shows the text "Center **Bold** Header" on the first line (center section), and the date on the second line (center section).

```
<headerFooter>
 <oddHeader>&CCenter &"- ,Bold"Bold
 &"- ,Regular"Header_x000A_&D</oddHeader>
</headerFooter>
```

*end example]*

General Rules:

There is no required order in which these codes must appear.

The first occurrence of the following codes turns the formatting ON, the second occurrence turns it OFF again:

- strikethrough
- superscript
- subscript

Superscript and subscript cannot both be ON at same time. Whichever comes first wins and the other is ignored, while the first is ON.

&L - code for "left section" (there are three header / footer locations, "left", "center", and "right"). When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the left section.

&P - code for "current page #"

&N - code for "total pages"

&font size - code for "text font size", where *font size* is a font size in points.

&K - code for "text font color"

RGB Color is specified as RRGGBB

Theme Color is specified as TTSSNN where TT is the theme color Id, S is either "+" or "-" of the tint/shade value, NN is the tint/shade value.

&S - code for "text strikethrough" on / off

&X - code for "text super script" on / off

&Y - code for "text subscript" on / off

&C - code for "center section". When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the center section.

- 1    &D - code for "date"
- 2    &T - code for "time"
- 3    &G - code for "picture as background"
- 4    &U - code for "text single underline"
- 5    &E - code for "double underline"
- 6    &R - code for "right section". When two or more occurrences of this section marker exist, the contents
- 7    from all markers are concatenated, in the order of appearance, and placed into the right section.
- 8    &Z - code for "this workbook's file path"
- 9    &F - code for "this workbook's file name"
- 10   &A - code for "sheet tab name"
- 11   &+ - code for add to page #.
- 12   &- - code for subtract from page #.
- 13   &"*font name,font type*" - code for "text font name" and "text font type", where *font name* and *font type*
- 14   are strings specifying the name and type of the font, separated by a comma. When a hyphen appears in *font*
- 15   *name*, it means "none specified". Both of *font name* and *font type* can be localized values.
- 16   &"-,Bold" - code for "bold font style"
- 17   &B - also means "bold font style".
- 18   &"-,Regular" - code for "regular font style"
- 19   &"-,Italic" - code for "italic font style"
- 20   &I - also means "italic font style"
- 21   &"-,Bold Italic" code for "bold italic font style"
- 22   &O - code for "outline style"
- 23   &H - code for "shadow style"
- 24   The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.37 **f (Formula)**

Formula for the cell. The formula expression is contained in the character node of this element.

[Example:

<f>SUM(C4:E4)</f>

end example]

The possible values for the t attribute have type ST\_CellFormulaType, and are as follows:

- array (Array Entered)
- dataTable (Table Formula, see below)
- normal (Normal)
- shared (Shared Formula)

A *data table* is a range of cells that shows how changing certain values in one or more formulas affects the results of those formulas. A data table provides a shortcut for calculating multiple versions in one operation, and a way to view and compare the results of all of the different variations together on a worksheet.

Both one- and two-input variable data tables can be created (see attribute dt2D). [Example: A one-input variable data table might be used to see how different interest rates affect a monthly mortgage payment, while a two-input variable data table might be used to show how different interest rates and loan terms will affect the mortgage payment. end example]

Data tables shall be recalculated whenever a worksheet is recalculated.

In a one-input variable data table, values are listed either down a column (column-oriented) or across a row (row-oriented) (see attribute dtr).

Formulas that are used in a one-input variable data table shall refer to an input cell (see attribute r1), the cell in which each input value from a data table is substituted. Any cell on a worksheet can be the input cell. Although the input cell does not need to be part of the data table, the formulas in data tables shall refer to that input cell.

Two-input variable data tables use only one formula with two lists of input values. The formula shall refer to two input cells (see attributes r1 and r2).

The top-left cell in the data table is called the *master cell*.

Parent Elements
c (§3.3.1.3); nc (§3.11.1.3); oc (§3.11.1.5)

Attributes	Description
aca (Always	true indicates that this formula is an array formula and the entire array shall be

Attributes	Description
Calculate Array)	<p>calculated in full. If false the individual cells of the array shall be calculated as needed.</p> <p>[Note: The primary case where an array formula shall be calculated in part instead of in full is when some cells in the array depend on other cells that are semi-calculated, e.g., contains the function =RAND(). end note]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bx (Assigns Value to Name)	<p>Specifies that this formula assigns a value to a name.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ca (Calculate Cell)	<p>Indicates that this formula needs to be recalculated the next time calculation is performed. For example, this is always set on volatile functions, like =RAND(), and circular references.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
del1 (Input 1 Deleted)	<p>Whether the first input cell for data table has been deleted. Applies to data table formula only. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
del2 (Input 2 Deleted)	<p>Whether the second input cell for data table has been deleted. Applies to data table formula only. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dt2D (Data Table 2-D)	<p>Data table is two-dimensional. Only applies to the data tables function. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dtr (Data Table Row)	<p>true if one-dimensional data table is a row, otherwise it's a column. Only applies to the data tables function. Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
r1 (Data Table Cell 1)	<p>First input cell for data table. Only applies to the data tables array function "TABLE()". Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
r2 (Input Cell 2)	<p>Second input cell for data table when dt2D is '1'. Only applies to the data tables array function "TABLE()". Written on master cell of data table formula only.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
ref (Range of Cells)	<p>Range of cells which the formula applies to. Only required for shared formula, array formula or data table. Only written on the master formula, not subsequent formula's belonging to the same shared group, array, or data table.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
si (Shared Group Index)	<p data-bbox="414 296 1235 327">Optional attribute to optimize load performance by sharing formulas.</p> <p data-bbox="414 369 1484 611">When a formula is a shared formula (t value is shared) then this value indicates the group to which this particular cell's formula belongs. The first formula in a group of shared formulas is saved in the f element. This is considered the 'master' formula cell. Subsequent cells sharing this formula need not have the formula written in their f element. Instead, the attribute si value for a particular cell is used to figure what the formula expression should be based on the cell's relative location to the master formula cell.</p> <p data-bbox="414 653 1446 751">A cell is shared only when si is used and t is shared. The formula expression for a cell that is specified to be part of a shared formula (and is not the master) shall be ignored, and the master formula shall override.</p> <p data-bbox="414 793 1430 1003">If a master cell of a shared formula range specifies that a particular cell is part of the shared formula range, and that particular cell does not use the si and t attributes to indicate that it is shared, then the particular cell's formula shall override the shared master formula. If this cell occurs in the middle of a range of shared formula cells, the earlier and later formulas shall continue sharing the master formula, and the cell in question shall not share the formula of the master cell formula.</p> <p data-bbox="414 1045 1414 1144">Loading and handling of a cell and formula using an si attribute and whose t value is shared, located outside the range specified in the master cell associated with the si group, is implementation defined.</p> <p data-bbox="414 1186 1312 1218">Master cell references on the same sheet shall not overlap with each other.</p> <p data-bbox="414 1260 1390 1318">The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
t (Formula Type)	<p data-bbox="414 1341 613 1373">Type of formula.</p> <p data-bbox="414 1415 1422 1474">The possible values for this attribute are defined by the ST_CellFormulaType simple type (§3.18.7).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellFormula">
 <simpleContent>
 <extension base="ST_Formula">
 <attribute name="t" type="ST_CellFormulaType" use="optional" default="normal"/>
 <attribute name="aca" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="ref" type="ST_Ref" use="optional"/>
 <attribute name="dt2D" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="dtr" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="del1" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="del2" type="xsd:boolean" use="optional" default="false"/>

 <attribute name="r2" type="ST_CellRef" use="optional"/>
 <attribute name="ca" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="si" type="xsd:unsignedInt" use="optional"/>
 <attribute name="bx" type="xsd:boolean" use="optional" default="false"/>
 </extension>
 </simpleContent>
</complexType>
```

3.3.1.38 firstFooter (First Page Footer)

First page footer content. Only used when headerFooter@differentFirst is '1'. Corresponds to first printed page. The first logical page in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside the first page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.39 firstHeader (First Page Header)

First page header content. Only used when headerFooter@differentFirst is '1'. Corresponds to first printed page. The first logical page in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside the first page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.40 formula (Formula)

The content of this element is a formula whose calculated value specifies the criteria for the conditional formatting rule.

- 1 The possible values for this element are defined by the ST\_Formula simple type (§3.18.36).

Parent Elements
cfRule (§3.3.1.9); rdn (§3.11.1.13)

### 2 3.3.1.41 formula1 (Formula 1)

- 3 The first formula in the DataValidation dropdown. It used as a bounds for 'between' and 'notBetween' relational  
 4 operators, and the only formula used for other relational operators (equal, notEqual, lessThan, lessThanOrEqual,  
 5 greaterThan, greaterThanOrEqual), or for custom or list type data validation. The content can be a formula or a  
 6 constant or a list series (comma separated values).

- 7 The possible values for this element are defined by the ST\_Formula simple type (§3.18.36).

Parent Elements
dataValidation (§3.3.1.30)

### 8 3.3.1.42 formula2 (Formula 2)

- 9 The second formula in the DataValidation dropdown. It used as a bounds for 'between' and 'notBetween'  
 10 relational operators only.

- 11 The possible values for this element are defined by the ST\_Formula simple type (§3.18.36).

Parent Elements
dataValidation (§3.3.1.30)

### 12 3.3.1.43 headerFooter (Header Footer Settings)

- 13 Header and footer settings.

14 *[Example:*

- 15 This example demonstrates "Header" at the top and "Footer" at the bottom of a page.

```
16 <headerFooter>
17 <oddHeader>&CHeader</oddHeader>
18 <oddFooter>&CFooter</oddFooter>
19 </headerFooter>
```

20 *end example]*

- 21 The tokens in the header & footer elements can be localized. An application may decide which locales are  
 22 supported. Even when a locale is not supported, the header and footer text must be loaded, and only the  
 23 formatting is discarded.

evenHeader (Even Page Header)

§3.3.1.36

firstFooter (First Page Footer)

§3.3.1.38

firstHeader (First Page Header)

§3.3.1.39

oddFooter (Odd Page Footer)

§3.3.1.55

oddHeader (Odd Header)

§3.3.1.56

2

**Attributes****Description**alignWithMargins  
(Align Margins)

Align header footer margins with page margins. When `true`, as left/right margins grow and shrink, the header and footer edges stay aligned with the margins. When `false`, headers and footers are aligned on the paper edges, regardless of margins.

The possible values for this attribute are defined by the XML Schema boolean datatype.

differentFirst  
(Different First  
Page)

Different first page header and footer. When `true` then `firstHeader` and `firstFooter` specify first page header and footer values. If `false` and `firstHeader` / `firstFooter` are present, they are ignored.

The possible values for this attribute are defined by the XML Schema boolean datatype.

differentOddEven  
(Different Odd Even  
Header Footer)

Different odd and even page headers and footers. When `true` then `oddHeader` / `oddFooter` and `evenHeader` / `evenFooter` specify page header and footer values for odd and even pages. If `false` then `oddHeader` / `oddFooter` is used, even when `evenHeader` / `evenFooter` are present.

The possible values for this attribute are defined by the XML Schema boolean datatype.

scaleWithDoc  
(Scale Header &  
Footer With  
Document)

Scale header and footer with document scaling.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HeaderFooter">
 <sequence>
 <element name="oddHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="oddFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="evenHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="evenFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="firstHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="firstFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="differentOddEven" type="xsd:boolean" default="false"/>
 <attribute name="differentFirst" type="xsd:boolean" default="false"/>
 <attribute name="scaleWithDoc" type="xsd:boolean" default="true"/>
 <attribute name="alignWithMargins" type="xsd:boolean" default="true"/>
</complexType>
```

### 3.3.1.44 hyperlink (Hyperlink)

A single hyperlink

#### Parent Elements

hyperlinks (§3.3.1.45)

Attributes	Description
display (Display String)	Display string, if different from string in string table. This is a property on the hyperlink object, but does not need to appear in the spreadsheet application UI.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Relationship Id)  Namespace: .../officeDocument /2006/relationships	Relationship Id in this sheet's relationships part, expressing the target location of the resource.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
location (Location)	Location within target. If target is a workbook (or this workbook) this shall refer to a sheet and cell or a defined name. Can also be an HTML anchor if target is HTML file.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Cell location of hyperlink on worksheet.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
tooltip (Tool Tip)	This is additional text to help the user understand more about the hyperlink. This can be displayed as hover text when the mouse is over the link, for example.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
 <attribute name="ref" type="ST_Ref" use="required"/>
 <attribute ref="r:id" use="optional"/>
 <attribute name="location" type="ST_Xstring" use="optional"/>
 <attribute name="tooltip" type="ST_Xstring" use="optional"/>
 <attribute name="display" type="ST_Xstring" use="optional"/>
</complexType>
```

3.3.1.45 hyperlinks (Hyperlinks)

Collection of hyperlinks.

[Example:

This example shows a hyperlink in cell A11, with hover text displaying "Search Page". The relationship Id references a relationship from the sheet to the external target resource.

```
<hyperlinks>
 <hyperlink ref="A11" r:id="rId1" tooltip="Search Page"/>
</hyperlinks>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
hyperlink (Hyperlink)	§3.3.1.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlinks">
 <sequence>
 <element name="hyperlink" type="CT_Hyperlink" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

3.3.1.46 iconSet (Icon Set)

Describes an icon set conditional formatting rule.

[Example: This example demonstrates the "3Arrows" style of icons. The first icon in the set shall be shown if the cell's value is less than the 33rd percentile. The second icon in the set shall be shown if the cell's value is less

than the 67th percentile, and greater than or equal to the 33rd percentile. The third icon in the set shall be shown if the cell's value is greater than or equal to the 67th percentile.

```
<iconSet iconSet="3Arrows">
 <cfvo type="percentile" val="0"/>
 <cfvo type="percentile" val="33"/>
 <cfvo type="percentile" val="67"/>
</iconSet>
```

*end example]*

Parent Elements
cfRule (§3.3.1.9)

Child Elements	Subclause
cfvo (Conditional Format Value Object)	§3.3.1.10

Attributes	Description
iconSet (Icon Set)	The icon set to display.  The possible values for this attribute are defined by the ST_IconSetType simple type (§3.18.44).
percent (Percent)	Indicates whether the thresholds indicate percentile values, instead of number values.  The possible values for this attribute are defined by the XML Schema boolean datatype.
reverse (Reverse Icons)	If '1', reverses the default order of the icons in this icon set.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showValue (Show Value)	Indicates whether to show the values of the cells on which this icon set is applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IconSet">
 <sequence>
 <element name="cfvo" type="CT_Cfvo" minOccurs="2" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="iconSet" type="ST_IconSetType" use="optional" default="3TrafficLights1"/>
 <attribute name="showValue" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="percent" type="xsd:boolean" default="true"/>
 <attribute name="reverse" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.3.1.47 `ignoredError` (Ignored Error)

A single ignored error type for a range of cells.

A cell is considered to have an error condition when it meets one of the conditions specified in the attribute descriptions below. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number, for example, in calculations.

Note that this is simply a guess by the implementing application, and a recommendation to the user. Cells with the errors specified below may have perfectly valid reasons for being in such a state, for example a cell formatted as text which contains numeric Postal Codes or Order numbers. It is useful to format these cells as text so that leading zeros remain as part of the value instead of being removed.

An `<ignoreError>` element is not written in the file unless the user has specifically reviewed the error and decided to keep the cell state as it is, and no longer wishes to be alerted about it for this cell. This can be helpful for the application to decide which errors should be surfaced to the user vs kept quiet because the user doesn't want these to be surfaced (e.g., because they are legitimate cell states).

[*Example:* This example shows that cells A1 and B2 both contain numbers stored as text, and this error has been reviewed and specifically flagged to be no longer surfaced as an error to the user.

```
<ignoredErrors>
 <ignoredError sqref="A1 B2" numberStoredAsText="1"/>
</ignoredErrors>
```

*end example]*

Note: more than one kind of error can exist on a cell. These flags are not mutually exclusive.

Parent Elements
ignoredErrors (§3.3.1.48)

Attributes	Description
calculatedColumn (Calculated Column)	Ignore errors when cells contain a value different from a calculated column formula. In other words, for a calculated column, a cell in that column is considered to have an error if its formula is different from the calculated column formula, or doesn't contain a formula at all.  The possible values for this attribute are defined by the XML Schema boolean datatype.
emptyCellReference (Empty Cell Reference)	Ignore errors when formulas refer to empty cells.  The possible values for this attribute are defined by the XML Schema boolean datatype.
evalError (Evaluation Error)	Ignore errors when cells contain formulas that result in an error.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
formula (Formula)	Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region.  The possible values for this attribute are defined by the XML Schema boolean datatype.
formulaRange (Formula Range)	Ignore errors when formulas omit certain cells in a region.  The possible values for this attribute are defined by the XML Schema boolean datatype.
listDataValidation (List Data Validation)	Ignore errors when a cell's value in a Table does not comply with the Data Validation rules specified.  The possible values for this attribute are defined by the XML Schema boolean datatype.
numberStoredAsText (Number Stored As Text)	Ignore errors when numbers are formatted as text or are preceded by an apostrophe.  The possible values for this attribute are defined by the XML Schema boolean datatype.
sqref (Sequence of References)	Reference to a range of cells that have this ignored error.  The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).
twoDigitTextYear (Two Digit Text Year)	Ignore errors when formulas contain text formatted cells with years represented as 2 digits.  The possible values for this attribute are defined by the XML Schema boolean datatype.
unlockedFormula (Unlocked Formula)	Ignore errors when unlocked cells contain formulas.  The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_IgnoredError">
3 <attribute name="sqref" type="ST_Sqref" use="required"/>
4 <attribute name="evalError" type="xsd:boolean" use="optional" default="false"/>
5 <attribute name="twoDigitTextYear" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="numberStoredAsText" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="formula" type="xsd:boolean" use="optional" default="false"/>
8 <attribute name="formulaRange" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="unlockedFormula" type="xsd:boolean" use="optional" default="false"/>
10 <attribute name="emptyCellReference" type="xsd:boolean" use="optional" default="false"/>
11 <attribute name="listDataValidation" type="xsd:boolean" use="optional" default="false"/>
12 <attribute name="calculatedColumn" type="xsd:boolean" use="optional" default="false"/>
13 </complexType>

```

### 14 3.3.1.48 ignoredErrors (Ignored Errors)

15 A collection of ignored errors, by cell range.

#### Parent Elements

Parent Elements

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
ignoredError (Ignored Error)	§3.3.1.47

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_IgnoredErrors">
 <sequence>
 <element name="ignoredError" type="CT_IgnoredError" minOccurs="1" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 3.3.1.49 inputCells (Input Cells)

This collection describes each input cell for the scenario.

Parent Elements
scenario (§3.3.1.73)

Attributes	Description
deleted (Deleted)	Input cell was deleted. This input cell shall be present in the file format, but shall not be presented to the user as part of the scenario inputs, nor run as part of the scenario.  The possible values for this attribute are defined by the XML Schema boolean datatype.
numFmtId (Number Format Id)	This number format Id is used only when displaying the scenario manager input UI, and is used to properly format for display the cached input values (see val attribute) for the scenario.  The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
r (Reference)	Cell reference indicating the input cell address.  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
undone (Undone)	Cell's deletion was undone. When true the r (reference) value shall not adjust in response to the cell moving due to row / column insert or delete, or cell move.  The possible values for this attribute are defined by the XML Schema boolean datatype.
val (Value)	Value that should be used for the cell when this scenario is run.

Attributes	Description
	<p>Note: val does not need a corresponding data type, the value is put into the cell when the scenario is run.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_InputCells">
3 <attribute name="r" type="ST_CellRef" use="required"/>
4 <attribute name="deleted" type="xsd:boolean" use="optional" default="false"/>
5 <attribute name="undone" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="val" type="ST_Xstring" use="required"/>
7 <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
8 </complexType>
```

9 3.3.1.50 is (Rich Text Inline)

10 This element allows for strings to be expressed directly in the cell definition instead of implementing the shared  
11 string table.

12 [Example:

```
13 <c r="A1">
14 <is>
15 <t>String</t>
16 </is>
17 </c>
```

18 end example]

Parent Elements
c (§3.3.1.3); nc (§3.11.1.3); oc (§3.11.1.5)

19

Child Elements	Subclause
phoneticPr (Phonetic Properties)	§3.4.3
r (Rich Text Run)	§3.4.4
rPh (Phonetic Run)	§3.4.6
t (Text)	§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rst">
 <sequence>
 <element name="t" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="r" type="CT_RElt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="rPh" type="CT_PhoneticRun" minOccurs="0" maxOccurs="unbounded"/>
 <element name="phoneticPr" minOccurs="0" maxOccurs="1" type="CT_PhoneticPr"/>
 </sequence>
</complexType>
```

### 3.3.1.51 legacyDrawing (Legacy Drawing Reference)

This element is present when the sheet contains drawing shapes defined by VML. In this case, the element contains an explicit relationship whose ID points to the part containing the VML definitions.

[Example:

```
<drawing r:id="rId1"/>
```

end example]

#### Parent Elements

chartsheet (§3.3.1.11); dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

#### Attributes

id (Relationship Id)  
  
Namespace:  
.../officeDocument  
/2006/relationships

#### Description

This value references a relationship Id for the sheet. The relationship shall point to the part containing the VML definition.  
  
The possible values for this attribute are defined by the ST\_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LegacyDrawing">
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 3.3.1.52 legacyDrawingHF (Legacy Drawing Reference in Header Footer)

This element specifies the explicit relationship to the part containing the VML defining pictures rendered in the header / footer of the sheet.

#### Parent Elements

chartsheet (§3.3.1.11); dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

#### Attributes

#### Description

Attributes	Description
id (Relationship Id)	This value references a relationship Id for the sheet. The relationship shall point to the part containing the VML definition.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_LegacyDrawing">
3 <attribute ref="r:id" use="required"/>
4 </complexType>
```

### 5 3.3.1.53 mergeCell (Merged Cell)

6 A single merged cell

Parent Elements
mergeCells (§3.3.1.54)

7

Attributes	Description
ref (Reference)	Range defined by merge cell.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

8 The following XML Schema fragment defines the contents of this element:

```
9 <complexType name="CT_MergeCell">
10 <attribute name="ref" type="ST_Ref" use="required"/>
11 </complexType>
```

### 12 3.3.1.54 mergeCells (Merge Cells)

13 This collection expresses all the merged cells in the sheet.

14 *[Example:*

15 This example shows that three ranges are merged. The formatting and content for the merged range is always  
16 stored in the top left cell.

```
17 <mergeCells>
18 <mergeCell ref="C2:F2"/>
19 <mergeCell ref="B19:C20"/>
20 <mergeCell ref="E19:G19"/>
21 </mergeCells>
```

22 *end example]*

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
mergeCell (Merged Cell)	§3.3.1.53

Attributes	Description
count (Count)	A count of merged cell collections.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MergeCells">
 <sequence>
 <element name="mergeCell" type="CT_MergeCell" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.3.1.55 oddFooter (Odd Page Footer)

Odd page footer value. Corresponds to odd printed pages. Odd page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an odd page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

### 3.3.1.56 oddHeader (Odd Header)

Odd page header value. Corresponds to odd printed pages. Odd page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an odd page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

### 3.3.1.57 **oleObject (Embedded Object)**

Information for an individual embedded object.

Parent Elements
oleObjects (§3.3.1.58)

3

Attributes	Description
autoLoad (Auto Load)	Specifies whether the host application for the embedded object shall be called to load the object data automatically when the parent workbook is opened.  The possible values for this attribute are defined by the XML Schema boolean datatype.
dvAspect (Data or View Aspect)	Specifies the desired Data or View Aspect of the object when drawing or getting data  The possible values for this attribute are defined by the ST_DvAspect simple type (§3.18.25).
id (Relationship Id)  Namespace: .../officeDocument /2006/relationships	Relationship Id of the relationship pointing to the object persistence part.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
link (Embedded Object's Link Moniker)	The embedded object's link moniker.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oleUpdate (Linked Embedded Object Update)	Indicates whether the linked object updates the cached data automatically or only when the container requests an update, only present if the embedded object is linked.  The possible values for this attribute are defined by the ST_OleUpdate simple type (§3.18.51).
progId (Embedded Object ProgId)	ProgId of the embedded object.  The possible values for this attribute are defined by the XML Schema string datatype.
shapeId (Shape Id)	Id of the shape this object is associated with. Corresponds with the shape @id in the drawingML part.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObject">
 <attribute name="progId" type="xsd:string" use="optional"/>
 <attribute name="dvAspect" type="ST_DvAspect" use="optional" default="DVASPECT_CONTENT"/>
 <attribute name="link" type="ST_Xstring" use="optional"/>
 <attribute name="oleUpdate" type="ST_OleUpdate" use="optional"/>
 <attribute name="autoLoad" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="shapeId" type="xsd:unsignedInt" use="required"/>
 <attribute ref="r:id" use="optional"/>
</complexType>
```

3.3.1.58      **oleObjects (Embedded Objects)**

Embedded objects collection in this worksheet.

[Example:

This example shows two embedded objects.

```
<oleObjects>
 <oleObject progId="Word.Document.12" shapeId="1025" r:id="rId4"/>
 <oleObject progId="PowerPoint.Show.12" shapeId="1026" r:id="rId5"/>
</oleObjects>
```

end example]

Parent Elements
dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
oleObject (Embedded Object)	§3.3.1.57

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObjects">
 <sequence>
 <element name="oleObject" type="CT_OleObject" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

3.3.1.59      **outlinePr (Outline Properties)**

Outline properties of the worksheet.

[Example: This example indicates that when an outline is applied to data, formatting shall be applied to the outline result.

```

1 <sheetPr>
2 <outlinePr applyStyles="1"/>
3 </sheetPr>
4 end example]

```

Parent Elements
sheetPr (§3.3.1.79)

5

Attributes	Description
applyStyles (Apply Styles in Outline)	<p>Flag indicating whether to apply styles in an outline, when outline is applied. Outline styles are described in Styles (§3.8).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showOutlineSymbols (Show Outline Symbols)	<p>Flag indicating whether the sheet has outline symbols visible. This flag shall always be overridden by the showOutlineSymbols attribute on sheetView when there is a conflict.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
summaryBelow (Summary Below)	<p>Flag indicating whether summary rows appear below detail in an outline, when applying an outline.</p> <p>When true a summary row is inserted below the detailed data being summarized and a new outline level is established on that row.</p> <p>When false a summary row is inserted above the detailed data being summarized and a new outline level is established on that row.</p> <p>Note that toggling this flag on existing outlines requires an update to cell table, specifically, putting the summary functions in the proper rows, and flagging these rows as new outline levels, and possibly resetting their collapsed state.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
summaryRight (Summary Right)	<p>Flag indicating whether summary columns appear to the right of detail in an outline, when applying an outline.</p> <p>When true a summary column is inserted to the right of the detailed data being summarized and a new outline level is established on that column.</p> <p>When false a summary column is inserted to the left of the detailed data being summarized and a new outline level is established on that column.</p> <p>Note that toggling this flag on existing outlines requires an update to cell table, specifically, putting the summary functions in the proper columns, and flagging these columns as new outline levels, and possibly resetting their collapsed state.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OutlinePr">
 <attribute name="applyStyles" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="summaryBelow" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="summaryRight" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showOutlineSymbols" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.3.1.60 pageMargins (Page Margins)

Page margins for a sheet or a custom sheet view.

[Example:

```
<pageMargins left="0.7" right="0.7" top="0.75" bottom="0.75" header="0.3"
 footer="0.3"/>
```

end example]

Parent Elements
chartsheet (§3.3.1.11); customSheetView (§3.3.1.23); customSheetView (§3.3.1.22); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
bottom (Bottom Page Margin)	Bottom Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
footer (Footer Page Margin)	Footer Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
header (Header Page Margin)	Header Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
left (Left Page Margin)	Left Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
right (Right Page Margin)	Right page margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
top (Top Page Margin)	Top Page Margin in inches.

Attributes	Description
Margin)	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageMargins">
 <attribute name="left" type="xsd:double" use="required"/>
 <attribute name="right" type="xsd:double" use="required"/>
 <attribute name="top" type="xsd:double" use="required"/>
 <attribute name="bottom" type="xsd:double" use="required"/>
 <attribute name="header" type="xsd:double" use="required"/>
 <attribute name="footer" type="xsd:double" use="required"/>
</complexType>
```

### 3.3.1.61 pageSetup (Page Setup Settings)

Page setup settings for the worksheet.

