1

Parent Elements
tableStyles (§3.8.42)

2

Child Elements	Subclause
tableStyleElement (Table Style)	§3.8.41

1

Attributes	Description
count (Table Style Count)	Count of table style elements defined for this table style.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Table Style Name)	Name of this table style.  The possible values for this attribute are defined by the XML Schema string datatype.
pivot (Pivot Style)	'True' if this table style should be shown as an available pivot table style.  Not mutually exclusive with table - both can be true.  The possible values for this attribute are defined by the XML Schema boolean datatype.
table (Table)	True if this table style should be shown as an available table style.  Not mutually exclusive with pivot - both can be true.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TableStyle">
4 <sequence>
5 <element name="tableStyleElement" type="CT_TableStyleElement" minOccurs="0"
6 maxOccurs="unbounded"/>
7 </sequence>
8 <attribute name="name" type="xsd:string" use="required"/>
9 <attribute name="pivot" type="xsd:boolean" use="optional" default="true"/>
10 <attribute name="table" type="xsd:boolean" use="optional" default="true"/>
11 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
12 </complexType>
```

13 **3.8.41 tableStyleElement (Table Style)**

14 This element specifies formatting for one area of a table or PivotTable. Together the sequence of these elements  
15 makes up one entire Table style or PivotTable style definition.

16 The order in which table style element formatting is applied is as follows:

17 **Table Style Element Order**

- 18
- 19
- 20
- 21
- 22
- Whole Table
  - First Column Stripe
  - Second Column Stripe
  - First Row Stripe
  - Second Row Stripe

- Last Column
- First Column
- Header Row
- Total Row
- First Header Cell
- Last Header Cell
- First Total Cell
- Last Total Cell

For instance, row stripe formatting 'wins' over column stripe formatting, and both 'win' over whole table formatting.

**PivotTable Style Element Order**

- Whole Table
- Page Field Labels
- Page Field Values
- First Column Stripe
- Second Column Stripe
- First Row Stripe
- Second Row Stripe
- First Column
- Header Row
- First Header Cell
- Subtotal Column 1
- Subtotal Column 2
- Subtotal Column 3
- Blank Row
- Subtotal Row 1
- Subtotal Row 2
- Subtotal Row 3
- Column Subheading 1
- Column Subheading 2
- Column Subheading 3
- Row Subheading 1
- Row Subheading 2
- Row Subheading 3
- Grand Total Column
- Grand Total Row

Parent Elements
tableStyle (§3.8.40)

1

Attributes	Description																																				
dxfld (Formatting Id)	Zero-based index to a dxf record in the dxfs collection, specifying differential formatting to use with this Table or PivotTable style element.  The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).																																				
size (Band Size)	Number of rows or columns in a single band of striping. Applies only when type is firstRowStripe, secondRowStripe, firstColumnStripe, or secondColumnStripe.  [Example:  In this example, the firstRowStripe size is set to 2, and the secondRowStripe size is set to 1: <table><tr><th>Column1</th><th>Column2</th><th>Column3</th><th>Column4</th></tr><tr><td>0.67</td><td>0.5</td><td>0.93</td><td>0.1</td></tr><tr><td>0.36</td><td>1</td><td>0.3</td><td>0.3</td></tr><tr><td>0.84</td><td>0.73</td><td>0.31</td><td>0.19</td></tr><tr><td>0.64</td><td>0.06</td><td>0.11</td><td>0.92</td></tr><tr><td>0.26</td><td>0.23</td><td>0.51</td><td>0.95</td></tr><tr><td>0.83</td><td>0.56</td><td>0.26</td><td>0.88</td></tr><tr><td>0.94</td><td>0.11</td><td>0.59</td><td>0.18</td></tr><tr><td>0.06</td><td>0.74</td><td>0.22</td><td>0.13</td></tr></table> <i>end example]</i>  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.	Column1	Column2	Column3	Column4	0.67	0.5	0.93	0.1	0.36	1	0.3	0.3	0.84	0.73	0.31	0.19	0.64	0.06	0.11	0.92	0.26	0.23	0.51	0.95	0.83	0.56	0.26	0.88	0.94	0.11	0.59	0.18	0.06	0.74	0.22	0.13
Column1	Column2	Column3	Column4																																		
0.67	0.5	0.93	0.1																																		
0.36	1	0.3	0.3																																		
0.84	0.73	0.31	0.19																																		
0.64	0.06	0.11	0.92																																		
0.26	0.23	0.51	0.95																																		
0.83	0.56	0.26	0.88																																		
0.94	0.11	0.59	0.18																																		
0.06	0.74	0.22	0.13																																		
type (Table Style Type)	Identifies this table style element's type.  The possible values for this attribute are defined by the ST_TableStyleType simple type (§3.18.79).																																				

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TableStyleElement">
4 <attribute name="type" type="ST_TableStyleType" use="required"/>
5 <attribute name="size" type="xsd:unsignedInt" use="optional" default="1"/>
6 <attribute name="dxflId" type="ST_DxfId" use="optional"/>
7 </complexType>
```

### 3.8.42 tableStyles (Table Styles)

This element represents a collection of Table style definitions for Table styles and PivotTable styles used in this workbook. It consists of a sequence of tableStyle records, each defining a single Table style.

A Table style is a collection of formatting that applies to structured regions of a Table or PivotTable [*Example: make the header row & totals bold face, and apply light gray fill to alternating rows in the data portion of the table to achieve striped or banded rows. end example*]

See the enumeration values in ST\_TableStyleType for a listing of structured Table regions to which formatting can be applied, and which together make up a single Table style definition.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
tableStyle (Table Style)	§3.8.40

Attributes	Description
count (Table Style Count)	Count of table styles defined in this collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
defaultPivotStyle (Default Pivot Style)	Name of the default table style to apply to new PivotTables. This can be set by the user interface.  The possible values for this attribute are defined by the XML Schema string datatype.
defaultTableStyle (Default Table Style)	Name of default table style to apply to new Tables. This can be set by the user interface.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyles">
 <sequence>
 <element name="tableStyle" type="CT_TableStyle" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
 <attribute name="defaultTableStyle" type="xsd:string" use="optional"/>
 <attribute name="defaultPivotStyle" type="xsd:string" use="optional"/>
</complexType>
```

### 3.8.43 top (Top Border)

This element specifies the color and line style for the top border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

### 3.8.44 vertical (Vertical Inner Border)

This element specifies the color and line style for the vertical inner border(s) of a range of cells. Used in the context of dxf elements only. For example, see the borders definitions for **TableStyleMedium28**.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	<p>The line style for this border.</p> <p>The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
 <sequence>
 <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

### 3.8.45 xf (Format)

A single xf element describes all of the formatting for a cell.

Parent Elements
cellStyleXfs (§3.8.9); cellXfs (§3.8.10)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
extLst (Future Feature Data Storage Area)	§3.2.10
protection (Protection Properties)	§3.8.33

Attributes	Description
applyAlignment (Apply Alignment)	A boolean value indicating whether the alignment formatting specified for this xf should be applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyBorder (Apply Border)	A boolean value indicating whether the border formatting specified for this xf should be applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFill (Apply Fill)	A boolean value indicating whether the fill formatting specified for this xf should be applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFont (Apply Font)	A boolean value indicating whether the font formatting specified for this xf should be applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyNumberFormat (Apply Number Format)	A boolean value indicating whether the number formatting specified for this xf should be applied.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyProtection	A boolean value indicating whether the protection formatting specified for this xf should

Attributes	Description
(Apply Protection)	<p>be applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
borderId (Border Id)	<p>Zero-based index of the border record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_BorderId simple type (§3.18.2).</p>
fillId (Fill Id)	<p>Zero-based index of the fill record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_FillId simple type (§3.18.31).</p>
fontId (Font Id)	<p>Zero-based index of the font record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_FontId simple type (§3.18.33).</p>
numFmtId (Number Format Id)	<p>Id of the number format (numFmt) record used by this cell format.</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).</p>
pivotButton (Pivot Button)	<p>A boolean value indicating whether the cell rendering includes a pivot table dropdown button.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
quotePrefix (Quote Prefix)	<p>A boolean value indicating whether the text string in a cell should be prefixed by a single quote mark (e.g., 'text). In these cases, the quote is not stored in the Shared Strings Part.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
xfId (Format Id)	<p>For xf records contained in cellXfs this is the zero-based index of an xf record contained in cellStyleXfs corresponding to the cell style applied to the cell.</p> <p>Not present for xf records contained in cellStyleXfs.</p> <p>The possible values for this attribute are defined by the ST_CellStyleXfId simple type (§3.18.11).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Xf">
 <sequence>
 <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
 <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
 <attribute name="fontId" type="ST_FontId" use="optional"/>
 <attribute name="fillId" type="ST_FillId" use="optional"/>
 <attribute name="borderId" type="ST_BorderId" use="optional"/>
 <attribute name="xfId" type="ST_CellStyleXfId" use="optional"/>
 <attribute name="quotePrefix" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="pivotButton" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="applyNumberFormat" type="xsd:boolean" use="optional"/>
 <attribute name="applyFont" type="xsd:boolean" use="optional"/>
 <attribute name="applyFill" type="xsd:boolean" use="optional"/>
 <attribute name="applyBorder" type="xsd:boolean" use="optional"/>
 <attribute name="applyAlignment" type="xsd:boolean" use="optional"/>
 <attribute name="applyProtection" type="xsd:boolean" use="optional"/>
</complexType>
```

### 3.9 Metadata

A cell in a spreadsheet application can have metadata associated with it. Metadata is just a set of additional properties about the particular cell, and this metadata is stored in the metadata xml part.

There are two types of metadata: cell metadata and value metadata. Cell metadata contains information about the cell itself, and this metadata can be carried along with the cell as it moves (insert, shift, copy/paste, merge, unmerge, etc). Value metadata is information about the value of a particular cell. Value metadata properties can be propagated along with the value as it is referenced in formulas.

The file format is architected such that it supports both value and cell metadata, as well as even allowing for future extensions. Formulas, such as CUBEMEMBER() or CUBE\*, shall make use of value metadata as part of the SpreadsheetML standard. So, only value metadata must be implemented as it is used by MDX cube functions for retrieving data from OLAP data sources. The other parts are allowed for future extensibility.

See the informative material for background information on OLAP and the various CUBE\* functions.

*[Example:* The CUBEMEMBER() function is used to return a specific member from an OLAP cube. The metadata will express the connection name (used as a friendly identifier for the external data connection to the OLAP server and cube), the mdx statement retrieving that member, and a set of operational attributes of the metadata that specify how it behaves in the spreadsheet application (i.e., whether it propagates through formula assignment, is able to be copy/pasted, etc).

```
<metadata xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/main">
```

```

1 <metadataTypes count="1">
2 <metadataType name="XLMDX" minSupportedVersion="120000" copy="1"
3 pasteAll="1" pasteValues="1" merge="1" splitFirst="1" rowColShift="1"
4 clearFormats="1" clearComments="1" assign="1" coerce="1"/>
5 </metadataTypes>
6 <metadataStrings count="2">
7 <s v="My Connection"/>
8 <s v="[Measures].[Internet Sales Amount]"/>
9 </metadataStrings>
10 <mdxMetadata count="1">
11 <mdx n="0" f="m">
12 <t c="1">
13 <n x="1"/>
14 </t>
15 </mdx>
16 </mdxMetadata>
17 <valueMetadata count="1">
18 <bk>
19 <rc t="1" v="0"/>
20 </bk>
21 </valueMetadata>
22 </metadata>

```

As seen above, the metadata string table contains two entries: the name of the connection (My Connection), and the expression that returns the Internet Sales Amount member from the cube. The metadataType specifies that the metadata persists with assignment, cell merging, copy/pasting, shifting rows/columns, when the formatting or comments are deleted from the cell, and is assigned to the upper left most cell if a merged cell is split. In the valueMetadata collection, the metadata block specifies that the first metadataType is used, and indexes the first (0th) entry in the mdxMetadata collection. This mdx element in the mdxMetadata collection in turn specifies the cube function type (m= cube member) and an index into the string table that specifies the connection name. It also contains a tuple (t) element which specifies, via index into the string table, which tuple is returned. *end example*

[Note: When copying a cell with metadata, and the cell contains an array formula, each pasted cell shall contain the value from the corresponding position in the array and should contain the metadata corresponding to that cell. *end note*]

### 3.9.1 bk (Metadata Block)

This element represents a block of metadata records.

Parent Elements
cellMetadata (§3.9.3); valueMetadata (§3.9.17)

Child Elements	Subclause
rc (Metadata Record)	§3.9.15

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataBlock">
 <sequence>
 <element name="rc" type="CT_MetadataRecord" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.9.2 bk (Future Metadata Block)

This element represents a block of future metadata information. This is a location for storing feature extension information.

Parent Elements
futureMetadata (§3.9.4)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FutureMetadataBlock">
 <sequence>
 <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
 </sequence>
</complexType>
```

### 3.9.3 cellMetadata (Cell Metadata)

This element represents cell metadata information. Cell metadata is information metadata about a specific cell, and it stays tied to that cell position.

[Note: Applications should not use this for storing metadata, but instead use valueMetadata. Cell metadata is included for storing information from future application. *end note*]

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
bk (Metadata Block)	§3.9.1

Attributes	Description
------------	-------------

Attributes	Description
count (Metadata Block Count)	Number of blocks of metadata records.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MetadataBlocks">
 <sequence>
 <element name="bk" type="CT_MetadataBlock" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>

```

### 3.9.4 futureMetadata (Future Metadata)

This element represents future metadata information.

Future data storage areas are xml storage areas that a later version of the spreadsheet application can store data into. So a V2 spreadsheet application may store data for new features that don't exist in the V1 version in a future storage area when saving to a format that the V1 version can open. The V1 version may be able to open the file, but won't necessarily be able to understand data that is stored in a future storage area. So the V1 version may ignore this data, but still round trip it in the file format so that V2 and V1 users can collaborate on the same spreadsheet.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
bk (Future Metadata Block)	§3.9.2
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
count (Future Metadata Block Count)	Number of future metadata blocks.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Metadata Type Name)	Metadata type name.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FutureMetadata">
 <sequence>
 <element name="bk" type="CT_FutureMetadataBlock" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

### 3.9.5 k (KPI MDX Metadata)

This element represents key performance indicator (KPI) MDX metadata. A KPI is typically an image that represents the state of some specific business measure at a given point in time. For instance, an image of a green traffic light indicating that customer satisfaction is good.

#### Parent Elements

mdx (§3.9.6)

#### Attributes

#### Description

n (Member Unique Name Index)

Index of member unique name in string store.  
  
The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

np (KPI Index)

Index of key performance indicator name in string store.  
  
The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

p (KPI Property)

Key performance indicator property.  
  
The possible values for this attribute are defined by the ST\_MdxKPIProperty simple type (§3.18.47).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxKPI">
 <attribute name="n" type="xsd:unsignedInt" use="required"/>
 <attribute name="np" type="xsd:unsignedInt" use="required"/>
 <attribute name="p" type="ST_MdxKPIProperty" use="required"/>
</complexType>
```

### 3.9.6 mdx (MDX Metadata Record)

This element represents a single record of MDX metadata information which can express a tuple, KPI, set, or member property.

#### Parent Elements

Parent Elements
mdxMetadata (§3.9.7)

Child Elements	Subclause
k (KPI MDX Metadata)	§3.9.5
ms (Set MDX Metadata)	§3.9.12
p (Member Property MDX Metadata)	§3.9.14
t (Tuple MDX Metadata)	§3.9.16

Attributes	Description
f (Cube Function Tag)	This is an enumeration representing the type of the calling cube function from the spreadsheet.  The possible values for this attribute are defined by the ST_MdxFunctionType simple type (§3.18.46).
n (Connection Name Index)	The zero based index of connection name in metadata string store, metadataStrings.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Mdx">
 <choice minOccurs="1" maxOccurs="1">
 <element name="t" type="CT_MdxTuple"/>
 <element name="ms" type="CT_MdxSet"/>
 <element name="p" type="CT_MdxMemeberProp"/>
 <element name="k" type="CT_MdxKPI"/>
 </choice>
 <attribute name="n" type="xsd:unsignedInt" use="required"/>
 <attribute name="f" type="ST_MdxFunctionType" use="required"/>
</complexType>

```

### 3.9.7 mdxMetadata (MDX Metadata Information)

This element represents a collection of specific MDX metadata records for the spreadsheet. This is used to build up the members, sets, tuples, KPIs, and member properties for the spreadsheet.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
mdx (MDX Metadata Record)	§3.9.6

1

Attributes	Description
count (MDX Metadata Record Count)	Number of MDX metadata metadata records.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_MdxMetadata">
4 <sequence>
5 <element name="mdx" type="CT_Mdx" minOccurs="1" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
8 </complexType>

```

### 9 3.9.8 metadata (Metadata)

10 This element represents the root node for all metadata information in the spreadsheet.

Parent Elements
Root element of SpreadsheetML Metadata part

11

Child Elements	Subclause
cellMetadata (Cell Metadata)	§3.9.3
extLst (Future Feature Data Storage Area)	§3.2.10
futureMetadata (Future Metadata)	§3.9.4
mdxMetadata (MDX Metadata Information)	§3.9.7
metadataStrings (Metadata String Store)	§3.9.9
metadataTypes (Metadata Types Collection)	§3.9.11
valueMetadata (Value Metadata)	§3.9.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Metadata">
 <sequence>
 <element name="metadataTypes" type="CT_MetadataTypes" minOccurs="0" maxOccurs="1"/>
 <element name="metadataStrings" type="CT_MetadataStrings" minOccurs="0" maxOccurs="1"/>
 <element name="mdxMetadata" type="CT_MdxMetadata" minOccurs="0" maxOccurs="1"/>
 <element name="futureMetadata" type="CT_FutureMetadata" minOccurs="0" maxOccurs="unbounded"/>
 <element name="cellMetadata" type="CT_MetadataBlocks" minOccurs="0" maxOccurs="1"/>
 <element name="valueMetadata" type="CT_MetadataBlocks" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
 </sequence>
</complexType>
```

### 3.9.9 metadataStrings (Metadata String Store)

This element represents the metadata string store. This is a collection of strings that are used as a resource for the rest of the metadata part. It contains all the required OLAP strings used in the spreadsheet including the connection name, as well as mdx expressions identifying specific members and sets. It is indexed from individual metadata records so that the records can use these strings to build up the necessary mdx statements to retrieve the correct data from the OLAP cube.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
s (Character Value)	§3.13.8

Attributes	Description
count (MDX Metadata String Count)	Number of records in the string store.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataStrings">
 <sequence>
 <element name="s" type="CT_XStringElement" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

### 3.9.10 metadataType (Metadata Type Information)

This element represents information about metadata on cells - it defines a specific set of behaviors that the metadata shall adhere to when subject to other spreadsheet operations.

- 1 In general, many of these attributes represent operations that can be performed on a cell that allow the  
 2 metadata to remain associated with the cell. Operations that are set to 0 or false, will cause the metadata to be  
 3 disassociated from the cell when that operation is performed.

Parent Elements
metadataTypes (§3.9.11)

4

Attributes	Description
adjust (Adjust Metadata)	<p>A Boolean flag indicating that metadata corresponding to a particular cell needs to be notified when that cell's location is changed.</p> <p>[<i>Note: This is included in the file format for future extensibility.end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
assign (Metadata Formula Assignment)	<p>A Boolean flag indicating whether metadata is propagated by formula assignment operation. True when metadata should be propagated by assignment, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
cellMeta (Cell Metadata)	<p>A Boolean flag indicating whether metadata is cell metadata. True when the metadata is cell metadata, false otherwise - in the false case it is considered to be value metadata.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
clearAll (Metadata Clear All)	<p>A Boolean flag indicating whether metadata survives a "Clear: All" operation. True if the metadata persists after a clear all, false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
clearComments (Metadata Clear Comments)	<p>A Boolean flag indicating whether metadata remains after comments have been cleared from the cell. True if the metadata persists after Clear:Comments, false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
clearContents	A Boolean flag indicating whether metadata remains after the contents of a cell are

Attributes	Description
(Metadata Clear Contents)	<p>removed. True if metadata persists after a "Clear: Contents" action, false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
clearFormats (Metadata Clear Formats)	<p>A Boolean flag indicating whether metadata remains after formatting is removed from a cell. True if metadata persists after a "Clear: Formats", false otherwise.</p> <p>The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
coerce (Metadata Coercion)	<p>A Boolean flag indicating whether value metadata can be removed when this metadata data type is coerced to another type. True if the value metadata is removed upon coercion, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
copy (Metadata Copy)	<p>A Boolean flag indicating whether metadata is copied with a cell. True if the metadata is copied to other cells when this cell is copied, false otherwise.</p> <p>This shall be set to true if the paste attributes for the metadataType are going to be used.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
delete (Metadata Cell Value Delete)	<p>A Boolean flag indicating whether metadata survives deletion of a cell value. True when the metadata persists after the deletion of a cell value, false otherwise.</p> <p>This attribute is equivalent to the clearContents attribute.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
edit (Metadata Edit)	<p>A Boolean flag indicating whether metadata survives the editing of the cell's value. True if the metadata remains unchanged after the cell's value edit, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ghostCol (Metadata Ghost Column)	<p>A Boolean flag indicating whether metadata is copied to/from a ghost column. True when the metadata is copied to/from a ghost column, false otherwise.</p>

Attributes	Description
	<p>A ghost column is a single column that exists for the row header. It is not displayed to the end user. It is used to store default formatting for an entire row (i.e. the row gets the formatting for the corresponding cell in the ghost column). For instance, when an entire row is selected and a cell color is applied, this is stored once for the cell in the ghost column instead of for each cell in the row.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ghostRow (Metadata Ghost Row)	<p>A Boolean flag indicating whether metadata is copied to/from a ghost row. True when the metadata is copied to/from a ghost row, false otherwise.</p> <p>A ghost row is a single row that exists for the column header. It is not displayed to the end user. It is used to store default formatting for an entire column (i.e. the column gets the formatting for the corresponding cell in the ghost row). For instance, when an entire column is selected and a cell color is applied, this is stored once for the cell in the ghost row instead of for each cell in the column.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
merge (Metadata Merge)	<p>A Boolean flag indicating whether metadata survives cell merge. True if the metadata persists after a cell merge, false otherwise.</p> <p>It is up to the spreadsheet application on how to deal with conflicts when two cells that each have metadata are merged. The guidance here is to treat it the same as a 'regular' cell merge with the default behavior being that the data in the upper left cell wins.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
minSupportedVersion (Minimum Supported Version)	<p>The earliest version of the spreadsheet application that supports this metadata type.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
name (Metadata Type Name)	<p>Represents the name of this particular metadata type. This name shall be unique amongst all other metadataTypes.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
pasteAll (Metadata Paste All)	<p>A Boolean flag indicating whether metadata is populated to a new cell by "Paste: All". True when the metadata is populated on a Paste:All, false otherwise. Paste:All and regular paste should be implemented so that they are equivalent by the spreadsheet application.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>Note: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property.</p>

Attributes	Description
	<p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteBorders (Metadata Paste Borders)</p>	<p>A Boolean flag indicating whether metadata is populated with Paste: Borders. True when the metadata is populated when only borders are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: The spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteColWidths (Metadata Paste Column Widths)</p>	<p>A Boolean flag indicating whether metadata is populated by Paste: Column Widths. True if the metadata is populated when only column widths are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteComments (Metadata Paste Comments)</p>	<p>A Boolean flag indicating whether metadata is populated by Paste: Comments. True when metadata is populated when only comments are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteDataValidation (Metadata Paste Data Validation)</p>	<p>A Boolean flag indicating whether metadata is populated by Paste: Validation. True when metadata is populated when only data validation is pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
<p>pasteFormats (Metadata Paste Formats)</p>	<p>A Boolean flag indicating whether metadata is populated by Paste Special: Formats. True when metadata is populated when only formatting is pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteFormulas (Metadata Paste Formulas)</p>	<p>A Boolean flag indicating whether metadata is populated by Paste: Formulas. True when the metadata is populated when only formulas are pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteNumberForm ats (Metadata Paste Number Formats)</p>	<p>A Boolean flag indicating whether metadata is populated with Paste: Number Formats. True when metadata is populated when only number formatting is pasted, false otherwise.</p> <p>The copy flag shall be set to true for this paste behavior to be respected.</p> <p>[<i>Note</i>: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>pasteValues (Metadata Paste Special Values)</p>	<p>A Boolean flag indicating whether metadata is populated by Paste: Values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>rowColShift (Metadata Insert Delete)</p>	<p>A Boolean flag indicating whether metadata survives shifting due to row/column insertion/deletion. True if the metadata persists after the cell has been shifted, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>splitAll (Metadata Split All)</p>	<p>A Boolean flag indicating whether a merged cell split action has its metadata copied to all of the resulting cells. True if the metadata is copied to all new cells resulting from a split, false otherwise.</p> <p>If <code>splitFirst</code> is also set to true, <code>splitAll</code> wins - that is all the cells shall have the</p>

Attributes	Description
	metadata copied to them.  The possible values for this attribute are defined by the XML Schema boolean datatype.
splitFirst (Meatadata Split First)	A Boolean flag indicating whether when a merged cell is split its metadata is copied to only the first resulting cell. True when the metadata from a split cell is only copied to the first resulting cell, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_MetadataType">
3 <attribute name="name" type="ST_Xstring" use="required"/>
4 <attribute name="minSupportedVersion" type="xsd:unsignedInt" use="required"/>
5 <attribute name="ghostRow" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="ghostCol" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="edit" type="xsd:boolean" use="optional" default="false"/>
8 <attribute name="delete" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="copy" type="xsd:boolean" use="optional" default="false"/>

31 </complexType>
```

32 **3.9.11 metadataTypes (Metadata Types Collection)**

33 This element is a collection of metadata types.

Parent Elements
metadata (§3.9.8)

34

Child Elements	Subclause
metadataType (Metadata Type Information)	§3.9.10

1

Attributes	Description
count (Metadata Type Count)	<p>Number of metadata types.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_MetadataTypes">
4 <sequence>
5 <element name="metadataType" type="CT_MetadataType" minOccurs="1" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
8 </complexType>

```

### 9 3.9.12 ms (Set MDX Metadata)

10 This element represents an MDX set.

Parent Elements
mdx (§3.9.6)

11

Child Elements	Subclause
n (Member Unique Name Index)	§3.9.13

12

Attributes	Description
c (Sort By Member Index Count)	<p>Number of sort-by member indices. This is essentially the number of coordinates in the cube that this member is defined by.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
ns (Set Definition Index)	<p>Zero based index of the set definition in the metadata string store.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
o (Set Sort Order)	<p>An enumeration specifying what sort order is used to sort the set.</p> <p>The possible values for this attribute are defined by the ST_MdxSetOrder simple type (§3.18.48).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxSet">
 <sequence>
 <element name="n" type="CT_MetadataStringIndex" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="ns" type="xsd:unsignedInt" use="required"/>
 <attribute name="c" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="o" type="ST_MdxSetOrder" use="optional" default="u"/>
</complexType>
```

### 3.9.13 n (Member Unique Name Index)

This element represents an index of a member unique name in metadata string store that is used to define the sort-by set.

#### Parent Elements

ms (§3.9.12); t (§3.9.16)

#### Attributes

#### Description

s (String is a Set)

A Boolean flag indicating whether this string represents a set. True if the string represents a set, false otherwise.

The possible values for this attribute are defined by the XML Schema boolean datatype.

x (Index Value)

Value of the zero based index.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataStringIndex">
 <attribute name="x" type="xsd:unsignedInt" use="required"/>
 <attribute name="s" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.9.14 p (Member Property MDX Metadata)

This element represents an MDX member property.

#### Parent Elements

mdx (§3.9.6)

#### Attributes

#### Description

n (Member Unique Name Index)

The zero based index of member unique name in the metadata string store.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
np (Property Name Index)	The zero based index of the property name in metadata string store.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxMemberProp">
 <attribute name="n" type="xsd:unsignedInt" use="required"/>
 <attribute name="np" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.9.15 rc (Metadata Record)

This element represents a reference to a specific metadata record.

Parent Elements
bk (§3.9.1)

Attributes	Description
t (Metadata Record Type Index)	A 1-based index to the metadata record type in metadataTypes.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
v (Metadata Record Value Index)	A zero based index to a specific metadata record. If the corresponding metadataType has name="XLMDX", then this is an index to a record in mdxMetadata, otherwise this is an index to a record in the futureMetadata section whose name matches the name of the metadataType.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataRecord">
 <attribute name="t" type="xsd:unsignedInt" use="required"/>
 <attribute name="v" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.9.16 t (Tuple MDX Metadata)

This element represents an mdx tuple. A tuple is the intersection of two or more members of distinct dimensions in the cube. For instance, the three members (product, City, month) that are used to show the data point for how many products were sold.

- 1 The spreadsheet application should allow the values for the attributes of this element to be specified by the
- 2 OLAP server.

Parent Elements
mdx (§3.9.6)

3

Child Elements	Subclause
n (Member Unique Name Index)	§3.9.13

4

Attributes	Description
b (Server Formatting Bold Font)	<p>A Boolean flag indicating whether the bold style is applied. True if bold shall be applied, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bc (Server Formatting Background Color)	<p>Specifies the background color in RGB values. It is in hex and is read in the form of 0x00RRGGBB.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
c (Member Index Count)	<p>The number of member expressions in the tuple.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
ct (Server Formatting Culture Currency)	<p>The culture tag to use for currency number format.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
fc (Server Formatting Foreground Color)	<p>Represents the foreground color in RGB. It is in hex and is read in the form of 0x00RRGGBB.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
fi (Server Formatting Built-In Number Format Index)	<p>Server formatting built-in number format index. This is an index into the spreadsheet application's built in number formats that is used to specify formatting.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
i (Server Formatting Italic Font)	<p>A Boolean flag indicating that the italic formatting shall be applied. True if italic formatting is applied, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
si (Server Formatting String Index)	Server formatting string index in the metadata string store, used to index to a string that contains information on how to format the number.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
st (Server Formatting Strikethrough Font)	A Boolean flag indicating whether the strikethrough font style is applied. True if strikethrough shall be applied, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Server Formatting Underline Font)	A Boolean flag indicating whether the underline font style is applied. True if underline shall be applied, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MdxTuple">
 <sequence>
 <element name="n" type="CT_MetadataStringIndex" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="c" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="ct" type="ST_Xstring" use="optional"/>
 <attribute name="si" type="xsd:unsignedInt" use="optional"/>
 <attribute name="fi" type="xsd:unsignedInt" use="optional"/>
 <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="u" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.9.17 valueMetadata (Value Metadata)

This element represents the value metadata information for the spreadsheet. It is essentially a collection of block elements that each define the value metadata for a particular cell. Cells in the workbook index into this collection, and each block element in this collection in turn references the mdxMetadata records.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
bk (Metadata Block)	§3.9.1

Attributes	Description
count (Metadata Block Count)	<p>Number of blocks of metadata records.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataBlocks">
 <sequence>
 <element name="bk" type="CT_MetadataBlock" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

### 3.10 Pivot Tables

PivotTables display aggregated views of data easily and in an understandable layout. Hundreds or thousands of pieces of underlying information can be aggregated on row & column axes, revealing the meanings behind the data. PivotTable reports are used to organize and summarize your data in different ways. Creating a PivotTable report is about moving pieces of information around to see how they fit together. In a few gestures the pivot rows and columns can be moved into different arrangements and layouts.

A PivotTable object has a row axis area, a column axis area, a data area, and a page/report filter area. Additionally, PivotTables have a corresponding field list pane, or similar user interface, that displays all the fields of data that can be placed on one of the PivotTable areas. In SpreadsheetML, each PivotTable area maps to a collection of fields in the PivotTableDefinition that correspond to each area.

The following image shows the layout for the PivotTable areas.

Page/Filter Fields	
	Column Fields
Row Fields	Data Items

- 1
- 2 [Example:
- 3 The following image shows a table of data in a worksheet.

	A	C	F	H	I	O	P	Q	Z	AA	AB
1	Customer Name	Country	City	Product Category	Product Subcategory	Year	Quarter	Month	Sales Amount	Tax Amount	Freight
2	Michele Raman	Australia	Bendigo	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
3	Misty Raji	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
4	Tabitha E Arthur	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
5	Clarence D Rai	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3399.99	271.9992	84.9998
6	Jimmy L Moreno	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3399.99	271.9992	84.9998
7	Rob Verhoff	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3374.99	269.9992	84.3748
8	Levi Sai	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
9	Logan Gonzales	Australia	Brisbane	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
10	Dalton J Lee	Australia	Brisbane	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
11	Jessie J Ortega	Australia	Brisbane	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
12	Paul J. Shakespear	Australia	Caloundra	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
13	Joan R Martin	Australia	Caloundra	Bikes	Road Bikes	2001	3	September	699.0982	55.9279	17.4775
14	Casey Pal	Australia	Caloundra	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
15	Ethan G Coleman	Australia	Caloundra	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
16	Kendra Rubio	Australia	Caloundra	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
17	Bethany G Yuan	Australia	Cloverdale	Bikes	Mountain Bikes	2001	3	August	3399.99	271.9992	84.9998
18	Jasmine Wilson	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
19	Micah Wu	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
20	Warren L Zhang	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	July	699.0982	55.9279	17.4775
21	Ariana Stewart	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
22	Suzanne K Lu	Australia	Coffs Hart	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
23	Randall M Rubio	Australia	Cranbourr	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
24	Deborah K Kumar	Australia	Cranbourr	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
25	Krystal Holt	Australia	Cranbourr	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
26	Patricia T Raman	Australia	Cranbourr	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
27	Wendy Dominguez	Australia	Cranbourr	Bikes	Mountain Bikes	2001	3	August	3374.99	269.9992	84.3748
28	Willie She	Australia	Darlinghu	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
29	Alan Zhu	Australia	Darlinghu	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
30	Dawn R Tang	Australia	Darlinghu	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568

The following image shows a PivotTable summary of the worksheet table data.

	A	B	C	D	E	F	G
1							
2		Country	(All)				
3		State	(All)				
4		City	(All)				
5							
6		Sum of Sales Amount	Column Labels				
7			2001			2001 Total	
8			3			3 Total	
9		Row Labels	July	August	September		
10		Bikes	209652.9046	222538.2892	173993.5128	606184.7066	606184.7066
11		Mountain Bikes	64424.81	60899.82	10174.97	135499.6	135499.6
12		Road Bikes	145228.0946	161638.4692	163818.5428	470685.1066	470685.1066
13		Grand Total	209652.9046	222538.2892	173993.5128	606184.7066	606184.7066

The filter area consists of the "Country", "State", and "City" fields. The row area consists of the "Product Category" and "Product Subcategory" fields. "Bikes" belongs to the "Product Category" field and both "Mountain Bikes" and "Road Bikes" belong to the "Product Subcategory" field. The column consists of the "Year" ("2001"), "Quarter" ("3"), and "Month" ("July", "August", and "September") fields.

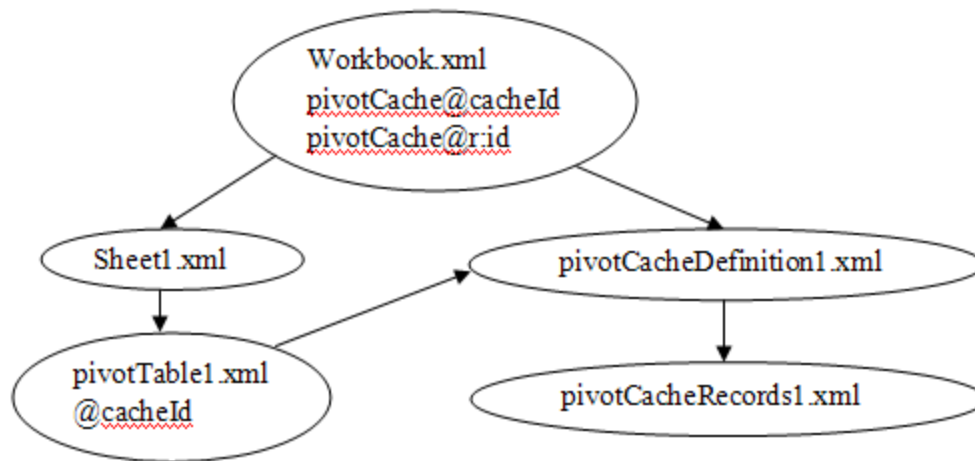

The following image shows the field list for the PivotTable in the previous image.

1

2 *File Structure*

The workbook points to (and owns the longevity of) the *pivotCacheDefinition* part, which in turn points to and owns the *pivotCacheRecords* part. The workbook also points to and owns the sheet part, which in turn points to and owns a *pivotTable* part definition, when a PivotTable is on the sheet. There can be multiple PivotTables on a sheet. The *pivotTable* part points to the appropriate *pivotCacheDefinition* which it is using. Since multiple PivotTables can use the same cache, the *pivotTable* part does not own the longevity of the *pivotCacheDefinition*.

The *pivotTable* part describes the particulars of the layout of the PivotTable on the sheet. It indicates what fields are on the row axis, the column axis, report filter, and values areas of the PivotTable. It also indicates formatting information about the PivotTable. If conditional formatting has been applied to the PivotTable, that is also expressed in the *pivotTable* part.

#### Outline of XML for pivotTableDefinition

```

<pivotTableDefinition>
 <location/>
 <pivotFields/>
 <rowFields/>
 <rowItems/>
 <colFields/>
 <colItems/>
 <pageFields/>
 <dataFields/>
 <conditionalFormats/>
 <pivotTableStyleInfo/>
</pivotTableDefinition>

```

The *pivotCacheRecords* part contains the underlying data to be aggregated. It is a cache of the source data.

#### Outline of XML for pivotCacheRecords

```
<pivotCacheRecords/>
<r/>
</pivotCacheRecords>
```

The *pivotCacheDefinition* part defines each field in the *pivotCacheRecords* part, including field name and information about the data contained in the field. The *pivotCacheDefinition* part also defines pivot items that are shared among the *pivotTableDefinition* and *pivotCacheRecords* parts.

Outline of XML for *pivotCacheDefinition*

```
<pivotCacheDefinition>
 <cacheSource/>
 <cacheFields>
 <cacheField>
 <sharedItems>
 <d/>
 </sharedItems>
 <fieldGroup/>
 </cacheField>
 </cacheFields>
</pivotCacheDefinition>
```

3.10.1 Pivot Tables

This section describes the definition of PivotTables in SpreadsheetML.

3.10.1.1 autoSortScope (AutoSort Scope)

Represents the sorting scope for the PivotTable.

Parent Elements
pivotField (§3.10.1.69)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AutoSortScope">
 <sequence>
 <element name="pivotArea" type="CT_PivotArea"/>
 </sequence>
</complexType>
```

3.10.1.2 b (Boolean)

Represents a boolean value for an item in the PivotTable.

**Parent Elements**

groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

1

**Child Elements****Subclause**

x (Member Property Index)

§3.10.1.96

2

Attributes	Description
c (Caption)	<p>Specifies the caption for the item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
cp (Member Property Count)	<p>Specifies the number of property values for this item.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this item has a calculated value.</p> <p>A value of on, 1, or true indicates the item has a calculated value.</p> <p>A value of off, 0, or false indicates the item does not have a calculated value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of on, 1, or true indicates this item is unused.</p> <p>A value of off, 0, or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item. This attribute is required.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
 <sequence>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="v" use="required" type="xsd:boolean"/>
 <attribute name="u" type="xsd:boolean"/>
 <attribute name="f" type="xsd:boolean"/>
 <attribute name="c" type="ST_Xstring"/>
 <attribute name="cp" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.3 cacheField (PivotCache Field)

Represent a single field in the PivotCache. This definition contains information about the field, such as its source, data type, and location within a level or hierarchy. The sharedItems complex type stores additional information about the data in this field. If there are no shared items, then values are stored directly in the pivotCacheRecords part.

[Example:

```
<cacheField name="Group" numFmtId="0">
 <sharedItems count="3">
 <s v="Pacific"/>
 <s v="North America"/>
 <s v="Europe"/>
 </sharedItems>
</cacheField>
```

end example]

Parent Elements
cacheFields (§3.10.1.4)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
fieldGroup (Field Group Properties)	§3.10.1.30
mpMap (Member Properties Map)	§3.10.1.58
sharedItems (Shared Items)	§3.10.1.90

Attributes	Description
caption (PivotCache Field Caption)	Specifies the caption of the cache field.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
databaseField (Database Field)	<p>Specifies a boolean value that indicates whether this field came from the source database rather having been created by the application.</p> <p>A value of on, 1, or true indicates the field is from the source database.</p> <p>A value of off, 0, or false indicates the field was created by the application.</p> <p>[<i>Note</i>: This attribute could be used for a defined grouped or calculated field. In this case, source database fields should precede defined grouped or calculated fields. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
formula (Calculated Field Formula)	<p>Specifies the formula for the calculated field. This formula is specified by the end-user. Calculated fields can perform calculations by using the contents of other fields in the PivotTable.</p> <p>In formulas you create for calculated fields or calculated items, you can use operators and expressions as you do in other worksheet formulas. You can use constants and refer to data from the PivotTable, but you cannot use cell references or defined names. You cannot use worksheet functions that require cell references or defined names as arguments, and you cannot use array functions.</p> <p>Further behaviors and restrictions apply to formulas for calculated fields:</p> <ul style="list-style-type: none"> <li>Formulas for calculated fields operate on the sum of the underlying data for any fields in the formula. For example, the formula =Sales * 1.2 multiplies the sum of the sales for each type and region by 1.2; it does not multiply each individual sale by 1.2 and then sum the multiplied amounts.</li> <li>Formulas cannot refer to totals.</li> </ul> <p>For more information about formulas see §3.17 in Formulas. For more information about defined names see §3.2.6 in Workbook.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
hierarchy (Hierarchy)	<p>Specifies the hierarchy that this field is part of.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
level (Hierarchy Level)	<p>Specifies the hierarchy level that this field is part of.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
mappingCount (Member Property)	Specifies the number of property mappings for this field.

Attributes	Description
Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
memberPropertyField (Member Property Field)	<p>Specifies a boolean value that indicates whether the field contains OLAP member property information.</p> <p>A value of on, 1, or true indicates this field contains OLAP member property information.</p> <p>A value of off, 0, or false indicates this field does not contain OLAP member property information.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
name (PivotCache Field Name)	<p>Specifies the name of the cache field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
numFmtId (Number Format Id)	<p>Specifies the number format that is applied to all items in the field. Number formats are written to the styles part. For more information see §3.8.31 in Styles.</p> <p>Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout of the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).</p>
propertyName (Property Name)	<p>Specifies the name of the property if this field is an OLAP property field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
serverField (Server-based Field)	<p>Specifies a boolean value that indicates whether the field is a server-based page field.</p> <p>A value of on, 1, or true indicates this field is a server-based page field.</p> <p>A value of off, 0, or false indicates this field is not a server-based page field.</p> <p>Note: this attribute applies to ODBC sources only.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sqlType (SQL Data Type)	<p>Specifies the SQL data type of the field. This attribute stores an ODBC data type and applies to ODBC data sources only. A value is supplied for this attribute only if it is provided to the application.</p> <p>The following are data types supported by ODBC. For a more information, see the ODBC specification.</p> <ul style="list-style-type: none"> <li>0 SQL_UNKNOWN_TYPE</li> </ul>

Attributes	Description
	<ul style="list-style-type: none"> <li>• 1 SQL_CHAR</li> <li>• 2 SQL_VARCHAR</li> <li>• -1 SQL_LONGVARCHAR</li> <li>• -8 SQL_WCHAR</li> <li>• -9 SQL_WVARCHAR</li> <li>• -10 SQL_WLONGVARCHAR</li> <li>• 3 SQL_DECIMAL</li> <li>• 2 SQL_NUMERIC</li> <li>• 5 SQL_SMALLINT</li> <li>• 4 SQL_INTEGER</li> <li>• 7 SQL_REAL</li> <li>• 6 SQL_FLOAT</li> <li>• 8 SQL_DOUBLE</li> <li>• -7 SQL_BIT</li> <li>• -6 SQL_TINYINT</li> <li>• -5 SQL_BIGINT</li> <li>• -2 SQL_BINARY</li> <li>• -3 SQL_VARBINARY</li> <li>• -4 SQL_LONGVARBINARY</li> <li>• 9 SQL_TYPE_DATE or SQL_DATE</li> <li>• 10 SQL_TYPE_TIME or SQL_TIME</li> <li>• 11 SQL_TYPE_TIMESTAMP or SQL_TIMESTAMP</li> <li>• 102 SQL_INTERVAL_MONTH</li> <li>• 101 SQL_INTERVAL_YEAR</li> <li>• 107 SQL_INTERVAL_YEAR_TO_MONTH</li> <li>• 103 SQL_INTERVAL_DAY</li> <li>• 104 SQL_INTERVAL_HOUR</li> <li>• 105 SQL_INTERVAL_MINUTE</li> <li>• 106 SQL_INTERVAL_SECOND</li> <li>• 108 SQL_INTERVAL_DAY_TO_HOUR</li> <li>• 109 SQL_INTERVAL_DAY_TO_MINUTE</li> <li>• 110 SQL_INTERVAL_DAY_TO_SECOND</li> <li>• 111 SQL_INTERVAL_HOUR_TO_MINUTE</li> <li>• 112 SQL_INTERVAL_HOUR_TO_SECOND</li> <li>• 113 SQL_INTERVAL_MINUTE_TO_SECOND</li> <li>• -11 SQL_GUID</li> <li>• -20 SQL_SIGNED_OFFSET</li> <li>• -22 SQL_UNSIGNED_OFFSET</li> </ul> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
uniqueList (Unique List Retrieved)	<p>Specifies a boolean value that indicates whether the application was able to get a list of unique items for the field. The attribute only applies to PivotTables that use ODBC and is intended to be used in conjunction with optimization features in the application. For example, the application can optimize memory usage when populating PivotCache</p>

Attributes	Description
	<p>records if it has a list of unique items for a field before all the records are retrieved from ODBC.</p> <p>A value of on, 1, or true indicates the application was able to get a list of unique values for the field.</p> <p>A value of off, 0, or false indicates the application was unable to get a list of unique values for the field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CacheField">
 <sequence>
 <element name="sharedItems" type="CT_SharedItems" minOccurs="0" maxOccurs="1"/>
 <element name="fieldGroup" minOccurs="0" type="CT_FieldGroup"/>
 <element name="mpMap" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="caption" type="ST_Xstring" use="optional"/>
 <attribute name="propertyName" type="ST_Xstring" use="optional"/>
 <attribute name="serverField" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="uniqueList" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
 <attribute name="formula" type="ST_Xstring" use="optional"/>
 <attribute name="sqlType" type="xsd:int" use="optional" default="0"/>
 <attribute name="hierarchy" type="xsd:int" use="optional" default="0"/>
 <attribute name="level" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="databaseField" type="xsd:boolean" default="true"/>
 <attribute name="mappingCount" type="xsd:unsignedInt" use="optional"/>
 <attribute name="memberPropertyField" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

#### 3.10.1.4 cacheFields (PivotCache Fields)

Represents the collection of field definitions in the source data.

[Example:

```

1 <cacheFields count="1">
2 <cacheField name="Group" numFmtId="0">
3 <sharedItems count="3">
4 <s v="One"/>
5 <s v="Two"/>
6 <s v="Three"/>
7 </sharedItems>
8 </cacheField>
9 </cacheFields>

```

*end example]*

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
cacheField (PivotCache Field)	§3.10.1.3

Attributes	Description
count (Field Count)	Specifies the number of fields in the cache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_CacheFields">
15 <sequence>
16 <element name="cacheField" type="CT_CacheField" minOccurs="0" maxOccurs="unbounded"/>
17 </sequence>
18 <attribute name="count" type="xsd:unsignedInt"/>
19 </complexType>

```

### 3.10.1.5 cacheHierarchies (PivotCache Hierarchies)

Represents the collection of OLAP hierarchies in the PivotCache.

*[Example:*

```

23 <cacheHierarchies count="2">
24 <cacheHierarchy uniqueName="[Account].[Account]" caption="Account"
25 attribute="1" keyAttribute="1"
26 defaultMemberUniqueName="[Account].[Account].[All Accounts]"
27 allUniqueName="[Account].[Account].[All Accounts]"
28 dimensionUniqueName="[Account]" count="0"/>

```

```

1 <cacheHierarchy uniqueName="[Account].[Account Number]" caption="Account
2 Number" attribute="1" defaultMemberUniqueName="[Account].[Account
3 Number].[All Accounts]" allUniqueName="[Account].[Account Number].[All
4 Accounts]" dimensionUniqueName="[Account]" count="0"/>
5 </cacheHierarchies>

```

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
cacheHierarchy (PivotCache Hierarchy)	§3.10.1.6

Attributes	Description
count (Hierarchy Count)	Specifies the number of OLAP hierarchies in the cache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CacheHierarchies">
 <sequence>
 <element name="cacheHierarchy" minOccurs="0" maxOccurs="unbounded" type="CT_CacheHierarchy"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.6 cacheHierarchy (PivotCache Hierarchy)

Represents an OLAP hierarchy in the PivotCache.

*[Example:*

```

<cacheHierarchy uniqueName="[Account].[Account Number]" caption="Account Number"
 attribute="1" defaultMemberUniqueName="[Account].[Account Number].[All
 Accounts]" allUniqueName="[Account].[Account Number].[All Accounts]"
 dimensionUniqueName="[Account]" count="0"/>

```

*end example]*

Parent Elements
cacheHierarchies (§3.10.1.5)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
fieldsUsage (Fields Usage)	§3.10.1.31
groupLevels (OLAP Grouping Levels)	§3.10.1.40

1

Attributes	Description
allCaption (Display Name of 'All')	Specifies the display name of the "all" member of this hierarchy.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
allUniqueName (Unique Name of 'All')	Specifies the unique name of the "all" member of this hierarchy.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
attribute (Attribute Hierarchy)	Specifies a boolean value that indicates whether this hierarchy is an attribute hierarchy. An attribute hierarchy is an OLAP member that is exposed as a flat, single-level hierarchy on the OLAP server.  A value of on, 1, or true indicates this hierarchy is an attribute hierarchy.  A value of off, 0, or false indicates this hierarchy is not an attribute hierarchy.  The possible values for this attribute are defined by the XML Schema boolean datatype.
caption (Hierarchy Display Name)	Specifies the display name of the hierarchy.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
count (Levels Count)	Specifies the number of levels in this hierarchy.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
defaultMemberUniqueName (Default Member Unique Name)	Specifies the unique name of the default member of this hierarchy  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dimensionUniqueName (Dimension Unique Name)	Specifies the unique name of the dimension to which this hierarchy belongs.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
displayFolder (Display Folder)	Specifies the display folder in which this hierarchy should be displayed.  The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
hidden (Hidden)	<p>Specifies a boolean value that indicates whether the hierarchy is hidden.</p> <p>A value of on, 1, or true indicates this hierarchy is hidden.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
iconSet (KPI Icon Set)	<p>Specifies the icon set to use to visualize a KPI trend or status expression. PivotTables use the icon sets available for conditional formatting in SpreadsheetML. See associated simple type definition for details. The following values are used by PivotTables:</p> <ul style="list-style-type: none"> <li>• no value: default iconset. For status KPI this corresponds to 3 traffic lights. For trend KPI this corresponds to 3-arrows.</li> <li>• 1: Variance Arrow - 3 arrow.</li> <li>• 2: 3 arrows</li> <li>• 3: Status Arrow Ascending - 5 arrows.</li> <li>• 4: Status Arrow Descending - 5 arrows</li> <li>• 5: Standard Arrow - 5 arrows gray.</li> <li>• 6: Traffic Light Single - 3 traffic lights 1.</li> <li>• 7: Traffic Light, Traffic Light Multiple - 3 traffic lights 2.</li> <li>• 8: Gauge Ascending - 5 quarters.</li> <li>• 9: Gauge Descending - 5 quarters.</li> <li>• 10: Thermometer, Cylinder, Smiley Face - 3 signs.</li> <li>• 11: Road Signs - 3 symbols.</li> </ul> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
keyAttribute (Key Attribute Hierarchy)	<p>Specifies a boolean value that indicates whether this hierarchy is the key attribute hierarchy in an OLAP dimension.</p> <p>A value of on, 1, or true indicates this hierarchy is the key attribute hierarchy in an OLAP dimension.</p> <p>A value of off, 0, or false indicates this hierarchy is not a key attribute hierarchy.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
measure (Measure Hierarchy)	<p>Specifies a boolean value that indicates whether this hierarchy is a measure.</p> <p>A value of on, 1, or true indicates this hierarchy is a measure.</p> <p>A value of off, 0, or false indicates this hierarchy is not a measure.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
measureGroup (Measure Group Name)	<p>Specifies the name of the measure group to which this hierarchy belongs.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

Attributes	Description
measures (Measures)	<p>Specifies a boolean value that indicates whether this hierarchy contains all the measures.</p> <p>A value of on, 1, or true indicates this hierarchy contains all the measures.</p> <p>A value of off, 0, or false indicates this hierarchy does not contain all the measures.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
memberValueDatatype (Member Value Data Type)	<p>Specifies the data type of the member value. This attribute stores an OLEDB data type.</p> <p>[<i>Note:</i> Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbtype_indicators.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbtype_indicators.asp</a> <i>end note</i>]</p> <p>memberValueDataType is stored for key attribute hierarchies in order to tell when the application will offer date filtering instead of label filtering in OLAP PivotTables. Date filtering is only offered when the data type is Date/Time. memberValueDatatype="7" indicates a date/time data type.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedShort datatype.</p>
oneField (One Field)	<p>Specifies a boolean value that indicates whether this hierarchy is associated with only one field due to its position in the view.</p> <p>A value of on, 1, or true indicates this hierarchy is associated with only one field.</p> <p>A value of off, 0, or false indicates this field is not restricted to only one association due to its position in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
parentSet (Parent Set)	<p>Specifies the parent hierarchy of the set. If the attribute is missing it means that the parent hierarchy is unknown or doesn't exist in the cache.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
set (Set)	<p>Specifies a boolean value that indicates whether this hierarchy is a set.</p> <p>A value of on, 1, or true indicates this hierarchy is a set.</p> <p>A value of off, 0, or false indicates this hierarchy is not a set.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
time (Time)	<p>Specifies a boolean value that indicates whether this hierarchy is of type time.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates this hierarchy is of type time.</p> <p>A value of off, 0, or false indicates is of a different type.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>unbalanced</b> (Unbalanced)	<p>Specifies a boolean value that indicates whether this hierarchy is an unbalanced hierarchy. If value is not written, then this attribute either cannot be determined or does not apply to the current hierarchy.</p> <p>A value of on, 1, or true indicates this hierarchy is unbalanced.</p> <p>A value of off, 0, or false indicates is balanced.</p> <p>For more information on balanced hierarchies, see the documentation provided for your OLAP server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>unbalancedGroup</b> (Unbalanced Group)	<p>Specifies a boolean value that indicated whether the grouped version of this hierarchy is an unbalanced hierarchy. If value is not written, then this attribute either cannot be determined or does not apply to the current hierarchy.</p> <p>A value of on, 1, or true indicates this hierarchy is unbalanced when grouped.</p> <p>A value of off, 0, or false indicates is balanced when grouped.</p> <p>For more information on balanced hierarchies, see the documentation provided for your OLAP server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<b>uniqueName</b> (Hierarchy Unique Name)	<p>Specifies the unique name of the hierarchy.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheHierarchy">
 <sequence>
 <element name="fieldsUsage" minOccurs="0" type="CT_FieldsUsage"/>
 <element name="groupLevels" minOccurs="0" type="CT_GroupLevels"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="uniqueName" use="required" type="ST_Xstring"/>
 <attribute name="caption" use="optional" type="ST_Xstring"/>
 <attribute name="measure" type="xsd:boolean" default="false"/>
 <attribute name="set" type="xsd:boolean" default="false"/>
 <attribute name="parentSet" type="xsd:unsignedInt" use="optional"/>
 <attribute name="iconSet" type="xsd:int" default="0"/>
 <attribute name="attribute" type="xsd:boolean" default="false"/>
 <attribute name="time" type="xsd:boolean" default="false"/>
 <attribute name="keyAttribute" type="xsd:boolean" default="false"/>
 <attribute name="defaultMemberUniqueName" type="ST_Xstring"/>
 <attribute name="allUniqueName" type="ST_Xstring"/>
 <attribute name="allCaption" type="ST_Xstring"/>
 <attribute name="dimensionUniqueName" type="ST_Xstring"/>
 <attribute name="displayFolder" type="ST_Xstring"/>
 <attribute name="measureGroup" type="ST_Xstring"/>
 <attribute name="measures" type="xsd:boolean" default="false"/>
 <attribute name="count" use="required" type="xsd:unsignedInt"/>
 <attribute name="oneField" type="xsd:boolean" default="false"/>
 <attribute name="memberValueDatatype" use="optional" type="xsd:unsignedShort"/>
 <attribute name="unbalanced" use="optional" type="xsd:boolean"/>
 <attribute name="unbalancedGroup" use="optional" type="xsd:boolean"/>
 <attribute name="hidden" type="xsd:boolean" default="false"/>
</complexType>
```

### 3.10.1.7 cacheSource (PivotCache Source Description)

Represents the description of data source whose data is stored in the pivot cache. The data source refers to the underlying rows or database records that provide the data for a PivotTable. You can create a PivotTable report from a SpreadsheetML table, an external database (including OLAP cubes), multiple SpreadsheetML worksheets, or another PivotTable.

Quarter	Region	Sport	Sales
Qtr1	East	Golf	\$5,000
Qtr1	East	Safari	\$9,000
Qtr1	East	Tennis	\$1,500
Qtr2	East	Golf	\$2,000
Qtr2	East	Safari	\$6,000
Qtr2	East	Tennis	\$500
Qtr1	West	Golf	\$3,500
Qtr1	West	Tennis	\$6,000
Qtr2	West	Golf	\$2,500
Qtr2	West	Tennis	\$3,200

Information about the data source is stored in the connection element and is retrieved using the connectionId attribute.

[Example:

```
<cacheSource type="external" connectionId="1"/>
```

end example]

OLAP data sources are distinguished from other data sources in SpreadsheetML. OLAP records are not stored in the *pivotCacheRecords* part, whereas all records for non-OLAP data sources are stored in the cache.

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
consolidation (Consolidation Source)	§3.10.1.20
extLst (Future Feature Data Storage Area)	§3.2.10
worksheetSource (Worksheet PivotCache Source)	§3.10.1.95

Attributes	Description
connectionId (Connection Index)	Specifies the index to the workbook connection. This attribute is used when the cache type is 'External.' See §3.13.1 for more information about the connection element.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Cache Type)	Specifies the cache type.  The possible values for this attribute are defined by the ST_SourceType simple type (§3.18.77).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheSource">
 <choice minOccurs="0" maxOccurs="1">
 <element name="worksheetSource" type="CT_WorksheetSource" minOccurs="1" maxOccurs="1"/>
 <element name="consolidation" type="CT_Consolidation" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0"/>
 </choice>
 <attribute name="type" type="ST_SourceType" use="required"/>
 <attribute name="connectionId" type="xsd:unsignedInt" default="0" use="optional"/>
</complexType>
```

### 3.10.1.8 [calculatedItem \(Calculated Item\)](#)

Represents an item within a PivotTable field that uses a formula . The formula is specified in the formula attribute.

- 1 Calculations and options available for a PivotTable depend on whether the source data came from an  
 2 OLAP database or another type of database. This complex type applies to non-OLAP external data or on  
 3 worksheet data. See `calculatedMember` for information on calculations on OLAP data sources.

Parent Elements
<code>calculatedItems</code> (§3.10.1.9)

4

Child Elements	Subclause
<code>extLst</code> (Future Feature Data Storage Area)	§3.2.10
<code>pivotArea</code> (Pivot Area)	§3.3.1.66

5

Attributes	Description
<code>field</code> (Field Index)	<p>Specifies the index of the <code>pivotField</code> with which this calculated item is associated.</p> <p>The possible values for this attribute are defined by the XML Schema <code>unsignedInt</code> datatype.</p>
<code>formula</code> (Calculated Item Formula)	<p>Specifies the formula of the calculated item. In formulas you create for calculated items, you can use operators and expressions as you do in other worksheet formulas. You can use constants and refer to data from the PivotTable, but you cannot use cell references or defined names. You cannot use worksheet functions that require cell references or defined names as arguments, and you cannot use array functions.</p> <p>Further behaviors and restrictions apply to formulas for <code>calculatedItems</code>:</p> <ul style="list-style-type: none"> <li>Formulas for calculated items operate on the individual records; the calculated item formula <code>=Dairy *115%</code> multiplies each individual sale of Dairy times 115%, after which the multiplied amounts are summarized together in the data area.</li> <li>Formulas cannot refer to totals.</li> <li>You can include the field name in a reference to an item. The item name must be in square brackets. Use this format to avoid <code>#NAME?</code> errors when two items in two different fields in a report have the same name.</li> <li>You can refer to an item by its position in the PivotTable as currently sorted and displayed. The item referred to in this way can change whenever the positions of items change or different items are displayed or hidden. Hidden items are not counted in this index.</li> <li>You can use relative positions to refer to items. The positions are determined relative to the calculated item that contains the formula. If the position you give is before the first item or after the last item in the field, the formula results in a <code>#REF!</code> error.</li> </ul> <p>For more information about formulas see §3.17 in Formulas. For more information about defined names see §3.2.6 in Workbook.</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type</p>

Attributes	Description
	(§3.18.96).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CalculatedItem">
 <sequence>
 <element name="pivotArea" type="CT_PivotArea"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="field" type="xsd:unsignedInt" use="optional"/>
 <attribute name="formula" type="ST_Xstring"/>
</complexType>

```

### 3.10.1.9 **calculatedItems** (Calculated Items)

Represents the collection of calculated items.

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
calculatedItem (Calculated Item)	§3.10.1.8

Attributes	Description
count (Calculated Item Formula Count)	Specifies the number of calculated item formulas in the cache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CalculatedItems">
 <sequence>
 <element name="calculatedItem" maxOccurs="unbounded" type="CT_CalculatedItem"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.10 **calculatedMember** (Calculated Member)

Represents a calculated OLAP hierarchy. A calculated member is a member of an OLAP-based PivotTable whose value is calculated on the OLAP server. For PivotTables that are created from OLAP cubes the summarized values are precalculated on the OLAP server before the SpreadsheetML application displays the results. These fields appear in the PivotTable field list but cannot be changed from within the PivotTable. You cannot change the summary function used to calculate data fields or subtotals, or add calculated items.

Calculated members are defined by the Multidimensional Expressions (MDX) expression in the mdx attribute.

[Example:

```
<calculatedMembers count="1">
 <calculatedMember name="[Product].[Product Categories].[All
 Products].[Calculated Member]" mdx="'[Product].[Product Categories].[All
 Products].[Accessories]'" memberName="Calculated Member"
 hierarchy="[Product].[Product Categories]" parent="[Product].[Product
 Categories].[All Products]"/>
</calculatedMembers>
```

end example]

Parent Elements
calculatedMembers (§3.10.1.11)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
hierarchy (Hierarchy Name)	Specifies the name of the hierarchy to which the calculated member belongs.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
mdx (Calculated Member MDX Formula)	Specifies the MDX formula for the calculated member.  [Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: <a href="http://msdn2.microsoft.com/en-us/library/ms145595.aspx">http://msdn2.microsoft.com/en-us/library/ms145595.aspx</a> end note]  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
memberName (OLAP Calculated Member Name)	Specifies the OLAP member name for the calculated member.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
name (Calculated Member Name)	Specifies the name of the calculated member.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
parent (Parent	Specifies the name of the parent of the calculated member.

Attributes	Description
Name)	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
set (Set)	<p>Specifies a boolean value that indicates whether this calculated member describes a calculated set rather than a calculated member.</p> <p>A value of on, 1, or true indicates this is a calculated set.</p> <p>A value of off, 0, or false indicates this is a calculated member.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
solveOrder (Calculated Members Solve Order)	<p>Specifies the order in which this calculated member is calculated in relation to other calculated members.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_CalculatedMember">
3 <sequence minOccurs="0">
4 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
5 </sequence>
6 <attribute name="name" use="required" type="ST_Xstring"/>
7 <attribute name="mdx" use="required" type="ST_Xstring"/>
8 <attribute name="memberName" type="ST_Xstring"/>
9 <attribute name="hierarchy" type="ST_Xstring"/>
10 <attribute name="parent" type="ST_Xstring"/>
11 <attribute name="solveOrder" type="xsd:int" default="0"/>
12 <attribute name="set" type="xsd:boolean" default="false"/>
13 </complexType>

```

#### 14 3.10.1.11 [calculatedMembers \(Calculated Members\)](#)

15 Represents the collection of calculated members in an OLAP PivotTable.

16 *[Example:*

```

17 <calculatedMembers count="1">
18 <calculatedMember name="[Product].[Product Categories].[All
19 Products].[Calculated Member]" mdx="'[Product].[Product Categories].[All
20 Products].[Accessories]'" memberName="Calculated Member"
21 hierarchy="[Product].[Product Categories]" parent="[Product].[Product
22 Categories].[All Products]"/>
23 </calculatedMembers>

```

24 *end example]*

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
calculatedMember (Calculated Member)	§3.10.1.10

Attributes	Description
count (Calculated Members Count)	Specifies the number of calculated members.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalculatedMembers">
 <sequence>
 <element name="calculatedMember" maxOccurs="unbounded" type="CT_CalculatedMember"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.12 [chartFormat \(PivotChart Format\)](#)

Represents the format defined in the PivotChart that is associated with this PivotTable.

*[Example:*

```
<sh:pivotTableDefinition xmlns:sh="..." name="PivotTable1" cacheId="0"
 applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
 applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="1"
 dataCaption="Values" updatedVersion="3" minRefreshableVersion="3"
 showCalcMbrs="0" useAutoFormatting="1" colGrandTotals="0" itemPrintTitles="1"
 createdVersion="3" indent="0" outline="1" outlineData="1"
 multipleFieldFilters="0" chartFormat="1" fieldListSortAscending="1">
```

*end example]*

Parent Elements
chartFormats (§3.10.1.13)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
chart (Chart Index)	<p>Specifies the index of the chart part to which the formatting applies. For more information see the DrawingML specification for more information on the chart part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
format (Pivot Format Id)	<p>Specifies the index of the pivot format that is currently in use. This index corresponds to a dxf element in the Styles part. For more information see the Styles section (§3.8).</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
series (Series Format)	<p>Specifies a boolean value that indicates whether format applies to a series.</p> <p>A value of on, 1, or true indicates this format applies to a series.</p> <p>A value of off, 0, or false indicates this format applies to a data point.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ChartFormat">
 <sequence>
 <element name="pivotArea" type="CT_PivotArea"/>
 </sequence>
 <attribute name="chart" use="required" type="xsd:unsignedInt"/>
 <attribute name="format" use="required" type="xsd:unsignedInt"/>
 <attribute name="series" type="xsd:boolean" default="false"/>
</complexType>

```

### 3.10.1.13 chartFormats (PivotChart Formats)

Represents the collection of formats applied to PivotChart.

[Example:

```

<sh:chartFormats count="4">
 <sh:chartFormat chart="0" format="0" series="1">
 <sh:pivotArea type="data" outline="0">
 <sh:references count="3">
 <sh:reference field="4294967294" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 <sh:reference field="14" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 </sh:references>
 </sh:pivotArea>
 </sh:chartFormat>
</sh:chartFormats>

```

```

1 <sh:reference field="15" count="1" selected="0">
2 <sh:x v="2"/>
3 </sh:reference>
4 </sh:references>
5 </sh:pivotArea>
6 </sh:chartFormat>
7 <sh:chartFormat chart="0" format="1" series="1">
8 <sh:pivotArea type="data" outline="0">
9 <sh:references count="3">
10 <sh:reference field="4294967294" count="1" selected="0">
11 <sh:x v="0"/>
12 </sh:reference>
13 <sh:reference field="14" count="1" selected="0">
14 <sh:x v="0"/>
15 </sh:reference>
16 <sh:reference field="15" count="1" selected="0">
17 <sh:x v="3"/>
18 </sh:reference>
19 </sh:references>
20 </sh:pivotArea>
21 </sh:chartFormat>
22 <sh:chartFormat chart="0" format="2" series="1">
23 <sh:pivotArea type="data" outline="0">
24 <sh:references count="3">
25 <sh:reference field="4294967294" count="1" selected="0">
26 <sh:x v="1"/>
27 </sh:reference>
28 <sh:reference field="14" count="1" selected="0">
29 <sh:x v="0"/>
30 </sh:reference>
31 <sh:reference field="15" count="1" selected="0">
32 <sh:x v="2"/>
33 </sh:reference>
34 </sh:references>
35 </sh:pivotArea>
36 </sh:chartFormat>
37 <sh:chartFormat chart="0" format="3" series="1">
38 <sh:pivotArea type="data" outline="0">
39 <sh:references count="3">
40 <sh:reference field="4294967294" count="1" selected="0">
41 <sh:x v="1"/>
42 </sh:reference>

```

```
1 <sh:reference field="14" count="1" selected="0">
2 <sh:x v="0"/>
3 </sh:reference>
4 <sh:reference field="15" count="1" selected="0">
5 <sh:x v="3"/>
6 </sh:reference>
7 </sh:references>
8 </sh:pivotArea>
9 </sh:chartFormat>
10 </sh:chartFormats>
```

11 *end example]*

Parent Elements
pivotTableDefinition (§3.10.1.73)

12

Child Elements	Subclause
chartFormat (PivotChart Format)	§3.10.1.12

13

Attributes	Description
count (Format Count)	Specifies the number of formats in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_ChartFormats">
16 <sequence>
17 <element name="chartFormat" maxOccurs="unbounded" type="CT_ChartFormat"/>
18 </sequence>
19 <attribute name="count" type="xsd:unsignedInt" default="0"/>
20 </complexType>
```

21 **3.10.1.14 colFields (Column Fields)**

22 Represents the collection of fields that are on the column axis of the PivotTable.

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

23

24 In the image above, the blue field is a column field.

In the following SpreadsheetML example, "Year", "Quarter" and "Month" are on the column axis of the PivotTable, in that order.

[Example:

```
<colFields count="3">
 <field x="14"/>
 <field x="15"/>
 <field x="16"/>
</colFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
field (Field)	§3.10.1.29

Attributes	Description
count (Repeated Items Count)	Specifies the number of items in this collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColFields">
 <sequence>
 <element name="field" maxOccurs="unbounded" type="CT_Field"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

### 3.10.1.15 colHierarchiesUsage (Column OLAP Hierarchy References)

Represents the collection of references to OLAP hierarchies on the column axis of a PivotTable.

[Example:

```
<sh:colHierarchiesUsage count="2">
 <sh:colHierarchyUsage hierarchyUsage="33"/>
 <sh:colHierarchyUsage hierarchyUsage="-2"/>
</sh:colHierarchiesUsage>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
colHierarchyUsage (Column OLAP Hierarchies)	§3.10.1.16

Attributes	Description
count (Items Count)	Specifies the number of items in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColHierarchiesUsage">
 <sequence>
 <element name="colHierarchyUsage" minOccurs="1" maxOccurs="unbounded"
 type="CT_HierarchyUsage"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.16 colHierarchyUsage (Column OLAP Hierarchies)

Represents the collection of references to OLAP Hierarchies on the column axis of a PivotTable.

*[Example:*

```
<sh:colHierarchyUsage hierarchyUsage="33"/>
```

*end example]*

Parent Elements
colHierarchiesUsage (§3.10.1.15)

Attributes	Description
hierarchyUsage (Hierarchy Usage)	Specifies the reference to an OLAP hierarchy in a PivotTable.  The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HierarchyUsage">
 <attribute name="hierarchyUsage" type="xsd:int" use="required"/>
</complexType>
```

### 3.10.1.17 `colItems` (Column Items)

Represents the collection of column items of the PivotTable.

In the following SpreadsheetML example the item values are found in cells C6:H8. For example "2001" / "3" / "July" values are in C7:C9. Those are the first column item values and are referenced by the first `<i>` element below.

[Example:

```
<colItems count="5">
 <i>
 <x/>
 <x/>
 <x/>
 </i>
 <i r="2">
 <x v="1"/>
 </i>
 <i r="2">
 <x v="2"/>
 </i>
 <i t="default" r="1">
 <x/>
 </i>
 <i t="default">
 <x/>
 </i>
</colItems>
```

end example]

The first `<i>` collection represents all item values for the first column in the column axis area of the PivotTable. The first `<x>` in the first `<i>` corresponds to the first field in the columns area of the PivotTable, namely "Year". The implied index value of '0' on this `<x>` indicates that the item value for this first item in the column is the 0th item for this pivotField. The 0th item for this pivotField is itself an index to an item value into this field's shared items collection in the pivotCacheDefinition part, namely "2001".

The item values corresponding to the second and third `<x>` elements can be found in the same way, arriving at "3" for the second item value, and arriving at "July" for the third item value for this first column.

The second `<i>` collection expresses all 3 item values for the second column in the column axis area. The `@r` value of '2' indicates that the first two item values from the previous column will be repeated here, which means that the first item value for this second column will be "2001" again and the second item value for this second column will be "3". The third item value is expressed by the only `<x>` element under this second `<i>` element, and without further explanation is understood to reference the item value "August".

1

Parent Elements
pivotTableDefinition (§3.10.1.73)

2

Child Elements	Subclause
i (Row Items)	§3.10.1.44

3

Attributes	Description
count (Column Item Count)	Specifies the number of items on the column axis of the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

4 The following XML Schema fragment defines the contents of this element:

```

5 <complexType name="CT_colItems">
6 <sequence>
7 <element name="i" maxOccurs="unbounded" type="CT_I"/>
8 </sequence>
9 <attribute name="count" type="xsd:unsignedInt"/>
10 </complexType>

```

### 11 3.10.1.18 conditionalFormat (Conditional Formatting)

12 Represents the conditional formatting defined in the PivotTable.

Parent Elements
conditionalFormats (§3.10.1.19)

13

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pivotAreas (Pivot Areas)	§3.10.1.66

14

Attributes	Description
priority (Priority)	Specifies the priority of PivotTable conditional formatting rule.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
scope (Conditional Formatting Scope)	Specifies the scope of PivotTable conditional formatting rule.

Attributes	Description
	The possible values for this attribute are defined by the ST_Scope simple type (§3.18.69).
type (Conditional Formatting Rule Type)	Specifies the type of PivotTable conditional formatting rule. See associated simple type definition for details.  The possible values for this attribute are defined by the ST_Type simple type (§3.18.84).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ConditionalFormat">
 <sequence>
 <element name="pivotAreas" type="CT_PivotAreas"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="scope" type="ST_Scope" default="selection"/>
 <attribute name="type" type="ST_Type" default="none"/>
 <attribute name="priority" use="required" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.19 conditionalFormats (Conditional Formats)

Represents the collection of conditional formats applied to a PivotTable.

[Example:

```

<sh:conditionalFormats count="1">
 <sh:conditionalFormat priority="1">
 <sh:pivotAreas count="1">
 <sh:pivotArea type="data" collapsedLevelsAreSubtotals="1">
 <sh:references count="5">
 <sh:reference field="4294967294" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 <sh:reference field="2" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 <sh:reference field="14" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 </sh:references>
 </sh:pivotArea>
 </sh:pivotAreas>
 </sh:conditionalFormat>
</sh:conditionalFormats>

```

```

1 <sh:reference field="15" count="2" selected="0">
2 <sh:x v="2"/>
3 <sh:x v="3"/>
4 </sh:reference>
5 </sh:references>
6 </sh:pivotArea>
7 </sh:pivotAreas>
8 </sh:conditionalFormat>
9 </sh:conditionalFormats>

```

end example]

Parent Elements
<a href="#">pivotTableDefinition (§3.10.1.73)</a>

Child Elements	Subclause
<a href="#">conditionalFormat (Conditional Formatting)</a>	<a href="#">§3.10.1.18</a>

Attributes	Description
<a href="#">count (Conditional Format Count)</a>	Specifies the number of conditional formats defined for the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ConditionalFormats">
 <sequence>
 <element name="conditionalFormat" maxOccurs="unbounded" type="CT_ConditionalFormat"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>

```

3.10.1.20 consolidation (Consolidation Source)

Represents the description of the PivotCache source using multiple consolidation ranges. This element is used when the source of the PivotTable is a collection of ranges in the workbook. The ranges are specified in the rangeSets collection. The logic for how the application consolidates the data in the ranges is application-specific. For example, the application may consolidate data based on its position in the worksheet that the end-user specifies.

Parent Elements
<a href="#">cacheSource (§3.10.1.7)</a>

Child Elements	Subclause
pages (Page Item Values)	§3.10.1.65
rangeSets (Range Sets)	§3.10.1.80

1

Attributes	Description
autoPage (Auto Page)	<p>Specifies a boolean value that indicates whether the application will automatically create one additional page field to describe/qualify the source ranges.</p> <p>A value of on, 1, or true indicates the application will create an additional page field.</p> <p>A value of off, 0, or false indicates will not create an additional page field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Consolidation">
4 <sequence>
5 <element name="pages" type="CT_Pages" minOccurs="0" maxOccurs="1"/>
6 <element name="rangeSets" type="CT_RangeSets" minOccurs="1" maxOccurs="1"/>
7 </sequence>
8 <attribute name="autoPage" type="xsd:boolean" default="true" use="optional"/>
9 </complexType>

```

### 10 3.10.1.21 d (Date Time)

11 Represents a date-time value in the PivotTable.

Parent Elements
groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

12

Child Elements	Subclause
x (Member Property Index)	§3.10.1.96

13

Attributes	Description
c (Caption)	<p>Specifies the caption for the item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
cp (Member Property Count)	<p>Specifies the number of member property values.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

Attributes	Description
f (Calculated Item Value)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of on, 1, or true indicates this is a calculated item value.</p> <p>A value of off, 0, or false indicates this is not a calculated item value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of on, 1, or true indicates this is an unused item.</p> <p>A value of off, 0, or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DateTime">
 <sequence>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="v" use="required" type="xsd:dateTime"/>
 <attribute name="u" type="xsd:boolean"/>
 <attribute name="f" type="xsd:boolean"/>
 <attribute name="c" type="ST_Xstring"/>
 <attribute name="cp" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.22 dataField (Data Field Item)

Represents a field from a source list, table, or database that contains data that is summarized in a PivotTable.

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

A data field represents data that's derived from a field in the source list or database. The Sport field, for example, might come from a column in the source list that's labeled Sport and contains the names of various sports (Golf, Tennis) for which the source list has sales figures. Source data can be taken from an SpreadsheetML list or range, an external database or cube, or another PivotTable. Data fields use summary functions to

combine values from the underlying source data. You can also use custom calculations to compare data values, or add your own formulas that use elements of the report or other worksheet data.

[Example:

```
<dataFields count="1">
 <dataField name="Sum of Sales Amount" fld="25" baseField="0" baseItem="0"/>
</dataFields>
```

end example]

Parent Elements
dataFields (§3.10.1.23)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
baseField ('Show Data As' Base Field)	Specifies the index to the base field when the ShowDataAs calculation is in use.  The possible values for this attribute are defined by the XML Schema int datatype.
baseItem ('Show Data As' Base Setting)	Specifies the index to the base item when the ShowDataAs calculation is in use.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
fld (Field)	Specifies the index to the field (<r>) in the pivotCacheRecords part that this data item summarizes.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Data Field Name)	Specifies the name of the data field.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
numFmtId (Number Format Id)	Specifies the index to the number format applied to this data field. Number formats are written to the styles part. See the Styles section (§3.8) for more information on number formats.  Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.

Attributes	Description
	The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
showDataAs (Show Data As Display Format)	<p>Specifies the display format for this data field.</p> <p>Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_ShowDataAs simple type (§3.18.72).</p>
subtotal (Subtotal)	<p>Specifies the aggregation function that applies to this data field.</p> <p>The possible values for this attribute are defined by the ST_DataConsolidateFunction simple type (§3.18.18).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_DataField">
3 <sequence>
4 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
5 </sequence>
6 <attribute name="name" use="optional" type="ST_Xstring"/>
7 <attribute name="fld" type="xsd:unsignedInt" use="required"/>
8 <attribute name="subtotal" type="ST_DataConsolidateFunction" default="sum"/>
9 <attribute name="showDataAs" type="ST_ShowDataAs" default="normal"/>
10 <attribute name="baseField" type="xsd:int" default="-1"/>
11 <attribute name="baseItem" type="xsd:unsignedInt" default="1048832"/>
12 <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
13 </complexType>
```

14 **3.10.1.23 dataFields (Data Fields)**

15 Represents the collection of items in the data region of the PivotTable.

16 *[Example:*

```
17 <dataFields count="1">
18 <dataField name="Sum of Sales Amount" fld="25" baseField="0" baseItem="0"/>
19 </dataFields>
```

20 *end example]*

Parent Elements
pivotTableDefinition (§3.10.1.73)

21

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
dataField (Data Field Item)	§3.10.1.22

1

Attributes	Description
count (Data Items Count)	Specifies the number of items in the data region of the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_DataFields">
4 <sequence>
5 <element name="dataField" maxOccurs="unbounded" type="CT_DataField"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt"/>
8 </complexType>

```

### 9 3.10.1.24 dimension (OLAP Dimension)

10 Represents a PivotTable OLAP Dimension. A dimension is a field that organizes a single type of data into a  
 11 hierarchy with levels of detail. For example, an OLAP database could contain a Time dimension providing data  
 12 for levels Year, Month, Week, and Day, allowing you to create reports that let you compare day-to-day sales  
 13 results or view a summary of your sales for an entire year.

Parent Elements
dimensions (§3.10.1.25)

14

Attributes	Description
caption (Dimension Display Name)	Specifies the display name of the dimension.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
measure (Measure)	Specifies a boolean value that indicates whether this is a measure dimension.  A value of on, 1, or true indicates this dimension is a measure dimension.  A value of off, 0, or false indicates this dimension is not a measure dimension.  The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Dimension Name)	Specifies the name of the dimension.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
uniqueName (Dimension Unique Name)	Specifies the unique name of the dimension.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotDimension">
 <attribute name="measure" type="xsd:boolean" default="false"/>
 <attribute name="name" use="required" type="ST_Xstring"/>
 <attribute name="uniqueName" use="required" type="ST_Xstring"/>
 <attribute name="caption" use="required" type="ST_Xstring"/>
</complexType>
```

### 3.10.1.25 dimensions (OLAP Dimensions)

Represents the collection of PivotTable OLAP dimensions.

[Example:

```
<dimensions count="22">
 <dimension name="Account" uniqueName="[Account]" caption="Account"/>
 <dimension name="Customer" uniqueName="[Customer]" caption="Customer"/>
 <dimension name="Date" uniqueName="[Date]" caption="Date"/>

9 </dimensions>

```

*end example]*

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
dimension (OLAP Dimension)	§3.10.1.24

Attributes	Description
count (OLAP Dimensions Count)	Specifies the number of OLAP dimensions in the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_Dimensions">
15 <sequence>
16 <element name="dimension" minOccurs="0" maxOccurs="unbounded" type="CT_PivotDimension"/>
17 </sequence>
18 <attribute name="count" type="xsd:unsignedInt"/>
19 </complexType>

```

### 3.10.1.26 discretePr (Discrete Grouping Properties)

Represents the collection of discrete grouping properties for a field group.

*[Example:*

...

```

24 <fieldGroup par="6" base="0">
25 <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
26 endDate="2006-05-06T00:00:00"/>

```

```

1 <groupItems count="14">
2 <s v="<1/1/2002"/>
3 <s v="Jan"/>
4 <s v="Feb"/>
5 <s v="Mar"/>
6 <s v="Apr"/>
7 <s v="May"/>
8 <s v="Jun"/>
9 <s v="Jul"/>
10 <s v="Aug"/>
11 <s v="Sep"/>
12 <s v="Oct"/>
13 <s v="Nov"/>
14 <s v="Dec"/>
15 <s v=">5/6/2006"/>
16 </groupItems>
17 </fieldGroup>
18 </cacheField>
19 <cacheField name="Name" numFmtId="0">
20 <sharedItems count="4">
21 <s v="Joe"/>
22 <s v="John"/>
23 <s v="Bob"/>
24 <s v="Robert"/>
25 </sharedItems>
26 <fieldGroup par="4"/>
27 </cacheField>
28 <cacheField name="ProductID" numFmtId="0">
29 <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
30 containsInteger="1" minValue="1" maxValue="4" count="4">
31 <n v="1"/>
32 <n v="2"/>
33 <n v="3"/>
34 <n v="4"/>
35 </sharedItems>

```

```

1 <fieldGroup base="2">
2 <rangePr startNum="1" endNum="4" groupInterval="2"/>
3 <groupItems count="4">
4 <s v="<1"/>
5 <s v="1-2"/>
6 <s v="3-4"/>
7 <s v=">5"/>
8 </groupItems>
9 </fieldGroup>
10 </cacheField>

```

*end example]*

Parent Elements
fieldGroup (§3.10.1.30)

Child Elements	Subclause
x (Shared Items Index)	§3.10.1.97

Attributes	Description
count (Mapping Index Count)	Specifies the number of mapping indexes for this grouped field.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_DiscretePr">
16 <sequence>
17 <element name="x" maxOccurs="unbounded" type="CT_Index"/>
18 </sequence>
19 <attribute name="count" type="xsd:unsignedInt"/>
20 </complexType>

```

### 3.10.1.27 e (Error Value)

Represents an error value. The use of this item indicates that an error value is present in the PivotTable source.  
The error is recorded in the value attribute.

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

1

Attributes	Description
b (Bold)	<p>Specifies a boolean value that indicates whether the value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains bold formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bc (background Color)	<p>Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
c (Item Caption)	<p>Specifies the item/member caption</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
cp (Member Property Count)	<p>Specifies the number of member property values.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of on, 1, or true indicates value is a calculated item value.</p> <p>A value of off, 0, or false indicates this value is not a calculated item value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains italic formatting on the server.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains strikethrough formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of on, 1, or true indicates this item is not used.</p> <p>A value of off, 0, or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item. This attribute depends on how the application records errors.</p> <p>[Note: While the error values are determined by the application, the following are some example error values that could be used:</p> <ul style="list-style-type: none"> <li>• #DIV/0!</li> <li>• #NAME?</li> <li>• #VALUE!</li> <li>• #NULL!</li> <li>• #NUM!</li> <li>• #REF!</li> <li>• #N/A</li> <li>• #GETTING_DATA</li> </ul> <p><i>end note]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type</p>

Attributes	Description
	(§3.18.96).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Error">
 <sequence>
 <element name="tpls" minOccurs="0" type="CT_Tuples"/>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="v" use="required" type="ST_Xstring"/>
 <attribute name="u" type="xsd:boolean"/>
 <attribute name="f" type="xsd:boolean"/>
 <attribute name="c" type="ST_Xstring"/>
 <attribute name="cp" type="xsd:unsignedInt"/>
 <attribute name="in" type="xsd:unsignedInt" use="optional"/>
 <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.10.1.28 entries (Entries)

Represents the collection of OLAP sheet data entries.

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Attributes	Description
count (Tuple Count)	Specifies the number of tuple entries.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCSDTCEntries">
 <choice maxOccurs="unbounded">
 <element name="m" type="CT_Missing"/>
 <element name="n" type="CT_Number"/>
 <element name="e" type="CT_Error"/>
 <element name="s" type="CT_String"/>
 </choice>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.29 field (Field)

Represents a generic field that can appear either on the column or the row region of the PivotTable. There will be as many <x> elements as there are item values in any particular column or row.

[Example:

```
<sh:field x="2"/>
```

end example]

#### Parent Elements

colFields (§3.10.1.14); rowFields (§3.10.1.81)

Attributes	Description
x (Field Index)	Specifies the index to a pivotField item value. There will be as many x elements as there are item values in any particular column. Note that these x elements sometimes are not explicitly written, but instead "inherited" from the previous column or i element, via the value of @r. The pivotField items don't list values explicitly, but instead reference a shared item value in the pivotCacheDefinition part. The first instance of x has no attribute value @v associated with it, so the default value for @v is assumed to be "0".  The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Field">
 <attribute name="x" type="xsd:int" use="required"/>
</complexType>
```

### 3.10.1.30 fieldGroup (Field Group Properties)

Represents the collection of properties for a field group.

[Example:

```

1 ...
2 <fieldGroup par="6" base="0">
3 <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
4 endDate="2006-05-06T00:00:00"/>
5 <groupItems count="14">
6 <s v="<1/1/2002"/>
7 <s v="Jan"/>
8 <s v="Feb"/>
9 <s v="Mar"/>
10 <s v="Apr"/>
11 <s v="May"/>
12 <s v="Jun"/>
13 <s v="Jul"/>
14 <s v="Aug"/>
15 <s v="Sep"/>
16 <s v="Oct"/>
17 <s v="Nov"/>
18 <s v="Dec"/>
19 <s v=">5/6/2006"/>
20 </groupItems>
21 </fieldGroup>
22 </cacheField>
23 <cacheField name="Name" numFmtId="0">
24 <sharedItems count="4">
25 <s v="Joe"/>
26 <s v="John"/>
27 <s v="Bob"/>
28 <s v="Robert"/>
29 </sharedItems>
30 <fieldGroup par="4"/>
31 </cacheField>
32 <cacheField name="ProductID" numFmtId="0">
33 <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
34 containsInteger="1" minValue="1" maxValue="4" count="4">
35 <n v="1"/>
36 <n v="2"/>
37 <n v="3"/>
38 <n v="4"/>
39 </sharedItems>

```

```
1 <fieldGroup base="2">
2 <rangePr startNum="1" endNum="4" groupInterval="2"/>
3 <groupItems count="4">
4 <s v="<1"/>
5 <s v="1-2"/>
6 <s v="3-4"/>
7 <s v=">5"/>
8 </groupItems>
9 </fieldGroup>
10 ...
```

11 *end example]*

Parent Elements
cacheField (§3.10.1.3)

12

Child Elements	Subclause
discretePr (Discrete Grouping Properties)	§3.10.1.26
groupItems (OLAP Group Items)	§3.10.1.38
rangePr (Range Grouping Properties)	§3.10.1.78

13

Attributes	Description
base (Field Base)	Specifies the base of this field, if any.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
par (Parent)	Specifies the parent of this field, if any.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_FieldGroup">
16 <sequence>
17 <element name="rangePr" minOccurs="0" type="CT_RangePr"/>
18 <element name="discretePr" minOccurs="0" type="CT_DiscretePr"/>
19 <element name="groupItems" minOccurs="0" type="CT_GroupItems"/>
20 </sequence>
21 <attribute name="par" type="xsd:unsignedInt" use="optional"/>
22 <attribute name="base" type="xsd:unsignedInt" use="optional"/>
23 </complexType>
```

### 3.10.1.31 fieldsUsage (Fields Usage)

Represents the fields in the cache that are being used by this hierarchy.

[Example:

```

<fieldsUsage count="6">
 <fieldUsage x="-1"/>
 <fieldUsage x="2"/>
 <fieldUsage x="3"/>
 <fieldUsage x="4"/>
 <fieldUsage x="5"/>
 <fieldUsage x="6"/>
</fieldsUsage>

```

end example]

Parent Elements
cacheHierarchy (§3.10.1.6)

Child Elements	Subclause
fieldUsage (PivotCache Field Id)	§3.10.1.32

Attributes	Description
count (Field Count)	Specifies the number of fields that are being used by this hierarchy.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_FieldsUsage">
 <sequence>
 <element name="fieldUsage" minOccurs="0" maxOccurs="unbounded" type="CT_FieldUsage"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.32 fieldUsage (PivotCache Field Id)

Represents a cache field used in this hierarchy.

[Example:

```

<fieldUsage x="-1"/>

```

1 *end example]*

Parent Elements
fieldsUsage (§3.10.1.31)

2

Attributes	Description
x (Field Index)	Specifies the index of a field.  The possible values for this attribute are defined by the XML Schema int datatype.

3 The following XML Schema fragment defines the contents of this element:

```
4 <complexType name="CT_FieldUsage">
5 <attribute name="x" use="required" type="xsd:int"/>
6 </complexType>
```

### 7 3.10.1.33 filter (PivotTable Advanced Filter)

8 Represents a PivotTable advanced filter.

9 [Example:

```
10 <sh:filter fld="3" type="count" id="1" iMeasureHier="187">
11 <sh:autoFilter ref="A1">
12 <sh:filterColumn colId="0">
13 <sh:top10 val="5"/>
14 </sh:filterColumn>
15 </sh:autoFilter>
16 </sh:filter>
```

17 *end example]*

Parent Elements
filters (§3.10.1.34)

18

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
extLst (Future Feature Data Storage Area)	§3.2.10

19

Attributes	Description
description (Pivot Filter Description)	Specifies the description of the pivot filter.  The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
evalOrder (Evaluation Order)	Specifies the evaluation order of the pivot filter. This attribute is zero-based.  The possible values for this attribute are defined by the XML Schema int datatype.
fld (Field Index)	Specifies the index of the field to which this pivot filter belongs.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Pivot Filter Id)	Specifies the unique identifier of the pivot filter as assigned by the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iMeasureFld (Measure Field Index)	Specifies the index of the measure field. This attribute is used only by filters in Relational pivots and specifies on which measure a value filter should apply.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iMeasureHier (Measure Index)	Specifies the index of the measure cube field. This attribute is used only by filters in OLAP pivots and specifies on which measure a value filter should apply.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
mpFld (Member Property Field Id)	Specifies the index of the field representing the member property field on which this pivot filter is defined. This attribute is used only by label pivot filters.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Pivot Filter Name)	Specifies the name of the pivot filter.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
stringValue1 (Label Pivot)	Specifies the string value "1" used by label pivot filters.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
stringValue2 (Label Pivot Filter String Value 2)	Specifies the string value "2" used by label pivot filters.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
type (Pivot Filter Type)	Specifies the type of the pivot filter.  The possible values for this attribute are defined by the ST_PivotFilterType simple type

Attributes	Description
	(§3.18.61).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFilter">
 <sequence>
 <element name="autoFilter" minOccurs="1" maxOccurs="1" type="CT_AutoFilter"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="fld" use="required" type="xsd:unsignedInt"/>
 <attribute name="mpFld" type="xsd:unsignedInt" use="optional"/>
 <attribute name="type" use="required" type="ST_PivotFilterType"/>
 <attribute name="evalOrder" use="optional" type="xsd:int" default="0"/>
 <attribute name="id" use="required" type="xsd:unsignedInt"/>
 <attribute name="iMeasureHier" use="optional" type="xsd:unsignedInt"/>
 <attribute name="iMeasureFld" use="optional" type="xsd:unsignedInt"/>
 <attribute name="name" type="ST_Xstring"/>
 <attribute name="description" type="ST_Xstring"/>
 <attribute name="stringValue1" type="ST_Xstring"/>
 <attribute name="stringValue2" type="ST_Xstring"/>
</complexType>
```

3.10.1.34 filters (Filters)

Represents the collection of filters that apply to this PivotTable.

[Example:

```
<sh:filters count="1">
 <sh:filter fld="3" type="count" id="1" iMeasureHier="187">
 <sh:autoFilter ref="A1">
 <sh:filterColumn colId="0">
 <sh:top10 val="5"/>
 </sh:filterColumn>
 </sh:autoFilter>
 </sh:filter>
</sh:filters>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
filter (PivotTable Advanced Filter)	§3.10.1.33

Attributes	Description
count (Pivot Filter Count)	Specifies the number of pivot filters in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFilters">
 <sequence>
 <element name="filter" minOccurs="0" maxOccurs="unbounded" type="CT_PivotFilter"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

### 3.10.1.35 format (PivotTable Format)

Represents the format defined in the PivotTable.

Parent Elements
formats (§3.10.1.36)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
action (Format Action)	Specifies the formatting behavior for the area indicated in the pivotArea element. The default value for this attribute is "formatting," which indicates that the specified cells have some formatting applied. The format is specified in the dxflId attribute. If the formatting is cleared from the cells, then the value of this attribute becomes "blank."  The possible values for this attribute are defined by the ST_FormatAction simple type (§3.18.35).
dxflId (Format Id)	Specifies the identifier of the format the application is currently using for the PivotTable. Formatting information is written to the styles part. See the Styles section (§3.8) for more information on formats.  Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.  The possible values for this attribute are defined by the ST_DxflId simple type (§3.18.26).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Format">
 <sequence>
 <element name="pivotArea" type="CT_PivotArea"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="action" type="ST_FormatAction" default="formatting"/>
 <attribute name="dxId" type="ST_DxfId" use="optional"/>
</complexType>
```

### 3.10.1.36 formats (PivotTable Formats)

Represents the collection of formats applied to PivotTable.

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
format (PivotTable Format)	§3.10.1.35

Attributes	Description
count (Formats Count)	Specifies the number of formats in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Formats">
 <sequence>
 <element name="format" maxOccurs="unbounded" type="CT_Format"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

### 3.10.1.37 group (OLAP Group)

Represents an OLAP level group.

[Example:

```
<group name="CategoryX1_Grp_1" uniqueName="[Product].[Product Categories].
[Product Categories1].[GROUPMEMBER.[CategoryX1_Grp_1]].[Product]].
[Product Categories]].[All Products]]" caption="Group1"
uniqueParent="[Product].[Product Categories].[All Products]" id="1">
```

```

1 <groupMembers count="2">
2 <groupMember
3 uniqueName="[Product].[Product Categories].[Category].&[4]"/>
4 <groupMember
5 uniqueName="[Product].[Product Categories].[Category].&[1]"/>
6 </groupMembers>
7 </group>

```

8 *end example]*

Parent Elements
groups (§3.10.1.43)

Child Elements	Subclause
groupMembers (OLAP Group Members)	§3.10.1.42

Attributes	Description
caption (Group Caption)	Specifies the caption for this group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Group Id)	Specifies the unique number for this group within the level.  The possible values for this attribute are defined by the XML Schema int datatype.
name (Group Name)	Specifies the name of this group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
uniqueName (Unique Group Name)	Specifies the unique name of this group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
uniqueParent (Parent Unique Name)	Specifies the unique name of the parent of this group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LevelGroup">
 <sequence>
 <element name="groupMembers" type="CT_GroupMembers"/>
 </sequence>
 <attribute name="name" use="required" type="ST_Xstring"/>
 <attribute name="uniqueName" use="required" type="ST_Xstring"/>
 <attribute name="caption" use="required" type="ST_Xstring"/>
 <attribute name="uniqueParent" type="ST_Xstring"/>
 <attribute name="id" type="xsd:int"/>
</complexType>
```

### 3.10.1.38 groupItems (OLAP Group Items)

Represents the collection of items in a field group.

[Example:

```
...
<fieldGroup par="6" base="0">
 <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
 endDate="2006-05-06T00:00:00"/>
 <groupItems count="14">
 <s v="<1/1/2002"/>
 <s v="Jan"/>
 <s v="Feb"/>
 <s v="Mar"/>
 <s v="Apr"/>
 <s v="May"/>
 <s v="Jun"/>
 <s v="Jul"/>
 <s v="Aug"/>
 <s v="Sep"/>
 <s v="Oct"/>
 <s v="Nov"/>
 <s v="Dec"/>
 <s v=">5/6/2006"/>
 </groupItems>
</fieldGroup>
</cacheField>

27 ...
28 end example]

```

Parent Elements
fieldGroup (§3.10.1.30)

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Attributes	Description
count (Items Created Count)	Specifies the number of items created for this grouped field.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GroupItems">
 <choice maxOccurs="unbounded">
 <element name="m" type="CT_Missing"/>
 <element name="n" type="CT_Number"/>
 <element name="b" type="CT_Boolean"/>
 <element name="e" type="CT_Error"/>
 <element name="s" type="CT_String"/>
 <element name="d" type="CT_DateTime"/>
 </choice>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.39 groupLevel (OLAP Grouping Levels)

Represents the collection of OLAP grouping levels.

[Example:

```

<groupLevel uniqueName="[Product].[Product Categories].[Category]"
 caption="Category">
 <groups count="1">
 <group name="CategoryX1_Grp_1" uniqueName="[Product].[Product
 Categories].[Product Categories1].
 [GROUPMEMBER.[CategoryX1_Grp_1]].[Product]].[Product Categories]].
 [All Products]]]" caption="Group1" uniqueParent="[Product].
 [Product Categories].[All Products]" id="1">
 <groupMembers count="2">
 <groupMember
 uniqueName="[Product].[Product Categories].[Category].&[4]"/>
 <groupMember
 uniqueName="[Product].[Product Categories].[Category].&[1]"/>
 </groupMembers>
 </group>
</groups>
</groupLevel>

```

end example]

Parent Elements
groupLevels (§3.10.1.40)

1

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
groups (OLAP Level Groups)	§3.10.1.43

2

Attributes	Description
caption (Grouping Level Display Name)	Specifies the display name for this grouping level.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customRollUp (Custom Roll Up)	Specifies a boolean value that indicates whether this group level has a custom roll up. A value of on, 1, or true indicates this group level has a custom roll up.  A value of off, 0, or false indicates this group level does not have a custom roll up.  The possible values for this attribute are defined by the XML Schema boolean datatype.
uniqueName (Unique Name)	Specifies the unique name for this grouping level.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
user (User-Defined Group Level)	Specifies a boolean value that indicates whether this is a user-defined group level.  A value of on, 1, or true indicates this is a user-defined group.  A value of off, 0, or false indicates this group is not user-defined.  The possible values for this attribute are defined by the XML Schema boolean datatype.

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_GroupLevel">
5 <sequence>
6 <element name="groups" minOccurs="0" type="CT_Groups"/>
7 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
8 </sequence>
9 <attribute name="uniqueName" use="required" type="ST_Xstring"/>
10 <attribute name="caption" use="required" type="ST_Xstring"/>
11 <attribute name="user" type="xsd:boolean" default="false"/>
12 <attribute name="customRollUp" type="xsd:boolean" default="false"/>
13 </complexType>

```

#### 14 3.10.1.40 groupLevels (OLAP Grouping Levels)

15 Represents the collection of OLAP grouping levels.

16 [Example:

```

1 <groupLevels count="5">
2 <groupLevel uniqueName="[Product].[Product Categories].[(All)]"
3 caption="(All)"/>
4 <groupLevel uniqueName="[Product].[Product Categories].[Product Categories1]"
5 caption="Product Categories1" user="1"/>
6 <groupLevel uniqueName="[Product].[Product Categories].[Category]"
7 caption="Category">
8 <groups count="1">
9 <group name="CategoryXl_Grp_1" uniqueName="[Product].[Product Categories].
10 [Product Categories1].[GROUPMEMBER.[CategoryXl_Grp_1]].
11 [Product]].[Product Categories].[All Products]]" caption="Group1"
12 uniqueParent="[Product].[Product Categories].[All Products]" id="1">
13 <groupMembers count="2">
14 <groupMember
15 uniqueName="[Product].[Product Categories].[Category].&[4]"/>
16 <groupMember
17 uniqueName="[Product].[Product Categories].[Category].&[1]"/>
18 </groupMembers>
19 </group>
20 </groups>
21 </groupLevel>
22 <groupLevel uniqueName="[Product].[Product Categories].[Subcategory]"
23 caption="Subcategory"/>
24 <groupLevel uniqueName="[Product].[Product Categories].[Product]"
25 caption="Product"/>
26 </groupLevels>

```

end example]

Parent Elements
cacheHierarchy (§3.10.1.6)

Child Elements	Subclause
groupLevel (OLAP Grouping Levels)	§3.10.1.39

Attributes	Description
count (Grouping Level Count)	Specifies the number of grouping levels.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupLevels">
 <sequence>
 <element name="groupLevel" maxOccurs="unbounded" type="CT_GroupLevel"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

#### 3.10.1.41 groupMember (OLAP Group Member)

Represents an OLAP group member.

[Example:

```
<groupMember uniqueName="[Product].[Product Categories].[Category].&[1]"/>
```

end example]

Parent Elements
groupMembers (§3.10.1.42)

Attributes	Description
group (Group)	<p>Specifies a boolean value that indicates whether this member represents a group.</p> <p>A value of on, 1, or true indicates this member represents a group.</p> <p>A value of off, 0, or false indicates this member does not represent a group.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
uniqueName (Group Member Unique Name)	<p>Specifies the unique name of this group member.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

group (Group)	<p>Specifies a boolean value that indicates whether this member represents a group.</p> <p>A value of on, 1, or true indicates this member represents a group.</p> <p>A value of off, 0, or false indicates this member does not represent a group.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
uniqueName (Group Member Unique Name)	<p>Specifies the unique name of this group member.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupMember">
 <attribute name="uniqueName" use="required" type="ST_Xstring"/>
 <attribute name="group" type="xsd:boolean" default="false"/>
</complexType>
```

#### 3.10.1.42 groupMembers (OLAP Group Members)

Represents the collection of OLAP group members.

[Example:

```

1 <groupMembers count="2">
2 <groupMember uniqueName="[Product].[Product Categories].[Category].&[4]"/>
3 <groupMember uniqueName="[Product].[Product Categories].[Category].&[1]"/>
4 </groupMembers>

```

5 *end example]*

Parent Elements
group (§3.10.1.37)

6

Child Elements	Subclause
groupMember (OLAP Group Member)	§3.10.1.41

7

Attributes	Description
count (Group Member Count)	Specifies the number of group members in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

8 The following XML Schema fragment defines the contents of this element:

```

9 <complexType name="CT_GroupMembers">
10 <sequence>
11 <element name="groupMember" maxOccurs="unbounded" type="CT_GroupMember"/>
12 </sequence>
13 <attribute name="count" type="xsd:unsignedInt"/>
14 </complexType>

```

### 15 3.10.1.43 groups (OLAP Level Groups)

16 Represents the collection of OLAP level groups.

17 *[Example:*

```

18 <groups count="1">
19 <group name="CategoryX1_Grp_1" uniqueName="[Product].[Product Categories].
20 [Product Categories1].[GROUPMEMBER.[CategoryX1_Grp_1]].[Product]].
21 [Product Categories]].[All Products]]" caption="Group1"
22 uniqueParent="[Product].[Product Categories].[All Products]" id="1">

```

```

1 <groupMembers count="2">
2 <groupMember
3 uniqueName="[Product].[Product Categories].[Category].&[4]"/>
4 <groupMember
5 uniqueName="[Product].[Product Categories].[Category].&[1]"/>
6 </groupMembers>
7 </group>
8 </groups>

```

*end example]*

Parent Elements
groupLevel (§3.10.1.39)

Child Elements	Subclause
group (OLAP Group)	§3.10.1.37

Attributes	Description
count (Level Group Count)	Specifies the number of level groups in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

13 <complexType name="CT_Groups">
14 <sequence>
15 <element name="group" maxOccurs="unbounded" type="CT_LevelGroup"/>
16 </sequence>
17 <attribute name="count" type="xsd:unsignedInt"/>
18 </complexType>

```

#### 3.10.1.44 i (Row Items)

Represents the collection of items in the row region of the PivotTable. In this example the item values are found in cells B10:B13. For example "Bikes" is in B10, and corresponds to the first <i> element below.

*[Example:*

```

23 <rowItems count="4">
24 <i>
25 <x/>
26 </i>

```

```

1 <i r="1">
2 <x/>
3 </i>
4 <i r="1">
5 <x v="1"/>
6 </i>
7 <i t="grand">
8 <x/>
9 </i>
10 </rowItems>

```

*end example]*

Parent Elements
collItems (§3.10.1.17); rowItems (§3.10.1.84)

Child Elements	Subclause
x (Member Property Index)	§3.10.1.96

Attributes	Description
i (Data Field Index)	<p>Specifies a zero-based index indicating the referenced data item it in a data field with multiple data items.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
r (Repeated Items Count)	<p>Specifies the number of items to repeat from the previous row item. Note: The first item has no @r explicitly written. Since a default of "0" is specified in the schema, for any item whose @r is missing, a default value of "0" is implied.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
t (Item Type)	<p>Specifies the type of the item. Value of 'default' indicates a grand total as the last row item value</p> <p>The possible values for this attribute are defined by the ST_ItemType simple type (§3.18.45).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_I">
 <sequence>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="t" type="ST_ItemType" default="data"/>
 <attribute name="r" type="xsd:unsignedInt" default="0"/>
 <attribute name="i" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.45 item (PivotTable Field Item)

Represents a single item in PivotTable field.

[Example:

```
<sh:item x="66"/>
```

end example]

Parent Elements
items (§3.10.1.46)

Attributes	Description
c (Child Items)	<p>Specifies a boolean value that indicates whether the approximate number of child items for this item is greater than zero.</p> <p>A value of on, 1, or true indicates the approximate number of child items for this item is greater than zero.</p> <p>A value of off, 0, or false indicates the approximate number of child items for this item is zero.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
d (Expanded)	<p>Specifies a boolean value that indicates whether this item has been expanded in the PivotTable view.</p> <p>A value of on, 1, or true indicates this item has been expanded.</p> <p>A value of off, 0, or false indicates this item is collapsed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
e (Drill Across Attributes)	<p>Specifies a boolean value that indicates whether attribute hierarchies nested next to each other on a PivotTable row or column will offer drilling "across" each other or not. For example, if the application offers drill across for attribute hierarchies and not for user hierarchies, this attribute would only be written when two attribute hierarchies are</p>

Attributes	Description
	<p>placed next to each other on an axis.</p> <p>A value of on, 1, or true indicates there is a drill across attribute hierarchies positioned next to each other on a pivot axis.</p> <p>A value of off, 0, or false indicates there is not drill across attribute hierarchies.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
f (Calculated Member)	<p>Specifies a boolean value that indicates whether this item is a calculated member.</p> <p>A value of on, 1, or true indicates this item is a calculated member.</p> <p>A value of off, 0, or false indicates this item is not calculated.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
h (Hidden)	<p>Specifies a boolean value that indicates whether the item is hidden.</p> <p>A value of on, 1, or true indicates item is hidden.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
m (Missing)	<p>Specifies a boolean value that indicate whether the item has a missing value.</p> <p>A value of on, 1, or true indicates the item value is missing. The application should still retain the item settings in case the item reappears during a later refresh.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
n (Item User Caption)	<p>Specifies the user caption of the item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
s (Character)	<p>Specifies a boolean value that indicates whether the item has a character value.</p> <p>A value of on, 1, or true indicates the item has a string/character value.</p> <p>A value of off, 0, or false indicates item the item has a value of a different type.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sd (Hide Details)	<p>Specifies a boolean value that indicates whether the details are hidden for this item.</p> <p>A value of on, 1, or true indicates item details are hidden.</p> <p>A value of off, 0, or false indicates item details are shown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
t (Item Type)	<p>Specifies the type of this item. A value of 'default' indicates the subtotal or total item.</p> <p>The possible values for this attribute are defined by the ST_ItemType simple type (§3.18.45).</p>
x (Item Index)	<p>Specifies the item index in pivotFields collection in the PivotCache. Applies only non-OLAP PivotTables.</p> <p>In the following example, "Product Category" and "Product Subcategory" are on the row axis of the PivotTable, in that order.</p> <pre>&lt;rowFields count="2"&gt;   &lt;field x="7"/&gt;   &lt;x="8"/&gt; &lt;/rowFieldsfield &gt;</pre> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Item">
3 <attribute name="n" type="ST_Xstring"/>
4 <attribute name="t" type="ST_ItemType" default="data"/>
5 <attribute name="h" type="xsd:boolean" default="false"/>
6 <attribute name="s" type="xsd:boolean" default="false"/>
7 <attribute name="sd" type="xsd:boolean" default="true"/>
8 <attribute name="f" type="xsd:boolean" default="false"/>
9 <attribute name="m" type="xsd:boolean" default="false"/>
10 <attribute name="c" type="xsd:boolean" default="false"/>
11 <attribute name="x" type="xsd:unsignedInt" use="optional"/>
12 <attribute name="d" type="xsd:boolean" default="false"/>
13 <attribute name="e" type="xsd:boolean" default="true"/>
14 </complexType>
```

#### 15 3.10.1.46 items (Field Items)

16 Represents the collection of items in a PivotTable field. The items in the collection are ordered by index. Items  
17 represent the unique entries from the field in the source data.

18 In the following image, the item Golf represents all rows of data in the source list for which the Sport field  
19 contains the entry Golf.

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

The order in which the items are listed is the order they would appear on a particular axis (row or column, for example).

In the following SpreadsheetML example, the first field is "Customer Name" and the first item referenced here is `<item x="66"/>` which references the value "Adam L Flores" in the `pivotCacheDefinition`. Therefore if you added "Customer Name" to the row axis, "Adam L Flores" would be the first row item listed.

[Example:

```
<pivotFields count="28">
 <pivotField showAll="0" includeNewItemsInFilter="1">
 <items count="8">
 <item x="66"/>
 <item x="133"/>
 <item x="74"/>
 <item x="27"/>
 <item x="118"/>
 <item x="63"/>
 <item x="141"/>
 <item t="default"/>
 </items>
 </pivotField>
 <pivotField showAll="0" includeNewItemsInFilter="1"/>
 <pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
 <items count="2">
 <item x="0"/>
 <item t="default"/>
 </items>
 </pivotField>
</pivotFields>
```

end example]

Parent Elements
<code>pivotField</code> (§3.10.1.69)

Child Elements	Subclause
<code>item</code> (PivotTable Field Item)	§3.10.1.45

Attributes	Description
<code>count</code> (Field Count)	Specifies the number of fields in the PivotTable.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Items">
 <sequence>
 <element name="item" maxOccurs="unbounded" type="CT_Item"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

#### 3.10.1.47 kpi (OLAP KPI)

Represents the KPI defined on the OLAP server and stored in the PivotCache.

[Example:

```
<kpi uniqueName="Growth in Customer Base" caption="Growth in Customer Base"
 displayFolder="Customer Perspective\Expand Customer Base"
 measureGroup="Internet Sales" value="[Measures].[Growth in Customer Base]"
 goal="[Measures].[Growth in Customer Base Goal]"
 status="[Measures].[Growth in Customer Base Status]"
 trend="[Measures].[Growth in Customer Base Trend]"/>
```

end example]

Parent Elements
kpis (§3.10.1.48)

Attributes	Description
caption (KPI Display Name)	Specifies the display name of the KPI.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
displayFolder (KPI Display Folder)	Specifies the folder where this KPI will be displayed in a list of fields for the PivotTable. This attribute depends on how the application exposes a list of fields in the user interface.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
goal (KPI Goal Unique Name)	Specifies the unique name of the KPI goal measure.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
measureGroup (KPI Measure Group Name)	<p>Specifies the name of the measure group to which this KPI belongs.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
parent (Parent KPI)	<p>Specifies the name of the parent KPI for this KPI.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
status (KPI Status Unique Name)	<p>Specifies the unique name of the KPI status measure.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
time (Time Member KPI Unique Name)	<p>Specifies the unique name of the KPI current time member.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
trend (KPI Trend Unique Name)	<p>Specifies the unique name of the KPI trend measure.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
uniqueName (KPI Unique Name)	<p>Specifies the unique name of the KPI.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
value (KPI Value Unique Name)	<p>Specifies the unique name of the KPI value measure.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
weight (KPI Weight Unique Name)	<p>Specifies the unique name of the KPI weight measure.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCDKPI">
 <attribute name="uniqueName" use="required" type="ST_Xstring"/>
 <attribute name="caption" use="optional" type="ST_Xstring"/>
 <attribute name="displayFolder" type="ST_Xstring"/>
 <attribute name="measureGroup" type="ST_Xstring"/>
 <attribute name="parent" type="ST_Xstring"/>
 <attribute name="value" use="required" type="ST_Xstring"/>
 <attribute name="goal" type="ST_Xstring"/>
 <attribute name="status" type="ST_Xstring"/>
 <attribute name="trend" type="ST_Xstring"/>
 <attribute name="weight" type="ST_Xstring"/>
 <attribute name="time" type="ST_Xstring"/>
</complexType>
```

#### 3.10.1.48 kpis (OLAP KPIs)

Represents the collection of Key Performance Indicators (KPIs) defined on the OLAP server and stored in the PivotCache.

*[Example:*

```
<kpis count="3">
 <kpi uniqueName="Growth in Customer Base" caption="Growth in Customer Base"
 displayFolder="Customer Perspective\Expand Customer Base"
 measureGroup="Internet Sales" value="[Measures].[Growth in Customer Base]"
 goal="[Measures].[Growth in Customer Base Goal]"
 status="[Measures].[Growth in Customer Base Status]"
 trend="[Measures].[Growth in Customer Base Trend]"/>
 <kpi uniqueName="Net Income" caption="Net Income"
 displayFolder="Financial Perspective\Maintain Overall Margins"
 measureGroup="Financial Reporting" value="[Measures].[Net Income Value]"
 goal="[Measures].[Net Income Goal]" status="[Measures].[Net Income Status]"
 trend="[Measures].[Net Income Trend]"/>
 <kpi uniqueName="Operating Profit" caption="Operating Profit"
 displayFolder="Financial Perspective\Maintain Overall Margins"
 measureGroup="Financial Reporting" parent="Net Income"
 value="[Measures].[Operating Profit Value]"
 goal="[Measures].[Operating Profit Goal]"
 status="[Measures].[Operating Profit Status]"
 trend="[Measures].[Operating Profit Trend]"/>
 ...
end example]
```

#### Parent Elements

pivotCacheDefinition (§3.10.1.67)

1

Child Elements	Subclause
kpi (OLAP KPI)	§3.10.1.47

2

Attributes	Description
count (KPI Count)	Specifies the number of KPIs stored in the PivotCache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_PCDKPIs">
5 <sequence>
6 <element name="kpi" minOccurs="0" maxOccurs="unbounded" type="CT_PCDKPI"/>
7 </sequence>
8 <attribute name="count" type="xsd:unsignedInt"/>
9 </complexType>

```

#### 10 3.10.1.49 location (PivotTable Location)

11 Represents location information for the PivotTable.

12 [Example:

```

13 <location ref="B6:G13" firstHeaderRow="1" firstDataRow="4" firstDataCol="1"
14 rowPageCount="3" colPageCount="1"/>

```

15 end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

16

Attributes	Description
colPageCount (Columns Per Page)	Specifies the number of columns per page for this PivotTable that the filter area will occupy. By default there is a single column of filter fields per page and the fields occupy as many rows as there are fields.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
firstDataCol (First Data Column)	Specifies the first column of the PivotTable data, relative to the top left cell in the ref value.  The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.
firstDataRow (PivotTable Data First Row)	Specifies the first row of the PivotTable data, relative to the top left cell in the ref value.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
firstHeaderRow (First Header Row)	Specifies the first row of the PivotTable header, relative to the top left cell in the ref value.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ref (Reference)	Specifies the first row of the PivotTable.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
rowPageCount (Rows Per Page Count)	Specifies the number of rows per page for this PivotTable that the filter area will occupy. By default there is a single column of filter fields per page and the fields occupy as many rows as there are fields.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Location">
 <attribute name="ref" use="required" type="ST_Ref"/>
 <attribute name="firstHeaderRow" use="required" type="xsd:unsignedInt"/>
 <attribute name="firstDataRow" use="required" type="xsd:unsignedInt"/>
 <attribute name="firstDataCol" use="required" type="xsd:unsignedInt"/>
 <attribute name="rowPageCount" type="xsd:unsignedInt" default="0"/>
 <attribute name="colPageCount" type="xsd:unsignedInt" default="0"/>
</complexType>

```

### 3.10.1.50 m (No Value)

Represents a value that was not specified.

[Example:

```

<sharedItems containsString="0" containsBlank="1" count="1">
 <m/>
</sharedItems>

```

end example]

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

1

Attributes	Description
b (Bold)	<p>Specifies a boolean value that indicates whether the value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains bold formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bc (background Color)	<p>Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
c (Caption)	<p>Specifies the caption for this item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
cp (Member Property Count)	<p>Specifies the number of member property values for this item.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of on, 1, or true indicates this item is a calculated value.</p> <p>A value of off, 0, or false indicates this item is not calculated.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains underline formatting on the server.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of on, 1, or true indicates this item is unused.</p> <p>A value of off, 0, or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Missing">
 <sequence>
 <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="u" type="xsd:boolean"/>
 <attribute name="f" type="xsd:boolean"/>
 <attribute name="c" type="ST_Xstring"/>
 <attribute name="cp" type="xsd:unsignedInt"/>
 <attribute name="in" type="xsd:unsignedInt" use="optional"/>
 <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.10.1.51 map (OLAP Measure Group)

Represents a PivotTable OLAP measure group - Dimension map.

[Example:

```
<map measureGroup="0" dimension="2"/>
```

end example]

#### Parent Elements

maps (§3.10.1.52)

Attributes	Description
dimension (Dimension Id)	Specifies the identifier for the dimension.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
measureGroup (Measure Group Id)	Specifies the identifier of the measure group.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureDimensionMap">
 <attribute name="measureGroup" use="optional" type="xsd:unsignedInt"/>
 <attribute name="dimension" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.52 maps (OLAP Measure Group)

Represents the PivotTable OLAP measure group - Dimension maps.

[Example:

```

<maps count="3">
 <map measureGroup="0" dimension="2"/>
 <map measureGroup="1" dimension="19"/>
 <map measureGroup="2" dimension="8"/>
</maps>

```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
map (OLAP Measure Group)	§3.10.1.51

Attributes	Description
count (Measure Group Count)	Specifies the number of measure groups, or dimension maps, in the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MeasureDimensionMaps">
 <sequence>
 <element name="map" minOccurs="0" maxOccurs="unbounded" type="CT_MeasureDimensionMap"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.53 measureGroup (OLAP Measure Group)

Represents a PivotTable OLAP measure group.

[Example:

```

<measureGroup name="Sales Orders" caption="Sales Orders"/>

```

end example]

Parent Elements
-----------------

Parent Elements
measureGroups (§3.10.1.54)

Attributes	Description
caption (Measure Group Display Name)	Specifies the display name of the measure group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
name (Measure Group Name)	Specifies the name of the measure group.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureGroup">
 <attribute name="name" use="required" type="ST_Xstring"/>
 <attribute name="caption" use="required" type="ST_Xstring"/>
</complexType>
```

### 3.10.1.54 measureGroups (OLAP Measure Groups)

Represents the collection of PivotTable OLAP measure groups.

[Example:

```
<measureGroups count="11">
 <measureGroup name="Exchange Rates" caption="Exchange Rates"/>
 <measureGroup name="Financial Reporting" caption="Financial Reporting"/>
 <measureGroup name="Internet Customers" caption="Internet Customers"/>
 <measureGroup name="Internet Orders" caption="Internet Orders"/>
 <measureGroup name="Internet Sales" caption="Internet Sales"/>
 <measureGroup name="Reseller Orders" caption="Reseller Orders"/>
 <measureGroup name="Reseller Sales" caption="Reseller Sales"/>
 <measureGroup name="Sales Orders" caption="Sales Orders"/>
 <measureGroup name="Sales Reasons" caption="Sales Reasons"/>
 <measureGroup name="Sales Summary" caption="Sales Summary"/>
 <measureGroup name="Sales Targets" caption="Sales Targets"/>
</measureGroups>
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
measureGroup (OLAP Measure Group)	§3.10.1.53

Attributes	Description
count (Measure Group Count)	Specifies the number of measure groups in the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureGroups">
 <sequence>
 <element name="measureGroup" minOccurs="0" maxOccurs="unbounded" type="CT_MeasureGroup"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.55 member (Member)

Represents an item that may be included or excluded.

Parent Elements
members (§3.10.1.56)

Attributes	Description
name (Hidden Item Name)	Specifies the name of a hidden item.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Member">
 <attribute name="name" use="required" type="ST_Xstring"/>
</complexType>
```

### 3.10.1.56 members (Members)

Represents the collection of items that may be included or excluded.

Parent Elements
pivotHierarchy (§3.10.1.72)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
member (Member)	§3.10.1.55

1

Attributes	Description
count (Item Count)	Specifies the number of items in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
level (Hierarchy Level)	Specifies the hierarchy level with which these items are associated.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Members">
4 <sequence>
5 <element name="member" maxOccurs="unbounded" type="CT_Member"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt"/>
8 <attribute name="level" use="optional" type="xsd:unsignedInt"/>
9 </complexType>

```

### 10 3.10.1.57 mp (OLAP Member Property)

11 Represents an OLAP member property.

12 *[Example:*

```
13 <sh:mp field="7"/>
```

14 *end example]*

Parent Elements
mps (§3.10.1.59)

15

Attributes	Description
field (Field Index)	Specifies the index of the field with which this member property is associated.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
level (Level Index)	Specifies the index of the level to which this member property applies.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
name (OLAP Member Property Unique Name)	<p>Specifies the unique name of the OLAP member property. The following attributes depend on the name attribute:</p> <ul style="list-style-type: none"> <li>• nameLen</li> <li>• pLen</li> <li>• pPos</li> </ul> <p>These attributes consist of metadata about a member in an OLAP cube and are usually displayed in a tooltip or mechanism in the user interface.</p> <p>For example, if the value for name equals "[Store].[Store Name].[Store Manager]":</p> <ul style="list-style-type: none"> <li>• nameLen will equal 20. This would refer to "[Store].[Store Name]"</li> <li>• pPos will equal 22. This would refer to starting character of "Store Manager"</li> <li>• pLen will equal 13. This would to length of "Store Manager"</li> </ul> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
nameLen (Name Length)	<p>Specifies the length of the unique name portion of name. For example, if the value for name equals "[Store].[Store Name].[Store Manager]", nameLen will equal 20. This would refer to "[Store].[Store Name]".</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
pLen (Property Name Length)	<p>Specifies the length of the property name portion of name. For example, if the value for name equals "[Store].[Store Name].[Store Manager]", pLen will equal 13. This would to length of "Store Manager".</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
pPos (Property Name Character Index)	<p>Specifies the index of the character where the property name portion begins in name. For example, if the value for name equals "[Store].[Store Name].[Store Manager]", pPos will equal 22. This would refer to starting character of "Store Manager".</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
showAsCaption (Show As Caption)	<p>Specifies a boolean value that indicates whether to show the property a member caption.</p> <p>A value of on, 1, or true indicates member property value will be shown in as a caption.</p> <p>A value of off, 0, or false indicates member property value will not be shown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showCell (Show Cell)	<p>Specifies a boolean value that indicates whether to show the member property value in a PivotTable cell.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates member property value will be shown in a cell.</p> <p>A value of off, 0, or false indicates member property value will not be shown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showTip (Show Tooltip)	<p>Specifies a boolean value that indicates whether to show the member property value in a tooltip on the appropriate PivotTable view cells.</p> <p>A value of on, 1, or true indicates member property value will be shown in a tooltip.</p> <p>A value of off, 0, or false indicates member property value will not be shown. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_MemberProperty">
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="showCell" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showTip" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showAsCaption" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="nameLen" type="xsd:unsignedInt" use="optional"/>
 <attribute name="pPos" type="xsd:unsignedInt" use="optional"/>
 <attribute name="pLen" type="xsd:unsignedInt" use="optional"/>
 <attribute name="level" type="xsd:unsignedInt" use="optional"/>
 <attribute name="field" use="required" type="xsd:unsignedInt"/>
</complexType>

```

### 3.10.1.58 mpMap (Member Properties Map)

Represents a mapping to cached member properties.

[Example:

```
<mpMap v="7"/>
```

end example]

Parent Elements
cacheField (§3.10.1.3)

Attributes	Description
v (Shared Items Index)	Specifies the index into the shared items table in the PivotCache that identifies this item.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_X">
 <attribute name="v" type="xsd:int" default="0"/>
</complexType>
```

### 3.10.1.59 mps (OLAP Member Properties)

Represents the collection of OLAP member property. Member properties contain additional information that's available about the items in an OLAP dimension field. For example, if a Geography dimension has property fields Population and Average Income available, you could create a PivotTable report that displays the sales figures for cities where your products are selling well. By displaying and analyzing the population and income figures for these cities, you could target cities with similar demographics for your marketing campaign.

[Example:

```
<sh:mps count="3">
 <sh:mp field="7"/>
 <sh:mp field="8"/>
 <sh:mp field="9"/>
</sh:mps>
```

end example]

Parent Elements
pivotHierarchy (§3.10.1.72)

Child Elements	Subclause
mp (OLAP Member Property)	§3.10.1.57

Attributes	Description
count (OLAP Member Properties Count)	Specifies the number of OLAP member properties in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MemberProperties">
 <sequence>
 <element name="mp" maxOccurs="unbounded" type="CT_MemberProperty"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.60 n (Numeric)

Represents a numeric value in the PivotTable.

[Example:

```
<sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
 containsInteger="1" minValue="3" maxValue="3" count="1">
 <n v="3"/>
</sharedItems>
```

end example]

#### Parent Elements

entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

#### Child Elements

tpls (Tuples)

x (Member Property Index)

#### Subclause

§3.10.1.93

§3.10.1.96

#### Attributes

#### Description

b (Bold)

Specifies a boolean value that indicates whether this value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.

A value of on, 1, or true indicates this value contains italic formatting on the server.

The possible values for this attribute are defined by the XML Schema boolean datatype.

bc (Background Color)

Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.

The possible values for this attribute are defined by the ST\_UnsignedIntHex simple type (§3.18.86).

c (Caption)

Specifies the caption for this item.

The possible values for this attribute are defined by the ST\_Xstring simple type

Attributes	Description
	(§3.18.96).
cp (Member Property Count)	<p>Specifies the number of member property values for this item.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of on, 1, or true indicates this item is a calculated value.</p> <p>A value of off, 0, or false indicates this item is not calculated.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains italic formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains strikethrough formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
u (Unused Item)	<p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of on, 1, or true indicates this item is not used.</p> <p>A value of off, 0, or false indicates this item is used.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
un (Underline)	Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.  A value of on, 1, or true indicates this value contains underline formatting on the server.  The possible values for this attribute are defined by the XML Schema boolean datatype.
v (Value)	Specified the value of this item.  The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Number">
 <sequence>
 <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="v" use="required" type="xsd:double"/>
 <attribute name="u" type="xsd:boolean"/>
 <attribute name="f" type="xsd:boolean"/>
 <attribute name="c" type="ST_Xstring"/>
 <attribute name="cp" type="xsd:unsignedInt"/>
 <attribute name="in" type="xsd:unsignedInt" use="optional"/>
 <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.10.1.61 [page \(Page Items\)](#)

Represents the collection of page item values for a page field.

Parent Elements
pages (§3.10.1.65)

Child Elements	Subclause
pageItem (Page Item)	§3.10.1.64

Attributes	Description
count (Page Item)	Specifies the number of page item strings in the collectoin.

Attributes	Description
String Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCDSPage">
 <sequence>
 <element name="pageItem" type="CT_PageItem" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.10.1.62 pageField (Page Field)

Represents a field on the page or report filter of the PivotTable.