Parent Elements
customSheetView (§3.3.1.23); dialogsSheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
blackAndWhite (Black And White)	Print black and white.  The possible values for this attribute are defined by the XML Schema boolean datatype.
cellComments (Print Cell Comments)	This attribute specifies how to print cell comments.  The possible values for this attribute are defined by the ST_CellComments simple type (§3.18.6).
copies (Number Of Copies)	Number of copies to print.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
draft (Draft)	Print without graphics.  The possible values for this attribute are defined by the XML Schema boolean datatype.
errors (Print Error Handling)	Specifies how to print cell values for cells with errors.  The possible values for this attribute are defined by the ST_PrintError simple type (§3.18.62).
firstPageNumber (First Page Number)	Page number for first printed page. If no value is specified, then 'automatic' is assumed.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
fitToHeight (Fit To Height)	<p>Number of vertical pages to fit on.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
fitToWidth (Fit To Width)	<p>Number of horizontal pages to fit on.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
horizontalDpi (Horizontal DPI)	<p>Horizontal print resolution of the device.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
id (Id)  Namespace: .../officeDocument /2006/relationships	<p>Relationship Id of the devMode printer settings part.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
orientation (Orientation)	<p>Orientation of the page.</p> <p>The possible values for this attribute are defined by the ST_Orientation simple type (§3.18.52).</p>
pageOrder (Page Order)	<p>Order of printed pages.</p> <p>The possible values for this attribute are defined by the ST_PageOrder simple type (§3.18.53).</p>
paperSize (Paper Size)	<p>Paper size</p> <ul style="list-style-type: none"> <li>1 = Letter paper (8.5 in. by 11 in.)</li> <li>2 = Letter small paper (8.5 in. by 11 in.)</li> <li>3 = Tabloid paper (11 in. by 17 in.)</li> <li>4 = Ledger paper (17 in. by 11 in.)</li> <li>5 = Legal paper (8.5 in. by 14 in.)</li> <li>6 = Statement paper (5.5 in. by 8.5 in.)</li> <li>7 = Executive paper (7.25 in. by 10.5 in.)</li> <li>8 = A3 paper (297 mm by 420 mm)</li> <li>9 = A4 paper (210 mm by 297 mm)</li> <li>10 = A4 small paper (210 mm by 297 mm)</li> <li>11 = A5 paper (148 mm by 210 mm)</li> <li>12 = B4 paper (250 mm by 353 mm)</li> <li>13 = B5 paper (176 mm by 250 mm)</li> <li>14 = Folio paper (8.5 in. by 13 in.)</li> <li>15 = Quarto paper (215 mm by 275 mm)</li> <li>16 = Standard paper (10 in. by 14 in.)</li> <li>17 = Standard paper (11 in. by 17 in.)</li> </ul>

Attributes	Description
	<p>18 = Note paper (8.5 in. by 11 in.)  19 = #9 envelope (3.875 in. by 8.875 in.)  20 = #10 envelope (4.125 in. by 9.5 in.)  21 = #11 envelope (4.5 in. by 10.375 in.)  22 = #12 envelope (4.75 in. by 11 in.)  23 = #14 envelope (5 in. by 11.5 in.)  24 = C paper (17 in. by 22 in.)  25 = D paper (22 in. by 34 in.)  26 = E paper (34 in. by 44 in.)  27 = DL envelope (110 mm by 220 mm)  28 = C5 envelope (162 mm by 229 mm)  29 = C3 envelope (324 mm by 458 mm)  30 = C4 envelope (229 mm by 324 mm)  31 = C6 envelope (114 mm by 162 mm)  32 = C65 envelope (114 mm by 229 mm)  33 = B4 envelope (250 mm by 353 mm)  34 = B5 envelope (176 mm by 250 mm)  35 = B6 envelope (176 mm by 125 mm)  36 = Italy envelope (110 mm by 230 mm)  37 = Monarch envelope (3.875 in. by 7.5 in.).  38 = 6 3/4 envelope (3.625 in. by 6.5 in.)  39 = US standard fanfold (14.875 in. by 11 in.)  40 = German standard fanfold (8.5 in. by 12 in.)  41 = German legal fanfold (8.5 in. by 13 in.)  42 = ISO B4 (250 mm by 353 mm)  43 = Japanese double postcard (200 mm by 148 mm)  44 = Standard paper (9 in. by 11 in.)  45 = Standard paper (10 in. by 11 in.)  46 = Standard paper (15 in. by 11 in.)  47 = Invite envelope (220 mm by 220 mm)  50 = Letter extra paper (9.275 in. by 12 in.)  51 = Legal extra paper (9.275 in. by 15 in.)  52 = Tabloid extra paper (11.69 in. by 18 in.)  53 = A4 extra paper (236 mm by 322 mm)  54 = Letter transverse paper (8.275 in. by 11 in.)  55 = A4 transverse paper (210 mm by 297 mm)  56 = Letter extra transverse paper (9.275 in. by 12 in.)  57 = SuperA/SuperA/A4 paper (227 mm by 356 mm)  58 = SuperB/SuperB/A3 paper (305 mm by 487 mm)  59 = Letter plus paper (8.5 in. by 12.69 in.)  60 = A4 plus paper (210 mm by 330 mm)  61 = A5 transverse paper (148 mm by 210 mm)  62 = JIS B5 transverse paper (182 mm by 257 mm)  63 = A3 extra paper (322 mm by 445 mm)  64 = A5 extra paper (174 mm by 235 mm)  65 = ISO B5 extra paper (201 mm by 276 mm)</p>

Attributes	Description
	<p>66 = A2 paper (420 mm by 594 mm)          67 = A3 transverse paper (297 mm by 420 mm)          68 = A3 extra transverse paper (322 mm by 445 mm)</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
scale (Print Scale)	<p>Print scaling. Valid values range from 10 to 400.</p> <p>For example:</p> <p>10 - 10%          20 - 20%          ...          100 - 100%          ...          400 - 400%</p> <p>This setting is overridden when fitToWidth and/or fitToHeight are in use.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
useFirstPageNumber (Use First Page Number)	<p>Use firstPageNumber value for first page number, and do not auto number the pages.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
usePrinterDefaults (Use Printer Defaults)	<p>Use the printer's defaults settings for page setup values and don't use the default values specified in the schema. For example, if dpi is not present or specified in the XML, the application shall not assume 600dpi as specified in the schema as a default and instead shall let the printer specify the default dpi.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
verticalDpi (Vertical DPI)	<p>Vertical print resolution of the device.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageSetup">
 <attribute name="paperSize" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="scale" type="xsd:unsignedInt" use="optional" default="100"/>
 <attribute name="firstPageNumber" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="fitToWidth" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="fitToHeight" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="pageOrder" type="ST_PageOrder" use="optional" default="downThenOver"/>
 <attribute name="orientation" type="ST_Orientation" use="optional" default="default"/>
 <attribute name="usePrinterDefaults" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="blackAndWhite" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="draft" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="cellComments" type="ST_CellComments" use="optional" default="none"/>
 <attribute name="useFirstPageNumber" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="errors" type="ST_PrintError" use="optional" default="displayed"/>
 <attribute name="horizontalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
 <attribute name="verticalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
 <attribute name="copies" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute ref="r:id" use="optional"/>
</complexType>
```

### 3.3.1.62 pageSetup (Chart Sheet Page Setup)

This element provides page setup properties for chart sheets.

#### Parent Elements

chartsheet (§3.3.1.11); customSheetView (§3.3.1.22)

Attributes	Description
blackAndWhite (Black And White)	Print black and white.  The possible values for this attribute are defined by the XML Schema boolean datatype.
copies (Number Of Copies)	Number of copies to print.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
draft (Draft)	Print draft quality.  The possible values for this attribute are defined by the XML Schema boolean datatype.
firstPageNumber (First Page Number)	Page number for first printed page. If no value is specified, then 'automatic' is assumed.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Horizontal print resolution of the device.  The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.
id (Id)  Namespace: .../officeDocument /2006/relationships	Relationship Id of the devMode printer settings part.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
orientation (Orientation)	Orientation of the page.  The possible values for this attribute are defined by the ST_Orientation simple type (§3.18.52).
paperSize (Paper Size)	1 = Letter paper (8.5 in. by 11 in.) 2 = Letter small paper (8.5 in. by 11 in.) 3 = Tabloid paper (11 in. by 17 in.) 4 = Ledger paper (17 in. by 11 in.) 5 = Legal paper (8.5 in. by 14 in.) 6 = Statement paper (5.5 in. by 8.5 in.) 7 = Executive paper (7.25 in. by 10.5 in.) 8 = A3 paper (297 mm by 420 mm) 9 = A4 paper (210 mm by 297 mm) 10 = A4 small paper (210 mm by 297 mm) 11 = A5 paper (148 mm by 210 mm) 12 = B4 paper (250 mm by 353 mm) 13 = B5 paper (176 mm by 250 mm) 14 = Folio paper (8.5 in. by 13 in.) 15 = Quarto paper (215 mm by 275 mm) 16 = Standard paper (10 in. by 14 in.) 17 = Standard paper (11 in. by 17 in.) 18 = Note paper (8.5 in. by 11 in.) 19 = #9 envelope (3.875 in. by 8.875 in.) 20 = #10 envelope (4.125 in. by 9.5 in.) 21 = #11 envelope (4.5 in. by 10.375 in.) 22 = #12 envelope (4.75 in. by 11 in.) 23 = #14 envelope (5 in. by 11.5 in.) 24 = C paper (17 in. by 22 in.) 25 = D paper (22 in. by 34 in.) 26 = E paper (34 in. by 44 in.) 27 = DL envelope (110 mm by 220 mm) 28 = C5 envelope (162 mm by 229 mm) 29 = C3 envelope (324 mm by 458 mm) 30 = C4 envelope (229 mm by 324 mm) 31 = C6 envelope (114 mm by 162 mm) 32 = C65 envelope (114 mm by 229 mm) 33 = B4 envelope (250 mm by 353 mm) 34 = B5 envelope (176 mm by 250 mm)

Attributes	Description
	<p>35 = B6 envelope (176 mm by 125 mm)  36 = Italy envelope (110 mm by 230 mm)  37 = Monarch envelope (3.875 in. by 7.5 in.).  38 = 6 3/4 envelope (3.625 in. by 6.5 in.)  39 = US standard fanfold (14.875 in. by 11 in.)  40 = German standard fanfold (8.5 in. by 12 in.)  41 = German legal fanfold (8.5 in. by 13 in.)  42 = ISO B4 (250 mm by 353 mm)  43 = Japanese double postcard (200 mm by 148 mm)  44 = Standard paper (9 in. by 11 in.)  45 = Standard paper (10 in. by 11 in.)  46 = Standard paper (15 in. by 11 in.)  47 = Invite envelope (220 mm by 220 mm)  50 = Letter extra paper (9.275 in. by 12 in.)  51 = Legal extra paper (9.275 in. by 15 in.)  52 = Tabloid extra paper (11.69 in. by 18 in.)  53 = A4 extra paper (236 mm by 322 mm)  54 = Letter transverse paper (8.275 in. by 11 in.)  55 = A4 transverse paper (210 mm by 297 mm)  56 = Letter extra transverse paper (9.275 in. by 12 in.)  57 = SuperA/SuperA/A4 paper (227 mm by 356 mm)  58 = SuperB/SuperB/A3 paper (305 mm by 487 mm)  59 = Letter plus paper (8.5 in. by 12.69 in.)  60 = A4 plus paper (210 mm by 330 mm)  61 = A5 transverse paper (148 mm by 210 mm)  62 = JIS B5 transverse paper (182 mm by 257 mm)  63 = A3 extra paper (322 mm by 445 mm)  64 = A5 extra paper (174 mm by 235 mm)  65 = ISO B5 extra paper (201 mm by 276 mm)  66 = A2 paper (420 mm by 594 mm)  67 = A3 transverse paper (297 mm by 420 mm)  68 = A3 extra transverse paper (322 mm by 445 mm)</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
useFirstPageNumber (Use First Page Number)	<p>Use firstPageNumber value for first page number, and do not auto number the pages.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
usePrinterDefaults (Use Printer Defaults)	<p>Use the printer's defaults settings for page setup values and don't use the default values specified in the schema. For example, if dpi is not present or specified in the XML, the application shall not assume 600dpi as specified in the schema as a default and instead shall let the printer specify the default dpi.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
verticalDpi	Vertical print resolution of the device.

Attributes	Description
(Vertical DPI)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CsPageSetup">
 <attribute name="paperSize" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="firstPageNumber" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="orientation" type="ST_Orientation" use="optional" default="default"/>
 <attribute name="usePrinterDefaults" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="blackAndWhite" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="draft" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="useFirstPageNumber" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="horizontalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
 <attribute name="verticalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
 <attribute name="copies" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute ref="r:id" use="optional"/>
</complexType>
```

### 3.3.1.63 pageSetUpPr (Page Setup Properties)

Page setup properties of the worksheet

Parent Elements
sheetPr (§3.3.1.79)

Attributes	Description
autoPageBreaks (Show Auto Page Breaks)	Flag indicating whether the sheet displays Automatic Page Breaks. The possible values for this attribute are defined by the XML Schema boolean datatype.
fitToPage (Fit To Page)	Flag indicating whether the Fit to Page print option is enabled. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageSetUpPr">
 <attribute name="autoPageBreaks" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="fitToPage" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.3.1.64 pane (View Pane)

Worksheet view pane

Parent Elements
-----------------

Parent Elements
customSheetView (§3.3.1.23); sheetView (§3.3.1.83)

1

Attributes	Description
activePane (Active Pane)	The pane that is active.  The possible values for this attribute are defined by the ST_Pane simple type (§3.18.54).
state (Split State)	Indicates whether the pane has horizontal / vertical splits, and whether those splits are frozen.  The possible values for this attribute are defined by the ST_PaneState simple type (§3.18.55).
topLeftCell (Top Left Visible Cell)	Location of the top left visible cell in the bottom right pane (when in Left-To-Right mode).  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
xSplit (Horizontal Split Position)	Horizontal position of the split, in 1/20th of a point; 0 (zero) if none. If the pane is frozen, this value indicates the number of columns visible in the top pane.  The possible values for this attribute are defined by the XML Schema double datatype.
ySplit (Vertical Split Position)	Vertical position of the split, in 1/20th of a point; 0 (zero) if none. If the pane is frozen, this value indicates the number of rows visible in the left pane.  The possible values for this attribute are defined by the XML Schema double datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Pane">
4 <attribute name="xSplit" type="xsd:double" use="optional" default="0"/>
5 <attribute name="ySplit" type="xsd:double" use="optional" default="0"/>
6 <attribute name="topLeftCell" type="ST_CellRef" use="optional"/>
7 <attribute name="activePane" type="ST_Pane" use="optional" default="topLeft"/>
8 <attribute name="state" type="ST_PaneState" use="optional" default="split"/>
9 </complexType>

```

10 

### 3.3.1.65 picture (Background Image)

11 Background sheet image.

12 *[Example:*13 `<picture r:id="rId1"/>`14 *end example]*

Parent Elements
chartsheet (§3.3.1.11); worksheet (§3.3.1.96)

1

Attributes	Description
id (Relationship Id)	Relationship Id pointing to the image part.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_SheetBackgroundPicture">
4 <attribute ref="r:id" use="required"/>
5 </complexType>
```

### 6 3.3.1.66 pivotArea (Pivot Area)

7 Rule describing a PivotTable selection.

Parent Elements
autoSortScope (§3.10.1.1); calculatedItem (§3.10.1.8); chartFormat (§3.10.1.12); format (§3.10.1.35); pivotAreas (§3.10.1.66); pivotSelection (§3.3.1.67)

8

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
references (References)	§3.10.2.2

9

Attributes	Description
axis (Axis)	The region of the PivotTable to which this rule applies.  The possible values for this attribute are defined by the ST_Axis simple type (§3.18.1).
cacheIndex (Cache Index)	Flag indicating whether any indexes refer to fields or items in the Pivot cache and not the view.  The possible values for this attribute are defined by the XML Schema boolean datatype.
collapsedLevelsAre Subtotals (Collapsed Levels Are Subtotals)	Flag indicating if collapsed levels/dimensions are considered subtotals.  The possible values for this attribute are defined by the XML Schema boolean datatype.
dataOnly (Data Only)	Flag indicating whether only the data values (in the data area of the view) for an item selection are selected and does not include the item labels.  The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
field (Field Index)	<p>Index of the field that this selection rule refers to.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
fieldPosition (Field Position)	<p>Position of the field within the axis to which this rule applies.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
grandCol (Include Column Grand Total)	<p>Flag indicating whether the column grand total is included.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
grandRow (Include Row Grand Total)	<p>Flag indicating whether the row grand total is included.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
labelOnly (Labels Only)	<p>Flag indicating whether only the item labels for an item selection are selected and does not include the data values (in the data area of the view).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
offset (Offset Reference)	<p>A Reference that specifies a subset of the selection area. Points are relative to the top left of the selection area.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).</p>
outline (Outline)	<p>Flag indicating whether the rule refers to an area that is in outline mode.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
type (Rule Type)	<p>Indicates the type of selection rule.</p> <p>The possible values for this attribute are defined by the ST_PivotAreaType simple type (§3.18.60).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotArea">
 <sequence>
 <element name="references" minOccurs="0" type="CT_PivotAreaReferences"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="field" use="optional" type="xsd:int"/>
 <attribute name="type" type="ST_PivotAreaType" default="normal"/>
 <attribute name="dataOnly" type="xsd:boolean" default="true"/>
 <attribute name="labelOnly" type="xsd:boolean" default="false"/>
 <attribute name="grandRow" type="xsd:boolean" default="false"/>
 <attribute name="grandCol" type="xsd:boolean" default="false"/>
 <attribute name="cacheIndex" type="xsd:boolean" default="false"/>
 <attribute name="outline" type="xsd:boolean" default="true"/>
 <attribute name="offset" type="ST_Ref"/>
 <attribute name="collapsedLevelsAreSubtotals" type="xsd:boolean" default="false"/>
 <attribute name="axis" type="ST_Axis" use="optional"/>
 <attribute name="fieldPosition" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.3.1.67 pivotSelection (PivotTable Selection)

A collection of PivotTable structure selections. A PivotTable structure selection is a way of specifying what cells in the PivotTable are selected. Instead of specifying cell addresses in a sqref, a particular area or structure within the PivotTable is specified. In this way there is semantic meaning regarding what is selected, rather than simply a list of cell or ranges contained in the selection. Typically fields on the row or column axis are selected.

*[Example: For example, the innermost field (Product SubCategory) is selected in this PivotTable:*

	A	B	C
1			
2		State	{All} ▾
3		City	{All} ▾
4			
5			Column Labels ▾
6			2001
7			3
8			July
9		Row Labels ▾	Sum of Sales Amount
10		Bikes	209652.9046
11		Mountain Bikes	64424.81
12		Mountain-100 Black, 38	3374.99
13		Mountain-100 Black, 42	3374.99
14		Mountain-100 Black, 44	13499.96
15		Mountain-100 Black, 48	3374.99
16		Mountain-100 Silver, 38	6799.98
17		Mountain-100 Silver, 42	6799.98
18		Mountain-100 Silver, 44	16999.95
19		Mountain-100 Silver, 48	10199.97
20		Road Bikes	145228.0946
21		Road-150 Red, 44	25047.89
22		Road-150 Red, 48	42939.24
23		Road-150 Red, 52	21469.62
24		Road-150 Red, 56	25047.89
25		Road-150 Red, 62	28626.16
26		Road-650 Black, 44	699.0982
27		Road-650 Black, 52	
28		Road-650 Black, 62	699.0982
29		Road-650 Red, 44	699.0982
30		Road-650 Red, 48	
31		Road-650 Red, 52	
32		Road-650 Red, 58	
33		Road-650 Red, 60	
34		Grand Total	209652.9046

The corresponding pivotSelection XML should look like this:

```
<pivotSelection pane="bottomRight" showHeader="1" axis="axisRow" dimension="2"
 activeRow="11" activeCol="1" previousRow="11" previousCol="1" click="1"
 r:id="rId1">
```

```

1 <pivotArea dataOnly="0" labelOnly="1" fieldPosition="0">
2 <references count="1">
3 <reference field="9" count="0"/>
4 </references>
5 </pivotArea>
6 </pivotSelection>

```

axis indicates that this selection is on the row axis, dimension indicates the field level within the row axis that is selected (zero-based index), activeCol and activeRow respectively indicate where in the grid the selection is located, and reference field indicates to which particular field the selection corresponds.

*end example]*

Parent Elements
sheetView (§3.3.1.83)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
activeCol (Active Column)	<p>The column (zero-based) of active cell for structure selection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
activeRow (Active Row)	<p>The row (zero-based) of active cell for structure selection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
axis (Axis)	<p>Axis of the PivotTable on which this selection lies.</p> <p>The possible values for this attribute are defined by the ST_Axis simple type (§3.18.1).</p>
click (Click Count)	<p>Number of clicks for this structure selection. For some selection combinations, subsequent clicks on the same target area cycles the actual selection through some variances. Therefore number of clicks on the selection must be recorded, if it is desirable to restore this state of the selection cycle on load.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
count (Selection Count)	<p>Number of selections for the structure selection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

Attributes	Description
data (Data Selection)	<p>Flag indicating whether the structure selection is for data only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dimension (Dimension)	<p>Indicates the field level within the axis that is selected (zero-based index).</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
extendable (Extendable)	<p>Flag indicating whether the structure selection can have additional selections added to it.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
id (Relationship Id)  Namespace: .../officeDocument /2006/relationships	<p>Relationship Id pointing to the particular PivotTable Part corresponding to this selection.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
label (Label)	<p>Flag indicating whether the structure selection is for labels only (e.g., a grand total row is selected).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
max (Maximum)	<p>The maximum line the structure selection contains.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
min (Minimum)	<p>The minimum line the structure selection contains.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
pane (Pane)	<p>The pane to which this PivotTable structure selection belongs.</p> <p>The possible values for this attribute are defined by the ST_Pane simple type (§3.18.54).</p>
previousCol (Previous Column Selection)	<p>1-based index to the column immediately left of the structure selection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
previousRow (Previous Row)	<p>1-based index to the row immediately above the structure selection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
showHeader (Show Header)	<p>Flag indicating whether selection toggle from data only to header only to both is enabled. False means disabled.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
start (Start)	<p>The line the structure selection begins (zero-based). This is the line clicked to initiate the structure selection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PivotSelection">
 <sequence>
 <element name="pivotArea" type="CT_PivotArea"/>
 </sequence>
 <attribute name="pane" type="ST_Pane" use="optional" default="topLeft"/>
 <attribute name="showHeader" type="xsd:boolean" default="false"/>
 <attribute name="label" type="xsd:boolean" default="false"/>
 <attribute name="data" type="xsd:boolean" default="false"/>
 <attribute name="extendable" type="xsd:boolean" default="false"/>
 <attribute name="count" type="xsd:unsignedInt" default="0"/>
 <attribute name="axis" type="ST_Axis" use="optional"/>
 <attribute name="dimension" type="xsd:unsignedInt" default="0"/>
 <attribute name="start" type="xsd:unsignedInt" default="0"/>
 <attribute name="min" type="xsd:unsignedInt" default="0"/>
 <attribute name="max" type="xsd:unsignedInt" default="0"/>
 <attribute name="activeRow" type="xsd:unsignedInt" default="0"/>
 <attribute name="activeCol" type="xsd:unsignedInt" default="0"/>
 <attribute name="previousRow" type="xsd:unsignedInt" default="0"/>
 <attribute name="previousCol" type="xsd:unsignedInt" default="0"/>
 <attribute name="click" type="xsd:unsignedInt" default="0"/>
 <attribute ref="r:id" use="optional"/>
</complexType>

```

### 3.3.1.68 printOptions (Print Options)

Print options for the sheet. Printer-specific settings are stored separately in the Printer Settings part as defined in Part 1.

Parent Elements
customSheetView (§3.3.1.23); dialogsSheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
gridLines (Print Grid Lines)	<p>Used in conjunction with gridLinesSet. If both gridLines and gridLinesSet are true, then grid lines shall print. Otherwise, they shall not (i.e., one or both have false values).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
gridLinesSet (Grid Lines Set)	Used in conjunction with gridLines. If both gridLines and gridLinesSet are true, then grid lines shall print. Otherwise, they shall not (i.e., one or both have false values).

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
headings (Print Headings)	Print row and column headings.  The possible values for this attribute are defined by the XML Schema boolean datatype.
horizontalCentered (Horizontal Centered)	Center on page horizontally when printing.  The possible values for this attribute are defined by the XML Schema boolean datatype.
verticalCentered (Vertical Centered)	Center on page vertically when printing.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PrintOptions">
 <attribute name="horizontalCentered" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="verticalCentered" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="headings" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="gridLines" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="gridLinesSet" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.3.1.69 [protectedRange \(Protected Range\)](#)

A specified range to be protected. Ranges listed here are protected only when the sheet protection is ON and the cell is flagged as being locked. If no password is specified here, then read/write permissions are automatically given to all users, regardless of additional security descriptor information. In other words, the security descriptor information (specific types of access) at the user level is only applied if a password for this range is specified.

When a password is specified, then users not listed specifically as having access should be prompted with a password. If that user supplies the correct password, then they may edit the range or cell in question. This protection is optional and may be ignored by applications who choose not to support this functionality.

Parent Elements
protectedRanges (§3.3.1.70)

Attributes	Description
name (Name)	Range title. This is used as a descriptor, not as a named range definition.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
password (Password)	Specifies the hash of the password required for editing this range. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionsPassword

Attributes	Description
	<p>attribute of §3.2.29.</p> <p>The resulting value is hashed using the algorithm defined below.</p> <p>[Note: An example algorithm to hash the user input into the value stored is as follows:</p> <pre> // Function Input: //   szPassword: NULL terminated C-Style string //   cchPassword: The number of characters in szPassword (not //               including the NULL terminator) WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {     WORD wPasswordHash;     const CHAR *pch;      wPasswordHash = 0;      if (cchPassword &gt; 0)     {         pch = &amp;szPassword[cchPassword];         while (pch-- != szPassword)         {             wPasswordHash = ((wPasswordHash &gt;&gt; 14) &amp; 0x01)   ((wPasswordHash &lt;&lt; 1) &amp; 0x7fff);             wPasswordHash ^= *pch;         }         wPasswordHash ^= (0x8000   ('N' &lt;&lt; 8)   'K');     }      return(wPasswordHash); } end note] </pre> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).</p>
securityDescriptor (Security Descriptor)	<p>Optional setting to specify the relative security descriptor. The security descriptor defines user accounts who may edit this range without providing a password to access the range. Removing this attribute shall remove all permissions granted or denied to users for this range.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
sqref (Sequence of References)	<p>The range to be protected.</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ProtectedRange">
 <attribute name="password" type="ST_UnsignedShortHex" use="optional"/>
 <attribute name="sqref" type="ST_Sqref" use="required"/>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="securityDescriptor" type="xsd:string" use="optional"/>
</complexType>
```

3.3.1.70      **protectedRanges (Protected Ranges)**

This collection specifies all protected ranges on this worksheet.

*[Example:*

This example demonstrates that A1:C5 have been protected, with no password specified.

```
<protectedRanges>
 <protectedRange sqref="A1:C5" name="Range1"/>
</protectedRanges>
```

*end example]*

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
protectedRange (Protected Range)	§3.3.1.69

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ProtectedRanges">
 <sequence>
 <element name="protectedRange" type="CT_ProtectedRange" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

3.3.1.71      **row (Row)**

The element expresses information about an entire row of a worksheet, and contains all cell definitions for a particular row in the worksheet.