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a page or report filter field. Page/filter fields allow you to filter the entire PivotTable to display data for a single item or all the items.

[Example:

```
<sh:pageField fld="43" hier="103"
 name="[Product].[Product Categories].[All Products]" cap="All Products"/>
```

end example]

Parent Elements
pageFields (§3.10.1.63)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
cap (Hierarchy Display Name)	Specifies the display name of the hierarchy.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
fld (Field)	Specifies the index of the field that appears on the page or filter report area of the PivotTable.  The possible values for this attribute are defined by the XML Schema int datatype.
hier (OLAP Hierarchy Index)	Specifies the index of the OLAP hierarchy to which this item belongs.  The possible values for this attribute are defined by the XML Schema int datatype.
item (Item Index)	Specifies the index of the item in the PivotCache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Hierarchy Unique Name)	Specifies the unique name of the hierarchy.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PageField">
 <sequence minOccurs="0">
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="fld" use="required" type="xsd:int"/>
 <attribute name="item" use="optional" type="xsd:unsignedInt"/>
 <attribute name="hier" type="xsd:int"/>
 <attribute name="name" type="ST_Xstring"/>
 <attribute name="cap" type="ST_Xstring"/>
</complexType>

```

### 3.10.1.63 pageFields (Page Field Items)

Represents the collection of items in the page or report filter region of the PivotTable.

[Example:

```

<sh:pageFields count="2">
 <sh:pageField fld="43" hier="103"
 name="[Product].[Product Categories].[All Products]" cap="All Products"/>
 <sh:pageField fld="66" hier="126"
 name="[Promotion].[Promotions].[All Promotions]" cap="All Promotions"/>
</sh:pageFields>

```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
pageField (Page Field)	§3.10.1.62

1

Attributes	Description
count (Page Item Count)	Specifies the number of items in the page region of the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_PageFields">
4 <sequence>
5 <element name="pageField" maxOccurs="unbounded" type="CT_PageField"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt"/>
8 </complexType>

```

### 9 3.10.1.64 [pageItem \(Page Item\)](#)

10 Represents an item value for a PivotTable page.

Parent Elements
page (§3.10.1.61)

11

Attributes	Description
name (Page Item Name)	Specifies the name of this page item.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

12 The following XML Schema fragment defines the contents of this element:

```

13 <complexType name="CT_PageItem">
14 <attribute name="name" type="ST_Xstring" use="required"/>
15 </complexType>

```

### 16 3.10.1.65 [pages \(Page Item Values\)](#)

17 Represents the collection of page item values for each page field.

Parent Elements
consolidation (§3.10.1.20)

18

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
page (Page Items)	§3.10.1.61

1

Attributes	Description
count (Page Item String Count)	Specifies the number of page item strings in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Pages">
4 <sequence>
5 <element name="page" type="CT_PCDSCPage" minOccurs="1" maxOccurs="4"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
8 </complexType>

```

### 9 3.10.1.66 pivotAreas (Pivot Areas)

10 Represents the collection of pivot areas that comprise the PivotTable location.

11 [Example:

```

12 <sh:pivotAreas count="1">
13 <sh:pivotArea field="2" dataOnly="0" outline="0"/>
14 </sh:pivotAreas>

```

15 end example]

Parent Elements
conditionalFormat (§3.10.1.18)

16

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

17

Attributes	Description
count (Pivot Area Count)	Specifies the number of PivotAreas for the PivotTable location.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotAreas">
 <sequence>
 <element name="pivotArea" minOccurs="0" maxOccurs="unbounded" type="CT_PivotArea"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.67 pivotCacheDefinition (PivotCache Definition)

Represents the pivotCacheDefinition part. This part defines each field in the source data, including the name, the string resources of the instance data (for shared items), and information about the type of data that appears in the field.

[Example:

```
<pivotCacheDefinition xmlns="..." xmlns:r="..." r:id="rId1" refreshedBy="AnonUser"
 refreshedDate="2006-05-22T10:07:16" createdVersion="3" refreshedVersion="3"
 minRefreshableVersion="3" recordCount="182">
 <cacheSource type="worksheet">
 <worksheetSource name="Table1"/>
 </cacheSource>
 <cacheFields count="28">
 <cacheField name="Customer Name" numFmtId="0">
 <cacheField name="Postal Code" numFmtId="0">
 <sharedItems/>
 </cacheField>
 <cacheField name="Product Category" numFmtId="0">
 <sharedItems count="1">
 <s v="Bikes"/>
 </sharedItems>
 </cacheField>
 <cacheField name="Year" numFmtId="0">
 <sharedItems count="1">
 <s v="2001"/>
 </sharedItems>
 </cacheField>
 <cacheField name="Quarter" numFmtId="0">
 <sharedItems containsSemiMixedTypes="0" containsString="0"
 containsNumber="1" containsInteger="1" minValue="3" maxValue="3"
 count="1">
 <n v="3"/>
 </sharedItems>
 </cacheField>
 </cacheFields>
</pivotCacheDefinition>
```

1 *end example]*

Child Elements	Subclause
cacheFields (PivotCache Fields)	§3.10.1.4
cacheHierarchies (PivotCache Hierarchies)	§3.10.1.5
cacheSource (PivotCache Source Description)	§3.10.1.7
calculatedItems (Calculated Items)	§3.10.1.9
calculatedMembers (Calculated Members)	§3.10.1.11
dimensions (OLAP Dimensions)	§3.10.1.25
extLst (Future Feature Data Storage Area)	§3.2.10
kpis (OLAP KPIs)	§3.10.1.48
maps (OLAP Measure Group)	§3.10.1.52
measureGroups (OLAP Measure Groups)	§3.10.1.54
tupleCache (Tuple Cache)	§3.10.1.94

3

Attributes	Description
backgroundQuery (Background Query)	<p>Specifies a boolean value that indicates whether the application should query and retrieve records asynchronously from the cache.</p> <p>A value of on, 1, or true indicates the application will retrieve records asynchronously from the cache.</p> <p>A value of off, 0, or false indicates the application will retrieve records synchronously.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
createdVersion (PivotCache Created Version)	<p>Specifies the version of the application that created the cache. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
enableRefresh (Enable PivotCache Refresh)	<p>Specifies a boolean value that indicates whether the end-user can refresh the cache. This attribute depends on whether the application exposes a method for allowing end-users control over refreshing the cache via the user interface.</p> <p>A value of on, 1, or true indicates the end-user can refresh the cache.</p> <p>A value of off, 0, or false indicates the end-user cannot refresh the cache.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
<b>id (Relationship Identifier)</b>  Namespace: .../officeDocument /2006/relationships	Specifies the unique identifier that corresponds to the related pivotCacheRecords part. See (§3.10.1.68) for more information.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
<b>invalid (Invalid Cache)</b>	Specifies a boolean value that indicates whether the cache is invalid and needs to be refreshed.  A value of on, 1, or true indicates the cache is invalid and needs to be refreshed.  A value of off, 0, or false indicates the cache does not need to be refreshed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
<b>minRefreshableVersion (Minimum Version Required for Refresh)</b>	Specifies the earliest version of the application that is required to refresh the cache. This attribute is application-dependent.  The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
<b>missingItemsLimit (Missing Items Limit)</b>	Specifies the number of unused items to allow before discarding unused items. This attribute is application-dependent. The application must specify a threshold for unused items.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
<b>optimizeMemory (Optimize Cache for Memory)</b>	Specifies a boolean value that indicates whether the application will apply optimizations to the cache to reduce memory usage. This attribute is application-dependent. This application must define its own cache optimization methods. The application must also decide whether to expose cache optimization status via the user interface or an object model.  A value of on, 1, or true indicates the application will apply optimizations to the cache.  A value of off, 0, or false indicates the application will not apply optimizations to the cache.  The possible values for this attribute are defined by the XML Schema boolean datatype.
<b>recordCount (PivotCache Record Count)</b>	Specifies the number of records in the cache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
refreshedBy (Last Refreshed By)	<p>Specifies the name of the end-user who last refreshed the cache. This attribute is application-dependent and is specified by applications that track and store the identity of the current user. This attribute also depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
refreshedDate (PivotCache Last Refreshed Date)	<p>Specifies the date when the cache was last refreshed. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
refreshedVersion (PivotCache Last Refreshed Version)	<p>Specifies the version of the application that last refreshed the cache. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
refreshOnLoad (Refresh On Load)	<p>Specifies a boolean value that indicates whether the application will refresh the cache when the workbook has been opened.</p> <p>A value of on, 1, or true indicates that application will refresh the cache when the workbook is loaded.</p> <p>A value of off, 0, or false indicates the application will not automatically refresh cached data. The end user must trigger refresh of the cache manually via the application user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
saveData (Save Pivot Records)	<p>Specifies a boolean value that indicates whether the pivot records are saved with the cache.</p> <p>A value of on, 1, or true indicates pivot records are saved in the cache.</p> <p>A value of off, 0, or false indicates are not saved in the cache.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
supportAdvancedDrill (Supports Attribute Drilldown)	<p>Specifies whether the cache's data source supports attribute drilldown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
supportSubquery (Supports Subqueries)	<p>Specifies whether the cache's data source supports subqueries.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
tupleCache (Stores	<p>Specifies a boolean value that indicates whether the PivotCache is used store information</p>

Attributes	Description
Cache for OLAP Functions)	<p>for OLAP sheet data functions.</p> <p>A value of on, 1, or true indicates information about OLAP sheet data functions are stored in the cache.</p> <p>A value of off, 0, or false indicates the PivotCache does not contain information about OLAP sheet data functions.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
upgradeOnRefresh (Upgrade PivotCache on Refresh)	<p>Specifies a boolean value that indicates whether the cache is scheduled for version upgrade. This attribute depends on whether the application exposes mechanisms via the user interface whereby the cache may be upgraded.</p> <p>A value of on, 1, or true indicates the cache is scheduled for upgrade.</p> <p>A value of off, 0, or false indicates the cache is not scheduled for upgrade.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCacheDefinition">
 <sequence>

```

### 3.10.1.68 pivotCacheRecords (PivotCache Records)

Represents the collection of records in the PivotCache. This part stores the underlying source data that the PivotTable aggregates.

[Example:

```
<pivotCacheRecords xmlns="..." xmlns:r="..." count="2">
 <r>
 <x v="0"/>
 <s v="Pacific"/>
 <x v="0"/>
 <s v="Australia"/>
 <x v="0"/>
```

```
1 <x v="0"/>
2 <s v="3550"/>
3 <x v="0"/>
4 <x v="0"/>
5 <s v="Road-150 Red, 62"/>
6 <s v="This bike is ridden by race winners. Developed with the Adventure
7 Works Cycles professional race team, it has a extremely light
8 heat-treated aluminum frame, and steering that allows precision
9 control."/>
10 <s v="No Discount"/>
11 ...
12 <n v="89.4568000000000001"/>
13 </r>
14 ...
15 end example]
```

16

Parent Elements
Root element of SpreadsheetML Pivot Table Cache Records part

17

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
r (PivotCache Record)	§3.10.1.77

Attributes	Description
count (PivotCache Records Count)	Specifies the number of records in the cache.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

18 The following XML Schema fragment defines the contents of this element:

```
19 <complexType name="CT_PivotCacheRecords">
20 <sequence>
21 <element name="r" minOccurs="0" maxOccurs="unbounded" type="CT_Record"/>
22 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
23 </sequence>
24 <attribute name="count" type="xsd:unsignedInt"/>
25 </complexType>
```

26 3.10.1.69 pivotField (PivotTable Field)

27 Represents a single field in the PivotTable. This complex type contains information about the field, including the  
28 collection of items in the field.

[Example:

```

<pivotField axis="axisRow" allDrilled="1" showAll="0" measureFilter="1"
 sortType="descending">
 <items count="8">
 <item s="1" c="1" x="0"/>
 <item s="1" c="1" x="1"/>
 <item c="1" x="2"/>
 <item c="1" x="3"/>
 <item c="1" x="4"/>
 <item c="1" x="5"/>
 <item c="1" x="6"/>
 <item t="default"/>
 </items>
 <autoSortScope>
 <pivotArea dataOnly="0" outline="0" fieldPosition="0">
 <references count="2">
 <reference field="4294967294" count="1" selected="0">
 <x v="0"/>
 </reference>
 <reference field="25" count="1" selected="0">
 <x v="0"/>
 </reference>
 </references>
 </pivotArea>
 </autoSortScope>
</pivotField>

```

end example]

Parent Elements
pivotFields (§3.10.1.70)

Child Elements	Subclause
autoSortScope (AutoSort Scope)	§3.10.1.1
extLst (Future Feature Data Storage Area)	§3.2.10
items (Field Items)	§3.10.1.46

Attributes	Description
allDrilled (All Items Expanded)	Specifies a boolean value that indicates whether all items in the field are expanded. Applies only to OLAP PivotTables.

Attributes	Description
	<p>A value of on, 1, or true indicates all items in the field are expanded.</p> <p>A value of off, 0, or false indicates all items are not expanded. However some items may be expanded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
autoShow (Auto Show)	<p>Specifies a boolean value that indicates whether an "AutoShow" filter is applied to this field. This attribute depends on the implementation of filtering in the application.</p> <p>A value of on, 1, or true indicates an "AutoShow" filter is applied to the field.</p> <p>A value of off, 0, or false indicates an "AutoShow" filter is not applied.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
avgSubtotal (Average)	<p>Specifies a boolean value that indicates whether to apply the 'Average' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates the subtotal for this field is 'Average.'</p> <p>A value of off, 0, or false indicates a different aggregation function is applied to the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
axis (Axis)	<p>Specifies the region of the PivotTable that this field is displayed.</p> <p>The possible values for this attribute are defined by the ST_Axis simple type (§3.18.1).</p>
compact (Compact)	<p>Specifies a boolean value that indicates whether the application will display fields compactly in the sheet on which this PivotTable resides.</p> <p>A value of on, 1, or true indicates the next field should be displayed in the same column of the sheet.</p> <p>A value of off, 0, or false indicates each pivot field will display in its own column in the sheet.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
countASubtotal (CountA)	<p>Specifies a boolean value that indicates whether to apply the 'countA' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates the subtotal for this field is 'countA.'</p> <p>A value of off, 0, or false indicates a different aggregation function is applied to the subtotal for this field.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
countSubtotal (Count)	<p>Specifies a boolean value that indicates whether to apply the 'count' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates the subtotal for this field is 'count.'</p> <p>A value of off, 0, or false indicates a different aggregation function is applied to the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dataField (Data Field)	<p>Specifies a boolean value that indicates whether this field appears in the data region of the PivotTable.</p> <p>A value of on, 1, or true indicates this field appears in the data region of the PivotTable.</p> <p>A value of off, 0, or false indicates this field appears in another region of the PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dataSourceSort (Data Source Sort)	<p>Specifies a boolean value that indicates whether sort is applied to this field in the data source.</p> <p>A value of on, 1, or true indicates this field is sorted in the data source.</p> <p>A value of off, 0, or false indicates this field is not sorted in the data source.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
defaultAttributeDrillState (Drill State)	<p>Specifies a boolean value that indicates the drill state of the attribute hierarchy in an OLAP-based PivotTable.</p> <p>A value of on, 1, or true indicates the attribute hierarchy is expanded.</p> <p>A value of off, 0, or false indicates the attribute hierarchy is collapsed.</p> <p>This attribute is designed to allow the application to issue more optimized queries when all items of each field have the same drill state.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
defaultSubtotal (Show Default Subtotal)	<p>Specifies a boolean value that indicates whether the default subtotal aggregation function is displayed for this field.</p> <p>A value of on, 1, or true indicates the default subtotal aggregation function is displayed for this field.</p>

Attributes	Description
	<p>A value of off, 0, or false indicates the default aggregation function is not displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragOff (Drag Off)	<p>Specifies a boolean value that indicates whether the field can be removed from the PivotTable.</p> <p>A value of on, 1, or true indicates the field can be removed from the PivotTable.</p> <p>A value of off, 0, or false indicates the field cannot be removed from the PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToCol (Drag To Column)	<p>Specifies a boolean value that indicates whether the field can be dragged to the column axis.</p> <p>A value of on, 1, or true indicates the field can be dragged to the column axis.</p> <p>A value of off, 0, or false indicates the field cannot be dragged to the column axis.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToData (Field Can Drag to Data)	<p>Specifies a boolean value that indicates whether the field can be dragged to the data region.</p> <p>A value of on, 1, or true indicates the field can be dragged to the data region.</p> <p>A value of off, 0, or false indicates the field cannot be dragged to the data region.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToPage (Drag Field to Page)	<p>Specifies a boolean value that indicates whether the field can be dragged to the page region.</p> <p>A value of on, 1, or true indicates the field can be dragged to the page region.</p> <p>A value of off, 0, or false indicates the field cannot be dragged to the page region.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToRow (Drag To Row)	<p>Specifies a boolean value that indicates whether the field can be dragged to the row axis.</p> <p>A value of on, 1, or true indicates the field can be dragged to the row axis.</p> <p>A value of off, 0, or false indicates the field cannot be dragged to the row axis.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hiddenLevel	<p>Specifies a boolean value that indicates whether there is a hidden level in the PivotTable.</p>

Attributes	Description
(Hidden Level)	<p>This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates the OLAP PivotTable contains a hidden level.</p> <p>A value of off, 0, or false indicates the OLAP PivotTable does not contain any hidden levels.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
hideNewItems (Hide New Items)	<p>Specifies a boolean value that indicates whether new items that appear after a refresh should be hidden by default.</p> <p>A value of on, 1, or true indicates that items that appear after a refresh should be hidden by default.</p> <p>A value of off, 0, or false indicates that items that appear after a refresh should be shown by default.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
includeNewItemsInFilter (Inclusive Manual Filter)	<p>Specifies a boolean value that indicates whether manual filter is in inclusive mode.</p> <p>A value of on, 1, or true indicates the manual filter is inclusive.</p> <p>A value of off, 0, or false indicates the manual filter is not inclusive.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
insertBlankRow (Insert Blank Row)	<p>Specifies a boolean value that indicates whether to insert a blank row after each item.</p> <p>A value of on, 1, or true indicates that a blank row will be inserted after each item.</p> <p>A value of off, 0, or false indicates no additional rows will be inserted after each item.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
insertPageBreak (Insert Item Page Break)	<p>Specifies a boolean value that indicates whether to insert a page break after each item.</p> <p>A value of on, 1, or true indicates that a page break will be inserted after each item.</p> <p>A value of off, 0, or false indicates no page breaks will be inserted after items.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
itemPageCount (Items Per Page Count)	<p>Specifies the number of items showed per page in the PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
maxSubtotal (Max	<p>Specifies a boolean value that indicates whether to apply the 'max' aggregation function</p>

Attributes	Description
Subtotal)	<p>in the subtotal of this field.</p> <p>A value of on, 1, or true indicates that the 'max' aggregation function is applied in the subtotal for this field.</p> <p>A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
measureFilter (Measure Filter)	<p>Specifies a boolean value that indicates whether field has a measure based filter.</p> <p>A value of on, 1, or true indicates the field has a measure-based filter.</p> <p>A value of off, 0, or false indicates does not have a measure-based filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
minSubtotal (Min Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'min' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates that the 'min' aggregation function is applied in the subtotal for this field.</p> <p>A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
multipleItemSelectionAllowed (Multiple Field Filters)	<p>Specifies a boolean value that indicates whether the field can have multiple items selected in the page field.</p> <p>A value of on, 1, or true indicates the PivotTable can have multiple items selected in the page field.</p> <p>A value of off, 0, or false indicates the PivotTable cannot have multiple items selected in the page field. This attribute depends on the application support for selecting multiple items in page fields.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
name (Field Name)	<p>Specifies the name of the field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
nonAutoSortDefault (Auto Sort)	<p>Specifies a boolean value that indicates whether sort operation that will be applied to field should be AutoSort operation or simple data sort operation.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates that an AutoSort operation will be applied to the field.</p> <p>A value of off, 0, or false indicates a simple data sort operation will be applied to the field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
numFmtId (Number Format Id)	<p>Specifies the identifier of the number format to apply to this field. Number formats are written to the styles part. See the Styles section (§3.8) for more information on number formats.</p> <p>Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).</p>
outline (Outline Items)	<p>Specifies a boolean value that indicates whether the items in this field should be shown in Outline form.</p> <p>A value of on, 1, or true indicates the items in this field will be shown in Outline form.</p> <p>A value of off, 0, or false indicates the items in this field will not be shown in Outline form. This attribute depends on the application support for displaying items in Outline form.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
productSubtotal (Product Subtotal)	<p>Specifies a boolean value that indicates whether to apply 'product' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates that the 'product' aggregation function is applied in the subtotal for this field.</p> <p>A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rankBy (Auto Show Rank By)	<p>Specifies the index of the data field by which AutoShow will rank.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
serverField (Server-based Page Field)	<p>Specifies a boolean value that indicates whether this is a server-based page field.</p> <p>A value of on, 1, or true indicates this is a server-based page field.</p>

Attributes	Description
	<p>A value of off, 0, or false indicates this is a local page field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showAll (Show All Items)	<p>Specifies a boolean value that indicates whether to show all items for this field.</p> <p>A value of on, 1, or true indicates that all items be shown.</p> <p>A value of off, 0, or false indicates items be shown according to user specified criteria.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showDropDowns (Show PivotField Header Drop Downs)	<p>Specifies a boolean value that indicates whether to hide drop down buttons on PivotField headers. This attribute depends on the application implementation for filtering in the user interface.</p> <p>A value of on, 1, or true indicates the application will display some mechanism for selecting and applying filters--for example, a dropdown menu--in the user interface.</p> <p>A value of off, 0, or false indicates for mechanism for applying a filter will be displayed in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showPropAsCaption (Show As Caption)	<p>Specifies a boolean value that indicates whether to show the property as a member caption.</p> <p>A value of on, 1, or true indicates the property will be shown as a member caption.</p> <p>A value of off, 0, or false indicates the property will not be shown as a member caption.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showPropCell (Show Member Property in Cell)	<p>Specifies a boolean value that indicates whether to show the member property value in a PivotTable cell.</p> <p>A value of on, 1, or true indicates the property value will be shown in a PivotTable cell.</p> <p>A value of off, 0, or false indicates the property value will not be shown in a PivotTable cell.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showPropTip (Show Member Property ToolTip)	<p>Specifies a boolean value that indicates whether to show the member property value in a tooltip on the appropriate PivotTable cells.</p> <p>A value of on, 1, or true indicates the property value will be shown in a tooltip in the user interface.</p>

Attributes	Description
	<p>A value of off, 0, or false indicates the property will not be shown in a tooltip. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sortType (Auto Sort Type)	<p>Specifies the type of sort that is applied to this field.</p> <p>The possible values for this attribute are defined by the ST_FieldSortType simple type (§3.18.29).</p>
stdDevPSubtotal (StdDevP Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'stdDevP' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates that the 'stdDevP' aggregation function is applied in the subtotal for this field.</p> <p>A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
stdDevSubtotal (StdDev Subtotal)	<p>Specifies a boolean value that indicates whether to use 'stdDev' in the subtotal of this field.</p> <p>A value of on, 1, or true indicates that the 'stdDev' aggregation function is applied in the subtotal for this field.</p> <p>A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
subtotalCaption (Custom Subtotal Caption)	<p>Specifies the custom text that is displayed for the subtotals label.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
subtotalTop (Subtotals At Top)	<p>Specifies a boolean value that indicates whether to display subtotals at the top of the group. Applies only when Outline is true.</p> <p>A value of on, 1, or true indicates a subtotal will be display at the top of the group.</p> <p>A value of off, 0, or false indicates subtotal will not be displayed at the top of the group.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sumSubtotal (Sum Subtotal)	<p>Specifies a boolean value that indicates whether apply the 'sum' aggregation function in the subtotal of this field.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates the 'sum' aggregation function will be applied in the subtotal of this field.</p> <p>A value of off, 0, or false indicates another aggregation function will be applied in the subtotal of this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
topAutoShow (Top Auto Show)	<p>Specifies a boolean value that indicates whether an AutoShow filter applied to this field is set to show the top ranked values.</p> <p>A value of on, 1, or true indicates whether an AutoShow filter will show top values for this field.</p> <p>A value of off, 0, or false indicates bottom ranked values will be shown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
uniqueMemberProperty (Unique Member Property)	<p>Specifies the unique name of the member property to be used as a caption for the field and field items.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
varPSubtotal (VarP Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'varP' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates the 'varP' aggregation function will be applied in the subtotal of this field.</p> <p>A value of off, 0, or false indicates another aggregation function will be applied in the subtotal of this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
varSubtotal (Variance Subtotal)	<p>Specifies a boolean value that indicates whether to apply the 'variance' aggregation function in the subtotal of this field.</p> <p>A value of on, 1, or true indicates the 'variance' aggregation function will be applied in the subtotal of this field.</p> <p>A value of off, 0, or false indicates another aggregation function will be applied in the subtotal of this field.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

3.10.1.70 pivotFields (PivotTable Fields)

Represents the collection of fields that appear on the PivotTable.

[Example:

```
<pivotFields count="28">
 <pivotField showAll="0" includeNewItemsInFilter="1">
 <items count="8">
 <item x="66"/>
 <item x="133"/>
 <item x="74"/>
 <item x="27"/>
 <item x="118"/>
 <item x="63"/>
 <item x="141"/>
 <item t="default"/>
 </items>
 </pivotField>
 <pivotField showAll="0" includeNewItemsInFilter="1"/>
 <pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
 <items count="2">
 <item x="0"/>
 <item t="default"/>
 </items>
 </pivotField>
</pivotFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
pivotField (PivotTable Field)	§3.10.1.69

Attributes	Description
count (Field Count)	Specifies the number of fields in the PivotTable.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFields">
 <sequence>
 <element name="pivotField" maxOccurs="unbounded" type="CT_PivotField"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.71 pivotHierarchies (PivotTable OLAP Hierarchies)

Represents the collection of OLAP hierarchies associated with the PivotTable.

[Example:

```
<sh:pivotHierarchies count="3">
 <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
 <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
 <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
 <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
</sh:pivotHierarchies>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
pivotHierarchy (OLAP Hierarchy)	§3.10.1.72

Attributes	Description
count (OLAP Hierarchy Count)	Specifies the number of OLAP hierarchies in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotHierarchies">
 <sequence>
 <element name="pivotHierarchy" maxOccurs="unbounded" type="CT_PivotHierarchy"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.72 pivotHierarchy (OLAP Hierarchy)

Represents a OLAP hierarchy associated with the PivotTable. A hierarchy is a hierarchical representation of related OLAP dimensions. Hierarchies are defined on the OLAP server and cannot be changed in the PivotTable.

For example, hierarchy "A" might be defined as follows:

Level 1            Country/Region

Level 2            State\Provence

Level 3            City

[Example:

```
<sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
```

end example]

§3.2.10

members (Members)

§3.10.1.56

mps (OLAP Member Properties)

§3.10.1.59

#### Attributes

#### Description

caption (Hierarchy Caption)

Specifies the user defined caption of the hierarchy.

The possible values for this attribute are defined by the ST\_Xstring simple type (§3.18.96).

dragOff (Drag Off)

Specifies a boolean value that indicates whether the user is allowed to remove this hierarchy from the PivotTable.

A value of on, 1, or true indicates the user can remove this hierarchy from the PivotTable.

Attributes	Description
	<p>A value of off, 0, or false indicates the user cannot remove the hierarchy from the PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToCol (Drag To Column)	<p>Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the column area of the PivotTable.</p> <p>A value of on, 1, or true indicates the user can put this hierarchy into the column area of the PivotTable.</p> <p>A value of off, 0, or false indicates the user cannot remove this hierarchy.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToData (Drag To Data)	<p>Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the data area of the view.</p> <p>A value of on, 1, or true indicates</p> <p>A value of off, 0, or false indicates</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToPage (Drag to Page)	<p>Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the page area of the PivotTable.</p> <p>A value of on, 1, or true indicates the user can put this hierarchy into the page area of the PivotTable.</p> <p>A value of off, 0, or false indicates cannot put this hierarchy into the page area.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dragToRow (Drag To Row)	<p>Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the row area of the PivotTable.</p> <p>A value of on, 1, or true indicates the user can put this hierarchy into the row area of the PivotTable.</p> <p>A value of off, 0, or false indicates cannot put this hierarchy into the row area.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
includeNewItemFilter (Inclusive Manual Filter)	<p>Specifies a boolean value that indicates whether the application will show only the items the user has selected.</p> <p>A value of on, 1, or true indicates the application will show only items the user has</p>

Attributes	Description
	<p>selected; all other items will be hidden.</p> <p>A value of off, 0, or false indicates the application will show all items.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
multipleItemSelectionAllowed (Multiple Field Filters)	<p>Specifies a boolean value that indicates whether the user can select multiple members when the hierarchy is in the page field area of the view.</p> <p>A value of on, 1, or true indicates the user can select multiple members.</p> <p>A value of off, 0, or false indicates the user cannot select multiple members.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
outline (Outline New Levels)	<p>Specifies a boolean value that indicates whether new levels added to the PivotTable are shown in Outline mode.</p> <p>A value of on, 1, or true indicates new levels are shown in Outline mode.</p> <p>A value of off, 0, or false indicates new items are not shown in Outline mode.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showInFieldList (Show In Field List)	<p>Specifies a boolean value that indicates whether this hierarchy is omitted from the field list. This attribute depends on how the application exposes a list of fields for PivotTables in the user interface.</p> <p>A value of on, 1, or true indicates this hierarchy is show in the field list or similar mechanism in the user interface.</p> <p>A value of off, 0, or false indicates is not shown in the field list.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
subtotalTop (New Levels Subtotals At Top)	<p>Specifies a boolean value that indicates whether new levels added to the view will show their subtotals at the top.</p> <p>A value of on, 1, or true indicates new levels added to the view show their subtotals at the top.</p> <p>A value of off, 0, or false indicates new levels added to the view show their subtotals at the bottom.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotHierarchy">
 <sequence>
 <element name="mps" minOccurs="0" type="CT_MemberProperties"/>
 <element name="members" minOccurs="0" maxOccurs="unbounded" type="CT_Members"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="outline" type="xsd:boolean" default="false"/>
 <attribute name="multipleItemSelectionAllowed" type="xsd:boolean" default="false"/>
 <attribute name="subtotalTop" type="xsd:boolean" default="false"/>
 <attribute name="showInFieldList" type="xsd:boolean" default="true"/>
 <attribute name="dragToRow" type="xsd:boolean" default="true"/>
 <attribute name="dragToCol" type="xsd:boolean" default="true"/>
 <attribute name="dragToPage" type="xsd:boolean" default="true"/>
 <attribute name="dragToData" type="xsd:boolean" default="false"/>
 <attribute name="dragOff" type="xsd:boolean" default="true"/>
 <attribute name="includeNewItemInFilter" type="xsd:boolean" default="false"/>
 <attribute name="caption" type="ST_Xstring" use="optional"/>
</complexType>
```

### 3.10.1.73 pivotTableDefinition (PivotTable Definition)

Represents the PivotTable root element for non-null PivotTables. There exists one pivotTableDefinition for each PivotTableDefinition part. The PivotTable definition encompasses the following information:

#### Structure

- Top-level attributes
- Location information
- Collection of fields
- Fields on the row axis
- Items on the row axis (specific values)
- Fields on the column axis
- Items on the column axis (specific values)
- Fields on the report filter region
- Fields in the values region
- Style information

#### Outline of the XML for a pivotTableDefinition

```
<pivotTableDefinition>
 <location/>
 <pivotFields/>
 <rowFields/>
 <rowItems/>
```

```

1 <colFields/>
2 <colItems/>
3 <pageFields/>
4 <dataFields/>
5 <conditionalFormats/>
6 <pivotTableStyleInfo/>
7 </pivotTableDefinition>

```

## Illustrations

### Layout

#### Row field

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a row field.

A PivotTable report that has more than one row field has one inner row field (Sport, in the example below), the one closest to the data area. Any other row fields are outer row fields (Region, in the example below). Items in the outermost row field are displayed only once, but items in the rest of the row fields are repeated as needed.

	A	B	C
3	Sum of Sales		Quarter ▼
4	Region ▼	Sport ▼	Qtr1
5	East	Golf	5,000
6		Safari	9,000
7		Tennis	1,500
8	East Total		15,500
9	West	Golf	3,500

Region is an outer row field; Sport is an inner row field.

#### Column field

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a column field.

#### Page field

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a page field.

Page fields allow you to filter the entire PivotTable report to display data for a single item or all the items.

#### *Data field*

	A	B	C
1	Region	(All) ▼	
2			
3	Sum of Sales	Quarter ▼	
4	Sport ▼	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a data field.

Data fields provide the data values to be summarized. Usually data fields contain numbers, which are combined with the Sum summary function, but data fields can also contain text, in which case the PivotTable report uses the Count summary function.

If a report has more than one data field, a single field button named Data appears in the report for access to all of the data fields.

*[Example:*

```
<?xml ...?>
<sh:pivotTableDefinition xmlns:sh="..." name="PivotTable1" cacheId="3"
 applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
 applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="1"
 dataCaption="Values" updatedVersion="3" minRefreshableVersion="3"
 showCalcMbrs="0" useAutoFormatting="1" colGrandTotals="0" itemPrintTitles="1"
 createdVersion="3" indent="0" outline="1" outlineData="1"
 multipleFieldFilters="0" fieldListSortAscending="1">

The possible values for this attribute are defined by the XML Schema unsignedInt																										

Attributes	Description
	datatype.
cacheId (PivotCache Definition Id)	<p>Specifies the identifier of the related PivotCache definition. This Id is listed in the pivotCaches collection in the workbook part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
chartFormat (Chart Format Id)	<p>Specifies the next chart formatting identifier to use on the PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
colGrandTotals (Grand Totals On Columns)	<p>Specifies a boolean value that indicates whether grand totals should be displayed for the PivotTable columns.</p> <p>A value of on, 1, or true indicates grand totals should be displayed.</p> <p>A value of off, 0, or false indicates grand totals should not be displayed for PivotTable columns.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
colHeaderCaption (Column Header Caption)	<p>Specifies the string to be displayed in column header in compact mode. This attribute depends on whether the application implements a compact mode for displaying PivotTables in the user interface.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
compact (Compact New Fields)	<p>Specifies a boolean value that indicates whether new fields should have their compact flag set to true.</p> <p>A value of on, 1, or true indicates new fields should default to compact mode equal to true.</p> <p>A value of off, 0, or false indicates new fields should default to compact mode equal to false. This attribute depends on whether the application implements a compact mode in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
compactData (Compact Data)	<p>Specifies a boolean value that indicates whether the field next to the data field in the PivotTable should be displayed in the same column of the spreadsheet</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
createdVersion (PivotCache Created Version)	<p>Specifies the version of the application that created the cache. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte</p>

Attributes	Description
	datatype.
customListSort (Custom List AutoSort)	<p>Specifies a boolean value that indicates whether the "custom lists" option is offered when sorting this PivotTable.</p> <p>A value of on, 1, or true indicates custom lists are offered when sorting this PivotTable.</p> <p>A value of off, 0, or false indicates custom lists are not offered. This attribute depends on the implementation of sorting features in the application.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dataCaption (Data Field Header Name)	<p>Specifies the name of the value area field header in the PivotTable. This caption is shown when the PivotTable when two or more fields are in the values area.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
dataOnRows (Data On Rows)	<p>Specifies a boolean value that indicates the default orientation for fields in the data region.</p> <p>A value of on, 1, or true indicates vertical orientation.</p> <p>A value of off, 0, or false indicates horizontal orientation.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dataPosition (Default Data Field Position)	<p>Specifies the default position for the data field in the PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
disableFieldList (Disable Field List)	<p>Specifies a boolean value that indicates whether to disable the PivotTable field list.</p> <p>A value of on, 1, or true indicates the field list, or similar mechanism for selecting fields in the user interface, is disabled.</p> <p>A value of off, 0, or false indicates the field list is enabled.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
editData (Allow Edit Data)	<p>Specifies a boolean value that indicates whether the user is allowed to edit the cells in the data area of the PivotTable.</p> <p>A value of on, 1, or true indicates the user can edit values in the data area.</p> <p>A value of off, 0, or false indicates the cells in the data area are not editable.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
enableDrill (Enable	Specifies a boolean value that indicates whether the user is prevented from drilling down

Attributes	Description
Drill Down)	<p>on a PivotItem or aggregate value.</p> <p>A value of on, 1, or true indicates the user can drill down on a pivot item or aggregate value.</p> <p>A value of off, 0, or false indicates the user is prevented from drilling down pivot item.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
enableFieldProperties (Enable Field Properties)	<p>Specifies a boolean value that indicates whether the user is prevented from displaying PivotField properties.</p> <p>A value of on, 1, or true indicates the user can display pivot field properties.</p> <p>A value of off, 0, or false indicates the user cannot display pivot field properties. This attribute depends on how pivot field properties are exposed in the application user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
enableWizard (Enable PivotTable Wizard)	<p>Specifies a boolean value that indicates whether the user is prevented from displaying the PivotTable wizard.</p> <p>A value of on, 1, or true indicates the user may display the PivotTable wizard.</p> <p>A value of off, 0, or false indicates the user may not display the PivotTable wizard. This attribute depends on whether the application exposes a wizard or similar mechanism for creating and working with PivotTables in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
errorCaption (Error Caption)	<p>Specifies the string to be displayed in cells that contain errors.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
fieldListSortAscending (Default Sort Order)	<p>Specifies a boolean value that indicates whether fields in the PivotTable are sorted in non-default order in the field list.</p> <p>A value of on, 1, or true indicates fields for the PivotTable are sorted in the field list. The sort order from the data source is applied for range-based PivotTables. Alphabetical sorting is applied for external data PivotTables.</p> <p>A value of off, 0, or false indicates fields in the field list are not sorted.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fieldPrintTitles (Field Print Titles)	<p>Specifies a boolean value that indicates whether the row and column titles from the PivotTable should be printed.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates row and column titles should be printed.</p> <p>A value of off, 0, or false indicates row and column titles should not be printed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
grandTotalCaption (Grand Totals Caption)	<p>Specifies the string to be displayed for grand totals.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
gridDropZones (Enable Drop Zones)	<p>Specifies a boolean value that indicates whether the in-grid drop zones should be enabled.</p> <p>A value of on, 1, or true indicates in-grid drop zones should be enabled.</p> <p>A value of off, 0, or false indicates in-grid drop zones should be disabled. This attribute depends on how the application implements drop zones in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
immersive (Stop Immersive UI)	<p>Specifies a boolean value that indicates whether PivotTable immersive experience user interface should be turned off.</p> <p>A value of on, 1, or true indicates the PivotTable immersive experience should be turned off for this PivotTable.</p> <p>A value of off, 0, or false indicates the immersive experience should be left on. This attribute depends on whether the application implements an immersive experience in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
indent (Indentation for Compact Axis)	<p>Specifies the indentation increment for compact axis and can be used to set the Report Layout to Compact Form.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
itemPrintTitles (Item Print Titles)	<p>Specifies a boolean value that indicates whether PivotItem names should be repeated at the top of each printed page.</p> <p>A value of on, 1, or true indicates pivot items names should be repeated at the top of each page.</p> <p>A value of off, 0, or false indicates should not be repeated.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
mdxSubqueries (MDX Subqueries Supported)	<p>Specifies a boolean value that indicates whether MDX sub-queries are supported by OLAP data provider for this PivotTable.</p> <p>A value of on, 1, or true indicates MDX sub-queries are supported by the OLAP data provider.</p> <p>A value of off, 0, or false indicates MDX sub-queries are not supported.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
mergeItem (Merge Titles)	<p>Specifies a boolean value that indicates whether row or column titles that span multiple cells should be merged into a single cell.</p> <p>A value of on, 1, or true indicates that titles that span multiple cells will be merged into a single cell.</p> <p>A value of off, 0, or false indicates titles are not merged.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
minRefreshableVersion (Minimum Refreshable Version)	<p>Specifies the minimum version of the application required to update this PivotTable view. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
missingCaption (Caption for Missing Values)	<p>Specifies the string to be displayed in cells with no value</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
multipleFieldFilters (Multiple Field Filters)	<p>Specifies a boolean value that indicates whether the fields of a PivotTable can have multiple filters set on them.</p> <p>A value of on, 1, or true indicates the fields of a PivotTable can have multiple filters.</p> <p>A value of off, 0, or false indicates the fields of a PivotTable can only have a simple filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
name (Name)	<p>Specifies the PivotTable name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
outline (Outline New Fields)	<p>Specifies a boolean value that indicates whether new fields should have their outline flag set to true.</p> <p>A value of on, 1, or true indicates new fields will be created with outline equal to true.</p>

Attributes	Description
	<p>A value of off, 0, or false indicates new fields will be created with outline equal to false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
outlineData (Outline Data Fields)	<p>Specifies a boolean value that indicates whether data fields in the PivotTable should be displayed in outline form.</p> <p>A value of on, 1, or true indicates data fields will display in outline form.</p> <p>A value of off, 0, or false indicates data fields will not display in outline form.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
pageOverThenDown (Page Over Then Down)	<p>Specifies a boolean value that indicates how the page fields are laid out when there are multiple PivotFields in the page area.</p> <p>A value of on, 1, or true indicates the fields will display "Over, then down"</p> <p>A value of off, 0, or false indicates the fields will display "down, then Over"</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
pageStyle (Page Header Style Name)	<p>Specifies the name of the style to apply to each of the field item headers in the page area of the PivotTable.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
pageWrap (Page Wrap)	<p>Specifies the number of page fields to display before starting another row or column.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
pivotTableStyle (Table Style Name)	<p>Specifies the name of the style to apply to the main table area of the PivotTable.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
preserveFormatting (Preserve Formatting)	<p>Specifies a boolean value that indicates whether the formatting applied by the user to the PivotTable cells is discarded on refresh.</p> <p>A value of on, 1, or true indicates the formatting applied by the end user is discarded on refresh.</p> <p>A value of off, 0, or false indicates the end-user formatting is retained on refresh.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
printDrill (Print Drill Indicators)	<p>Specifies a boolean value that indicates whether drill indicators should be printed.</p> <p>A value of on, 1, or true indicates</p>

Attributes	Description
	<p>A value of off, 0, or false indicates</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
published (Data Fields Published)	<p>Specifies a boolean value that indicates whether data fields in the PivotTable are published.</p> <p>A value of on, 1, or true indicates</p> <p>A value of off, 0, or false indicates</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rowGrandTotals (Row Grand Totals)	<p>Specifies a boolean value that indicates whether grand totals should be displayed for the PivotTable rows. The default value for this attribute is true.</p> <p>A value of on, 1, or true indicates grand totals will be displayed for the PivotTable rows.</p> <p>A value of off, 0, or false indicates grand totals will not be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rowHeaderCaption (Row Header Caption)	<p>Specifies the string to be displayed in row header in compact mode.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
showCalcMbrs (Show Calculated Members)	<p>Specifies a boolean value that indicates whether calculated members should be shown in the PivotTable view. This attribute applies to PivotTables from OLAP-sources only.</p> <p>A value of on, 1, or true indicates that calculated members should be shown.</p> <p>A value of off, 0, or false indicates calculated members should not be shown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showDataDropDo wn (Show Drop Down)	<p>Specifies a boolean value that indicates whether the drop-down lists for the fields in the PivotTable should be hidden. This attribute depends on whether the application implements drop down lists or similar mechanism in the user interface.</p> <p>A value of on, 1, or true indicates drop down lists will be displayed for fields.</p> <p>A value of off, 0, or false indicates drop down lists will not be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showDataTips (Show ToolTips on Data)	<p>Specifies a boolean value that indicates whether tooltips should be displayed for PivotTable data cells.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates tooltips will be displayed.</p> <p>A value of off, 0, or false indicates tooltips will not be displayed. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showDrill (Show Expand Collapse)	<p>Specifies a boolean value that indicates whether drill indicators should be hidden.</p> <p>A value of on, 1, or true indicates drill indicators will be displayed.</p> <p>A value of off, 0, or false indicates drill indicators will not be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showDropZones (Show Drop Zones)	<p>Specifies a boolean value that indicates whether the PivotTable should display large drop zones when there are no fields in the data region.</p> <p>A value of on, 1, or true indicates a large drop zone will be displayed.</p> <p>A value of off, 0, or false indicates a large drop zone will not be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showEmptyCol (Show Empty Column)	<p>Specifies a boolean value that indicates whether to include empty columns in the table.</p> <p>A value of on, 1, or true indicates empty columns will be included in the PivotTable.</p> <p>A value of off, 0, or false indicates empty columns will be excluded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showEmptyRow (Show Empty Row)	<p>Specifies a boolean value that indicates whether to include empty rows in the table.</p> <p>A value of on, 1, or true indicates empty rows will be included in the PivotTable.</p> <p>A value of off, 0, or false indicates empty rows will be excluded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showError (Show Error)	<p>Specifies a boolean value that indicates whether to show error messages in cells.</p> <p>A value of on, 1, or true indicates error messages will be shown in cells.</p> <p>A value of off, 0, or false indicates error messages will be shown through another mechanism the application provides in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showHeaders	Specifies a boolean value that indicates whether to suppress display of pivot field

Attributes	Description
(Show Field Headers)	<p>headers.</p> <p>A value of on, 1, or true indicates field headers will be shown in the PivotTable.</p> <p>A value of off, 0, or false indicates field headers will be excluded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showItems (Show Item Names)	<p>Specifies a boolean value that indicates whether to display item names when adding a field onto a PivotTable that has no data fields.</p> <p>A value of on, 1, or true indicates item names will be displayed.</p> <p>A value of off, 0, or false indicates item names will not be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showMemberPropertyTips (Show Member Property ToolTips)	<p>Specifies a boolean value that indicates whether member property information should be omitted from PivotTable tooltips.</p> <p>A value of on, 1, or true indicates member property information will be included.</p> <p>A value of off, 0, or false indicates member property information will be excluded. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showMissing (Show Missing)	<p>Specifies a boolean value that indicates whether to show a message in cells with no value.</p> <p>A value of on, 1, or true indicates to show a message string in cells without values.</p> <p>A value of off, 0, or false indicates no message string will shown in cells without values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showMultipleLabel (Show Multiple Labels)	<p>Specifies a boolean value that indicates whether a page field with multiple selected items should display "(multiple items)" instead of "All". This attribute applies only to non-OLAP PivotTables. The messages displayed depend on the application implementation.</p> <p>A value of on, 1, or true indicates a different message string will be displayed for a page field with multiple items.</p> <p>A value of off, 0, or false indicates the same message string will be displayed for all page fields.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
subtotalHiddenItems (Subtotal Hidden Items)	<p>Specifies a boolean value that indicates whether data for hidden pivotItems for PivotFields in the data area should be included in subtotals.</p> <p>A value of on, 1, or true indicates that data for hidden pivot items in the data area will be included in subtotals.</p> <p>A value of off, 0, or false indicates hidden pivot items will not be included in subtotals.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
tag (PivotTable Custom String)	<p>Specifies a user-defined string that is associated with this PivotTable.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
updatedVersion (PivotTable Last Updated Version)	<p>Specifies the version of the application that last updated the PivotTable view. This attribute is application-dependent.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
useAutoFormatting (Auto Formatting)	<p>Specifies a boolean value that indicates whether auto formatting has been applied to the PivotTable view.</p> <p>A value of on, 1, or true indicates</p> <p>A value of off, 0, or false indicates</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
vacatedStyle (Vacated Style)	<p>Specifies the name of the style to apply to the cells left blank when a PivotTable shrinks during a refresh operation</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
visualTotals (Total Visual Data)	<p>Specifies a boolean value that indicates whether totals should be based on visible data only. This attribute applies to OLAP PivotTables only.</p> <p>A value of on, 1, or true indicates subtotals will be computed on visible data only.</p> <p>A value of off, 0, or false indicates subtotals will be computed on all data.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

34 3.10.1.74 pivotTableStyleInfo (PivotTable Style)

35 Represent information on style applied to the PivotTable.

36 [Example:

```
37 <sh:pivotTableStyleInfo name="PivotStyleLight16" showRowHeaders="1"
38 showColHeaders="1" showRowStripes="0" showColStripes="0" showLastColumn="1"/>
```

39 end example]

pivotTableDefinition (§3.10.1.73)

40

Attributes	Description
------------	-------------

Attributes	Description
name (Table Style Name)	<p>Specifies the name of the table style to use with this table.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
showColHeaders (Show Table Style Column Header Formatting)	<p>Specifies a boolean value that indicates whether to show column headers for the table.</p> <p>A value of on, 1, or true indicates column headers will be shown.</p> <p>A value of off, 0, or false indicates column headers will be omitted.</p> <p>'True' if table style column header formatting should be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showColStripes (Show Column Stripes)	<p>Specifies a boolean value that indicates whether to show column stripe formatting for the table.</p> <p>A value of on, 1, or true indicates column stripe formatting will be shown.</p> <p>A value of off, 0, or false indicates no column formatting will be shown.</p> <p>True if table style column stripe formatting should be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showLastColumn (Show Last Column)	<p>Specifies a boolean value that indicates whether to show the last column.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showRowHeaders (Show Row Header Formatting)	<p>Specifies a boolean value that indicates whether to show row headers for the table.</p> <p>A value of on, 1, or true indicates table style formatting will be displayed.</p> <p>A value of off, 0, or false indicates table style formatting will not be displayed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showRowStripes (Show Row Stripes)	<p>Specifies a boolean value that indicates whether to show row stripe formatting for the table.</p> <p>A value of on, 1, or true indicates row stripe formatting will be displayed.</p> <p>A value of off, 0, or false indicates no row formatting will be shown.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotTableStyle">
 <attribute name="name" type="xsd:string"/>
 <attribute name="showRowHeaders" type="xsd:boolean"/>
 <attribute name="showColHeaders" type="xsd:boolean"/>
 <attribute name="showRowStripes" type="xsd:boolean"/>
 <attribute name="showColStripes" type="xsd:boolean"/>
 <attribute name="showLastColumn" type="xsd:boolean" use="optional"/>
</complexType>
```

### 3.10.1.75 query (Query)

Represents an OLAP sheet data cached query.

Parent Elements
queryCache (§3.10.1.76)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93

Attributes	Description
mdx (MDX Query String)	<p>Specifies the Multidimensional Expressions (MDX) query string.</p> <p>[<i>Note:</i> Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at:  <a href="http://msdn2.microsoft.com/en-us/library/ms145595.aspx">http://msdn2.microsoft.com/en-us/library/ms145595.aspx</a> <i>end note</i>]</p> <p>See the MDX Language Reference for more information:</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Query">
 <sequence>
 <element name="tpls" minOccurs="0" type="CT_Tuples"/>
 </sequence>
 <attribute name="mdx" use="required" type="ST_Xstring"/>
</complexType>
```

### 3.10.1.76 queryCache (OLAP Query Cache)

Represents the cache of OLAP sheet data queries.

Parent Elements
-----------------

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
query (Query)	§3.10.1.75

Attributes	Description
count (Cached Query Count)	Specifies the number of cached queries in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryCache">
 <sequence>
 <element name="query" maxOccurs="unbounded" type="CT_Query"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.77 r (PivotCache Record)

Represents a single record of data in the PivotCache.

[Example:

```
<r>
 <s v="3550"/>
 <s v="Road-150 Red, 62"/>
 <s v="This bike is ridden by race winners. Developed with the Adventure Works
 Cycles professional race team, it has a extremely light heat-treated
 aluminum frame, and steering that allows precision control."/>
 <s v="No Discount"/>
 <x v="0"/>
 <s v="Australian Dollar"/>
 <n v="1"/>
 <n v="3578.27"/>
 <n v="0"/>
 <n v="2171.294199999999998"/>
 <n v="3578.27"/>
 <n v="89.4568000000000001"/>
</r>
```

end example]

Parent Elements
pivotCacheRecords (§3.10.1.68)

1

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85
x (Shared Items Index)	§3.10.1.97

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Record">
4 <choice maxOccurs="unbounded">
5 <element name="m" type="CT_Missing"/>
6 <element name="n" type="CT_Number"/>
7 <element name="b" type="CT_Boolean"/>
8 <element name="e" type="CT_Error"/>
9 <element name="s" type="CT_String"/>
10 <element name="d" type="CT_DateTime"/>
11 <element name="x" type="CT_Index"/>
12 </choice>
13 </complexType>

```

### 14 3.10.1.78 rangePr (Range Grouping Properties)

15 Represents the collection of range grouping properties.

16 *[Example:*

```

17 <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
18 endDate="2006-05-06T00:00:00"/>

```

19 *end example]*

Parent Elements
fieldGroup (§3.10.1.30)

20

Attributes	Description
autoEnd (Source Data Ending Range)	Specifies a boolean value that indicates whether the application will use the source data to set the ending range value.

Attributes	Description
	<p>A value of on, 1, or true indicates the ending range value will be set from the source data.</p> <p>A value of off, 0, or false indicates ending range values will be set by the value specified in endDate or endNum.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
autoStart (Source Data Set Beginning Range)	<p>Specifies a boolean value that indicates whether we use source data to set the beginning range value.</p> <p>A value of on, 1, or true indicates the beginning range value will be set from the source data.</p> <p>A value of off, 0, or false indicates the beginning range value will be set from the value specified in startDate or startNum.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
endDate (Date Grouping End Value)	<p>Specifies the ending value for date grouping if autoEnd is false.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>
endNum (Numeric Grouping End Value)	<p>Specifies the ending value for numeric grouping if autoEnd is false.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
groupBy (Group By)	<p>Specifies the grouping.</p> <p>The possible values for this attribute are defined by the ST_GroupBy simple type (§3.18.39).</p>
groupInterval (Grouping Interval)	<p>Specifies the grouping interval for numeric range grouping. Specifies the number of days to group by in date range grouping.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
startDate (Date Grouping Start Value)	<p>Specifies the starting value for date grouping if autoStart is false.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>
startNum (Numeric Grouping Start Value)	<p>Specifies the starting value for numeric grouping if autoStart is false.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RangePr">
 <attribute name="autoStart" type="xsd:boolean" default="true"/>
 <attribute name="autoEnd" type="xsd:boolean" default="true"/>
 <attribute name="groupBy" type="ST_GroupBy" default="range"/>
 <attribute name="startNum" type="xsd:double"/>
 <attribute name="endNum" type="xsd:double"/>
 <attribute name="startDate" type="xsd:dateTime"/>
 <attribute name="endDate" type="xsd:dateTime"/>
 <attribute name="groupInterval" type="xsd:double" default="1"/>
</complexType>
```

### 3.10.1.79 rangeSet (Range Set)

Represents a single range in the rangeSets collection. This complex type is intended to facilitate creating a PivotTable report by consolidating SpreadsheetML ranges that have similar categories of data to be summarized. The simplest layout for the data source is for each rangeSets of data to be in list-like format, with column labels in the first row, row labels in the first column, the rest of the rows having similar items in the same row and column, and no blank rows or columns within the range. A particular rangeSet can consist of a built-in named range that is provided by the application, a user defined named range, a range reference, or a reference to an external workbook.

When multiple ranges are consolidated using this functionality, up to 4 custom report filters (also known as page fields) can be created to help filter the PivotTable report, by specifically enabling one or more of the individual ranges to be selected in the report filter. For each custom page field created, a custom label can be specified and assigned to each range participating in the consolidation range, so that the PivotTable can be filtered by one or more of the ranges being summarized.

[Example: Consider a workbook with 6 worksheets. On Sheet1 we have:

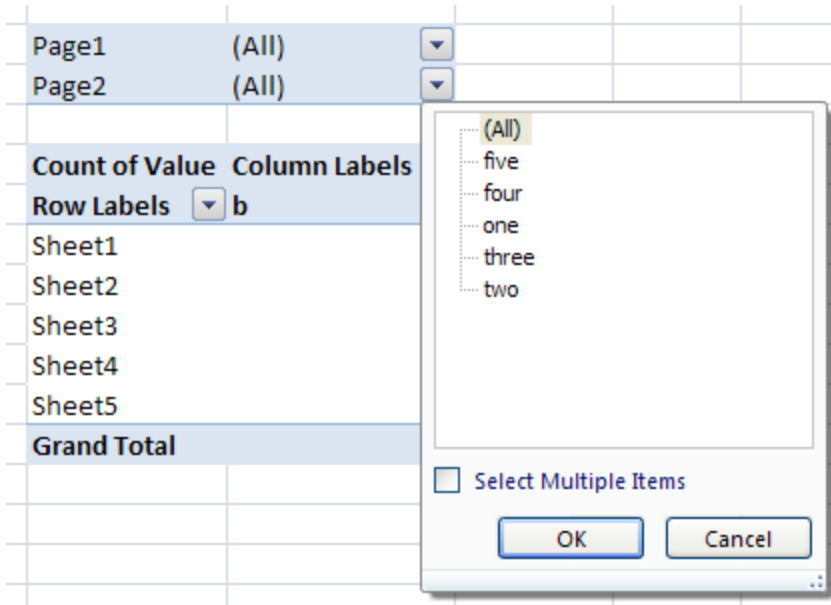

a	b
Sheet1	Sheet1
Sheet1	Sheet1

On Sheet2 we have:

a	b
Sheet2	Sheet2
Sheet2	Sheet2

... and so on up through Sheet5.

On Sheet6, we have the consolidated ranges being summarized by a PivotTable, and two page filters exist for the PivotTable.

Notice that for the second page filter, the items have been assigned a custom label, "one", "two", ..., "five", for each of Sheet1, Sheet2, ..., Sheet5 data sources, respectively. Similarly, the items have been assigned a custom label, "1", "2", ..., "5" for each of Sheet1, Sheet2, ..., Shet5 data sources, respectively.

The XML representing these custom page filters shall be like the following:

```
<cacheSource type="consolidation">
 <consolidation autoPage="0">
 <pages count="2">
 <page count="5">
 <pageItem name="1"/>
 <pageItem name="2"/>
 <pageItem name="3"/>
 <pageItem name="4"/>
 <pageItem name="5"/>
 </page>
 <page count="5">
 <pageItem name="one"/>
 <pageItem name="two"/>
 <pageItem name="three"/>
 <pageItem name="four"/>
 <pageItem name="five"/>
 </page>
 </pages>
 </consolidation>
</cacheSource>
```

```

1 <rangeSets count="5">
2 <rangeSet i1="0" i2="0" ref="A1:B3" sheet="Sheet1"/>
3 <rangeSet i1="1" i2="1" ref="A1:B3" sheet="Sheet2"/>
4 <rangeSet i1="2" i2="2" ref="A1:B3" sheet="Sheet3"/>
5 <rangeSet i1="3" i2="3" ref="A1:B3" sheet="Sheet4"/>
6 <rangeSet i1="4" i2="4" ref="A1:B3" sheet="Sheet5"/>
7 </rangeSets>
8 </consolidation>
9 </cacheSource>

```

*end example]*

[*Note:* Attributes i1, i2, i3, and i4 correspond to custom page fields created in the user interface. Spreadsheet ML only supports 4 custom page fields. *end note*]

#### Parent Elements

rangeSets (§3.10.1.80)

#### Attributes

#### Description

i1 (Field Item Index  
Page 1)

Specifies the index of a page field item in page filter one.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

i2 (Field Item Index  
Page 2)

Specifies the index of a page field item in page filter two.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

i3 (Field Item index  
Page 3)

Specifies the index of a page field item in page filter three.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

i4 (Field Item Index  
Page 4)

Specifies the index of a page field item in page filter four.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

id (Relationship Id)

Specifies the unique identifier of the Workbook part where the range set is stored. See Workbook (§) for more information.

Namespace:  
.../officeDocument  
/2006/relationships

The possible values for this attribute are defined by the ST\_RelationshipId simple type (§7.8.2.1).

name (Named  
Range)

Specifies the named range.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Specifies the cell range.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheet (Sheet Name)	Specifies the sheet name.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_RangeSet">
3 <attribute name="i1" type="xsd:unsignedInt" use="optional"/>
4 <attribute name="i2" type="xsd:unsignedInt" use="optional"/>
5 <attribute name="i3" type="xsd:unsignedInt" use="optional"/>
6 <attribute name="i4" type="xsd:unsignedInt" use="optional"/>
7 <attribute name="ref" type="ST_Ref" use="optional"/>
8 <attribute name="name" type="ST_Xstring" use="optional"/>
9 <attribute name="sheet" type="ST_Xstring" use="optional"/>
10 <attribute ref="r:id" use="optional"/>
11 </complexType>
```

12 **3.10.1.80 rangeSets (Range Sets)**

13 Represents the collection of reference-page items pairs.

Parent Elements
consolidation (§3.10.1.20)

14

Child Elements	Subclause
rangeSet (Range Set)	§3.10.1.79

15

Attributes	Description
count (Reference and Page Item Count)	Specifies the number of reference and page items.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RangeSets">
 <sequence>
 <element name="rangeSet" type="CT_RangeSet" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.81 rowFields (Row Fields)

Represents the collection of row fields for the PivotTable.

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a row field. A PivotTable report that has more than one row field has one inner row field (Sport, in the example below), the one closest to the data area. Any other row fields are outer row fields (Region, in the example below). Items in the outermost row field are displayed only once, but items in the rest of the row fields are repeated as needed.

	A	B	C
3	Sum of Sales		Quarter
4	Region	Sport	Qtr1
5	East	Golf	5,000
6		Safari	9,000
7		Tennis	1,500
8	East Total		15,500
9	West	Golf	3,500

In the image above, Region is an outer row field. Sport is an inner row field.

[Example:

```
<rowFields count="2">
 <field x="7"/>
 <field x="8"/>
</rowFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
field (Field)	§3.10.1.29

1

Attributes	Description
count (Repeated Items Count)	Specifies the number of repeated items in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_RowFields">
4 <sequence>
5 <element name="field" maxOccurs="unbounded" type="CT_Field"/>
6 </sequence>
7 <attribute name="count" type="xsd:unsignedInt" default="0"/>
8 </complexType>

```

### 9 3.10.1.82 rowHierarchiesUsage (Row OLAP Hierarchy References)

10 Represents the collection of references to OLAP hierarchies on the row axis of a PivotTable.

11 [Example:

```

12 <sh:rowHierarchiesUsage count="1">
13 <sh:rowHierarchyUsage hierarchyUsage="9"/>
14 </sh:rowHierarchiesUsage>

```

15 end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

16

Child Elements	Subclause
rowHierarchyUsage (Row OLAP Hierarchies)	§3.10.1.83

17

Attributes	Description
count (Item Count)	Specifies the number of items in the collection.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RowHierarchiesUsage">
 <sequence>
 <element name="rowHierarchyUsage" minOccurs="1" maxOccurs="unbounded"
 type="CT_HierarchyUsage"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.83 rowHierarchyUsage (Row OLAP Hierarchies)

Represents a references to an OLAP Hierarchy on the row axis of a PivotTable.

[Example:

```
<sh:rowHierarchyUsage hierarchyUsage="9"/>
```

end example]

Parent Elements
rowHierarchiesUsage (§3.10.1.82)

Attributes	Description
hierarchyUsage (Hierarchy Usage)	Specifies the reference to an OLAP hierarchy in a PivotTable.  The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HierarchyUsage">
 <attribute name="hierarchyUsage" type="xsd:int" use="required"/>
</complexType>
```

### 3.10.1.84 rowItems (Row Items)

Represents the collection of items in row axis of the PivotTable.

In the SpreadsheetML example below, the item values are found in cells B10:B13. For example "Bikes" is in B10, and corresponds to the first <i> element below.

[Example:

```
<rowItems count="4">
 <i>
 <x/>
 </i>
```

```
1 <i r="1">
2 <x/>
3 </i>
4 <i r="1">
5 <x v="1"/>
6 </i>
7 <i t="grand">
8 <x/>
9 </i>
10 </rowItems>
```

11 *end example]*

12 Looking at the layout of the PivotTable in this example, "Bikes" is the first (and only) item value in the first row,  
13 in cell B10. In the XML defining the PivotTable row item values, the first <i> element corresponds to the first  
14 row. There is a single index element <x>. The first (and only) <x> element corresponds to the first field on the  
15 row axis, namely "Product Category", and an index value of "0" indicates that the 0th item in the items  
16 collection for that pivotField definition is how to obtain the item value. Note that "Bikes" isn't explicitly listed  
17 as a value here, but instead the 0th item is an index to this field's shared items collection in the  
18 pivotCacheDefinition part.

19 For the second row there are two item values, one item value (Bikes) from the first field in that row (Product  
20 Category) and one item value (Mountain Bikes) from the second field in that row (Product Subcategory). In the  
21 PivotTable, the first item value "Bikes" is hidden from view. In the XML for this example, the second <i>  
22 element expresses both item values for this row. The first item value "Bikes" is expressed implicitly, because the  
23 value of @r on the second <i> element is '1', indicating that the first item value from the previous row will be  
24 reused again as the first item value for the current row. The second item value is expressed explicitly via the <x>  
25 element under the second <i> element. The index of '0' indicates that the 0th item in the <pivotField>  
26 element for that field is how to obtain the item value. Note again that the 0th item is itself an index into this  
27 field's shared items collection in the pivotCacheDefinition part.

28 The item values for the third row can be discovered in a similar way.

Parent Elements
pivotTableDefinition (§3.10.1.73)

29

Child Elements	Subclause
i (Row Items)	§3.10.1.44

30

Attributes	Description
count (Items in a	Specifies the number of items in the row axis of the PivotTable.

Attributes	Description
Row Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_rowItems">
 <sequence>
 <element name="i" maxOccurs="unbounded" type="CT_I"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.85 s (Character Value)

Represents a character value in a PivotTable.