*[Example:*

This row expresses information about row 2 in the worksheet, and contains 3 cell definitions.

```
1 <row r="2" spans="2:12">
2 <c r="C2" s="1">
3 <f>PMT(B3/12,B4,-B5)</f>
4 <v>672.68336574300008</v>
5 </c>
6 <c r="D2">
7 <v>180</v>
8 </c>

12 </row>
```

13 *end example]*

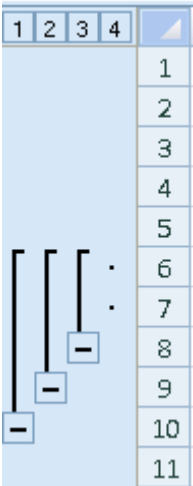

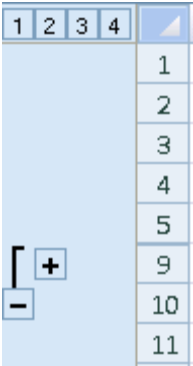

Parent Elements
sheetData (§3.3.1.77)

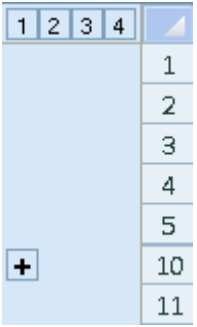

14

Child Elements	Subclause
c (Cell)	§3.3.1.3
extLst (Future Feature Data Storage Area)	§3.2.10

15

Attributes	Description
collapsed (Collapsed)	<p>'1' if the rows 1 level of outlining deeper than the current row are in the collapsed outline state. It means that the rows which are 1 outline level deeper (numerically higher value) than the current row are currently hidden due to a collapsed outline state.</p> <p>It is possible for collapsed to be false and yet still have the rows in question hidden. This can be achieved by having a lower outline level collapsed, thus hiding all the child rows.</p> <p>[Example: This example shows 3 levels of outlining:</p>

Attributes	Description
	<div></div> <p>In the XML shall be:</p> <pre>&lt;sheetData&gt;   &lt;row r="6" outlineLevel="3"/&gt;   &lt;row r="7" outlineLevel="3"/&gt;   &lt;row r="8" outlineLevel="2"/&gt;   &lt;row r="9" outlineLevel="1"/&gt; &lt;/sheetData&gt;</pre> <p><i>end example]</i></p> <p>[Example: This example shows the same outline feature, with the middle level collapsed:</p> <div></div> <p>In the XML shall be:</p> <pre>&lt;sheetData&gt;   &lt;row r="6" hidden="1" outlineLevel="3"/&gt;   &lt;row r="7" hidden="1" outlineLevel="3"/&gt;   &lt;row r="8" hidden="1" outlineLevel="2"/&gt;   &lt;row r="9" outlineLevel="1" collapsed="1"/&gt; &lt;/sheetData&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>[<i>Example:</i> This example shows the same outline feature as above, where both the middle and lowest level are collapsed:</p>  <p>In the XML shall be:</p> <pre> &lt;sheetData&gt;   &lt;row r="6" hidden="1" outlineLevel="3"/&gt;   &lt;row r="7" hidden="1" outlineLevel="3"/&gt;   &lt;row r="8" hidden="1" outlineLevel="2"/&gt;   &lt;row r="9" hidden="1" outlineLevel="1" collapsed="1"/&gt;   &lt;row r="10" collapsed="1"/&gt; &lt;/sheetData&gt; </pre> <p>Note that in this case, if the lowest level were expanded, the middle level would remain collapsed due to collapsed being true on row 9.</p> <p><i>end example]</i></p> <p>See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
customFormat (Custom Format)	<p>'1' if the row style should be applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
customHeight (Custom Height)	<p>'1' if the row height has been manually set.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hidden (Hidden)	<p>'1' if the row is hidden, e.g., due to a collapsed outline or by manually selecting and hiding a row.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
ht (Row Height)	<p>Row height measured in point size. There is no margin padding on row height.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
outlineLevel (Outline Level)	<p>Outlining level of the row, when outlining is on. See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
ph (Show Phonetic)	<p>'1' if the row should show phonetic.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
r (Row Index)	<p>Row index. Indicates to which row in the sheet this &lt;row&gt; definition corresponds.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
s (Style Index)	<p>Index to style record for the row (only applied if customFormat attribute is '1')</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spans (Spans)	<p>Optimization only, and not required. Specifies the range of non-empty columns (in the format X:Y) for the block of rows to which the current row belongs. To achieve the optimization, span attribute values in a single block should be the same.</p> <p>There are 16 rows per block, beginning with the first row.</p> <p>Note: this is an optimization, and is purely optional. Different span values within the same row block is allowed. Not writing the span value at all is also allowed.</p> <p>Blank rows are not required to write out span values.</p> <p>For example, if cells F8, E9, and D10 have data in them and the rest of the sheet is empty, then for those three rows (8,9, and 10), the spans value should each be "4:6":</p> <pre> &lt;sheetData&gt;   &lt;row r="8" spans="4:6"&gt;     &lt;c r="F8"&gt;       &lt;v&gt;1&lt;/v&gt;     &lt;/c&gt;   &lt;/row&gt;   &lt;row r="9" spans="4:6"&gt;     &lt;c r="E9"&gt;       &lt;v&gt;2&lt;/v&gt;     &lt;/c&gt;   &lt;/row&gt;   &lt;row r="10" spans="4:6"&gt; </pre>

Attributes	Description
	<pre>       &lt;c r="D10"&gt;         &lt;v&gt;3&lt;/v&gt;       &lt;/c&gt;     &lt;/row&gt;   &lt;/sheetData&gt; </pre> <p>For example, if cells A1 and J10 have data in them and the rest of the sheet is empty, then the rows should be written like this:</p> <pre> &lt;sheetData&gt;   &lt;row r="1" spans="1:10"&gt;     &lt;c r="A1"&gt;       &lt;v&gt;1&lt;/v&gt;     &lt;/c&gt;   &lt;/row&gt;   &lt;row r="10" spans="1:10"&gt;     &lt;c r="J10"&gt;       &lt;v&gt;2&lt;/v&gt;     &lt;/c&gt;   &lt;/row&gt; &lt;/sheetData&gt; </pre> <p>The possible values for this attribute are defined by the ST_CellSpans simple type (§3.18.10).</p>
thickBot (Thick Bottom)	<p>'1' if any cell in the row has a medium or thick bottom border, or if any cell in the row directly below the current row has a thick top border. When true and customHeight is false, this flag means that the row height has been adjusted higher by .75 points of the normal style font height. This also means that if the row no longer contains these borders, then the height is automatically re-adjusted down.</p> <p>This adjustment is in addition to any adjustment of height due to thickTop.</p> <p>Medium borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> <li>• mediumDashDotDot</li> <li>• slantDashDot</li> <li>• mediumDashDot</li> <li>• mediumDashed</li> <li>• medium</li> </ul> <p>Thick borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> <li>• thick</li> <li>• double</li> </ul> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
thickTop (Thick Top Border)	<p>True if the row has a medium or thick top border, or if any cell in the row directly above the current row has a thick bottom border. When true and customHeight is false, this</p>

Attributes	Description
	<p>flag means that the row height has been adjusted higher by .75 points of the normal style font height. This also means that if the row no longer contains these borders, then the height is automatically re-adjusted down.</p> <p>This adjustment is in addition to any adjustment of height due to thickBot.</p> <p>Medium borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> <li>• mediumDashDotDot</li> <li>• slantDashDot</li> <li>• mediumDashDot</li> <li>• mediumDashed</li> <li>• medium</li> </ul> <p>Thick borders are these enumeration values from the Styles Part:</p> <ul style="list-style-type: none"> <li>• thick</li> <li>• double</li> </ul> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Row">
 <sequence>
 <element name="c" type="CT_Cell" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="r" type="xsd:unsignedInt" use="optional"/>
 <attribute name="spans" type="ST_CellSpans" use="optional"/>
 <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="customFormat" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="ht" type="xsd:double" use="optional"/>
 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="customHeight" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="outlineLevel" type="xsd:unsignedByte" use="optional" default="0"/>
 <attribute name="collapsed" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="thickTop" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="thickBot" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.3.1.72 rowBreaks (Horizontal Page Breaks (Row))

Horizontal page break information used for print layout view, page layout view, drawing print breaks in normal view, and for printing the worksheet.

[Example: This example shows a break inserted at cell B25:

```

1 <rowBreaks count="1" manualBreakCount="1">
2 <brk id="24" max="16383" man="1"/>
3 </rowBreaks>

```

4 *end example]*

Parent Elements
customSheetView (§3.3.1.23); worksheet (§3.3.1.96)

5

Child Elements	Subclause
brk (Break)	§3.3.1.2

6

Attributes	Description
count (Page Break Count)	Number of breaks in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
manualBreakCount (Manual Break Count)	Number of manual breaks in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

7 The following XML Schema fragment defines the contents of this element:

```

8 <complexType name="CT_PageBreak">
9 <sequence>
10 <element name="brk" type="CT_Break" minOccurs="0" maxOccurs="unbounded"/>
11 </sequence>
12 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
13 <attribute name="manualBreakCount" type="xsd:unsignedInt" use="optional" default="0"/>
14 </complexType>

```

### 15 3.3.1.73 scenario (Scenario)

16 An individual scenario description. See parent element for example.

Parent Elements
scenarios (§3.3.1.74)

17

Child Elements	Subclause
inputCells (Input Cells)	§3.3.1.49

18

Attributes	Description
comment (Scenario Comment)	<p>Comment for this scenario, rich text not supported.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
count (Changing Cell Count)	<p>Number of input cells.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
hidden (Hidden Scenario)	<p>Scenario is hidden when the sheet is protected and 'edit scenarios' is not enabled in sheet protection options. If the scenario is marked as hidden but sheet protection options specify to allow editing scenarios, then the scenario shall not be hidden.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
locked (Scenario Locked)	<p>Scenario is locked for editing when the sheet is protected. If sheet is protected and "edit scenarios" is enabled, then this setting is ignored.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
name (Scenario Name)	<p>Scenario's name (user input). Must be unique for the workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
user (User Name)	<p>Name of user who last changed the scenario.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Scenario">
 <sequence>
 <element name="inputCells" type="CT_InputCells" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="locked" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
 <attribute name="user" type="ST_Xstring" use="optional"/>
 <attribute name="comment" type="ST_Xstring" use="optional"/>
</complexType>

```

### 3.3.1.74 scenarios (Scenarios)

A collection of Scenarios. A scenario is a named what-if model that includes variable cells linked together by one or more formulas. For example, you might want to compare best-case and worst-case scenarios for sales in a coffee shop, based on the number of cups of coffee sold in a week.

[Example:

```

1 <scenarios current="1" show="0" sqref="G4 G6 G7 G8">
2 <scenario name="Best Case" locked="1" count="3" user="anonymous"
3 comment="Created on 6/9/2006_x000a_Modified on 6/9/2006">
4 <inputCells r="D5" val="151" numFmtId="37"/>
5 <inputCells r="D9" val="226"/>
6 <inputCells r="D13" val="126"/>
7 </scenario>
8 <scenario name="Worst Case" locked="1" count="3" user="anonymous"
9 comment="Created on 6/9/2006">
10 <inputCells r="D5" val="50" numFmtId="37"/>
11 <inputCells r="D9" val="40"/>
12 <inputCells r="D13" val="30"/>
13 </scenario>
14 </scenarios>

```

*end example]*

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
scenario (Scenario)	§3.3.1.73

Attributes	Description
current (Current Scenario)	Zero-based index to current scenario selected. Can correspond to selection UI.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
show (Last Shown Scenario)	Zero-based index to last shown scenario. Indicates which scenario was last selected by the user to be run/shown.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sqref (Sequence of References)	Range or sequence of cells used for scenario results summary.  The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scenarios">
 <sequence>
 <element name="scenario" type="CT_Scenario" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="current" type="xsd:unsignedInt" use="optional"/>
 <attribute name="show" type="xsd:unsignedInt" use="optional"/>
 <attribute name="sqref" type="ST_Sqref" use="optional"/>
</complexType>
```

### 3.3.1.75 selection (Selection)

Worksheet view selection.

#### Parent Elements

customSheetView (§3.3.1.23); sheetView (§3.3.1.83)

Attributes	Description
activeCell (Active Cell Location)	Location of the active cell.  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
activeCellId (Active Cell Index)	0-based index of the range reference (in the array of references listed in sqref) containing the active cell. Only used when the selection in sqref is not contiguous. Therefore, this value needs to be aware of the order in which the range references are written in sqref.  When this value is out of range then activeCell can be used.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pane (Pane)	The pane to which this selection belongs.  The possible values for this attribute are defined by the ST_Pane simple type (§3.18.54).
sqref (Sequence of References)	Range of the selection. Can be non-contiguous set of ranges.  The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Selection">
 <attribute name="pane" type="ST_Pane" use="optional" default="topLeft"/>
 <attribute name="activeCell" type="ST_CellRef" use="optional"/>
 <attribute name="activeCellId" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="sqref" type="ST_Sqref" use="optional" default="A1"/>
</complexType>
```

### 3.3.1.76 [sheetCalcPr \(Sheet Calculation Properties\)](#)

This element contains calculation properties for the worksheet.

Parent Elements
worksheet (§3.3.1.96)

Attributes	Description
fullCalcOnLoad (Full Calculation On Load)	Indicates whether the application should do a full calculate on load due to contents on this sheet. After load and successful calc, the application shall set this value to false. Set this to true when the application should calculate the workbook on load.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetCalcPr">
 <attribute name="fullCalcOnLoad" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.3.1.77 [sheetData \(Sheet Data\)](#)

This collection represents the cell table itself. This collection expresses information about each cell, grouped together by rows in the worksheet.

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
row (Row)	§3.3.1.71

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetData">
 <sequence>
 <element name="row" type="CT_Row" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.78 [sheetFormatPr \(Sheet Format Properties\)](#)

Sheet formatting properties.

Parent Elements
dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
<b>baseColWidth</b> (Base Column Width)	<p>Specifies the number of characters of the maximum digit width of the normal style's font. This value does not include margin padding or extra padding for gridlines. It is only the number of characters.</p> <p>See defaultColWidth description in this section for details on calculating this value.</p> <p>See the col element description, particularly the width attribute description, for more information on what is meant by "maximum digit width".</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
<b>customHeight</b> (Custom Height)	<p>'True' if defaultRowHeight value has been manually set, or is different from the default value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>defaultColWidth</b> (Default Column Width)	<p>Default column width measured as the number of characters of the maximum digit width of the normal style's font.</p> <p>If the user has not set this manually, then it can be calculated:  <math>\text{defaultColWidth} = \text{baseColumnWidth} + \{\text{margin padding (2 pixels on each side, totalling 4 pixels)}\} + \{\text{gridline (1pixel)}\}</math></p> <p>If the user has set this manually, then there is no calculation, and simply a value is specified.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
<b>defaultRowHeight</b> (Default Row Height)	<p>Default row height measured in point size. Optimization so we don't have to write the height on all rows. This can be written out if most rows have custom height, to achieve the optimization.</p> <p>When the row height of all rows in a sheet is the default value, then that value is written here, and customHeight is not set. If a few rows have a different height, that information is written directly on each row. However, if most or all of the rows in the sheet have the same height, but that height isn't the default height, then that height value should be written here (as an optimization), and the customHeight flag should also be set. In this case, all rows having this height do not need to express the height, only rows whose height differs from this value need to be explicitly expressed.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
<b>outlineLevelCol</b> (Column Outline Level)	<p>Highest number of outline levels for columns in this sheet. These values must be in synch with the actual sheet outline levels.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>

Attributes	Description
outlineLevelRow (Maximum Outline Row)	Highest number of outline level for rows in this sheet. These values must be in synch with the actual sheet outline levels.  The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
thickBottom (Thick Bottom Border)	'True' if rows have a thick bottom border by default.  The possible values for this attribute are defined by the XML Schema boolean datatype.
thickTop (Thick Top Border)	'True' if rows have a thick top border by default.  The possible values for this attribute are defined by the XML Schema boolean datatype.
zeroHeight (Hidden By Default)	'True' if rows are hidden by default. This setting is an optimization used when most rows of the sheet are hidden. In this case, instead of writing out every row and specifying hidden, it is much shorter to only write out the rows that are not hidden, and specify here that rows are hidden by default, and only not hidden if specified.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SheetFormatPr">
 <attribute name="baseColWidth" type="xsd:unsignedInt" use="optional" default="8"/>
 <attribute name="defaultColWidth" type="xsd:double" use="optional"/>
 <attribute name="defaultRowHeight" type="xsd:double" use="required"/>
 <attribute name="customHeight" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="zeroHeight" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="thickTop" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="thickBottom" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="outlineLevelRow" type="xsd:unsignedByte" use="optional" default="0"/>
 <attribute name="outlineLevelCol" type="xsd:unsignedByte" use="optional" default="0"/>
</complexType>

```

### 3.3.1.79 [sheetPr \(Sheet Properties\)](#)

Sheet-level properties.

Parent Elements
dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
outlinePr (Outline Properties)	§3.3.1.59
pageSetUpPr (Page Setup Properties)	§3.3.1.63
tabColor (Sheet Tab Color)	§3.3.1.90

Attributes	Description
codeName (Code Name)	<p>Specifies a stable name of the sheet, which should not change over time, and does not change from user input. This name should be used by code to reference a particular sheet.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
enableFormatConditionsCalculation (Enable Conditional Formatting Calculations)	<p>Flag indicating whether the conditional formatting calculations shall be evaluated. If set to false, then the min/max values of color scales or databars or threshold values in Top N rules shall not be updated. Essentially the conditional formatting "calc" is off.</p> <p>This is useful when conditional formats are being set programmatically at runtime, recalculation of the conditional formatting does not need to be done until the program execution has finished setting all the conditional formatting properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
filterMode (Filter Mode)	<p>Flag indicating whether the worksheet has one or more autofilters or advanced filters on.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
published (Published)	<p>Flag indicating whether the worksheet is published.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
syncHorizontal (Synch Horizontal)	<p>Flag indicating whether this worksheet is horizontally synced to the synchRef anchor point. When true and scroll location is missing from the window properties, the window view shall be scrolled to the horizontal (row) aspect of the synchRef value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
synchRef (Synch Reference)	<p>Anchor point for worksheet's window.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).</p>
syncVertical (Synch Vertical)	<p>Flag indicating whether this worksheet is vertically synced to the synchRef anchor point. When true and scroll location is missing from the window properties, the window view shall be scrolled to the vertical (column) aspect of the synchRef value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
transitionEntry (Transition Formula Entry)	<p>Flag indicating whether the Transition Formula Entry (Lotus compatibility) option is enabled.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
transitionEvaluation (Transition Formula Evaluation)	<p>Flag indicating whether the Transition Formula Evaluation (Lotus compatibility) option is enabled.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetPr">
 <sequence>
 <element name="tabColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="outlinePr" type="CT_OutlinePr" minOccurs="0" maxOccurs="1"/>
 <element name="pageSetUpPr" type="CT_PageSetUpPr" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="syncHorizontal" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="syncVertical" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="syncRef" type="ST_Ref" use="optional"/>
 <attribute name="transitionEvaluation" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="transitionEntry" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="published" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="codeName" type="xsd:string" use="optional"/>
 <attribute name="filterMode" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="enableFormatConditionsCalculation" type="xsd:boolean" use="optional"
 default="true"/>
</complexType>
```

3.3.1.80 sheetPr (Chart Sheet Properties)

This element specifies chart sheet properties.

Parent Elements
chartsheet (§3.3.1.11)

Child Elements	Subclause
tabColor (Sheet Tab Color)	§3.3.1.90

Attributes	Description
codeName (Code Name)	Specifies a stable name of the sheet, which should not change over time, and does not change from user input. This name should be used by code to reference a particular sheet.  The possible values for this attribute are defined by the XML Schema string datatype.
published (Published)	Flag indicating whether the chart sheet is published.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartsheetPr">
 <sequence>
 <element name="tabColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="published" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="codeName" type="xsd:string" use="optional"/>
</complexType>
```

### 3.3.1.81 sheetProtection (Sheet Protection Options)

This collection expresses the sheet protection options to enforce when the sheet is protected.

[Example:

This example demonstrates that the sheet is protected, objects and scenarios may be edited, and

```
<sheetProtection sheet="1" objects="1" scenarios="1" formatCells="0"
 selectLockedCells="1"/>
```

end example]

#### Parent Elements

dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
autoFilter (AutoFilter Locked)	Autofilters are locked when the sheet is protected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
deleteColumns (Delete Columns Locked)	Deleting columns is locked when the sheet is protected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
deleteRows (Delete Rows Locked)	Deleting rows is locked when the sheet is protected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
formatCells (Format Cells Locked)	Formatting cells is locked when the sheet is protected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
formatColumns (Format Columns Locked)	Formatting columns is locked when the sheet is protected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
formatRows (Format Rows Locked)	Formatting rows is locked when the sheet is protected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
insertColumns	Inserting columns is locked when the sheet is protected.

Attributes	Description
(Insert Columns Locked)	The possible values for this attribute are defined by the XML Schema boolean datatype.
insertHyperlinks (Insert Hyperlinks Locked)	<p>Inserting hyperlinks is locked when the sheet is protected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
insertRows (Insert Rows Locked)	<p>Inserting rows is locked when the sheet is protected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
objects (Objects Locked)	<p>Objects are locked when the sheet is protected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
password (Password)	<p>Specifies the hash of the password required for editing this worksheet. This protection is optional and may be ignored by applications that choose not to support this functionality. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionsPassword attribute of §3.2.29.</p> <p>The resulting value is hashed using the algorithm defined below.</p> <p>[Note: An example algorithm to hash the user input into the value stored is as follows:</p> <pre> // Function Input: //   szPassword: NULL terminated C-Style string //   cchPassword: The number of characters in szPassword (not //               including the NULL terminator) WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {     WORD wPasswordHash;     const CHAR *pch;      wPasswordHash = 0;      if (cchPassword &gt; 0)     {         pch = &amp;szPassword[cchPassword];         while (pch-- != szPassword)         {             wPasswordHash = ((wPasswordHash &gt;&gt; 14) &amp; 0x01)   ((wPasswordHash &lt;&lt; 1) &amp; 0x7fff);             wPasswordHash ^= *pch;         }         wPasswordHash ^= (0x8000   ('N' &lt;&lt; 8)   'K');     }      return(wPasswordHash); } end note]</pre>

Attributes	Description
	The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).
pivotTables (Pivot Tables Locked)	Pivot tables are locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
scenarios (Scenarios Locked)	Scenarios are locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
selectLockedCells (Select Locked Cells Locked)	Selection of locked cells is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
selectUnlockedCells (Select Unlocked Cells Locked)	Selection of unlocked cells is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
sheet (Sheet Locked)	Sheet is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
sort (Sort Locked)	Sorting is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_SheetProtection">
3 <attribute name="password" type="ST_UnsignedShortHex" use="optional"/>
4 <attribute name="sheet" type="xsd:boolean" use="optional" default="false"/>
5 <attribute name="objects" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="scenarios" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="formatCells" type="xsd:boolean" use="optional" default="true"/>
8 <attribute name="formatColumns" type="xsd:boolean" use="optional" default="true"/>
9 <attribute name="formatRows" type="xsd:boolean" use="optional" default="true"/>
10 <attribute name="insertColumns" type="xsd:boolean" use="optional" default="true"/>
11 <attribute name="insertRows" type="xsd:boolean" use="optional" default="true"/>

18 <attribute name="pivotTables" type="xsd:boolean" use="optional" default="true"/>
19 <attribute name="selectUnlockedCells" type="xsd:boolean" use="optional" default="false"/>
20 </complexType>

```

### 21 3.3.1.82 sheetProtection (Chart Sheet Protection)

22 This collection expresses the chart sheet protection options to enforce when the chart sheet is protected.

Parent Elements
chartsheet (§3.3.1.11)

1

Attributes	Description
content (Contents)	<p>When true prevents users from making changes to items that are part of the chart, such as data series, axes, and legends. The chart continues to reflect changes made to its source data.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
objects (Objects Locked)	<p>When true prevents users from making changes to graphic objects— including shapes, text boxes, and controls— unless you unlock the specific objects before you protect the chart sheet.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
password (Password)	<p>Specifies the hash of the password required for editing this chart sheet. This protection is optional and may be ignored by applications that choose not to support this functionality. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionPassword attribute of §3.2.29.</p> <p>The resulting value is hashed using the algorithm defined below.</p> <p>[Note: An example algorithm to hash the user input into the value stored is as follows:</p> <pre>// Function Input: //   szPassword: NULL terminated C-Style string //   cchPassword: The number of characters in szPassword (not // including the NULL terminator) WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {     WORD wPasswordHash;     const CHAR *pch;      wPasswordHash = 0;      if (cchPassword &gt; 0)     {         pch = &amp;szPassword[cchPassword];         while (pch-- != szPassword)         {             wPasswordHash = ((wPasswordHash &gt;&gt; 14) &amp; 0x01)   ((wPasswordHash &lt;&lt; 1) &amp; 0x7fff);             wPasswordHash ^= *pch;         }         wPasswordHash ^= (0x8000   ('N' &lt;&lt; 8)   'K');     } }</pre>

Attributes	Description
	<pre>         return(wPasswordHash);     } end note] </pre> <p>The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_ChartsheetProtection">
3 <attribute name="password" type="ST_UnsignedShortHex" use="optional"/>
4 <attribute name="content" type="xsd:boolean" use="optional" default="false"/>
5 <attribute name="objects" type="xsd:boolean" use="optional" default="false"/>
6 </complexType>

```

### 7 3.3.1.83 sheetView (Worksheet View)

8 A single sheet view definition. When more than 1 sheet view is defined in the file, it means that when opening  
9 the workbook, each sheet view corresponds to a separate window within the spreadsheet application, where  
10 each window is showing the particular sheet. containing the same workbookViewId value, the last sheetView  
11 definition is loaded, and the others are discarded. When multiple windows are viewing the same sheet, multiple  
12 sheetView elements (with corresponding workbookView entries) are saved.

Parent Elements
sheetViews (§3.3.1.85)

13

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pane (View Pane)	§3.3.1.64
pivotSelection (PivotTable Selection)	§3.3.1.67
selection (Selection)	§3.3.1.75

14

Attributes	Description
colorId (Color Id)	<p>Index to the color value for row/column text headings and gridlines. This is an 'index color value' (ICV) rather than rgb value.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
defaultGridColor (Default Grid Color)	<p>Flag indicating that the consuming application should use the default grid lines color (system dependent). Overrides any color specified in colorId.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
rightToLeft (Right To Left)	<p>Flag indicating whether the sheet is in 'right to left' display mode. When in this mode, Column A is on the far right, Column B ;is one column left of Column A, and so on. Also, information in cells is displayed in the Right to Left format.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showFormulas (Show Formulas)	<p>Flag indicating whether this sheet should display formulas.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showGridLines (Show Grid Lines)	<p>Flag indicating whether this sheet should display gridlines.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showOutlineSymbols (Show Outline Symbols)	<p>Flag indicating whether the sheet has outline symbols visible. This flag shall always override SheetPr element's outlinePr child element whose attribute is named showOutlineSymbols when there is a conflict.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showRowColHeaders (Show Headers)	<p>Flag indicating whether the sheet should display row and column headings.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showRuler (Show Ruler)	<p>Show the ruler in Page Layout View.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showWhiteSpace (Show White Space)	<p>Flag indicating whether page layout view shall display margins. False means do not display left, right, top (header), and bottom (footer) margins (even when there is data in the header or footer).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showZeros (Show Zero Values)	<p>Flag indicating whether the window should show 0 (zero) in cells containing zero value. When false, cells with zero value appear blank instead of showing the number zero.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
tabSelected (Sheet Tab Selected)	<p>Flag indicating whether this sheet is selected. When only 1 sheet is selected and active, this value should be in synch with the activeTab value. In case of a conflict, the Start Part setting wins and sets the active sheet tab.</p> <p>Note: multiple sheets can be selected, but only one sheet can be active at one time.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
topLeftCell (Top Left Visible Cell)	<p>Location of the top left visible cell Location of the top left visible cell in the bottom right pane (when in Left-to-Right mode).</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>

Attributes	Description
view (View Type)	<p>Indicates view type.</p> <p>The possible values for this attribute are defined by the ST_SheetViewType simple type (§3.18.71).</p>
windowProtection (Window Protection)	<p>Flag indicating whether the panes in the window are locked due to workbook protection. This is an option when the workbook structure is protected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
workbookViewId (Workbook View Index)	<p>Zero-based index of this workbook view, pointing to a workbookView element in the bookViews collection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
zoomScale (Zoom Scale)	<p>Window zoom magnification for current view representing percent values. Valid values range from 10 to 400. Horizontal &amp; Vertical scale together.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>Current view can be Normal, Page Layout, or Page Break Preview.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
zoomScaleNormal (Zoom Scale Normal View)	<p>Zoom magnification to use when in normal view, representing percent values. Valid values range from 10 to 400. Horizontal &amp; Vertical scale together.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>Applies for worksheet sheet type only; zero implies the automatic setting.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

Attributes	Description
<b>zoomScalePageLayoutView</b> (Zoom Scale Page Layout View)	<p>Zoom magnification to use when in page layout view, representing percent values. Valid values range from 10 to 400. Horizontal &amp; Vertical scale together.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>Applies for worksheet sheet type only; zero implies the automatic setting.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
<b>zoomScaleSheetLayoutView</b> (Zoom Scale Page Break Preview)	<p>Zoom magnification to use when in page break preview, representing percent values. Valid values range from 10 to 400. Horizontal &amp; Vertical scale together.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>Applies for worksheet only; zero implies the automatic setting.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetView">
 <sequence>
 <element name="pane" type="CT_Pane" minOccurs="0" maxOccurs="1"/>
 <element name="selection" type="CT_Selection" minOccurs="0" maxOccurs="4"/>
 <element name="pivotSelection" type="CT_PivotSelection" minOccurs="0" maxOccurs="4"/>
 <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="windowProtection" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showFormulas" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showGridLines" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showRowColHeaders" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showZeros" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="rightToLeft" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="tabSelected" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showRuler" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showOutlineSymbols" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="defaultGridColor" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="showWhiteSpace" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="view" type="ST_SheetViewType" use="optional" default="normal"/>
 <attribute name="topLeftCell" type="ST_CellRef" use="optional"/>
 <attribute name="colorId" type="xsd:unsignedInt" use="optional" default="64"/>
 <attribute name="zoomScale" type="xsd:unsignedInt" use="optional" default="100"/>
 <attribute name="zoomScaleNormal" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="zoomScaleSheetLayoutView" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="zoomScalePageLayoutView" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="workbookViewId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.3.1.84 sheetView (Chart Sheet View)

This element specifies a chart sheet view. See sheetView (§3.3.1.83) for an example.