[Example:

```
<sharedItems count="2">
 <s v="7527 Brook Way"/>
 <s v="3310 Harvey Way"/>
</sharedItems>
```

end example]

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

Attributes	Description
b (Bold)	<p>Specifies a boolean value that indicates whether this value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains bold formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bc (Background Color)	Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.

Attributes	Description
	The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
c (Item Caption)	<p>Specifies the caption for the this item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
cp (Member Property Count)	<p>Specifies the number of member property values.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
f (Calculated Item)	<p>Specifies a boolean value that indicates whether this is a calculated item value.</p> <p>A value of on, 1, or true indicates this item is a calculated value.</p> <p>A value of off, 0, or false indicates this item is not a calculated value.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fc (Foreground Color)	<p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).</p>
i (Italic)	<p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains italic formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
in (Format Index)	<p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
st (Strikethrough)	<p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains strikethrough formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application

Attributes	Description
	<p>marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of on, 1, or true indicates this item is unused.</p> <p>A value of off, 0, or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
un (Underline)	<p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of on, 1, or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
v (Value)	<p>Specifies the value of the item.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
 <sequence>
 <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
 </sequence>
 <attribute name="v" use="required" type="ST_Xstring"/>
 <attribute name="u" type="xsd:boolean"/>
 <attribute name="f" type="xsd:boolean"/>
 <attribute name="c" type="ST_Xstring"/>
 <attribute name="cp" type="xsd:unsignedInt"/>
 <attribute name="in" type="xsd:unsignedInt" use="optional"/>
 <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
 <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.86 serverFormat (Server Format)

Represents the numeric format specified by the OLAP server for a tuple.

Parent Elements
serverFormats (§3.10.1.87)

Attributes	Description
culture (Culture)	<p>Specifies a language used to determine the currency symbol to display for currency values. For example, if the culture is "en-us", the values in the application will format the values with a dollar sign. If the culture is "fr-fr" the application will format the values with a euro sign.</p> <p>This value conforms to the language tagging conventions of RFC 3066 and later. The pattern &lt;language&gt;-&lt;REGION&gt; is used, e.g., "en-us" or "fr-fr".</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
format (Format)	<p>Specifies the format string to use for all other numeric values. This string is supplied by the OLAP server. Therefore, the syntax for reading the format string depends on the server implementation.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_ServerFormat">
3 <attribute name="culture" use="optional" type="ST_Xstring"/>
4 <attribute name="format" use="optional" type="ST_Xstring"/>
5 </complexType>
```

### 6 3.10.1.87 serverFormats (Server Formats)

7 Represents the collection of numeric and currency formats specified by the OLAP server for a tuple

Parent Elements
tupleCache (§3.10.1.94)

8

Child Elements	Subclause
serverFormat (Server Format)	§3.10.1.86

9

Attributes	Description
count (Format Count)	<p>Specifies the number of formats in the collection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ServerFormats">
 <sequence>
 <element name="serverFormat" type="CT_ServerFormat" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.88 set (OLAP Set)

Represents an OLAP sheet data set or tuple set. The set is defined by a Multidimensional Expressions (MDX) query that specifies criteria for the dimension members that belong to the set.

For example, the following MDX expression defines the set for the 10 salespersons with the lowest sales:

```
BottomCount([Salesperson].[Salesperson Name].Members,10,[Measures].[Sales])
```

The MDX expression is specified in the setDefinition attribute.

#### Parent Elements

sets (§3.10.1.89)

#### Child Elements

#### Subclause

sortByTuple (Sort By Tuple)

§3.10.1.91

tpls (Tuples)

§3.10.1.93

Attributes	Description
count (Number of Tuples)	Specifies the number of tuples in the set.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
maxRank (Maximum Rank Requested)	Specifies the largest rank entry the user has requested.  The possible values for this attribute are defined by the XML Schema int datatype.
queryFailed (Query Failed)	Specifies a boolean value that indicates whether querying on this set failed.  A value of on, 1, or true indicates a query against this set failed.  A value of off, 0, or false indicates a query against this set succeeded.  The possible values for this attribute are defined by the XML Schema boolean datatype.
setDefinition (MDX)	Specifies the Multidimensional Expressions (MDX) set definition.

Attributes	Description
Set Definition)	<p>[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: <a href="http://msdn2.microsoft.com/en-us/library/ms145595.aspx">http://msdn2.microsoft.com/en-us/library/ms145595.aspx</a> end note]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
sortType (Set Sort Order)	<p>Specifies the sort order of the set.</p> <p>The possible values for this attribute are defined by the ST_SortType simple type (§3.18.76).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Set">
 <sequence>
 <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
 <element name="sortByTuple" minOccurs="0" type="CT_Tuples"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
 <attribute name="maxRank" use="required" type="xsd:int"/>
 <attribute name="setDefinition" use="required" type="ST_Xstring"/>
 <attribute name="sortType" type="ST_SortType" default="none"/>
 <attribute name="queryFailed" type="xsd:boolean" default="false"/>
</complexType>

```

### 3.10.1.89 sets (Sets)

Represents the collection of OLAP sheet data entries or tuple sets.

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
set (OLAP Set)	§3.10.1.88

Attributes	Description
count (Tuple Set Count)	<p>Specifies the number of tuple sets.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sets">
 <sequence>
 <element name="set" maxOccurs="unbounded" type="CT_Set"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

### 3.10.1.90 sharedItems (Shared Items)

Represents the collection of unique items for a field in the PivotCacheDefinition. The sharedItems complex type stores data type and formatting information about the data in a field. Items in the PivotCacheDefinition can be shared in order to reduce the redundancy of those values that are referenced in multiple places across all the PivotTable parts. For example, a value might be part of a filter, it might appear on a row or column axis, and will appear in the pivotCacheRecords definition as well. However, because of the performance cost of creating the optimized shared items, items are only shared if they are actually in use in the PivotTable. Therefore, depending on user actions on the PivotTable layout, the pivotCacheDefinition and underlying PivotCacheRecords part may be updated.

If there are no shared items, then field values are stored directly in the pivotCacheRecords part.

[Example:

```
<sharedItems count="1">
 <s v="[Customer].[Customer Geography].[Country].&[United States]"
 c="United States"/>
</sharedItems>
```

end example]

The following attributes are not required or validated if there are no items in sharedItems.

- containsBlank
- containsSemiMixedTypes
- containsMixedTypes
- longText

The following attributes not validated unless there is more than one item in sharedItems or the one and only item is not a blank item. If the first item is a blank item the data type the field cannot be verified.

- containsNumber
- containsDates
- containsString
- containsInteger

The following attributes are not validated and can be omitted without loss of functionality.

- containsNonDate
- count

The following attributes are not required and can be omitted. However, refreshing the PivotTable could produce different groupings than before.

- maxDate
- minDate
- maxValue
- minValue

Note: validation is performed to ensure that “date” attributes are not mixed with “value” attributes.

Parent Elements
cacheField (§3.10.1.3)

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Attributes	Description
containsBlank (Contains Blank)	<p>Specifies a boolean value that indicates whether this field contains a blank value.</p> <p>A value of on, 1, or true indicates this field contains one or more blank values.</p> <p>A value of off, 0, or false indicates this field does not contain blank values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsDate (Contains Date)	<p>Specifies a boolean value that indicates that the field contains at least one date.</p> <p>A value of on, 1, or true indicates the field contains at least one date value.</p> <p>A value of off, 0, or false indicates the field does not contain any date values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsInteger (Contains Integer)	<p>Specifies a boolean value that indicates whether this field contains integer values.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates this field contains integer values.</p> <p>A value of off, 0, or false indicates non-integer or mixed values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsMixedTypes (Contains Mixed Data Types)	<p>Specifies a boolean value that indicates whether this field contains more than one data type.</p> <p>A value of on, 1, or true indicates this field contains more than one data type.</p> <p>A value of off, 0, or false indicates contains only one data type. The field may still contain blank values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsNonDate (Contains Non Date)	<p>Specifies a boolean value that indicates that the field contains at least one value that is not a date.</p> <p>A value of on, 1, or true indicates the field contains at least one non-date values.</p> <p>A value of off, 0, or false indicates this field contains no date fields.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsNumber (Contains Numbers)	<p>Specifies a boolean value that indicates whether this field contains numeric values.</p> <p>A value of on, 1, or true indicates this field contains at least one numeric value.</p> <p>A value of off, 0, or false indicates this field contains no numeric values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsSemiMixedTypes (Contains Semi Mixed Data Types)	<p>Specifies a boolean value that indicates that this field contains text values. The field may also contain a mix of other data type and blank values.</p> <p>A value of on, 1, or true indicates at least one text value, and may also contain a mix of other data types and blank values.</p> <p>A value of off, 0, or false indicates the field does not have a mix of text and other values.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
containsString (Contains String)	<p>Specifies a boolean value that indicates whether this field contains a text value.</p> <p>A value of on, 1, or true indicates this field contains at least one text value.</p> <p>A value of off, 0, or false indicates this field does not contain any text values.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
count (Shared Items Count)	<p>Specifies the number of shared items to load for this field.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
longText (Long Text)	<p>Specifies a boolean value that indicates whether this field contains a long text value. A string is considered long if it is over 255 characters.</p> <p>A value of on, 1, or true indicates the value contains more than 255 characters of text.</p> <p>A value of off, 0, or false indicates the value contains less than 255 characters.</p> <p>[<i>Note</i>: This is used as many legacy spreadsheet application support a limit of 255 characters for text values. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
maxDate (Maximum Date Time Value)	<p>Specifies the maximum date/time value found in a date field.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>
maxValue (Maximum Numeric Value)	<p>Specifies the maximum numeric value found in a numeric field.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>
minDate (Minimum Date Time)	<p>Specifies the minimum date/time value found in a date field.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>
minValue (Minimum Numeric Value)	<p>Specifies the minimum numeric value found in a numeric field.</p> <p>The possible values for this attribute are defined by the XML Schema double datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SharedItems">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="m" type="CT_Missing" minOccurs="1" maxOccurs="1"/>
 <element name="n" type="CT_Number" minOccurs="1" maxOccurs="1"/>
 <element name="b" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
 <element name="e" type="CT_Error" minOccurs="1" maxOccurs="1"/>
 <element name="s" type="CT_String" minOccurs="1" maxOccurs="1"/>
 <element name="d" type="CT_DateTime" minOccurs="1" maxOccurs="1"/>
 </choice>
 <attribute name="containsSemiMixedTypes" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="containsNonDate" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="containsDate" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="containsString" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="containsBlank" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="containsMixedTypes" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="containsNumber" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="containsInteger" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="minValue" type="xsd:double" use="optional"/>
 <attribute name="maxValue" type="xsd:double" use="optional"/>
 <attribute name="minDate" type="xsd:dateTime" use="optional"/>
 <attribute name="maxDate" type="xsd:dateTime" use="optional"/>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
 <attribute name="longText" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.91 [sortByTuple \(Sort By Tuple\)](#)

Represents the sort applied to a tuple.

Parent Elements
set (§3.10.1.88)

Child Elements	Subclause
tpl (Tuple)	§3.10.1.92

Attributes	Description
c (Member Name Count)	Specifies the number of member names.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tuples">
 <sequence>
 <element name="tpl" type="CT_Tuple" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="c" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.10.1.92 tpl (Tuple)

Represents an OLAP sheet data entry member.

#### Parent Elements

sortByTuple (§3.10.1.91); tpls (§3.10.1.93)

#### Attributes

#### Description

fld (Field Index)

Specifies the index of the field to which the member belongs.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

hier (Hierarchy Index)

Specifies the index of the hierarchy to which the member belongs.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

item (Item Index)

Specifies the index of the item in the field that represents this item.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tuple">
 <attribute name="fld" type="xsd:unsignedInt"/>
 <attribute name="hier" type="xsd:unsignedInt"/>
 <attribute name="item" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.10.1.93 tpls (Tuples)

Represents members for the OLAP sheet data entry, also known as a tuple.

#### Parent Elements

e (§3.10.1.27); m (§3.10.1.50); n (§3.10.1.60); query (§3.10.1.75); s (§3.10.1.85); set (§3.10.1.88)

#### Child Elements

#### Subclause

Child Elements	Subclause
tpl (Tuple)	§3.10.1.92

Attributes	Description
c (Member Name Count)	Specifies the number of member names.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tuples">
 <sequence>
 <element name="tpl" type="CT_Tuple" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="c" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.10.1.94 tupleCache (Tuple Cache)

Represents the cache of OLAP sheet data members, or tuples.

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
entries (Entries)	§3.10.1.28
extLst (Future Feature Data Storage Area)	§3.2.10
queryCache (OLAP Query Cache)	§3.10.1.76
serverFormats (Server Formats)	§3.10.1.87
sets (Sets)	§3.10.1.89

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TupleCache">
 <sequence>
 <element name="entries" minOccurs="0" type="CT_PCSDTCEntries"/>
 <element name="sets" minOccurs="0" type="CT_Sets"/>
 <element name="queryCache" minOccurs="0" type="CT_QueryCache"/>
 <element name="serverFormats" minOccurs="0" maxOccurs="1" type="CT_ServerFormats"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
</complexType>
```

### 3.10.1.95 worksheetSource (Worksheet PivotCache Source)

Represents the location of the source of the data that is stored in the cache.

[Example:

```
<cacheSource type="worksheet">
 <worksheetSource name="Table1" r:id="rId2"/>
</cacheSource>
```

end example]

Parent Elements
cacheSource (§3.10.1.7)

Attributes	Description
id (Relationship Id)  Namespace: .../officeDocument /2006/relationships	Specifies the identifier to the Sheet part whose data is stored in the cache. See the Sheet section (§3.2) for more information.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Named Range)	Specifies the named range that is the source of the data.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Specifies the reference that defines a cell range that is the source of the data. This attribute depends on how the application implements cell references.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheet (Sheet Name)	Specifies the name of the sheet that is the source for the cached data.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WorksheetSource">
 <attribute name="ref" type="ST_Ref" use="optional"/>
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="sheet" type="ST_Xstring" use="optional"/>
 <attribute ref="r:id" use="optional"/>
</complexType>
```

### 3.10.1.96 x (Member Property Index)

Represents an array of indexes to cached member property values.

**Parent Elements**

b (§3.10.1.2); d (§3.10.1.21); e (§3.10.1.27); i (§3.10.1.44); m (§3.10.1.50); n (§3.10.1.60); s (§3.10.1.85)

**Attributes****Description**

v (Shared Items Index)

Specifies the index into the shared items table in the PivotCache that identifies this item.

The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_X">
 <attribute name="v" type="xsd:int" default="0"/>
</complexType>
```

**3.10.1.97 x (Shared Items Index)**

This element represents an array of indexes to cached shared item values

**Parent Elements**

discretePr (§3.10.1.26); r (§3.10.1.77); reference (§3.10.2.1); tables (§3.13.9)

**Attributes****Description**

v (Shared Items Index)

Specifies the index into the shared items table in the PivotCache that identifies this item.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Index">
 <attribute name="v" use="required" type="xsd:unsignedInt"/>
</complexType>
```

**3.10.2 Shared Pivot Table Data**

This section defines the part where shared PivotTable data is stored.

**3.10.2.1 reference (Reference)**

Represents a set of selected fields and selected items within those fields.

[Example:

```
<sh:reference field="4294967294" count="1" selected="0">
 <sh:x v="0"/>
</sh:reference>
```

1 *end example]*

Parent Elements
references (§3.10.2.2)

2

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
x (Shared Items Index)	§3.10.1.97

3

Attributes	Description
avgSubtotal (Include Average Filter)	<p>Specifies a boolean value that indicates whether the 'average' aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the average aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
byPosition (Positional Reference)	<p>Specifies a boolean value that indicates whether the item is referred to by position rather than item index.</p> <p>A value of on, 1, or true indicates the item is referred to by position.</p> <p>A value of off, 0, or false indicates the item is referred to by index.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
count (Item Index Count)	<p>Specifies the number of item indexes in the collection of indexes (x tags).</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
countASubtotal (Include CountA Filter)	<p>Specifies a boolean value that indicates whether the 'countA' subtotal is included in the filter.</p> <p>A value of on, 1, or true indicates the count aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
countSubtotal (Include Count)	<p>Specifies a boolean value that indicates whether the count aggregate function is included in the filter.</p>

Attributes	Description
Subtotal)	<p>A value of on, 1, or true indicates the count aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
defaultSubtotal (Include Default Filter)	<p>Specifies a boolean value that indicates whether the default subtotal is included in the filter.</p> <p>A value of on, 1, or true indicates the default subtotal will is included in the filter. The default is to display the total or the grand total.</p> <p>A value of off, 0, or false indicates another subtotal or aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
field (Field Index)	<p>Specifies the index of the field to which this filter refers. A value of -2 indicates the 'data' field.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
maxSubtotal (Include Maximum Filter)	<p>Specifies a boolean value that indicates whether the 'maximum' aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the maximum aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
minSubtotal (Include Minimum Filter)	<p>Specifies a boolean value that indicates whether the 'minimum' aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the minimum aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
productSubtotal (Include Product Filter)	<p>Specifies a boolean value that indicates whether the 'product' aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the product aggregation function will is included in the</p>

Attributes	Description
	<p>filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
relative (Relative Reference)	<p>Specifies a boolean value that indicates whether the item is referred to by a relative reference rather than an absolute reference. This attribute is used if posRef is set to true.</p> <p>A value of on, 1, or true indicates the item is referred to by a relative reference.</p> <p>A value of off, 0, or false indicates the item is referred to by an absolute reference.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
selected (Selected)	<p>Specifies a boolean value that indicates whether this field has selection. This attribute is used when the PivotTable is in Outline view. It is also used when both header and data cells have selection.</p> <p>A value of on, 1, or true indicates the field has selection.</p> <p>A value of off, 0, or false indicates the field does not have selection.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
stdDevPSubtotal (Include StdDevP Filter)	<p>Specifies a boolean value that indicates whether the population standard deviation aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the population standard deviation aggregation function will be included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
stdDevSubtotal (Include StdDev Filter)	<p>Specifies a boolean value that indicates whether the standard deviation aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the standard deviation aggregation function will be included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sumSubtotal (Include Sum Filter)	<p>Specifies a boolean value that indicates whether the sum aggregate function is included in the filter.</p>

Attributes	Description
	<p>A value of on, 1, or true indicates the sum aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
varPSubtotal (Include VarP Filter)	<p>Specifies a boolean value that indicates whether the population variance aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the population variance aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
varSubtotal (Include Var Filter)	<p>Specifies a boolean value that indicates whether the variance aggregate function is included in the filter.</p> <p>A value of on, 1, or true indicates the variance aggregation function will is included in the filter.</p> <p>A value of off, 0, or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotAreaReference">
 <sequence>
 <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_Index"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="field" use="optional" type="xsd:unsignedInt"/>
 <attribute name="count" type="xsd:unsignedInt"/>
 <attribute name="selected" type="xsd:boolean" default="true"/>
 <attribute name="byPosition" type="xsd:boolean" default="false"/>
 <attribute name="relative" type="xsd:boolean" default="false"/>
 <attribute name="defaultSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="sumSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="countASubtotal" type="xsd:boolean" default="false"/>
 <attribute name="avgSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="maxSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="minSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="productSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="countSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="stdDevSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="stdDevPSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="varSubtotal" type="xsd:boolean" default="false"/>
 <attribute name="varPSubtotal" type="xsd:boolean" default="false"/>
</complexType>
```

### 3.10.2.2 references (References)

Represents the set of selected fields and the selected items within those fields.

*[Example:*

```
<sh:references count="5">
 <sh:reference field="4294967294" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 <sh:reference field="2" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 <sh:reference field="14" count="1" selected="0">
 <sh:x v="0"/>
 </sh:reference>
 <sh:reference field="15" count="2" selected="0">
 <sh:x v="2"/>
 <sh:x v="3"/>
 </sh:reference>
</sh:references>
```

*end example]*

Parent Elements
pivotArea (§3.3.1.66)

Child Elements	Subclause
reference (Reference)	§3.10.2.1

Attributes	Description
count (Pivot Filter Count)	Specifies the number of filtered records available in the PivotTable.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotAreaReferences">
 <sequence>
 <element name="reference" maxOccurs="unbounded" type="CT_PivotAreaReference"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

## 3.11 Shared Workbook Data

The Shared Workbooks architecture enables a spreadsheet application to record revisions made to a workbook (e.g., track changes), and is designed to enable either single, or multiple users editing the same workbook at the same time. Therefore the application needs to support the ability to read changes made by another user and update it's own state of the same workbook with those changes, even when those changes are made concurrently with other changes made by other users. Inevitably there will be conflicts, and therefore merge conflict resolution should be supported the runtime application. The file format only contains enough information so that the spreadsheet application can deal with conflicts, and can undo/redo changes from the change history at run time.

### 3.11.1 Shared Workbook Data

Within a shared workbook, the changes made to the spreadsheet at runtime are persisted as sets of different revisions collectively forming a revision history. These are persisted to the file on disk during a save event, and are saved in different xml parts known as revision logs. There is a headers table xml part that summarizes when changes were made, who made them, and it lists the relationship from each header to the individual revision log that records the specific changes.

*[Example: This example shows the header and revision log for two simple events: adding text to a cell, and inserting a new sheet.*

First, take a look at the header table, and revision log:

```

1 <headers xmlns="..." xmlns:r="..." guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}">
2 <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
3 dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
4 r:id="rId1">
5 <sheetIdMap count="3">
6 <sheetId val="1"/>
7 <sheetId val="2"/>
8 <sheetId val="3"/>
9 </sheetIdMap>
10 </header>
11 </headers>

```

And the revision log is essentially empty:

```
<revisions xmlns="..." xmlns:r="..." />
```

Now, after inserting the text "foo" into cell A1, and saving, the header looks like this:

```

15 <headers xmlns="..." xmlns:r="..." guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
16 diskRevisions="1" revisionId="1" version="2">
17 <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
18 dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
19 r:id="rId1">
20 <sheetIdMap count="3">
21 <sheetId val="1"/>
22 <sheetId val="2"/>
23 <sheetId val="3"/>
24 </sheetIdMap>
25 </header>
26 <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
27 dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
28 r:id="rId2" minRId="1">
29 <sheetIdMap count="3">
30 <sheetId val="1"/>
31 <sheetId val="2"/>
32 <sheetId val="3"/>
33 </sheetIdMap>
34 </header>
35 </headers>

```

A new header entry is added, with a GUID and a revision ID (rId2) that specifies which log to look into to see the details about the revision.

The old log is saved, and the newly created log (corresponding to rId2) now looks like this:

```

1 <revisions xmlns="..." xmlns:r="...">
2 <rcc rId="1" sId="1">
3 <nc r="A1" t="inlineStr">
4 <is>
5 <t>foo</t>
6 <phoneticPr fontId="0"/>
7 </is>
8 </nc>
9 </rcc>
10 </revisions>

```

The log shows that the contents of a cell were revised, and the new cell contents is text containing "foo" as the string.

After inserting a new sheet, the header looks like this:

```

14 <headers xmlns="..." xmlns:r="..." guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
15 diskRevisions="1" revisionId="2" version="3">
16 <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
17 dateTime="2006-07-14T13:42:54" maxSheetId="4"
18 userName="UserName" r:id="rId1">
19 <sheetIdMap count="3">
20 <sheetId val="1"/>
21 <sheetId val="2"/>
22 <sheetId val="3"/>
23 </sheetIdMap>
24 </header>
25 <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
26 dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
27 r:id="rId2" minRId="1">
28 <sheetIdMap count="3">
29 <sheetId val="1"/>
30 <sheetId val="2"/>
31 <sheetId val="3"/>
32 </sheetIdMap>
33 </header>
34 <header guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
35 dateTime="2006-07-14T13:48:56" maxSheetId="5" userName="UserName"
36 r:id="rId3" minRId="2">

```

```

1 <sheetIdMap count="4">
2 <sheetId val="1"/>
3 <sheetId val="2"/>
4 <sheetId val="3"/>
5 <sheetId val="4"/>
6 </sheetIdMap>
7 </header>
8 </headers>

```

You can see that the last, most recent, header entry shows an entry for the new sheet. The most recent log looks like this:

```

11 <revisions xmlns="..." xmlns:r="...">
12 <ris rId="2" sheetId="4" name="[shared example.xlsx]Sheet4"
13 sheetPosition="3"/>
14 <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="delete"/>
15 <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="add"/>
16 </revisions>

```

This shows the new sheet, sheetId 4, is added to the workbook. The custom view (rcv) for the user is updated as a new sheet was added.

*end example]*

### 3.11.1.1 header (Header)

This element is essentially a table that contains metadata about a list of specific changes that have taken place for this workbook. It lists when the changes were made, who made them, and the relationship IDs so that the log detailing the specific change can be found. If tracking changes, or sharing workbooks, are enabled, then changes are persisted on the Save event, or at a specified time interval. A header is created for each set of changes.

Parent Elements
Root element of SpreadsheetML Shared Workbook Revision Headers partheaders (§3.11.1.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
reviewedList (Reviewed List)	§3.11.1.15
sheetIdMap (Sheet Id Map)	§3.11.1.24

Attributes	Description
dateTime (Date)	The date and time when this set of revisions was saved.

Attributes	Description
Time)	<p>Note: This can happen when the user explicitly saves, or the save can occur due to a time interval, specified in the spreadsheet application, elapsing.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>
guid (GUID)	<p>A globally unique identifier for this set of revisions.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
id (Relationship ID)  Namespace: .../officeDocument /2006/relationships	<p>This is the ID that is used to find the corresponding log record of the changes made for this header.</p> <p>Use the corresponding relationship expressed in the revisionHeaders part to locate the log record that lists the specific changes.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
maxRId (Max Revision Id)	<p>The highest revision Id that belongs to this header.</p> <p>Note: this can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
maxSheetId (Last Sheet Id)	<p>Internal identifier of the next available sheet in this workbook.</p> <p>Note: the numbering here should be the index of the next available sheet in the workbook in a 1-based index system.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
minRId (Minimum Revision Id)	<p>The lowest revision id that belongs to this header.</p> <p>Note: this can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
userName (User Name)	<p>A string representing the name of the user making the revision..</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionHeader">
 <sequence>
 <element name="sheetIdMap" minOccurs="1" maxOccurs="1" type="CT_SheetIdMap"/>
 <element name="reviewedList" minOccurs="0" maxOccurs="1" type="CT_ReviewedRevisions"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="dateTime" type="xsd:dateTime" use="required"/>
 <attribute name="maxSheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="userName" type="ST_Xstring" use="required"/>
 <attribute ref="r:id" use="required"/>
 <attribute name="minRId" type="xsd:unsignedInt" use="optional"/>
 <attribute name="maxRId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.11.1.2 headers (Revision Headers)

This element represents the list of revision headers.

This section contains many references to history, versions, and revisions, and it is helpful to clarify the relationships here. In general, a series of changes (revisions) can be made to a spreadsheet. When a batch of those revisions is saved to disk, the version number of the spreadsheet is incremented. The batch of changes is saved to the revision history, which is persisted on disk with the file in the form of different log files and headers.

There are some attributes that deal with history which may seem redundant (such as `diskRevisions`, and `history`, among others) - these are there for backwards compatibility with older versions of spreadsheet applications and do not need to be used for creating new files.

Child Elements	Subclause
header (Header)	§3.11.1.1

Attributes	Description
diskRevisions (Disk Revisions)	<p>A Boolean value indicating that this shared workbook file contains revisions. True when the workbook does have revisions, false otherwise.</p> <p>[Note: this attribute is used for backwards compatibility. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
exclusive (Exclusive Mode)	<p>A Boolean value indicating that this shared workbook is in exclusive mode.</p> <p>A workbook is in exclusive mode when a user has a lock on it for appending revisions to the file.</p> <p>[Note: This is used for backwards compatibility with older spreadsheet applications. <i>end</i></p>

Attributes	Description
	<p><i>note]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
guid (Last Revision GUID)	<p>The globally unique identifier of the last set of revisions. This shall match the GUID for the most recent header.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
history (History)	<p>A Boolean value indicating that this shared workbook maintains a revision history. True if a history is maintained, false otherwise.</p> <p><i>[Note: This is used for backwards compatibility with older spreadsheet applications. end note]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
keepChangeHistory (Keep Change History)	<p>A Boolean value indicating whether the revision history should be kept for this shared workbook. True if the history should be kept, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
lastGuid (Last GUID)	<p>Unique identifier of the last set of revisions that was saved into the file.</p> <p>Note: The spreadsheet application may have certain modes, such as a timed save mode, where the application doesn't do a full save, but instead just appends the most recent revision records. In cases like this, for a new user that opens such a file while it is being edited, the file that was loaded from disk will only have the changes that were saved during a full save. To get the current state of the file which includes edits by other users, the spreadsheet application would need to apply all the revisions from lastGuid to guid.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).</p>
preserveHistory (Preserve History)	<p>An integer representing the number of days the spreadsheet application will keep the change history for this workbook.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
protected (Protected)	<p>A Boolean value indicating whether the change tracking in this shared workbook can be removed. True if the tracking can be removed, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
revisionId (Revision Id)	<p>The current revision number of this shared workbook.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
shared (Shared Workbook)	<p>A Boolean value indicating that this workbook is shared. True when the workbook is shared, false otherwise.</p>

Attributes	Description
	<p>[Note: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
trackRevisions (Track Revisions)	<p>A Boolean value indicating that revisions are tracked in this shared workbook. True when revisions are tracked, false otherwise.</p> <p>[Note: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
version (Version)	<p>An integer representing the current version of this shared workbook. The integer should begin counting from 1 for the first version.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_RevisionHeaders">
 <sequence>
 <element name="header" type="CT_RevisionHeader" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="lastGuid" type="ST_Guid" use="optional"/>
 <attribute name="shared" type="xsd:boolean" default="true"/>
 <attribute name="diskRevisions" type="xsd:boolean" default="false"/>
 <attribute name="history" type="xsd:boolean" default="true"/>
 <attribute name="trackRevisions" type="xsd:boolean" default="true"/>
 <attribute name="exclusive" type="xsd:boolean" default="false"/>
 <attribute name="revisionId" type="xsd:unsignedInt" default="0"/>
 <attribute name="version" type="xsd:int" default="1"/>
 <attribute name="keepChangeHistory" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="protected" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="preserveHistory" type="xsd:unsignedInt" default="30"/>
</complexType>

```

### 3.11.1.3 nc (New Cell Data)

This element represents new cell data that was added to the worksheet.

For most spreadsheet application purposes, only the data type and reference will need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the <rfmt> element can be used to record style information instead of the S (style index) attribute.

#### Parent Elements

1

Parent Elements
rcc (§3.11.1.9)

2

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
f (Formula)	§3.3.1.37
is (Rich Text Inline)	§3.3.1.50
v (Cell Value)	§3.3.1.93

Attributes	Description
cm (Cell Metadata Index)	<p>The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
ph (Show Phonetic)	<p>A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
r (Reference)	<p>An A1 style reference to the location of this cell</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
s (Style Index)	<p>The index of this cell's style. Style records are stored in the Styles Part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
t (Cell Data Type)	<p>An enumeration representing the cell's data type.</p> <p>The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).</p>
vm (Value Metadata Index)	<p>The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell">
 <sequence>
 <element name="f" type="CT_CellFormula" minOccurs="0" maxOccurs="1"/>
 <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="is" type="CT_Rst" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="r" type="ST_CellRef" use="optional"/>
 <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="t" type="ST_CellType" use="optional" default="n"/>
 <attribute name="cm" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 3.11.1.4 ndxf (New Formatting Information)

This element represents new differential formatting information for this cell. This formatting is applied to the existing formatting of the cell.

Parent Elements
rcc (§3.11.1.9)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
border (Border)	§3.8.4
extLst (Future Feature Data Storage Area)	§3.2.10
fill (Fill)	§3.8.19
font (Font)	§3.8.21
numFmt (Number Format)	§3.8.30
protection (Protection Properties)	§3.8.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxf">
 <sequence>
 <element name="font" type="CT_Font" minOccurs="0" maxOccurs="1"/>
 <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
 <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="1"/>
 <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
 <element name="border" type="CT_Border" minOccurs="0" maxOccurs="1"/>
 <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 3.11.1.5 oc (Old Cell Data)

This element represents old cell data. Old cell data is data that was previously stored in the cell.

For most spreadsheet application purposes, only the data type and reference will need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the <rfmt> element can be used to record style information instead of the S (style index) attribute.

Parent Elements
rcc (§3.11.1.9)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
f (Formula)	§3.3.1.37
is (Rich Text Inline)	§3.3.1.50
v (Cell Value)	§3.3.1.93

Attributes	Description
cm (Cell Metadata Index)	<p>The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
ph (Show Phonetic)	<p>A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
r (Reference)	<p>An A1 style reference to the location of this cell</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
s (Style Index)	<p>The index of this cell's style. Style records are stored in the Styles Part.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
t (Cell Data Type)	An enumeration representing the cell's data type.

Attributes	Description
	The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).
vm (Value Metadata Index)	<p>The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Cell">
 <sequence>
 <element name="f" type="CT_CellFormula" minOccurs="0" maxOccurs="1"/>
 <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 <element name="is" type="CT_Rst" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="r" type="ST_CellRef" use="optional"/>
 <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="t" type="ST_CellType" use="optional" default="n"/>
 <attribute name="cm" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

### 3.11.1.6 odfx (Old Formatting Information)

This element represents the old differential formatting information for this cell. Old differential formatting is differential formatting that was previously applied to the cell.

Parent Elements
rcc (§3.11.1.9)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
border (Border)	§3.8.4
extLst (Future Feature Data Storage Area)	§3.2.10
fill (Fill)	§3.8.19
font (Font)	§3.8.21
numFmt (Number Format)	§3.8.30
protection (Protection Properties)	§3.8.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxf">
 <sequence>
 <element name="font" type="CT_Font" minOccurs="0" maxOccurs="1"/>
 <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
 <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="1"/>
 <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
 <element name="border" type="CT_Border" minOccurs="0" maxOccurs="1"/>
 <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 3.11.1.7 oldFormula (Old Formula)

This element represents the old formula for a defined name in this cell. This is only used for named cells. Formulas that are entered in a cell with no name are represented by the formula element <f>.

The possible values for this element are defined by the ST\_Formula simple type (§3.18.36).

Parent Elements
rdn (§3.11.1.13)

### 3.11.1.8 raf (Revision AutoFormat)

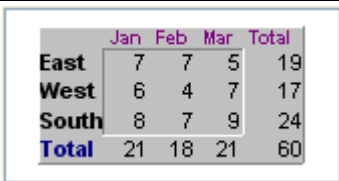

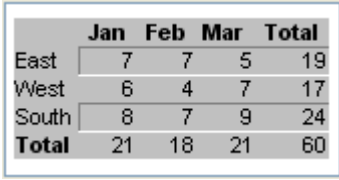

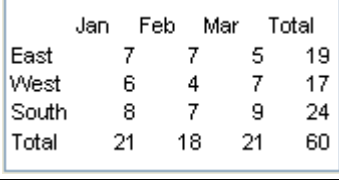

This element represents a revision record of auto formatting change information for a table.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
applyAlignmentFor mats (Apply Alignment Formats)	If true apply legacy table autoformat alignment properties.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyBorderForma ts (Apply Border Formats)	If true apply legacy table autoformat border properties.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFontFormats (Apply Font Formats)	If true apply legacy table autoformat font properties.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyNumberForm ats (Apply Number Formats)	If true apply legacy table autoformat number format properties.  The possible values for this attribute are defined by the XML Schema boolean datatype.
applyPatternForm ats (Apply Pattern Formats)	If true apply legacy table autoformat pattern properties.  The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description																																																																																																																																																																				
applyWidthHeight Formats (Apply Width / Height Formats)	<p>If true apply legacy table autoformat width/height properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description	
	14	
	15	
	16	
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.	
ref (Reference)	A-1 style reference to the location where the formatting was applied  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).	
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.	

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_RevisionAutoFormatting">
3 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
4 <attributeGroup ref="AG_AutoFormat"/>
5 <attribute name="ref" type="ST_Ref" use="required"/>
6 </complexType>
```

### 7 3.11.1.9 rcc (Revision Cell Change)

8 This element stores information about the contents of the cell that was replaced.

Parent Elements
revisions (§3.11.1.16); rm (§3.11.1.19); rrc (§3.11.1.21)

9

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Child Elements	Subclause
nc (New Cell Data)	§3.11.1.3
ndxf (New Formatting Information)	§3.11.1.4
oc (Old Cell Data)	§3.11.1.5
odxf (Old Formatting Information)	§3.11.1.6

1

Attributes	Description
dx (Formatting)	<p>A Boolean flag indicating that there was a differential formatting change for this cell - true if there was a formatting change, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
endOfListFormula Update (End of List Formula Update)	<p>A Boolean flag indicating that indicates that the formula used at the end of a list has been updated. True if the formula was updated, false otherwise.</p> <p>Note: List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
numFmtId (Number Format Id)	<p>Zero-based index of the number format (Fmt) record used by this cell format (XF).</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).</p>
odxf (Old Formatting)	<p>Flag indicating that there is old formatting information available for this cell.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
oldPh (Old Phonetic Text)	<p>A Boolean flag indicating whether there is old phonetic text information available. True when there is old phonetic text information available, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
oldQuotePrefix (Old Quote Prefix)	<p>A Boolean value indicating if a single quote prefix is was used on this cell previously. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix was used previously, false otherwise</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ph (Phonetic Text)	<p>A Boolean flag indicating whether this cell contains phonetic text or not. True when the cell contains phonetic text, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
quotePrefix (Quote Prefix)	<p>A Boolean value indicating if a single quote prefix is used. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix is used, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
s (Style Revision)	<p>Flag indicating that formatting change for this cell affected the cell's style. (Only applicable for Undo operations)</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sId (Sheet Id)	<p>Internal identifier of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
ua (Revision From Rejection)	<p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
xfDxf (Row Column Formatting Change)	<p>Flag indicating that the formatting change had an effect on the formatting of the entire row or column that this cell belongs to. (Only applicable for Undo operations).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

#### 3.11.1.10 rcft (Revision Merge Conflict)

This element represents a revision record which indicates that there was a merge conflict.

##### Parent Elements

revisions (§3.11.1.16)

##### Attributes

##### Description

ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_RevisionConflict">
3 <attributeGroup ref="AG_RevData"/>
4 <attribute name="sheetId" type="xsd:unsignedInt" use="optional"/>
5 </complexType>
```

### 6 3.11.1.11 rcmt (Revision Cell Comment)

7 This element represents a revision record of a cell comment change.

Parent Elements
revisions (§3.11.1.16)

8

Attributes	Description
action (User Action)	An enumeration identifying what kind of an operation the user performed on the comment.  The possible values for this attribute are defined by the ST_RevisionAction simple type (§3.18.67).
alwaysShow (Always Show Comment)	A Boolean value indicating that the user has set this comment to always be visible. True if the comment is set to always be visible, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.
author (Author)	A string representing the name of the author who changed this comment.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cell (Cell)	An A-1 style reference to the cell where the comment was changed.  The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
guid (GUID)	A globally unique identifier of this comment.  The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
hiddenColumn (Hidden Column)	A Boolean value indicating that the comment belongs to a cell in a hidden column. True if the comment is in a hidden column, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.
hiddenRow (Comment In Hidden Row)	A Boolean value indicating that the comment belongs to a cell in a hidden row. True if the comment is in a hidden row, false otherwise.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
newLength (New Comment Length)	Length of the comment text added in this revision.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
old (Old Comment)	An ignorable Boolean value used for backwards compatibility that indicates that the original comment was created by a legacy spreadsheet application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
oldLength (Original Comment Length)	Length of the comment before this revision was made.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_RevisionComment">
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="cell" type="ST_CellRef" use="required"/>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="action" type="ST_RevisionAction" default="add"/>
 <attribute name="alwaysShow" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="old" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="hiddenRow" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="hiddenColumn" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="author" type="ST_Xstring" use="required"/>
 <attribute name="oldLength" type="xsd:unsignedInt" default="0"/>
 <attribute name="newLength" type="xsd:unsignedInt" default="0"/>
</complexType>

```

### 3.11.1.12 rcv (Revision Custom View)

This element represents a revision record of adding or removing a custom view to the workbook

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
action (User Action)	An enumeration representing the type of action that the user performed.  The possible values for this attribute are defined by the ST_RevisionAction simple type

Attributes	Description
	(§3.18.67).
guid (GUID)	A globally unique identifier of the custom view.  The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_RevisionCustomView">
3 <attribute name="guid" type="ST_Guid" use="required"/>
4 <attribute name="action" type="ST_RevisionAction" use="required"/>
5 </complexType>
```

### 6 3.11.1.13 rdn (Revision Defined Name)

7 This element represents a revision record of a defined name change.

Parent Elements
revisions (§3.11.1.16)

8

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
formula (Formula)	§3.3.1.40
oldFormula (Old Formula)	§3.11.1.7

9

Attributes	Description
comment (Name Comment)	A string representing a comment about the defined name.  Note: This comment can be shown by the spreadsheet application in a names management UI so that users have more information about what the defined name is used for.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customMenu (New Custom Menu)	A string representing the new custom menu text  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customView (Custom View)	A Boolean flag indicating that this named range belongs to a custom view  The possible values for this attribute are defined by the XML Schema boolean datatype.
description (Description)	A string representing the new description text for the defined name.

Attributes	Description																																		
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).																																		
function (Function)	<p>A Boolean value indicating that the defined name refers to a function. True if the defined name is a function, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																																		
functionGroupId (Function Group Id)	<p>Represents the new function group id.</p> <p>Function group ids are used to help classify functions. For instance, functions in the same group can be searched or selected easily from the spreadsheet applications UI. For instance, filtering the list of all functions to allow the user to choose from functions used for financial data.</p> <p>The following group ids should be used:</p> <table data-bbox="414 772 738 1371"> <tr> <th>ID</th><th>Function group</th></tr> <tr><td>1</td><td>Financial</td></tr> <tr><td>2</td><td>Date and Time</td></tr> <tr><td>3</td><td>Math and Trig</td></tr> <tr><td>4</td><td>Statistical</td></tr> <tr><td>5</td><td>Lookup &amp; Reference</td></tr> <tr><td>6</td><td>Database</td></tr> <tr><td>7</td><td>Text</td></tr> <tr><td>8</td><td>Logical</td></tr> <tr><td>9</td><td>Information</td></tr> <tr><td>10</td><td>Commands</td></tr> <tr><td>11</td><td>Customizing</td></tr> <tr><td>12</td><td>Macro Control</td></tr> <tr><td>13</td><td>DDE/External</td></tr> <tr><td>14</td><td>User Defined</td></tr> <tr><td>15</td><td>Engineering</td></tr> <tr><td>14</td><td>Cube</td></tr> </table> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>	ID	Function group	1	Financial	2	Date and Time	3	Math and Trig	4	Statistical	5	Lookup & Reference	6	Database	7	Text	8	Logical	9	Information	10	Commands	11	Customizing	12	Macro Control	13	DDE/External	14	User Defined	15	Engineering	14	Cube
ID	Function group																																		
1	Financial																																		
2	Date and Time																																		
3	Math and Trig																																		
4	Statistical																																		
5	Lookup & Reference																																		
6	Database

12	Macro Control																																		
13	DDE/External																																		
14	User Defined																																		
15	Engineering																																		
14	Cube																																		
help (New Help Topic)	<p>A string representing the new help topic text.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>																																		
hidden (Named Range Hidden)	<p>A Boolean value indicating whether the named range is now hidden.</p> <p>Note: hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																																		

Attributes	Description
localSheetId (Local Name Sheet Id)	<p>An integer representing the id of the sheet to which this defined name belongs. This shall be used local defined names only.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
name (Name)	<p>A string representing the name for this defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
oldComment (Old Name Comment)	<p>A string representing the old comment about the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
oldCustomMenu (Old Custom Menu Text)	<p>A string representing the old custom menu text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
oldDescription (Old Description)	<p>A string representing the old description text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
oldFunction (Old Function)	<p>A Boolean flag indicating that the old name was a function</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
oldFunctionGroupId (Old Function Group Id)	<p>Old function group ID.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
oldHelp (Old Help Topic)	<p>A string representing the old help topic text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
oldHidden (Old Hidden)	<p>A Boolean flag indicating whether the named range was hidden</p> <p>Note: hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
oldShortcutKey (Old Short Cut Key)	<p>Old keyboard shortcut.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>

Attributes	Description
oldStatusBar (Old Status Bar)	<p>A string representing the old status bar text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
shortcutKey (Shortcut Key)	<p>Represents the new keyboard shortcut.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
statusBar (Status Bar)	<p>A string representing the new status bar text.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
ua (Revision From Rejection)	<p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionDefinedName">
 <sequence>
 <element name="formula" type="ST_Formula" minOccurs="0" maxOccurs="1"/>

 <attribute name="oldStatusBar" type="ST_Xstring" use="optional"/>
 <attribute name="comment" type="ST_Xstring" use="optional"/>
 <attribute name="oldComment" type="ST_Xstring" use="optional"/>
</complexType>
```

#### 3.11.1.14 reviewed (Reviewed)

This element represents an identifier of a single reviewed revision. A reviewed revision, is a revision that has been reviewed via the spreadsheet application's track changes feature, has been accepted, and has been saved.

##### Parent Elements

reviewedList (§3.11.1.15)

##### Attributes

##### Description

rId (revision Id)	<p>ID of a reviewed revision.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
-------------------	-------------------------------------------------------------------------------------------------------------------------------------

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Reviewed">
 <attribute name="rId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.11.1.15 reviewedList (Reviewed List)

This element maintains a list of reviewed revisions.

Parent Elements
header (§3.11.1.1)

Child Elements	Subclause
reviewed (Reviewed)	§3.11.1.14

Attributes	Description
count (Reviewed Revisions Count)	<p>Number of reviewed revisions.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ReviewedRevisions">
 <sequence>
 <element name="reviewed" type="CT_Reviewed" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.11.1.16 revisions (Revisions)

This element represents the root node of a list of revisions made in this shared workbook. This root node shows up at the beginning of every log file that contains specific revisions made to the workbook.

When multiple users are sharing, and editing, a workbook at the same time, there may be conflicting changes.

The spreadsheet application should have logic to resolve such conflicts, and the file format should only contain enough information so that the spreadsheet application can restore the workbook to the correct state after conflict resolution. Revisions can also be tracked by the spreadsheet application for review by the user at a later time (as opposed to only dealing with conflicts on a save event.) Some edits to workbooks will be made as a result of this conflict resolution. So, there will be cases where a revision is effectively undone by another user, and as a result that undoing is itself a revision that adds or changes data in the file. These types of operations are tracked by the ua and ra attributes of many different elements.

[Example:

Step 1:

User 1 inserts Column A. So the XML in the revision log would look like this:

```

1 <revisions xmlns="..." xmlns:r="...">
2 <rrc rId="1" sId="1" ref="A1:A1048576" action="insertCol"/>
3 </revisions>

```

Step 2:

User 2 synchronizes the file to pick up that change, but then activates the Track Changes feature, and rejects that change. This effectively performs an undo on User 1's insertion. This is denoted in the file with the ua attribute meaning that this change happened as the result of an undo. The XML for the revision log would look like this:

```

9 <revisions xmlns="..." xmlns:r="...">
10 <rrc rId="2" ua="1" sId="1" ref="A1:A1048576" action="deleteCol"/>
11 <rcft rId="1" ua="1" sheetId="1"/>
12 </revisions>

```

Step 3:

User 1 types "foo" in A1, and saves the file. A conflict resolution dialog is shown since User 2's version of the file removed the inserted Column A. User 1 chooses to accept their own changes. This undoes the change that User 2 made. So, in effect, it performed an undo on a previous undo operation. This is denoted in the file format by the ra attribute meaning that a the change occurred because a previous undo was undone. So the resulting XML for the newest log file looks like this:

```

19 <revisions xmlns="..." xmlns:r="...">
20 <rrc rId="3" ua="1" ra="1" sId="1" ref="A1:A1048576" action="insertCol"/>
21 <rcft rId="2" ua="1" sheetId="1"/>
22 <rcc rId="4" sId="1">
23 <nc r="A1" t="inlineStr">
24 <is>
25 <t>foo</t>
26 </is>
27 </nc>
28 </rcc>
29 <rcft rId="2" sheetId="1"/>
30 </revisions>

```

*end example]*

#### Parent Elements

Root element of SpreadsheetML Shared Workbook Revision Log part

#### Child Elements

#### Subclause

raf (Revision AutoFormat)

§3.11.1.8

Child Elements	Subclause
rcc (Revision Cell Change)	§3.11.1.9
rcft (Revision Merge Conflict)	§3.11.1.10

 </choice>
</complexType>

```

### 3.11.1.17 rfmt (Revision Format)

This element represents a revision record of information about a formatting change.

Parent Elements
revisions (§3.11.1.16); rm (§3.11.1.19); rrc (§3.11.1.21)

Child Elements	Subclause
dxflst (Formatting)	§3.8.14
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
length (Length)	<p>The number of characters that were affected by a string change, counting from start.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
s (Style)	<p>Flag indicating that this formatting change affected a cell's style. (Only applicable for Undo operations).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sheetId (Sheet Id)	<p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
sqref (Sequence Of References)	<p>A worksheet range to which this formatting was applied. [Note: For applications supporting the default grid size (see §3.17.5), full column and row references shall explicitly state the row and column components, e.g., "A1:A1048576" For column "A", and A1:XFD1 for row "1". Applications with larger grid sizes shall interpret these to mean "column A" and "row 1" respectively, for their larger grid size. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).</p>
start (Start index)	<p>An integer representing an index showing which character a string change starts at within the string in the cell.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
xfDxf (Row or Column Formatting Change)	<p>A Boolean flag indicating that this formatting change had an affect on the formatting of an entire row or column that an affected cell(s) belongs to. (Only applicable for Undo operations)</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_RevisionFormatting">
3 <sequence>
4 <element name="dxf" type="CT_Dxf" minOccurs="0" maxOccurs="1"/>
5 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
6 </sequence>
7 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
8 <attribute name="xfDxf" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="s" type="xsd:boolean" use="optional" default="false"/>
10 <attribute name="sqref" type="ST_Sqref" use="required"/>
11 <attribute name="start" type="xsd:unsignedInt" use="optional"/>
12 <attribute name="length" type="xsd:unsignedInt" use="optional"/>
13 </complexType>

```

### 3.11.1.18 ris (Revision Insert Sheet)

This element represents a revision record of a sheet that was inserted.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
name (Sheet Name)	The name of the new sheet.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetPosition (Sheet Position)	An integer representing the zero based position of the new sheet in the sheet tab bar.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionInsertSheet">
 <attributeGroup ref="AG_RevData"/>
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="sheetPosition" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.11.1.19 rm (Revision Cell Move)

This element represents a revision record on a cell(s) that moved.

1

Parent Elements
revisions (§3.11.1.16)

2

Child Elements	Subclause
rcc (Revision Cell Change)	§3.11.1.9
rfmt (Revision Format)	§3.11.1.17
undo (Undo)	§3.11.1.25

Attributes	Description
destination (Destination)	New A1 style location of the cell(s) that were moved  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
source (Source)	The original A1 style location of the cell(s) that were moved  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sourceSheetId (Source Sheet Id)	An integer representing the internal id of the sheet where the cell(s) originally resided.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionMove">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="undo" type="CT_UndoInfo" minOccurs="0" maxOccurs="unbounded"/>
 <element name="rcc" type="CT_RevisionCellChange" minOccurs="0" maxOccurs="unbounded"/>
 <element name="rfmt" type="CT_RevisionFormatting" minOccurs="0" maxOccurs="unbounded"/>
 </choice>
 <attributeGroup ref="AG_RevData"/>
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="source" type="ST_Ref" use="required"/>
 <attribute name="destination" type="ST_Ref" use="required"/>
 <attribute name="sourceSheetId" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

#### 3.11.1.20 [rqt \(Revision Query Table\)](#)

This element represents a revision record of a query table field change.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
fieldId (Field Id)	ID of the specific query table field that was removed.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ref (QueryTable Reference)	Location of the affected query table.  The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionQueryTableField">
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="ref" type="ST_Ref" use="required"/>
 <attribute name="fieldId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

#### 3.11.1.21 [rrc \(Revision Row Column Insert Delete\)](#)

This element represents a revision record of a row/column insert/delete action.

Parent Elements
revisions (§3.11.1.16)

1

Child Elements	Subclause
rcc (Revision Cell Change)	§3.11.1.9
rfmt (Revision Format)	§3.11.1.17
undo (Undo)	§3.11.1.25

2

Attributes	Description
action (User Action)	<p>Indicates what type of action the user just performed on the row or column.</p> <p>The possible values for this attribute are defined by the ST_rwColActionType simple type (§3.18.68).</p>
edge (Edge Deleted)	<p>A Boolean flag indicating that a row or column is being deleted at the edge of a sorted range (only applicable to a Delete Row/Column revision types).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
eol (End Of List)	<p>A Boolean flag indicating that a row or a column is being inserted at the end of a list of data.</p> <p>Note: List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ra (Revision Undo Rejected)	<p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
ref (Reference)	<p>A reference to the location of the rows/columns that were inserted or deleted.</p> <p>[Note: A reference to a whole column or row shall include both the column and row components. For example, column A is referenced by "A1:A1048576", and row 1 is referenced by "A1:XFD1". However, because this attribute value is occurring in the context of an entire row or column insert, the column component of a row reference can be ignored, and the row component of a column reference can be ignored. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).</p>
rId (Revision Id)	<p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_RevisionRowColumn">
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="undo" type="CT_UndoInfo" minOccurs="0" maxOccurs="unbounded"/>
 <element name="rcc" type="CT_RevisionCellChange" minOccurs="0" maxOccurs="unbounded"/>
 <element name="rfmt" type="CT_RevisionFormatting" minOccurs="0" maxOccurs="unbounded"/>
 </choice>
 <attributeGroup ref="AG_RevData"/>
 <attribute name="sId" type="xsd:unsignedInt" use="required"/>
 <attribute name="eol" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="ref" type="ST_Ref" use="required"/>
 <attribute name="action" type="ST_rwColActionType" use="required"/>
 <attribute name="edge" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

#### 3.11.1.22 rsnm (Revision Sheet Name)

This element represents a revision record tracking the renaming a sheet.

Parent Elements
revisions (§3.11.1.16)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
newName (New Sheet Name)	A string representing the new sheet name  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldName (Old Sheet Name)	A string representing the old sheet name

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.  The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_RevisionSheetRename">
 <sequence>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attributeGroup ref="AG_RevData"/>
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="oldName" type="ST_Xstring" use="required"/>
 <attribute name="newName" type="ST_Xstring" use="required"/>
</complexType>

```

### 3.11.1.23 sheetId (Sheet Id)

This element represents a sheet that revision may take place on. Each sheet in the workbook should be represented by one of these elements, and each sheet has an id associated with it. Sheet ids are used to refer to sheets internally by the spreadsheet application.

Parent Elements
sheetIdMap (§3.11.1.24)

Attributes	Description
val (Sheet Id)	An integer serving as a number by which to reference the sheet internally.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetId">
 <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

#### 3.11.1.24 sheetIdMap (Sheet Id Map)

This element represents a list of sheets and corresponding ids that are used for tracking revision records.

Parent Elements
header (§3.11.1.1)

Child Elements	Subclause
sheetId (Sheet Id)	§3.11.1.23

Attributes	Description
count (Sheet Count)	Number of sheets.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetIdMap">
 <sequence>
 <element name="sheetId" type="CT_SheetId" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

#### 3.11.1.25 undo (Undo)

This element represents undo information for row/column deletion when there are functions in the spreadsheet that reference the deleted rows/columns. This element is not applicable for insert revisions.

Parent Elements
rm (§3.11.1.19); rrc (§3.11.1.21)

Attributes	Description
------------	-------------

Attributes	Description
array (Array Entered)	<p>Flag indicating that the affected formula was array-entered.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
cs (Cross Sheet Move)	<p>A Boolean flag indicating this was a cross-sheet move. True if it was a cross sheet move, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dn (Defined Name)	<p>Identifies the named range that referenced the deleted cell range. Mutually exclusive with the cell reference attribute.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
dr (Range)	<p>The range which was deleted that is referenced by the affected formula.</p> <p>The possible values for this attribute are defined by the ST_RefA simple type (§3.18.65).</p>
exp (Expression)	<p>Identifies the type of the expression that should be adjusted in the corresponding formula.</p> <p>The possible values for this attribute are defined by the ST_FormulaExpression simple type (§3.18.37).</p>
index (Index)	<p>Index of the expression within the corresponding formula that was affected by this change.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
nf (Defined Name Formula)	<p>A Boolean flag indicating that the corresponding formula is part of a defined name. True if this formula is part of a defined name, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
r (Cell Reference)	<p>Location of the cell whose formula referenced the deleted cell range. Mutually exclusive with the defined name attribute</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
ref3D (Reference 3D)	<p>A Boolean flag indicating that the expression contained the sheet name in addition to the cell reference. True if it contained the sheet name, false otherwise.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sId (Sheet Id)	<p>Internal Id of the worksheet that contained the formula that referenced the deleted cell range. Mutually exclusive with the defined name attribute.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

Attributes	Description
v (Value Needed)	A Boolean flag indicating the formula needs the actual value of the cell(s) it's referencing. True if the formula requires the value of the cell it references, false otherwise.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UndoInfo">
 <attribute name="index" type="xsd:unsignedInt" use="required"/>
 <attribute name="exp" type="ST_FormulaExpression" use="required"/>
 <attribute name="ref3D" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="array" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="v" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="nf" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="cs" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="dr" type="ST_RefA" use="required"/>
 <attribute name="dn" type="ST_Xstring" use="optional"/>
 <attribute name="r" type="ST_CellRef" use="optional"/>
 <attribute name="sId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.11.2 Shared Workbook User Data

This subclause specifies information about the users of a shared workbook.

#### 3.11.2.1 userInfo (User Information)

This element represents a user, and it stores information about a specific user as it relates to revisions.

Parent Elements
users (§3.11.2.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
dateTime (Date Time)	Date and time when this user opened the shared workbook.  The possible values for this attribute are defined by the XML Schema dateTime datatype.
guid (User Revisions GUID)	A globally unique identifier identifying the last set of revisions that this user is synchronized to.  This attribute can be used by the spreadsheet application to ensure that revisions this user depends on aren't deleted.

Attributes	Description
	The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
id (User Id)	An integer representing an internal user id for this user.  Note: this number is allowed to be negative.  The possible values for this attribute are defined by the XML Schema int datatype.
name (User Name)	Display name for this user  [Note: User name strings should not be longer than 54 characters. <i>end note</i> ]  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SharedUser">
 <sequence>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="guid" type="ST_Guid" use="required"/>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="id" type="xsd:int" use="required"/>
 <attribute name="dateTime" type="xsd:dateTime" use="required"/>
</complexType>

```

### 3.11.2.2 users (User List)

This element represents a list of users who currently have this shared workbook open. This list does not include any users who have the workbook open in Read-Only mode.

Parent Elements
Root element of SpreadsheetML Shared Workbook User Data part

Child Elements	Subclause
userInfo (User Information)	§3.11.2.1

Attributes	Description
count (Active User Count)	Number of users who currently have this shared workbook open.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Users">
 <sequence>
 <element name="userInfo" minOccurs="0" maxOccurs="256" type="CT_SharedUser"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.12 QueryTable Data

Query tables are 2 dimensional tables of data bound to an external query of some kind. A query table could for example show specific data from a text file, from a web query, or from a database query.

*[Example:*

Data connectivity can use a number of different technologies. The following spreadsheetML fragment is one an example of a query table connected to a database:

```
<queryTable xmlns="..." name="Northwind Orders" rowNumbers="1"
 growShrinkType="overwriteClear" connectionId="1" autoFormatId="16"
 applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
 applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="0">
 <queryTableRefresh nextId="15">
 <queryTableFields count="12">
 <queryTableField id="1" name="OrderID" tableColumnId="1"/>
 <queryTableField id="2" name="CustomerID" tableColumnId="2"/>
 <queryTableField id="3" name="EmployeeID" tableColumnId="3"/>
 <queryTableField id="4" name="OrderDate" tableColumnId="4"/>
 <queryTableField id="5" name="RequiredDate" tableColumnId="5"/>
 <queryTableField id="6" name="ShippedDate" tableColumnId="6"/>
 <queryTableField id="7" name="ShipName" tableColumnId="7"/>
 <queryTableField id="8" name="ShipAddress" tableColumnId="8"/>
 <queryTableField id="9" name="ShipCity" tableColumnId="9"/>
 <queryTableField id="10" name="ShipRegion" tableColumnId="10"/>
 <queryTableField id="11" name="ShipPostalCode" tableColumnId="11"/>
 <queryTableField id="12" name="ShipCountry" tableColumnId="12"/>
 </queryTableFields>
 </queryTableRefresh>
</queryTable>
```

*end example]*

And here's an example of the spreadsheetML fragment defining a query table connected to a text import:

*[Example:*

```
<queryTable xmlns="..." name="data in text" connectionId="1" autoFormatId="16"
 applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="1"
 applyPatternFormats="1" applyAlignmentFormats="0"
 applyWidthHeightFormats="0"/>
```

*end example]*

Elsewhere in the spreadsheetML file, a connection element is defined with the name "Northwind Orders" that describes how to connect to the appropriate database to refresh data for the query table.

### 3.12.1 deletedField (Deleted Field)

This element specifies a field that has been deleted from the query table.

*[Example:*

```
<queryTableDeletedFields count="2">
 <deletedField name="ShipVia"/>
 <deletedField name="Freight"/>
</queryTableDeletedFields>
```

*end example]*

Parent Elements
queryTableDeletedFields (§3.12.3)

Attributes	Description
name (Deleted Fields Name)	Specifies the name of the deleted field.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DeletedField">
 <attribute name="name" type="ST_Xstring" use="required"/>
</complexType>
```

### 3.12.2 queryTable (Query Table)

This element specifies all the relevant properties for a query table, one query table element is stored for each query table object in the spreadsheetML document.

Parent Elements
Root element of SpreadsheetML Query Table part

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
queryTableRefresh (QueryTable Refresh Information)	§3.12.6

1

Attributes	Description																												
adjustColumnWidth (Adjust Column Width On Refresh)	<p>Specifies whether to automatically adjust column widths on refresh to fit the data retrieved. true if column widths should be adjusted.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																												
applyAlignmentFormats (Apply Alignment Formats)	<p>If true apply legacy table autoformat alignment properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																												
applyBorderFormats (Apply Border Formats)	<p>If true apply legacy table autoformat border properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																												
applyFontFormats (Apply Font Formats)	<p>If true apply legacy table autoformat font properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																												
applyNumberFormats (Apply Number Formats)	<p>If true apply legacy table autoformat number format properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																												
applyPatternFormats (Apply Pattern Formats)	<p>If true apply legacy table autoformat pattern properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																												
applyWidthHeightFormats (Apply Width / Height Formats)	<p>If true apply legacy table autoformat width/height properties.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The possible values for this attribute are defined by the XML Schema unsignedInt																														

Attributes	Description
	datatype.
backgroundRefresh (Background Refresh)	<p>Specifies whether or not the query table shall try to refresh data in the background.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
connectionId (Connection Id)	<p>Specifies the ID number of the external data connection to use to refresh data in the query table.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
disableEdit (Disable Edit)	<p>Specifies whether the connection element used with this query table shall be editable. If true, then the connection is not editable.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
disableRefresh (Disable Refresh)	<p>Specifies whether the query table shall be refreshable. If true, then the query table is not refreshable.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fillFormulas (Fill Adjacent Formulas)	<p>Specifies whether or not formulas in columns adjacent to the query table should be filled down whenever the query table is refreshed. This is helpful since the number of rows returned by a query table refresh operation can vary.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
firstBackgroundRefresh (First Background Refresh)	<p>Specifies whether or not data has ever been refreshed for this query table. If the very first background data refresh had not completed at the time the file was saved, this attribute will be set to true.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
growShrinkType (Grow Shrink Type)	<p>Specifies the type of behavior expected for dealing with a variable number of rows of data in the query table between refresh operations.</p> <p>The meaning of the possible values of this attribute {insertClear, insertDelete, overwriteClear} are explained in detail in the definition of the simple type.</p> <p>The possible values for this attribute are defined by the ST_GrowShrinkType simple type (§3.18.40).</p>
headers (First Row Column Titles)	<p>Specifies whether or not the query table has first row with column titles.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
intermediate (Intermediate)	<p>Specifies whether this query table is in an intermediate state, having been defined but not fully formed and populated with data.</p> <p>In this state, fields and ranges of the query table may be unknown.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
name (QueryTable Name)	<p>Specifies the name of the query table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
preserveFormatting (Preserve Formatting On Refresh)	<p>Specifies whether the application should try to preserve formatting in the query table and copy this formatting to any new rows of data.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
refreshOnLoad (Refresh On Load)	<p>Specifies whether the query table shall refresh its data automatically when the spreadsheetML document is loaded or opened.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
removeDataOnSave (Remove Data On Save)	<p>Specifies whether the query table shall remove all data from the worksheet before the spreadsheetML document is saved.</p> <p>Note: this is very helpful for situations where people who have different permissions to view data want to share the same spreadsheetML document. All data from the last user will be removed, and new users re-query the external data sources with their own credentials.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rowNumbers (Row Numbers)	<p>Specifies whether the query table shall include a first column of row numbers.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTable">
 <sequence>
 <element name="queryTableRefresh" type="CT_QueryTableRefresh" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="headers" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="rowNumbers" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="disableRefresh" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="backgroundRefresh" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="firstBackgroundRefresh" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="refreshOnLoad" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="growShrinkType" type="ST_GrowShrinkType" use="optional" default="insertDelete"/>
 <attribute name="fillFormulas" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="removeDataOnSave" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="disableEdit" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="preserveFormatting" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="adjustColumnWidth" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="intermediate" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="connectionId" type="xsd:unsignedInt" use="required"/>
 <attributeGroup ref="AG_AutoFormat"/>
</complexType>
```

3.12.3 queryTableDeletedFields (Deleted Fields)

This element is the collection for deletedField (§3.12.1) elements, each of which represents a column or field that has been deleted from the query table.

[Example:

```
<queryTableDeletedFields count="2">
 <deletedField name="ShipVia"/>
 <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

Parent Elements
queryTableRefresh (§3.12.6)

Child Elements	Subclause
deletedField (Deleted Field)	§3.12.1

Attributes	Description
count (Deleted	Specifies how many deleted fields there are.

Attributes	Description
Fields Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTableDeletedFields">
 <sequence>
 <element name="deletedField" type="CT_DeletedField" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.12.4 queryTableField (QueryTable Field)

This element holds the properties related to a specific field or column in a query table.

Parent Elements
queryTableFields (§3.12.5)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
clipped (Clipped Column)	<p>Specifies whether this field/column is currently clipped and thus not visible in the worksheet.</p> <p>Note: this state might occur for example when a query table is defined near the edge of a worksheet or other object in the spreadsheet that can't be overwritten with external data. In this case some of the fields are displayed, but not all of them.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dataBound (Data Bound Column)	<p>Specifies whether this column is a user-defined column or comes from the external data query. User defined columns shall be preserved during data refresh operations. User-defined columns are only supported on query tables that are attached to table objects.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
fillFormulas (Fill This Formula On Refresh)	<p>Specifies whether the formula in this field/column should be filled down on data refresh.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
id (Field Id)	Specifies the unique identifier of the query table field.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Name)	Specifies the unique name of the query table field.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
rowNumbers (Row Numbers)	true if this column contains the row numbers for the records returned.  The possible values for this attribute are defined by the XML Schema boolean datatype.
tableColumnId (Table Column Id)	Specifies the unique identifier for the table column if the query table is attached to a table object rather than just a range in the sheet.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_QueryTableField">
 <sequence minOccurs="0">
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="name" type="ST_Xstring" use="optional"/>
 <attribute name="dataBound" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="rowNumbers" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="fillFormulas" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="clipped" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="tableColumnId" type="xsd:unsignedInt" default="0"/>
</complexType>

```

### 3.12.5 queryTableFields (Query table fields)

This element is the collection for queryTableField elements.

Parent Elements
queryTableRefresh (§3.12.6)

Child Elements	Subclause
queryTableField (QueryTable Field)	§3.12.4

Attributes	Description
count (Column Count)	Specifies the number of columns there are in this query table. Includes both query-defined and user-defined columns, but not deleted columns.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTableFields">
 <sequence>
 <element name="queryTableField" type="CT_QueryTableField" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
 <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

### 3.12.6 queryTableRefresh (QueryTable Refresh Information)

This element contains information related to refreshing the query table.

Parent Elements
queryTable (§3.12.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
queryTableDeletedFields (Deleted Fields)	§3.12.3
queryTableFields (Query table fields)	§3.12.5
sortState (Sort State)	§3.3.1.89

Attributes	Description
fieldIdWrapped (Next Field Id Wrapped)	Whether or not the idFieldNext value wrapped around.  The possible values for this attribute are defined by the XML Schema boolean datatype.
headersInLastRefresh (Headers In Last Refresh)	Whether or not the Query Table had titles last refresh.  The possible values for this attribute are defined by the XML Schema boolean datatype.
minimumVersion (Minimum Refresh Version)	For backward compatibility with legacy versions of spreadsheet applications, this attribute specifies the minimum version of the application that is expected to correctly refresh the data in the query table without any problems.  Note: if this attribute is specified, an earlier version of a spreadsheet application should alert the user to the potential incompatibilities when a refresh is attempted.  The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

Attributes	Description
nextId (Next field id)	Specifies the next unique queryTableField (§3.12.4) id number available for assignment.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
preserveSortFilterLayout (Preserve Sort & Filter Layout)	Specifies whether sorting, autofilter, layout, and table block formatting should be preserved for this query table across data refresh operations.  Note: if this attribute is set to false, the query table might be more or less recreated from scratch when data is refreshed. In this case, all user deleted or rearranged columns, user inserted columns that aren't bound to external data, and table column formatting are discarded.  The possible values for this attribute are defined by the XML Schema boolean datatype.
unboundColumnsLeft (Columns Left)	Specifies the number of extra columns included at the left end of the field array that aren't bound to external data.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
unboundColumnsRight (Columns Right)	Specifies the number of extra columns included at the right end of the Table that aren't bound to external data.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_QueryTableRefresh">
 <sequence>
 <element name="queryTableFields" type="CT_QueryTableFields" minOccurs="1" maxOccurs="1"/>
 <element name="queryTableDeletedFields" type="CT_QueryTableDeletedFields" minOccurs="0"
 maxOccurs="1"/>
 <element name="sortState" minOccurs="0" maxOccurs="1" type="CT_SortState"/>
 <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
 </sequence>
 <attribute name="preserveSortFilterLayout" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="fieldIdWrapped" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="headersInLastRefresh" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="minimumVersion" type="xsd:unsignedByte" use="optional" default="0"/>
 <attribute name="nextId" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="unboundColumnsLeft" type="xsd:unsignedInt" use="optional" default="0"/>
 <attribute name="unboundColumnsRight" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>

```

## 3.13 External Data Connections

SpreadsheetML allows for the definition of top level data connection objects that describe how to retrieve data from external sources. These connection objects are independent of the constructs in the spreadsheet application that display data such as tables, PivotTables, etc.

Some information about a connection is considered part of the connection's definition. Other information is not inherently part of the connection, but it describes the way the connection is to be used by the containing workbook. Note that in many cases, the spreadsheet application does not need knowledge of the command syntax for the external data source (e.g., database query language), and simply stores a command string that was created by a data provider API (e.g., an ODBC driver).

A connection's definition can be established in a standalone connection file for easier sharing and reuse, but this reference documentation deals with the XML representation for external data connections that is directly embedded within a SpreadsheetML document. This embedded representation is expected whenever external data is used, and ensures portability of the document and continued operation of the external query in the most cases.

### 3.13.1 connection (Connection)

This element contains both the definition of how to get at an external data source as well as information describing how the connection is used within the workbook. Specific constructs in a worksheet, such as OLAP formulas, QueryTables, or PivotTables make use of information in the connection to retrieve or refresh data based on default events or the user's explicit request.

Parent Elements
connections (§3.13.2)

Child Elements	Subclause
dbPr (Database Properties)	§3.13.3
extLst (Future Feature Data Storage Area)	§3.2.10
olapPr (OLAP Properties)	§3.13.5
parameters (Query Parameters)	§3.13.7
textPr (Text Import Settings)	§3.13.12
webPr (Web Query Properties)	§3.13.13

Attributes	Description
background (Background Refresh)	Indicates whether the connection can be refreshed in the background (asynchronously). true if preferred usage of the connection is to refresh asynchronously in the background; false if preferred usage of the connection is to refresh synchronously in the foreground.

Attributes	Description
	<p>This flag should be intentionally ignored in specific cases.</p> <p>[<i>Example</i>: An example of when the flag would be ignored is in the case of a connection to OLAP data on Microsoft SQL Server Analysis Services, where the connection is used by both a PivotTable and also by CUBE functions within the workbook. That connection will always be refreshed synchronously by the PivotTable and will always be refreshed asynchronously by the CUBE functions. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
credentials (Reconnection Method)	<p>Specifies the authentication method to be used when establishing (or re-establishing) the connection.</p> <p>The possible values for this attribute are defined by the ST_CredMethod simple type (§3.18.17).</p>
deleted (Deleted Connection)	<p>Indicates whether the associated workbook connection has been deleted. <code>true</code> if the connection has been deleted; otherwise, <code>false</code>.</p> <p>Deleted connections contain only the attributes <code>name</code> and <code>deleted=true</code>, all other information is removed from the SpreadsheetML file.</p> <p>If a new connection is created with the same name as a deleted connection, then the deleted connection is overwritten by the new connection.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
description (Connection Description)	<p>Specifies the user description for this connection.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
id (Connection Id)	<p>Specifies The unique identifier of this connection.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
interval (Automatic Refresh Interval)	<p>Specifies the number of minutes between automatic refreshes of the connection. When this attribute is not present, the connection is not automatically refreshed.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
keepAlive (Keep Connection Open)	<p><code>true</code> when the spreadsheet application should make efforts to keep the connection open. When <code>false</code>, the application should close the connection after retrieving the information. This corresponds to the <code>MaintainConnection</code> property of a <code>PivotCache</code> object.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
minRefreshableVersion (Minimum Version Required for Refresh)	<p>For compatibility with legacy spreadsheet applications. This represents the minimum version # that is required to be able to correctly refresh the data connection. This attribute applies to connections that are used by a QueryTable.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
name (Connection Name)	<p>Specifies the name of the connection. Each connection must have a unique name.</p> <p>When a connection has been marked as deleted and then a new connection is added with the same name, the deleted connection is replaced with the new connection.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
new (New Connection)	<p>true if the connection has not been refreshed for the first time; otherwise, false. This state can happen when the user saves the file before a query has finished returning.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
odcFile (Connection File)	<p>Specifies the full path to external connection file from which this connection was created. If a connection fails during an attempt to refresh data, and reconnectionMethod=1, then the spreadsheet application will try again using information from the external connection file instead of the connection object embedded within the workbook.</p> <p>This is a benefit for data source and spreadsheetML document manageability. If the definition in the external connection file is changed (e.g., because of a database server name change), then the workbooks that made use of that connection will fail to connect with their internal connection information, and reload the new connection information from this file.</p> <p>This attribute is cleared by the spreadsheet application when the user manually edits the connection definition within the workbook. May be expressed in URI or system-specific file path notation.</p> <p>[Note: Applications can decide what forms of URI they support, and whether system-specific file path notations will be supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
onlyUseConnectionFile (Only Use Connection File)	<p>Indicates whether the spreadsheet application should always and only use the connection information in the external connection file indicated by the odcFile attribute when the connection is refreshed.</p> <p>If false, then the spreadsheet application should follow the procedure indicated by the reconnectionMethod attribute described below.</p>

Attributes	Description
	<p>Applies only to OLE DB and ODBC connections, this attribute is ignored for other types of connections.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
reconnectionMethod (Reconnection Method)	<p>Specifies what the spreadsheet application should do when a connection fails.</p> <p>The values are as follows:</p> <p>1 = As required: On refresh use the existing connection information and if it ends up being invalid then get updated connection information, if available from the external connection file.</p> <p>2 = Always: On every refresh get updated connection information from the external connection file, if available, and use that instead of the existing connection information. In this case the data refresh will fail if the external connection file is unavailable.</p> <p>3 = Never: Never get updated connection information from the external connection file even if it is available and even if the existing connection information is invalid.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
refreshedVersion (Last Refresh Version)	<p>For backward compatibility purposes, this attribute indicates the version of the spreadsheet application that last refreshed the connection.</p> <p>This attribute applies to connections that are used by a query table.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedByte datatype.</p>
refreshOnLoad (Refresh on Open)	<p>true if this connection should be refreshed when opening the file; otherwise, false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
saveData (Save Data)	<p>true if the external data fetched over the connection to populate a table is to be saved with the workbook; otherwise, false.</p> <p>This exists for data security purposes - if no external data is saved in (or "cached") in the workbook, then current user credentials can be required every time to retrieve the relevant data, and people won't see the data the workbook author had last been using before saving the file.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
savePassword (Save Password)	<p>true if the password is to be saved as part of the connection string; otherwise, False.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

Attributes	Description
singleSignOnId (SSO Id)	<p>Identifier for Single Sign On (SSO) used for authentication between an intermediate spreadsheetML server and the external data source.</p> <p>[<i>Note</i>: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at:  <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/spptsdk/html/cSSOReturnCodes_SV01001109.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/spptsdk/html/cSSOReturnCodes_SV01001109.asp</a> <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
sourceFile (Source Database File)	<p>Used when the external data source is file-based. When a connection to such a data source fails, the spreadsheet application attempts to connect directly to this file. May be expressed in URI or system-specific file path notation.</p> <p>[<i>Note</i>: Applications can decide what forms of URI they support, and whether system-specific file path notations will be supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
type (Database Source Type)	<p>Specifies the data source type.</p> <p>Values are as follows:</p> <ol style="list-style-type: none"> <li>1. ODBC-based source</li> <li>2. DAO-based source</li> <li>3. File based database source</li> <li>4. Web query</li> <li>5. OLE DB-based source</li> <li>6. Text-based source</li> <li>7. ADO record set</li> <li>8. DSP</li> </ol> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connection">
 <sequence>
 <element name="dbPr" minOccurs="0" maxOccurs="1" type="CT_DbPr"/>
 <element name="olapPr" minOccurs="0" maxOccurs="1" type="CT_OlapPr"/>

 <attribute name="singleSignOnId" use="optional" type="ST_Xstring"/>
</complexType>
```

### 3.13.2 connections (Connections)

This element exists when there are one or more connections in the workbook. It is a container for the individual connection objects.

Parent Elements
Root element of SpreadsheetML Connections part

Child Elements	Subclause
connection (Connection)	§3.13.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connections">
 <sequence>
 <element name="connection" minOccurs="1" maxOccurs="unbounded" type="CT_Connection"/>
 </sequence>
</complexType>
```

### 3.13.3 dbPr (Database Properties)

This element stores all properties associated with an ODBC or OLE DB external data connection.

[Example:

Data connectivity can use a number of different technologies. The following is one example XML fragment defining an OLE DB connection and the associated dbPr element:

```
<connection id="2"
 odcFile="C:\My Documents\My Data Sources\Northwind Orders.odc" keepAlive="1"
 name="Northwind Orders" description="northwind" type="5" refreshedVersion="3">
 <dbPr connection="Provider=SQLOLEDB.1;Integrated Security=SSPI;Persist
 Security Info=True;Initial Catalog=Northwind;Data Source=dataserver1;Use
 Procedure for Prepare=1;Auto Translate=True;Packet Size=4096;Workstation
 ID=LOCAL_MACHINE_NAME;Use Encryption for Data=False;Tag with column
 collation when possible=False"
 command=""Northwind"."dbo"."Orders""
 commandType="3"/>
</connection>
```

end example]

Parent Elements
connection (§3.13.1)

Attributes	Description
command (Command Text)	The string containing the database command to pass to the data provider API that will interact with the external source in order to retrieve data. These strings can be constructed in a variety of ways (from simple UIs built into the spreadsheet application for browsing and choosing tables and fields, to external applications providing user interface to build up complex queries, to advanced users editing text queries). The spreadsheetML application need not understand the command syntax; it can simply pass the command string to the data provider API in order to retrieve the latest external data.  [Example: Data connectivity can use a number of different technologies. The following is one example of an ODBC command string of commandType=2 (for a Microsoft SQL Server database):  command="SELECT Orders.OrderID, Orders.OrderDate, Orders.ShipName, Orders.ShipAddress, Orders.ShipCity, Orders.ShipRegion, Orders.ShipPostalCode, Orders.ShipCountry_x000d__x000a_FROM Northwind.dbo.Orders Orders_x000d__x000a_WHERE (Orders.ShipCountry=?)"

Attributes	Description
	<p>Some characters in this string have been escaped - for more information on the escaping scheme, please refer to the ST_Xstring type definition. <i>end example</i></p> <p>[Note: the "?" syntax in the string is something that the ODBC data provider is aware of and may replace with a parameter before execution. <i>end note</i>]</p> <p>[Example: Data connectivity can use a number of different technologies. The following is one example of an OLE DB command string of commandType=3 (for an Oracle database):</p> <pre>command="&amp;quot;TESTDB&amp;quot;.&amp;quot;ShippersTable&amp;quot;;"</pre> <p><i>end example</i></p> <p>[Note: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:</p> <ul style="list-style-type: none"> <li>• <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_statements.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_statements.asp</a></li> <li>• <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_minimum_grammar.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_minimum_grammar.asp</a></li> <li>• <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbusing_commands.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbusing_commands.asp</a></li> </ul> <p><i>end note</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
commandType (OLE DB Command Type)	<p>Specifies the OLE DB command type.</p> <p>Supported values are as follows:</p> <ol style="list-style-type: none"> <li>1. Query specifies a cube name</li> <li>2. Query specifies a SQL statement</li> <li>3. Query specifies a table name</li> <li>4. Query specifies that default information has been given, and it is up to the provider how to interpret.</li> <li>5. Query is against a web based List Data Provider.</li> </ol> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
connection (Connection String)	<p>The connection string is used to make contact with an OLE DB or ODBC data source. These can be constructed in a variety of ways (from UI wizards built into the data provider code, to external query applications, to advanced users editing text files). The spreadsheetML application need not understand the connection syntax at all; it can simply pass the command string to the data provider API in order to re-establish a connection with the external data source.</p>

Attributes	Description
	<p>[Example: ODBC connection string to a database:</p> <pre>connection="DRIVER=SQL Server;SERVER=example_server;UID=example_useralias;APP=Microsoft Office 2007;WSID=user_alias;Trusted_Connection=Yes"</pre> <p><i>end example]</i></p> <p>[Example: of an OLE DB connection string to an Oracle database:</p> <pre>connection="Provider=OraOLEDB.Oracle.1;Password=example_password;Persist Security Info=True;User ID=example_useralias;Data Source=example_server;Extended Properties="""</pre> <p><i>end example]</i></p> <p>[Note: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:</p> <ul style="list-style-type: none"> <li>• <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/dasdkodbcoverview.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/dasdkodbcoverview.asp</a></li> <li>• <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbcsql/od_odbc_d_4x4k.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbcsql/od_odbc_d_4x4k.asp</a></li> <li>• <a href="http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdreforacleprovspec.asp">http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdreforacleprovspec.asp</a></li> </ul> <p><i>end note]</i></p> <p>Connection strings syntaxes are specific to individual ODBC or OLE DB data provider drivers.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
serverCommand (Command Text)	<p>Specifies a second command text string that is persisted when PivotTable server-based page fields are in use.</p> <p>For ODBC connections, serverCommand is usually a broader query than command (no WHERE clause is present in the former). Based on these 2 commands, parameter UI can be populated and parameterized queries can be constructed.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DbPr">
 <attribute name="connection" use="required" type="ST_Xstring"/>
 <attribute name="command" use="optional" type="ST_Xstring"/>
 <attribute name="serverCommand" use="optional" type="ST_Xstring"/>
 <attribute name="commandType" use="optional" type="xsd:unsignedInt" default="2"/>
</complexType>
```

### 3.13.4 m (No Value)

This element is present when tables in a web query are missing.

Parent Elements
tables (§3.13.9)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableMissing"/>
```

### 3.13.5 olapPr (OLAP Properties)

This element contains all the properties needed for an OLAP data connection. OLE DB for OLAP is the data provider, and OLAP connections contain both the dbPr and olapPr child elements.

[Example:

Data connectivity can use a number of different technologies. The following is an example of a connection to an SAP BW OLAP data source:

```
<connection id="1" odcFile="C:\My Documents\My Data Sources\${INFOCUBE.odc}"
 keepAlive="1" name="SAP demo cube" description="SAP DemoCube" type="5"
 refreshedVersion="3" background="1">
 <dbPr connection="Provider=MDrmSap.2;Data Source=BI2;User
 ID=TESTUSER;Location=TESTSERVERNAME;Cache Authentication=False;Encrypt
 Password=False;Integrated Security="";Mask Password=False;Persist
 Encrypted=False;Persist Security Info=True;Impersonation
 Level=Anonymous;Mode=Read;Protection Level=None;Extended
 Properties="SFC_CLIENT=800;";Initial Catalog=${INFOCUBE}"
 command="$0D_DECU" commandType="1"/>
 <olapPr sendLocale="1" rowDrillCount="1000" serverFill="0"
 serverNumberFormat="0" serverFont="0" serverFontColor="0"/>
</connection>
```

end example]

[Example:

Data connectivity can use a number of different technologies. The following is an example of a connection to a Microsoft SQL Server Analysis Services OLAP data source:

```
<connection id="1"
 odcFile="C:\My Documents\My Data Sources\Adventure Works DW.odc" keepAlive="1"
 name="Adventure Works DW" type="5" refreshedVersion="3" background="1">
 <dbPr connection="Provider=MSOLAP.3;Cache Authentication=False;Integrated
 Security=SSPI;Persist Security Info=True;Initial Catalog=Adventure Works
 DW;Data Source=DATASERVER1;Impersonation
 Level=Impersonate;Mode=ReadWrite;Protection Level=Pkt Privacy;Auto Synch
 Period=20000;Default Isolation Mode=0;Default MDX Visual Mode=0;MDX
 Compatibility=1;MDX Unique Name Style=0;Non Empty
 Threshold=0;SQLQueryMode=Calculated;Safety Options=2;Secured Cell
 Value=0;SOURCE_DSN_SUFFIX=";SQL Compatibility=0;Compression Level=0;Real Time
 Olap=False;Packet Size=4096" command="Adventure Works" commandType="1"/>
 <olapPr sendLocale="1" rowDrillCount="1000"/>
</connection>
```

*end example]*

[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/dasdkoledboverview.asp> *end note]*

#### Parent Elements

connection (§3.13.1)

#### Attributes

#### Description

local (Local Cube)

Flag indicating whether we should get data from the local cube on refresh versus the original data source. true if a local cube has been created for OLAP data, and it should be used instead of the server.

The possible values for this attribute are defined by the XML Schema boolean datatype.

localConnection  
(Local Cube  
Connection)

Specifies a connection string to use when a local cube is available. This is used when local is set to true.

[Example:

```
<olapPr local="true" localConnection="OLEDB;Provider=MSOLAP;Data
Source=C:\Data\DataCube.cub" >
```

... end example]

Attributes	Description
	<p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
localRefresh (Local Refresh)	<p>Flag indicating whether we should refresh the local cube from the original data source. When <code>true</code>, the original OLAP data source is queried each time the user explicitly refreshes the data in the application, and a new local cube is constructed from this query.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rowDrillCount (Drill Through Count)	<p>Maximum number of drill-through rows to return when the user drills through an aggregate value in a PivotTable.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
sendLocale (Send Locale to OLAP)	<p>When <code>true</code>, the spreadsheetML app should send the user interface locale ID to the OLAP provider to retrieve localized member names and properties, etc. When <code>false</code>, no locale ID is expected.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
serverFill (OLAP Fill Formatting)	<p>When <code>true</code> a PivotTable based on an OLAP source should format the data and aggregate cells in the PivotTable view using the background color from the OLAP source if this information is available. When <code>false</code>, OLAP server background fill colors are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
serverFont (OLAP Server Font)	<p>When <code>true</code>, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font from the OLAP source (e.g., Arial or Tahoma). When <code>false</code>, OLAP server fonts are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
serverFontColor (OLAP Font Formatting)	<p>When <code>true</code> a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font color from the OLAP source. When <code>false</code>, OLAP server font colors are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
serverNumberFormat (OLAP Number Format)	<p>When <code>true</code>, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the number format from the OLAP source. When <code>false</code>, OLAP server number formats are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OlapPr">
 <attribute name="local" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="localConnection" use="optional" type="ST_Xstring"/>
 <attribute name="localRefresh" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="sendLocale" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="rowDrillCount" use="optional" type="xsd:unsignedInt"/>
 <attribute name="serverFill" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="serverNumberFormat" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="serverFont" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="serverFontColor" use="optional" type="xsd:boolean" default="true"/>
</complexType>
```

### 3.13.6 parameter (Parameter Properties)

This element stores properties about any parameters used with external data connections. Parameters are used to change the query executed externally and cause different data to be retrieved into the workbook. The type of parameter used – see ST\_parameterType (§3.18.56) – determines whether the user will be prompted for a value before data is refreshed, or the value will be pulled from a cell in the workbook, or whether the same value should be used until explicitly changed in the data connection. Parameters are valid for ODBC and web queries.

*[Example:*

Data connectivity can use a number of different technologies. The following is an example of XML defining a connection to a Microsoft Access database, with a parameter based on the value in cell C1 on the first sheet.

```
<connection id="1" name="Connection" type="1" refreshedVersion="2"
 background="1" saveData="1">
 <dbPr connection="DSN=MS Access
 Database;DBQ=C:\Desktop\db1.mdb;DefaultDir=C:\Desktop;DriverId=25;FIL=MS
 Access;MaxBufferSize=2048;PageTimeout=5;" command="SELECT Table1.Field1,
 Table1.Field2_x000d__x000a_FROM `C:\Desktop\db1`.Table1
 Table1_x000d__x000a_WHERE (Table1.Field2=?)" />
 <parameters count="1">
 <parameter name="user specified value" sqlType="4" parameterType="cell"
 cell="Sheet1!C1"/>
 </parameters>
</connection>
```

*end example]*

Note that the command string in the dbPr element contains a "?" character. This character serves as a parameter marker.

- 1 [Note: Data connectivity can use a number of different technologies. One example of potential values stored in  
 2 this attribute can be found at: [http://msdn.microsoft.com/library/default.asp?url=/library/en-](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcstatement_parameters.asp)  
 3 [us/odbc/htm/odbcstatement\\_parameters.asp](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcstatement_parameters.asp) *end note*]

parameters (§3.13.7)

4

Attributes	Description
boolean (Boolean)	Boolean value to use as the query parameter. Used only when parameterType = value.  The possible values for this attribute are defined by the XML Schema boolean datatype.
cell (Cell Reference)	Cell reference indicating which cell's value to use for the query parameter. Used only when parameterType = cell.  [Example:  <Parameter parameterType="cell" cell="Sheet1!\$C\$1">  end example]  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
double (Double)	Non-integer numeric value to use as the query parameter. Used only when parameterType = value.  The possible values for this attribute are defined by the XML Schema double datatype.
integer (Integer)	Integer value to use as the query parameter. Used when parameterType = value.  The possible values for this attribute are defined by the XML Schema int datatype.
name (Parameter Name)	The name of the parameter.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
parameterType (Parameter Type)	Type of parameter used. If the parameterType=value, then the value from boolean, double, integer, or string will be used. In this case, it is expected that only one of {boolean, double, integer, or string} will be specified.  The possible values for this attribute are defined by the ST_ParameterType simple type (§3.18.56).
prompt (Parameter Prompt String)	Prompt string for the parameter. Presented to the spreadsheet user along with input UI to collect the parameter value before refreshing the external data. Used only when parameterType = prompt.

Attributes	Description																																												
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).																																												
refreshOnChange (Refresh on Change)	<p>Flag indicating whether the query should automatically refresh when the contents of a cell that provides the parameter value changes. If true, then external data is refreshed using the new parameter value every time there's a change. If false, then external data is only refreshed when requested by the user, or some other event triggers refresh (e.g., workbook opened).</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>																																												
sqlType (SQL Data Type)	<p>SQL data type of the parameter. Only valid for ODBC sources.</p> <p>Supported values include:</p> <table data-bbox="415 699 1195 1850"> <tr> <th data-bbox="415 699 545 751">-22</th><th data-bbox="545 699 1195 751">SQL_UNSIGNED_OFFSET</th></tr> <tr><td data-bbox="415 751 545 804">-20</td><td data-bbox="545 751 1195 804">SQL_SIGNED_OFFSET</td></tr> <tr><td data-bbox="415 804 545 856">-11</td><td data-bbox="545 804 1195 856">SQL_GUID</td></tr> <tr><td data-bbox="415 856 545 909">-10</td><td data-bbox="545 856 1195 909">SQL_WLONGVARCHAR</td></tr> <tr><td data-bbox="415 909 545 961">-9</td><td data-bbox="545 909 1195 961">SQL_WVARCHAR</td></tr> <tr><td data-bbox="415 961 545 1014">-8</td><td data-bbox="545 961 1195 1014">SQL_WCHAR</td></tr> <tr><td data-bbox="415 1014 545 1066">-7</td><td data-bbox="545 1014 1195 1066">SQL_BIT</td></tr> <tr><td data-bbox="415 1066 545 1119">-6</td><td data-bbox="545 1066 1195 1119">SQL_TINYINT</td></tr> <tr><td data-bbox="415 1119 545 1171">-5</td><td data-bbox="545 1119 1195 1171">SQL_BIGINT</td></tr> <tr><td data-bbox="415 1171 545 1224">-4</td><td data-bbox="545 1171 1195 1224">SQL_LONGVARBINARY</td></tr> <tr><td data-bbox="415 1224 545 1276">-3</td><td data-bbox="545 1224 1195 1276">SQL_VARBINARY</td></tr> <tr><td data-bbox="415 1276 545 1329">-2</td><td data-bbox="545 1276 1195 1329">SQL_BINARY</td></tr> <tr><td data-bbox="415 1329 545 1381">-1</td><td data-bbox="545 1329 1195 1381">SQL_LONGVARCHAR</td></tr> <tr><td data-bbox="415 1381 545 1434">0</td><td data-bbox="545 1381 1195 1434">SQL_UNKNOWN_TYPE</td></tr> <tr><td data-bbox="415 1434 545 1486">1</td><td data-bbox="545 1434 1195 1486">SQL_CHAR</td></tr> <tr><td data-bbox="415 1486 545 1539">2</td><td data-bbox="545 1486 1195 1539">SQL_NUMERIC</td></tr> <tr><td data-bbox="415 1539 545 1591">3</td><td data-bbox="545 1539 1195 1591">SQL_DECIMAL</td></tr> <tr><td data-bbox="415 1591 545 1644">4</td><td data-bbox="545 1591 1195 1644">SQL_INTEGER</td></tr> <tr><td data-bbox="415 1644 545 1696">5</td><td data-bbox="545 1644 1195 1696">SQL_SMALLINT</td></tr> <tr><td data-bbox="415 1696 545 1749">6</td><td data-bbox="545 1696 1195 1749">SQL_FLOAT</td></tr> <tr><td data-bbox="415 1749 545 1801">7</td><td data-bbox="545 1749 1195 1801">SQL_REAL</td></tr> <tr><td data-bbox="415 1801 545 1850">8</td><td data-bbox="545 1801 1195 1850">SQL_DOUBLE</td></tr> </table>	-22	SQL_UNSIGNED_OFFSET	-20	SQL_SIGNED_OFFSET	-11	SQL_GUID	-10	SQL_WLONGVARCHAR	-9	SQL_WVARCHAR	-8	SQL_WCHAR	-7	SQL_BIT	-6	SQL_TINYINT	-5	SQL_BIGINT	-4	SQL_LONGVARBINARY	-3	SQL_VARBINARY	-2	SQL_BINARY	-1	SQL_LONGVARCHAR	0	SQL_UNKNOWN_TYPE	1	SQL_CHAR	2	SQL_NUMERIC	3	SQL_DECIMAL	4	SQL_INTEGER	5	SQL_SMALLINT	6	SQL_FLOAT	7	SQL_REAL	8	SQL_DOUBLE

string (String)	<p>String value to use as the query parameter. Used only when parameterType = value.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>																																		

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Parameter">
3 <attribute name="name" use="optional" type="ST_Xstring"/>
4 <attribute name="sqlType" use="optional" type="xsd:int" default="0"/>
5 <attribute name="parameterType" use="optional" type="ST_ParameterType" default="prompt"/>
6 <attribute name="refreshOnChange" use="optional" type="xsd:boolean" default="false"/>
7 <attribute name="prompt" use="optional" type="ST_Xstring"/>
8 <attribute name="boolean" use="optional" type="xsd:boolean"/>
9 <attribute name="double" use="optional" type="xsd:double"/>
10 <attribute name="integer" use="optional" type="xsd:int"/>
11 <attribute name="string" use="optional" type="ST_Xstring"/>
12 <attribute name="cell" use="optional" type="ST_Xstring"/>
13 </complexType>

```

### 3.13.7 parameters (Query Parameters)

This element serves as a collection of parameters for an ODBC or web query.

Parent Elements
connection (§3.13.1)

Child Elements	Subclause
parameter (Parameter Properties)	§3.13.6

Attributes	Description
count (Parameter Count)	<p>The number of parameters used.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Parameters">
 <sequence>
 <element name="parameter" minOccurs="1" maxOccurs="unbounded" type="CT_Parameter"/>
 </sequence>
 <attribute name="count" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

### 3.13.8 s (Character Value)

This element is used to specify an HTML table to import by name. If the tables are not named, they'll be specified with the <x v="[index]"> syntax instead.

Parent Elements
metadataStrings (§3.9.9); tables (§3.13.9)

Attributes	Description
v (Value)	<p>The name of the table to retrieve when the web query is refreshed. This corresponds to the string used for the id attribute of the HTML &lt;table&gt; tag.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_XStringElement">
 <attribute name="v" type="ST_Xstring" use="required"/>
</complexType>
```

### 3.13.9 tables (Tables)

This element serves as the collection of tables to be returned via a web query data connection. Tables are then most commonly referenced by <x> via their indices (in order of the <Table> tags in the HTML page).

Parent Elements
webPr (§3.13.13)

Child Elements	Subclause
m (No Value)	§3.13.4
s (Character Value)	§3.13.8
x (Shared Items Index)	§3.10.1.97

Attributes	Description
count (Count of Tables)	Number of tables to pull data from when refreshing from a web query.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tables">
 <choice minOccurs="1" maxOccurs="unbounded">
 <element name="m" type="CT_TableMissing"/>
 <element name="s" type="CT_XStringElement"/>
 <element name="x" type="CT_Index"/>
 </choice>
 <attribute name="count" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

### 3.13.10 textField (Text Import Field Settings)

This element specifies field settings for text import.

Parent Elements
textFields (§3.13.11)

Attributes	Description
------------	-------------

Attributes	Description
position (Position)	<p>The character position the field starts at for fixed-length fields. The index is 0-based. If this attribute does not exist, position=0 is assumed. Subsequent textField elements or carriage returns in the text stream serve to denote endpoints for text fields.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
type (Field Type)	<p>Specifies the field Type. When text is imported into cells in the worksheet, the data in the cells are converted to the type defined here.</p> <p>Types can be specified by the user, or determined algorithmically via heuristics and text analysis.</p> <p>The possible values for this attribute are defined by the ST_ExternalConnectionType simple type (§3.18.28).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextField">
 <attribute name="type" use="optional" type="ST_ExternalConnectionType" default="general"/>
 <attribute name="position" use="optional" type="xsd:unsignedInt" default="0"/>
</complexType>
```

### 3.13.11 textFields (Fields)

This element that denotes a set of fields to retrieve from a text file. Contains 1 or more textField elements.

Parent Elements
textPr (§3.13.12)

Child Elements	Subclause
textField (Text Import Field Settings)	§3.13.10

Attributes	Description
count (Count of Fields)	<p>Number of distinct fields to retrieve.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFields">
 <sequence>
 <element name="textField" minOccurs="1" maxOccurs="unbounded" type="CT_TextField"/>
 </sequence>
 <attribute name="count" use="optional" type="xsd:unsignedInt" default="1"/>
</complexType>
```

### 3.13.12 textPr (Text Import Settings)

This element contains all of the text import settings.

Here's an example of the XML for a text connection:

*[Example:*

```
<connection id="1" name="text data" type="6" refreshedVersion="3" background="1"
 saveData="1">
 <textPr prompt="0" codePage="437" sourceFile="C:\Desktop\text data.txt"
 delimiter="|">
 <textFields count="5">
 <textField/>
 <textField type="text" position="7"/>
 <textField type="text" position="28"/>
 <textField position="36"/>
 <textField type="text" position="41"/>
 </textFields>
 </textPr>
</connection>
```

*example]*

Parent Elements
connection (§3.13.1)

Child Elements	Subclause
textFields (Fields)	§3.13.11

Attributes	Description
codePage (Code Page)	Code page associated with the text file.  <i>[Example:s of supported values include: 1256: Arabic (Windows) 775: Baltic (DOS)</i>

Attributes	Description
	<p> 28594: Baltic (ISO)  1257: Baltic (Windows)  852: Central European (DOS)  28592: Central European (ISO)  10029: Central European (Mac)  1250: Central European (Windows)  936: Chinese Simplified (GB2312)  950: Chinese Traditional (Big5)  10082: Croatian (Mac)  866: Cyrillic (DOS)  28595: Cyrillic (ISO)  20866: Cyrillic (KOI8-R)  21866: Cyrillic (KOI8-U)  10007: Cyrillic (Mac)  1251: Cyrillic (Windows)  28603: Estonian (ISO)  863: French Canadian (DOC)  737: Greek (DOS)  28597: Greek (ISO)  10006: Greek (Mac)  1253: Greek (Windows)  869: Greek, Modern (DOS)  1255: Hebrew (Windows)  861: Icelandic (DOS)  10079: Icelandic (Mac)  932: Japanese (Shift-JIS)  949: Korean  1361: Korean (Johab)  28605: Latin 9 (ISO)  865: Nordic (DOS)  855: OEM Cyrillic  437: OEM United States  860: Portuguese (DOS)  10010: Romanian (Mac)  20261: T.61  874: Thai (Windows)  857: Turkish (DOS)  28599: Turkish (ISO)  10081: Turkish (Mac)  1254: Turkish (Windows)  10017: Ukrainian (Mac)  65000: Unicode (UTF-7)  65001: Unicode (UTF-8)  20127: US-ASCII  1258: Vietnamese (Windows)  850: Western European (DOS) </p>

Attributes	Description																																				
	<div>28591: Western European (ISO) 10000: Western European (Mac) 1252: Western European (Windows)</div> <div>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</div>																																				
comma (Comma is Delimiter)	<div>Flag indicating whether to treat comma characters as field delimiters.</div> <div>The possible values for this attribute are defined by the XML Schema boolean datatype.</div>																																				
consecutive (Consecutive Delimiters)	<div>Flag indicating whether consecutive delimiters should be treated as just one delimiter. If this flag is true than it's possible or even likely that some rows will return more fields than others, and these fields will always fill cells in the worksheet from left to right.</div> <div>The possible values for this attribute are defined by the XML Schema boolean datatype.</div>																																				
decimal (Decimal Separator)	<div>The decimal separator character. This and the thousands attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used.</div> <div>The following table shows the results when you import text into a spreadsheet application using various separators. Numeric results are displayed in the rightmost column.</div> <table><tr><th>System decimal separator</th><th>System thousands separator</th><th>Text file decimal separator value</th><th>Text file thousands Separator value</th><th>Text imported</th><th>Cell value (displayed)</th></tr><tr><td>Period</td><td>Comma</td><td>Comma</td><td>Period</td><td>123.123,45</td><td>123,123.45 (numeric)</td></tr><tr><td>Period</td><td>Comma</td><td>Comma</td><td>Comma</td><td>123.123,45</td><td>123.123,45 (text)</td></tr><tr><td>Comma</td><td>Period</td><td>Comma</td><td>Period</td><td>123,123.45</td><td>123,123.45 (numeric)</td></tr><tr><td>Period</td><td>Comma</td><td>Period</td><td>Comma</td><td>123 123.45</td><td>123 123.45 (text)</td></tr><tr><td>Period</td><td>Comma</td><td>Period</td><td>Space</td><td>123 123.45</td><td>123,123.45 (numeric)</td></tr></table> <div>Strings values of this attribute are expected to be one character in length.</div> <div>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</div>	System decimal separator	System thousands separator	Text file decimal separator value	Text file thousands Separator value	Text imported	Cell value (displayed)	Period	Comma	Comma	Period	123.123,45	123,123.45 (numeric)	Period	Comma	Comma	Comma	123.123,45	123.123,45 (text)	Comma	Period	Comma	Period	123,123.45	123,123.45 (numeric)	Period	Comma	Period	Comma	123 123.45	123 123.45 (text)	Period	Comma	Period	Space	123 123.45	123,123.45 (numeric)

Period	Comma	Period	Space	123 123.45	123,123.45 (numeric)																																
delimited (Delimited File)	<div>true if the file is Tab or character delimited. false if the file should be parsed according to fixed length fields.</div> <div>The possible values for this attribute are defined by the XML Schema boolean datatype.</div>																																				

Attributes	Description
delimiter (Custom Delimiter)	<p>User-specified character to be treated as a field delimiter. Only single characters are supported.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
fileType (File Type)	<p>Ignorable attribute with enum value that equals either "Macintosh," "Windows (ANSI)," or "MS-DOS (PC-8)" (see the definition of ST_FileType) and determines the kind of character set to use during import.</p> <p>Only one of fileType and codePage should be specified for a textPr.</p> <p>The possible values for this attribute are defined by the ST_FileType simple type (§3.18.30).</p>
firstRow (First Row)	<p>Indicates at what row of the file to start the data import. All unsignedInt values are valid, although it's possible that firstRow will be higher than the number of rows in the text file, in which case no data will be imported.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
prompt (Prompt for File Name)	<p>Flag indicating whether the user wants to be prompted for the file name on refresh. If false, then the user is not prompted. If true or not present, then the user is prompted.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
qualifier (Qualifier)	<p>Character used as the text string qualifier.</p> <p>The possible values for this attribute are defined by the ST_Qualifier simple type (§3.18.63).</p>
semicolon (Semicolon is Delimiter)	<p>Flag indicating whether to treat semicolon characters as field delimiters.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sourceFile (Source File Name)	<p>Path to the text file to use to import external data. May be expressed in URI or system-specific file path notation.</p> <p>[Note: Applications can decide what forms of URI they support, and whether system-specific file path notations will be supported. end note]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
space (Space is Delimiter)	<p>Flag indicating whether to treat space characters as field delimiters.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
tab (Tab as	<p>Flag indicating whether to treat tab characters as field delimiters. If false, then tabs will</p>

Attributes	Description
Delimiter)	not be used as delimiters. If true or not present, then they will be used as delimiters.  The possible values for this attribute are defined by the XML Schema boolean datatype.
thousands (Thousands Separator)	The thousands separator character. This and the decimal attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used. Please refer to the decimal attribute description above for a Table describing the behavior.  Strings values of this attribute are expected to be one character in length.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TextPr">
 <sequence>
 <element name="textFields" minOccurs="0" maxOccurs="1" type="CT_TextFields"/>
 </sequence>
 <attribute name="prompt" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="fileType" use="optional" type="ST_FileType" default="win"/>
 <attribute name="codePage" use="optional" type="xsd:unsignedInt" default="1252"/>
 <attribute name="firstRow" use="optional" type="xsd:unsignedInt" default="1"/>
 <attribute name="sourceFile" use="optional" type="ST_Xstring" default=""/>
 <attribute name="delimited" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="decimal" use="optional" type="ST_Xstring" default="."/>
 <attribute name="thousands" use="optional" type="ST_Xstring" default=","/>
 <attribute name="tab" use="optional" type="xsd:boolean" default="true"/>
 <attribute name="space" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="comma" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="semicolon" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="consecutive" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="qualifier" use="optional" type="ST_Qualifier" default="doubleQuote"/>
 <attribute name="delimiter" use="optional" type="ST_Xstring"/>
</complexType>

```

### 3.13.13 webPr (Web Query Properties)

This element specifies the properties for a web query source. A web query will retrieve data from HTML tables, and can also supply HTTP "Get" parameters to be processed by the web server in generating the HTML by including the parameters and parameter elements.

Here's an example of a web query connection:

[Example:

```

1 <connection id="1" name="Connection" type="4" refreshedVersion="0"
2 background="1" saveData="1">
3 <webPr sourceData="1" parsePre="1" consecutive="1"
4 url="http://ServerName/Image%20Library/Forms/AllItems.aspx" htmlTables="1">
5 <tables count="1">
6 <s v="contentthumbnail"/>
7 </tables>
8 </webPr>
9 </connection>

```

*end example]*

Parent Elements
connection (§3.13.1)

Child Elements	Subclause
tables (Tables)	§3.13.9

Attributes	Description
consecutive (Consecutive Delimiters)	Flag indicating whether consecutive delimiters should be treated as just one delimiter.  The possible values for this attribute are defined by the XML Schema boolean datatype.
editPage (Edit Query URL)	The URL of the user-facing web page showing the web query data. This URL is persisted in the case that sourceData="true" and url has been redirected to reference an XML file. Then the user-facing page can be shown in the UI, and the XML data can be retrieved behind the scenes.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
firstRow (Use First Row)	Flag indicating whether to parse all tables inside a PRE block with the same width settings as the first row.  The possible values for this attribute are defined by the XML Schema boolean datatype.
htmlFormat (HTML Formatting Handling)	How to handle formatting from the HTML source when bringing web query data into the worksheet. Relevant when sourceData is True.  Values are as follows: 1. None - no formatting at all 2. RTF - honor just rich text formatting 3. All - honor all html formatting.  The possible values for this attribute are defined by the ST_HtmlFmt simple type

1. None - no formatting at all
2. RTF - honor just rich text formatting
3. All - honor all html formatting.

Attributes	Description
	(§3.18.43).
htmlTables (HTML Tables Only)	<p>Flag indicating whether web queries should only work on HTML tables.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
parsePre (Parse PRE)	<p>Flag indicating whether data contained within HTML &lt;PRE&gt; tags in the web page is parsed into columns when you import the page into a query table.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
post (Web Post)	<p>Returns or sets the string used with the post method of inputting data into a web server to return data from a web query.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
sourceData (Import XML Source Data)	<p>Flag indicating that XML source data should be imported instead of the HTML table itself.</p> <p>Used when a web query exists to an HTML table with the following attribute.</p> <pre>&lt;TABLE ... o:WebQuerySourceHRef="http://..." ... &gt; ... &lt;/TABLE&gt;</pre> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
textDates (Dates as Text)	<p>Flag indicating whether dates should be imported into cells in the worksheet as text rather than dates.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
url (URL)	<p>URL to use to refresh external data.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>
xl2000 (Refreshed in Excel 2000)	<p>This flag exists for backward compatibility with older existing spreadsheet files, and is set to true if this web query was refreshed in a spreadsheet application newer than or equal to Microsoft Excel 2000.</p> <p>This is an optional attribute that can be ignored.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
xl97 (Created in Excel 97)	<p>This flag exists for backward compatibility with older existing spreadsheet files, and is set to true if this web query was created in Microsoft Excel 97.</p> <p>This is an optional attribute that can be ignored.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
xml (XML Source)	<p>true if the web query source is XML (versus HTML), otherwise false.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPr">
 <sequence>
 <element name="tables" minOccurs="0" maxOccurs="1" type="CT_Tables"/>
 </sequence>
 <attribute name="xml" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="sourceData" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="parsePre" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="consecutive" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="firstRow" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="xl97" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="textDates" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="xl2000" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="url" use="optional" type="ST_Xstring"/>
 <attribute name="post" use="optional" type="ST_Xstring"/>
 <attribute name="htmlTables" use="optional" type="xsd:boolean" default="false"/>
 <attribute name="htmlFormat" use="optional" type="ST_HtmlFmt" default="none"/>
 <attribute name="editPage" use="optional" type="ST_Xstring"/>
</complexType>
```

### 3.14 Supplementary Workbook Data

External links are used when linking the workbook to other workbooks or external data. The most frequent feature for linking a workbook to other workbooks is through the use of formulas. In this case the formula references a range or defined name in another workbook. Hyperlinks on cells and other spreadsheet objects are also considered an external link. OLE links are yet another technology used to link the workbook to another object. Finally, Dynamic Data Exchange, or DDE, servers can be used to access external data. DDE servers are accessed through formulas in the workbook.

External links are saved with the target source in a relationship file so that external resources are easily discoverable in lightweight relationship XML rather than deep in the application's XML.

For a workbook consumer.xlsx that makes use of data in another workbook called data.xlsx, the following XML would exist in consumer.xlsx to describe the external link:

[Example:

```
<Relationships xmlns="...">
 <Relationship Id="rId1" Type=".../externalLinkPath" Target="data.xlsx"
 TargetMode="External"/>
</Relationships>
```

end example]

And the following XML would exist to describe cached data retrieved from the external workbook:

[Example:

```

1 <externalLink xmlns="...">
2 <externalBook xmlns:r="..." r:id="rId1">
3 <sheetNames>
4 <sheetName val="Sheet1"/>
5 <sheetName val="Sheet2"/>
6 <sheetName val="Sheet3"/>
7 </sheetNames>
8 <sheetDataSet>
9 <sheetData sheetId="0"/>
10 <sheetData sheetId="1"/>
11 <sheetData sheetId="2">
12 <row r="11">
13 <cell r="B11">
14 <v>47</v>
15 </cell>
16 </row>
17 <row r="12">
18 <cell r="B12">
19 <v>19</v>
20 </cell>
21 </row>
22 <row r="13">
23 <cell r="B13">
24 <v>38</v>
25 </cell>
26 </row>
27 </sheetData>
28 </sheetDataSet>
29 </externalBook>
30 </externalLink>

```

*end example]*

The Supplementary Workbook Data section of SpreadsheetML is complimentary to the External Data Connections (§3.13) section in maintaining all the information about external information that impacts the workbook.

### 3.14.1 cell (External Cell Data)

This element is used to store cached values from external sources such as other workbooks. Formulas from external cells are not stored in the consuming workbook. Also, for this context, the attribute `t` cannot have a value of `inlineStr`. Rich text is not supported in this context either.

#### Parent Elements

Parent Elements
row (§3.14.12)

Child Elements	Subclause
v (Cell Value)	§3.3.1.93

Attributes	Description
r (Reference)	<p>Describes the cell location in the external book.</p> <p>[Example:</p> <pre>&lt;cell r="B12"&gt;   &lt;v&gt;74&lt;/v&gt; &lt;/cell&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
t (Type)	<p>Indicates the data type of the cell value.</p> <p>The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).</p>
vm (Value Metadata)	<p>The index of the cell's value metadata, if any exists.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalCell">
 <sequence>
 <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="r" type="ST_CellRef" use="optional"/>
 <attribute name="t" type="ST_CellType" use="optional" default="n"/>
 <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

### 3.14.2 ddeItem (DDE Item definition)

This element represents a DDE item.

Parent Elements
ddeItems (§3.14.3)

Child Elements	Subclause
values (DDE Name Values)	§3.14.19

1

Attributes	Description
advise (Advise)	Specifies whether the DDE server should notify the application when the external data changes. Default value is false.  The possible values for this attribute are defined by the XML Schema boolean datatype.
name (DDE Name)	Specifies the DDE item name.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ole (OLE)	Set to true if this item uses OLE. Default value is false.  The possible values for this attribute are defined by the XML Schema boolean datatype.
preferPic (Data is an Image)	Set to true if data from this DDE item is an image format. Default value is false.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_DdeItem">
4 <sequence>
5 <element name="values" type="CT_DdeValues" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 <attribute name="name" type="ST_Xstring" default="0"/>
8 <attribute name="ole" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="advise" type="xsd:boolean" use="optional" default="false"/>
10 <attribute name="preferPic" type="xsd:boolean" use="optional" default="false"/>
11 </complexType>

```

### 12 3.14.3 ddeItems (DDE Items Collection)

13 This element serves as a collection for ddeItem elements.

Parent Elements
ddeLink (§3.14.4)

14

Child Elements	Subclause
ddeItem (DDE Item definition)	§3.14.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeItems">
 <sequence>
 <element name="ddeItem" type="CT_DdeItem" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.14.4 ddeLink (DDE Connection)

This element represents a connection to an external Dynamic Data Exchange (DDE) server. DDE is a method of sending data between applications using Windows messages according to a documented protocol that has been stable since about 1990.

The hierarchy of names defined by a DDE server is Application, Topics, and Items. Topics often correspond to units such as files or documents or database names, and Items refer to subsets of the data such as cell ranges, rows, fields, columns. DDE items can have multiple values as well.

*[Example:*

Data connectivity can use a number of different technologies. The following is just one example of a spreadsheetML fragment describing the product Microsoft Excel being used as a DDE server to provide data to the current spreadsheet document:

```
<ddeLink xmlns:r="..." ddeService="excel" ddeTopic="[dsource.xls]Sheet1">
 <ddeItems>
 <ddeItem name="R1C1" advise="1"/>
 <ddeItem name="StdDocumentName" ole="1" advise="1"/>
 </ddeItems>
</ddeLink>
```

*end example]*

Parent Elements
externalLink (§3.14.8)

Child Elements	Subclause
ddeItems (DDE Items Collection)	§3.14.3

Attributes	Description
ddeService (Service name)	Service name (i.e., application name) for the DDE connection. This is a required attribute.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
ddeTopic (Topic for DDE server)	Describes something for the DDE application to which the channel pertains— usually a document of that application. This is a required attribute.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_DdeLink">
3 <sequence>
4 <element name="ddeItems" type="CT_DdeItems" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="ddeService" type="ST_Xstring" use="required"/>
7 <attribute name="ddeTopic" type="ST_Xstring" use="required"/>
8 </complexType>

```

### 9 3.14.5 definedName (Defined Name)

10 This element contains information about a named range in an external workbook.

Parent Elements
definedNames (§3.14.6)

11

Attributes	Description
name (Defined Name)	The defined name. This attribute is required.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
refersTo (Refers To)	Name range definition string.  [Example:  <pre> &lt;definedNames&gt;   &lt;definedName name="namedrange"     refersTo="='Sheet1'!\$D\$5:\$D\$10"/&gt; &lt;/definedNames&gt; </pre> ...end example]  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sheetId (Sheet Id)	The index of the worksheet that the named range applies to for named ranges that are scoped to a particular worksheet rather than the full workbook. This attribute is optional.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalDefinedName">
 <attribute name="name" type="ST_Xstring" use="required"/>
 <attribute name="refersTo" type="ST_Xstring" use="optional"/>
 <attribute name="sheetId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

### 3.14.6 definedNames (Named Links)

This element is a collection of the defined names associated with the supporting workbook.

Parent Elements
externalBook (§3.14.7)

Child Elements	Subclause
definedName (Defined Name)	§3.14.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalDefinedNames">
 <sequence>
 <element name="definedName" type="CT_ExternalDefinedName" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.14.7 externalBook (External Workbook)

This element represents an external workbook which is supplying data to the current workbook.

Parent Elements
externalLink (§3.14.8)

Child Elements	Subclause
definedNames (Named Links)	§3.14.6
sheetDataSet (Cached Worksheet Data)	§3.14.14
sheetNames (Supporting Workbook Sheet Names)	§3.14.16

Attributes	Description
------------	-------------

Attributes	Description
id (Relationship to supporting book file path)	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the worksheet XML file in the current spreadsheetML document ZIP archive that makes use of this externalbook.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalBook">
 <sequence>
 <element name="sheetNames" type="CT_ExternalSheetNames" minOccurs="0" maxOccurs="1"/>
 <element name="definedNames" type="CT_ExternalDefinedNames" minOccurs="0" maxOccurs="1"/>
 <element name="sheetDataSet" type="CT_ExternalSheetDataSet" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 3.14.8 externalLink (External Reference)

This element is a container for specific types of external links.

Parent Elements
Root element of SpreadsheetML External Workbook References part

Child Elements	Subclause
ddeLink (DDE Connection)	§3.14.4
externalBook (External Workbook)	§3.14.7
extLst (Future Feature Data Storage Area)	§3.2.10
oleLink (OLE Link)	§3.14.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalLink">
 <choice>
 <element name="externalBook" type="CT_ExternalBook" minOccurs="0" maxOccurs="1"/>
 <element name="ddeLink" type="CT_DdeLink" minOccurs="0" maxOccurs="1"/>
 <element name="oleLink" type="CT_OleLink" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </choice>
</complexType>
```

### 3.14.9 oleItem (OLE Link Item)

This element represents an OLE link.

Parent Elements
oleItems (§3.14.10)

1

Attributes	Description
advise (Advise)	Set to true if the OLE server should notify the application when the external data changes. Default value is false.  The possible values for this attribute are defined by the XML Schema boolean datatype.
icon (Icon)	Set to true if the object is represented by an icon.  The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Object Name)	The object's name.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
preferPic (Object is an Image)	Set to true if the object is represented by an image.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_OleItem">
4 <attribute name="name" type="ST_Xstring" use="required"/>
5 <attribute name="icon" type="xsd:boolean" use="optional" default="false"/>
6 <attribute name="advise" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="preferPic" type="xsd:boolean" use="optional" default="false"/>
8 </complexType>

```

### 9 3.14.10 oleItems (OLE Link Items)

10 This element is a collection of OLE items.

Parent Elements
oleLink (§3.14.11)

11

Child Elements	Subclause
oleItem (OLE Link Item)	§3.14.9

12 The following XML Schema fragment defines the contents of this element:

```

13 <complexType name="CT_OleItems">
14 <sequence>
15 <element name="oleItem" type="CT_OleItem" minOccurs="0" maxOccurs="unbounded"/>
16 </sequence>
17 </complexType>

```

### 3.14.11 oleLink (OLE Link)

This element represents an external link to an OLE2 connection, specified by a progID/object pair.

Parent Elements
externalLink (§3.14.8)

Child Elements	Subclause
oleItems (OLE Link Items)	§3.14.10

Attributes	Description
id (OLE Link Relationship)  Namespace: .../officeDocument /2006/relationships	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the external file name used for this oleLink.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
progId (OLE Link ProgID)	The progID for the OLE connection.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleLink">
 <sequence>
 <element name="oleItems" type="CT_OleItems" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="required"/>
 <attribute name="progId" type="ST_Xstring" use="required"/>
</complexType>
```

### 3.14.12 row (Row)

This element contains data for an external worksheet row.

Parent Elements
sheetData (§3.14.13)

Child Elements	Subclause
cell (External Cell Data)	§3.14.1

Attributes	Description
r (Row)	<p>Row number of the row in the external book containing the cell data referenced. This attribute is required.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ExternalRow">
 <sequence>
 <element name="cell" type="CT_ExternalCell" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="r" type="xsd:unsignedInt" use="required"/>
</complexType>

```

### 3.14.13 sheetData (External Sheet Data Set)

This element contains the cached worksheet data associated with a supporting workbook.

For an example, please refer to example at the beginning of this section.

Parent Elements
sheetDataSet (§3.14.14)

Child Elements	Subclause
row (Row)	§3.14.12

Attributes	Description
refreshError (Last Refresh Resulted in Error)	<p>Specifies that the last external data refresh for this sheet did not succeed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
sheetId (Sheet Id)	<p>Index of sheet in the external workbook that is referenced and partially cached in this data set. This is a 1-based index. This attribute is required.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetData">
 <sequence>
 <element name="row" type="CT_ExternalRow" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
 <attribute name="refreshError" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 3.14.14 sheetDataSet (Cached Worksheet Data)

This element serves as the collection for 1 or more sheetData elements.

Parent Elements
externalBook (§3.14.7)

Child Elements	Subclause
sheetData (External Sheet Data Set)	§3.14.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetDataSet">
 <sequence>
 <element name="sheetData" type="CT_ExternalSheetData" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 3.14.15 sheetName (Sheet Name)

Name of a worksheet in the supporting workbook

Parent Elements
sheetNames (§3.14.16)

Attributes	Description
val (Sheet Name Value)	Name of the sheet. This attribute is required.  The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetName">
 <attribute name="val" type="ST_Xstring"/>
</complexType>
```

### 3.14.16 sheetNames (Supporting Workbook Sheet Names)

This element is the container for all of the worksheet names in a supporting workbook.

Parent Elements
externalBook (§3.14.7)

Child Elements	Subclause
sheetName (Sheet Name)	§3.14.15

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetNames">
 <sequence>
 <element name="sheetName" minOccurs="1" maxOccurs="unbounded" type="CT_ExternalSheetName"/>
 </sequence>
</complexType>
```

### 3.14.17 val (DDE Link Value)

This element specifies a value associated with a particular DDE item.

Here's an example of how values, value, and val elements are written out in the spreadsheetML for a ddeItem supplied by a DDE server. In this example different cells in the workbook are bound to these specific DDE items

[Example:

```
<ddeLink xmlns:r="..." ddeService="StockSrv" ddeTopic="Prices">
 <ddeItems>
 <ddeItem name="Bread" advise="1">
 <values>
 <value>
 <val>3.5</val>
 </value>
 </values>
 </ddeItem>
 <ddeItem name="Milk" advise="1">
 <values>
 <value>
 <val>5.7400000000000002</val>
 </value>
 </values>
 </ddeItem>
```

```

1 <ddeItem name="MSFT" advise="1">
2 <values>
3 <value>
4 <val>54.130000000000003</val>
5 </value>
6 </values>
7 </ddeItem>
8 <ddeItem name="StdDocumentName" ole="1" advise="1"/>
9 </ddeItems>
10 </ddeLink>

```

*example]*

The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
value (§3.14.18)

### 3.14.18 value (Value)

This element contains a value associated with a particular DDE item. This serves as a container for the val element.

Parent Elements
values (§3.14.19)

Child Elements	Subclause
val (DDE Link Value)	§3.14.17

Attributes	Description
t (DDE Value Type)	Indicates the type of the DDE value.  The possible values for this attribute are defined by the ST_DdeValueType simple type (§3.18.24).

The following XML Schema fragment defines the contents of this element:

```

19 <complexType name="CT_DdeValue">
20 <sequence>
21 <element name="val" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
22 </sequence>
23 <attribute name="t" type="ST_DdeValueType" use="optional" default="n"/>
24 </complexType>

```

### 3.14.19 values (DDE Name Values)

This element defines a collection of values associated with DDE item.

Parent Elements
ddeItem (§3.14.2)

Child Elements	Subclause
value (Value)	§3.14.18

Attributes	Description
cols (Columns)	<p>The number of columns of data that will be returned by the DDE server for this DDE item. The default value of this attribute is 1.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rows (Rows)	<p>The number of rows of data that will be returned by the DDE server for this DDE item. The default value of this attribute is 1.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeValues">
 <sequence>
 <element name="value" minOccurs="1" maxOccurs="unbounded" type="CT_DdeValue"/>
 </sequence>
 <attribute name="rows" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="cols" type="xsd:unsignedInt" use="optional" default="1"/>
</complexType>
```

## 3.15 Volatile Dependencies

The volatileDependencies part provides a cache of data that supports Real Time Data (RTD) and CUBE functions in the workbook. Both of these types of functions require connectivity to external servers to retrieve their data. For RTD functions, an RTD interface defines how data is provided on the server, and how it is retrieved on the client. Similarly, CUBE functions access data in OLAP cubes via their own function syntax. The volatileDependencies part provides that cache of data and supporting information about these functions and their data servers and connections. This allows the spreadsheet application to work with cached values when recalculating the workbook when the external server is not available.

[Note: How users of SpreadsheetML access RTD data depends on the integration the user's spreadsheet application provides for RTD. *end note*]

[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: [http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vbaxl11/html/xlobjIRtdServer\\_HV03085058.asp](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vbaxl11/html/xlobjIRtdServer_HV03085058.asp) end note]

#### File Architecture

The workbook holds the relationship to the volatile dependencies part.

#### Illustration

The following image shows an example implementation of CUBE and Real Time Data (RTD) functions in a worksheet.

	A
1	=RTD("jrt dx.rtd",,"aaa")
2	
3	=CUBEMEMBER("xlext dat9 Adventure Works DW Adventure Works","[Department].[Departments].[Corporate]")
4	=CUBEVALUE("xlext dat9 Adventure Works DW Adventure Works",A3)
5	=CUBESET("xlext dat9 Adventure Works DW Adventure Works","[Customer].[Customer Geography].[All Customers].[United Kingdom].children","Set")
6	=CUBERANKEDMEMBER("xlext dat9 Adventure Works DW Adventure Works",,\$A\$3,ROW(A1))
7	=CUBESETCOUNT(A3)
8	=CUBEMEMBERPROPERTY("xlext dat9 Adventure Works DW Adventure Works","[Product].[Product].[All Products].[Blade]","Class")
9	=CUBEKPIMEMBER("xlext dat9 Adventure Works DW Adventure Works","Growth in Customer Base",2)
10	

The following example shows the XML that describes the functions in the illustration.

[Example:

```
1 <volTypes xmlns="...">
2 <volType type="realTimeData">
3 <main first="jrtdx.rtd">
4 <tp t="s">
5 <v>aaa: 4447</v>
6 <stp/>
7 <stp>aaa</stp>
8 <tr r="A1" s="1"/>
9 </tp>
10 </main>
11 </volType>
12 <volType type="olapFunctions">
13 <main first="xlextdat9 Adventure Works DW Adventure Works">
14 <tp t="e">
15 <v>#N/A</v>
16 <stp>1</stp>
17 <tr r="A6" s="1"/>
18 <tr r="A9" s="1"/>
19 <tr r="A8" s="1"/>
20 <tr r="A5" s="1"/>
21 <tr r="A4" s="1"/>
22 <tr r="A3" s="1"/>
23 </tp>
24 </main>
25 </volType>
26 </volTypes>
```

27 *end example]*

28 While RTD and Cube functions share the cache, there are differences in how the data is interpreted. For  
29 example, RTD dependencies, volTypes/volType/main@first specifies the ProgId of the RTD server. Whereas  
30 for OLAP dependencies, main@first indicates the connection name.

31 **3.15.1 main (Main)**

32 Represents dependency information for all topics within a type that share the same first string or function  
33 argument.