Parent Elements
sheetViews (§3.3.1.86)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
tabSelected (Sheet Tab Selected)	Flag indicating whether the sheet tab is selected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
workbookViewId (Workbook View Id)	Zero-based index of this workbook view, pointing to a workbookView element in the bookViews collection.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
zoomScale (Window Zoom Scale)	<p>Window zoom magnification, representing percent values. Valid values range from 10 to 400. Horizontal &amp; Vertical scale together.</p> <p>For example:</p> <p>10 - 10%</p> <p>20 - 20%</p> <p>...</p> <p>100 - 100%</p> <p>...</p> <p>400 - 400%</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
zoomToFit (Zoom To Fit)	<p>Flag indicating whether chart sheet is zoom to fit window.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_ChartsheetView">
3 <sequence>
4 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="tabSelected" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="zoomScale" type="xsd:unsignedInt" default="100" use="optional"/>
8 <attribute name="workbookViewId" type="xsd:unsignedInt" use="required"/>
9 <attribute name="zoomToFit" type="xsd:boolean" use="optional" default="false"/>
10 </complexType>

```

### 11 3.3.1.85 sheetViews (Sheet Views)

12 Worksheet views collection.

13 *[Example:*

14 This example shows one sheet view definition. The definition indicates that the current sheet is the  
15 active/selected sheet, and that there is a split pane applied to the view. This definition also indicates for each of  
16 the four window panes of the split which cell is the active cell for that pane.

```

1 <sheetViews>
2 <sheetView tabSelected="1" workbookViewId="0">
3 <pane xSplit="2310" ySplit="2070" topLeftCell="C1"
4 activePane="bottomRight"/>
5 <selection/>
6 <selection pane="bottomLeft" activeCell="A6" sqref="A6"/>
7 <selection pane="topRight" activeCell="C1" sqref="C1"/>
8 <selection pane="bottomRight" activeCell="E13" sqref="E13"/>
9 </sheetView>
10 </sheetViews>

```

*end example]*

Parent Elements
dialogsheets (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
sheetView (Worksheet View)	§3.3.1.83

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_SheetViews">
15 <sequence>
16 <element name="sheetView" type="CT_SheetView" minOccurs="1" maxOccurs="unbounded"/>
17 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
18 </sequence>
19 </complexType>

```

### 3.3.1.86 sheetViews (Chart Sheet Views)

This element specifies chart sheet views.

Parent Elements
chartsheet (§3.3.1.11)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
sheetView (Chart Sheet View)	§3.3.1.84

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartsheetViews">
 <sequence>
 <element name="sheetView" type="CT_ChartsheetView" minOccurs="1" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

3.3.1.87 smartTags (Smart Tags)

This collection expresses all smart tags associated with cells on this sheet. There can be multiple smart tags associated with a particular cell, and many cells with smart tags for a given worksheet.

[Example:

This example shows three smart tags, each one associated with a unique cell on the worksheet.

```
<smartTags>
 <cellSmartTags r="A1">
 <cellSmartTag type="0"/>
 </cellSmartTags>
 <cellSmartTags r="B1">
 <cellSmartTag type="0"/>
 </cellSmartTags>
 <cellSmartTags r="B2">
 <cellSmartTag type="0"/>
 </cellSmartTags>
</smartTags>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
cellSmartTags (Cell Smart Tags)	§3.3.1.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTags">
 <sequence>
 <element name="cellSmartTags" type="CT_CellSmartTags" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.3.1.88 **sortCondition** (Sort Condition)

Sort condition. When more than one sortCondition is specified, the first condition is applied first, then the second condition is applied, and so on.

Parent Elements
sortState (§3.3.1.89)

Attributes	Description
customList (Custom List)	Sort by a custom list.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
descending (Descending)	Sort descending.  The possible values for this attribute are defined by the XML Schema boolean datatype.
dxfld (Format Id)	Format Id when sortBy=cellColor or fontColor  The possible values for this attribute are defined by the ST_Dxfld simple type (§3.18.26).
iconId (Icon Id)	Zero-based index of an icon in an icon set. The absence of this attribute means "no icon"  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iconSet (Icon Set)	Icon set index when sortBy=icon.  The possible values for this attribute are defined by the ST_IconSetType simple type (§3.18.44).
ref (Reference)	Column/Row that this sort condition applies to. This must be contained within the ref in CT_SortState.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sortBy (Sort By)	Type of sort.  The possible values for this attribute are defined by the ST_SortBy simple type (§3.18.74).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SortCondition">
 <attribute name="descending" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="sortBy" type="ST_SortBy" use="optional" default="value"/>
 <attribute name="ref" type="ST_Ref" use="required"/>
 <attribute name="customList" type="ST_Xstring" use="optional"/>
 <attribute name="dxId" type="ST_DxfId" use="optional"/>
 <attribute name="iconSet" type="ST_IconSetType" use="optional" default="3Arrows"/>
 <attribute name="iconId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.89 sortState (Sort State)

This collection preserves the AutoFilter sort state.

[Example: This example shows a sort which is case-sensitive, descending sort. While the range of data to sort is B4:E8, the range to sort by is B4:B8.

```
<sortState caseSensitive="1" ref="B4:E8">
 <sortCondition descending="1" ref="B4:B8"/>
</sortState>
```

end example]

Parent Elements
autoFilter (§3.3.1.1); queryTableRefresh (§3.12.6); table (§3.5.1.2); worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
sortCondition (Sort Condition)	§3.3.1.88

Attributes	Description
caseSensitive (Case Sensitive)	Flag indicating whether or not the sort is case-sensitive.  The possible values for this attribute are defined by the XML Schema boolean datatype.
columnSort (Sort by Columns)	Flag indicating whether or not to sort by columns. Only applies to ranges that don't have AutoFilter applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.
ref (Sort Range)	The whole range of data to sort (not just the sort-by column).  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sortMethod (Sort Method)	Strokes or PinYin sort method. Applies only to these application UI languages: <ul style="list-style-type: none"><li>Chinese Simplified</li></ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>Chinese Traditional</li> <li>Japanese</li> </ul> <p>For these languages, alternate sort methods can be selected, affecting how the data is sorted.</p> <p>The possible values for this attribute are defined by the ST_SortMethod simple type (§3.18.75).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SortState">
 <sequence>
 <element name="sortCondition" minOccurs="0" maxOccurs="64" type="CT_SortCondition"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="columnSort" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="caseSensitive" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="sortMethod" type="ST_SortMethod" use="optional" default="none"/>
 <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>

```

### 3.3.1.90 [tabColor \(Sheet Tab Color\)](#)

Background color of the sheet tab.

Parent Elements
sheetPr (§3.3.1.79); sheetPr (§3.3.1.80)

Attributes	Description
auto (Automatic)	<p>A boolean value indicating the color is automatic and system color dependent.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indexed (Index)	<p>Indexed color value. Only used for backwards compatibility. References a color in indexedColors.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rgb (Alpha Red Green Blue Color Value)	<p>Standard Alpha Red Green Blue color value (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
theme (Theme Color)	<p>Index into the &lt;clrScheme&gt; collection, referencing a particular &lt;sysClr&gt; or &lt;srgbClr&gt; value expressed in the Theme part.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p><i>[Example:</i></p> <p>Here are some examples of how to apply tint to color:</p> <p><b>If (tint &lt; 0)</b>  <math display="block">\text{Lum}' = \text{Lum} * (1.0 + \text{tint})</math> <p>For example: Lum = 200; tint = -0.5; Darken 50%  <math display="block">\text{Lum}' = 200 * (0.5) \Rightarrow 100</math> <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black)  <math display="block">\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0</math> <p><b>If (tint &gt; 0)</b>  <math display="block">\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))</math> <p>For example: Lum = 100; tint = 0.75; Lighten 75%  <math display="block">\begin{aligned} \text{Lum}' &amp;= 100 * (1 - 0.75) + (255 - 255 * (1 - 0.75)) \\ &amp;= 100 * .25 + (255 - 255 * .25) \\ &amp;= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}</math> <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white)  <math display="block">\begin{aligned} \text{Lum}' &amp;= 100 * (1 - 1) + (255 - 255 * (1 - 1)) \\ &amp;= 100 * 0 + (255 - 255 * 0) \\ &amp;= 0 + (255 - 0) = 255 \end{aligned}</math> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p> </p></p></p></p></p></p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <attribute name="auto" type="xsd:boolean" use="optional"/>
 <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
 <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
 <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

3.3.1.91 tablePart (Table Part)

A single Table Part reference.

Parent Elements
tableParts (§3.3.1.92)

Attributes	Description
id (Relationship Id)	This relationship Id is used to locate a particular table definition part.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePart">
 <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.92 tableParts (Table Parts)

This collection expresses a relationship Id pointing to every table on this sheet.

[Example: This example indicates that the current sheet has two tables, and their definitions can be found by locating the appropriate relationships from the sheet:

```
<tableParts count="2">
 <tablePart r:id="rId1"/>
 <tablePart r:id="rId2"/>
</tableParts>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
tablePart (Table Part)	§3.3.1.91

1

Attributes	Description
count (Count)	A count of table elements in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TableParts">
4 <sequence>
5 <element name="tablePart" type="CT_TablePart" minOccurs="0" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
8 </complexType>

```

### 9 3.3.1.93 v (Cell Value)

10 This element expresses the value contained in a cell. If the cell contains a string, then this value is an index into  
 11 the shared string table, pointing to the actual string value. Otherwise, the value of the cell is expressed directly  
 12 in this element. Cells containing formulas express the last calculated result of the formula in this element.

13 For applications not wanting to implement the shared string table, an 'inline string' may be expressed in an <is>  
 14 element under <c> (instead of a <v> element under <c>), in the same way a string would be expressed in the  
 15 shared string table. See <is> for an example.

16 *[Example: In this example cell B4 contains the number "360".*

```

17 <c r="B4">
18 <v>360</v>
19 </c>

```

20 *end example]*

21 The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
c (§3.3.1.3); cell (§3.14.1); nc (§3.11.1.3); oc (§3.11.1.5); tp (§3.15.3)

### 22 3.3.1.94 webPublishItem (Web Publishing Item)

23 This element represents information for a single item or object which can be published to HTML.

Parent Elements
webPublishItems (§3.3.1.95)

Attributes	Description
autoRepublish (Automatically Publish)	<p>Automatically publish this item every time the workbook is saved.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
destinationFile (Destination File Name)	<p>Destination file name. Indicates where to save the HTML publish file.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
divId (Destination Bookmark)	<p>Destination bookmark. Identifies a specific &lt;div&gt; section in the published HTML file when a subset of the workbook is published to HTML. Each item that has been published from a workbook is written to a unique &lt;div&gt; element in HTML. On re-publishing a particular item from the workbook, only that item's corresponding &lt;div&gt; content is updated. Therefore each publish item corresponds to a unique &lt;div&gt; element. It is possible to add new publish items to an existing published page, and it is possible to re-publish individual items without republishing the entire workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
id (Id)	<p>This is a unique number "nnnnn" of the webPublishItem. This value is used to generate the divId and styleId values.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
sourceObject (Source Object Name)	<p>Source object name (required for sourceType = pivotTable, query, or label).</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
sourceRef (Source Id)	<p>Source range (required for sourceType = 'range').</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).</p>
sourceType (Web Source Type)	<p>Type of web source (or objects to publish).</p> <p>The possible values for this attribute are defined by the ST_WebSourceType simple type (§3.18.94).</p>
title (Title)	<p>HTML title of published item. For example, this value can appear in the web browser window's title bar.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishItem">
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="divId" type="ST_Xstring" use="required"/>
 <attribute name="sourceType" type="ST_WebSourceType" use="required"/>
 <attribute name="sourceRef" type="ST_Ref" use="optional"/>
 <attribute name="sourceObject" type="ST_Xstring" use="optional"/>
 <attribute name="destinationFile" type="ST_Xstring" use="required"/>
 <attribute name="title" type="ST_Xstring" use="optional"/>
 <attribute name="autoRepublish" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.95 webPublishItems (Web Publishing Items)

This represents a listing of individual objects in this workbook that have been published (to HTML).

Note:When one of these objects is selected to be published, just the object is published to HTML, not the entire workbook contents.

[Example: This example shows two items which have been previously selected for publishing. One is a range (A6:C6), the other is a chart, named "Chart 1".

```
<webPublishItems count="2">
 <webPublishItem id="11289" divId="Views_11289" sourceType="range"
 sourceRef="A6:C6" destinationFile="D:\Publish.htm" published="0"/>
 <webPublishItem id="6433" divId="Views_6433" sourceType="chart"
 sourceObject="Chart 1" destinationFile="D:\Publish.mht" published="0"/>
</webPublishItems>
```

end example]

Parent Elements
chartsheet (§3.3.1.11); worksheet (§3.3.1.96)

Child Elements	Subclause
webPublishItem (Web Publishing Item)	§3.3.1.94

Attributes	Description
count (Web Publishing Items Count)	Number of items.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishItems">
 <sequence>
 <element name="webPublishItem" type="CT_WebPublishItem" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.3.1.96 worksheet (Worksheet)

This is the root element of Sheet Parts that are of type 'worksheet'.

Parent Elements
Root element of SpreadsheetML Worksheet part

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
cellWatches (Cell Watch Items)	§3.3.1.8
colBreaks (Vertical Page Breaks)	§3.3.1.13
cols (Column Information)	§3.3.1.16
conditionalFormatting (Conditional Formatting)	§3.3.1.17
controls (Embedded Controls)	§3.3.1.19
customProperties (Custom Properties)	§3.3.1.21
customSheetViews (Custom Sheet Views)	§3.3.1.25
dataConsolidate (Data Consolidate)	§3.3.1.27
dataValidations (Data Validations)	§3.3.1.31
dimension (Worksheet Dimensions)	§3.3.1.33
drawing (Drawing)	§3.3.1.34
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43
hyperlinks (Hyperlinks)	§3.3.1.45
ignoredErrors (Ignored Errors)	§3.3.1.48
legacyDrawing (Legacy Drawing Reference)	§3.3.1.51
legacyDrawingHF (Legacy Drawing Reference in Header Footer)	§3.3.1.52
mergeCells (Merge Cells)	§3.3.1.54
oleObjects (Embedded Objects)	§3.3.1.58
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Page Setup Settings)	§3.3.1.61
phoneticPr (Phonetic Properties)	§3.4.3

Child Elements	Subclause
picture (Background Image)	§3.3.1.65
printOptions (Print Options)	§3.3.1.68
protectedRanges (Protected Ranges)	§3.3.1.70
rowBreaks (Horizontal Page Breaks (Row))	§3.3.1.72
scenarios (Scenarios)	§3.3.1.74
sheetCalcPr (Sheet Calculation Properties)	§3.3.1.76
sheetData (Sheet Data)	§3.3.1.77
sheetFormatPr (Sheet Format Properties)	§3.3.1.78
sheetPr (Sheet Properties)	§3.3.1.79
sheetProtection (Sheet Protection Options)	§3.3.1.81
sheetViews (Sheet Views)	§3.3.1.85
smartTags (Smart Tags)	§3.3.1.87
sortState (Sort State)	§3.3.1.89
tableParts (Table Parts)	§3.3.1.92
webPublishItems (Web Publishing Items)	§3.3.1.95

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Worksheet">
 <sequence>
 <element name="sheetPr" type="CT_SheetPr" minOccurs="0" maxOccurs="1"/>
 <element name="dimension" type="CT_SheetDimension" minOccurs="0" maxOccurs="1"/>
 <element name="sheetViews" type="CT_SheetViews" minOccurs="0" maxOccurs="1"/>
 <element name="sheetFormatPr" type="CT_SheetFormatPr" minOccurs="0" maxOccurs="1"/>
 <element name="cols" type="CT_Cols" minOccurs="0" maxOccurs="unbounded"/>
 <element name="sheetData" type="CT_SheetData" minOccurs="1" maxOccurs="1"/>
 <element name="sheetCalcPr" type="CT_SheetCalcPr" minOccurs="0" maxOccurs="1"/>
 <element name="sheetProtection" type="CT_SheetProtection" minOccurs="0" maxOccurs="1"/>
 <element name="protectedRanges" type="CT_ProtectedRanges" minOccurs="0" maxOccurs="1"/>
 <element name="scenarios" type="CT_Scenarios" minOccurs="0" maxOccurs="1"/>
 <element name="autoFilter" type="CT_AutoFilter" minOccurs="0" maxOccurs="1"/>
 <element name="sortState" type="CT_SortState" minOccurs="0" maxOccurs="1"/>
 <element name="dataConsolidate" type="CT_DataConsolidate" minOccurs="0" maxOccurs="1"/>

 <element name="conditionalFormatting" type="CT_ConditionalFormatting" minOccurs="0"
 maxOccurs="unbounded"/>
 <element name="dataValidations" type="CT_DataValidations" minOccurs="0" maxOccurs="1"/>
 <element name="hyperlinks" type="CT_Hyperlinks" minOccurs="0" maxOccurs="1"/>
 <element name="printOptions" type="CT_PrintOptions" minOccurs="0" maxOccurs="1"/>
 <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
 <element name="pageSetup" type="CT_PageSetup" minOccurs="0" maxOccurs="1"/>
 <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 <element name="rowBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
 <element name="colBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
 <element name="customProperties" type="CT_CustomProperties" minOccurs="0" maxOccurs="1"/>
 <element name="cellWatches" type="CT_CellWatches" minOccurs="0" maxOccurs="1"/>
 <element name="ignoredErrors" type="CT_IgnoredErrors" minOccurs="0" maxOccurs="1"/>
 <element name="smartTags" type="CT_SmartTags" minOccurs="0" maxOccurs="1"/>
 <element name="drawing" type="CT_Drawing" minOccurs="0" maxOccurs="1"/>
 <element name="legacyDrawing" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
 <element name="legacyDrawingHF" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
 <element name="picture" type="CT_SheetBackgroundPicture" minOccurs="0" maxOccurs="1"/>
 <element name="oleObjects" type="CT_OleObjects" minOccurs="0" maxOccurs="1"/>
 <element name="controls" type="CT_Controls" minOccurs="0" maxOccurs="1"/>
 <element name="webPublishItems" type="CT_WebPublishItems" minOccurs="0" maxOccurs="1"/>
 <element name="tableParts" type="CT_TableParts" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

### 3.3.2 AutoFilter Settings

The following subclause defines the settings which can be specified as part of an AutoFilter definition. An *AutoFilter* temporarily hides rows based on a filter criteria, which is applied column by column to a table of data in the worksheet.

1    3.3.2.1            colorFilter (Color Filter Criteria)

2    This element specifies the color to filter by and whether to use the cell's fill or font color in the filter criteria. If  
3    the cell's font or fill color does not match the color specified in the criteria, the rows corresponding to those cells  
4    are hidden from view.

5    [Example:

```
6 <filterColumn colId="1">
7 <colorFilter dxfId="0" cellColor="0"/>
8 </filterColumn>
```

9    end example]

10

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
cellColor (Filter By Cell Color)	Flag indicating whether or not to filter by the cell's fill color. '1' indicates to filter by cell fill. '0' indicates to filter by the cell's font color.  For rich text in cells, if the color specified appears in the cell at all, it shall be included in the filter.  The possible values for this attribute are defined by the XML Schema boolean datatype.
dxfId (Differential Format Record Id)	Id of differential format record (dxf) in the Styles Part which expresses the color value to filter by.  The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).

11    The following XML Schema fragment defines the contents of this element:

```
12 <complexType name="CT_ColorFilter">
13 <attribute name="dxfId" type="ST_DxfId" use="optional"/>
14 <attribute name="cellColor" type="xsd:boolean" use="optional" default="true"/>
15 </complexType>
```

16    3.3.2.2            customFilter (Custom Filter Criteria)

17    A custom AutoFilter specifies an operator and a value. There can be at most two customFilters specified, and in  
18    that case the parent element specifies whether the two conditions are joined by 'and' or 'or'. For any cells  
19    whose values do not meet the specified criteria, the corresponding rows shall be hidden from view when the  
20    filter is applied.

21    [Example:

```

1 <customFilters and="1">
2 <customFilter operator="greaterThanOrEqual" val="0.2"/>
3 <customFilter operator="lessThanOrEqual" val="0.5"/>
4 </customFilters>

```

5 *end example]*

Parent Elements
customFilters (§3.3.2.3)

6

Attributes	Description
operator (Filter Comparison Operator)	Operator used by the filter comparison.  The possible values for this attribute are defined by the ST_FilterOperator simple type (§3.18.32).
val (Top or Bottom Value)	Top or bottom value used in the filter criteria.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

7 The following XML Schema fragment defines the contents of this element:

```

8 <complexType name="CT_CustomFilter">
9 <attribute name="operator" type="ST_FilterOperator" default="equal" use="optional"/>
10 <attribute name="val" type="ST_Xstring"/>
11 </complexType>

```

### 12 3.3.2.3 customFilters (Custom Filters)

13 When there is more than one custom filter criteria to apply (an 'and' or 'or' joining two criteria), then this  
 14 element groups the customFilter elements together.

Parent Elements
filterColumn (§3.3.2.7)

15

Child Elements	Subclause
customFilter (Custom Filter Criteria)	§3.3.2.2

16

Attributes	Description
and (And)	Flag indicating whether the two criterias have an "and" relationship. '1' indicates "and", '0' indicates "or".  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomFilters">
 <sequence>
 <element name="customFilter" type="CT_CustomFilter" minOccurs="1" maxOccurs="2"/>
 </sequence>
 <attribute name="and" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.3.2.4 dateGroupItem (Date Grouping)

This collection is used to express a group of dates or times which are used in an AutoFilter criteria. See parent element for an example. Values are always written in the calendar type of the first date encountered in the filter range, so that all subsequent dates, even when formatted or represented by other calendar types, can be correctly compared for the purposes of filtering.

#### Parent Elements

filters (§3.3.2.8)

#### Attributes

#### Description

dateTimeGrouping (Date Time Grouping)	Grouping level.  The possible values for this attribute are defined by the ST_DateTimeGrouping simple type (§3.18.23).
day (Day)	Day (1-31)  The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
hour (Hour)	Hour (0-23)  The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
minute (Minute)	Minute (0-59)  The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
month (Month)	Month (1-12)  The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
second (Second)	Second (0-59)  The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
year (Year)	Year (4 digits)

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedShort datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DateGroupItem">
 <attribute name="year" type="xsd:unsignedShort" use="required"/>
 <attribute name="month" type="xsd:unsignedShort" use="optional"/>
 <attribute name="day" type="xsd:unsignedShort" use="optional"/>
 <attribute name="hour" type="xsd:unsignedShort" use="optional"/>
 <attribute name="minute" type="xsd:unsignedShort" use="optional"/>
 <attribute name="second" type="xsd:unsignedShort" use="optional"/>
 <attribute name="dateTimeGrouping" type="ST_DateTimeGrouping" use="required"/>
</complexType>
```

### 3.3.2.5 dynamicFilter (Dynamic Filter)

This collection specifies dynamic filter criteria. These criteria are considered dynamic because they can change, either with the data itself (e.g., "above average") or with the current system date (e.g., show values for "today"). For any cells whose values do not meet the specified criteria, the corresponding rows shall be hidden from view when the filter is applied.

[Example:

```
<filterColumn colId="0">
 <dynamicFilter type="today"/>
</filterColumn>
```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
maxVal (Max Value)	<p>A maximum value for dynamic filter. It shall be required for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate.</p> <p>The above criteria are based on a value range. For example, if today's date is September 22nd, then the range for thisWeek is the values greater than or equal to September 17 and less than September 24. In the thisWeek range, the lower value is expressed using val. The higher value is expressed using maxVal.</p> <p>These dynamic filter shall not require val / maxVal: Q1, Q2, Q3, Q4,</p>

Attributes	Description
	<p>M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11 and M12.</p> <p>The above criteria shall not specify the range using val and maxVal because Q1 always starts from M1 to M3, and M1 is always January.</p> <p>These types of dynamic filters shall use val and shall not use maxVal: aboveAverage and belowAverage</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
type (Dynamic filter type)	<p>Dynamic filter type, e.g., "today" or "nextWeek".</p> <p>The possible values for this attribute are defined by the ST_DynamicFilterType simple type (§3.18.27).</p>
val (Value)	<p>A minimum value for dynamic filter. See description of maxVal to understand when val is required.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_DynamicFilter">
3 <attribute name="type" type="ST_DynamicFilterType" use="required"/>
4 <attribute name="val" type="xsd:double" use="optional"/>
5 <attribute name="maxVal" type="xsd:double" use="optional"/>
6 </complexType>

```

### 7 3.3.2.6 filter (Filter)

8 This element expresses a filter criteria value.

9 *[Example:*

```

10 <filters>
11 <filter val="0.316588716"/>
12 <filter val="0.667439395"/>
13 <filter val="0.823086999"/>
14 </filters>

```

15 *end example]*

Parent Elements
filters (§3.3.2.8)

16

Attributes	Description
val (Filter Value)	Filter value used in the criteria.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Filter">
3 <attribute name="val" type="ST_Xstring"/>
4 </complexType>
```

### 5 3.3.2.7 filterColumn (AutoFilter Column)

6 The filterColumn collection identifies a particular column in the AutoFilter range and specifies filter information  
7 that has been applied to this column. If a column in the AutoFilter range has no criteria specified, then there is  
8 no corresponding filterColumn collection expressed for that column.

Parent Elements
autoFilter (§3.3.1.1)

9

Child Elements	Subclause
colorFilter (Color Filter Criteria)	§3.3.2.1
customFilters (Custom Filters)	§3.3.2.3
dynamicFilter (Dynamic Filter)	§3.3.2.5
extLst (Future Feature Data Storage Area)	§3.2.10
filters (Filter Criteria)	§3.3.2.8
iconFilter (Icon Filter)	§3.3.2.9
top10 (Top 10)	§3.3.2.10

10

Attributes	Description
colId (Filter Column Data)	Zero-based index indicating the AutoFilter column to which this filter information applies.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
hiddenButton (Hidden AutoFilter Button)	Flag indicating whether the AutoFilter button for this column is hidden.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showButton (Show Filter Button)	Flag indicating whether the filter button is visible. For example, when the cell containing the filter button is merged with another cell, the filter button may be hidden, and not drawn.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FilterColumn">
 <choice minOccurs="0" maxOccurs="1">
 <element name="filters" type="CT_Filters" minOccurs="0" maxOccurs="1"/>
 <element name="top10" type="CT_Top10" minOccurs="0" maxOccurs="1"/>
 <element name="customFilters" type="CT_CustomFilters" minOccurs="0" maxOccurs="1"/>
 <element name="dynamicFilter" type="CT_DynamicFilter" minOccurs="0" maxOccurs="1"/>
 <element name="colorFilter" type="CT_ColorFilter" minOccurs="0" maxOccurs="1"/>
 <element name="iconFilter" minOccurs="0" maxOccurs="1" type="CT_IconFilter"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </choice>
 <attribute name="colId" type="xsd:unsignedInt" use="required"/>
 <attribute name="hiddenButton" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showButton" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.3.2.8 filters (Filter Criteria)

When multiple values are chosen to filter by, or when a group of date values are chosen to filter by, this element groups those criteria together.

*[Example:*

```
<filters>
 <dateGroupItem year="2006" month="1" day="2" dateTimeGrouping="day"/>
 <dateGroupItem year="2005" month="1" day="2" dateTimeGrouping="day"/>
</filters>
```

*end example]*

Parent Elements
filterColumn (§3.3.2.7)

Child Elements	Subclause
dateGroupItem (Date Grouping)	§3.3.2.4
filter (Filter)	§3.3.2.6

Attributes	Description
blank (Filter by Blank)	Flag indicating whether to filter by blank.  The possible values for this attribute are defined by the XML Schema boolean datatype.
calendarType (Calendar Type)	Calendar type for date grouped items. Used to interpret the values in dateGroupItem. This is the calendar type used to evaluate all dates in the filter column, even when those dates are not using the same calendar system / date formatting.

Attributes	Description
	The possible values for this attribute are defined by the ST_CalendarType simple type (§3.18.5).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Filters">
 <sequence>
 <element name="filter" type="CT_Filter" minOccurs="0" maxOccurs="unbounded"/>
 <element name="dateGroupItem" type="CT_DateGroupItem" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="blank" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="calendarType" type="ST_CalendarType" use="optional" default="none"/>
</complexType>

```

### 3.3.2.9 iconFilter (Icon Filter)

This element specifies the icon set and particular icon within that set to filter by. For any cells whose icon does not match the specified criteria, the corresponding rows shall be hidden from view when the filter is applied.