34

Parent Elements	
volType (§3.15.5)	

Child Elements	Subclause
tp (Topic)	§3.15.3

1

Attributes	Description
first (First String)	<p>Specifies the first string of all topics within this main. This string corresponds to the first argument to the RTD or CUBE function.</p> <p>For RTD functions, this argument represents the progID of the IRTDServer.</p> <p>[Example:  <code>&lt;main first="jrtdx.rtd"&gt;</code>  <i>end example</i>]</p> <p>For CUBE functions, this argument represents the CUBE connection.</p> <p>[Example:  <code>&lt;main first="xlextat9 Adventure Works DW Adventure Works"&gt;</code>  <i>end example</i>]</p> <p>For more information on RTD and CUBE functions in SpreadsheetML, see §3.17 in Formulas.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_VolMain">
4 <sequence>
5 <element name="tp" type="CT_VolTopic" minOccurs="1" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="first" type="ST_Xstring" use="required"/>
8 </complexType>

```

### 9 3.15.2 stp (Strings in Subtopic)

10 Represents all strings in the topic except for the first. An stp is allocated for each additional argument. For  
 11 example, for the topic {"progid", "", "foo"}, there would be two STPs: "" and "foo".

12 For Cube functions, value of "1" indicates that all of the related cells with calling cube functions have been  
 13 refreshed.

14 The possible values for this element are defined by the ST\_Xstring simple type (§3.18.96).

Parent Elements
tp (§3.15.3)

### 3.15.3 tp (Topic)

Represents dependency information for all topics within a volatile dependency type that share the same first string or argument.

For the RTD function, this collection will contain the remaining parameters of the function, and indicate the last known value and data type of that value.

Parent Elements
main (§3.15.1)

Child Elements	Subclause
stp (Strings in Subtopic)	§3.15.2
tr (References)	§3.15.4
v (Cell Value)	§3.3.1.93

Attributes	Description
t (Type)	<p>Specifies the type of the cell value. This value corresponds to the type of data returned by the RTD or CUBE function.</p> <p>In the following RTD example, the value "aaa: 4447" has a string data type.</p> <p>[Example:  <pre>&lt;tp t="s"&gt;   &lt;v&gt;aaa: 4447&lt;/v&gt; &lt;/tp&gt; end example]</pre> </p> <p>For Cube functions, this attribute can be ignored when stp value is "1".</p> <p>The possible values for this attribute are defined by the ST_VolValueType simple type (§3.18.93).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolTopic">
 <sequence>
 <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
 <element name="stp" type="ST_Xstring" minOccurs="0" maxOccurs="unbounded"/>
 <element name="tr" type="CT_VolTopicRef" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="t" type="ST_VolValueType" use="optional" default="n"/>
</complexType>
```

### 3.15.4 tr (References)

Represents the reference to a cell that depends on this topic. Each topic may have one or more cells dependencies.

For CUBE functions, each <tr> element contains a cell whose cube function call dependent on the connection in main@first.

Parent Elements
tp (§3.15.3)

Attributes	Description
r (Reference)	<p>Specifies a reference to the cell location. The location is scoped to the sheet specified in s.</p> <p><i>[Example:</i>            &lt;tr r="A6" s="1"/&gt;  <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).</p>
s (Sheet Id)	<p>Specifies the sheet index.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolTopicRef">
 <attribute name="r" type="ST_CellRef" use="required"/>
 <attribute name="s" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 3.15.5 volType (Volatile Dependency Type)

Represents dependency information for a specific type or external data server. There is no limit on the number of external dependencies that may exist for a workbook in SpreadsheetML.

Parent Elements
volTypes (§3.15.6)

Child Elements	Subclause
main (Main)	§3.15.1

Attributes	Description
type (Type)	<p>Specifies the type of the external dependency.</p> <p><i>[Example:</i>  <code>&lt;volType type="olapFunctions"&gt;</code>  <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_VolDepType simple type (§3.18.92).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_VolType">
 <sequence>
 <element name="main" type="CT_VolMain" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="type" type="ST_VolDepType" use="required"/>
</complexType>

```

### 3.15.6 volTypes (Volatile Dependency Types)

Represents the collection of external dependencies for a workbook. This element defines the structure of the volatileDependencies part. There can only be one volatileDependencies part for each workbook. However, the part may contain one or more dependency types.

The volatileDependencies part stores the following information for Real Time Data (RTD) and CUBE functions:

- Cached values
- Parameters used
- Connection and Server names

*[Example: Outline of XML Structure*

```

<volTypes xmlns="...">
 <volType type="realTimeData">
 </volType>
 <volType type="olapFunctions">
 </volType>
</volTypes>

```

*end example]*

Parent Elements
Root element of SpreadsheetML Volatile Dependencies part

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
volType (Volatile Dependency Type)	§3.15.5

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_VolTypes">
 <sequence>
 <element name="volType" type="CT_VolType" minOccurs="1" maxOccurs="unbounded"/>
 <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
 </sequence>
</complexType>

```

### 3.16 Custom XML Mappings

Custom XML Mappings enable binding of arbitrary XML data structures and arbitrary XML schema definitions to the workbook. Once a DataBinding has been established, then various XML nodes can be mapped to table columns, ranges of cells, or even single cells (for non-repeating attributes and elements). Once an XML Mapping is fully defined, the application is able to import and export XML instance structures according to the schema definition.

While the original schema or XML definition may reside on disk or at some file location outside the workbook, a copy of the schema is stored in the workbook.

Every time an XML instance or schema is added to the workbook, a new map object is created which ties together the schemas and where the various elements are mapped in the workbook.

*[Example:*

```

<MapInfo SelectionNamespaces="">
 <Schema ID="Schema1">
 <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema">
 <xsd:element nillable="true" name="Root">
 <xsd:complexType>
 <xsd:sequence minOccurs="0">
 <xsd:element minOccurs="0" nillable="true" name="EmployeeInfo"
 form="unqualified">

```

```

1 <xsd:complexType>
2 <xsd:sequence minOccurs="0">
3 <xsd:element minOccurs="0" nillable="true" type="xsd:string"
4 name="Name" form="unqualified"></xsd:element>
5 <xsd:element minOccurs="0" nillable="true" type="xsd:date"
6 name="Date" form="unqualified"></xsd:element>
7 <xsd:element minOccurs="0" nillable="true" type="xsd:integer"
8 name="Code" form="unqualified"></xsd:element>
9 </xsd:sequence>
10 </xsd:complexType></xsd:element>

11
12 <xsd:element minOccurs="0" maxOccurs="unbounded" nillable="true"
13 name="ExpenseItem" form="unqualified">
14 <xsd:complexType>
15 <xsd:sequence minOccurs="0">
16 <xsd:element minOccurs="0" nillable="true" type="xsd:date"
17 name="Date" form="unqualified"></xsd:element>
18 <xsd:element minOccurs="0" nillable="true" type="xsd:string"
19 name="Description" form="unqualified"></xsd:element>
20 <xsd:element minOccurs="0" nillable="true" type="xsd:double"
21 name="Amount" form="unqualified"></xsd:element>
22 </xsd:sequence>
23 </xsd:complexType></xsd:element>
24 </xsd:sequence>
25 <xsd:attribute name="Currency" form="unqualified"
26 type="xsd:string"></xsd:attribute>
27 <xsd:attribute name="Approved" form="unqualified"
28 type="xsd:string"></xsd:attribute>
29 </xsd:complexType>
30 </xsd:element>
31 </xsd:schema>
32 </Schema>
33 <Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
34 ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
35 PreserveSortAFLayout="true" PreserveFormat="true">
36 <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
37 </Map>
38 </MapInfo>

```

*end example]*

For XML mapped into a SpreadsheetML Table there will also be additional information in the SpreadsheetML file which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in a `xmlColumnPr` element, under the `tableColumn` node.

[Example:

```
<table xmlns="..." id="1" name="Table1" displayName="Table1" ref="A1:H11"
 tableType="xml" totalsRowShown="0" connectionId="1">
 <tableColumns count="5">
 <tableColumn id="1" uniqueName="Name" name="Name">
 <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Name"
 xmlDataType="string"/>
 </tableColumn>
 <tableColumn id="2" uniqueName="Date" name="Date">
 <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Date"
 xmlDataType="date"/>
 </tableColumn>
 <tableColumn id="3" uniqueName="Code" name="Code">
 <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Code"
 xmlDataType="integer"/>
 </tableColumn>
 <tableColumn id="4" uniqueName="Description" name="Description">
 <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Description"
 xmlDataType="string"/>
 </tableColumn>
 <tableColumn id="5" uniqueName="Amount" name="Amount">
 <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Amount"
 xmlDataType="double"/>
 </tableColumn>
 </tableColumns>
 <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
 showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
</table>
```

end example]

For XML mapped into a single SpreadsheetML cell there will also be additional information in the TableSingleCells part which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in the xmlPr element under the xmlCellPr node.

[Example:

```
<singleXmlCells xmlns="...">
 <singleXmlCell id="2" name="Table2" displayName="Table2" r="D19"
 connectionId="1">
 <xmlCellPr id="1" uniqueName="Currency">
 <xmlPr mapId="1" xpath="/Root/@Currency" xmlDataType="string"/>
 </xmlCellPr>
 </singleXmlCell>
```

```

1 <singleXmlCell id="3" name="Table3" displayName="Table3" r="D20"
2 connectionId="1">
3 <xmlCellPr id="1" uniqueName="Approved">
4 <xmlPr mapId="1" xpath="/Root/@Approved" xmlDataType="string"/>
5 </xmlCellPr>
6 </singleXmlCell>
7 <singleXmlCell id="4" name="Table4" displayName="Table4" r="D18"
8 connectionId="1">
9 <xmlCellPr id="1" uniqueName="Name">
10 <xmlPr mapId="1" xpath="/Root/EmployeeInfo/Name" xmlDataType="string"/>
11 </xmlCellPr>
12 </singleXmlCell>
13 </singleXmlCells>

```

*end example]*

### 3.16.1 DataBinding (XML Mapping)

This element contains properties which specify how the XML mapping should work.

*[Example:*

```
<DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
```

*end example]*

Parent Elements
Map (§3.16.2)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
ConnectionID (Reference to Connection ID)	Specifies the Connection ID to the external connection in the External Data Connections part.  Required if FileBinding is true.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
DataBindingLoadM ode (XML Data Loading Behavior)	Specifies the mode for loading XML data related to this DataBinding.  Supported values are as follows:

Attributes	Description
	<p>0 - None 1 - Normal 2 - Delay Load 3 - Asynchronous 4 - Object Model</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
DataBindingName (Unique Identifier)	<p>Specifies the data binding name. These must be unique for each DataBinding.</p> <p>[Example:  <code>&lt;DataBinding DataBindingName="Binding1" FileBinding="true"  FileBindingName="Binding1" DataBindingLoadMode="1"/&gt;</code>  <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
FileBinding (Binding to External File)	<p>Specifies whether the data should be retrieved directly from an XML file. The path to the file is in the corresponding connection element</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
FileBindingName (File Binding Name)	<p>Specifies the file binding name. These must be unique for each DataBinding.</p> <p>[Example:  <code>&lt;DataBinding DataBindingName="Binding1" FileBinding="true"  FileBindingName="Binding1" DataBindingLoadMode="1"/&gt;</code>  <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DataBinding">
 <sequence>
 <any/>
 </sequence>
 <attribute name="DataBindingName" type="xsd:string" use="optional"/>
 <attribute name="FileBinding" type="xsd:boolean" use="optional"/>
 <attribute name="ConnectionID" type="xsd:unsignedInt" use="optional"/>
 <attribute name="FileBindingName" type="xsd:string" use="optional"/>
 <attribute name="DataBindingLoadMode" type="xsd:unsignedInt" use="required"/>
</complexType>

```

### 3.16.2 Map (XML Mapping Properties)

This element contains all of the properties related to the XML map, and the behaviors expected during data refresh operations.

[Example:

```
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
 ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
 PreserveSortAFLayout="true" PreserveFormat="true">
 <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
```

end example]

Parent Elements
MapInfo (§3.16.3)

Child Elements	Subclause
DataBinding (XML Mapping)	§3.16.1

Attributes	Description
Append (Append Data to Table)	Specifies whether XML data should overwrite or be appended to the end of the table or range of mapped cells when data is refreshed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
AutoFit (AutoFit Table on Refresh)	Specifies whether columns should be resized to fit the XML data after a data refresh operation.  The possible values for this attribute are defined by the XML Schema boolean datatype.
ID (XML Mapping ID)	Specifies the ID of the XML map.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
Name (XML Mapping Name)	Specifies the name of the XML map.  The possible values for this attribute are defined by the XML Schema string datatype.
PreserveFormat (Preserve Cell Formatting)	Specifies whether cell number formatting in the sheet should be preserved during data refresh operations, or whether the number formatting defined by the XML data type should be used.  The possible values for this attribute are defined by the XML Schema boolean datatype.
PreserveSortAFLay out (Preserve AutoFilter State)	Specifies whether to keep the filter state of the Table or cell range intact during a data refresh.  The possible values for this attribute are defined by the XML Schema boolean datatype.
RootElement (Root)	Specifies the names of the root XML element.

Attributes	Description
Element Name)	The possible values for this attribute are defined by the XML Schema string datatype.
SchemaID (Schema Name)	Specifies the unique name of the schema used for the mapping. The possible values for this attribute are defined by the XML Schema string datatype.
ShowImportExportValidationErrors (Show Validation Errors)	Specifies whether validation errors should be displayed during data refresh or data export. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Map">
 <sequence>
 <element name="DataBinding" type="CT_DataBinding" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="ID" type="xsd:unsignedInt" use="required"/>
 <attribute name="Name" type="xsd:string" use="required"/>
 <attribute name="RootElement" type="xsd:string" use="required"/>
 <attribute name="SchemaID" type="xsd:string" use="required"/>
 <attribute name="ShowImportExportValidationErrors" type="xsd:boolean" use="required"/>
 <attribute name="AutoFit" type="xsd:boolean" use="required"/>
 <attribute name="Append" type="xsd:boolean" use="required"/>
 <attribute name="PreserveSortAFLayout" type="xsd:boolean" use="required"/>
 <attribute name="PreserveFormat" type="xsd:boolean" use="required"/>
</complexType>

```

### 3.16.3 MapInfo (XML Mapping)

This element acts as the container for all of the XML schemas and maps attached to the SpreadsheetML document.

Parent Elements
Root element of SpreadsheetML Custom XML Mappings part

Child Elements	Subclause
Map (XML Mapping Properties)	§3.16.2
Schema (XML Schema)	§3.16.4

Attributes	Description
SelectionNamespaces (Prefix Mappings for XPath Expressions)	Specifies namespaces for use in XPath expressions when it is necessary to define new namespaces externally. Namespaces are defined in the XML style, as a space-separated list of namespace declaration attributes

Attributes	Description
	<p>[<i>Example:</i> The following example contains elements that belong to "a" and "b", in addition to elements that do not belong to any namespace.</p> <pre> &lt;?xml version="1.0"?&gt;   &lt;root&gt;     &lt;branch&gt;branch&lt;/branch&gt;     &lt;a:root xmlns:a="http://myserver.com"&gt;       &lt;a:branch&gt;a-branch&lt;/a:branch&gt;       &lt;b:branch xmlns:b="http://yourserver.com"&gt;         b-branch&lt;/b:branch&gt;       &lt;/a:root&gt;     &lt;/root&gt;   &lt;/root&gt; end example] </pre> <p>Note: This is used when writing Xpath expressions at runtime against the XML instance structures, because the Xpath expressions use namespace prefixes instead of the fully spelled out namespace.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_MapInfo">
3 <sequence>
4 <element name="Schema" type="CT_Schema" minOccurs="1" maxOccurs="unbounded"/>
5 <element name="Map" type="CT_Map" minOccurs="1" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="SelectionNamespaces" type="xsd:string" use="required"/>
8 </complexType>

```

### 9 3.16.4 Schema (XML Schema)

10 This element contains the XML tree for an attached schema.

Parent Elements
MapInfo (§3.16.3)

11

Child Elements	Subclause
Any element from any namespace	n/a

12

Attributes	Description
ID (Schema ID)	<p>Specifies the unique name or ID for this attached schema.</p> <p>[<i>Example:</i></p> <pre> ID = "Schema1" end example] </pre>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
Namespace (Schema Root Namespace)	<p>Specifies the namespace used by the schema.</p> <p>[Example:</p> <pre>&lt;MapInfo SelectionNamespaces="..."&gt;   &lt;Schema ID="Schema1" Namespace="..."&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
SchemaRef (Schema Reference)	<p>The schemaRef attribute is used in the specific case where the schema definition happens to include another XSD that contributes to the same namespace. The value of this attribute is the relative path to a "root" XSD on disk which in turn references the other XDS files contributing type definitions to the same namespace.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Schema">
 <sequence>
 <any/>
 </sequence>
 <attribute name="ID" type="xsd:string" use="required"/>
 <attribute name="SchemaRef" type="xsd:string" use="optional"/>
 <attribute name="Namespace" type="xsd:string" use="optional"/>
</complexType>
```

## 3.17 Formulas

### 3.17.1 Introduction

A SpreadsheetML *formula* is an equation that performs a calculation that typically involves the values of one or more cells in one or more worksheets.

A formula is an expression that can contain the following: constants, operators, cell references, calls to functions, and names.

[Example: Consider the formula  $\text{PI}() * (\text{A2}^2)$ . In this case,

- $\text{PI}()$  results in a call to the function  $\text{PI}$ , which returns the value of  $\pi$ .
- The cell reference  $\text{A2}$  returns the value in that cell.
- 2 is a numeric constant.
- The caret (^) operator raises its left operand to the power of its right operand.
- The parentheses, ( and ), are used for grouping.

- The asterisk (\*) operator performs multiplication of its two operands.

*end example]*

### 3.17.2 Syntax

The general syntax of a formula is as follows:

*formula:*

*expression*

*expression:*

*( expression )*

*constant*

*prefix-operator expression*

*expression infix-operator expression*

*expression postfix-operator*

*cell-reference*

*function-call*

*name*

where *expression* is an arbitrarily complex expression involving constants (§3.17.2.1), operators (§0), cell references (§3.17.2.3), calls to functions (§3.17.2.4), and names (§3.17.2.5).

A *token* is the minimal lexical element of a formula. The categories of tokens are: constants (except for *array-constant*), operators, cell references, function names, names, and punctuators. The *punctuators* are:

- Left parenthesis ( ( ) and right parenthesis ( ) ) used for expression grouping and in a function call.
- Comma ( , ) used in a function call and an *array-constant*.
- Left brace ( { }, right brace ( } ), and semicolon ( ; ) used in an *array-constant*.

In a formula, an arbitrary number of space characters (U+0020) can precede the first token or follow the final token. An arbitrary number of space characters can separate two adjacent tokens, except that no space characters shall separate a *function-name* from the left parenthesis ( ( ) that follows it. Such space characters have no effect on the semantics of a formula; however, such spaces shall be distinguished from the space operator (§0).

All arithmetic terms in an *expression* are real numbers. [Example: In the expression 1/3, although the operands appear to be integers, they are, in fact, real numbers, and the result is 0.33..., not 0, as would result from integer division. *end example]*

As ranges of data are fundamental to spreadsheet calculations, many SpreadsheetML functions are able to take arrays as inputs and to return arrays as outputs. The way in which formula return values are returned into the worksheet differs based on whether the formula in a given cell was *array entered* or not, but intermediate calculations are always done for the full arrays when they are used as inputs. The differences with an array-entered formula are:

- No implicit intersection is performed on cell range inputs.

- The results of the formula's calculation can be returned across multiple cells in the sheet.

When a range of cell references is used in a formula that is array-entered in an area larger than that range, the excess cells take on a value of #N/A.

[*Example:* Here are some formulas taking array constants and ranges:

- $(B2:B4*C2:C4)+10.5$  performs three calculations:  $(B2*C2)+10.5$ ,  $(B3*C3)+10.5$ , and  $(B4*C4)+10.5$ .
- $SQRT(\{1,2,3,4\})$  returns 1 when entered normally.
- $SQRT(\{1,2,3,4\})$  returns 1 when array-entered into a single cell, but if it's array-entered in four or more cells in a contiguous row, it will return 1, 1.41, 1.73, and 2 in the first four cells, respectively, and #N/A in any additional cells in the horizontal range for which it was array-entered. (For display purposes, the values returned have been truncated to two decimal places.)
- $SUM(SQRT(\{1,2,3,4\}))$  returns 6.14 when entered normally, since array calculations are always performed by the  $SQRT$  function, and the array output is understood as a valid input by the  $SUM$  function.

With A1:A4 holding the values 1, 2, 3, and 4, respectively:

- $SQRT(A1:A4)$  entered normally will do implicit intersection if it is in any of the rows 1–4, and return the  $SQRT$  of the number in the same row.
- $SQRT(A1:A4)$  returns 1 when array-entered into a single cell, since it does not do implicit intersection in this case. If it's array-entered in multiple cells in a contiguous column, it will return 1, 1.41, 1.73, 2, #N/A, ..., respectively, in the cells in its vertical output range. *end example*

### 3.17.2.1 Constants

A *constant* is a predefined value that is not calculated, and, therefore, does not change. A constant has the following form:

*constant:*

*error-constant*

*logical-constant*

*numerical-constant*

*string-constant*

*array-constant*

*error-constant:*

#DIV/0! | #N/A | #NAME? | #NULL! | #NUM! | #REF! | #VALUE!

*logical-constant:*

FALSE

TRUE

*numerical-constant:*

*whole-number-part* [ *.* ] [ *exponent-part* ]

*.* *fractional-part* [ *exponent-part* ]

*whole-number-part* *.* *fractional-part* [ *exponent-part* ]

*whole-number-part:*

*digit-sequence*

*fractional-part:*

*digit-sequence*

*exponent-part:*

*e* [ *sign* ] *digit-sequence*

*E* [ *sign* ] *digit-sequence*

*sign:*

+

-

*digit-sequence:*

a series of one or more decimal digits

*string-constant:*

" [ *string-chars* ] "

*string-chars*

*string-char*

*string-chars string-char*

*string-char*

""

any character except "

To include a double-quote character (") in *string-chars*, precede it with another double-quote character.

[Example: "ab""cd" contains the characters ab"cd, and """"abcd"""" contains the characters "abcd". *end example*]

An *array constant* is a list of one or more constants organized in one or two dimensions, and delimited by braces. An array constant has the following form:

*array-constant:*

{ *constant-list-rows* }

*constant-list-rows:*

*constant-list-row*

*constant-list-rows ; constant-list-row*

*constant-list-row:*

*constant*

*constant-list-row , constant*

An *array-constant* shall not contain

- An *array-constant*.
- Columns or rows of unequal length.

Any *numerical-constant* in an *array-constant* can be preceded immediately by a *prefix-operator*.

The *constants* in an *array-constant* can have different types.

[Guidance An implementation is encouraged to not unnecessarily limit the number of rows and columns in an *array-constant*. end guidance]

[Example: {1, 3.5, TRUE, "Hello"} is a 1x4 array of constants.

To represent the values 10, 20, 30, and 40, as a 1x4 array, use {10, 20, 30, 40}.

To represent the values 10, 20, 30, and 40 in the first row, and 50, 60, 70, and 80 in the second row, use the following 2x4 array constant: {10, 20, 30, 40; 50, 60, 70, 80}. end example]

*error-constant* is described in §3.17.2.7.

Each *constant* has a corresponding type (§3.17.2.6), as follows:

Constant Form	Type
<i>array-constant</i>	array
<i>error-constant</i>	error
<i>logical-constant</i>	logical
<i>numerical-constant</i>	number
<i>string-constant</i>	text

In the context of cell formulas and values in SpreadsheetML, the following definition of precision shall apply:

By default, default representation of precision shall be as defined by the XML schema double type <http://www.w3.org/TR/xmlschema-2/#double>. The default is therefore 53-bits of mantissa precision.

An application that uses XML schema double can optionally state the precision in the Additional Characteristics part by writing out the number of bits in the mantissa and exponent.

A compliant consumer shall parse numbers of arbitrary precision without error.

### 3.17.2.2 Operators

An *operator* is a symbol that specifies the type of operation to perform on one or more operands. There are arithmetic, comparison, text, and reference operators.

*infix-operator:*

: | , | space | ^ | \* | / | + | - | & | = | <> | < | <= | > | >=

*postfix-operator:*

%

*prefix-operator:*

-

The *operators* permitted in *expression* are:

Operators			
Family	Operator	Description	Precedence

Operators			
Reference operators	:	Binary range operator, which takes two cell reference (§3.17.2.3) operands, and results in one reference to the cells inclusive of, and between, those references. [Example: SUM(B5:C15), which references 11 cells. end example]	highest
	,	Binary union operator, which takes two cell reference (§3.17.2.3) operands, and results in one reference to all those, possibly non-contiguous, cells. [Example: SUM( (B5:B15,D5:D15) )], which references 22 cells, 11 from column B, and 11 from column D. The grouping parentheses are necessary to indicate that the comma is an operator rather than a punctuator separating two arguments. end example]	
	space	Binary intersection operator, which takes two cell reference (§3.17.2.3) operands, and results in one reference to those, possibly non-contiguous, cells that are common. If the intersection is empty, the result is #NULL!. [Example: COUNT( (B1:C1) (C1:D1) ), which results in a reference to C1, while COUNT( (B1:D1) (B1,D1) ) results in a single reference to B1 and D1. end example]	
Arithmetic operators	-	Unary minus	
	%	Percentage (unary postfix), which divides its operand by 100. [Example: 10.5%, which results in 0.105. end example]	
	^	Exponentiation	
	*	Multiplication	
	/	Division	
	+	Addition	
	-	Subtraction	
Text operator	&	Text concatenation (Each of the two operands is converted to text, if necessary, before concatenation.)	
Comparison operators	=	Equal-to	lowest
	<>	Not-equal-to	
	<	Less-than	

Operators			
	<=	Less-than or equal-to	
	>	Greater-than	
	>=	Greater-than-or-equal-to	

*expression* can contain grouping parentheses to document the default precedence or to override it.

*operators* in *expression* having the same precedence associate left-to-right.

[*Example*: Given that cell E38 contains the value 4, and cell F38 contains the value 2, the formula

$((-1+E38^2)*3-F38)/2$

produces the result 21.5. *end example*]

The comparison operators yield TRUE for true and FALSE for false. An expression with value 0 tests logically false while one with any non-zero value tests true.

For any given operator in an expression, if only one operand is an error value, the result is that error value. If more than one operand has an error value and those error values are the same, the result is that error value. If more than one operand has an error value and those error values are not all the same, as to which of those error values is used as the result is unspecified.

If the semantics of an operator having a given operand are not specified by this Standard, the result is #VALUE!.

[*Example*: "abc"+1 results in #VALUE!, and "abc"/0 results in #VALUE! rather than #DIV/0!. *end example*]

### 3.17.2.3 Cell References

Each set of horizontal cells in a worksheet is a *row*, and each set of vertical cells is a *column*. A cell's row and column combination designates the location of that cell. [*Guidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in a worksheet. *end guidance*]

A *cell reference* designates one or more cells on the same worksheet. Using references, one can:

- Use data contained in different parts of the same worksheet in a single formula.
- Use the value from a single cell in several formulas.
- Refer to cells on other sheets in the same workbook, and even to other workbooks. (References to cells in other workbooks are called *links*.)

A cell reference has the following form:

*cell-reference:*

*name*

[ [ [ [ *workbook-name* ] ] [ *sheet-name* : ] ] *sheet-name* ! ] *A1-reference*

[ [ [ [ *workbook-name* ] ] [ *sheet-name* : ] ] *sheet-name* ! ]

*A1-reference* : *A1-reference*

[ [ [ [ *workbook-name* ] ] [ *sheet-name* : ] ] *sheet-name* ! ] *R1C1-reference*

[ [ [ [ *workbook-name* ] ] [ *sheet-name* : ] ] *sheet-name* ! ]

*R1C1-reference* : *R1C1-reference*

*workbook-name:*

*book-name-start-character* [ *book-name-characters* ]

*book-name-start-character:*

any character except ' , \* , [ , ] , : , and ?

*book-name-characters:*

*book-name-characters* *book-name-character*

*book-name-character:*

any character except \* , [ , ] , : , and ?

*sheet-name:*

*sheet-name-start-character* [ *sheet-name-characters* ]

*sheet-name-start-character:*

any character except ' , \* , [ , ] , \ , : , / , and ?

*sheet-name-characters:*

*sheet-name-characters* *sheet-name-character*

*sheet-name-character:*

any character except \* , [ , ] , \ , : , / , and ?

A *relative cell reference* is based on the relative position of the cell that contains the formula and the cell to which the reference refers. If the position of the cell that contains the formula changes, the reference is changed along with it.

An *absolute cell reference* always refers to the absolute location of a cell. If the position of the cell that contains the formula changes, the absolute reference remains the same.

A *mixed cell reference* has either an absolute column and relative row, or an absolute row and relative column.

It is possible to process the same cell or set of cells on multiple worksheets within a workbook, using a 3-D *reference*. A reference of this type is made up of the cell reference, preceded by a range of worksheet names, and an exclamation mark character (!), in that order. A 3-D reference can be used to refer to cells on other sheets, to defined names, and to create formulas by using the following functions: AVERAGE, AVERAGEA, COUNT, COUNTA, MAX, MAXA, MIN, MINA, PRODUCT, STDEV, STDEVA, STDEVP, STDEVPA, SUM, VAR, VARA, VARP, and VARPA.

3-D references shall not be used in multi-cell formulas.

By default, a cell reference is understood to refer to one or more cells in the current worksheet. However, a cell reference can be preceded by its parent worksheet name and an exclamation mark (!), in that order. This allows

cells in one worksheet to be referenced in another worksheet of the same workbook. [*Example*: The cell reference `MonthlyTotals!D1:D12` might be used from within a sibling (or the same) worksheet of `MonthlyTotals` to refer to those 12 cells. *end example*]

An *area* is a set of rectangular-shaped contiguous cells. An area can be a single cell. [*Example*: `A5` and `B6:C10` each designate one area, and `D3:D5, E12:F15` designates two areas (the comma (,) being the union operator). *end example*] [*Note*: The number of areas designated by a cell reference can be obtained by calling the function `AREAS` (§3.17.7.10). *end note*]

There are two cell reference styles: `A1` (§3.17.2.3.1) and `R1C1` (§3.17.2.3.2).

### 3.17.2.3.1 A1-Style Cell References

A cell reference using the `A1` reference style has the following form:

*A1-reference:*

*A1-column*

*A1-row*

*A1-column A1-row*

*A1-column:*

*A1-relative-column*

*A1-absolute-column*

*A1-relative-column:*

A Latin letter A–Z

The Latin letters AA–AZ, BA–BZ, ..., ZA–ZZ, AAA–AAZ, ABA–ABZ, ..., and so on

*A1-absolute-column:*

\$ *A1-relative-column*

*A1-row:*

*A1-relative-row*

*A1-absolute-row*

*A1-relative-row:*

A positive decimal number

*A1-absolute-row:*

\$ *relative-row*

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has an alphabetic heading named sequentially from left-to-right, A–Z, then AA–AZ, BA–BZ, ..., ZA–ZZ, AAA–AAZ, ABA–ABZ, and so on. Column letters are not case-sensitive.

A relative reference to a single cell is written as its column letter immediately followed by its row number. A relative reference to a whole row is written as its row number. A relative reference to a whole column is written as its column letter. A reference to a range of two or more cells is written as two single-cell references separated by the binary range operator (:). An absolute `A1` reference is made up of a cell's column letter followed by its row number, with each being preceded by a dollar character (\$). [*Example*: `A2`, `B34`, and `B5:D8` are relative `A1` references. `$A$2`, `$B$34`, and `$B$5:$D$8` are absolute `A1` references. `$A2`, `B$34`, and `$B5:D$8` are mixed `A1` references. *end example*]

[*Example:* SUM(Sheet2:Sheet13!B5) adds all the values contained in cell B5 on all the worksheets between and including Sheet2 and Sheet13. *end example*]

For rules on how deal with potential ambiguities between cell references and defined names, see §3.17.5.1.

### 3.17.2.3.2 R1C1-Style Cell Reference

A cell reference using the R1C1 reference style has the following form:

*R1C1-reference:*

*R1C1-row*

*R1C1-column*

*R1C1-row R1C1-column*

*R1C1-row:*

*R1C1-relative-row*

*R1C1-absolute-row*

*R1C1-relative-row:*

R [ *R1C1-relative-number* ]

*R1C1-absolute-row:*

R

R *R1C1-absolute-number*

*R1C1-column:*

*R1C1-relative-column*

*R1C1-absolute-column*

*R1C1-relative-column:*

C [ *R1C1-relative-number* ]

*R1C1-absolute-column:*

C

C *R1C1-absolute-number*

*R1C1-relative-number:*

An optionally signed decimal number

*R1C1-absolute-number:*

A positive decimal number

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has a numeric heading numbered sequentially from left-to-right, starting at 1.

A whole row is referenced by omitting the column, and a whole column is referenced by omitting the row. An absolute row or column reference uses absolute row or column numbers, respectively. A relative row or column reference uses, respectively, row or column offsets from the cell containing the formula, with a negative offset indicating a row to the left or a column above, and a positive offset indicateing a row to the right or a column below. Specifying an offset of zero is equivalent to omitting that offset and its delimiting brackets. [*Example:* R[-2]C refers to the cell two rows up and in the same column, R[2]C[2] refers to the cell two rows down and two columns to the right, R2C2 refers to the cell in the second row and in the second column, R[-1] refers to the entire row above the active cell, and R refers to the current row. *end example*]

The R1C1 alternate reference style can only be used at runtime. See §3.17.6.1 for XML-related details.

### 3.17.2.4 Functions

A *function* is a named formula that takes zero or more arguments, performs an operation, and, optionally, returns a result. A function call has the following form:

*function-call:*

*function-name* ( [ *argument-list* ] )

*function-name:*

*predefined-function-name*

*user-defined-function-name*

*predefined-function-name:*

ABS | ACOS | ACOSH | any of the other functions defined in §3.17.7

*user-defined-function-name:*

*letter* [ *user-defined-name-characters* ]

*user-defined-name-characters:*

*user-defined-name-characters* *user-defined-name-character*

*user-defined-name-character:*

*letter*

any decimal digit 0–9

.

*letter:*

any Latin letter A–Z, a–z

*argument-list:*

*argument*

*argument-list* , *argument*

*argument:*

*expression*

*predefined-function-names* and *user-defined-function-names* are not case-sensitive.

A *user-defined-function-name* shall not have any of the following forms:

- TRUE or FALSE
- *name*
- *cell-reference*

[*Guidance*: An implementation is encouraged to support *user-defined-function-names* at least as long as 255 characters. *end guidance*]

The semantics of a call to a function having a *user-defined-function-name* are unspecified.

[*Example*: Here are some function calls: PI( ), POWER(A1,B3), and SUM(C6:C10). *end example*]

An argument to a function can be a call to a function. That is, function calls can nest. [*Guidance* An implementation is encouraged to support at least 64 levels of nested function calls. *end guidance*]

Some functions take a variable number of arguments. This is indicated in the Syntax sections of §3.17.7 by their having *argument-list* as all, or the trailing part, of their argument list. The total number of arguments that shall be passed to such functions is at least 1.

[*Guidance* An implementation is encouraged to support function calls having at least 255 arguments. *end guidance*]

Expressions can have one or more values. Scalar expressions designate a single value, and cell references and array constants can designate multiple values. In the case of a multi-value expression, the way in which this is handled by a function when passed as an argument depends on a number of factors.

Most functions and operators expect either single- or multi-valued arguments and perform all of the array calculations whenever multi-valued arguments are present. [*Example*: `SQRT({1;2;3;4})`; see the examples in §3.17.2. *end example*]

When a function expects a single-valued argument but a multi-valued expression is passed, an attempt can be made to convert that set of values to a single value. For an array value or constant, the value of the expression is the value of the first element within that array value or constant. For a cell range, the first element can be used, or implicit intersection can be performed—the exact behavior is unspecified.

When a function expects a multi-valued argument but a single-valued expression is passed, that single-valued argument is treated as a 1x1 array.

For rules on how deal with potential ambiguities between function names and defined names, see §3.17.5.1.

### 3.17.2.5 Names

A *name* is an alias for a constant, a cell reference, or a formula. [*Note*: A name in a formula can make it easier to understand the purpose of that formula. For example, the formula `SUM(FirstQuarterSales)` is easier to identify than `SUM(C20:C30)`. *end note*]

Here is the syntax for *name*:

```

name:
 [workbook-name !] name-start-character [name-characters]

name-start-character:
 letter
 —
 \

name-characters:
 name-characters name-character

name-character:
 letter
 any decimal digit 0–9
 —
 .

```

*names* are not case-sensitive.

All *names* within a workbook shall be unique. If the same *names* are defined in two workbooks, both *names* can be used in the same context by prefixing them with their corresponding workbook name and an exclamation mark (!). [Example: SUM(Sales.xlsx!ProjectedSales) refers to the named range ProjectedSales in the workbook named Sales.xlsx. end example]

A *name* shall not have any of the following forms:

- TRUE or FALSE
- *user-defined-function-name*
- *cell-reference*

[Guidance An implementation is encouraged to support *names* at least as long as 255 characters. end guidance]

For rules on how deal with potential ambiguities between function names and defined names, or between cell references and defined names, see §3.17.5.1.

### 3.17.2.6 Types and Values

Each *expression* has a type. SpreadsheetML formulas support the following types: array, error, logical, number, and text.

An array value or constant represents a collection of one or more elements, whose values can have any type (i.e., the elements of an array need not all have the same type).

An error value (§3.17.2.7) or constant represents an error, and can have any value defined for *error-constant* (§3.17.2.1).

A logical value or constant represents a truth value, and can have any value defined for *logical-constant* (§3.17.2.1).

A numeric value or constant represents a real number, and can have any value defined for *numeric-constant* (§3.17.2.1). The term "number" is used as a generic name for any expression of type *number*.

A text value or constant represents arbitrary text, and can have any value defined for *string-constant* (§3.17.2.1). The term "string" is used as a generic name for any expression of type *text*.

An implementation is permitted to provide an implicit conversion from *string-constant* to number. However, the rules by which such conversions take place are implementation-defined. [Example: An implementation might choose to accept "123"+10 by converting the string "123" to the number 123. Such conversions might be locale-specific in that a *string-constant* such as "10,56" might be converted to 10.56 in some locales, but not in others, depending on the radix point character. end example]

[Guidance An implementation is encouraged to support strings at least as long as 32,767 characters. end guidance]

A complex number is represented as a string in one of two equivalent text formats:  $x + yi$  or  $x + yj$ , where  $x$  is the real part, and  $y$  is the imaginary part. [Example: "3+4i" and "-2.5-34.6j" end example]

### 3.17.2.7 Single- and Multi-Cell Formulas

A single-cell formula is applied to a single cell while a multi-cell formula is applied to a range of cells as a group.

When a single-cell formula results in a single value, the designated cell takes on that value. [Example: When cell A10 contains  $\text{SIN}(0.3)$ , the result stored in that cell is 0.295520207. end example]

When a multi-cell formula results in a single value, each of the designated cells takes on that value. [Example: When the group of cells A10:A12 contains  $\text{SIN}(0.3)$ , the result stored in each of those cells is 0.295520207. end example]

When a single-cell formula results in multiple values, the designated cell takes on the first of those values. [Example: When cell A10 contains  $\text{SIN}(\{0.3, 0.4, 0.5\})$ , the result stored in that cell is 0.295520207 ( $\text{SIN}(0.3)$ ). end example]

When a multi-cell formula results in multiple values (such as when the multi-cell formula is array-entered), the designated cells take on corresponding values, according to the shape of the cell group and the values. Specifically,

- If the cell group and values have the same shape (i.e., the same number of rows and columns), each cell takes on the value corresponding to its relative position.
- If the cell group has fewer columns than the values, the left-most columns of the values are stored in the cells.
- If the cell group has fewer rows than the values, the top-most rows of the values are stored in the cells.
- If the cell group has more columns than the values, each cell takes on the value corresponding to its relative position, except that
  - For a cell group  $1 \times N$  array or a two-dimensional array, the excess right-most cells take on an unspecified value.
  - For a cell group  $N \times 1$  array, the excess columns are clones of the first column.
- If the cell group has more rows than the values, each cell takes on the value corresponding to its relative position, except that:
  - For a cell group  $N \times 1$  array or a two-dimensional array, the excess bottom-most cells take on an unspecified value.
  - For a cell group  $1 \times N$  array, the excess rows are clones of the first row.

[Example: Case 1: The  $1 \times 3$  group of cells A20:C20 has applied to it the formula  $\text{SIN}(\{0.3, 0.4, 0.5\})$ . The number of rows and columns in the group exactly matches the number of rows and columns in the result. Those cells then contain 0.295520207, 0.389418342, and 0.479425539, which correspond to  $\text{SIN}(0.3)$ ,  $\text{SIN}(0.4)$ , and  $\text{SIN}(0.5)$ , respectively.

Case 2: The 1x2 group of cells A20:B20 has applied to it the formula  $\text{SIN}(\{0.3, 0.4, 0.5\})$ . The number of columns in the group is less than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207 and 0.389418342, which correspond to  $\text{SIN}(0.3)$  and  $\text{SIN}(0.4)$ , respectively, the left-most part of the set of values.

Case 3: The 1x4 group of cells A20:D20 has applied to it the formula  $\text{SIN}(\{0.3, 0.4, 0.5\})$ . The number of columns in the group is greater than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207, 0.389418342, 0.479425539, and an unspecified value, which correspond to  $\text{SIN}(0.3)$ ,  $\text{SIN}(0.4)$ , and  $\text{SIN}(0.5)$ , respectively, with the fourth value being unspecified.

Case 4: The 2x2 group of cells A30:B31 has applied to it the formula  $\text{SIN}(\{0.1, 0.2, 0.3\})$ . The number of columns in the group is less than the number of columns in the result. As a result, the cells in row 30 contain 0.295520207 and 0.389418342, which correspond to  $\text{SIN}(0.3)$  and  $\text{SIN}(0.4)$ , respectively. The number of rows in the group is greater than the number of rows in the result, so the cells in 31 are a copy of the cells in row 30. The left-most part of the set of values is propagated into the cells.

Case 5: The 2x2 group of cells A40:B41 has applied to it the formula  $\text{SIN}(\{0.1, 0.2, 0.3; 0.4, 0.5, 0.6; 0.7, 0.8, 0.9\})$ . The number of columns in the group is less than the number of columns in the result. As a result, the left-most column values are stored. The number of rows in the group is less than the number of rows in the result. As a result, the top-most column values are stored. *example*

### 3.17.3 Error values

The evaluation of an expression can result in an error having one of a number of *error values*. These error values are:

Error Value	Reason for Occurrence
#DIV/0!	Intended to indicate when any number, including zero, is divided by zero. [ <i>Note</i> : However, any error code divided by zero results in that error code. <i>end note</i> ]
#N/A	Intended to indicate when a designated value is not available. [ <i>Example</i> : Some functions, such as SUMX2MY2, perform a series of operations on corresponding elements in two arrays. If those arrays do not have the same number of elements, then for some elements in the longer array, there are no corresponding elements in the shorter one; that is, one or more values in the shorter array are not available. <i>end example</i> ] This error value can be produced by calling the function NA (§3.17.7.221).
#NAME?	Intended to indicate when what looks like a name is used, but no such name has been defined. [ <i>Example</i> : XYZ/3, where XYZ is not a defined name. Total is & A10, where neither Total nor is is a defined name. Presumably, "Total is " & A10 was intended. SUM(A1C10), where the range A1:C10 was intended. <i>end example</i> ]
#NULL!	Intended to indicate when two areas are required to intersect, but do not. [ <i>Example</i> : In the case of SUM(B1 C1), the space between B1 and C1 is treated as the binary intersection operator, when a comma was intended. <i>end example</i> ]
#NUM!	Intended to indicate when an argument to a function has a compatible type, but has a

Error Value	Reason for Occurrence
	value that is outside the domain over which that function is defined. (This is known as a <i>domain error</i> .) [Example: Certain calls to ASIN, ATANH, FACT, and SQRT might result in domain errors. <i>end example</i> ] Intended to indicate that the result of a function cannot be represented in a value of the specified type, typically due to extreme magnitude. (This is known as a <i>range error</i> .) [Example: FACT(1000) might result in a range error. <i>end example</i> ]
#REF!	Intended to indicate when a cell reference is invalid. [Example: If a formula contains a reference to a cell, and then the row or column containing that cell is deleted, a #REF! error results. If a worksheet does not support 20,001 columns, OFFSET(A1,0,20000) will result in a #REF! error. <i>end example</i> ]
#VALUE!	Intended to indicate when an incompatible type argument is passed to a function, or an incompatible type operand is used with an operator. [Example: In the case of a function argument, text was expected, but a number was provided <i>end example</i> ]

Each error value has a corresponding *error-constant* (§3.17.2.1).

[Note: A number of functions operate on error values: They include ERROR.TYPE (§3.17.7.109), ISERR (§3.17.7.174), ISERROR (§3.17.7.175), and ISNA (§3.17.7.178). *end note*]

### 3.17.4 Dates and Times

Each unique instant in SpreadsheetML time is represented as a distinct non-negative numeric *serial value*, which is made up of an integer date component and a fractional time component. As dates and times are numeric values, they can take part in arithmetic operations.

Numerous functions take as arguments one or more serial values or strings representing dates and/or times. Functions that care only about the date shall ignore any time information that is provided. Functions that care only about the time shall ignore any date information that is provided.

#### 3.17.4.1 Date Representation

Going forward in time, the date component of a serial value increases by 1 each day.

There are two different bases for serial values:

- In the *1900 date base system*, the lower limit is January 1, 1900, which has serial value 1. The upper-limit is December 31, 9999, which has serial value 2,958,465.
- In the *1904 date base system*, the lower limit is January 1, 1904, which has serial value 0. The upper-limit is December 31, 9999, which has serial value 2,957,003.

A serial value outside of the range for its date base system is ill-formed.

As to which date base system an implementation uses by default or whether it allows its users to switch between date base systems, is unspecified. See §3.17.6.7 for XML-related details. [Note: As the XML allows either date base system to be used, an implementation must be able to deal with both systems. *end note*]

For legacy reasons, an implementation using the 1900 date base system shall treat 1900 as though it was a leap year. [Note: That is, serial value 59 corresponds to February 28, and serial value 61 corresponds to March 1, the next day, allowing the (non-existent) date February 29 to have the serial value 60. *end note*] A consequence of this is that for dates between January 1 and February 28, WEEKDAY shall return a value for the day immediately prior to the correct day, so that the (non-existent) date February 29 has a day-of-the-week that immediately follows that of February 28, and immediately precedes that of March 1.

[Example: For the 1900 date base system:

DATEVALUE("01-Jan-1900") results in the serial value 1.0000000...  
 DATEVALUE("03-Feb-1910") results in the serial value 3687.0000000...  
 DATEVALUE("01-Feb-2006") results in the serial value 38749.0000000...  
 DATEVALUE("31-Dec-9999") results in the serial value 2958465.0000000...

For the 1904 date base system:

DATEVALUE("01-Jan-1904") results in the serial value 0.0000000...  
 DATEVALUE("03-Feb-1910") results in the serial value 2225.0000000...  
 DATEVALUE("01-Feb-2006") results in the serial value 37287.0000000...  
 DATEVALUE("31-Dec-9999") results in the serial value 2957003.0000000...

*end example]*

#### 3.17.4.2 Time Representation

The time component of a serial value ranges in value from 0–0.99999999, and represents times from 0:00:00 (12:00:00 AM) to 23:59:59 (11:59:59 P.M.), respectively.

Going forward in time, the time component of a serial value increases by 1/86,400 each second. [Note: As such, the time 12:00 has a serial value time component of 0.5. *end note*]

[Example:

TIMEVALUE("00:00:00") results in the serial value 0.0000000...  
 TIMEVALUE("00:00:01") results in the serial value 0.0000115...  
 TIMEVALUE("10:05:54") results in the serial value 0.4207639...  
 TIMEVALUE("12:00:00") results in the serial value 0.5000000...  
 TIMEVALUE("23:59:59") results in the serial value 0.9999884...

*end example]*

#### 3.17.4.3 Combined Date and Time Representation

Any date component can be added to any time component to produce a serial value for that date/time combination.

[*Example:* For the 1900 date base system:

DATE(1910,2,3)+TIME(10,5,54) results in the serial value 3687.4207639...

DATE(1900,1,1)+TIME(12,0,0) results in the serial value 1.5000000...

DATE(9999,12,31)+TIME(23,59,59) results in the serial value 2958465.9999884...

For the 1904 date base system:

DATE(1910,2,3)+TIME(10,5,54) results in the serial value 2225.4207639...

DATE(1904,1,1)+TIME(12,0,0) results in the serial value 0.5000000...

DATE(9999,12,31)+TIME(23,59,59) results in the serial value 2957003.9999884...

*end example]*

### 3.17.5 Limits and Precision

#### 3.17.5.1 Limits

In SpreadsheetML, cell references range from column A1–A1048576 (column A:A) to column XFD1–XFD1048576 (column XFD:XFD).

An implementation can extend this range. However, to avoid ambiguities, it is necessary to ensure that defined names are distinct from cell references, or that one takes precedence over the other. With this in mind, the following rules apply:

- A producer or consumer shall consider a defined name of the form used by cells in the range A1–XFD1048576 to be invalid.
- All other names outside this range can be defined names and shall override a cell reference if an ambiguity exists.

[*Example:* LOG10 is always a cell reference, LOG10(...) is always a formula, and LOG01000 can be a defined name that overrides a cell reference. *end example]*

#### 3.17.5.2 Precision

In order to clarify the semantics of cell formulas and values in SpreadsheetML, it is necessary to specify the precision of the numbers being represented in the file format. These numbers are therefore regarded as ranging over a specific value space, which defaults to the following:

The *value space* consists of the values  $m \times 2^n$ , where  $m$  is an integer whose absolute value is less than  $2^{53}$ , and  $n$  is an integer between -1075 and 970, inclusive.  $m$  is herein referred to as the *binary mantissa*, and  $n$  is herein referred to as the *binary exponent*.

[*Note:* The default precision is patterned after the IEEE double-precision 64-bit floating-point type [IEEE 754-1985]. *end note]*

Implementing applications can use the characteristics markup (§7.7) to specify other value spaces to replace the default in a given workbook. When present in the workbook, the value space defined using the characteristics markup overrides the default value space.

Regardless of the specific value space in use, values shall have a lexical representation as described in §3.17.5.3. Any numerical expression conforming to this lexical description is valid. However, numbers of higher precision than available in the value space, and numbers that lie outside the range representable in the value space shall be loaded as numbers in the value space or otherwise handled according to the prescription in §3.17.5.4.

### 3.17.5.3 Lexical Representation

The value space shall have a lexical representation consisting of a base 10 mantissa followed, optionally, by the character "E" or "e", followed by a base 10 exponent. The exponent shall be an integer. The mantissa shall be a decimal number. The representations for exponent and mantissa shall follow the lexical rules for integer and decimal below. If the "E" or "e" and the following exponent are omitted, an exponent value of 0 is assumed.

Lexical representations for zero can take a positive or negative sign.

[*Example*: -1E4, 1267.43233E12, 12.78e-2, 12, -0, and 0 are all valid literals for numbers in the default value space. 4503599627370497.5 is also a valid literal, although it represents the same value as 4503599627370497 (2<sup>52</sup> + 1) in the default value space (as explained in §3.17.5.4). *end example*]

An *Integer* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) with an optional leading sign. If the sign is omitted, "+" is assumed. [*Example*: -1, 0, 12678967543233, +100000. *end example*]

A *Decimal Number* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) separated by a period as a decimal indicator. An optional leading sign is allowed. If the sign is omitted, "+" is assumed. Leading and trailing zeroes are optional. If the fractional part is zero, the period and following zero(s) can be omitted. [*Example*: -1.23, 12678967.543233, +100000.00, 210. *end example*]

### 3.17.5.4 Interpretation

Strings that are valid according to the lexical definition in §3.17.5.3 shall be interpreted as values in the value space as follows:

18. The mantissa shall be interpreted as a real number expressed in base 10

19. The exponent shall be interpreted as an integer expressed in base 10

20. The raw value for a numerical expression shall be interpreted as

mantissa x 10<sup>exponent</sup>

21. If the raw value is larger than the largest value in the value space (2<sup>1023</sup> - 1, by default), or smaller than the smallest value in the value space (- 2<sup>1023</sup> + 1, by default), then a consuming application shall treat this as equivalent to the error value #NUM! (§3.17.3). Otherwise the value in the value space that is closest to the raw value is chosen as the interpretation. In the case that two values are equally close, the one with the smaller absolute value is chosen.

## 3.17.6 XML Representation

### 3.17.6.1 Cell Reference Style

A workbook saved with reference style A1 (§3.17.2.3.1), shall have the refMode attribute of the calcPr element (§3.2.2) in the Workbook part's XML omitted or set to A1. A workbook saved with reference style R1C1 (§3.17.2.3.2) shall have that refMode attribute set to R1C1. [Example: With R1C1 mode set, here is how the XML might look:

```
<workbook ...>
 ...
 <calcPr calcId="122211" fullCalcOnLoad="1" refMode="R1C1"/>
 ...
</workbook>
```

*end example]*

Regardless of the value of the refMode attribute, cell references shall be stored in XML in the A1 form. [Note: This attribute's value tells an implementation which reference style to use at runtime. *end note]*

### 3.17.6.2 Scalar Formulas

A scalar formula shall be represented in a worksheet's XML by an f element that contains the text of the formula, and a v element that contains the text version of the last computed value for that formula. This pair of elements shall be inside a c element, which is, in turn, shall be inside a row element. [Example: Consider the scalar formula  $\text{SQRT}(C2^2 + D2^2)$ , where C2 refers to a cell containing the number 12.5, and D2 refers to a cell containing the number 9.6. The corresponding XML might be as follows:

```
<row r="2" spans="2:4">
 <c r="B2" s="40">
 <f>SQRT(C2^2+D2^2)</f>
 <v>15.761027885261798</v>
 </c>
 <c r="C2" s="0">
 <v>12.5</v>
 </c>
 <c r="D2" s="0">
 <v>9.6</v>
 </c>
</row>
```

In the scalar formula `CONCATENATE("The total is ",C7," units")`, C7 refers to a cell containing the number 23. The corresponding XML might be as follows:

```

1 <row r="7" spans="2:4" ht="285">
2 <c r="B7" s="4" t="str">
3 <f>CONCATENATE("The total is ",C7," units")</f>
4 <v>The total is 23 units</v>
5 </c>
6 <c r="C7" s="0">
7 <v>23</v>
8 </c>
9 </row>

```

As the function CONCATENATE returns a string, the value for the cell's t attribute is str.

*end example]*

### 3.17.6.3 Array Formulas

An array-entered formula shall be represented in XML just like other formulas, except that the array-entered formula's f element shall contain an attribute t, whose value shall be array.

For a single-cell formula, the r attribute shall designate that cell. [*Example:* Consider the array formula SUM(C11:C12\*D11:D12). The corresponding XML might be as follows:

```

17 <row r="11" spans="2:4" ht="300">
18 <c r="B11" s="16">
19 <f t="array" r="B11">SUM(C11:C12*D11:D12)</f>
20 <v>110</v>
21 </c>
22 <c r="C11" s="4">
23 <v>10</v>
24 </c>
25 <c r="D11" s="0">
26 <v>3</v>
27 </c>
28 </row>
29 <row r="12" spans="2:4" ht="285">
30 <c r="C12" s="4">
31 <v>20</v>
32 </c>
33 <c r="D12" s="0">
34 <v>4</v>
35 </c>
36 </row>

```

As this formula is a single-cell formula, the r attribute contains the name of that cell, B11. *end example]*

For a multi-cell formula, the *r* attribute of the top-left cell of the range of cells to which that formula applies shall designate the range of cells to which that formula applies. The *c* elements for all cells except the top-left cell in that range shall not have an *f* element; however, they shall each have a *v* element. [Example: Consider the array formula A1:A3\*B1:B3, which is applied to the cell range C1:C3. The corresponding XML might be as follows:

```
<row r="1" spans="1:3">
 <c r="A1" s="0">
 <v>112</v>
 </c>
 <c r="B1" s="0">
 <v>2.34</v>
 </c>
 <c r="C1" s="0">
 <f t="array" r="C1:C3">A1:A3*B1:B3</f>
 <v>262.08</v>
 </c>
</row>
<row r="2" spans="1:3">
 <c r="A2" s="0">
 <v>209</v>
 </c>
 <c r="B2" s="0">
 <v>1.28</v>
 </c>
 <c r="C2" s="0">
 <v>267.52</v>
 </c>
</row>
<row r="3" spans="1:3">
 <c r="A3" s="0">
 <v>128</v>
 </c>
 <c r="B3" s="0">
 <v>3.12</v>
 </c>
 <c r="C3" s="0">
 <v>399.36</v>
 </c>
</row>
```

As this formula is a multi-cell formula, the *r* attribute of cell C1 contains the name of that cell range, C1:C3, and cells C2 and C3 do not have an *f* element. *end example*]

#### 3.17.6.4 Formula Evaluation Order

The order in which formulas are evaluated is determined by the order of their corresponding *c* elements in the *calcChain* element of the Calculation Chain part (§3.6.2).

### 3.17.6.5 Name Representation

A formula can contain one or more names. These names shall be defined in the Worksheet part's XML with each being the subject of a `definedName` element, inside a `definedNames` element. [Example: Consider the scalar formula `SUM(value1,value2)`. The corresponding XML might be as follows:

```
<definedNames>
 <definedName name="value1" localSheetId="0">Sheet2!B2</definedName>
 <definedName name="value2" localSheetId="0">Sheet2!B3</definedName>
</definedNames>
...
<c r="E5" s="0">
 <f ce="1">SUM(value1,value2)</f>
 <v>8</v>
</c>
```

*end example]*

Each name shall be the subject of an `lpstr` element in the Application-Defined File Properties part.

```
<TitlesOfParts>
 <vt:vector ... baseType="lpstr">
 <vt:lpstr>Sheet1</vt:lpstr>
 <vt:lpstr>Sheet2</vt:lpstr>
 <vt:lpstr>Sheet3</vt:lpstr>
 <vt:lpstr>value1</vt:lpstr>
 <vt:lpstr>value2</vt:lpstr>
 </vt:vector>
</TitlesOfParts>
```

### 3.17.6.6 Value Representation

The most recent value of a formula shall be stored in the corresponding `v` element, as follows:

Result Type	Representation
array	The text form of the array's value.
error	The text form of the error value.
logical	The text 0 for FALSE and 1 for TRUE.
number	The unformatted text form of the number, as accurately as possible.
text	All of the characters in the text.

### 3.17.6.7 Dates and Times

As a date and/or time is represented by a number, a date/time serial value shall be stored in XML as the unformatted text form of that number, as accurately as possible.

The date base system is recorded in the Workbook part's XML by the presence or absence of the date1904 attribute of the workbookPr element. A value of 1 for this attribute indicates 1904. [Example:

1900: <workbookPr showObjects="all"/>

1904: <workbookPr date1904="1" showObjects="all"/>

end example]

### 3.17.7 Predefined Function Definitions

The **Syntax** entry for each function defined in this clause corresponds to a call to that function. The names in any **Syntax** entry typeset as in *number* and *string-l*, are parameter names for that function, and are local to that function definition's description.

When the type of an argument passed to a function is incompatible with the type expected the error value #VALUE! is returned by that function.

The set of predefined functions is divided into the following functional categories:

Category	Formulas
Cube	CUBEKPIMEMBER (§3.17.7.65), CUBEMEMBER (§3.17.7.65), CUBEMEMBERPROPERTY (§3.17.7.66), CUBERANKEDMEMBER (§3.17.7.67), CUBESET (§3.17.7.68), CUBESETCOUNT (§3.17.7.69), CUBEVALUE (§3.17.7.70)
Database	DAVERAGE (§3.17.7.77), DCOUNT (§3.17.7.80), DCOUNTA (§3.17.7.81), DGET (§3.17.7.90), DMAX (§3.17.7.91), DMIN (§3.17.7.92), DPRODUCT (§3.17.7.96), DSTDEV (§3.17.7.97), DSTDEVP (§3.17.7.98), DSUM (§3.17.7.99), DVAR (§3.17.7.101), and DVARP (§3.17.7.102).
Date and Time	DATE (§3.17.7.73), DATEDIF (§3.17.7.75), DATEVALUE (§3.17.7.75), DAY (§3.17.7.77), DAYS360 (§3.17.7.79), EDATE (§3.17.7.103), EOMONTH (§3.17.7.105), HOUR (§3.17.7.142), MINUTE (§3.17.7.211), MONTH (§3.17.7.217), NETWORKDAYS (§3.17.7.223), NOW (§3.17.7.231), SECOND (§3.17.7.284), TIME (§3.17.7.320), TIMEVALUE (§3.17.7.321), TODAY (§3.17.7.322), WEEKDAY (§3.17.7.340), WEEKNUM (§3.17.7.342), WORKDAY (§3.17.7.343), YEAR (§3.17.7.346), and YEARFRAC (§3.17.7.348)
Engineering	BESSELI (§3.17.7.23), BESSELJ (§3.17.7.24), BESSELK (§3.17.7.25), BESSELY (§3.17.7.26), BIN2DEC (§3.17.7.29), BIN2HEX (§3.17.7.30), BIN2OCT (§3.17.7.31), COMPLEX (§3.17.7.45), CONVERT (§3.17.7.48), DEC2BIN (§3.17.7.83), DEC2HEX (§3.17.7.85), DEC2OCT (§3.17.7.86), DELTA (§3.17.7.88), ERF (§3.17.7.107), ERFI (§3.17.7.108), GESTEP (§3.17.7.135), HEX2BIN (§3.17.7.138), HEX2DEC (§3.17.7.140), HEX2OCT (§3.17.7.141), IMABS (§3.17.7.148), IMAGINARY (§3.17.7.149), IMARGUMENT (§3.17.7.150), IMCONJUGATE (§3.17.7.151), IMCOS (§3.17.7.152), IMDIV (§3.17.7.153), IMEXP (§3.17.7.154), IMLN (§3.17.7.155), IMLOG10 (§3.17.7.156), IMLOG2 (§3.17.7.157), IMPOWER (§3.17.7.158), IMPRODUCT (§3.17.7.159), IMREAL

### 3.17.7.1 ABS

#### Syntax:

ABS ( *x* )

**Description:** Computes the absolute value of *x*.

#### Arguments:

Name	Type	Description
<i>x</i>	number	The value whose absolute value is to be determined.

**Return Type and Value:** number – The absolute value of *x*.

[*Example:*

ABS(10.5) results in 10.5

ABS(0) results in 0

ABS(-10.5) results in 10.5

*end example]*

### 3.17.7.2 ACCRINT

#### Syntax:

ACCRINT ( *issue* , *first-interest* , *settlement* , *rate* , [ *par* ] , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the accrued interest for a security that pays periodic interest.

#### Mathematical Formula:

$$ACCRINT = par \times \frac{rate}{frequency} \times \sum_{i=1}^{NC} \frac{A_i}{NL_i}$$

where:

*A<sub>i</sub>* = number of accrued days for the *i*<sup>th</sup> quasi-coupon period within odd period.

*NC* = number of quasi-coupon periods that fit in odd period. If this number contains a fraction, raise it to the next whole number.

*NL<sub>i</sub>* = normal length in days of the *i*<sup>th</sup> quasi-coupon period within odd period.

1 **Arguments:**

Name	Type	Description												
<i>issue</i>	number	The security's issue date.												
<i>first-interest</i>	number	The security's first interest date.												
<i>settlement</i>	number	The security's settlement date.												
<i>rate</i>	number	The security's annual coupon rate.												
<i>par</i>	number	The security's par value. If omitted, 1,000 is used.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

2

3 Time information in the date arguments is ignored.

4 **Return Type and Value:** number – The accrued interest for a security that pays periodic interest.

5 However, if

- 6 • *issue*, *first-interest*, or *settlement* is out of range for the current date base value, #NUM! is returned
- 7 • *issue*  $\geq$  *settlement*, #NUM! is returned
- 8 • *rate* or *par*  $\leq$  0, #NUM! is returned
- 9 • *frequency* is any number other than 1, 2, or 4, #NUM! is returned
- 10 • *basis*  $<$  0 or *basis*  $>$  4, #NUM! is returned

11 [Example:

12

13 ACCRINT (DATE (2006,3,1),DATE (2006,9,1),DATE (2006,5,1),0.1,1100,2,0) results in 18.33

14 ACCRINT (DATE (2006,3,1),DATE (2006,9,1),DATE (2006,5,1),0.1,,2,0) results in 16.67

15

16 end example]

## 3.17.7.3 ACCRINTM

**Syntax:**

ACCRINTM ( *issue* , *settlement* , *rate* , [ [ *par* ] [ , [ *basis* ] ] ] )

**Description:** Computes the accrued interest for a security that pays interest at maturity.

**Mathematical Formula:**

$$ACCRINTM = par \times rate \times \frac{A}{D}$$

where:

A = Number of accrued days counted according to a monthly basis. For interest at maturity items, the number of days from the issue date to the maturity date is used.

D = Annual Year Basis.

**Arguments:**

Name	Type	Description												
<i>issue</i>	number	The security's issue date.												
<i>settlement</i>	number	The security's settlement date.												
<i>rate</i>	number	The security's annual coupon rate.												
<i>par</i>	number	The security's par value. If omitted, 1,000 is used.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The accrued interest for a security that pays interest at maturity.