[Example:

```

<filterColumn colId="3">
 <iconFilter iconSet="3Arrows" iconId="0"/>
</filterColumn>

```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
iconId (Icon Id)	Zero-based index of an icon in an icon set. The absence of this attribute means "no icon"  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iconSet (Icon Set)	Specifies which icon set is used in the filter criteria.  The possible values for this attribute are defined by the ST_IconSetType simple type (§3.18.44).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_IconFilter">
 <attribute name="iconSet" type="ST_IconSetType" use="required"/>
 <attribute name="iconId" type="xsd:unsignedInt" use="optional"/>
</complexType>

```

3.3.2.10 top10 (Top 10)

This element specifies the top N (percent or number of items) to filter by.

[Example: This example filters the first column by the top 10 percent of the values in that column. For all cells in the column whose value falls outside the top 10 percent of the value in that column, the rows corresponding to those cells are hidden from the view. In this example, there are 6 cells in the range, containing 1, 2, 3, 4, 5, 6 respectively.

```
<filterColumn colId="0">
 <top10 percent="1" val="5" filterVal="6"/>
</filterColumn>
```

end example]

Parent Elements

filterColumn (§3.3.2.7)

Attributes

Description

filterVal (Filter Value)	The actual cell value in the range which is used to perform the comparison for this filter. The possible values for this attribute are defined by the XML Schema double datatype.
percent (Filter by Percent)	Flag indicating whether or not to filter by percent value of the column. A false value filters by number of items. The possible values for this attribute are defined by the XML Schema boolean datatype.
top (Top)	Flag indicating whether or not to filter by top order. A false value filters by bottom order. The possible values for this attribute are defined by the XML Schema boolean datatype.
val (Top or Bottom Value)	Top or bottom value to use as the filter criteria. For example "Filter by Top 10 Percent" or "Filter by Top 5 Items". The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Top10">
 <attribute name="top" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="percent" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="val" type="xsd:double" use="required"/>
 <attribute name="filterVal" type="xsd:double" use="optional"/>
</complexType>
```

### 3.4 Shared String Table

A workbook may contain thousands of cells containing string (non-numeric) data. Furthermore this data is very likely to be repeated across many rows or columns. The goal of implementing a single string table that is shared across the workbook is to improve performance in opening and saving the file by only reading and writing the repetitive information once.

Consider for example a workbook summarizing information for cities within various countries. There may be a column for the name of the country, a column for the name of each city in that country, and a column containing the data for each city. In this case the country name is repetitive, being duplicated in many cells. In many cases the repetition is extensive, and a tremendous savings is realized by making use of a shared string table when saving the workbook. When displaying text in the spreadsheet, the cell table will just contain an index into the string table as the value of a cell, instead of the full string.

The shared string table contains all the necessary information for displaying the string: the text, formatting properties, and phonetic properties (for East Asian languages).

Most strings in a workbook have formatting applied at the cell level, that is, the entire string in the cell has the same formatting applied. In these cases, the formatting for the cell is stored in the styles part, and the string for the cell can be stored in the shared strings table. In this case, the strings stored in the shared strings table are very simple text elements, and the following xml illustrates the example.

*[Example:*

```
<sst xmlns=http://schemas.openxmlformats.org/spreadsheetml/2006/5/main
 count="8" uniqueCount="4">
 <si>
 <t>United States</t>
 </si>
 <si>
 <t>Seattle</t>
 </si>
 <si>
 <t>Denver</t>
 </si>
 <si>
 <t>New York</t>
 </si>
</sst>
```

*end example]*

In the above example we can see that the string table is just a collection of string items that consist of simple text elements. Note that any numeric data in the workbook is not shown in the shared string table.

Some strings in the workbook may have formatting applied at a level that is more granular than the cell level. For instance, specific characters within the string may be bolded, have coloring, italicizing, etc. In these cases, the formatting is stored along with the text in the string table, and is treated as a unique entry in the table. The following xml illustrates this.

[Example:

```
<sst xmlns=http://schemas.openxmlformats.org/spreadsheetml/2006/5/main
 count="8" uniqueCount="4">
 <si>
 <r>
 <t xml:space="preserve">United </t>
 </r>
 <r>
 <rPr>
 <sz val="11"/>
 <color rgb="FFFF0000"/>
 <rFont val="Calibri"/>
 <family val="2"/>
 <scheme val="minor"/>
 </rPr>
 <t>States</t>
 </r>
 </si>
 <si>
 <t>Seattle</t>
 </si>
 <si>
 <t>Denver</t>
 </si>
 <si>
 <t>New York</t>
 </si>
</sst>
```

In the above example you can see that this time, the text "United States" has specific, colored, formatting applied to the text, "States." *end example]*

### 3.4.1 charset (Character Set)

This element defines the font character set of this font.

This field is used in font creation and selection if a font of the given facename is not available on the system. Although it is not required to have around when resolving font facename, the information can be stored for when needed to help resolve which font face to use of all available fonts on a system.

Charset represents the basic set of characters associated with a font (that it can display), and roughly corresponds to the ANSI codepage (8-bit or DBCS) of that character set used by a given language. Given more common use of Unicode where many fonts support more than one of the traditional charset categories, and the use of font linking, using charset to resolve font name is less and less common, but still can be useful.

These are operating-system-dependent values.

[Note: The following are some of the possible the character sets:

INT Value	Character Set
0	ANSI_CHARSET
1	DEFAULT_CHARSET
2	SYMBOL_CHARSET
77	MAC_CHARSET
128	SHIFTJIS_CHARSET
129	HANGEUL_CHARSET
129	HANGUL_CHARSET
130	JOHAB_CHARSET
134	GB2312_CHARSET
136	CHINESEBIG5_CHARSET
161	GREEK_CHARSET
162	TURKISH_CHARSET
163	VIETNAMESE_CHARSET
177	HEBREW_CHARSET
178	ARABIC_CHARSET
186	BALTIC_CHARSET
204	RUSSIAN_CHARSET
222	THAI_CHARSET
238	EASTEUROPE_CHARSET
255	OEM_CHARSET

The OEM\_CHARSET value specifies a character set that is operating-system dependent. *end note*

Fonts with other character sets may exist in the operating system. If an application uses a font with an unknown character set, it should not attempt to translate or interpret strings that are rendered with that font.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	The value of an integer, where each value corresponds to a different character set. Valid values are 0 to 255.  The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IntProperty">
 <attribute name="val" type="xsd:int" use="required"/>
</complexType>
```

### 3.4.2 outline (Outline)

This element displays only the inner and outer borders of each character. This is very similar to Bold in behavior.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element.  If omitted, the default value is true.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.4.3 phoneticPr (Phonetic Properties)

This element represents a collection of phonetic properties that affect the display of phonetic text for this String Item (si).

Phonetic text is used to give hints as to the pronunciation of an East Asian language, and the hints are displayed as text within the spreadsheet cells across the top portion of the cell. Since the phonetic hints are text, every phonetic hint is expressed as a phonetic run (rPh), and these properties specify how to display that phonetic run.

[Example:

```

1 <si>
2 <t>課< 毛</t>
3 <rPh sb="0" eb="1">
4 <t>カ</t>
5 </rPh>
6 <rPh sb="4" eb="5">
7 <t>夕</t>
8 </rPh>
9 <phoneticPr fontId="1"/>
10 </si>

```

11 *end example]*

12 The above example shows a String Item that displays some Japanese text "課< 毛". It also displays some  
13 phonetic text across the top of the cell. The phonetic text character, "カ" is displayed over the "課" character and  
14 the phonetic text "夕" is displayed above the "毛" character, using the font record in the style sheet at index 1.

15

Parent Elements
is (§3.3.1.50); si (§3.4.8); text (§3.7.6); worksheet (§3.3.1.96)

Attributes	Description
alignment (Alignment)	Specifies how the text for the phonetic run is aligned across the top of the cells, with respect to the main text in the body of the cell.  The possible values for this attribute are defined by the ST_PhoneticAlignment simple type (§3.18.58).
fontId (Font Id)	An integer that is a zero-based index into the font record in the style sheet. Represents the font to be used to display this phonetic run.  If this index is out of bounds, then the default font of the Normal style should be used in its place. This default font should be at index 0.  The possible values for this attribute are defined by the ST_FontId simple type (§3.18.33).
type (Character Type)	An enumeration which specifies which type of East Asian character set should be used to display the phonetic run  The possible values for this attribute are defined by the ST_PhoneticType simple type (§3.18.59).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhonicPr">
 <attribute name="fontId" type="ST_FontId" use="required"/>
 <attribute name="type" type="ST_PhonicType" use="optional" default="fullwidthKatakana"/>
 <attribute name="alignment" type="ST_PhonicAlignment" use="optional" default="left"/>
</complexType>
```

### 3.4.4 r (Rich Text Run)

This element represents a run of rich text. A rich text run is a region of text that share a common set of properties, such as formatting properties. The properties are defined in the rPr element, and the text displayed to the user is defined in the Text (t) element.

Parent Elements
is (§3.3.1.50); si (§3.4.8); text (§3.7.6)

Child Elements	Subclause
rPr (Run Properties)	§3.4.7
t (Text)	§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RElt">
 <sequence>
 <element name="rPr" type="CT_RPrElt" minOccurs="0" maxOccurs="1"/>
 <element name="t" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 3.4.5 rFont (Font)

This element is a string representing the name of the font assigned to display this run.

Parent Elements
rPr (§3.4.7)

Attributes	Description
val (String Value)	<p>A string representing the name of the font. If the font doesn't exist (because it isn't installed on the system), or the charset is invalid for that font, then another font should be substituted.</p> <p>The string length for this attribute shall be 0 to 31 characters.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontName">
 <attribute name="val" type="ST_Xstring" use="required"/>
</complexType>
```

### 3.4.6 rPh (Phonetic Run)

This element represents a run of text which displays a phonetic hint for this String Item (si).

Phonetic hints are used to give information about the pronunciation of an East Asian language. The hints are displayed as text within the spreadsheet cells across the top portion of the cell.

#### Parent Elements

is (§3.3.1.50); si (§3.4.8); text (§3.7.6)

#### Child Elements

t (Text)

#### Subclause

§3.4.12

#### Attributes

#### Description

eb (Base Text End Index)

An integer used as a zero-based index representing the ending offset into the base text for this phonetic run. This represents the ending point in the base text the phonetic hint applies to.

This value shall be between 0 and the total length of the base text. The following condition shall be true:  $sb < eb$ .

It is recommended that the following condition also be satisfied:  
That for any two consecutive phonetic runs,  $sb_1 < eb_1 \leq sb_2 < eb_2$  to avoid overlapping phonetic runs

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

sb (Base Text Start Index)

An integer used as a zero-based index representing the starting offset into the base text for this phonetic run. This represents the starting point in the base text the phonetic hint applies to.

This value shall be between 0 and the total length of the base text. The following condition shall be true:  $sb < eb$ .

It is recommended that the following condition also be satisfied:  
That for any two consecutive phonetic runs,  $sb_1 < eb_1 \leq sb_2 < eb_2$  to avoid overlapping phonetic runs.

The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhonicRun">
 <sequence>
 <element name="t" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="sb" type="xsd:unsignedInt" use="required"/>
 <attribute name="eb" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.4.7 rPr (Run Properties)

This element represents a set of properties to apply to the contents of this rich text run.

Parent Elements
r (§3.4.4)

Child Elements	Subclause
b (Bold)	§3.8.2
charset (Character Set)	§3.4.1
color (Data Bar Color)	§3.3.1.14
condense (Condense)	§3.8.12
extend (Extend)	§3.8.16
family (Font Family)	§3.8.17
i (Italic)	§3.8.25
outline (Outline)	§3.4.2
rFont (Font)	§3.4.5
scheme (Scheme)	§3.8.36
shadow (Shadow)	§3.8.37
strike (Strike Through)	§3.4.10
sz (Font Size)	§3.4.11
u (Underline)	§3.4.13
vertAlign (Vertical Alignment)	§3.4.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RPrElt">
 <choice maxOccurs="unbounded">
 <element name="rFont" type="CT_FontName" minOccurs="0" maxOccurs="1"/>
 <element name="charset" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
 <element name="family" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
 <element name="b" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="i" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="strike" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="outline" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="shadow" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="condense" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="extend" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="sz" type="CT_FontSize" minOccurs="0" maxOccurs="1"/>
 <element name="u" type="CT_UnderlineProperty" minOccurs="0" maxOccurs="1"/>
 <element name="vertAlign" type="CT_VerticalAlignFontProperty" minOccurs="0" maxOccurs="1"/>
 <element name="scheme" type="CT_FontScheme" minOccurs="0" maxOccurs="1"/>
 </choice>
</complexType>
```

### 3.4.8 si (String Item)

This element is the representation of an individual string in the Shared String table.

If the string is just a simple string with formatting applied at the cell level, then the String Item (si) should contain a single text element used to express the string. However, if the string in the cell is more complex - i.e., has formatting applied at the character level - then the string item shall consist of multiple rich text runs which collectively are used to express the string.

#### Parent Elements

sst (§3.4.9)

phoneticPr (Phonetic Properties)

§3.4.3

r (Rich Text Run)

§3.4.4

rPh (Phonetic Run)

§3.4.6

t (Text)

§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rst">
 <sequence>
 <element name="t" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="r" type="CT_RElt" minOccurs="0" maxOccurs="unbounded"/>
 <element name="rPh" type="CT_PhoneticRun" minOccurs="0" maxOccurs="unbounded"/>
 <element name="phoneticPr" minOccurs="0" maxOccurs="1" type="CT_PhoneticPr"/>
 </sequence>
</complexType>
```

### 3.4.9 sst (Shared String Table)

This element is the root of the Shared String Table, which serves as a collection of individual String Items (si).

Parent Elements
Root element of SpreadsheetML Shared String Table part

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
si (String Item)	§3.4.8

Attributes	Description
count (String Count)	<p>An integer representing the total count of strings in the workbook. This count does not include any numbers, it counts only the total of text strings in the workbook.</p> <p>This attribute is optional unless uniqueCount is used, in which case it is required.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
uniqueCount (Unique String Count)	<p>An integer representing the total count of unique strings in the Shared String Table. A string is unique even if it is a copy of another string, but has different formatting applied at the character level.</p> <p><i>[Example: World, World, and World.</i></p> <p>The count would be 3, and the uniqueCount would be 2. Only one entry for "World" would show in the table because it is the same string, just with different formatting applied at the cell level (i.e., applied to the entire string in the cell). The "World" string would get a separate unique entry in the shared string table because it has different formatting applied to specific characters.</p> <p><i>end example]</i></p> <p>This attribute is optional unless count is used, in which case it is required.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sst">
 <sequence>
 <element name="si" type="CT_Rst" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
 <attribute name="uniqueCount" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.4.10 strike (Strike Through)

This element draws a strikethrough line through the horizontal middle of the text.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.4.11 sz (Font Size)

This element represents the point size (1/72 of an inch) of the Latin and East Asian text.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A double representing the value of a positive measurement in points (1/72 of an inch).

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontSize">
 <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

### 3.4.12 t (Text)

This element represents the text content shown as part of a string.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
is (§3.3.1.50); r (§3.4.4); rPh (§3.4.6); si (§3.4.8); text (§3.7.6)

### 3.4.13 u (Underline)

This element represents the underline formatting style.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Underline Value)	<p>An enumeration representing the style of underlining that is used.</p> <p>The none style is equivalent to not using underlining at all.</p> <p>The possible values for this attribute are defined by the ST_UnderlineValues simple type (§3.18.85).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnderlineProperty">
 <attribute name="val" type="ST_UnderlineValues" use="optional" default="single"/>
</complexType>
```

### 3.4.14 vertAlign (Vertical Alignment)

This element adjusts the vertical position of the text relative to the text's default appearance for this run. It is used to get 'superscript' or 'subscript' texts, and shall reduce the font size (if a smaller size is available) accordingly.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

1

Attributes	Description
val (Value)	<p>An enumeration representing the vertical-alignment setting.</p> <p>Setting this to either <code>subscript</code> or <code>superscript</code> shall make the font size smaller if a smaller font size is available.</p> <p>The possible values for this attribute are defined by the <code>ST_VerticalAlignRun</code> simple type (§3.18.90).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_VerticalAlignFontProperty">
4 <attribute name="val" type="ST_VerticalAlignRun" use="required"/>
5 </complexType>
```

6 **3.5 Tables**

7 A table helps organize and provide structure to lists of information in a worksheet. Tables have clearly labeled  
8 columns, rows, and data regions. Tables make it easier for users to sort, analyze, format, manage, add, and  
9 delete information.

10 If a region of data is designated as a Table, then special behaviors can be applied which help the user perform  
11 useful actions. For example, if the user types additional data in the row adjacent to the bottom of the table, the  
12 table can expand and automatically add that data to the data region of the table. Similarly, adding a column is as  
13 easy as typing a new column heading to the right or left of the current column headings. Filter and sort abilities  
14 can automatically be surfaced to the user via the drop down arrows. Special calculated columns can be created  
15 which summarize or calculate data in the table. These columns have the ability to expand and shrink according  
16 to size of the table, and maintain proper formula referencing.

17 Tables can be created from data already present in the worksheet, from an external data query, or from  
18 mapping a collection of repeating XML elements to a worksheet range.

19 The sheet XML stores the numeric and textual data. The table XML records the various attributes for the  
20 particular table object.

21 *[Example:*

```
22 <table xmlns=http://schemas.openxmlformats.org/spreadsheetml/2006/5/main
23 id="1" name="MarginTable" displayName="MarginTable" ref="D3:G6"
24 totalsRowShown="0">
```

```

1 <autoFilter ref="D3:G6"/>
2 <tableColumns count="4">
3 <tableColumn id="1" name="Product"/>
4 <tableColumn id="2" name="Wholesale"/>
5 <tableColumn id="3" name="Retail"/>
6 <tableColumn id="4" name="Margin" dataDxfId="0">
7 <calculatedColumnFormula d="1">[Retail]-
8 [Wholesale]</calculatedColumnFormula>
9 </tableColumn>
10 </tableColumns>
11 <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
12 showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
13 </table>

```

*end example]*

The above xml example shows a table that spans cells D3 through G6, and has four columns: Product, Wholesale, Retail, and Margin. Margin is a column where each cell has its values calculated based on the formula (Retail - Wholesale), where those values are taken from the cells in the table columns on the corresponding row. The table has a style applied, "TableStyleMedium9", but the styles formatting isn't applied to the first column and the column striping isn't shown. Note that all the data and text values are stored in the sheet xml; the table xml just stores the properties that are specific to this table, and it is referenced by the sheet.

### 3.5.1 Tables

Tables are ranges of data in the worksheet that have special behavior applied which allow users to better sort, analyze, format, manage, add, and delete data. Tables and table columns can also be referenced through formulas by the spreadsheet application using friendly names, making formula calculations that use tables much easier to understand and maintain. Tables provide a natural way for working with large sets of tabular data.

The tables described in this section are of the multi cell variety, as opposed to single cell tables created from XML mappings.

Each table gets its own xml part, and the relationship between a table part and the sheet is defined in the sheet's \_rels directory. The sheet xml also references this id since there can be more than one table on a sheet. The sheet xml contains all the numeric and textual data, and the table xml records properties of the table as well as some formatting rules for data and text displayed in the table cells.

#### 3.5.1.1 `calculatedColumnFormula` (Calculated Column Formula)

Columns in a table can have cells that are calculated, usually based on values in other cells in the table. This element stores the formula that is used to perform the calculation for each cell in this column.

It shall be understood that formulas which reference columns of this table, shall be calculated using the cells in those columns on the same row of the table as the cell that the formula resides in.

1 See §3.17 for details on valid/invalid formulas.

Parent Elements
tableColumn (§3.5.1.3)

2

Attributes	Description
array (Array)	A Boolean value that indicates whether this formula is an array style formula.  The possible values for this attribute are defined by the XML Schema boolean datatype.

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_TableFormula">
5 <simpleContent>
6 <extension base="ST_Formula">
7 <attribute name="array" type="xsd:boolean" default="false"/>
8 </extension>
9 </simpleContent>
10 </complexType>

```

### 11 3.5.1.2 table (Table)

12 This element is the root element for a table that is not a single cell XML table.

Parent Elements
Root element of SpreadsheetML Table Definitions part

13

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
extLst (Future Feature Data Storage Area)	§3.2.10
sortState (Sort State)	§3.3.1.89
tableColumns (Table Columns)	§3.5.1.4
tableStyleInfo (Table Style)	§3.5.1.5

14

Attributes	Description
comment (Table Comment)	A string representing a textual comment about the table.  Note: this can be used by the spreadsheet application in other UI. For example, there may be name UI that is used to organize defined names and function references, if tables are listed in that UI the comment can give more information about the table.  The maximum length of this string should be 32767 characters.

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
<p>connectionId (Connection ID)</p>	<p>An integer representing an ID to indicate which connection from the connections collection is used by this table.</p> <p>This shall only be used for tables that are based off of xml maps.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
<p>dataCellStyle (Data Style Name)</p>	<p>A string representing the name of the cell style that is applied to the data area cells of the table.</p> <p>If this string is missing or invalid, then the data cell style specified by the current table style should be applied.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
<p>dataDxfId (Data Area Format Id)</p>	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating which format to apply to the data area of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
<p>displayName (Table Name)</p>	<p>A string representing the name of the table. This is the name that shall be used in formula references, and displayed in the UI to the spreadsheet user.</p> <p>This name shall not have any spaces in it, and it must be unique amongst all other displayNames and definedNames in the workbook. The character lengths and restrictions are the same as for definedNames. See <i>SpreadsheetML Reference - Workbook definedNames</i> section for details</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
<p>headerRowBorderDxfId (Header Row Border Format Id)</p>	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating what border formatting to apply to the header row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
<p>headerRowCellStyle (Header Row Style)</p>	<p>A string representing the name of the cell style that is applied to the header row cells of the table.</p> <p>If this string is missing or invalid, then the header row style specified by the current table</p>

Attributes	Description
	<p>style should be applied.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
headerRowCount (Header Row Count)	<p>An integer representing the number of header rows showing at the top of the table. 0 means that the header row is not shown.</p> <p>It is up to the spreadsheet application to determine if numbers greater than 1 are allowed. Unless the spreadsheet application has a feature where there may ever be more than one header row, this number should not be higher than 1.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
headerRowDxfId (Header Row Format Id)	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating which format to apply to the header row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
id (Table Id)	<p>A non zero integer representing the unique identifier for this table. Each table in the workbook shall have a unique id.</p> <p>Note: Ids can be used to refer to the specific table in the workbook. For instance a future records bucket could refer to the table using this id.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
insertRow (Insert Row Showing)	<p>A Boolean value indicating whether the insert row is showing. True when the insert row is showing, false otherwise.</p> <p>The insert row should only be shown if the table has no data.</p> <p>Note: When a user clicks the insert row in the UI, it provides them an easy way to enter data into a table.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
insertRowShift (Insert Row Shift)	<p>A Boolean that indicates whether cells in the sheet had to be inserted when the insert row was shown for this table. True if the cells were shifted, false otherwise.</p> <p>Note: This happens when there are values in cells immediately below the table when the table is created and the insert row is shown. In this case blank cells for the insert row are inserted, and the existing values in the sheet are shifted down by one row to make room.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
name (Name)	<p>A string representing the name of the table that is used to reference the table programmatically through the spreadsheet applications object model. This string shall be unique per table per sheet. It has the same length and character restrictions as for displayName.</p> <p>By default this should be the same as the table's displayName. This name should also be kept in synch with the displayName when the displayName is updated in the UI by the spreadsheet user.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
published (Published)	<p>A Boolean representing whether this table is marked as published for viewing by a server based spreadsheet application. True if it should be viewed by the server spreadsheet application, false otherwise.</p> <p>Note: Such an application might only display objects from the workbook that are marked as published, thus being able to load and calculate the entire workbook but only show the specific items that are marked as published. This can allow the server spreadsheet rendering to provide a more restricted view of the workbook.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ref (Reference)	<p>The range on the relevant sheet that the table occupies expressed using A1 style referencing.</p> <p>The reference shall include the totals row if it is shown.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).</p>
tableBorderDxfId (Table Border Format Id)	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating what border formatting to apply to the borders of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
tableType (Table Type)	<p>An optional enumeration specifying the type or source of the table.</p> <p>Indicates whether the table is based off of an external data query, data in a worksheet, or from an xml data mapped to a worksheet.</p> <p>The possible values for this attribute are defined by the ST_TableType simple type (§3.18.80).</p>
totalsRowBorderDxfId (Totals Row Border Format Id)	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating what border formatting to apply to the totals row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p>

Attributes	Description
	The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
totalsRowCellStyle (Totals Row Style)	<p>A string representing the name of the cell style that is applied to the totals row cells of the table.</p> <p>If this string is missing or invalid, then the totals row style specified by the current table style should be applied.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
totalsRowCount (Totals Row Count)	<p>An integer representing the number of totals rows that shall be shown at the bottom of the table.</p> <p>0 means that the totals row is not shown. It is up to the spreadsheet application to determine if numbers greater than 1 are allowed. Unless the spreadsheet application has a feature where they may ever be more than one totals row, this number should not be higher than 1.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
totalsRowDxfId (Totals Row Format Id)	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating which format to apply to the totals row of this table.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
totalsRowShown (Totals Row Shown)	<p>A Boolean indicating whether the totals row has ever been shown in the past for this table. True if the totals row has been shown, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Table">
 <sequence>
 <element name="autoFilter" type="CT_AutoFilter" minOccurs="0" maxOccurs="1"/>
 <element name="sortState" type="CT_SortState" minOccurs="0" maxOccurs="1"/>
 <element name="tableColumns" type="CT_TableColumns" minOccurs="1" maxOccurs="1"/>
 <element name="tableStyleInfo" type="CT_TableStyleInfo" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="displayName" type="ST_Xstring" use="required"/>
 <attribute name="comment" type="ST_Xstring" use="optional"/>
 <attribute name="ref" type="ST_Ref" use="required"/>
 <attribute name="tableType" type="ST_TableType" use="optional" default="worksheet"/>
 <attribute name="headerRowCount" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="insertRow" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="insertRowShift" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="totalsRowCount" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="totalsRowShown" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="published" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="headerRowDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="dataDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="totalsRowDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="headerRowBorderDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="tableBorderDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="totalsRowBorderDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="headerRowCellStyle" type="ST_Xstring" use="optional"/>
 <attribute name="dataCellStyle" type="ST_Xstring" use="optional"/>
 <attribute name="totalsRowCellStyle" type="ST_Xstring" use="optional"/>
 <attribute name="connectionId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.5.1.3 tableColumn (Table Column)

An element representing a single column for this table.