However, if

- issue* or *settlement* is out of range for the current date base value, #NUM! is returned
- issue* ≥ *settlement*, #NUM! is returned

- *rate* or *par*  $\leq 0$ , #NUM! is returned
- *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned

[Example:

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,1100,0) results in 18.33333333

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,,0) results in 16.66666667

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,) results in 16.66666667

end example]

#### 3.17.7.4 ACOS

**Syntax:**

ACOS ( *x* )

**Description:** Computes the arc cosine of *x*.

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value whose arc cosine is to be determined.

**Return Type and Value:** number – The arc cosine of *x*.

However, if *x* is outside the interval [-1,+1], #NUM! is returned

[Example:

ACOS(-1) results in 3.141592654

ACOS(0) results in 1.570796327

ACOS(1) results in 0

end example]

#### 3.17.7.5 ACOSH

**Syntax:**

ACOSH ( *x* )

**Description:** Computes the inverse hyperbolic cosine of *x*.

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
$x$	number	The value whose inverse hyperbolic cosine is to be determined.

1

2 **Return Type and Value:** number – The inverse hyperbolic cosine of  $x$ .3 However, if  $x < 1$ , #NUM! is returned.

4 [Example:

5

6 ACOSH(1) results in 0

7 ACOSH(10) results in 2.993222846

8 ACOSH(100) results in 5.298292366

9

10 end example]

11 **3.17.7.6 ADDRESS**12 **Syntax:**

13 ADDRESS ( *row-number* , *col-number* [ , [ *ref-type* ] [ , [ *A1-ref-style-flag* ]  
 14 [ , *sheet-name* ] ] )

15 **Description:** Creates a cell address, given the specified row and column numbers.16 **Arguments:**

Name	Type	Description										
<i>row-number</i>	number	The number of the row.										
<i>col-number</i>	number	The number of the column.										
<i>ref-type</i>	number	<div>The type of reference to return, as follows:<table><tr><th>Value</th><th>Type of Reference Returned</th></tr><tr><td>1 or omitted</td><td>Absolute row and column</td></tr><tr><td>2</td><td>Absolute row; relative column</td></tr><tr><td>3</td><td>Relative row; absolute column</td></tr><tr><td>4</td><td>Relative row and column</td></tr></table></div>	Value	Type of Reference Returned	1 or omitted	Absolute row and column	2	Absolute row; relative column	3	Relative row; absolute column	4	Relative row and column
Value	Type of Reference Returned											
1 or omitted	Absolute row and column											
2	Absolute row; relative column											
3	Relative row; absolute column											
4	Relative row and column											
<i>A1-ref-style-flag</i>	logical	The style of the reference. If TRUE or omitted, an A1-style reference (§3.17.2.3.1) is returned; otherwise, an R1C1-style reference (§3.17.2.3.2) is returned.										
<i>sheet-name</i>	text	The name of the worksheet to be used. If omitted, no										

Name	Type	Description
		sheet name is used.

**Return Type and Value:** text – A cell address, given the specified row and column numbers.

However, if

- *row-number* or *col-number* < 1, #NUM! is returned.
- *ref-type* is outside the range 1–4, #NUM! is returned.

[Example:

In A1-reference style mode:

ADDRESS(5,7,1) results in \$G\$5

ADDRESS(5,7,2) results in G\$5

ADDRESS(5,7,3) results in \$G5

ADDRESS(5,7,4) results in G5

ADDRESS(5,7,,,"Sheet1") results in Sheet1!\$G\$5

In R1C1-reference style mode:

ADDRESS(5,7,1,FALSE) results in R5C7

ADDRESS(5,7,2,FALSE) results in R5C[7]

ADDRESS(5,7,3,FALSE) results in R[5]C7

ADDRESS(5,7,4,FALSE) results in R[5]C[7]

end example]

### 3.17.7.7 AMORDEGRC

**Syntax:**

AMORDEGRC ( *cost* , *date-purchased* , *first-period* , *salvage* , *period* ,  
*rate* [ , [ *basis* ] ] )

**Description:** Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account. The function is similar to AMORLINC (§3.17.7.7), except that a depreciation coefficient is applied in the calculation depending on the life of the assets.)

**Arguments:**

Name	Type	Description
<i>cost</i>	number	The cost of the asset.

Name	Type	Description												
<i>date-purchased</i>	number	The date of the purchase of the asset.												
<i>first-period</i>	number	The date of the end of the first period.												
<i>salvage</i>	number	The salvage value at the end of the life of the asset.												
<i>period</i>	number	The period.												
<i>rate</i>	number	The rate of depreciation.												
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

1

2 **Return Type and Value:** number – The depreciation for each accounting period.

3 However, if

- 4 • *cost*, *salvage*, *period*, or *rate* < 0, #NUM! is returned.
- 5 • *date-purchased* or *first-period* is out of range for the current date base value, #NUM! is returned.
- 6 • *basis* < 0 or *basis* > 4, #NUM! is returned.
- 7 • The life of the assets is between 0 and 1, 1 and 2, 2 and 3, or 4 and 5, #NUM! is returned.

8 This function returns the depreciation until the last period of the life of the assets or until the cumulated value

9 of depreciation is greater than the cost of the assets minus the salvage value.

10 The depreciation coefficients are:

Life of assets (1/rate)	Depreciation Coefficient
Between 3 and 4 years	1.5
Between 5 and 6 years	2
More than 6 years	2.5

11

12 The depreciation rate grows to 50 percent for the period preceding the last period, and grows to 100 percent for

13 the last period.

[Example:

AMORDEGRC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1) results in 776.00

end example]

### 3.17.7.8 AMORLINC

#### Syntax:

AMORLINC ( *cost* , *date-purchased* , *first-period* , *salvage* , *period* ,  
*rate* [ , [ *basis* ] ] )

**Description:** Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account.)

#### Arguments:

Name	Type	Description												
<i>cost</i>	number	The cost of the asset.												
<i>date-purchased</i>	number	The date of the purchase of the asset.												
<i>first-period</i>	number	The date of the end of the first period.												
<i>salvage</i>	number	The salvage value at the end of the life of the asset.												
<i>period</i>	number	The period.												
<i>rate</i>	number	The rate of depreciation.												
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

**Return Type and Value:** number – The depreciation for each accounting period.

However, if:

- cost*, *salvage*, *period*, or *rate* < 0, #NUM! is returned.

- *date-purchased* or *first-period* is out of range for the current date base value, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

AMORLINC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1) results in 360.00

end example]

### 3.17.7.9 AND

**Syntax:**

AND ( *argument-list* )

**Description:** Tests if all *arguments* in *argument-list* are TRUE.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, array, or cell reference	The <i>arguments</i> in <i>argument-list</i> designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

**Return Type and Value:** logical – TRUE if all *arguments* in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, the return value is unspecified.

[Example:

AND(TRUE) results in TRUE

AND(TRUE, FALSE) results in FALSE

AND(10>5, 3=1+2, 5) results in TRUE

AND({10,5,6,7}, TRUE, E6:F6) results in TRUE, when E6 contains TRUE and F6 contains 10

end example]

### 3.17.7.10 AREAS

**Syntax:**

AREAS ( *reference* )

**Description:** Finds the number of areas (§3.17.2.3) designated by *reference*.

**Arguments:**

Name	Type	Description
<i>reference</i>	reference	A reference to a single cell or to a range of cells that can refer to multiple areas.

**Return Type and Value:** number – The number of areas designated by *reference*.

However, if the reference designates no areas, #NUM! is returned.

[Example:

AREAS(E312) results in 1

AREAS(E311:F313) results in 1

AREAS((E312:F314,G316:H316,G311)) results in 3, given the union of the three areas

AREAS((E312:F314 E313:F314 F312:F314)) results in 1, given the intersection of the three areas

end example]

### 3.17.7.11 ASC

**Syntax:**

ASC ( *string* )

**Description:** For double-byte character set (DBCS) languages, converts all full-width (double-byte) characters to half-width (single-byte) characters.

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the text to be converted. If <i>string</i> does not contain any full-width characters, nothing in <i>string</i> is converted.

**Return Type and Value:** text – The text resulting from the conversion.

[Example:

ASC("ABC") results in ABC

ASC("エクセル") results in エ&#x167;&#x169;&#x16b;&#x16d;&#x16f;

end example]

### 3.17.7.12 ASIN

**Syntax:**

ASIN (  $x$  )

**Description:** Computes the arc sine of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The value whose arc sine is to be determined.

**Return Type and Value:** number – The arc sine of  $x$ .

However, if  $x$  is outside the interval  $[-1,+1]$ , #NUM! is returned.

[Example:

ASIN(-1) results in -1.570796327

ASIN(0) results in 0

ASIN(1) results in 1.570796327

end example]

### 3.17.7.13 ASINH

**Syntax:**

ASINH (  $x$  )

**Description:** Computes the inverse hyperbolic cosine of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The value whose inverse hyperbolic sine is to be determined.

**Return Type and Value:** number – The inverse hyperbolic cosine of  $x$ .

[Example:

ASINH(1) results in 0.881373587

ASINH(10) results in 2.99822295

ASINH(100) results in 5.298342366

ASINH(0.5) results in 0.481211825

end example]

### 3.17.7.14 ATAN

**Syntax:**

ATAN (  $x$  )

**Description:** Computes the arc tangent of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The value whose arc tangent is to be determined.

**Return Type and Value:** number – The arc tangent of  $x$ .

[Example:

ATAN(-1) results in -0.785398163

ATAN(0) results in 0

ATAN(1) results in 0.785398163

ATAN(-10) results in 1.471127674

ATAN(10) results in 1.471127674

end example]

### 3.17.7.15 ATAN2

**Syntax:**

ATAN2 (  $x$  ,  $y$  )

**Description:** Computes the arc tangent of the coordinates  $x$  and  $y$ .

**Arguments:**

Name	Type	Description
$x$	number	The first coordinate.
$y$	number	The second coordinate.

**Return Type and Value:** number – The arc tangent of  $x$ .

However, if both  $x$  and  $y$  are zero, #DIV/0! is returned.

[Example:

ATAN2(1,1) results in 0.785398163

ATAN2(-2,2) results in 2.35619449  
 ATAN2(3,-3) results in -0.785398163  
 end example]

### 3.17.7.16 ATANH

#### Syntax:

ATANH ( x )

**Description:** Computes the inverse hyperbolic tangent of  $x$ .

#### Arguments:

Name	Type	Description
$x$	number	The value whose inverse hyperbolic tangent is to be determined.

**Return Type and Value:** number – The inverse hyperbolic tangent of  $x$ .

However, if  $x$  is outside the interval  $[-1,+1]$ , #NUM! is returned.

[Example:

ATANH(-0.999999) results in -7.254328619  
 ATANH(0) results in 0  
 ATANH(0.999999) results in 7.254328619

end example]

### 3.17.7.17 AVEDEV

#### Syntax:

AVEDEV ( argument-list )

**Description:** Computes the average of the absolute deviations of a set of data points from their mean. AVEDEV is a measure of the variability in a data set.

#### Mathematical Formula:

The number of combinations is as follows, where  $number = n$  and  $number-chosen = k$ :

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

#### Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, array, or reference that contains a number. The list can be a single argument that is an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the average of the absolute deviations is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The average of the absolute deviations of a set of data points from their mean.

[Example:

AVEDEV(-3.5,1.4,6.9,-4.5) results in 4.075

AVEDEV({-3.5,1.4,6.9,-4.5}) results in 4.075

end example]

### 3.17.7.18 AVERAGE

**Syntax:**

AVERAGE ( *argument-list* )

**Description:** Computes the arithmetic mean of the numeric values of its arguments.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, or reference that contains a number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. If an array or cell reference argument contains logical values, text, or empty cells, those values shall be ignored; however, cells having the value 0 shall be counted. [Note: The function AVERAGEA (§3.17.7.18) does include cell reference arguments that refer to logical values or text representations of numbers. end note]

**Return Type and Value:** number – The arithmetic mean of the values of its arguments.

[Example:

AVERAGE(1,2,3,4,5) results in 3

AVERAGE({1,2;3,4}) results in 2.5

AVERAGE({1,2,3,4,5},6,"7") results in 4

AVERAGE({1,"2",TRUE,4}) results in 2.5, as the logical value and numeric text are ignored

end example]

### 3.17.7.19 AVERAGEA

**Syntax:**

AVERAGEA ( *argument-list* )

**Description:** Computes the arithmetic mean of the values of its arguments.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, text, or reference that contains a number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. Arguments with value TRUE evaluate to 1; arguments with value FALSE evaluate to 0. An array or cell reference argument that contains text evaluates to 0. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Note: The function AVERAGE (§3.17.7.18) does not include cell reference arguments that refer to logical values or text representations of numbers. end note]

**Return Type and Value:** number – The arithmetic mean of the values of its arguments.

[Example:

AVERAGEA(10,E1), where E1 is an empty cell, results in 10, as E1 is ignored

AVERAGEA(10,E2), where E2 contains TRUE, results in 5.5

AVERAGEA(10,E3), where E3 contains FALSE, results in 5

end example]

### 3.17.7.20 AVERAGEIF

**Syntax:**

**AVERAGEIF** ( *cell-range* , *selection-criteria* [ , *average-range* ] )

**Description:** Applies selection criteria on the values in one range of cells and averages the values of the cells in a corresponding range.

**Arguments:**

Name	Type	Description
<i>cell-range</i>	reference	The range of cells to be inspected. Cells in <i>cell-range</i> that contain TRUE or FALSE are ignored. If a cell is an empty cell, it is ignored.
<i>selection-criteria</i>	number, expression, reference, text	Designates the cells that are to be averaged. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). If a cell in <i>selection-criteria</i> is empty, it is treated as if it contained 0.
<i>average-range</i>	reference	Designates the cells whose values are averaged. In this case, <i>average-range</i> need not have the same size and shape as <i>cell-range</i> . The actual cells that are averaged are determined by using the top, left cell in <i>average-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range</i> . If <i>average-range</i> is omitted, <i>cell-range</i> also designates the cells whose values are averaged. If a cell is an empty cell, it is ignored.

**Return Type and Value:** number – The average of the values of the cells corresponding to those selected.

However, if no cells in the range meet the criteria, the return value is unspecified.

[*Example:* Assuming A2:A4 contains 10, 20, and 30:

AVERAGEIF(A2:A4, ">15") results in 25, the average of 20 and 30.

*end example]*

### 3.17.7.21 AVERAGEIFS

**Syntax:**

AVERAGEIFS ( *average-range* , *cell-range-1* , *selection-criteria-1*  
[ , *cell-range-2* , *selection-criteria-2* [ , ... ] ] )

**Description:** The average of the values of all cells that meet multiple criteria.

**Arguments:**

Name	Type	Description
<i>average-range</i>	reference	Designates the cells whose values are averaged. In this case, <i>average-range</i> need not have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>average-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . If a cell in <i>average-range</i> is empty, that cell is ignored. Each cell in <i>average-range</i> is used in the average calculation only if all of the corresponding criteria specified are true for that cell.
<i>cell-range-1</i>	number, expression, reference, text	Designates the first range of cells to be inspected.
<i>selection-criteria-1</i>	reference, text	<i>selection-criteria-1</i> specifies the criteria for the first range of cells that will be averaged. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If a cell in any selection criteria range is empty, it is treated as if its value was 0. Cells that contain TRUE evaluate to 1; cells in any range that contain FALSE evaluate to 0. <i>selection-criteria-1</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>cell-range-n</i>	number, expression, reference, text	The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively.
<i>selection-criteria-n</i>	reference, text	

**Return Type and Value:** number – The average of the cells corresponding to those selected.

However, if

- Cells in *average-range* are empty or contain text values that cannot be translated into numbers, the return value is unspecified.
- There are no cells that meet all the criteria, the return value is unspecified.

[Example: Given the following data:

	A	B	C	D
1	Student	First Quiz Grade	Second Quiz Grade	Final Exam Grade
2	Emilio	75	85	87
3	Julie	94	80	88
4	Hans	86	93	Incomplete
5	Frederique	Incomplete	75	75

AVERAGEIFS(B2:B5,B2:B5,">70",B2:B5,"<90") results in 80.5 (the average for all students all first quiz grades that are between 70 and 90)

AVERAGEIFS(D2:D5,D2:D5,"<>Incomplete",D2:D5,">80") results in 87.5 (the average for all students all first quiz grades that are above 80 and not marked "Incomplete")

AVERAGEIFS(B2:D5,B2:B5,"<>Incomplete",C2:C5,"<>Incomplete",D2:D5,"<>Incomplete") results in 82.375 (the average grades for all students who do not have incomplete grades)

end example]

### 3.17.7.22 BAHTTEXT

#### Syntax:

BAHTTEXT ( *number* )

**Description:** Produces a string containing *number* formatted according to the Thai convention.

#### Arguments:

Name	Type	Description
<i>number</i>	number	The value to be formatted.

**Return Type and Value:** text – The text containing *number* formatted.

[Example:

BAHTTEXT(1234) results in หนึ่งพันสองร้อยสามสิบสี่บาทถ้วน

*end example]*

### 3.17.7.23 BESSELI

#### Syntax:

BESSELI (  $x$  ,  $n$  )

**Description:** The modified Bessel function  $I_n(x)$ , which is equivalent to the Bessel function  $J_n(x)$  evaluated for purely imaginary arguments.

#### Mathematical Formula:

The  $n$ -th order modified Bessel function of the variable  $x$  is:

$$I_n(x) = (i)^{-n} J_n(ix)$$

#### Arguments:

Name	Type	Description
$x$	number	The value at which to evaluate the function.
$n$	number	The order of the Bessel function. This value is truncated to an integer.

**Return Type and Value:** number – The Bessel function  $I_n(x)$ .

However, if  $n < 0$ , #NUM! is returned.

[Example:

BESSELI(-5.6,0) results in 46.73755194

BESSELI(2.345,5) results in 0.023137792

*end example]*

### 3.17.7.24 BESSELJ

#### Syntax:

BESSELJ (  $x$  ,  $n$  )

**Description:** The Bessel function  $J_n(x)$ .

#### Mathematical Formula:

The  $n$ -th order Bessel function of the variable  $x$  is:

1 
$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

2 where:

3 
$$\Gamma(n+k+1) = \int_0^{\infty} e^{-x} x^{n+k} dx$$

4 is the Gamma function.

5 **Arguments:**

Name	Type	Description
<i>x</i>	number	The value at which to evaluate the function.
<i>n</i>	number	The order of the Bessel function. This value is truncated to an integer.

7 **Return Type and Value:** number – The Bessel function Jn(x).

8 However, if *n* < 0, #NUM! is returned.

9 *[Example:*

11 BESSELJ(-5.6,0) results in 0.026970887

12 BESSELJ(2.345,5) results in 0.014627862

14 *end example]*

15 **3.17.7.25 BESSELK**

16 **Syntax:**

17 BESSELK ( *x* , *n* )

18 **Description:** The modified Bessel function Kn(x), which is equivalent to using the Bessel function Jn(x) and Yn(x).

19 **Mathematical Formula:**

20 The n-th order modified Bessel function of the variable x is:

21 
$$K_n(x) = \frac{P}{2} i^{n+1} [J_n(ix) + iY_n(ix)].$$

22 where Jn and Yn are the J and Y Bessel functions, respectively.

23 **Arguments:**

Name	Type	Description
$x$	number	The value at which to evaluate the function.
$n$	number	The order of the Bessel function. This value is truncated to an integer.

1

2 **Return Type and Value:** number – The Bessel function  $K_n(x)$ .

3 However, if  $n < 0$ , #NUM! is returned.

4 [Example:

5

6 BESSELK(2.345,5) results in 3.904137225

7

8 end example]

### 9 3.17.7.26 BESSELY

10 **Syntax:**

11 BESSELY (  $x$  ,  $n$  )

12 **Description:** Weber's Bessel function  $Y_n(x)$ .

13 **Mathematical Formula:**

14 The  $n$ -th order Bessel function of the variable  $x$  is:

$$Y_n(x) = \lim_{v \rightarrow n} \frac{J_v(x) \cos(v \pi) - J_{-v}(x)}{\sin(v \pi)}$$

15

16 **Arguments:**

Name	Type	Description
$x$	number	The value at which to evaluate the function.
$n$	number	The order of the Bessel function. This value is truncated to an integer.

17

18 **Return Type and Value:** number – The Weber's Bessel function  $Y_n(x)$ .

19 However, if  $n < 0$ , #NUM! is returned.

20 [Example:

21

22 BESSELY(2.345,5) results in -4.98977884

*end example]*

### 3.17.7.27 BETADIST

#### Syntax:

BETADIST (  $x$  ,  $\alpha$  ,  $\beta$  [ , [  $A$  ] , [  $B$  ] ] )

**Description:** Computes the cumulative beta probability density function.

#### Arguments:

Name	Type	Description
$x$	number	The value between $A$ and $B$ at which to evaluate the function.
$\alpha$	number	A parameter of the distribution.
$\beta$	number	A parameter of the distribution.
$A$	number	The lower bound to the interval of $x$ . If omitted, the lower bound is 0.
$B$	number	The upper bound to the interval of $x$ . If omitted, the upper bound is 1.

**Return Type and Value:** number – The cumulative beta probability density function.

However, if

- $\alpha$  or  $\beta \leq 0$ , #NUM! is returned.
- $x < A$ ,  $x > B$ , or  $A = B$ , #NUM! is returned.

[Example:

BETADIST(0.5,1,2) results in 0.75

BETADIST(0.5,1,2,-4.5,7.3) results in 0.66791152

BETADIST(0.5,1,2,,2.3) results in 0.387523629

*end example]*

### 3.17.7.28 BETAINV

#### Syntax:

BETAINV (  $probability$  ,  $\alpha$  ,  $\beta$  [ , [  $A$  ] , [  $B$  ] ] )

**Description:** Computes the inverse of the cumulative distribution function for a specified beta distribution.

Given a value for  $probability$ , BETAINV is used to seek for the value  $x$  such that BETADIST( $x$ ,  $\alpha$ ,  $\beta$ ,

$A, B$ ) = *probability*. Thus, precision of BETAINV depends on precision of BETADIST. BETAINV uses an iterative search technique.

**Arguments:**

Name	Type	Description
<i>probability</i>	number	A probability associated with the beta distribution.
<i>alpha</i>	number	A parameter of the distribution.
<i>beta</i>	number	A parameter of the distribution.
<i>A</i>	number	The lower bound to the interval of $x$ . If omitted, the lower bound is 0.
<i>B</i>	number	The upper bound to the interval of $x$ . If omitted, the upper bound is 1.

**Return Type and Value:** number – The inverse of the cumulative distribution function for a specified beta distribution.

However, if

- *alpha* or *beta*  $\leq 0$ , #NUM! is returned.
- *probability*  $< 0$  or *probability*  $> 1$ , #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[Example:

BETAINV(0.5,1,2) results in 0.29289341

BETAINV(0.5,1,2,-4.5,7.3) results in -1.043857765

BETAINV(0.5,1,2,,2.3) results in 0.673654842

end example]

### 3.17.7.29 BIN2DEC

**Syntax:**

BIN2DEC ( *number* )

**Description:** Makes the decimal equivalent of *number*.

**Arguments:**

Name	Type	Description
<i>number</i>	number	A 10-digit binary number that is to be converted to a

Name	Type	Description
		decimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

1

2 **Return Type and Value:** number – The decimal equivalent of *number*.

3 However, if

- 4 • *number* contains one or more non-binary digits, #NUM! is returned.
- 5 • *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (-512
- 6 decimal) to 011111111 (511 decimal), inclusive, #NUM! is returned.

7 [Example:

8

9 BIN2DEC(111) results in 7

10 BIN2DEC(11111111) results in 255

11 BIN2DEC(111111110) results in -2

12 BIN2DEC(100000000) results in -512

13

14 end example]

15 **3.17.7.30 BIN2HEX**16 **Syntax:**17 BIN2HEX ( *number* [ , *num-hex-digits* ] )

18 **Description:** Makes the uppercase hexadecimal equivalent of *number*, with the result having *num-hex-digits*

19 digits.

20 **Arguments:**

Name	Type	Description
<i>number</i>	number	A 10-digit binary number that is to be converted to a hexadecimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
<i>num-hex-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-</i>

Name	Type	Description
		<i>hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer.

**Return Type and Value:** text – The uppercase hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (200 hex, -512 decimal) to 0111111111 (1FF hex, 511 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

BIN2HEX(1) results in 1

BIN2HEX(1,4) results in 0001

BIN2HEX(111111) results in 3F

BIN2HEX(1111000000) results in FFFFFFFC0

BIN2HEX(1000000000,3) results in FFFFFFFE00

end example]

### 3.17.7.31 BIN2OCT

**Syntax:**

BIN2OCT ( *number* [ , *num-oct-digits* ] )

**Description:** Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	number	A 10-digit binary number that is to be converted to an octal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use two's-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
<i>num-oct-digits</i>	number	<i>num-oct-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has

Name	Type	Description
		10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer.

**Return Type and Value:** text – The octal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (1000 octal, -512 decimal) to 0111111111 (0777 octal, 511 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* < 0 or > 10, #NUM! is returned.

[Example:

BIN2OCT(1) results in 1

BIN2OCT(1,4) results in 0001

BIN2OCT(111111) results in 77

BIN2OCT(1111000000) results in 7777777700

BIN2OCT(1000000000,3) results in 7777777000

end example]

### 3.17.7.32 BINOMDIST

**Syntax:**

BINOMDIST ( *number-successes* , *number-trials* , *success-probability* , *cumulative-flag* )

**Description:** Computes the individual term binomial distribution probability.

**Mathematical Formula:**

The binomial probability mass function is:

$$b(x; n, p) = \binom{n}{x} p^x (1-p)^{n-x}$$

where:

$$\binom{n}{x}$$

is COMBIN(n, x).

The cumulative binomial distribution is:

$$B(x; n, p) = \sum_{y=0}^x b(y; n, p)$$

**Arguments:**

Name	Type	Description
<i>number-successes</i>	number	The number of successes in <i>number-trials</i> , truncated to an integer.
<i>number-trials</i>	number	The number of independent trials, truncated to an integer.
<i>success-probability</i>	number	The probability of success on each trial.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned, which is the probability that there are at most <i>number-successes</i> successes; if FALSE, the probability mass function is returned, which is the probability that there are <i>number-successes</i> successes.

**Return Type and Value:** number – The individual term binomial distribution probability.

However, if

- number-successes* < 0 or *number-successes* > *number-trials*, #NUM! is returned.
- success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[Example:

BINOMDIST(6,10,0.5,FALSE) results in 0.205078125

BINOMDIST(6,10,0.5,TRUE) results in 0.828125

end example]

### 3.17.7.33 CEILING

**Syntax:**

CEILING ( *x* , *significance* )

**Description:** Computes a value that is *x* rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value to be rounded
<i>significance</i>	number	The multiple to which <i>x</i> is to be rounded.

**Return Type and Value:** number – The rounded-up value of *x*.

However, if *x* and *significance* have different signs, #NUM! is returned.

[Example:

CEILING(2.5,1) rounds 2.5 up to nearest multiple of 1; that is, to 3

CEILING(-2.5,-2) rounds -2.5 up to nearest multiple of -2; that is, to -4

CEILING(1.5,0.1) rounds 1.5 up to the nearest multiple of 0.1; that is, to 1.5

CEILING(0.234,0.01) rounds 0.234 up to the nearest multiple of 0.01; that is, to 0.24

end example]

### 3.17.7.34 CELL

**Syntax:**

CELL ( *category* [ , *reference* ] )

**Description:** Retrieves information about the formatting, location, or contents of the upper-left cell indicated by *reference*. *category* indicates the kind of information to be retrieved.

**Arguments:**

Name	Type	Description
<i>category</i>	text	The category string as defined in the table following.
<i>reference</i>	reference	Refers to the cell whose category information is being requested. If <i>reference</i> is a cell range, the first cell in that range is the cell whose category information is being requested. If <i>reference</i> is omitted, the information retrieved pertains to the most recent cell whose value was changed. For the category "format", if <i>reference</i> designates a cell formatted with a built-in number format, the number format string is as defined in the table following.

<i>category</i>	Meaning	Result Type
"address"	Reference of the first cell in <i>reference</i> .	text
"col"	Column number of the cell in <i>reference</i> .	number

<i>category</i>	<b>Meaning</b>	<b>Result Type</b>
"color"	1 if the cell is formatted in color for negative values; otherwise, 0. 0 if the cell does not contain a number.	number
"contents"	Value of the upper-left cell in <i>reference</i> .	Text or number
"filename"	Fully qualified filename of the file that contains <i>reference</i> . However, if the worksheet that contains <i>reference</i> has not yet been saved, the filename is an empty string.	text
"format"	Number format of the cell. (See the table of formats below.) The number format string has "-" appended if the cell is formatted in color for negative values. The number format string has "(" appended if the cell is formatted in color for positive or all values.	text
"parentheses"	1 if the cell is formatted with parentheses for positive or all values; otherwise, 0. 0 if the cell does not contain a number.	number
"prefix"	Text value corresponding to the label prefix of the cell, as follows: <ul style="list-style-type: none"> <li>• Single quotation mark ( ' ) if the cell contains left-aligned text</li> <li>• Double quotation mark ( " ) if the cell contains right-aligned text</li> <li>• Caret ( ^ ) if the cell contains centered text</li> <li>• Backslash ( \ ) if the cell contains fill-aligned text</li> <li>• Empty string if the cell contains anything else</li> </ul>	text
"protect"	0 if the cell is not locked; otherwise, 1.	number
"row"	Row number of the cell in reference.	number
"type"	Text value corresponding to the type of data in the cell. <ul style="list-style-type: none"> <li>• "b" (blank) if the cell is empty</li> <li>• "l" (label) if the cell contains a text constant</li> <li>• "v" (value) if the cell contains anything else</li> </ul>	text
"width"	Column width of the cell rounded off to an integer. Each unit of column width is equal to the width of one character in the default font size.	number

1

<i>Format</i>	<b>Number Format String</b>
0	"F0"
0.00	"F2"
#,##0	",0"
#,##0.00	",2"
\$#,##0_); (\$#,##0)	"C0"

<i>Format</i>	<b>Number Format String</b>
\$#,##0_);[Red](\$#,##0)	"C0 -"
\$#,##0.00_);(\$#,##0.00)	"C2"
\$#,##0.00_);[Red](\$#,##0.00)	"C2 -"
0%	"P0"
0.00%	"P2"
0.00E+00	"S2"
General	"G"
# ?/? # ??/??	"G"
d-mmm-yy dd-mmm-yy	"D1"
d-mmm dd-mmm	"D2"
mmm-yy	"D3"
m/d/yy m/d/yy h:mm mm/dd/yy	"D4"
mm/dd	"D5"
h:mm:ss AM/PM	"D6"
h:mm AM/PM	"D7"
h:mm:ss	"D8"
h:mm	"D9"

1

2 **Return Type and Value:** various (see table above) – The value corresponding to *category*, and whose type is  
3 shown in the category value table above.

4 However, if *category* is invalid, #VALUE! is returned.

5 [Example:

6

7 CELL("address",A10) might result in \$E\$289

8 CELL("contents",A10:B10), results in xxx, when A10 contains xxx, and B10 contains anything

9 CELL("filename",A10) might result in E:\Formulas\[Test.xlsx]Sheet1

10 CELL("format",A10) results in G, when A10 contains xxx

11 CELL("format",A10) results in F2-, when A10 contains (123.00)

12 CELL("format",A10) results in C3-, when A10 contains \$123,456.780

13 CELL("format",A10) results in S3, when A10 contains 1.235E+05

14 CELL("prefix",A10) results in ', when A10 contains xxx

15 CELL("type",A10) results in 1, when A10 contains xxx

*end example]*

### 3.17.7.35 CHAR

#### Syntax:

CHAR ( *x* )

**Description:** Determines the character that is represented by the value *number*.

#### Arguments:

Name	Type	Description
<i>x</i>	number	A value in the range 1–255, which designates the character.

**Return Type and Value:** text – The character represented by the value *number*.

[*Example:*

CHAR(65) results in A

CHAR(A10) results in A, when A10 contains 65

*end example]*

### 3.17.7.36 CHIDIST

#### Syntax:

CHIDIST ( *x* , *degrees-freedom* )

**Description:** Computes the one-tailed probability of the chi-squared distribution.

#### Mathematical Formula:

CHIDIST =  $P(X > x)$ , where  $X$  is a  $\chi^2$  random variable.

#### Arguments:

Name	Type	Description
<i>x</i>	number	The value at which the distribution is to be evaluated.
<i>degrees-freedom</i>	number	The number of degrees of freedom, truncated to an integer.

**Return Type and Value:** number – The one-tailed probability of the chi-squared distribution.

However, if

- $x < 0$ , #NUM! is returned.
- $degrees-freedom < 1$  or  $degrees-freedom > 10^{10}$ , #NUM! is returned.

[Example:

CHIDIST(3.5,4) results in 0.47787835

CHIDIST(12.34,7) results in 0.089917721

end example]

### 3.17.7.37 CHIINV

**Syntax:**

CHIINV ( *probability* , *degrees-freedom* )

**Description:** Computes the inverse of the one-tailed probability of the chi-squared distribution. Given a value for *probability*, CHIINV seeks for a value  $x$  such that  $\text{CHIDIST}(x, \text{degrees-freedom}) = \text{probability}$ . Thus, precision of CHIINV depends on precision of CHIDIST. CHIINV uses an iterative search technique.

**Arguments:**

Name	Type	Description
<i>probability</i>	number	A probability associated with the chi-squared distribution.
<i>degrees-freedom</i>	number	The number of degrees of freedom, truncated to an integer.

**Return Type and Value:** number – The inverse of the one-tailed probability of the chi-squared distribution.

However, if

- $probability < 0$  or  $probability > 1$ , #NUM! is returned.
- $degrees-freedom < 1$  or  $degrees-freedom \geq 10^{10}$ , #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned

[Example:

CHIINV(0.5,4) results in 3.356694001

CHIINV(0.3,7) results in 8.38343064

end example]

## 3.17.7.38 CHITEST

**Syntax:**CHITEST ( *actual-range* , *expected-range* )

**Description:** Computes the test for independence. CHITEST returns the value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

**Mathematical Formula:**

The  $\chi^2$  test first calculates a  $\chi^2$  statistic using the formula:

$$\chi^2 = \sum_{i=1}^r \sum_{j=1}^c \frac{(A_{ij} - E_{ij})^2}{E_{ij}}$$

where:

$A_{ij}$  = actual frequency in the i-th row, j-th column

$E_{ij}$  = expected frequency in the i-th row, j-th column

$r$  = number of rows

$c$  = number of columns

CHITEST uses the  $\chi^2$  distribution with an appropriate number of degrees of freedom, df. If  $r > 1$  and  $c > 1$ , then  $df = (r - 1)(c - 1)$ . If  $r = 1$  and  $c > 1$ , then  $df = c - 1$  or if  $r > 1$  and  $c = 1$ , then  $df = r - 1$ .

**Arguments:**

Name	Type	Description
<i>actual-range</i>	reference	The range of data that contains observations to test against expected values.
<i>expected-range</i>	reference	The range of data that contains the ratio of the product of row totals and column totals to the grand total.

**Return Type and Value:** number – The value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

However, if:

- The number of rows and columns is exactly one, the return value is unspecified.
- *actual-range* and *expected-range* have a different number of data points, the return value is unspecified.

[Example: Given the following data:

	A	B	C
--	---	---	---

	A	B	C
1	Men (Actual)	Women (Actual)	Description
2	58	35	Agree
3	11	25	Neutral
4	10	23	Disagree
5	Men (Expected)	Women (Expected)	Description
6	45.35	47.65	Agree
7	17.56	18.44	Neutral
8	16.09	16.91	Disagree

CHITEST(A2:B4,A6:B8) results in 0.000308

*end example]*

### 3.17.7.39 CHOOSE

#### Syntax:

CHOOSE ( *index* , *argument-list* )

**Description:** Selects the *argument* in *argument-list* that corresponds by position to *index*.

#### Arguments:

Name	Type	Description
<i>index</i>	number	An index into <i>argument-list</i> , truncated to an integer. The value of <i>index</i> shall be in the position range 1– <i>n</i> , where <i>argument-1</i> is position 1, <i>argument-2</i> is position 2, and so on up to <i>argument-n</i> . If <i>index</i> is an array, the value or every element in that array is evaluated, and if the formula was array-entered, the result is an array of chosen values.
<i>argument-list</i>	any	The <i>arguments</i> in any given <i>argument-list</i> need not all have the same type.

**Return Type and Value:** any, including array – The *argument* in *argument-list* that corresponds by position to *index*.

However, if the value of *index* is not an index into *argument-list*, #VALUE! is returned.

[Example:

CHOOSE(E7,F7,G7,H7,I7,J7,K7,L7) results in Monday, when E7 contains 2, and the cells F7:L7 each contain the names of the week, from Sunday to Saturday

SUM(CHOOSE(E1,F20:G20,H20:J24)) results in the sum of the elements designated by F20:G20 or H20:J24, as determined by the value of E1

If B9:B11 contain 1, 3, and 3, respectively, and CHOOSE(B9:B11,10,20,30) is array-entered into 3 cells, the values of those 3 cells is 10, 30, and 30, respectively.

*end example]*

#### 3.17.7.40 CLEAN

##### Syntax:

CLEAN ( *string* )

##### Description:

Makes a string that is a copy of *string* with all so-called "non-printable" characters—those with internal values in the range U+0000–001F—removed.

##### Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string to be cleaned.

**Return Type and Value:** text – The trimmed copy of *string*.

[*Example:*

CLEAN("A" & CHAR(2) & "BC") results in ABC, which is stored in A10  
LEN(A10) results in 3

*end example]*

#### 3.17.7.41 CODE

##### Syntax:

CODE ( *string* )

**Description:** Determines the numeric code of the first character in *string*.

##### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>string</i>	text	Designates a string containing one or more characters.

**Return Type and Value:** number – The numeric code of the first character in *string*.

However, if *string* is empty, #VALUE! is returned.

[Example:

CODE("abc") results in 97

CODE(A10) results in 97, when A1 contains abc

end example]

### 3.17.7.42 COLUMN

**Syntax:**

COLUMN ( [ *reference* ] )

**Description:** Finds the number of the column(s) corresponding to *reference*.

**Arguments:**

Name	Type	Description
<i>reference</i>	reference	A reference to a single cell or to a range of contiguous cells. If omitted, the behavior is as if <i>reference</i> referred to the cell containing the formula.

**Return Type and Value:** number – If *reference* refers to a single cell or to a single column of cells, the corresponding column is returned. If *reference* refers to a range of cells involving multiple columns, a horizontal array of the corresponding columns as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[Example:

COLUMN() results in 4, when the cell containing the formula is in column 4

COLUMN(E17:E19) results in 5

COLUMN(E16:F17) results in a horizontal array containing 5 and 6, respectively

end example]

## 3.17.7.43 COLUMNS

**Syntax:**COLUMNS ( *array* )**Description:** Finds the number of columns corresponding to *array*.**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	Any array.

**Return Type and Value:** number – The number of columns corresponding to *array*.However, if the range of cells referred to by *array* is not contiguous, #NULL! is returned.*[Example:*

COLUMNS(E16:F16) results in 2

COLUMNS(E16:G18) results in 3

COLUMNS({1,2;3,4}) results in 2

*end example]*

## 3.17.7.44 COMBIN

**Syntax:**COMBIN ( *number* , *number-chosen* )**Description:** Computes the possible number of groups of size *number-chosen* that can be formed from *number* objects. *[Note: A combination is any set or subset of objects, regardless of their internal order. Combinations are distinct from permutations, for which the internal order is significant. end note]***Mathematical Formula:**The number of combinations is as follows, where *number* = *n* and *number-chosen* = *k*:

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

where:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

**Arguments:**

Name	Type	Description
<i>number</i>	number	The total number of objects available, truncated to an integer.
<i>number-chosen</i>	number	The number of objects in each combination, truncated to an integer.

**Return Type and Value:** number – The number of different combinations of *number-chosen* in *number*.

However, if

- *number* < 0, #NUM! is returned.
- *number-chosen* < 0, #NUM! is returned.
- *number* < *number-chosen*, #NUM! is returned.

[Example:

COMBIN(8,2) results in 28

COMBIN(10,4) results in 210

COMBIN(6,5) results in 6

end example]

### 3.17.7.45 COMPLEX

**Syntax:**

COMPLEX ( *real-number* , *imaginary-number* [ , *suffix* ] )

**Description:** Makes a complex number in  $x + yi$  or  $x + yj$  text format from the arguments.

**Arguments:**

Name	Type	Description
<i>real-number</i>	number	The real number coefficient.
<i>imaginary-number</i>	number	The imaginary number coefficient.
<i>suffix</i>	text	"i" or "j". If omitted, "i" is used.

**Return Type and Value:** text – The complex number string specified by the arguments.

If *real-number* has the value 0 and *imaginary-number* has a non-zero value, the resulting string contains just the real number. If *real-number* has a non-zero value and *imaginary-number* has a zero value, the resulting string contains just the imaginary number and suffix. If both *real-number* and *imaginary-number* have a zero value, the resulting string is "0".

However, if *suffix* is neither "i" nor "j", #VALUE! is returned.

[Example:

COMPLEX(-3.5,19.6) results in -3.5+19.6i

COMPLEX(3.5,-19.6,"j") results in 3.5-19.6j

COMPLEX(3.5,0) results in 3.5

COMPLEX(0,2.4) results in 2.4i

COMPLEX(0,0) results in 0

end example]

### 3.17.7.46 CONCATENATE

**Syntax:**

CONCATENATE ( *argument-list* )

**Description:** Makes a string that is the concatenation of all the strings corresponding to the *arguments* in *argument-list*, taken left-to-right.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> shall designate a string.

**Return Type and Value:** text – The concatenated string.

[Example:

CONCATENATE("text") results in text

CONCATENATE("The total is ",A10," units") results in The total is 43 units, when A10 contains 43

CONCATENATE(3," + ",4," = ",3+4) results in 3 + 4 = 7

end example]

### 3.17.7.47 CONFIDENCE

**Syntax:**

CONFIDENCE ( *alpha* , *standard-dev* , *size* )

**Description:** Computes a value that can be used to construct a confidence interval for a population mean.

**Arguments:**

Name	Type	Description
<i>alpha</i>	number	The significance level used to compute the confidence level.
<i>standard-dev</i>	number	The population standard deviation for the data range.
<i>size</i>	number	The sample size, truncated to an integer.

**Return Type and Value:** number – A value that can be used to construct a confidence interval for a population mean.

However, if

- $\alpha \leq 0$  or  $\alpha \geq 1$ , #NUM! is returned.
- $\text{standard-dev} \leq 0$ , #NUM! is returned.
- $\text{size} < 1$ , #NUM! is returned.

[Example:

CONFIDENCE(0.4,5,12) results in 1.214775614

CONFIDENCE(0.75,9,7) results in 1.083909234

end example]

### 3.17.7.48 CONVERT

**Syntax:**

CONVERT ( *number* , *from-unit* , *to-unit* )

**Description:** Converts a number from one measurement system to another.

**Arguments:**

Name	Type	Description
<i>number</i>	number	The value to be converted from <i>from-units</i> to <i>to-units</i> .
<i>from-unit</i>	text	The unit to be converted from, where the valid string values are shown in the tables below.
<i>to-unit</i>	text	The unit to be converted to, where the valid string values are shown in the tables below.

Weight and Mass	
Unit String	Meaning
g	Gram

Weight and Mass	
lbm	Pound mass (avoirdupois)
ozm	Ounce mass (avoirdupois)
sg	Slug
u	U (atomic mass unit)

1

Distance	
<i>Unit String</i>	<i>Meaning</i>
ang	Angstrom
ft	Foot
in	Inch
m	Meter
mi	Statute mile
Nmi	Nautical mile
Pica	Pica (1/72 inch)
yd	Yard

2

Time	
<i>Unit String</i>	<i>Meaning</i>
day	Day
hr	Hour
mn	Minute
sec	Second
yr	Year

3

Pressure	
<i>Unit String</i>	<i>Meaning</i>
at or atm	Atmosphere
mmHg	mm of Mercury
P or p	Pascal

4

Force	
<i>Unit String</i>	<i>Meaning</i>

Force	
dy or dyn	Dyne
lbf	Pound force
N	Newton

1

Energy	
<i>Unit String</i>	<i>Meaning</i>
BTU or btu	BTU
c	Thermodynamic calorie
cal	IT calorie
e	Erg
ev or eV	Electron volt
flb	Foot-pound
HPh or hh	Horsepower-hour
J	Joule
Wh or wh	Watt-hour

2

Power	
<i>Unit String</i>	<i>Meaning</i>
H or hp	Horsepower
W or w	Watt

3

Magnetism	
<i>Unit String</i>	<i>Meaning</i>
ga	Gauss
T	Tesla

4

Temperature	
<i>Unit String</i>	<i>Meaning</i>
C or cel	Degrees Celsius
F or fah	Degrees Fahrenheit
K or kel	Degrees Kelvin

5

Liquid Measure	
<i>Unit String</i>	<i>Meaning</i>
cup	Cup
gal	U.S. Gallon
l or lt	Liter
oz	Fluid ounce
pt or us_pt	U.S. pint
qt	U.S. Quart
tbs	Tablespoon
tsp	Teaspoon
uk_pt	U.K. pint

- 1
- 2 The following abbreviated unit prefixes can be used with any metric unit:

Abbreviated Unit Prefixes	
<i>Prefix String</i>	<i>Meaning</i>
E	exa (1E+18)
P	peta (1E+15)
T	tera (1E+12)
G	giga (1E+09)
M	mega (1E+06)
k	kilo (1E+03)
h	hecto (1E+02)
e	deka (1E+01)
d	deci (1E-01)
c	centi (1E-02)
m	milli (1E-03)
u	micro (1E-06)
n	nano (1E-09)
p	pico (1E-12)
f	femto (1E-15)
a	atto (1E-18)

- 3
- 4 Unit names and prefixes are case-sensitive.
- 5 **Return Type and Value:** number – The value of *number* in *from-units* converted to *to-units*.

However, if

- The value of *from-unit* or *to-unit* is invalid, #N/A is returned.
- The *from-unit* and *to-unit* are from different measurement categories, #N/A is returned.
- The value of *from-unit* or *to-unit* has an abbreviated unit prefix, yet none is supported for that unit, #N/A is returned.

[Example:

CONVERT(10,"ozm","g") results in 283.4951521

CONVERT(1,"yd","mm") results in 914.4000003

CONVERT(1,"yd","cm") results in 91.44000003

CONVERT(1,"yd","m") results in 0.9144

CONVERT(1,"yd","km") results in 0.0009144

CONVERT(1,"mi","Nmi") results in 0.868976242

CONVERT(1,"day","sec") results in 86400

CONVERT(0,"K","C") results in -273.15

end example]

### 3.17.7.49 CORREL

**Syntax:**

CORREL ( array-1 , array-2 )

**Description:** Computes the correlation coefficient of the two cell ranges designated by *array-1* and *array-2*.

**Mathematical Formula:**

The equation for the correlation coefficient is:

$$\text{Correl}(X,Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where x and y are the sample means AVERAGE(*array-1*) and AVERAGE(*array-2*).

**Arguments:**

Name	Type	Description
<i>array-1</i>	array, reference	The first cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>	array, reference	The second cell range. If an array or reference argument contains text, logical values, or empty cells, those values

Name	Type	Description
		are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The correlation coefficient of the cells in two cell ranges.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* and *array-2* is empty, the return value is unspecified.
- The standard deviation of the values in *array-1* or *array-2* equals zero, the return value is unspecified.

[Example:

CORREL({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7}) results in -0.714976

end example]

### 3.17.7.50 COS

**Syntax:**

COS ( *x* )

**Description:** Computes the cosine of *x*.

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value whose cosine is to be determined.

**Return Type and Value:** number – The cosine of *x*.

[Example:

COS(-1) results in 0.540302306

COS(0) results in 1

COS(1) results in 0.540302306

end example]

### 3.17.7.51 COSH

**Syntax:**

COSH ( *x* )

**Description:** Computes the hyperbolic cosine of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The value whose hyperbolic cosine is to be determined.

**Return Type and Value:** number – The hyperbolic cosine of  $x$ .

However, if the magnitude of  $x$  is too large, #NUM! is returned.

[Example:

COSH(-1) results in 1.543080635

COSH(0) results in 1

COSH(1) results in 1.543080635

end example]

### 3.17.7.52 COUNT

**Syntax:**

COUNT ( *argument-list* )

**Description:** Counts the number of *arguments* in *argument-list* that contain numbers, and the number of cells referred to by *arguments* in *argument-list*, which contain numbers.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> designates a value. Arguments that are numbers, logical values, dates, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, text, or error values in the array or reference shall be ignored. [Note: To count logical values, text, or error values as well, use the COUNTA (§3.17.7.53) function. end note]

**Return Type and Value:** number – The numeric argument and reference to numeric argument count.

[Example:

COUNT(1,2,3,4,5) results in 5  
COUNT({1,2,3,4,5}) results in 5  
COUNT({1,2,3,4,5},6,"7") results in 7  
COUNT(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored  
COUNT(10,E2), where E2 contains TRUE, results in 1, as E2 is ignored  
*end example]*

### 3.17.7.53 COUNTA

#### Syntax:

COUNTA ( *argument-list* )

**Description:** Counts the number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

#### Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> designates a value. Arguments with values of any type shall be counted. However, empty cells shall not be counted. If an argument is an array or reference, only values in that array or reference shall be counted. Empty cells and text values in the array or reference shall be ignored. [Note: To exclude logical values, text, or error values, use the COUNT (§3.17.7.52) function. <i>end note</i> ]

**Return Type and Value:** number – The number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

[*Example:*

COUNTA(1,2,3,4,5) results in 5  
COUNTA({1,2,3,4,5}) results in 15  
COUNTA({1,2,3,4,5},6,"7") results in 7  
COUNTA(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored  
COUNTA(10,E2), where E2 contains TRUE, results in 2, as E2 is counted  
*end example]*

### 3.17.7.54 COUNTBLANK

#### Syntax:

COUNTBLANK ( *cell-range* )

**Description:** Counts the number of cells in a specified range of cells, which are empty. A cell containing a formula that returns an empty string is counted, whereas a cell containing a zero value is not.

**Arguments:**

Name	Type	Description
<i>cell-range</i>	reference	Designates the range of cells to be inspected.

**Return Type and Value:** number – The number of empty cells in the range specified.

[Example:

COUNTBLANK(A2:C2), where A2 and B2 are empty, but C2 is not, results in 2

end example]

### 3.17.7.55 COUNTIF

**Syntax:**

COUNTIF ( *cell-range* , *selection-criteria* )

**Description:** Counts the number of cells in a specified range of cells, whose values meet the specified criteria.

**Arguments:**

Name	Type	Description
<i>cell-range</i>	reference	Designates the range of cells to be inspected.
<i>selection-criteria</i>	number, expression, reference, text	Designates the cells to be counted. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).

**Return Type and Value:** number – The number of cells in the range specified that meet the criteria.

[Example: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

COUNTIF(A1:D1, "=10") results in 2

1 COUNTIF(A1:D1, ">5") results in 3  
 2 COUNTIF(A1:D1, "<>10") results in 2

3 Given that A2, B2, C2, and D2, respectively, contain the values apples, oranges, grapes, and melons

4  
 5 COUNTIF(A2:D2, "\*es") results in 3  
 6 COUNTIF(A2:D2, "?a\*") results in 2  
 7 COUNTIF(A2:D2, "\*l\*") results in 2

8  
 9 *end example]*

### 10 3.17.7.56 COUNTIFS

#### 11 Syntax:

12 COUNTIFS ( *count-range* , *cell-range-1* , *selection-criteria-1*  
 13 [ , *cell-range-2* , *selection-criteria-2* [ , ... ] ] )

14 **Description:** Counts the number of cells within a range that meet multiple criteria.

#### 15 Arguments:

Name	Type	Description
<i>count-range</i>	reference	Designates the cells whose values are included. <i>count-range</i> does not have to have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>count-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> .
<i>cell-range-1</i>	reference	Designates the first range of cells to be inspected. Each cell in a range is counted only if all of the corresponding criteria specified are true for that cell.
<i>selection-criteria-1</i>	number, expression, reference, text	Designates the first range of cells to be counted. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>cell-range-n</i>	reference	The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> ,
<i>selection-criteria-n</i>	number, expression,	

Name	Type	Description
	reference, text	respectively.

- 1
- 2 If a cell in any argument is an empty cell, it is treated as if it had the value 0.

3 **Return Type and Value:** number – The count of the cells corresponding to those selected.

4 [Example: Given the following data:

	A	B	C	D
1	Sales Person	Exceeded Tables Quota	Exceeded Chairs Quota	Exceeded Desks Quota
2	Davolio	Yes	No	No
3	Buchanan	Yes	Yes	No
4	Suyama	Yes	Yes	Yes
5	Leverling	No	Yes	Yes

- 5
- 6 COUNTIFS(B2:D2, "=Yes") results in 1 (counts how many times Davolio exceeded a sales quota for tables,
- 7 chairs, and desks)
- 8 COUNTIFS(B2:B5, "=Yes", C2:C5, "=Yes") results in 2 (counts how many sales people exceeded both their
- 9 tables and chairs quota)
- 10 COUNTIFS(B5:D5, "=Yes", B3:D3, "=Yes") results in 1 (counts how many times Leverling and Buchanan
- 11 exceeded the same quota for tables, chairs, and desks)
- 12
- 13 end example]

### 14 3.17.7.57 COUPDAYBS

15 **Syntax:**

16 COUPDAYBS ( *settlement* , *maturity* , *frequency* [ , [ *basis* ] ] )

17 **Description:** Computes the number of days from the beginning of the coupon period to the settlement date.

18 **Arguments:**

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments,

Name	Type	Description												
		frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

1

2 Time information in the date arguments is ignored.

3 **Return Type and Value:** number – The number of days from the beginning of the coupon period to the  
4 settlement date.

5 However, if

- 6 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 7 • *settlement* ≥ *maturity*, #NUM! is returned.
- 8 • *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- 9 • *basis* < 0 or *basis* > 4, #NUM! is returned.

10 [Example:

11

12 COUPDAYBS (DATE (2007,1,25),DATE (2008,11,15),2,1) results in 71

13 COUPDAYBS (DATE (2007,1,25),DATE (2008,11,15),2) results in 70

14

15 end example]

### 16 3.17.7.58 COUPDAYS

17 **Syntax:**

18 COUPDAYS ( *settlement* , *maturity* , *frequency* [ , [ *basis* ] ] )

19 **Description:** Computes the number of days in the coupon period that contains the settlement date.

20 **Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The number of days in the coupon period that contains the settlement date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPDAYS (DATE (2007,1,25),DATE (2008,11,15),2,1) results in 181

COUPDAYS (DATE (2007,1,25),DATE (2008,11,15),2) results in 180

end example]

### 3.17.7.59 COUPDAYSNC

**Syntax:**

COUPDAYSNC ( *settlement* , *maturity* , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the number of days from the settlement date to the next coupon date.

**Arguments:**

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The number of days from the settlement date to the next coupon date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

[Example:

COUPDAYSNC (DATE (2007, 1, 25), DATE (2008, 11, 15), 2, 1) results in 110

COUPDAYSNC (DATE (2007, 1, 25), DATE (2008, 11, 15), 2) results in 110

end example]

### 3.17.7.60 COUPNCD

COUPNCD ( *settlement* , *maturity* , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the next coupon date after the settlement date.

1 **Arguments:**

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

2

3 Time information in the date arguments is ignored.

4 **Return Type and Value:** number – The next coupon date after the settlement date, as a date.

5 However, if

- 6 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 7 • *settlement*  $\geq$  *maturity*, #NUM! is returned.
- 8 • *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- 9 • *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

10 [Example:

11

12 COUPNCD(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 15-May-2007

13

14 end example]

15 **3.17.7.61 COUPNUM**16 COUPNUM ( *settlement* , *maturity* , *frequency* [ , [ *basis* ] ] )

17 **Description:** Computes the number of coupons payable between the settlement date and maturity date,  
18 rounded up to the nearest whole coupon.

# Arguments:

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The number of coupons payable between the settlement date and maturity date, rounded up to the nearest whole coupon.

However, if

- settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- settlement* ≥ *maturity*, #NUM! is returned.
- frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPNUM(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 4

end example]

## 3.17.7.62 COUPPCD

COUPPCD ( *settlement* , *maturity* , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the previous coupon date before the settlement date.

**Arguments:**

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The previous coupon date before the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

[Example:

COUPPCD(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 15-Nov-2006

end example]

### 3.17.7.63 COVAR

**Syntax:**

COVAR ( array-1 , array-2 )

**Description:** Computes covariance; that is, the average of the products of deviations for each data point pair in the two cell ranges designated by *array-1* and *array-2*.

**Mathematical Formula:**

The covariance is:

$$\text{Cov}(X,Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{n}$$

where *x* and *y* are the sample means `AVERAGE(array-1)` and `AVERAGE(array-2)`, and *n* is the sample size.

**Arguments:**

Name	Type	Description
<i>array-1</i>	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>		

**Return Type and Value:** number – The covariance.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[Example:

`COVAR({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in -1.375374

end example]

### 3.17.7.64 CRITBINOM

**Syntax:**

`CRITBINOM ( number-trials , success-probability , alpha )`

**Description:** Computes the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

**Arguments:**

Name	Type	Description
<i>number-trials</i>	number	The number of Bernoulli trials.
<i>success-</i>	number	The probability of success on each trial.

Name	Type	Description
<i>probability</i>		
<i>alpha</i>	number	The criterion value.

**Return Type and Value:** number – The smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

However, if

- *number-trials* < 0, #NUM! is returned.
- *success-probability* is < 0 or *success-probability* > 1, #NUM! is returned.
- *alpha* < 0 or *alpha* > 1, #NUM! is returned.

[Example:

CRITBINOM(6,0.5,0.75) results in 4

CRITBINOM(12,0.3,0.95) results in 6

end example]

### 3.17.7.65 CUBEKPIMEMBER

**Syntax:**

CUBEKPIMEMBER ( *connection* , *kpi-name* , *kpi-property* [ , [ *caption* ] ] )

**Description:** Fetches from the OLAP cube on the SQL Server designated by *connection*, a Key Performance Indicator (KPI) name, property, and measure, and displays the name and property in the cell. A KPI is a quantifiable measurement, such as monthly gross profit or quarterly employee turnover, used to monitor an organization's performance.

**Arguments:**

Name	Type	Description								
<i>connection</i>	text	The name of the connection to the cube.								
<i>kpi-name</i>	text	The name of the KPI in the cube.								
<i>kpi-property</i>	number	<div>The KPI component to be returned, truncated to integer; it shall be one of the following:<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>The actual value</td></tr><tr><td>2</td><td>A target value</td></tr><tr><td>3</td><td>The state of the KPI at a specific</td></tr></table></div>	Value	Description	1	The actual value	2	A target value	3	The state of the KPI at a specific
Value	Description									
1	The actual value									
2	A target value									
3	The state of the KPI at a specific									

Name	Type	Description	
			moment in time
		4	A measure of the value over time
		5	A relative importance assigned to the KPI
		6	A temporal context for the KPI
		If 1 is specified, only <i>kpi-name</i> is displayed in the cell.	
<i>caption</i>	text	An alternative string whose value is displayed in the cell instead of <i>kpi-name</i> and <i>kpi-property</i> .	

**Return Type and Value:** any – The selected key performance indicator.

However, if

- *kpi-name* is invalid, the return value is unspecified.
- *kpi-property* is outside the range 1–6, #N/A is returned.
- The *connection* name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.

[Example:

```
CUBEKPIMEMBER("Sales","MySalesKPI",1)
CUBEKPIMEMBER("Sales","MySalesKPI",2,"Sales KPI Goal")
```

end example]

### 3.17.7.66 CUBEMEMBER

**Syntax:**

CUBEMEMBER ( *connection* , *member-expression* , [ , [ *caption* ] ] )

**Description:** Fetches from the OLAP cube on the SQL Server designated by *connection*, the member or tuple defined by *member-expression*. [Note: This function is used to validate that the member or tuple exists in the cube. end note]

When a call to CUBEMEMBER is used as an argument to another CUBExxx function, the MDX expression that identifies the member or tuple is used by that CUBExxx function, rather than the displayed value in the cell of the CUBEMEMBER function.

**Arguments:**

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.
<i>member-expression</i>	text, reference, array	A multidimensional expression (MDX) that evaluates to a unique member in the cube. Alternatively, <i>member-expression</i> can be a tuple, specified as a cell range or an array constant.
<i>caption</i>	text	The string displayed in the cell instead of the caption from the cube (assuming it defines such a caption). When a tuple is returned, the caption used is the one for the last member in the tuple.

**Return Type and Value:** any – A member or tuple in a cube hierarchy.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```

CUBEMEMBER("Sales", "[Time].[Fiscal].[2004]")
CUBEMEMBER(A1,D$12)
CUBEMEMBER("Sales", (B4,C6,D5), "SalesFor2004")
CUBEMEMBER("Sales", {[Products].[Food];[Time].[Fiscal].[2004]})
CUBEMEMBER(A1,C$12:D$12)

```

end example]

### 3.17.7.67 CUBEMEMBERPROPERTY

**Syntax:**

```
CUBEMEMBERPROPERTY (connection , member-expression , property)
```

**Description:** Fetches a property of a member in the OLAP cube on an SQL Server. [*Note: Use this function to validate that a member name exists within the cube and to return the specified property for this member. end note*]

**Arguments:**

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.
<i>member-expression</i>	text	A multidimensional expression (MDX) that evaluates to a unique member in the cube.
<i>property</i>	text	The name of the property returned or a reference to a cell that contains the name of the property.

**Return Type and Value:** any – A property of a member in the OLAP cube.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.

[*Example:*

```
CUBEMEMBERPROPERTY("Sales","[Time].[Fiscal].[2004]",A3)
CUBEMEMBERPROPERTY("Sales","[Store].[MyFavoriteStore]",
"[Store].[Store Name].[Store Sqft]")
```

*end example*]

### 3.17.7.68 CUBERANKEDMEMBER

**Syntax:**

CUBERANKEDMEMBER ( *connection* , *set-expression* , *rank* [ , *caption* ] )

**Description:** Fetches the  $n^{\text{th}}$ , or ranked, member in a set.

**Arguments:**

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.

Name	Type	Description
<i>set-expression</i>	text	A set expression, such as "[{Item1}.children]".
<i>rank</i>	number	Specifies the top value to return, truncated to integer. If 1, the top value is returned; if 2, the second-most top value is returned; and so on.
<i>caption</i>	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).

**Return Type and Value:** any – The  $n^{\text{th}}$  member in the set.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified. , the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```
CUBERANKEDMEMBER("Sales",D4,1,"Top Month")
CUBERANKEDMEMBER("Sales",CUBESET("Sales","Summer","[2004].[June]",
"[2004].[July]","[2004].[August]"),3,"Top Month")
```

end example]

### 3.17.7.69 CUBESET

**Syntax:**

```
CUBESET (connection , set-expression [, [caption] [, [sort-order]
[, [sort-by]]]])
```

**Description:** Fetches from the OLAP cube on the SQL Server designated by *connection* the set of members or tuples that is defined by *set-expression*. [Note: Use this function to build dynamic reports that aggregate and filter data, by using the return value as a slicer in the CUBEVALUE function, the CUBERANKEDMEMBER function to choose specific members from the calculated set, and the CUBESETCOUNT function to control the size of the set. end note]

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description																								
<i>connection</i>	text	The name of the connection to the cube.																								
<i>set-expression</i>	text, reference	A set expression that results in a set of members or tuples. <i>set-expression</i> can also be a cell reference to range that contains one or more members, tuples, or sets included in the set.																								
<i>caption</i>	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).																								
<i>sort-order</i>	text	<p>The type of sort, if any, to perform; it can be one of the following:</p> <table> <tr> <th>Value</th><th>Description</th><th><i>sort-by</i> argument</th></tr> <tr> <td>0 or default</td><td>Leaves the set in existing order</td><td>Ignored</td></tr> <tr> <td>1</td><td>Sorts set in ascending order by <i>sort_by</i></td><td>Required</td></tr> <tr> <td>2</td><td>Sorts set in descending order by <i>sort_by</i></td><td>Required</td></tr> <tr> <td>3</td><td>Sorts set in alphabetic ascending order</td><td>Ignored</td></tr> <tr> <td>4</td><td>Sorts set in alphabetic descending order</td><td>Ignored</td></tr> <tr> <td>5</td><td>Sorts set in natural ascending order</td><td>Ignored</td></tr> <tr> <td>6</td><td>Sorts set in natural descending order</td><td>Ignored</td></tr> </table> <p>An alphabetic sort for a set of tuples sorts on the last element in each tuple.</p>	Value	Description	<i>sort-by</i> argument	0 or default	Leaves the set in existing order	Ignored	1	Sorts set in ascending order by <i>sort_by</i>	Required	2	Sorts set in descending order by <i>sort_by</i>	Required	3	Sorts set in alphabetic ascending order	Ignored	4	Sorts set in alphabetic descending order	Ignored	5	Sorts set in natural ascending order	Ignored	6	Sorts set in natural descending order	Ignored
Value	Description	<i>sort-by</i> argument																								
0 or default	Leaves the set in existing order	Ignored																								
1	Sorts set in ascending order by <i>sort_by</i>	Required																								
2	Sorts set in descending order by <i>sort_by</i>	Required																								
3	Sorts set in alphabetic ascending order	Ignored																								
4	Sorts set in alphabetic descending order	Ignored																								
5	Sorts set in natural ascending order	Ignored																								
6	Sorts set in natural descending order	Ignored																								
<i>sort-by</i>	text	The value by which to sort. [Example: To get the city with the highest sales, set-expression would be a set of cities, and sort-by would be the sales measure. To get the city with the highest population, set-expression would be a set of cities, and sort-by would be the population measure. end example]																								

1

2 **Return Type and Value:** any – The set of members or tuples.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.
- *sort-order* is outside the range 0–6, #N/A is returned.
- *sort-order* requires *sort-by*, but *sort-by* is omitted, #VALUE! is returned.