#### Parent Elements

tableColumns (§3.5.1.4)

#### Child Elements

#### Subclause

calculatedColumnFormula (Calculated Column Formula)

§3.5.1.1

extLst (Future Feature Data Storage Area)

§3.2.10

totalsRowFormula (Totals Row Formula)

§3.5.1.6

xmlColumnPr (XML Column Properties)

§3.5.1.7

#### Attributes

#### Description

Attributes	Description
dataCellStyle (Data Area Style Name)	<p>A string representing the name of the cell style that is applied to the cells in the data area of this table column.</p> <p>If this string is missing or invalid, then the data cell style specified by the current table style should be applied.</p> <p>This cell style should get precedence over the dataCellStyle defined by the table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
dataDxfId (Data & Insert Row Format Id)	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating which format to apply to the data area of this column. This formatting shall also apply to cells on the insert row for this column.</p> <p>The spreadsheet should fail to load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
headerRowCellStyle (Header Row Cell Style)	<p>A string representing the name of the cell style that is applied to the header row cell of this column.</p> <p>If this string is missing or invalid, then header row style specified by the current table style should be applied.</p> <p>This cell style should get precedence over the headerRowCellStyle defined by the table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
headerRowDxfId (Header Row Cell Format Id)	<p>A zero based integer index into the differential formatting records &lt;dxf&gt; in the styleSheet indicating which format to apply to the header cell of this column.</p> <p>The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).</p>
id (Table Field Id)	<p>An integer representing the unique identifier of this column. This shall be unique per table.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
name (Column name)	<p>A string representing the unique caption of the table column. This is what shall be displayed in the header row in the UI, and is referenced through functions. This name shall be unique per table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
queryTableFieldId	<p>An integer representing the query table field ID corresponding to this table column.</p>

Attributes	Description
(Query Table Field Id)	<p>The relationship between this table and the corresponding query table is expressed in <code>_rels</code> part for this table. Each <code>queryTableField</code> has a unique <code>id</code> attribute, and this <code>id</code> is what is referenced here.</p> <p>The possible values for this attribute are defined by the XML Schema <code>unsignedInt</code> datatype.</p>
totalsRowCellStyle (Totals Row Style Name)	<p>A string representing the name of the cell style that is applied to the Totals Row cell of this column.</p> <p>If this string is missing or invalid, then the totals row cell style specified by the current table style should be applied.</p> <p>This cell style should get precedence over the <code>totalsRowCellStyle</code> defined by the table.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§3.18.96).</p>
totalsRowDxfId (Totals Row Format Id)	<p>A zero based integer index into the differential formatting records <code>&lt;dxf&gt;</code> in the <code>styleSheet</code> indicating which format to apply to the totals row cell of this column.</p> <p>The spreadsheet shall not load if this index is out of bounds.</p> <p>The possible values for this attribute are defined by the <code>ST_DxfId</code> simple type (§3.18.26).</p>
totalsRowFunction (Totals Row Function)	<p>An enumeration indicating which type of aggregation to show in the totals row cell for this column.</p> <p>The possible values for this attribute are defined by the <code>ST_TotalsRowFunction</code> simple type (§3.18.83).</p>
totalsRowLabel (Totals Row Label)	<p>A String to show in the totals row cell for this column.</p> <p>This string shall be ignored unless the <code>totalsRowFunction="none"</code> for this column, in which case it is displayed in the totals row.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§3.18.96).</p>
uniqueName (Unique Name)	<p>An optional string representing the unique name of the table column. This string is used to bind the column to a field in an data table, so it shall should only be used when this table's <code>tableType</code> is <code>queryTable</code> or <code>xml</code>.</p> <p>This name shall be unique per table when it is used.</p> <p>For tables created from xml mappings, by default this should be the same as the name of the column, and should be kept in synch with the name of the column if that name is</p>

Attributes	Description
	<p>altered by the spreadsheet application.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TableColumn">
 <sequence>
 <element name="calculatedColumnFormula" type="CT_TableFormula" minOccurs="0" maxOccurs="1"/>
 <element name="totalsRowFormula" type="CT_TableFormula" minOccurs="0" maxOccurs="1"/>
 <element name="xmlColumnPr" type="CT_XmlColumnPr" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="uniqueName" type="ST_Xstring" use="optional"/>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="totalsRowFunction" type="ST_TotalsRowFunction" use="optional" default="none"/>
 <attribute name="totalsRowLabel" type="ST_Xstring" use="optional"/>
 <attribute name="queryTableFieldId" type="xsd:unsignedInt" use="optional"/>
 <attribute name="headerRowDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="dataDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="totalsRowDxfId" type="ST_DxfId" use="optional"/>
 <attribute name="headerRowCellStyle" type="ST_Xstring" use="optional"/>
 <attribute name="dataCellStyle" type="ST_Xstring" use="optional"/>
 <attribute name="totalsRowCellStyle" type="ST_Xstring" use="optional"/>
</complexType>

```

### 3.5.1.4 tableColumns (Table Columns)

An element representing the collection of all table columns for this table.

Parent Elements
table (§3.5.1.2)

Child Elements	Subclause
tableColumn (Table Column)	§3.5.1.3

Attributes	Description
count (Column Count)	<p>An integer representing the total count of how many columns there are in this Table. This count shall include both query-defined and user-defined columns.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableColumns">
 <sequence>
 <element name="tableColumn" type="CT_TableColumn" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.5.1.5 tableStyleInfo (Table Style)

This element describes which style is used to display this table, and specifies which portions of the table have the style applied.

Styles define set of formatting properties that may be easily referenced by cells or other objects in the spreadsheet application. A style can be applied to a table, but tables can define specific parts of the table that should not have the style applied independently of other table parts. For instance a table may not apply the row striping of the style, and may not show the style's formatting of the last column, but will apply the column striping and the formatting to the first column.

#### Parent Elements

table (§3.5.1.2)

#### Attributes

#### Description

name (Style Name)

A string representing the name of the table style to use with this table.

If the style name isn't valid then the spreadsheet application should use default style.

The possible values for this attribute are defined by the ST\_Xstring simple type (§3.18.96).

showColumnStripes (Show Column Stripes)

A Boolean indicating whether column stripe formatting is applied. True when style column stripe formatting is applied, false otherwise.

The possible values for this attribute are defined by the XML Schema boolean datatype.

showFirstColumn (Show First Column)

A Boolean indicating whether the first column in the table should have the style applied. True if the first column has the style applied, false otherwise.

The possible values for this attribute are defined by the XML Schema boolean datatype.

showLastColumn (Show Last Column)

A Boolean indicating whether the last column in the table should have the style applied. True if the last column has the style applied, false otherwise.

The possible values for this attribute are defined by the XML Schema boolean datatype.

showRowStripes (Show Row Stripes)

A Boolean indicating whether row stripe formatting is applied. True when style row stripe formatting is applied, false otherwise.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyleInfo">
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="showFirstColumn" type="xsd:boolean" use="optional"/>
 <attribute name="showLastColumn" type="xsd:boolean" use="optional"/>
 <attribute name="showRowStripes" type="xsd:boolean" use="optional"/>
 <attribute name="showColumnStripes" type="xsd:boolean" use="optional"/>
</complexType>
```

### 3.5.1.6 totalsRowFormula (Totals Row Formula)

This element contains a custom formula for aggregating values from the column.

Each tableColumn has a totalsRowFunction that can be used for simple aggregations such as average, standard deviation, min, max, count, and others. If a more custom calculation is desired, then this element should be used, and the totalsRowFunction shall be set to "custom".

Parent Elements
tableColumn (§3.5.1.3)

Attributes	Description
array (Array)	A Boolean value that indicates whether this formula is an array style formula.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableFormula">
 <simpleContent>
 <extension base="ST_Formula">
 <attribute name="array" type="xsd:boolean" default="false"/>
 </extension>
 </simpleContent>
</complexType>
```

### 3.5.1.7 xmlColumnPr (XML Column Properties)

An element defining the XML column properties for a column. This is only used for tables created from XML mappings.

[Example: Here is a simple example showing a table column that has an xmlColumnPr.

```
<tableColumn id="1" uniqueName="SomeElement" name="SomeElement">
 <xmlColumnPr mapId="1" xpath="/xml/foo/element" xmlDataType="string"/>
</tableColumn>
```

1 *end example]*

Parent Elements
tableColumn (§3.5.1.3)

2

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

3

Attributes	Description								
denormalized (Denormalized)	<p>A Boolean that indicates whether the contents of the column have been filled down due to flattening. True if it has been filled down (denormalized), false otherwise.</p> <p>This should be used when an XML mapping parent value has many children, and both the parent and child fields are mapped to their own column in the table.</p> <p>[Example:  <pre>&lt;Order ID="3"&gt;   &lt;Item&gt;Milk&lt;/Item&gt;   &lt;Item&gt;Bread&lt;/Item&gt;   &lt;Item&gt;Cheese&lt;/Item&gt; &lt;/Order&gt;</pre> </p> <p>The resulting table in the spreadsheet application would have two columns, the first with the item ID, filled down for each item in the table as follows:</p> <table> <tr> <td>Item ID</td><td>Item</td></tr> <tr> <td>3</td><td>Milk</td></tr> <tr> <td>3</td><td>Bread</td></tr> <tr> <td>3</td><td>Cheese</td></tr> </table> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>	Item ID	Item	3	Milk	3	Bread	3	Cheese
Item ID	Item								
3	Milk								
3	Bread								
3	Cheese								
mapId (XML Map Id)	<p>An integer representing the ID of the XML map this table field is associated with.</p> <p>The XML map will be defined in the xml maps part, and the Map element should have the corresponding id.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>								
xmlDataType (XML Data Type)	<p>An enumeration indicating which XML data type is used by this column.</p> <p>The possible values for this attribute are defined by the ST_XmlDataType simple type</p>								

Attributes	Description
	(\$3.18.95).
xpath (XPath)	<p>A string representing the XML path to the element this column is associated with.</p> <p>The spreadsheet application should support XPath limited to the following</p> <ul style="list-style-type: none"> <li>• The XPath is an absolute path to a simple-content element or attribute</li> </ul> <p><i>[Example:</i>  "/ns1:root/ns1:row/ns1:column1" is supported if 'column1' is a child-most node, but not  "/ns1:root/ns1:row" for the same document since 'row' is not a child.  <i>end example]</i></p> <ul style="list-style-type: none"> <li>• The XPath does not express axes, but uses the default child axes</li> </ul> <p><i>[Example:</i>  "/ns1:root/ns1:row" is supported but not "/ns1:root/child::ns1:row"  <i>end example]</i></p> <ul style="list-style-type: none"> <li>• An optional filter can be expressed at the end of the xpath</li> </ul> <p><i>[Example:</i>  "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported but not  "/ns1:root/ns1:row[@foo='abc']/ns1:column1"  <i>end example]</i></p> <ul style="list-style-type: none"> <li>• The filter can only contain a single expression comparing a named attribute to a specific value</li> <li>• Filters are only supported on XPaths that resolve to a simple-content element (not attributes)</li> <li>• The named attribute must be defined as an attribute of the simple-content element</li> <li>• The attribute name must be preceded by the short-hand (@) symbol representing the axes 'attribute'</li> </ul> <p><i>[Example:</i>  "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported not  "/ns1:root/ns1:row/ns1:column1[attribute::foo='abc']"  <i>end example]</i></p> <ul style="list-style-type: none"> <li>• An arbitrary amount of white-space can be embedded between filter tokens</li> </ul> <p><i>[Example:</i>  "/ns1:root/ns1:row/ns1:column1[ @ foo='abc']" is valid</p>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_XmlColumnPr">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="mapId" type="xsd:unsignedInt" use="required"/>
 <attribute name="xpath" type="ST_Xstring" use="required"/>
 <attribute name="denormalized" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="xmlDataType" type="ST_XmlDataType" use="required"/>
</complexType>

```

### 3.5.2 Single Cell Tables

A single cell table is generated from an XML mapping. These really just look like regular cells to the spreadsheet user, but shall be implemented as Tables "under the covers."

These tables don't have the full set of properties that multi cell tables do. They only have the various XML properties, and core table properties (such as id and name) that are needed to create a table and XML mapping. For instance the formatting properties, totals row, and headers row don't exist for the single cell XML tables. The formatting for these cells is maintained in the style sheet.

#### 3.5.2.1 singleXmlCell (Table Properties)

This element represents the table properties for a single cell XML table.

Parent Elements
singleXmlCells (§3.5.2.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
xmlCellPr (Cell Properties)	§3.5.2.3

Attributes	Description
connectionId (Connection ID)	<p>An integer representing an ID to indicate which connection from the connections collection is used by this table.</p> <p>This is only used for tables that are based off of xml maps</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Table Id)	An integer representing the unique identifier of the table.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
r (Reference)	An A1 cell style reference to the cell that the single cell xml table occupies.  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SingleXmlCell">
 <sequence>
 <element name="xmlCellPr" type="CT_XmlCellPr" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="r" type="ST_CellRef" use="required"/>
 <attribute name="connectionId" type="xsd:unsignedInt" use="required"/>
</complexType>

```

### 3.5.2.2 singleXmlCells (Single Cells)

This element is a container for a collection of singleXmlCell tables.

Parent Elements
Root element of SpreadsheetML Single Cell Table Definitions part

Child Elements	Subclause
singleXmlCell (Table Properties)	§3.5.2.1

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SingleXmlCells">
 <sequence>
 <element name="singleXmlCell" type="CT_SingleXmlCell" maxOccurs="unbounded"/>
 </sequence>
</complexType>

```

### 3.5.2.3 xmlCellPr (Cell Properties)

This element stores the XML properties for the cell of a single cell xml table.

Parent Elements
singleXmlCell (§3.5.2.1)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
xmlPr (Column XML Properties)	§3.5.2.4

1

Attributes	Description
id (Table Field Id)	<p>The unique identifier of the XML properties for the cell.</p> <p>This should always be set to the value of 1 since this id is always meant to be for a single cell xml table.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
uniqueName (Unique Table Name)	<p>An optional string representing the unique name of the table column. By default this is the same as the name of the column.</p> <p>This should hold the name of the element or attribute that this cell is referring to in the XML.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_XmlCellPr">
4 <sequence>
5 <element name="xmlPr" type="CT_XmlPr" minOccurs="1" maxOccurs="1"/>
6 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="id" type="xsd:unsignedInt" use="required"/>
9 <attribute name="uniqueName" type="ST_Xstring" use="optional"/>
10 </complexType>

```

### 11 3.5.2.4 xmlPr (Column XML Properties)

12 This element represents the column properties for single cell XML tables.

Parent Elements
xmlCellPr (§3.5.2.3)

13

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

14

Attributes	Description
------------	-------------

Attributes	Description
mapId (XML Map Id)	<p>An integer representing the ID of the XML map this table field is associated with.</p> <p>The XML map will be defined in the xml maps part, and the Map element should have the corresponding id.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
xmlDataType (XML Data Type)	<p>An enumeration indicating which XML data type is used by this column.</p> <p>The possible values for this attribute are defined by the ST_XmlDataType simple type (§3.18.95).</p>
xpath (XPath)	<p>A string representing the XML path to the element this column is associated with.</p> <p>The spreadsheet application should support XPath limited to the following:</p> <ul style="list-style-type: none"> <li>The XPath is an absolute path to a simple-content element or attribute</li> </ul> <p>[Example: "/ns1:root/ns1:row/ns1:column1" is supported if 'column1' is a child-most node, but not "/ns1:root/ns1:row" for the same document since 'row' is not a child. end example]</p> <ul style="list-style-type: none"> <li>The XPath does not express axes, but uses the default child axes</li> </ul> <p>[Example: "/ns1:root/ns1:row" is supported but not "/ns1:root/child::ns1:row" end example]</p> <ul style="list-style-type: none"> <li>An optional filter can be expressed at the end of the xpath</li> </ul> <p>[Example: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported but not "/ns1:root/ns1:row[@foo='abc']/ns1:column1" end example]</p> <ul style="list-style-type: none"> <li>The filter can only contain a single expression comparing a named attribute to a specific value</li> <li>Filters are only supported on XPaths that resolve to a simple-content element (not attributes)</li> <li>The named attribute must be defined as an attribute of the simple-content element</li> <li>The attribute name must be preceded by the short-hand (@) symbol representing the axes 'attribute'</li> </ul> <p>[Example:</p>

Attributes	Description
	<p>"/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported not "/ns1:root/ns1:row/ns1:column1[attribute::foo='abc']" <i>end example</i></p> <ul style="list-style-type: none"> <li>An arbitrary amount of white-space can be embedded between filter tokens</li> </ul> <p>[Example: "/ns1:root/ns1:row/ns1:column1[ @ foo='abc']" is valid <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_XmlPr">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="mapId" type="xsd:unsignedInt" use="required"/>
 <attribute name="xpath" type="ST_Xstring" use="required"/>
 <attribute name="xmlDataType" type="ST_XmlDataType" use="required"/>
</complexType>

```

### 3.6 Calculation Chain

The cells in a workbook can be calculated in different orders depending on various optimizations and dependencies. The calculation chain specifies the order in which the cells in a workbook were last calculated.

The calculation chain only deals with cells that require calculation - i.e., it only deals with cells that contain formulas. It does not track or express dependencies amongst the formulas, but rather only records the order in which the cells were last calculated.

The calculation chain order may change over time. One obvious way this can happen is that new formulas can be added, formulas can be removed or updated. The spreadsheet application may also optionally implement partial calculation as an optimization. Partial calculation is when the spreadsheet only recalculates cells that have had their dependencies or values changed. This way, when a number in a cell is changed, requiring an update to a dependent formula, only the cells that are affected by the update will be recalculated, as opposed to recalculating the entire workbook.

The calculation chain described in this section is not required by the spreadsheet application, but can be used if the spreadsheet application finds it useful. It can be loaded by a spreadsheet application, or the application may optionally construct it at run time in memory based on formula dependencies. Since the xml data described in this section is not strictly required, the spreadsheet application is free to ignore the order in which the calculation chain specifies calculations - i.e., even if the calculation chain is loaded, the spreadsheet application is free to perform calculations in a different order at run time.

[Example:

Consider the following workbook (the formulas shown instead of cell values):

	A	B	C	D	E
1	1	=A1	=B1+A1	=C1+B1+A1	=D1+C1+B1+A1
2					
3					
4					
5	1	=A5	=B5+A5	=C5+B5+A5	=D5+C5+B5+A5
6					
7					

There is a constant entered in A1 and A5, and next to each of those cells are a series of cells which contain formulas that depend on those cells.

After entering the cells on the first row, and then the cells on the 5th row, the calc chain xml looks like this:

```
<calcChain xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/5/main">
 <c r="E5" i="1"/>
 <c r="D5"/>
 <c r="C5"/>
 <c r="B5"/>
 <c r="E1"/>
 <c r="D1"/>
 <c r="C1"/>
 <c r="B1"/>
</calcChain>
```

It is in this order because B1 was calced first (it was the first formula entered in the workbook), followed by C1, D1, and so on. Then B5 was entered in the 5th row, followed by the other cells in the 5th row, ending with E5.

But, after a full recalculation, the spreadsheet application has realized that cells B5:E5 are on the same child chain, and cells B1:E1 are likewise on their own child chain. The xml now looks like this:

```
<calcChain xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/5/main">
 <c r="B1" i="1"/>
 <c r="C1" s="1"/>
 <c r="D1" s="1"/>
 <c r="E1" s="1"/>
 <c r="B5"/>
 <c r="C5" s="1"/>
 <c r="D5" s="1"/>
 <c r="E5" s="1"/>
</calcChain>
```

1 *end example]*

## 2 3.6.1 c (Cell)

3 This element represents a single cell, which shall contain a formula, in the calc chain. Cell's are calculated in the  
4 same order as c attribute is listed in the xml, starting from the top.

Parent Elements
calcChain (§3.6.2)

5

Attributes	Description
a (Array)	<p>A Boolean flag indicating whether the cell's formula is an array formula. True if this cell's formula is an array entered formula, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
i (Sheet Id)	<p>A sheet Id of a sheet the cell belongs to. If this is omitted, it is assumed to be the same as the i value of the previous cell.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
l (New Dependency Level)	<p>A Boolean flag indicating that the cell's formula starts a new dependency level. True if the formula starts a new dependency level, false otherwise.</p> <p>Starting a new dependency level means that all concurrent calculations, and child calculations, must be completed - and the cells have new values - before the calc chain can continue. In other words, this dependency level may depend on levels that came before it, and any later dependency levels may depend on this level; but not later dependency levels can have any calculations started until this dependency level completes.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
r (Cell Reference)	<p>An A-1 style reference to a cell.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
s (Child Chain)	<p>A Boolean flag indicating whether the cell's formula is on a child chain. True if this cell is part of a child chain, false otherwise. If this is omitted, it is assumed to be the same as the s value of the previous cell .</p> <p>A child chain is a list of calculations that occur which depend on the parent to the chain. There shall not be cross dependencies between child chains. Child chains are not the same as dependency levels - a child chain and its parent are all on the same dependency level. Child chains are series of calculations that can be independently farmed out to other threads or processors.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
t (New Thread)	A Boolean flag indicating whether the cell's formula starts a new thread. True if the cell's formula starts a new thread, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalcCell">
 <attribute name="r" type="ST_CellRef" use="required"/>
 <attribute name="i" type="xsd:int" use="optional" default="0"/>
 <attribute name="s" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="l" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="t" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="a" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.6.2 calcChain (Calculation Chain Info)

This element represents the root of the calculation chain.

Parent Elements
Root element of SpreadsheetML Calculation Chain part

Child Elements	Subclause
c (Cell)	§3.6.1
extLst (Future Feature Data Storage Area)	§3.2.10

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalcChain">
 <sequence>
 <element name="c" type="CT_CalcCell" minOccurs="1" maxOccurs="unbounded"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
</complexType>
```

## 3.7 Comments

A comment is a rich text note that is attached to & associated with a cell, separate from other cell content.

Comment content is stored separate from the cell, and is displayed in a drawing object (like a text box) that is separate from, but associated with, a cell. Comments are used as reminders, such as noting how a complex formula works, or to provide feedback to other users. Comments can also be used to explain assumptions made in a formula or to call out something special about the cell.

[Example:

```

1 <comments>
2 <authors>
3 <author>Bob</author>
4 <author>CBR</author>
5 </authors>
6 <commentList>
7 <comment ref="D4" authorId="0">
8 <text>
9 <r>
10 <rPr>
11
12 <sz val="8"/>
13 <color indexed="81"/>
14 <rFont val="Calibri"/>
15 <charset val="1"/>
16 <scheme val="minor"/>
17 </rPr>
18 <t>Bob:</t>
19 </r>
20 <r>
21 <rPr>
22 <sz val="8"/>
23 <color indexed="81"/>
24 <rFont val="Calibri"/>
25 <charset val="1"/>
26 <scheme val="minor"/>
27 </rPr>
28 <t xml:space="preserve">Why such high expense?</t>
29 </r>
30 </text>
31 </comment>
32 </commentList>
33 </comments>

```

*end example]*

This xml sample displays a comment by "Bob" (bolded) that says, "Why such high expense?" (non bolded).

### 3.7.1 author (Author)

This element holds a string representing the name of a single author of comments. Every comment must have an author. The maximum length of the author string is an implementation detail, but a good guideline is 255 chars.

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
authors (§3.7.2)

### 3.7.2 authors (Authors)

This element is a container that holds a list of comment author names. There may be many comment authors per sheet, but each author name must be unique per sheet. The information for each author is stored only once for that sheet, and comments refer to the author by zero based index.

Note that there can be multiple lists of authors per workbook since each sheet contains its own comments part, and each comments part defines a list of authors for comments on that sheet.

Parent Elements
comments (§3.7.5)

Child Elements	Subclause
author (Author)	§3.7.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Authors">
 <sequence>
 <element name="author" type="ST_Xstring" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.7.3 comment (Comment)

This element represents a single user entered comment.. Each comment shall have an author and can optionally contain richly formatted text.

Parent Elements
commentList (§3.7.4)

Child Elements	Subclause
text (Comment Text)	§3.7.6

Attributes	Description
authorId (Author Id)	Required. An unsigned integer which is used as the zero based index into the list of authors for this set of comments.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
guid (Unique Identifier for Comment)	<p>Unique identifier for this comment. The attribute is required and shall be unique across all comments in shared workbooks.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
ref (Cell Reference)	<p>Required. A string that serves as the A1 style reference to the cell that the comment is associated with. May only reference a single cell, not a range of cells, since comments are on a per cell basis.</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Comment">
 <sequence>
 <element name="text" type="CT_Rst" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="ref" type="ST_Ref" use="required"/>
 <attribute name="authorId" type="xsd:unsignedInt" use="required"/>
 <attribute name="guid" type="ST_Guid" use="optional"/>
</complexType>

```

### 3.7.4 commentList (List of Comments)

This element is a container that holds a list of comments for the sheet.

Parent Elements
comments (§3.7.5)

Child Elements	Subclause
comment (Comment)	§3.7.3

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CommentList">
 <sequence>
 <element name="comment" type="CT_Comment" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>

```

### 3.7.5 comments (Comments)

This element is the root container of a set of comments and comment authors for a particular sheet. Each set of comments for a sheet is stored in a separate xml part. The relationship part for a sheet defines a link to the correct comment part for that sheet.

Parent Elements
-----------------

Parent Elements
Root element of SpreadsheetML Comments part

1

Child Elements	Subclause
authors (Authors)	§3.7.2
commentList (List of Comments)	§3.7.4
extLst (Future Feature Data Storage Area)	§3.2.10

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Comments">
4 <sequence>
5 <element name="authors" type="CT_Authors" minOccurs="1" maxOccurs="1"/>
6 <element name="commentList" type="CT_CommentList" minOccurs="1" maxOccurs="1"/>
7 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
8 </sequence>
9 </complexType>

```

### 10 3.7.6 text (Comment Text)

11 This element contains rich text which represents the text of a comment. The maximum length for this text is a  
 12 spreadsheet application implementation detail. A recommended guideline is 32767 chars.

Parent Elements
comment (§3.7.3)

13

Child Elements	Subclause
phoneticPr (Phonetic Properties)	§3.4.3
r (Rich Text Run)	§3.4.4
rPh (Phonetic Run)	§3.4.6
t (Text)	§3.4.12

14 The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_Rst">
16 <sequence>
17 <element name="t" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
18 <element name="r" type="CT_RElt" minOccurs="0" maxOccurs="unbounded"/>
19 <element name="rPh" type="CT_PhoneticRun" minOccurs="0" maxOccurs="unbounded"/>
20 <element name="phoneticPr" minOccurs="0" maxOccurs="1" type="CT_PhoneticPr"/>
21 </sequence>
22 </complexType>

```

## 3.8 Styles

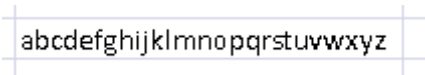

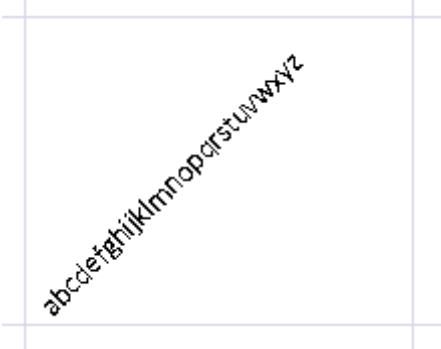

This subclause specifies the possible formatting information for the contents of the cells on a sheet in a SpreadsheetML document.

### 3.8.1 alignment (Alignment)

Formatting information pertaining to text alignment in cells. There are a variety of choices for how text is aligned both horizontally and vertically, as well as indentation settings, and so on.

Parent Elements
dx ( §3.8.14); ndx ( §3.11.1.4); odf ( §3.11.1.6); xf ( §3.8.45)

Attributes	Description
horizontal (Horizontal Alignment)	<p>Specifies the type of horizontal alignment in cells.</p> <p>The possible values for this attribute are defined by the ST_HorizontalAlignment simple type ( §3.18.42).</p>
indent (Indent)	<p>An integer value, where an increment of 1 represents 3 spaces. Indicates the number of spaces (of the normal style font) of indentation for text in a cell. The number of spaces to indent is calculated as following:</p> <p>Number of spaces to indent = indent value * 3</p> <p><i>[Example:</i> For example, an indent value of '1' means that the text begins 3 space widths (of the normal style font) from the edge of the cell. <i>end example]</i></p> <p><i>[Note:</i> The width of one space character is defined by the font. <i>end note]</i></p> <p>Only left, right, and distributed horizontal alignments are supported.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
justifyLastLine (Justify Last Line)	<p>A boolean value indicating if the cells justified or distributed alignment should be used on the last line of text. (This is typical for East Asian alignments but not typical in other contexts.)</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
readingOrder	An integer value indicating whether the reading order (bidirectionality) of the cell is left-

Attributes	Description
(Reading Order)	<p>to-right, right-to-left, or context dependent.</p> <p>0 - Context Dependent 1 - Left-to-Right 2 - Right-to-Left</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
relativeIndent (Relative Indent)	<p>An integer value (used only in a dxf element) to indicate the additional number of spaces of indentation to adjust for text in a cell.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
shrinkToFit (Shrink To Fit)	<p>A boolean value indicating if the displayed text in the cell should be shrunk to fit the cell width. Not applicable when a cell contains multiple lines of text.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
textRotation (Text Rotation)	<p>Text rotation in cells. Expressed in degrees. Values range from 0 to 180. The first letter of the text is considered the center-point of the arc.</p> <p>For 0 - 90, the value represents degrees above horizon. For 91-180 the degrees below the horizon is calculated as:</p> <p>[degrees below horizon] = 90 - textRotation.</p> <p>0</p>  <p>45</p>  <p>90</p>

Attributes	Description
	<div><div><div>abcdefghijklmnopqrstuvwxyz</div></div><div>135</div><div><div>abcdefghijklmnopqrstuvwxyz</div></div><div>180</div><div><div>abcdefghijklmnopqrstuvwxyz</div></div><div>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</div></div>
vertical (Vertical Alignment)	<div>Vertical alignment in cells.</div> <div>The possible values for this attribute are defined by the ST_VerticalAlignment simple</div>

Attributes	Description
	type (§3.18.89).
wrapText (Wrap Text)	A boolean value indicating if the text in a cell should be line-wrapped within the cell.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CellAlignment">
 <attribute name="horizontal" type="ST_HorizontalAlignment" use="optional"/>
 <attribute name="vertical" type="ST_VerticalAlignment" use="optional"/>
 <attribute name="textRotation" type="xsd:unsignedInt" use="optional"/>
 <attribute name="wrapText" type="xsd:boolean" use="optional"/>
 <attribute name="indent" type="xsd:unsignedInt" use="optional"/>
 <attribute name="relativeIndent" type="xsd:int" use="optional"/>
 <attribute name="justifyLastLine" type="xsd:boolean" use="optional"/>
 <attribute name="shrinkToFit" type="xsd:boolean" use="optional"/>
 <attribute name="readingOrder" type="xsd:unsignedInt" use="optional"/>
</complexType>

```

### 3.8.2 b (Bold)

Displays characters in bold face font style.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element.  If omitted, the default value is true.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

### 3.8.3 bgColor (Background Color)

Background color of the cell fill pattern. Cell fill patterns operate with two colors: a background color and a foreground color. These combine together to make a patterned cell fill.

Parent Elements
patternFill (§3.8.32)

Attributes	Description
auto (Automatic)	<p>A boolean value indicating the color is automatic and system color dependent.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indexed (Index)	<p>Indexed color value. Only used for backwards compatibility. References a color in indexedColors.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rgb (Alpha Red Green Blue Color Value)	<p>Standard Alpha Red Green Blue color value (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
theme (Theme Color)	<p>Index into the &lt;clrScheme&gt; collection, referencing a particular &lt;sysClr&gt; or &lt;srgbClr&gt; value expressed in the Theme part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p>[Example:</p> <p>Here are some examples of how to apply tint to color:</p> <p><b>If (tint &lt; 0)</b>  <math display="block">\text{Lum}' = \text{Lum} * (1.0 + \text{tint})</math> <p>For example: Lum = 200; tint = -0.5; Darken 50%  <math display="block">\text{Lum}' = 200 * (0.5) \Rightarrow 100</math> <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black)  <math display="block">\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0</math> <p><b>If (tint &gt; 0)</b>  <math display="block">\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))</math> <p>For example: Lum = 100; tint = 0.75; Lighten 75%</p> </p> </p></p></p>

Attributes	Description
	$\begin{aligned} \text{Lum}' &= 100 * (1-.75) + (\text{HLSMAX} - \text{HLSMAX} * (1-.75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white)</p> $\begin{aligned} \text{Lum}' &= 100 * (1-1) + (\text{HLSMAX} - \text{HLSMAX} * (1-1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <attribute name="auto" type="xsd:boolean" use="optional"/>
 <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
 <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
 <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

### 3.8.4 border (Border)

Expresses a single set of cell border formats (left, right, top, bottom, diagonal). Color is optional. When missing, 'automatic' is implied.

Parent Elements
borders (§3.8.5); dxf (§3.8.14); ndxf (§3.11.1.4); odxf (§3.11.1.6)

Child Elements	Subclause
bottom (Bottom Border)	§3.8.6
diagonal (Diagonal)	§3.8.13
horizontal (Horizontal Inner Borders)	§3.8.24
left (Left Border)	§3.8.27
right (Right Border)	§3.8.35
top (Top Border)	§3.8.43
vertical (Vertical Inner Border)	§3.8.44

Attributes	Description
diagonalDown	A boolean value indicating if the cell's diagonal border includes a diagonal line, starting at

Attributes	Description
(Diagonal Down)	<p>the top left corner of the cell and moving down to the bottom right corner of the cell.</p> <p>[Example:</p> <p>This example shows a thin diagonal down line:</p>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
diagonalUp (Diagonal Up)	<p>A boolean value indicating if the cell's diagonal border includes a diagonal line, starting at the bottom left corner of the cell and moving up to the top right corner of the cell.</p> <p>[Example:</p> <p>This example shows a thin diagonal up line:</p>  <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
outline (Outline)	<p>A boolean value indicating if left, right, top, and bottom borders should be applied only to outside borders of a cell range.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
 <sequence>
 <element name="left" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 <element name="right" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 <element name="top" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 <element name="bottom" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 <element name="diagonal" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 <element name="vertical" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 <element name="horizontal" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="diagonalUp" type="xsd:boolean" use="optional"/>
 <attribute name="diagonalDown" type="xsd:boolean" use="optional"/>
 <attribute name="outline" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.8.5 borders (Borders)

This element contains borders formatting information, specifying all border definitions for all cells in the workbook.

*[Example:* In this example the first border definition specifies that there are no borders, the second definition specifies that there is a thin bottom border and medium right border, and the third definition specifies that there is a double top border.

```
<borders count="3">
 <border>
 <left/>
 <right/>
 <top/>
 <bottom/>
 <diagonal/>
 </border>
 <border>
 <left/>
 <right style="medium">
 <color indexed="64"/>
 </right>
 <top/>
 <bottom style="thin">
 <color indexed="64"/>
 </bottom>
 <diagonal/>
 </border>
```

```

1 <border>
2 <left/>
3 <right/>
4 <top style="double">
5 <color auto="1"/>
6 </top>
7 <bottom/>
8 <diagonal/>
9 </border>
10 </borders>

```

*end example]*

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
border (Border)	§3.8.4

Attributes	Description
count (Border Count)	Count of border elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_Borders">
16 <sequence>
17 <element name="border" type="CT_Border" minOccurs="0" maxOccurs="unbounded"/>
18 </sequence>
19 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
20 </complexType>

```

### 3.8.6 bottom (Bottom Border)

This element specifies the color and line style for the bottom border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

1

Attributes	Description
style (Line Style)	The line style for this border.  The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

2 The following XML Schema fragment defines the contents of this element:

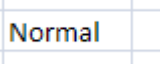

```
3 <complexType name="CT_BorderPr">
4 <sequence>
5 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
8 </complexType>
```

9 **3.8.7 cellStyle (Cell Style)**

10 This element expresses the name and related formatting records for a named cell style in this workbook.

11 The built-in cell styles are written here by name, but the corresponding formatting records are assumed rather  
12 than explicitly written. Following is a listing of each of the built-in cell style definitions, whose normative  
13 definition is in Annex D. Also following is a table mapping the builtinId value to the cell style name.

14 For all built-in cell styles, the builtinId determines the style, not the name. For all cell styles, Normal is applied  
15 by default.

builtinId	Cell Style Name	[Example: (informative)]
0	Normal	
1	RowLevel_ + level #	Depends on level:  1 =  2 =  3 =  4 =  5 =  6 =

builtinId	Cell Style Name	[Example: (informative)]
		<div>RowLevel_7</div> <div>7 =</div>
2	ColLevel_ + level #	Depends on level: <div>ColLevel_1</div> <div>1 =</div> <div>ColLevel_2</div> <div>2 =</div> <div>ColLevel_3</div> <div>3 =</div> <div>ColLevel_4</div> <div>4 =</div> <div>ColLevel_5</div> <div>5 =</div> <div>ColLevel_6</div> <div>6 =</div> <div>ColLevel_7</div> <div>7 =</div>
3	Comma	<div>1,234.00</div>
4	Currency	<div>\$1,234.00</div>
5	Percent	<div>123400%</div>
6	Comma [0]	<div>1,234</div>
7	Currency [0]	<div>\$ 1,234</div>
8	Hyperlink	<div><a href="#">hyperlink</a></div>
9	Followed Hyperlink	<div><a href="#">followed hyperlink</a></div>
10	Note	<div>Cell Style</div>
11	Warning Text	<div>Cell Style</div>

builtinId	Cell Style Name	[Example: (informative)]
15	Title	Cell Style
16	Heading 1	Cell Style
17	Heading 2	Cell Style
18	Heading 3	Cell Style
19	Heading 4	Cell Style
20	Input	Cell Style
21	Output	Cell Style
22	Calculation	Cell Style
23	Check Cell	Cell Style
24	Linked Cell	Cell Style
25	Total	Cell Style
26	Good	Cell Style
27	Bad	Cell Style
28	Neutral	Cell Style
29	Accent1	Cell Style
30	20% - Accent1	Cell Style

builtinId	Cell Style Name	[Example: (informative)]
31	40% - Accent1	Cell Style
32	60% - Accent1	Cell Style
33	Accent2	Cell Style
34	20% - Accent2	Cell Style
35	40% - Accent2	Cell Style
36	60% - Accent2	Cell Style
37	Accent3	Cell Style
38	20% - Accent3	Cell Style
39	40% - Accent3	Cell Style
40	60% - Accent3	Cell Style
41	Accent4	Cell Style
42	20% - Accent4	Cell Style
43	40% - Accent4	Cell Style
44	60% - Accent4	Cell Style
45	Accent5	Cell Style
46	20% - Accent5	Cell Style
47	40% - Accent5	Cell Style

builtinId	Cell Style Name	[Example: (informative)]
48	60% - Accent5	Cell Style
49	Accent6	Cell Style
50	20% - Accent6	Cell Style
51	40% - Accent6	Cell Style
52	60% - Accent6	Cell Style
53	Explanatory Text	Cell Style

#### Parent Elements

cellStyles (§3.8.8)

#### Child Elements

#### Subclause

extLst (Future Feature Data Storage Area)

§3.2.10

Attributes	Description
builtinId (Built-In Style Id)	<p>The index of a built-in cell style:</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
customBuiltin (Custom Built In)	<p>True indicates that this built-in cell style has been customized.</p> <p>By default built-in styles are not persisted when not in use. This flag indicates that a built-in style has been modified, and therefore should be saved with the workbook, even if not currently in use.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hidden (Hidden Style)	<p>If 'true' do not show this style in the application UI.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
iLevel (Outline Style)	<p>Indicates that this formatting is for an outline style . When styles are applied to outline levels (using the outline feature), this value is set and the formatting specified on this cell</p>

Attributes	Description
	style is applied to the corresponding level of the outline.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (User Defined Cell Style)	The name of the cell style.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
xfId (Format Id)	Zero-based index referencing an xf record in the cellStyleXfs collection. This is used to determine the formatting defined for this named cell style.  The possible values for this attribute are defined by the ST_CellStyleXfId simple type (§3.18.11).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CellStyle">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="xfId" type="ST_CellStyleXfId" use="required"/>
 <attribute name="builtinId" type="xsd:unsignedInt" use="optional"/>
 <attribute name="iLevel" type="xsd:unsignedInt" use="optional"/>
 <attribute name="hidden" type="xsd:boolean" use="optional"/>
 <attribute name="customBuiltin" type="xsd:boolean" use="optional"/>
</complexType>

```

### 3.8.8 cellStyles (Cell Styles)

This element contains the named cell styles, consisting of a sequence of named style records. A named cell style is a collection of direct or themed formatting (e.g., cell border, cell fill, and font type/size/style) grouped together into a single named style, and can be applied to a cell.

[Example: For example, "Normal", "Heading 1", "Title", and "20% Accent1" are named cell styles expressed below. They have builtinId's associated with them, and use xfId to reference the specific formatting elements pertaining to the particular style. The xfId is a zero-based index, referencing an xf record in the cellStyleXfs collection.

```

<cellStyles count="4">
 <cellStyle name="20% - Accent1" xfId="3" builtinId="30"/>
 <cellStyle name="Heading 1" xfId="2" builtinId="16"/>
 <cellStyle name="Normal" xfId="0" builtinId="0"/>
 <cellStyle name="Title" xfId="1" builtinId="15"/>
</cellStyles>

```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
cellStyle (Cell Style)	§3.8.7

Attributes	Description
count (Style Count)	Count of style elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellStyles">
 <sequence>
 <element name="cellStyle" type="CT_CellStyle" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.8.9 cellStyleXfs (Formatting Records)

This element contains the master formatting records (xf's) which define the formatting for all named cell styles in this workbook. Master formatting records reference individual elements of formatting (e.g., number format, font definitions, cell fills, etc) by specifying a zero-based index into those collections. Master formatting records also specify whether to apply or ignore particular aspects of formatting, for example whether to apply a border or not.

A cell can have both direct formatting (e.g., bold) and a cell style (e.g., Explanatory) applied to it. Therefore, both the cell style xf records and cell xf records must be read to understand the full set of formatting applied to a cell.

*[Example:* This example shows 4 master formatting records, each defining formatting for a named cell style (expressed in the cellStyles collection). Note that 0th record does not express any "apply" attributes, while the other records do express "apply" attribute values. For example, the last record specifies that number format, alignment, and protection formatting will not be applied to the cell, even when that information is specified in related formatting records.

```
<cellStyleXfs count="4">
 <xf numFmtId="0" fontId="0" fillId="0" borderId="0"/>
 <xf numFmtId="0" fontId="2" fillId="0" borderId="0" applyNumberFormat="0"
 applyFill="0" applyBorder="0" applyAlignment="0" applyProtection="0"/>
 <xf numFmtId="0" fontId="3" fillId="0" borderId="1" applyNumberFormat="0"
 applyFill="0" applyAlignment="0" applyProtection="0"/>
```

```

1 <xf numFmtId="0" fontId="4" fillId="2" borderId="2" applyNumberFormat="0"
2 applyAlignment="0" applyProtection="0"/>
3 </cellStyleXfs>

```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
xf (Format)	§3.8.45

Attributes	Description
count (Style Count)	Count of cell style (xf) elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

8 <complexType name="CT_CellStyleXfs">
9 <sequence>
10 <element name="xf" type="CT_Xf" minOccurs="1" maxOccurs="unbounded"/>
11 </sequence>
12 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
13 </complexType>

```

### 3.8.10 cellXfs (Cell Formats)

This element contains the master formatting records (xf) which define the formatting applied to cells in this workbook. These records are the starting point for determining the formatting for a cell. Cells in the Sheet Part reference the xf records by zero-based index.

A cell can have both direct formatting (e.g., bold) and a cell style (e.g., Explanatory) applied to it. Therefore, both the cell style xf records and cell xf records must be read to understand the full set of formatting applied to a cell.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
xf (Format)	§3.8.45

Attributes	Description
count (Format Count)	Count of xf elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellXfs">
 <sequence>
 <element name="xf" type="CT_Xf" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.8.11 colors (Colors)

Color information associated with this stylesheet. This collection is written whenever the legacy color palette has been modified (backwards compatibility settings) or a custom color has been selected while using this workbook.

When the color palette is modified, the indexedColors collection is written. When a custom color has been selected, the mruColors collection is written.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
indexedColors (Color Indexes)	§3.8.26
mruColors (MRU Colors)	§3.8.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
 <sequence>
 <element name="indexedColors" type="CT_IndexedColors" minOccurs="0" maxOccurs="1"/>
 <element name="mruColors" type="CT_MRUColors" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 3.8.12 condense (Condense)

Macintosh compatibility setting. Represents special word/character rendering on Macintosh, when this flag is set. The effect is to condense the text (squeeze it together). SpreadsheetML applications are not required to render according to this flag.

Parent Elements
-----------------

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.8.13 diagonal (Diagonal)

This element specifies the color and line style for the diagonal border(s) of a cell, possibly including diagonally up and diagonally down. The line style for diagonal up and diagonal down lines must be the same.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

### 3.8.14 dxf (Formatting)

A single dxf record, expressing incremental formatting to be applied.

Parent Elements
dxfs (§3.8.15); rfmt (§3.11.1.17)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
border (Border)	§3.8.4
extLst (Future Feature Data Storage Area)	§3.2.10
fill (Fill)	§3.8.19
font (Font)	§3.8.21
numFmt (Number Format)	§3.8.30
protection (Protection Properties)	§3.8.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxf">
 <sequence>
 <element name="font" type="CT_Font" minOccurs="0" maxOccurs="1"/>
 <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
 <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="1"/>
 <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
 <element name="border" type="CT_Border" minOccurs="0" maxOccurs="1"/>
 <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 3.8.15 dxfs (Formats)

This element contains the master differential formatting records (dxf's) which define formatting for all non-cell formatting in this workbook. Whereas xf records fully specify a particular aspect of formatting (e.g., cell borders) by referencing those formatting definitions elsewhere in the Styles part, dxf records specify incremental (or differential) aspects of formatting directly inline within the dxf element. The dxf formatting is to be applied on top of or in addition to any formatting already present on the object using the dxf record.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
dxf (Formatting)	§3.8.14

Attributes	Description
------------	-------------

Attributes	Description
count (Format Count)	Count of dxf elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxfs">
 <sequence>
 <element name="dxf" type="CT_Dxf" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.8.16 extend (Extend)

This element specifies a compatibility setting used for previous spreadsheet applications, resulting in special word/character rendering on those legacy applications, when this flag is set. The effect extends or stretches out the text. SpreadsheetML applications are not required to render according to this flag.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element.  If omitted, the default value is true.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.8.17 family (Font Family)

The font family this font belongs to. A font family is a set of fonts having common stroke width and serif characteristics. This is system level font information. The font name overrides when there are conflicting values.

Value	Font Family
0	Not applicable.
1	Roman
2	Swiss

Value	Font Family
3	Modern
4	Script
5	Decorative

1

Parent Elements
font (§3.8.21); rPr (§3.4.7)

2

Attributes	Description
val (Value)	<p>The value of an integer, where each value corresponds to a different character set. Valid values are 0 to 255.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_IntProperty">
5 <attribute name="val" type="xsd:int" use="required"/>
6 </complexType>
```

### 7 3.8.18 fgColor (Foreground Color)

8 Foreground color of the cell fill pattern. Cell fill patterns operate with two colors: a background color and a  
9 foreground color. These combine together to make a patterned cell fill.

Parent Elements
patternFill (§3.8.32)

10

Attributes	Description
auto (Automatic)	<p>A boolean value indicating the color is automatic and system color dependent.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indexed (Index)	<p>Indexed color value. Only used for backwards compatibility. References a color in indexedColors.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rgb (Alpha Red Green Blue Color Value)	<p>Standard Alpha Red Green Blue color value (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>

Attributes	Description
theme (Theme Color)	<p>Index into the &lt;clrScheme&gt; collection, referencing a particular &lt;sysClr&gt; or &lt;srgbClr&gt; value expressed in the Theme part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
tint (Tint)	<p>Specifies the tint value applied to the color.</p> <p>If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied.</p> <p>The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change.</p> <p>In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255.</p> <p><i>[Example:</i></p> <p>Here are some examples of how to apply tint to color:</p> <p><b>If (tint &lt; 0)</b></p> $\text{Lum}' = \text{Lum} * (1.0 + \text{tint})$ <p>For example: Lum = 200; tint = -0.5; Darken 50%</p> $\text{Lum}' = 200 * (0.5) \Rightarrow 100$ <p>For example: Lum = 200; tint = -1.0; Darken 100% (make black)</p> $\text{Lum}' = 200 * (1.0 - 1.0) \Rightarrow 0$ <p><b>If (tint &gt; 0)</b></p> $\text{Lum}' = \text{Lum} * (1.0 - \text{tint}) + (\text{HLSMAX} - \text{HLSMAX} * (1.0 - \text{tint}))$ <p>For example: Lum = 100; tint = 0.75; Lighten 75%</p> $\begin{aligned} \text{Lum}' &= 100 * (1 - 0.75) + (\text{HLSMAX} - \text{HLSMAX} * (1 - 0.75)) \\ &= 100 * .25 + (255 - 255 * .25) \\ &= 25 + (255 - 63) = 25 + 192 = 217 \end{aligned}$ <p>For example: Lum = 100; tint = 1.0; Lighten 100% (make white)</p> $\begin{aligned} \text{Lum}' &= 100 * (1 - 1) + (\text{HLSMAX} - \text{HLSMAX} * (1 - 1)) \\ &= 100 * 0 + (255 - 255 * 0) \\ &= 0 + (255 - 0) = 255 \end{aligned}$ <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <attribute name="auto" type="xsd:boolean" use="optional"/>
 <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
 <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
 <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

### 3.8.19 fill (Fill)

This element specifies fill formatting.

Parent Elements
dxfl (§3.8.14); fills (§3.8.20); ndxfl (§3.11.1.4); odxfl (§3.11.1.6)

Child Elements	Subclause
gradientFill (Gradient)	§3.8.23
patternFill (Pattern)	§3.8.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fill">
 <choice minOccurs="1" maxOccurs="1">
 <element name="patternFill" type="CT_PatternFill" minOccurs="0" maxOccurs="1"/>
 <element name="gradientFill" type="CT_GradientFill" minOccurs="0" maxOccurs="1"/>
 </choice>
</complexType>
```

### 3.8.20 fills (Fills)

This element defines the cell fills portion of the Styles part, consisting of a sequence of fill records. A cell fill consists of a background color, foreground color, and pattern to be applied across the cell.

*[Example: This cell has a yellow fill:*

This is the corresponding XML:

```
<fill>
 <patternFill patternType="solid">
 <fgColor rgb="FFFFFFF00"/>
 <bgColor indexed="64"/>
 </patternFill>
</fill>
```

This cell has a yellow fill with a thin horizontal crosshatch pattern applied (patternType = lightGrid):

This is the corresponding XML:

```
<fill>
 <patternFill patternType="lightGrid">
 <bgColor rgb="FFFFFF00"/>
 </patternFill>
</fill>
```

*end example]*

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
fill (Fill)	§3.8.19

Attributes	Description
count (Fill Count)	Count of fill elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fills">
 <sequence>
 <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.8.21 font (Font)

This element defines the properties for one of the fonts used in this workbook.

Parent Elements
dxf (§3.8.14); fonts (§3.8.22); ndxf (§3.11.1.4); odf (§3.11.1.6)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
b (Bold)	§3.8.2
charset (Character Set)	§3.4.1
color (Data Bar Color)	§3.3.1.14
condense (Condense)	§3.8.12
extend (Extend)	§3.8.16
family (Font Family)	§3.8.17
i (Italic)	§3.8.25
name (Font Name)	§3.8.29
outline (Outline)	§3.4.2
scheme (Scheme)	§3.8.36
shadow (Shadow)	§3.8.37
strike (Strike Through)	§3.4.10
sz (Font Size)	§3.4.11
u (Underline)	§3.4.13
vertAlign (Vertical Alignment)	§3.4.14

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Font">
 <choice maxOccurs="unbounded">
 <element name="name" type="CT_FontName" minOccurs="0" maxOccurs="1"/>
 <element name="charset" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
 <element name="family" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
 <element name="b" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="i" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="strike" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="outline" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="shadow" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="condense" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="extend" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="sz" type="CT_FontSize" minOccurs="0" maxOccurs="1"/>
 <element name="u" type="CT_UnderlineProperty" minOccurs="0" maxOccurs="1"/>
 <element name="vertAlign" type="CT_VerticalAlignFontProperty" minOccurs="0" maxOccurs="1"/>
 <element name="scheme" type="CT_FontScheme" minOccurs="0" maxOccurs="1"/>
 </choice>
</complexType>

```

### 3.8.22 fonts (Fonts)

This element contains all font definitions for this workbook.

[Example: This example expresses two fonts in the workbook. A Calibri family font, with font size of 11, and an Arial family font, with font size 12. The second font has strikethrough applied.]

```
1 <fonts count="2">
2
3 <sz val="11"/>
4 <color theme="1"/>
5 <name val="Calibri"/>
6 <family val="2"/>
7 <scheme val="minor"/>
8
9
10 <strike/>
11 <sz val="12"/>
12 <color theme="1"/>
13 <name val="Arial"/>
14 <family val="2"/>
15
16 </fonts>
```

17 *end example]*

Parent Elements
styleSheet (§3.8.39)

18

Child Elements	Subclause
font (Font)	§3.8.21

19

Attributes	Description
count (Font Count)	Count of font elements.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_Fonts">
22 <sequence>
23 <element name="font" type="CT_Font" minOccurs="0" maxOccurs="unbounded"/>
24 </sequence>
25 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
26 </complexType>
```

27 **3.8.23 gradientFill (Gradient)**

28 This element defines a gradient-style cell fill. Gradient cell fills can use one or two colors as the end points of  
29 color interpolation.

1 *[Example:*

2 This example shows a gradient cell fill, with color green at the top transitioning into blue at the bottom.

3  
4 This is the XML:

```
5 <fill>
6 <gradientFill degree="90">
7 <stop position="0">
8 <color rgb="FF92D050"/>
9 </stop>
10 <stop position="1">
11 <color rgb="FF0070C0"/>
12 </stop>
13 </gradientFill>
14 </fill>
```

15 This example shows a gradient cell fill, from the center. Note the left, right, top, and bottom values (and see  
16 explanation in the attribute section):

```
17
18 <fill>
19 <gradientFill type="path" left="0.2" right="0.8" top="0.2" bottom="0.8">
20 <stop position="0">
21 <color theme="0"/>
22 </stop>
23 <stop position="1">
24 <color theme="4"/>
25 </stop>
26 </gradientFill>
27 </fill>
```

28 *end example]*

#### Parent Elements

Parent Elements
fill (§3.8.19)

1

Child Elements	Subclause
stop (Gradient Stop)	§3.8.38

2

Attributes	Description
bottom (Bottom Convergence)	<p>Valid values are 0 to 1. Specifies in percentage format (from the top to the bottom) the position of the bottom edge of the inner rectangle (color 1). For bottom, 0 means the bottom edge of the inner rectangle is on the top edge of the cell, and 1 means it is on the bottom edge of the cell.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
degree (Linear Gradient Degree)	<p>Angle of the linear gradient - vertical, horizontal, diagonal.</p> <p><i>[Example:</i>  Note: in these examples, color 1 is white and color 2 is blue.</p> <p>90 = Horizontal &amp; color 1 to color 2</p>  <p>270 = Horizontal &amp; color 1 to color 2</p>  <p>0 = Vertical &amp; color 1 to color 2</p>  <p>180 = Vertical &amp; color 1 to color 2</p>  <p>45 = Diagonal Up &amp; top to bottom (color 1 to color 2)</p> <p>225 = Diagonal Up &amp; bottom to top (color 1 to color 2)</p> <p>135 = Diagonal Down &amp; top to bottom (color 1 to color 2)</p> <p>315 = Diagonal Down &amp; bottom to top (color 1 to color 2)</p> <p><i>end example]</i></p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.
left (Left Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the left to the right) the position of the left edge of the inner rectangle (color 1). For left, 0 means the left edge of the inner rectangle is on the left edge of the cell, and 1 means it is on the right edge of the cell. (applies to From Corner and From Center gradients).  The possible values for this attribute are defined by the XML Schema double datatype.
right (Right Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the left to the right) the position of the right edge of the inner rectangle (color 1). For right, 0 means the right edge of the inner rectangle is on the left edge of the cell, and 1 means it is on the right edge of the cell. (applies to From Corner and From Center gradients).  The possible values for this attribute are defined by the XML Schema double datatype.
top (Top Gradient Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the top to the bottom) the position of the top edge of the inner rectangle (color 1). For top, 0 means the top edge of the inner rectangle is on the top edge of the cell, and 1 means it is on the bottom edge of the cell. (applies to From Corner and From Center gradients).  The possible values for this attribute are defined by the XML Schema double datatype.
type (Gradient Fill Type)	Type of this gradient fill.  The possible values for this attribute are defined by the ST_GradientType simple type (§3.18.38).

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_GradientFill">
3 <sequence>
4 <element name="stop" type="CT_GradientStop" minOccurs="0" maxOccurs="unbounded"/>
5 </sequence>
6 <attribute name="type" type="ST_GradientType" use="optional" default="linear"/>
7 <attribute name="degree" type="xsd:double" use="optional" default="0"/>
8 <attribute name="left" type="xsd:double" use="optional" default="0"/>
9 <attribute name="right" type="xsd:double" use="optional" default="0"/>
10 <attribute name="top" type="xsd:double" use="optional" default="0"/>
11 <attribute name="bottom" type="xsd:double" use="optional" default="0"/>
12 </complexType>

```

### 13 3.8.24 horizontal (Horizontal Inner Borders)

14 This element specifies the color and line style for the horizontal inner border(s) of a range of cells. Used in the  
15 context of dxf elements only. For example, see the borders definitions for **TableStyleMedium28**.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

### 3.8.25 i (Italic)

Displays characters in italic font style. The italic style is defined by the font at a system level and is not specified by this specification.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

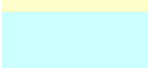

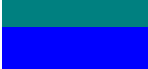

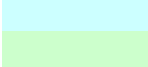

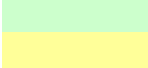

### 3.8.26 indexedColors (Color Indexes)

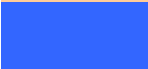

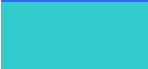

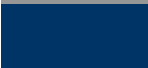

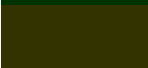

A deprecated indexing scheme for colours that is still required for some records, and for backwards compatibility with legacy formats.

- 1 This element contains a sequence of RGB color values that correspond to color indexes (zero-based). When  
2 using the default indexed color palette, the values are not written out, but instead are implied. When the color  
3 palette has been modified from default, then the entire color palette is written out.
- 4 Here is the table of default mappings from indexed color value to ARGB value. Note that 0-7 are redundant of 8-  
5 15 to preserve backwards compatibility.

Color Index	ARGB Value	[Example:
indexed="0"	00000000	
indexed="1"	00FFFFFF	
indexed="2"	00FF0000	
indexed="3"	0000FF00	
indexed="4"	000000FF	
indexed="5"	00FFFF00	
indexed="6"	00FF00FF	
indexed="7"	0000FFFF	
(none)	(none)	
indexed="8"	00000000	
indexed="9"	00FFFFFF	
indexed="10"	00FF0000	
indexed="11"	0000FF00	
indexed="12"	000000FF	
indexed="13"	00FFFF00	
indexed="14"	00FF00FF	
indexed="15"	0000FFFF	
indexed="16"	00800000	
indexed="17"	00008000	
indexed="18"	00000080	

indexed="19"	00808000	
indexed="20"	00800080	
indexed="21"	00008080	
indexed="22"	00C0C0C0	
indexed="23"	00808080	
indexed="24"	009999FF	
indexed="25"	00993366	
indexed="26"	00FFFFCC	
indexed="27"	00CCFFFF	
indexed="28"	00660066	
indexed="29"	00FF8080	
indexed="30"	000066CC	
indexed="31"	00CCCCFF	
indexed="32"	00000080	
indexed="33"	00FF00FF	
indexed="34"	00FFFF00	
indexed="35"	0000FFFF	
indexed="36"	00800080	
indexed="37"	00800000	
indexed="38"	00008080	
indexed="39"	000000FF	
indexed="40"	0000CCFF	
indexed="41"	00CCFFFF	
indexed="42"	00CCFFCC	
indexed="43"	00FFFF99	

indexed="44"	0099CCFF	
indexed="45"	00FF99CC	
indexed="46"	00CC99FF	
indexed="47"	00FFCC99	
indexed="48"	003366FF	
indexed="49"	0033CCCC	
indexed="50"	0099CC00	
indexed="51"	00FFCC00	
indexed="52"	00FF9900	
indexed="53"	00FF6600	
indexed="54"	00666699	
indexed="55"	00969696	
indexed="56"	00003366	
indexed="57"	00339966	
indexed="58"	00003300	
indexed="59"	00333300	
indexed="60"	00993300	
indexed="61"	00993366	
indexed="62"	00333399	
indexed="63"	00333333	
indexed="64"	System Foreground	n/a
indexed="65"	System Background	n/a

1

Parent Elements
colors (§3.8.11)

2

Child Elements	Subclause
rgbColor (RGB Color)	§3.8.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexedColors">
 <sequence>
 <element name="rgbColor" type="CT_RgbColor" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.8.27 left (Left Border)

This element specifies the color and line style for the left border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

### 3.8.28 mruColors (MRU Colors)

This element contains sequence of RGB values that correspond to custom colors selected by the user for this workbook.

Parent Elements
colors (§3.8.11)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MRUColors">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.8.29 name (Font Name)

This element specifies the face name of this font.

Parent Elements
font (§3.8.21)

Attributes	Description
val (String Value)	<p>A string representing the name of the font. If the font doesn't exist (because it isn't installed on the system), or the charset is invalid for that font, then another font should be substituted.</p> <p>The string length for this attribute shall be 0 to 31 characters.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontName">
 <attribute name="val" type="ST_Xstring" use="required"/>
</complexType>
```

### 3.8.30 numFmt (Number Format)

This element specifies number format properties which indicate how to format and render the numeric value of a cell.

Following is a listing of number formats whose formatCode value is implied rather than explicitly saved in the file. In this case a numFmtId value is written on the xf record, but no corresponding numFmt element is written. Some of these Ids are interpreted differently, depending on the UI language of the implementing application.

#### All Languages

ID	formatCode
----	------------

ID	formatCode
0	General
1	0
2	0.00
3	#,##0
4	#,##0.00
9	0%
10	0.00%
11	0.00E+00
12	# ?/?
13	# ??/??
14	mm-dd-yy
15	d-mmm-yy
16	d-mmm
17	mmm-yy
18	h:mm AM/PM
19	h:mm:ss AM/PM
20	h:mm
21	h:mm:ss
22	m/d/yy h:mm
37	#,##0 ;(#,##0)
38	#,##0 ;[Red](#,##0)
39	#,##0.00;(#,##0.00)
40	#,##0.00;[Red](#,##0.00)
45	mm:ss
46	[h]:mm:ss
47	mmss.0
48	##0.0E+0
49	@

- 1
- 2 **"General" Format**
- 3 Some additional comments about the "General" number format are appropriate.

The primary goal when a cell is using "General" formatting is to render the cell content without user-specified guidance to the best ability of the application.

*Alignment*

(Specified for Left-to-Right mode)

- Strings: left aligned
- Boolean/error values: centered
- Numbers: right aligned
- Dates: do not follow the "General" format, instead automatically convert to date formatting.

*Numbers*

The application shall attempt to display the full number up to 11 digits (inc. decimal point). If the number is too large, the application shall attempt to show exponential format. If the number has too many significant digits, the display shall be truncated. The optimal method of display is based on the available cell width. If the number cannot be displayed using any of these formats in the available width, the application shall show "#" across the width of the cell.

Conditions for switching to exponential format:

14. The cell value must have at least five digits for xE-xx
15. If the exponent is bigger than the size allowed, a floating point number cannot fit, so try exponential notation.
16. Similarly, for negative exponents, check if there is space for even one (non-zero) digit in floating point format.
17. Finally, if there isn't room for all of the significant digits in floating point format (for a negative exponent), exponential format shall display more digits if the exponent is less than -3. (The 3 is because E-xx takes 4 characters, and the leading 0 in floating point takes only 1 character. Thus, for an exponent less than -3, there is more than 3 additional leading 0's, more than enough to compensate for the size of the E-xx.)

Floating point rule:

For general formatting in cells, max overall length for cell display is 11, not including negative sign, but includes leading zeros and decimal separator.

Parent Elements
dxfl (§3.8.14); ndxfl (§3.11.1.4); numFmts (§3.8.31); odxfl (§3.11.1.6)

2

Attributes	Description
formatCode (Number Format Code)	The number format code for this number format.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
numFmtId (Number Format Id)	Id used by the master style records (xf's) to reference this number format.  The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_NumFmt">
5 <attribute name="numFmtId" type="ST_NumFmtId" use="required"/>
6 <attribute name="formatCode" type="ST_Xstring" use="required"/>
7 </complexType>

```

### 8 3.8.31 numFmts (Number Formats)

9 This element defines the number formats in this workbook, consisting of a sequence of numFmt records, where  
10 each numFmt record defines a particular number format, indicating how to format and render the numeric  
11 value of a cell.

12 *[Example:*

13 This cell is formatting as US currency:

\$1.23
--------

The XML expressing this format shows that the formatId is "166" and the decoded formatCode is \$#,##0.00

```
<numFmts count="1">
 <numFmt numFmtId="166" formatCode=""$";#,##0.00"/>
</numFmts>
```

end example]

Number Format Codes

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. To skip a section, the ending semicolon for that section must be written.

The first section, "Format for positive numbers", is the format code that applies to the cell when the cell value contains a positive number.

The second section, "Format for negative numbers", is the format code that applies to the cell when the cell value contains a negative number.

The third section, "Format for zeros", is the format code that applies to the cell when the cell value is zero.

The fourth, and last, section, "Format for text", is the format code that applies to the cell when the cell value is text.

The & (ampersand) text operator is used to join, or concatenate, two values.

The following table describes the different symbols that are available for use in custom number formats.

Format symbol	Description and result
0	Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format #.00
#	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. For example, if the custom format is #.##, and 8.9 is in the cell, the number 8.9 is displayed.

Format symbol	Description and result
?	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. For example, the custom format 0.0? aligns the decimal points for the numbers 8.9 and 88.99 in a column.
. (period)	Decimal point.
%	Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and adds the percentage symbol in the cell.
, (comma)	Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (#) or by zeros. A comma that follows a placeholder scales the number by one thousand. For example, if the format is #.0,, and the cell value is 12,200,000 then the number 12.2 is displayed.
E- E+ e- e+	Scientific format. The application shall display a number to the right of the "E" symbol that corresponds to the number of places that the decimal point was moved. For example, if the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is #0.0E+0, then the number 12.2E+6 is displayed.
\$-+/( ):space	Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (\). Alternatively, enclose the character in quotation marks. For example, if the number format is (000), and the value 12 is in the cell, the number (012) is displayed.
\	Display the next character in the format. The application shall not display the backslash. For example, if the number format is 0\!, and the value 3 is in the cell, the value 3! is displayed.
*	Repeat the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. For example, if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column.
_ (underline)	Skip the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. For example, the number format _(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses.
"text"	Display whatever text is inside the quotation marks. For example, the format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell.
@	Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. For example, if the number format is "Bob @" Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed.

## Text and spacing

### *Display both text and numbers*

To display both text and numbers in a cell, enclose the text characters in double quotation marks (" ") or precede a single character with a backslash (\). Single quotation marks shall not be used to denote text. Characters inside double quotes, or immediately following backslash shall never be interpreted as part of the format code lexicon; instead they shall always be treated as literal strings. Remember to include the characters in the appropriate section of the format codes. For example, type the format "\$0.00" Surplus";\$-0.00" Shortage" to display a positive amount as "\$125.74 Surplus" and a negative amount as "\$-125.74 Shortage."

The following characters are displayed without the use of quotation marks.

\$	Dollar sign			-	Minus sign
+	Plus sign			/	Slash mark
(	Left parenthesis			)	Right parenthesis
:	Colon			!	Exclamation point
^	Circumflex accent (caret)			&	Ampersand
'	Apostrophe			~	Tilde
{	Left curly bracket			}	Right curly bracket
<	Less-than sign			>	Greater-than sign
=	Equal sign				Space character

### *Include a section for text entry*

If included, a text section must be the last section in the number format. Include an "at" sign (@) in the section, precisely where the cell's text value should be displayed. If the @ character is omitted from the text section, text typed in the cell will not be displayed. To always display specific text characters with the typed text, enclose the additional text in double quotation marks (" "). For example, if "June" is typed into the cell, and the text format is "gross receipts for "@ , then the cell will display "gross receipts for June".

If the format does not include a text section, text entered in a cell is not affected by the format code.

### *Add spaces*

To create a space that is the width of a character in a number format, include an underscore, followed by the character. For example, when an underscore is followed with a right parenthesis, such as \_), positive numbers line up correctly with negative numbers that are enclosed in parentheses because positive numbers are displayed with a blank space after them exactly the width of the right parenthesis character.

### *Repeat characters*

1 To repeat the next character in the format to fill the column width, include an asterisk (\*) in the number format.  
 2 For example, type 0\*- to include enough dashes after a number to fill the cell, or type \*0 before any format to  
 3 include leading zeros.

#### 4 **Decimal places, spaces, colors, and conditions**

##### 5 *Include decimal places and significant digits*

6 To format fractions or numbers with decimal points, include the following digit placeholders in a section. If a  
 7 number has more digits to the right of the decimal point than there are placeholders in the format, the number  
 8 rounds to as many decimal places as there are placeholders. If there are more digits to the left of the decimal  
 9 point than there are placeholders, the extra digits are displayed. If the format contains only number signs (#) to  
 10 the left of the decimal point, numbers less than 1 begin with a decimal point.

11 # (number sign) displays only significant digits and does not display insignificant zeros.

12 0 (zero) displays insignificant zeros if a number has fewer digits than there are zeros in the format.

13 ? (question mark) adds spaces for insignificant zeros on either side of the decimal point so that decimal points  
 14 align when they are formatted with a fixed-width font, such as Courier New. ? can also be used for fractions that  
 15 have varying numbers of digits.

To display	As	Use this code
1234.59	1234.6	####.#
8.9	8.900	#.000
.631	0.6	0.#
12 1234.568	12.0 1234.57	#.0#
44.398 102.65 2.8	44.398 102.65 2.8 (with aligned decimals)	???.???
5.25 5.3	5 1/4 5 3/10 (with aligned fractions)	# ???/???

16  
17

##### 18 *Display a thousands separator*

19 To display a comma as a thousands separator or to scale a number by a multiple of 1,000, include a comma in  
 20 the number format.

To display	As	Use this code
------------	----	---------------

To display	As	Use this code
12000	12,000	#,###
12000	12	#,
12200000	12.2	0.0,,

### *Specify colors*

To set the text color for a section of the format, type the name of one of the following eight colors in square brackets in the section. The color code must be the first item in the section.

[Black]		[Blue]		[Cyan]
[Green]		[Magenta]		[Red]
[White]		[Yellow]		

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Valid numeric indexes for color range from 1 to 56, which reference by index to the legacy color palette.

[Note: the default legacy color palette values are listed in §3.8.26. In the format codes, [Color1] refers to the color associated with indexed="8", or black (by default), [Color2] refers to the color associated with indexed="9", or white (by default), and so on up to [Color56] referring to the color associated with indexed="63". If the color palette has been customized from default values, then the colors associated with these indexes will reflect those customizations.

### *Specify conditions*

To set number formats that will be applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; > Greater than; < Less than; >= Greater than or equal to, <= Less than or equal to, and <> Not equal to. For example, the following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.

[Red][<=100];[Blue][>100]

If the cell value does not meet any of the criteria, then pound signs ("#") are displayed across the width of the cell.

## **Currency, percentages, and scientific notation**

### *Include currency symbols*

To include currency symbols, place the currency symbol in the location it should when displayed.

### *Display percentages*

To display numbers as a percentage of 100 — for example, to display .08 as 8% or 2.8 as 280% — include the percent sign (%) in the number format.

*Display scientific notations*

To display numbers in scientific format, use exponent codes in a section — for example, E-, E+, e-, or e+.

If a format contains a zero (0) or number sign (#) to the right of an exponent code, the application displays the number in scientific format and inserts an "E" or "e". The number of zeros or number signs to the right of a code determines the number of digits in the exponent. "E-" or "e-" places a minus sign by negative exponents. "E+" or "e+" places a minus sign by negative exponents and a plus sign by positive exponents.

**Dates and times**

*Display days, months, and years*

To display	As	Use this code
Months	1–12	m
Months	01–12	mm
Months	Jan–Dec	mmm
Months	January–December	mmmm
Months	J–D	mmmmm
Days	1–31	d
Days	01–31	dd
Days	Sun–Sat	ddd
Days	Sunday–Saturday	dddd
Years	00–99	yy
Years	1900–9999	yyyy

See §3.17.4.1 for special handling of certain days in the year 1900.

*Month versus minutes*

1 If "m" or "mm" code is used immediately after the "h" or "hh" code (for hours) or immediately before the "ss"  
 2 code (for seconds), the application shall display minutes instead of the month.

3 *Display hours, minutes, and seconds*

To display	As	Use this code
Hours	0–23	h
Hours	00–23	hh
Minutes	0–59	m
Minutes	00–59	mm
Seconds	0–59	s
Seconds	00–59	ss
Time	4 AM	h AM/PM
Time	4:36 PM	h:mm AM/PM
Time	4:36:03 P	h:mm:ss A/P
Time	4:36:03.75	h:mm:ss.00
Elapsed time (hours and minutes)	1:02	[h]:mm
Elapsed time (minutes and seconds)	62:16	[mm]:ss
Elapsed time (seconds and hundredths)	3735.80	[ss].00

4

5 *Minutes versus month*

6 The "m" or "mm" code must appear immediately after the "h" or "hh" code or immediately before the "ss"  
 7 code; otherwise, these will display as the month instead of minutes.

8 *AM and PM*

9 If the format contains AM or PM, the hour is based on the 12-hour clock, where "AM" or "A" indicates times  
 10 from midnight until noon and "PM" or "P" indicates times from noon until midnight. Otherwise, the hour is  
 11 based on the 24-hour clock.

1 *Invalid date and time values*

2 Cells formatted with a date or time format and which contain invalid date or time values shall show the pound  
 3 sign ("#") across the width of the cell.

4 **International Considerations**

Format Code	Description
r	JPN/CHT Only.  When loading in JPN locale, code becomes "ee".  When loading in CHT locale, code becomes "e".
rr	JPN/CHT Only.  When loading in JPN locale, code becomes "gggee".  When loading in CHT locale, code becomes "e".
g	When loading in JPN locale: Single Roman character emperor reign  When loading in CHT (Taiwan only) locale: treat same as "gg".
gg	When loading in JPN locale: Single Kanji character emperor reign  When loading in CHT locale: Last era short name (since 1911)
ggg	When loading in JPN locale: Tow Kanji character emperor reign  When loading in CHT locale: Last era long name (since 1911)
e	When loading in JPN locale: Era year  When loading in CHT (Tawian only) locale: Era year since 1912. If preceeded by "g", "gg", or "ggg" then year of 1912, and year before 1912 are special, otherwise years less than 1912 are gregorian.  OTHER locales: becomes "yy"
ee	When loading in JPN locale: Era year w/ leading zero  When loading in CHT (Tawian only) locale: Era year since 1911  OTHER locales: becomes "yy"
b2	Hijri calander
b1	Gregorian calendar
[\$USD-409]	Specifies currency and locale/date system/number system information.  Syntax is [\$<Currency String>-<language info>]. Currency string is a string to use as a

Format Code	Description
	<p>currency symbol. Language info is a 32-bit value entered in hexadecimal format.</p> <p>Language info format (byte 3 is most significant byte):            Bytes 0,1: 16-bit Language ID (LID).            Byte 2: Calendar type. High bit indicates that input is parsed using specified calendar.            Byte 3: Number system type. High bit indicates that input is parsed using specified number system.</p> <p>Special language info values:            0xf800: System long date format            0xf400: System time format</p>

1

Parent Elements
styleSheet (§3.8.39)

2

Child Elements	Subclause
numFmt (Number Format)	§3.8.30

3

Attributes	Description
count (Number Format Count)	<p>Count of number format elements.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

4 The following XML Schema fragment defines the contents of this element:

```

5 <complexType name="CT_NumFmts">
6 <sequence>
7 <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="unbounded"/>
8 </sequence>
9 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
10 </complexType>
```

### 11 3.8.32 patternFill (Pattern)

12 This element is used to specify cell fill information for pattern and solid color cell fills. For solid cell fills (no  
 13 pattern), fgColor is used. For cell fills with patterns specified, then the cell fill color is specified by the bgColor  
 14 element.

Parent Elements
fill (§3.8.19)

1

Child Elements	Subclause
bgColor (Background Color)	§3.8.3
fgColor (Foreground Color)	§3.8.18

2

Attributes	Description
patternType (Pattern Type)	Specifies the fill pattern type (including solid and none) Default is none, when missing.  The possible values for this attribute are defined by the ST_PatternType simple type (§3.18.57).

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_PatternFill">
5 <sequence>
6 <element name="fgColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
7 <element name="bgColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 <attribute name="patternType" type="ST_PatternType" use="optional"/>
10 </complexType>

```

### 11 3.8.33 protection (Protection Properties)

12 Contains protection properties associated with the cell. Each cell has protection properties that can be set. The  
 13 cell protection properties do not take effect unless the sheet has been protected.

Parent Elements
dx ( §3.8.14); ndxf ( §3.11.1.4); odf ( §3.11.1.6); xf ( §3.8.45)

14

Attributes	Description
hidden (Hidden Cell)	A boolean value indicating if the cell is hidden. When the cell is hidden and the sheet on which the cell resides is protected, then the cell value will be displayed in the cell grid location, but the contents of the cell will not be displayed in the formula bar. This is true for all types of cell content, including formula, text, or numbers.  Therefore the cell A4 may contain a formula "=SUM(A1:A3)", but if the cell protection property of A4 is marked as hidden, and the sheet is protected, then the cell should display the calculated result (for example, "6"), but will not display the formula used to calculate the result.  The possible values for this attribute are defined by the XML Schema boolean datatype.
locked (Cell Locked)	A boolean value indicating if the cell is locked. When cells are marked as "locked" and the sheet is protected, then the options specified in the Sheet Part's sheetProtection

Attributes	Description
	<p>element (§3.3.1.81) are prohibited for these cells.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellProtection">
 <attribute name="locked" type="xsd:boolean" use="optional"/>
 <attribute name="hidden" type="xsd:boolean" use="optional"/>
</complexType>
```

### 3.8.34 rgbColor (RGB Color)

A single ARGB entry for the corresponding color index.

Parent Elements
indexedColors (§3.8.26)

Attributes	Description
rgb (Alpha Red Green Blue)	<p>Color value expressed in Alpha Red Green Blue format (ARGB).</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RgbColor">
 <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
</complexType>
```

### 3.8.35 right (Right Border)

This element specifies the color and line style for the right border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border.

Attributes	Description
	The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

### 3.8.36 scheme (Scheme)

Defines the font scheme, if any, to which this font belongs. When a font definition is part of a theme definition, then the font is categorized as either a major or minor font scheme component. When a new theme is chosen, every font that is part of a theme definition is updated to use the new major or minor font definition for that theme. Usually major fonts are used for styles like headings, and minor fonts are used for body & paragraph text.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Font Scheme)	Sets font scheme property.  The possible values for this attribute are defined by the ST_FontScheme simple type (§3.18.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontScheme">
 <attribute name="val" type="ST_FontScheme" use="required"/>
</complexType>
```

### 3.8.37 shadow (Shadow)

Macintosh compatibility setting. Represents special word/character rendering on Macintosh, when this flag is set. The effect is to render a shadow behind, beneath and to the right of the text. SpreadsheetML applications are not required to render according to this flag.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
------------	-------------

Attributes	Description
val (Value)	<p>A boolean value for the property specified by the parent XML element.</p> <p>If omitted, the default value is true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
 <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

### 3.8.38 stop (Gradient Stop)

One of a sequence of two or more gradient stops, constituting this gradient fill.

Parent Elements
gradientFill (§3.8.23)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
position (Gradient Stop Position)	<p>Position information for this gradient stop. Interpreted exactly like gradientFill left, right, bottom, top. The position indicated here indicates the point where the color is pure. Before and after this position the color can be in transition (or pure, depending on if this is the last stop or not).</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GradientStop">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="position" type="xsd:double" use="required"/>
</complexType>
```

### 3.8.39 styleSheet (Style Sheet)

This is the root element of the Styles part.

Parent Elements
Root element of SpreadsheetML Styles part

1

Child Elements	Subclause
borders (Borders)	§3.8.5
cellStyles (Cell Styles)	§3.8.8
cellStyleXfs (Formatting Records)	§3.8.9
cellXfs (Cell Formats)	§3.8.10
colors (Colors)	§3.8.11
dxfs (Formats)	§3.8.15
extLst (Future Feature Data Storage Area)	§3.2.10
fills (Fills)	§3.8.20
fonts (Fonts)	§3.8.22
numFmts (Number Formats)	§3.8.31
tableStyles (Table Styles)	§3.8.42

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Stylesheet">
4 <sequence>
5 <element name="numFmts" type="CT_NumFmts" minOccurs="0" maxOccurs="1"/>
6 <element name="fonts" type="CT_Fonts" minOccurs="0" maxOccurs="1"/>
7 <element name="fills" type="CT_Fills" minOccurs="0" maxOccurs="1"/>
8 <element name="borders" type="CT_Borders" minOccurs="0" maxOccurs="1"/>
9 <element name="cellStyleXfs" type="CT_CellStyleXfs" minOccurs="0" maxOccurs="1"/>
10 <element name="cellXfs" type="CT_CellXfs" minOccurs="0" maxOccurs="1"/>
11 <element name="cellStyles" type="CT_CellStyles" minOccurs="0" maxOccurs="1"/>
12 <element name="dxfs" type="CT_Dxfs" minOccurs="0" maxOccurs="1"/>
13 <element name="tableStyles" type="CT_TableStyles" minOccurs="0" maxOccurs="1"/>
14 <element name="colors" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
15 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
16 </sequence>
17 </complexType>
```

18 **3.8.40 tableStyle (Table Style)**

19 This element represents a single table style definition. The built-in table styles are written in the tableStyle  
20 element by name, but the corresponding tableStyleElement elements are assumed rather than explicitly  
21 written. Following is a listing of each of the built-in table style definitions, whose normative definition is in  
22 Annex D.

23 Any of the built-in tables styles, along with any additional table styles explicitly defined shall be supported by  
24 applications implementing table styles.

25 [Note: Each of the table styles is made up of a collection of formatting definitions, each of which corresponds to  
26 a particular structured region of the table. An application can decide to support these built-in types, and can also

- 1 decide to define more styles, each with their own definitions. An application can also decide whether the user
- 2 will be allowed to customize or further define additional table styles. *end note*]

Table Style	[Example: (informative)]