[Example:

```
CUBESet("Finance", "Order([Product].[Product].[Product Category]
.Members, [Measures].[Unit Sales], ASC)", "Products")
```

```
CUBESet("Sales", "[Product].[All Products].Children",
"Products", 1, "[Measures].[Sales Amount]")
```

end example]

### 3.17.7.70 CUBESetCOUNT

**Syntax:**

CUBESetCOUNT ( *set* )

**Description:** Computes the number of items in a set.

**Arguments:**

Name	Type	Description
<i>set</i>	text	An expression that evaluates to a set defined by the CUBESet function.

**Return Type and Value:** number – The number of items in a set.

[Example:

```
CUBESetCOUNT(A3)
```

```
CUBESetCOUNT(CUBESet("Sales", "[Product].[All Products].Children",
"Products", 1, "[Measures].[Sales Amount]"))
```

end example]

## 3.17.7.71 CUBEVALUE

**Syntax:**

CUBEVALUE ( *connection* , *argument-list* )

**Description:** Fetches from the OLAP cube on the SQL Server designated by *connection*, the aggregated value defined by a series of member-expression *arguments* in *argument-list*.

**Arguments:**

Name	Type	Description
<i>connection</i>	text	The name of the connection to the cube.
<i>argument-list</i>	text, reference	Each <i>argument</i> in <i>argument-list</i> is text containing a multidimensional expression (MDX) that evaluates to a member or tuple within the cube. Alternatively, an <i>argument</i> can be a set defined with the CUBESET function. Use any <i>argument</i> as a slicer to define the portion of the cube for which the aggregated value is returned. If no measure is specified in an <i>argument</i> , the default measure for that cube is used. If a cell reference is used for an <i>argument</i> , and that cell reference contains a CUBE function, then that <i>argument</i> uses the MDX expression for the item in the referenced cell, and not the value displayed in that referenced cell.

**Return Type and Value:** any – The aggregated value.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by an *argument* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified. (This can occur with multiple elements from the same hierarchy.)
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

CUBEVALUE("Sales", "[Measures].[Profit]", "[Time].[2004]",

```

1 "[All Product].[Beverages]")
2 CUBEVALUE(A1,"[Measures].[Profit]",D$12,$A23)
3 CUBEVALUE("Sales",B7,D$12,$A23)

```

end example]

### 3.17.7.72 CUMIPMT

#### Syntax:

CUMIPMT ( *rate* , *nper* , *pv* , *start-period* , *end-period* , *type* )

**Description:** Computes the cumulative interest paid on a loan between *start-period* and *end-period*.

#### Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>nper</i>	number	The total number of payment periods, truncated to integer.						
<i>pv</i>	number	The present value.						
<i>start-period</i>	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)						
<i>end-period</i>	number	The last period in the calculation.						
<i>type</i>	number	<div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Time information in the date arguments is ignored.

**Return Type and Value:** number – The cumulative interest paid on a loan.

However, if

- *rate*, *nper*, or *pv*  $\leq 0$ , #NUM! is returned.
- *start-period*  $< 1$  or *end-period*  $< 1$ , or *start-period*  $> end\_period$ , #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

CUMIPMT(0.09/12,30\*12,125000,13,24,0) results in -11135.23

CUMIPMT(0.09/12,30\*12,125000,1,1,0) results in -937.50

end example]

### 3.17.7.73 CUMPRINC

#### Syntax:

CUMPRINC ( *rate* , *nper* , *pv* , *start-period* , *end-period* , *type* )

**Description:** Computes the cumulative principal paid on a loan between *start-period* and *end-period*.

#### Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>nper</i>	number	The total number of payment periods, truncated to integer.						
<i>pv</i>	number	The present value.						
<i>start-period</i>	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)						
<i>end-period</i>	number	The last period in the calculation.						
<i>type</i>	number	<div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Time information in the date arguments is ignored.

**Return Type and Value:** number – The cumulative principal paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0, #NUM! is returned.
- *start-period* < 1 or *end-period* < 1, or *start-period* > *end-period*, #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

CUMPRINC(0.09/12,30\*12,125000,13,24,0) results in -934.11

CUMPRINC(0.09/12,30\*12,125000,1,1,0) results in -68.28

end example]

### 3.17.7.74 DATE

#### Syntax:

DATE ( *year* , *month* , *day* )

**Description:** Computes the serial value for the given date.

#### Arguments:

Name	Type	Description
<i>year</i>	number	<p>A year, truncated to integer, that together with <i>month</i> and <i>day</i> specifies the date whose serial value is to be computed.</p> <p>For the 1900 date base system:</p> <ul style="list-style-type: none"> <li>If <i>year</i> is in the range 0–1899, inclusive, the year shall be interpreted as <i>year</i> + 1900.</li> <li>If <i>year</i> is in the range 1900–9999, inclusive, the year shall be interpreted as <i>year</i>.</li> </ul> <p>For the 1904 date base system:</p> <ul style="list-style-type: none"> <li>If <i>year</i> is in the range 4–1899, inclusive, the year shall be interpreted as <i>year</i> + 1900.</li> <li>If <i>year</i> is in the range 1904–9999, inclusive, the year shall be interpreted as <i>year</i>.</li> </ul>
<i>month</i>	number	<p>A month, truncated to integer, that together with <i>year</i> and <i>day</i> specifies the date whose serial value is to be computed.</p> <p>If <i>month</i> is in the range 1–12, the month shall be interpreted as <i>month</i>. If <i>month</i> is less than 1 or greater than 12, the month shall be interpreted as the normalized value (see below) of <i>month</i>, and the year shall be adjusted accordingly.</p>
<i>day</i>	number	<p>A day, truncated to integer, that together with <i>month</i> and <i>year</i> specifies the date whose serial value is to be computed.</p> <p>If <i>day</i> is in the allowable range of days for the month, the day shall be interpreted as <i>day</i>. If <i>day</i> is less than 1 or greater than the number of days in the given month, the day shall be interpreted as the normalized value (see below) of <i>day</i>, and the year and month shall be adjusted</p>

Name	Type	Description
		accordingly.

Month and/or day normalization occurs when *month* and/or *day* is outside the range 1–12 and 1–number-of-days-in-the-given-month, respectively. Specifically, if *month* is greater than 12, that number of months shall be added to the first month in the year specified. If *month* is less than 1, the magnitude of that number of months, plus 1, is subtracted from the first month in the year specified. If *day* is greater than the number of days in the month specified, that number of days is added to the first day in the month specified. If *day* is less than 1, the magnitude of that number of months, plus 1, is subtracted from the first day in the month specified. If both *month* and *day* in the same date are normalized, *month* is normalized first.

**Return Type and Value:** number – The serial value for the given date.

However, if

- *year* is less than 0 or is greater-than or equal-to 10000, and the 1900 date base system is being used, #NUM! is returned.
- *year* is less than 4, is greater-than or equal-to 10000, is in the range 1900–1903, inclusive, and the 1904 date base system is being used, #NUM! is returned.

[Example: For the 1900 date base system:

DATE(0,1,1) results in a serial value of 1  
 DATE(1899,1,1) results in a serial value of 693598  
 DATE(1900,1,1) results in a serial value of 1  
 DATE(9999,12,31) results in a serial value of 2958465

For the 1904 date base system:

DATE(4,1,1) results in a serial value of 0  
 DATE(1899,1,1) results in a serial value of 692136  
 DATE(1904,1,1) results in a serial value of 0  
 DATE(9999,12,31) results in a serial value of 2957003

end example]

### 3.17.7.75 DATEDIF

**Syntax:**

DATEDIF ( *start-date* , *end-date* , *unit* )

**Description:** Calculates the number of days, months, or years between two dates.

**Arguments:**

Name	Type	Description														
<i>start-date</i>	number	The first date in the period, truncated to integer.														
<i>end-date</i>	number	The last date in the period, truncated to integer.														
<i>unit</i>	text	<div>The count to be returned, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>"Y"</td><td>The number of complete years in the period.</td></tr><tr><td>"M"</td><td>The number of complete months in the period.</td></tr><tr><td>"D"</td><td>The number of days in the period.</td></tr><tr><td>"MD"</td><td>The difference between the days in <i>start-date</i> and <i>end-date</i>. The months and years of the dates are ignored.</td></tr><tr><td>"YM"</td><td>The difference between the months in <i>start-date</i> and <i>end-date</i>. The days and years of the dates are ignored.</td></tr><tr><td>"YD"</td><td>The difference between the days of <i>start-date</i> and <i>end-date</i>. The years of the dates are ignored.</td></tr></table></div>	Value	Day Count Basis	"Y"	The number of complete years in the period.	"M"	The number of complete months in the period.	"D"	The number of days in the period.	"MD"	The difference between the days in <i>start-date</i> and <i>end-date</i> . The months and years of the dates are ignored.	"YM"	The difference between the months in <i>start-date</i> and <i>end-date</i> . The days and years of the dates are ignored.	"YD"	The difference between the days of <i>start-date</i> and <i>end-date</i> . The years of the dates are ignored.
Value	Day Count Basis															
"Y"	The number of complete years in the period.															
"M"	The number of complete months in the period.															
"D"	The number of days in the period.															
"MD"	The difference between the days in <i>start-date</i> and <i>end-date</i> . The months and years of the dates are ignored.															
"YM"	The difference between the months in <i>start-date</i> and <i>end-date</i> . The days and years of the dates are ignored.															
"YD"	The difference between the days of <i>start-date</i> and <i>end-date</i> . The years of the dates are ignored.															

**Return Type and Value:** number – The number of days, months, or years between two dates, depending on the value of *unit*.

However, if

- *start-date* or *end-date* is out of range for the current date base value, #NUM! is returned.
- *start-date*  $\geq$  *end-date* #NUM! is returned.
- *unit* is any value other than those shown in the table above, #NUM! is returned.

[Example:

DATEDIF (DATE (2001, 1, 1), DATE (2003, 1, 1), "Y") results in 2 complete years

DATEDIF (DATE (2001, 6, 1), DATE (2002, 8, 15), "D") results in 440 days

DATEDIF (DATE (2001, 6, 1), DATE (2002, 8, 15), "YD") results in 75 days

DATEDIF (DATE (2001, 6, 1), DATE (2002, 8, 15), "MD") results in 14 days

end example]

### 3.17.7.76 DATEVALUE

#### Syntax:

DATEVALUE ( *date-time-string* )

**Description:** Computes the serial value of the date and/or time represented by the string *date-time-string*, taking into account the current date base value.

#### Arguments:

Name	Type	Description
<i>date-time-string</i>	text	The date and/or time whose serial value is to be computed. <i>date-time-string</i> can have any valid date and/or time format. If the year portion of <i>date-time-string</i> is omitted, the current year is used. Any time information in <i>date-time-string</i> shall be ignored.

**Return Type and Value:** number – The serial value of the date and/or time represented by the string *date-time-string*.

However, if

- *date-time-string* is out of range for the current date base value, #VALUE! is returned.
- *date-time-string* does not represent a date, #VALUE! is returned.

[Example: When the current year is 2006,

DATEVALUE("2/1/2006")

DATEVALUE("01-Feb-2006 10:06 AM")

DATEVALUE("2006/2/1")

DATEVALUE("2006-2-1")

DATEVALUE("1-Feb")

all result in 38749 for the 1900 date base system, or 37287 for the 1904 date base system. *end example*]

### 3.17.7.77 DAVERAGE

#### Syntax:

DAVERAGE ( *database* , *field* , *criteria* )

**Description:** Averages the values in a column of a list or database that match the specified criteria.

[Note: In order to perform an operation on an entire column in a database, a blank line must be entered below the column labels in the criteria range. *end note*]

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database, which shall be a list of related data in which rows of related information are records, and columns of data are fields. The first row of the list shall contain labels for each column.
<i>field</i>	text, number	Indicates the column to which <i>criteria</i> shall be applied. It can either be a string containing the column's label, or the column's position number, where columns are numbered starting at 1. [Example: If column 3's label is "Age" then either 3 or "Age" can be used. end example]
<i>criteria</i>	reference	<p>The range of cells that contains the specified conditions. Each cell in that range that contains a condition shall have a value that is the form of a number, an expression, a cell reference, or text that defines which cells will be selected. In the case of text, a condition can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If the text form is used and the text does not begin with a comparison operator, the criteria matches any string starting with that text. [Example: A criteria of "Pea" can result in Pea, Pear, and Peach's being matched, whereas a criteria of "=Pea" will only match Pea. end example]</p> <p><i>criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).</p> <p>The range shall include at least one column label and at least one cell below the column label in which a condition for the column is specified. [Example: If the range G1:G2 contains the column label Income in G1 and the amount 10,000 in G2, one could define the range as MatchIncome and use that name as <i>criteria</i>. end example] The value of <i>criteria</i> shall not overlap the range specified by <i>database</i>.</p> <p>To find rows that meet multiple criteria for a single column, all of the criteria shall be specified directly below one another in separate rows of the <i>criteria</i> range.</p> <p>To find rows that meet multiple criteria for multiple columns, all of the criteria shall be specified in the same row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple criteria for multiple columns, where any criteria can be true, each of the criteria shall be specified in a different row of the <i>criteria</i></p>

Name	Type	Description
		<p>range.</p> <p>To find rows that meet multiple sets of criteria, where each set includes criteria for multiple columns, each set of criteria shall be specified in a separate row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple sets of criteria, where each set includes criteria for one column, multiple columns with the same column heading shall be included in the <i>criteria</i> range.</p>

1

2 **Return Type and Value:** number – The average of the values of the cells that correspond to the specified  
3 criteria.

4 [Example: Given the following data:

	A	B	C	D	E	F
1	Tree	Height	Age	Yield	Profit	Height
2	=Apple	>10				<16
3	=Pear					
4	Tree	Height	Age	Yield	Profit	
5	Apple	18	20	14	105.00	
6	Pear	12	12	10	96.00	
7	Cherry	13	14	9	105.00	
8	Apple	14	15	10	75.00	
9	Pear	9	8	8	76.80	
10	Apple	8	9	6	45.00	

5

6 the average yield of apple trees over 10 feet in height is computed by DAVVERAGE(A4:E10,"Yield",A1:B2),  
7 which results in 12

8 The average age of all trees is computed by DAVVERAGE(A4:E10,3,A4:E10), which results in 13

9

10 end example]

### 11 3.17.7.78 DAY

12 **Syntax:**

13 DAY ( date-value )

**Description:** Computes the numeric Gregorian day for the date and/or time having the given *date-value*, taking into account the current date base value.

**Arguments:**

Name	Type	Description
<i>date-value</i>	number, text	The date and/or time whose day is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any valid date and/or time format, in which case, any time information shall be ignored.

**Return Type and Value:** number – The Gregorian day for the date and/or time having the given *date-value*. The returned value shall be in the range 1–31.

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[Example:

DAY(DATE(2006,1,2)) results in 2

DAY(DATE(2006,0,2)) results in 31

DAY("2006/1/2 10:45 AM") results in 2

DAY(30000) results in 18 for the 1900 date base system, or 19 for the 1904 date base system

end example]

### 3.17.7.79 DAYS360

**Syntax:**

DAYS360 ( *start-date* , *end-date* [ , *method-flag* ] )

**Description:** Computes the signed number of days between two dates based on a 360-day year (twelve 30-day months).

**Arguments:**

Name	Type	Description	
<i>start-date</i>	number	<i>start-date</i> and <i>end-date</i> are the dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .	
<i>start-date</i>	number		
<i>method-flag</i>	logical	Specifies whether to use the U.S. or European method in the calculation, as follows:	
		Value	Meaning

Name	Type	Description	
		FALSE or omitted	U.S. (NASD) method: If the <i>start-date</i> is the 31st day of a month, it is changed to the 30th day of that same month. If the <i>end-date</i> is the 31st day of a month and the <i>start-date</i> is earlier than the 30th day of a month, the <i>end-date</i> is changed to the 1st day of the following month; otherwise the <i>end-date</i> is changed to the 30th day of the same month.
		TRUE	European method: <i>start-dates</i> and <i>end-dates</i> that occur on the 31st day of a month are changed to the 30th day of the same month.

1

2 **Return Type and Value:** number – The signed number of days between two dates based on a 360-day year  
3 (12 30-day months). If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude  
4 shall be the difference in days.

5 However, if *start-date* or *end-date* is out of range for the current date base value, #NUM! is returned.

6 [Example:

7

8 DAYS360(DATE(2002,2,3),DATE(2005,5,31)) results in 1198

9 DAYS360(DATE(2005,5,31),DATE(2002,2,3)) results in -1197

10 DAYS360(DATE(2002,2,3),DATE(2005,5,31),FALSE) results in 1198

11 DAYS360(DATE(2002,2,3),DATE(2005,5,31),TRUE) results in 1197

12

13 |end example]

#### 14 3.17.7.80 DB

15 **Syntax:**

16 DB ( cost , salvage , life , period [ , [ month ] ] )

17 **Description:** Computes the depreciation of an asset for a specified period using the fixed-declining balance  
18 method.

19 **Mathematical Formula:**

20 The fixed-declining balance method computes depreciation at a fixed rate. DB uses the following formulas to  
21 calculate depreciation for a period:

22 (cost - total depreciation from prior periods) \* rate

where:

$\text{rate} = 1 - ((\text{salvage} / \text{cost}) ^ (1 / \text{life}))$ , rounded to three decimal places

Depreciation for the first and last periods is a special case. For the first period, DB uses this formula:

$\text{cost} * \text{rate} * \text{month} / 12$

For the last period, DB uses this formula:

$((\text{cost} - \text{total depreciation from prior periods}) * \text{rate} * (12 - \text{month})) / 12$

#### Arguments:

Name	Type	Description
<i>cost</i>	number	The initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>period</i>	number	The period for which the depreciation is to be calculated. ( <i>period</i> shall use the same units as <i>life</i> .)
<i>month</i>	number	The number of months in the first year. If omitted, a value of 12 is used.

**Return Type and Value:** number – The depreciation of an asset for a specified period using the fixed-declining balance method.

However, if

- cost*, *salvage*, *life*, or *period* < 0, #NUM! is returned.
- month* is outside the range 1–12, #NUM! is returned.

[Example:

DB(1000000,100000,6,1,7) results in 186,083.33

DB(1000000,100000,6,2,7) results in 259,639.42

DB(1000000,100000,6,3,7) results in 176,814.44

DB(1000000,100000,6,4,7) results in 120,410.64

DB(1000000,100000,6,5,7) results in 81,999.64

DB(1000000,100000,6,6,7) results in 55,841.76

DB(1000000,100000,6,7,7) results in 15,845.10

*end example]*

### 3.17.7.81 DCOUNT

#### Syntax:

DCOUNT ( *database* , *field* , *criteria* )

**Description:** Counts the number of values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – The count of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §3.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Age fields that contain numbers is computed by DCOUNT(A4:E10, "Age", A1:F2), which results in 1.

*end example]*

### 3.17.7.82 DCOUNTA

#### Syntax:

DCOUNTA ( *database* , *field* , *criteria* )

**Description:** Counts the number of non-blank cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVVERAGE function §3.17.7.77.)

**Return Type and Value:** number – The count of the non-blank cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVVERAGE function §3.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by DCOUNTA(A4:E10, "Profit", A1:F2), which results in 1.

*end example]*

### 3.17.7.83 DDB

**Syntax:**

DDB ( *cost* , *salvage* , *life* , *period* [ , *factor* ] )

**Description:** Computes the depreciation of an asset for a specified period using the double-declining balance or some other specified method. [*Note:* Use VDB (§3.17.7.338) for a straight-line depreciation method when depreciation is greater than the declining balance calculation. *end note]*

**Mathematical Formula:**

MIN((cost - total depreciation from prior periods) \* (factor/life), (cost - salvage - total depreciation from prior periods))

**Arguments:**

Name	Type	Description
<i>cost</i>	number	The initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>period</i>	number	The period for which the depreciation is to be calculated. ( <i>period</i> shall use the same units as <i>life</i> .)
<i>factor</i>	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).

**Return Type and Value:** number – The depreciation of an asset for a specified period.

However, if

- salvage < 0 #NUM! is returned.

- cost life <= 0, #NUM! is returned.
- life <= 0 #NUM! is returned.
- period <= 0, #NUM! is returned.
- factor <= 0, #NUM! is returned.

[Example:

DDB(2400,300,10\*365,1) results in 1.32  
DDB(2400,300,10\*12,1,2) results in 40.00  
DDB(2400,300,10,1,2) results in 480.00  
DDB(2400,300,10,2,1.5) results in 306.00  
DDB(2400,300,10,10) results in 22.12

end example]

### 3.17.7.84 DEC2BIN

**Syntax:**

DEC2BIN ( *number* [ , *num-bin-digits* ] )

**Description:** Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	number	The decimal number that is to be converted to a binary string.
<i>num-bin-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer.

**Return Type and Value:** text – The binary equivalent of *number* using twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -512 (1000000000 binary) to 511 (0111111111 binary), inclusive, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2BIN(23) results in 10111

DEC2BIN(-256) results in 1100000000

DEC2BIN(18,7) results in 0010010

end example]

### 3.17.7.85 DEC2HEX

**Syntax:**

DEC2HEX ( *number* [ , *num-hex-digits* ] )

**Description:** Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	number	The decimal number that is to be converted to a hexadecimal string.
<i>num-hex-digits</i>	number	<i>num-hex-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer.

**Return Type and Value:** text – The hexadecimal equivalent of *number* using twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

However, if

- number* is outside the range -549,755,813,888 (8000000000 hex) to 549,755,813,887 (7FFFFFFF hex), inclusive, #NUM! is returned.
- number* needs more digits than *num-hex-digits*, #NUM! is returned.
- num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2HEX(23) results in 17

DEC2HEX(-256) results in FFFFFFFF00

DEC2HEX(18,7) results in 0000012

end example]

## 3.17.7.86 DEC2OCT

**Syntax:**DEC2OCT ( *number* [ , *num-oct-digits* ] )**Description:** Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.**Arguments:**

Name	Type	Description
<i>number</i>	number	The decimal number that is to be converted to an octal string.
<i>num-bin-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer.

**Return Type and Value:** text – The octal equivalent of *number* using twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

However, if

- number* is outside the range -536,870,912 (4000000000 octal) to 536,870,911 (3777777777 octal), inclusive, #NUM! is returned.
- number* needs more digits than *num-oct-digits*, #NUM! is returned.
- num-oct-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2OCT(23) results in 27

DEC2OCT(-256) results in 7777777400

DEC2OCT(18,7) results in 000022

end example]

## 3.17.7.87 DEGREES

**Syntax:**DEGREES ( *angle* )**Description:** Converts *angle* in radians into degrees.**Arguments:**

Name	Type	Description
<i>angle</i>	number	The number of radians that is to be converted into degrees.

1

2 **Return Type and Value:** number – *angle* in degrees.

3 [Example:

4

5 DEGREES(2 \* PI()) results in 360

6 DEGREES(PI()) results in 180

7 DEGREES(PI()/2) results in 90

8 DEGREES(8.5) results in 487.0141259

9

10 *end example]*

### 11 3.17.7.88 DELTA

12 **Syntax:**

13 DELTA ( *number-1* [ , *number-2* ] )

14 **Description:** Compares two numbers for equality.

15 **Arguments:**

Name	Type	Description
<i>number-1</i>	number	The numbers that are to be compared for equality. If <i>number-2</i> is omitted, it is assumed to be zero.
<i>number-2</i>	number	

16

17 **Return Type and Value:** number – 1 if *number-1* equals *number-2*; otherwise, 0.

18 [Example:

19

20 DELTA(10.5,10.5) results in 1

21 DELTA(10.5,10.6) results in 0

22 DELTA(10.5) results in 0

23 DELTA(0) results in 1

24

25 *end example]*

### 26 3.17.7.89 DEVSQ

27 **Syntax:**

28 DEVSQ ( *argument-list* )

**Description:** Computes the sum of squares of deviations of data points from their sample mean.

**Mathematical Formula:**

$$\text{DEVSQ} = \sum (x - \bar{x})^2$$

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, array, or reference to a number. Argument list can be a single argument that is an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the sum of squared deviations is to be calculated. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The sum of squares of deviations of data points from their sample mean.

[Example:

DEVSQ(5.6,8.2,9.2) results in 6.906666667

DEVSQ({5.6,8.2,9.2}) results in 6.906666667

end example]

### 3.17.7.90 DGET

**Syntax:**

DGET ( *database* , *field* , *criteria* )

Description: Extracts a single value from a column of a list that matches the specified criteria. (See the DAVERAGE function §3.17.7.77.)

**Arguments:**

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVVERAGE function §3.17.7.77.

**Return Type and Value:** number – The value of the cell that corresponds to the specified criteria.

However, if

- No record matches the criteria, #VALUE! is returned.
- More than one record matches the criteria, #NUM! is returned.

[Example: Using the data in the example in the DAVVERAGE function §3.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by DGET(A4:E7, "Yield", A1:A2), which results in 14.

end example]

### 3.17.7.91 DISC

**Syntax:**

DISC ( *settlement* , *maturity* , *pr* , *redemption* [ , [ *basis* ] ] )

**Description:** Computes the discount rate for a security.

**Mathematical Formula:**

$$DISC = \frac{\text{redemption} - \text{par}}{\text{par}} \times \frac{B}{DSM}$$

where:

B = number of days in a year, depending on the year basis.

DSM = number of days between settlement and maturity.

**Arguments:**

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>pr</i>	number	The security's price per \$100 face value.				
<i>redemption</i>	number	The security's redemption value per \$100 face value.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360
Value	Day Count Basis					
0 or omitted	US (NASD) 30/360					

Name	Type	Description	
		1	Actual/actual
		2	Actual/360
		3	Actual/365
		4	European 30/360

Time information in the date arguments is ignored.

**Return Type and Value:** number – The discount rate for a security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *pr* or *redemption*  $\leq$  0, #NUM! is returned.
- *basis*  $<$  0 or *basis*  $>$  4, #NUM! is returned.

[Example:

DISC(DATE(2007,1,25),DATE(2007,6,15),97.975,100,1) results in 5.2420%

end example]

### 3.17.7.92 DMAX

**Syntax:**

DMAX ( *database* , *field* , *criteria* )

**Description:** Computes the maximum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

**Arguments:**

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – The maximum of the values of the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §3.17.7.77:

The maximum profit of apple and pear trees is computed by DMAX(A4:E10, "Profit", A1:A3), which results in 105.

end example]

### 3.17.7.93 DMIN

#### Syntax:

DMIN ( *database* , *field* , *criteria* )

**Description:** Computes the minimum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – The minimum of the values of the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §3.17.7.77:

The minimum profit of apple trees over 10 in height is computed by DMIN(A4:E10, "Profit", A1:B2), which results in 75.

end example]

### 3.17.7.94 DOLLAR

#### Syntax:

DOLLAR ( *number* [ , *num-decimal* ] )

**Description:** Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands separator, radix point, and currency symbol are locale-specific. The format used is \$#,##0.00;(\$#,##0.00).

#### Arguments:

Name	Type	Description
<i>number</i>	number	The number that is to be formatted.
<i>num-decimal</i>	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If <i>num-decimal</i> is negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

1

2 **Return Type and Value:** text – The string containing *number* rounded to *num-decimal* decimal places, and have a  
3 currency symbol and thousands separators.

4 [Example: In a US-English context:

5

6 DOLLAR(1234.567) results in \$1,234.57

7 DOLLAR(1234.567, -2) results in \$1,200

8 DOLLAR(-1234.567,4) results in (\$1,234.5670)

9 In a France-French context:

10

11 DOLLAR(1234.567) results in 1 234,57 €

12 DOLLAR(1234.567, -2) results in 1 200 €

13 DOLLAR(-1234.567,4) results in -1 234,5670 €

14 In a Swiss-French context:

15

16 DOLLAR(1234.567) results in SFr. 1'234.57

17 DOLLAR(1234.567, -2) results in SFr. 1'200

18 DOLLAR(-1234.567,4) results in SFr. -1'234.5670

19 In a Norway-Norwegian (Nynorsk) context:

20

21 DOLLAR(1234.567) results in kr 1 234,57

22 DOLLAR(1234.567, -2) results in kr 1 200

23 DOLLAR(-1234.567,4) results in kr -1 234,5670

24 end example]

### 25 3.17.7.95 DOLLARDE

26 **Syntax:**

27 DOLLARDE ( *fractional-dollar* , *fraction* )

28 **Description:** Converts a dollar price expressed as a fraction into a dollar price expressed as a decimal number.

29 [Note: This function is used to convert fractional dollar numbers, such as securities prices, to decimal numbers.

30 end note]

**Arguments:**

Name	Type	Description
<i>fractional-dollar</i>	number	The number expressed as a fraction.
<i>fraction</i>	number	The integer to use in the denominator of the fraction. [Example: A <i>fractional-dollar</i> value of <i>m.n</i> means <i>m</i> + <i>n</i> / <i>fraction</i> dollars. end example]

**Return Type and Value:** number – The dollar price expressed as a decimal number.

However, if

- *fraction* < 0, #NUM! is returned.
- *fraction* = 0, #DIV/0! is returned.

[Example:

DOLLARDE(1.02,16) results in 1.125

DOLLARDE(1.1,32) results in 1.3125

end example]

### 3.17.7.96 DOLLARFR

**Syntax:**

DOLLARFR ( *decimal-dollar* , *fraction* )

Description: Converts a dollar price expressed as a decimal into a dollar price expressed as a fraction. [Note: This function is used to convert decimal dollar numbers, such as securities prices, to fractional numbers. end note]

**Arguments:**

Name	Type	Description
<i>decimal-dollar</i>	number	The number expressed as a decimal.
<i>fraction</i>	number	The integer to use in the denominator of the fraction.

**Return Type and Value:** number – The dollar price expressed as a fractional number. [Example: A result of *m.n* means *m* + *n*/*fraction* dollars. end example]

However, if

- *fraction* < 0, #NUM! is returned.

- *fraction* = 0, #DIV/0! is returned.

[Example:

DOLLARFR(1.125,16) results in 1.02

DOLLARFR(1.125,32) results in 1.04

end example]

### 3.17.7.97 DPRODUCT

#### Syntax:

DPRODUCT ( *database* , *field* , *criteria* )

**Description:** Computes the product of the values of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – The product of the values of the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §3.17.7.77:

The product of the yields from apple trees with a height greater than 10 is computed by DPRODUCT(A4:E10, "Yield", A1:B2), which results in 140.

end example]

### 3.17.7.98 DSTDEV

#### Syntax:

DSTDEV ( *database* , *field* , *criteria* )

**Description:** Estimates the standard deviation of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – An estimate of the standard deviation of a population based on the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §3.17.7.77:

The estimated standard deviation in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DSTDEV(A4:E10, "Yield", A1:A3), which results in 2.97.

end example]

### 3.17.7.99 DSTDEVP

**Syntax:**

DSTDEVP ( *database* , *field* , *criteria* )

**Description:** Computes the standard deviation of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

**Arguments:**

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – The standard deviation of a population based on the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §3.17.7.77:

The true standard deviation in the yield of apple and pear trees if the data in the database is the entire population is computed by DSTDEVP(A4:E10, "Yield", A1:A3), which results in 2.65.

*end example]*

### 3.17.7.100 DSUM

#### Syntax:

DSUM ( *database* , *field* , *criteria* )

**Description:** Computes the sum of the values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

#### Arguments:

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

**Return Type and Value:** number – The sum of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §3.17.7.77:

The total profit from apple trees is computed by DSUM(A4:E10, "Profit", A1:A2), which results in 225.

The total profit from apple trees with a height between 10 and 16 is computed by DSUM(A4:E10, "Profit", A1:F2), which results in 75.

*end example]*

### 3.17.7.101 DURATION

#### Syntax:

DURATION ( *settlement* , *maturity* , *coupon* , *yld* , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the Macauley duration for an assumed par value of \$100. Duration is defined as the weighted average of the present value of the cash flows and is used as a measure of a bond price's response to changes in yield.

#### Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.

Name	Type	Description												
<i>maturity</i>	number	The security's maturity date.												
<i>coupon</i>	number	The security's annual coupon rate.												
<i>yld</i>	number	The security's annual yield.												
<i>frequency</i>	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The Macauley duration for an assumed par value of \$100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *coupon* or *yld*  $< 0$ , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

[Example:

DURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1) results in 5.993774956

end example]

### 3.17.7.102 DVAR

**Syntax:**

DVAR ( *database* , *field* , *criteria* )

**Description:** Estimates the variance of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVVERAGE function §3.17.7.77.)

**Arguments:**

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVVERAGE function §3.17.7.77.

**Return Type and Value:** number – An estimate of the variance of a population based on the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVVERAGE function §3.17.7.77:

The estimated variance in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DVAR(A4:E10,"Yield",A1:A3), which results in 8.8.

*end example]*

### 3.17.7.103 DVARP

**Syntax:**

DVARP ( *database* , *field* , *criteria* )

**Description:** Calculates the variance of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVVERAGE function §3.17.7.77.)

**Arguments:**

Name	Type	Description
<i>database</i>	reference	The range of cells that makes up the list or database.
<i>field</i>	text, number	The column to which <i>criteria</i> shall be applied.
<i>criteria</i>	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVVERAGE function §3.17.7.77.

**Return Type and Value:** number – The variance of a population based on the entire population using the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVVERAGE function §3.17.7.77:

The true variance in the yield of apple and pear trees if the data in the database is the entire orchard population is computed by DVARP(A4:E10, "Yield", A1:A3), which results in 7.04.

end example]

### 3.17.7.104 EDATE

#### Syntax:

EDATE ( *start-date* , *month-offset* )

**Description:** Computes the serial value of the date that is *month-offset* months from the date specified by the date *date-string*, taking into account the current date base value.

#### Arguments:

Name	Type	Description
<i>start-date</i>	number	The start date.
<i>month-offset</i>	number	The number of months before or after <i>start-date</i> , truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> .

**Return Type and Value:** number – The serial value of the date that is *month-offset* months from the date specified by the date *date-string*, as a whole number.

However, if

- *start-value* is out of range for the current date base value, #NUM! is returned.
- *start-value* plus *month-offset* is out of range for the current date base value, #NUM! is returned.

[Example: For the 1900 date base system:

EDATE(DATE(2006,1,31),5) results in a serial value of 38898

EDATE(DATE(2004,2,29),12) results in a serial value of 38411

EDATE(DATE(2004,2,28),12) results in a serial value of 38411

EDATE(DATE(2004,1,15),-23) results in a serial value of 37302

For the 1904 date base system:

EDATE(DATE(2006,1,31),5) results in a serial value of 37436

EDATE(DATE(2004,2,29),12) results in a serial value of 36949

EDATE(DATE(2004,2,28),12) results in a serial value of 36949

EDATE(DATE(2004,1,15), -23) results in a serial value of 35840

*end example]*

### 3.17.7.105 EFFECT

#### Syntax:

EFFECT ( *nominal-rate* , *npery* )

**Description:** Computes the effective annual interest rate, given the nominal annual interest rate and the number of compounding periods per year.

#### Mathematical Formula:

$$EFFECT = \left( 1 + \frac{Nominal\_rate}{Npery} \right)^{Npery} - 1$$

#### Arguments:

Name	Type	Description
<i>nominal-rate</i>	number	The nominal interest rate.
<i>npery</i>	number	The number of compounding periods per year, truncated to integer.

**Return Type and Value:** number – The effective annual interest rate.

However, if

- *nominal-rate* ≤ 0, #NUM! is returned.
- *npery* < 1, #NUM! is returned.

[Example:

EFFECT(0.0525,4) results in 5.3543%

*end example]*

### 3.17.7.106 EOMONTH

#### Syntax:

EOMONTH ( *start-date* , *month-offset* )

**Description:** Computes the serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, taking into account the current date base value.

**Arguments:**

Name	Type	Description
<i>start-date</i>	number	The start date.
<i>month-offset</i>	number	The number of months before or after <i>start-date</i> , truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> .

**Return Type and Value:** number – The serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, as a whole number.

However, if

- *start-date* is not a valid date, #NUM! is returned.
- *start-date* plus *month-offset* yields an invalid date, #NUM! is returned.

[Example: For the 1900 date base system:

EOMONTH(DATE(2006,1,31),5) results in a serial value of 38898  
 EOMONTH(DATE(2004,2,29),12) results in a serial value of 38411  
 EOMONTH(DATE(2004,2,28),12) results in a serial value of 38411  
 EOMONTH(DATE(2004,1,15),-23) results in a serial value of 37315

For the 1904 date base system:

EOMONTH(DATE(2006,1,31),5) results in a serial value of 37436  
 EOMONTH(DATE(2004,2,29),12) results in a serial value of 36949  
 EOMONTH(DATE(2004,2,28),12) results in a serial value of 36949  
 EOMONTH(DATE(2004,1,15),-23) results in a serial value of 35853

end example]

### 3.17.7.107 ERF

**Syntax:**

ERF ( *lower-bound* [ , *upper-bound* ] )

**Description:** Computes the error function integrated between *lower-bound* and *upper-bound*.

**Mathematical Formula:**

If *upper-bound* is omitted:

$$\text{ERF}(z) = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2} dt$$

If *upper-bound* is present:

$$\text{ERF}(a, b) = \frac{2}{\sqrt{\pi}} \int_a^b e^{-t^2} dt = \text{ERF}(b) - \text{ERF}(a)$$

**Arguments:**

Name	Type	Description
<i>lower-bound</i>	number	The lower bound for integrating ERF.
<i>upper-bound</i>	number	The upper bound for integrating ERF. If omitted, the value of the upper bound is <i>lower-bound</i> , and the lower bound becomes zero.

**Return Type and Value:** number – The error function integrated between *lower-bound* and *upper-bound*.

However, if

- lower-bound* is negative, #NUM! is returned.
- upper-bound* is negative, #NUM! is returned.

[Example:

ERF(1.234, 4.5432) results in 0.08096060

ERF(0, 1.345) results in 0.94284416

ERF(0, 1.345) results in 0.94284416

end example]

### 3.17.7.108 ERFC

**Syntax:**

ERFC ( *lower-bound* )

**Description:** Computes the complementary error function integrated between *lower-bound* and  $\infty$ .

**Mathematical Formula:**

$$\text{ERFC}(x) = \frac{2}{\sqrt{\pi}} \int_x^{\infty} e^{-t^2} dt = 1 - \text{ERF}(x)$$

**Arguments:**

Name	Type	Description
<i>lower-bound</i>	number	The lower bound for integrating ERFC.

**Return Type and Value:** number – The complementary error function integrated between *lower-bound* and  $\infty$ .

However, if *lower-bound* is negative

*lower-bound* or *upper-bound* is negative, #NUM! is returned.

[Example:

ERFC(1.234) results in 0.08096060

ERFC(0) results in 1.00000000

end example]

### 3.17.7.109 ERROR.TYPE

**Syntax:**

ERROR.TYPE ( *value* )

**Description:** Determines the kind of the error value designated by *value*.

**Arguments:**

Name	Type	Description
<i>value</i>	any	A value whose type is to be determined. No conversion shall take place on the argument passed to this function.

**Return Type and Value:** number – The kind of the error value designated by *value*, as follows:

<i>value</i>	Return Value
#NULL!	1
#DIV/0!	2
#VALUE!	3
#REF!	4
#NAME?	5
#NUM!	6
#N/A	7
Anything else	#N/A

[Example:

ERROR.TYPE(A1) results in 2 if A1 evaluates to #DIV/0!

ERROR.TYPE(A1) results in 4 if A1 evaluates to #REF/0!

ERROR.TYPE(A1) results in 7 if A1 evaluates to #N/A

ERROR.TYPE(A1) results in #N/A if A1 evaluates to a non-error value, such as a number or text

end example]

### 3.17.7.110 EVEN

**Syntax:**

EVEN ( *x* )

**Description:** Computes *x* rounded to the nearest even integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value to be rounded.

**Return Type and Value:** number – The rounded value of *x*. If *x* is zero, the result is zero.

[Example:

EVEN(1.5) rounds 1.5 up to the nearest even integer; that is, to 2.

EVEN(3) rounds 3 up to the nearest even integer; that is, to 4.

EVEN(2) rounds 2 up to the nearest even integer; that is, to 2.

EVEN(-1) rounds -1 up to the nearest even integer; that is, to -2.

end example]

### 3.17.7.111 EXACT

**Syntax:**

EXACT ( *string-1* , *string-2* )

**Description:** Performs a case-sensitive comparison of *string-1* and *string-2*.

**Arguments:**

Name	Type	Description
<i>string-1</i>	text	The two strings to be compared.

Name	Type	Description
<i>string-2</i>	text	

**Return Type and Value:** logical – TRUE if *string-1* and *string-2* have the exact same length and contents; otherwise, FALSE.

[Example:

EXACT("ABC", "ABC") results in TRUE

EXACT("ABC", "ABCD") results in FALSE

EXACT("Abc", "aBC") results in FALSE

EXACT("", "") results in TRUE

end example]

### 3.17.7.112 EXP

**Syntax:**

EXP ( x )

**Description:** Computes  $e^x$ , where the constant  $e$  is the base of the natural logarithm.

**Arguments:**

Name	Type	Description
$x$	number	The exponent to which $e$ is to be raised.

**Return Type and Value:** number –  $e^x$ .

However, if  $x$  is too large for the result to be representable, #NUM! is returned.

[Example:

EXP(-1) results in 0.367879441

EXP(0) results in 1

EXP(1) results in 2.718281828

EXP(2) results in 7.389056099

end example]

### 3.17.7.113 EXPONDIST

**Syntax:**

EXPONDIST ( *x* , *lambda* , *cumulative-flag* )

**Description:** Computes the exponential distribution.

**Mathematical Formula:**

The equation for the probability density function is:

$$f(x; \lambda) = \lambda e^{-\lambda x}$$

The equation for the cumulative distribution function is:

$$F(x; \lambda) = 1 - e^{-\lambda x}$$

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value of the function.
<i>lambda</i>	number	The parameter value.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, EXPONDIST returns the cumulative distribution function; if FALSE, EXPONDIST returns the probability density function.

**Return Type and Value:** number – The exponential distribution.

However, if

- $x < 0$ , #NUM! is returned.
- $lambda \leq 0$ , #NUM! is returned.

[Example:

EXPONDIST(0.2,10,FALSE) results in 1.353352832

EXPONDIST(2.3,1.5,TRUE) results in 0.968254364

end example]

### 3.17.7.114 FACT

**Syntax:**

FACT ( *x* )

**Description:** Computes the factorial of *x*.

**Arguments:**

Name	Type	Description
$x$	number	The non-negative value whose factorial is to be computed. $x$ is truncated to an integer.

1

2 **Return Type and Value:** number – The factorial of  $x$ .

3 However, if

- 4 •  $x$  is negative, #NUM! is returned.
- 5 •  $x$  is too large for the result to be representable, #NUM! is returned.

6 *[Example:*

7

8 FACT(5) results in 120

9 FACT(3.5) results in 6

10 FACT(0) results in 1

11

12 *end example]*

### 13 3.17.7.115 FACTDOUBLE

14 **Syntax:**

15 FACTDOUBLE (  $n$  )

16 **Description:** Computes the double factorial of  $n$ .

17 **Mathematical Formula:**

18 If  $n$  is even:

$$19 \quad n!! = n(n-2)(n-4)\dots(4)(2)$$

20 If  $n$  is odd:

$$21 \quad n!! = n(n-2)(n-4)\dots(3)(1)$$

22 **Arguments:**

Name	Type	Description
$n$	number	The non-negative value whose double factorial is to be computed. $n$ is truncated to an integer.

23

24 **Return Type and Value:** number – The double factorial of  $n$ .

25 However, if

- $n$  is negative, #NUM! is returned.
- $n$  is too large for the result to be representable, #NUM! is returned.

[Example:

FACTDOUBLE(5) results in 15

FACTDOUBLE (3.5) results in 3

FACTDOUBLE (0) results in 1

end example]

### 3.17.7.116 FALSE

**Syntax:**

FALSE ( )

**Description:** Computes the value FALSE. (A call to function FALSE is equivalent to using the *logical-constant* FALSE.)

**Arguments:** None.

**Return Type and Value:** logical – The value FALSE.

[Example:

FALSE( ) results in FALSE

end example]

### 3.17.7.117 FDIST

**Syntax:**

FDIST (  $x$  , *degrees-freedom-1* , *degrees-freedom-2* )

**Description:** Computes the F probability distribution.

**Mathematical Formula:**

$FDIST=P(F>x)$ , where  $F$  is a random variable that has an F distribution with *degrees-freedom-1* and *degrees-freedom-2* degrees of freedom.

**Arguments:**

Name	Type	Description
$x$	number	The value at which the function is to be evaluated.
<i>degrees-</i>	number	The number of degrees of freedom for the numerator,

Name	Type	Description
<i>freedom-1</i>		truncated to an integer.
<i>degrees-freedom-2</i>	number	The number of degrees of freedom for the denominator, truncated to an integer.

**Return Type and Value:** number – The F probability distribution.

However, if

- *x* is negative, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10<sup>10</sup>, #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10<sup>10</sup>, #NUM! is returned.

[Example:

FDIST(12.345, 3, 4) results in 0.017226183

end example]

### 3.17.7.118 FIND

**Syntax:**

FIND ( *string-1* , *string-2* [ , *start-pos* ] )

**Description:** Performs a case-sensitive search for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (FIND is intended for use with languages that use the single-byte character set (SBCS), whereas FINDB (§3.17.7.119) is intended for use with languages that use the double-byte character set (DBCS).)

**Arguments:**

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> .
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

**Return Type and Value:** number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example:

FIND("de", "abcdef") results in 4

FIND(A10, B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

### 3.17.7.119 FINDB

**Syntax:**

FINDB ( *string-1* , *string-2* , [ *start-pos* ] )

**Description:** Performs a case-sensitive search for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (FINDB is intended for use with languages that use the double-byte character set (DBCS), whereas FIND (§3.17.7.118) is intended for use with languages that use the single-byte character set (SBCS).)

**Arguments:**

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> .
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

**Return Type and Value:** number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example: Assuming 1-byte characters

FINDB("de", "abcdef") results in 4

FINDB(A10,B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

### 3.17.7.120 FINV

#### Syntax:

FINV ( *probability* , *degrees-freedom-1* , *degrees-freedom-2* )

**Description:** Computes the inverse of the F probability distribution. Given a value for *probability*, FINV seeks that value  $x$  such that  $\text{FDIST}(x, \text{degrees-freedom1}, \text{degrees-freedom2}) = \text{probability}$ . Thus, precision of FINV depends on precision of FDIST. FINV uses an iterative search technique.

#### Arguments:

Name	Type	Description
<i>probability</i>	number	A probability associated with the F cumulative distribution.
<i>degrees-freedom-1</i>	number	The number of degrees of freedom for the numerator, truncated to an integer.
<i>degrees-freedom-2</i>	number	The number of degrees of freedom for the denominator, truncated to an integer.

**Return Type and Value:** number – The inverse of the F probability distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1*  $\geq 10^{10}$ , #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2*  $\geq 10^{10}$ , #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned

[Example:

FINV(0.5,3,4) results in 0.940534076

end example]

### 3.17.7.121 FISHER

#### Syntax:

FISHER (  $x$  )

**Description:** Computes the Fisher transformation at  $x$ .

**Mathematical Formula:**

$$z' = \frac{1}{2} \ln \left( \frac{1+x}{1-x} \right)$$

**Arguments:**

Name	Type	Description
$x$	number	The number for which the transformation is wanted.

**Return Type and Value:** number – The Fisher transformation at  $x$ .

However, if

- $x \leq -1$ , #NUM! is returned.
- $x \geq 1$ , #NUM! is returned.

[Example:

FISHER(-0.43) results in -0.459896681

FISHER(0.578) results in 0.659454094

end example]

### 3.17.7.122 FISHERINV

**Syntax:**

FISHERINV (  $y$  )

**Description:** Computes the inverse of the Fisher transformation.

**Mathematical Formula:**

$$x = \frac{e^{2y} - 1}{e^{2y} + 1}$$

**Arguments:**

Name	Type	Description
$y$	number	The number for which the inverse of the transformation is wanted.

**Return Type and Value:** number – The inverse of the Fisher transformation.

[Example:

FISHERINV(-0.43) results in 0.405321309

FISHERINV(0.578) results in 0.521210269

end example]

### 3.17.7.123 FIXED

#### Syntax:

FIXED ( *number* [ , [ *num-decimal* ] [ , *suppress-commas-flag* ] ] )

**Description:** Produces a string containing *number* rounded to *num-decimal* decimal places. Thousands separator commas are included as determined by *suppress-commas-flag*.

#### Arguments:

Name	Type	Description
<i>number</i>	number	Designate the number that is to be formatted, truncated to integer.
<i>num-decimal</i>	number	Designate the number of decimal places to be used in the resulting string. If negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.
<i>suppress-commas-flag</i>	logical	If TRUE, commas are not included; if FALSE or omitted, commas are included.

**Return Type and Value:** text – The string containing *number* rounded to *num-decimal* decimal places.

[Example:

FIXED(1234567) results in 1,234,567.00

FIXED(1234567.555555,4,TRUE) results in 1234567.5556

FIXED(.555555,10) results in 0.5555550000

FIXED(1234567,-3) results in 1,235,000

end example]

### 3.17.7.124 FLOOR

#### Syntax:

FLOOR ( *x* , *significance* )

**Description:** Computes  $x$  rounded down, toward zero, to the nearest multiple of *significance*. Regardless of the sign of  $x$ , a value is rounded down when adjusted away from zero.

**Arguments:**

Name	Type	Description
$x$	number	The value to be rounded,
<i>significance</i>	number	The multiple to which $x$ is to be rounded.

**Return Type and Value:** number – The rounded-down value of  $x$ .

However, if  $x$  and *significance* have different signs, #NUM! is returned.

[Example:

FLOOR(2.5,1) rounds 2.5 down to nearest multiple of 1; that is, to 2

FLOOR(-2.5,-2) rounds -2.5 down to nearest multiple of -2; that is, to -2

FLOOR(1.5,0.1) rounds 1.5 down to the nearest multiple of 0.1; that is, to 1.5

FLOOR(0.234,0.01) rounds 0.234 down to the nearest multiple of 0.01; that is, to 0.23

end example]

### 3.17.7.125 FORECAST

**Syntax:**

FORECAST ( $x$  , known-ys , known-xs )

**Description:** Calculates, or predicts, a future value by using existing values. The predicted value is a y-value for a given x-value. The known values are existing x-values and y-values, and the new value is predicted by using linear regression.

**Mathematical Formula:**

FORECAST= $a+bx$ , where:

$$a = \bar{y} - b\bar{x}$$

and:

$$b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

and where  $\bar{x}$  and  $\bar{y}$  are the sample means AVERAGE(known-xs) and AVERAGE(known-ys).

**Arguments:**

Name	Type	Description
$x$	number	The data point for which a value is to be predicted.
<i>known-xs</i>	array, reference	The independent data.
<i>known-ys</i>	array, reference	The dependent data.

**Return Type and Value:** number – The future value.

However, if

- *known-xs* and *known-ys* are empty or contain a different number of data points, the return value is unspecified.
- The variance of *known-xs* equals zero, the return value is unspecified.

[Example:

FORECAST(30,{6,7,9,15,21},{20,28,31,38,40}) results in 10.60725309

end example]

### 3.17.7.126 FREQUENCY

**Syntax:**

FREQUENCY ( *data-array* , *bins-array* )

**Description:** Calculates how often values occur within a range of values. A call to FREQUENCY shall be entered as an array formula.

**Arguments:**

Name	Type	Description
<i>data-array</i>	array, reference to number	Set of values for which frequencies are to be computed. If <i>data-array</i> contains no values, FREQUENCY returns an array of zeros. Cells containing text or that are empty are ignored.
<i>bins-array</i>	array, reference	Set of intervals into which the values in <i>data-array</i> are to be grouped. If <i>bins-array</i> contains no values, FREQUENCY returns the number of elements in <i>data-array</i> .

**Return Type and Value:** vertical array of numbers – The frequency at which values occur within a range of values. The number of elements in the returned array is one more than the number of elements in *bins-array*. The extra element contains the count of any values above the highest interval.

[Example:

If the cells A2:A10 contain 79, 85, 78, 85, 50, 81, 95, 88, and 97, and the cells B2:B4 contain 70, 79, and 89, FREQUENCY(A2:A10,B2:B4) results in a vertical array containing 1 (50), 2 (79, 78), 4 (85, 85, 81, 88), and 2 (95, 97).

end example]

### 3.17.7.127 FTEST

**Syntax:**

FTEST ( *array-1* , *array-2* )

**Description:** Computes the result of an F-test.

**Arguments:**

Name	Type	Description
<i>array-1</i>	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>		

**Return Type and Value:** number – The two-tailed probability that the variances in *array-1* and *array-2* are not significantly different.

However, if

- The number of data points in *array-1* or *array-2* is less than 2, the return value is unspecified.
- The variance of *array-1* or *array-2* is zero, the return value is unspecified.

[Example:

If the cells D6:D10 contain 6, 7, 9, 15, and 21, and the cells E6:E10 contain 20, 28, 31, 38, and 40, FTEST(D6:D10,E6:E10) results in 0.648317847

end example]

### 3.17.7.128 FV

**Syntax:**

FV ( *rate* , *nper* , *pmt* [ , [ *pv* ] [ , [ *type* ] ] ] )

**Description:** Computes the future value of an investment based on periodic, constant payments and a constant interest rate.

**Arguments:**

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>nper</i>	number	The total number of payment periods, truncated to integer.						
<i>pmt</i>	number	The payment made each period; it cannot change over the life of the annuity. [Note: Typically, <i>pmt</i> contains principal and interest, but no other fees or taxes. <i>end note</i> ] If omitted, <i>pvt</i> shall be provided.						
<i>pvt</i>	number	The the present value, or the lump-sum amount that a series of future payments is worth right now. If omitted, it is assumed to be 0, and <i>pmt</i> shall be provided.						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

**Return Type and Value:** number – The future value of an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

FV(0.06/12,10,-200,-500,1) 2,581.40

FV(0.12/12,12,-1000) results in 12,682.50

FV(0.11/12,35,-2000,,1) results in 82,846.25

FV(0.06/12,12,-100,-1000,1) results in 2,301.40

end example]

### 3.17.7.129 FVSCHEDULE

Syntax:

FVSCHEDULE ( *principal* , *schedule* )

**Description:** Computes the future value of an initial principal after applying a series of compound interest rates.  
 [Note: This function can be used to calculate the future value of an investment with a variable or adjustable rate.  
*end note*]

**Arguments:**

Name	Type	Description
<i>principal</i>	number	The present value.
<i>schedule</i>	array	Set of interest rates to apply. The values in this array can be numbers or blank cells. Blank cells are taken as zeros (i.e., no interest).

**Return Type and Value:** number – The future value of an initial principal after applying a series of compound interest rates.

However, if any element of the array *schedule* is not a number and not blank, #VALUE! is returned.

[Example:

FVSCHEDULE(1,{0.09,0.11,0.1}) results in 1.33089

*end example*]

### 3.17.7.130 GAMMADIST

**Syntax:**

GAMMADIST ( *x* , *alpha* , *beta* , *cumulative-flag* )

**Description:** Computes the gamma distribution.

**Mathematical Formula:**

The equation for the gamma probability density function is:

$$f(x; \alpha, \beta) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

The standard gamma probability density function is:

$$f(x; \alpha) = \frac{x^{\alpha-1} e^{-x}}{\Gamma(\alpha)}$$

When *alpha* = 1, GAMMADIST returns the exponential distribution with:

$$\lambda = \frac{1}{\theta}$$

For a positive integer  $n$ , when  $\alpha = n/2$ ,  $\beta = 2$ , and  $\text{cumulative} = \text{TRUE}$ , GAMMADIST returns  $(1 - \text{CHIDIST}(x))$  with  $n$  degrees of freedom.

When  $\alpha$  is a positive integer, GAMMADIST is also known as the Erlang distribution.

#### Arguments:

Name	Type	Description
$x$	number	The value at which the distribution is to be evaluated.
$\alpha$	number	A parameter of the distribution.
$\beta$	number	A parameter of the distribution. If $\beta = 1$ , GAMMADIST returns the standard gamma distribution.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function.

**Return Type and Value:** number – The gamma distribution.

However, if

- $x < 0$ , #NUM! is returned.
- $\alpha \leq 0$  or  $\beta \leq 0$ , #NUM! is returned.

[Example:

GAMMADIST(10,9,2,FALSE) results in 0.03263902

GAMMADIST(10,9,2,TRUE) results in 0.068093631

end example]

#### 3.17.7.131 GAMMAINV

##### Syntax:

GAMMAINV ( *probability* ,  $\alpha$  ,  $\beta$  )

**Description:** Computes the inverse of the gamma distribution. Given a value for *probability*, GAMMAINV seeks that value  $x$  such that  $\text{GAMMADIST}(x, \alpha, \beta, \text{TRUE}) = \text{probability}$ . Thus, the precision of GAMMAINV depends on the precision of GAMMADIST. GAMMAINV uses an iterative search technique.

##### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>probability</i>	number	The probability associated with the gamma distribution.
<i>alpha</i>	number	A parameter of the distribution.
<i>beta</i>	number	A parameter of the distribution. If <i>beta</i> = 1, GAMMAINV returns the standard gamma distribution.

**Return Type and Value:** number – The inverse of the gamma distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *alpha* ≤ 0 or *beta* ≤ 0, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[Example:

GAMMAINV(0.068,9,2) results in 9.997130086

end example]

### 3.17.7.132 GAMMALN

**Syntax:**

GAMMALN ( x )

**Description:** Computes the natural logarithm of the gamma function.

**Mathematical Formula:**

$$GAMMALN = LN(\Gamma(x))$$

where:

$$\Gamma(x) = \int_0^{\infty} e^{-u} u^{x-1} du$$

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value for which the gamma function is to be calculated.

**Return Type and Value:** number – The natural logarithm of the gamma function.

However, if  $x \leq 0$ , #NUM! is returned.

[Example:

GAMMALN(4.5) results in 2.453736571

end example]

### 3.17.7.133 GCD

**Syntax:**

GCD ( *argument-list* )

**Description:** Computes the greatest common divisor of the one or more numbers, designated by *arguments* in *argument-list*.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	numbers	The <i>arguments</i> in <i>argument-list</i> designate the values. Each argument is truncated to an integer.

**Return Type and Value:** number – The greatest common divisor of one or more numbers.

However, if any *argument* is negative, #NUM! is returned.

[Example:

GCD(5) results in 5

GCD(5, 2) results in 1

GCD(100, 50, 28) results in 2

GCD(24.5, 36.3) results in 12

GCD(7, 1) results in 1

GCD(5, 0) results in 5

end example]

### 3.17.7.134 GEOMEAN

**Syntax:**

GEOMEAN ( *argument-list* )

**Description:** Computes the geometric mean of an array or range of positive data.

**Mathematical Formula:**

$$GM_{\bar{y}} = \sqrt[n]{y_1 y_2 y_3 \dots y_n}$$

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, array, or reference to number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. Logical values and text representations of numbers that entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The geometric mean of an array or range of positive data.

However, if the value of any data point  $\leq 0$ , #NUM! is returned.

[Example:

GEOMEAN(10.5,5.3,2.9) results in 5.444454702

GEOMEAN(10.5,{5.3,2.9},"12") results in 6.633780588

end example]

### 3.17.7.135 GESTEP

**Syntax:**

GESTEP ( *number* [ , *step* ] )

**Description:** Tests if the value of *number* is greater than or equal to that of *step*.

**Arguments:**

Name	Type	Description
<i>number</i>	number	<i>number</i> is the value to test against <i>step</i> . If <i>step</i> is omitted, zero is used.
<i>step</i>	number	

**Return Type and Value:** number – 1 if *number*  $\geq$  *step*; otherwise, 0.

[Example:

GESTEP(5.6,-4.3) results in 1

GESTEP(5.6,5.6) results in 1

GESTEP(-5.6) results in 0

*end example]*

### 3.17.7.136 GETPIVOTDATA

#### Syntax:

```
GETPIVOTDATA (data-field , pivot-table , field-1 , item-1
[, field-2 , item-2 [, ...]])
```

**Description:** Retrieves data stored in a PivotTable report. Calculated fields or items and custom calculations are included in GETPIVOTDATA calculations.

#### Arguments:

Name	Type	Description
<i>data-field</i>	text	The name of the data field that contains the data to be retrieved.
<i>pivot-table</i>	reference to any cell, range of cells, or named range of cells in a PivotTable report	This information is used to determine which PivotTable report contains the data to be retrieved. If <i>pivot-table</i> is a range that includes two or more PivotTable reports, data shall be retrieved from whichever report was created most recently in the range.
<i>field-1</i> through <i>field-n</i>	text	Argument pairs <i>field-1</i> and <i>item-1</i> , <i>field-2</i> and <i>item-2</i> through <i>field-n</i> and <i>item-n</i> are field names and item names that describe the data to be retrieved. The pairs can be in any order. Field names and names for items other than dates/times (which shall be expressed as numbers) and numbers shall be enclosed in quotation marks. For OLAP PivotTable reports, items can contain the source name of the dimension as well as the source name of the item. [Example: A field and item pair for an OLAP PivotTable might look like this: "[Product]", "[Product].[All Products].[Foods].[Baked Goods]" <i>end example</i> ] If the field and item arguments describe a single cell, the value of that cell is returned regardless of its type or value.
<i>item-1</i> through <i>item-n</i>	text	

**Return Type and Value:** any – The data stored in a PivotTable report.

However, if

- *pivot-table* is not a range in which a PivotTable report is found, the return value is unspecified.
- The arguments do not describe a visible field, the return value is unspecified.
- The arguments include a page field that is not displayed, the return value is unspecified.

1 [Example: Given the following data:

	A	B	C	D	E
2	Region	North			
3					
4	Sum of Sales		Product		
5	Month	Salesperson	Beverages	Produce	Grand Total
6	March	Buchanan	\$ 3,522	\$ 10,201	\$ 13,723
7		Davolio	\$ 8,725	\$ 7,889	\$ 16,614
8	March Total		\$ 12,247	\$ 18,090	\$ 30,337
9	April	Buchanan	\$ 5,594	\$ 7,265	\$ 12,859
10		Davolio	\$ 5,461	\$ 668	\$ 6,129
11	April Total		\$ 11,055	\$ 7,933	\$ 18,988
12	Grand Total		\$ 23,302	\$ 26,023	\$ 49,325

3 GETPIVOTDATA("Sales", \$A\$4) returns the grand total of the Sales field, \$49,325.

4 GETPIVOTDATA("Sum of Sales", \$A\$4) also returns the grand total of the Sales field, \$49,325; the field  
5 name can be entered exactly as it looks on the sheet, or as its root (without "Sum of," "Count of," and so forth).

6 GETPIVOTDATA("Sales", \$A\$4, "Month", "March") returns the grand total for March, \$30,337.

7 GETPIVOTDATA("Sales", \$A\$4, "Month", "March", "Product", "Produce", "Salesperson", "Buchan  
8 an") returns \$10,201.

9 GETPIVOTDATA("Sales", \$A\$4, "Region", "South") is unspecified because the South region data is not  
10 visible.

11 GETPIVOTDATA("Sales", \$A\$4, "Product", "Beverages", "Salesperson", "Davolio") is unspecified  
12 because there is no total value of beverage sales for Davolio.

13

14 *end example]*

### 15 3.17.7.137 GROWTH

16 **Syntax:**

17 GROWTH ( *known-ys* [ , [ *known-xs* ] [ , [ *new-xs* ] [ , *const-flag* ] ] )

18 **Description:** Computes predicted exponential growth by using existing data. GROWTH can also fit an exponential  
19 curve to existing x-values and y-values.

20 **Arguments:**

Name	Type	Description
<i>known-ys</i>	array	Set of y-values already known in the relationship $y=b*m^x$ . If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	Set of x-values that might already be know in the

Name	Type	Description
		relationship $y=b*m^x$ . The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> must be a vector (that is, a <i>known-ys</i> with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>new-xs</i>	array	A set of new x-values for which GROWTH is to return corresponding y-values. <i>new-xs</i> shall include a column (or row) for each independent variable, just as <i>known-xs</i> does. So, if <i>known-ys</i> is in a single column, <i>known-xs</i> and <i>new-xs</i> shall have the same number of columns. If <i>known-ys</i> is in a single row, <i>known-xs</i> and <i>new-xs</i> shall have the same number of rows. If <i>new-xs</i> are omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant <i>b</i> to equal 1. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set equal to 1 and the <i>m</i> -values are adjusted so that $y=m^x$ .

1

2 **Return Type and Value:** array – The y-values for a series of new x-values.3 However, if any of the numbers in *known-ys* are zero or negative, #NUM! is returned.

4 [Example: Given the following data:

	A	B	C
1	Month	Units	Formula (corresponding units)
2	11	33,100	32618.20377
3	12	47,300	47729.42261
4	13	69,000	69841.30086
5	14	102,000	102197.0734
6	15	150,000	149542.4867
7	16	220,000	218821.8762
8	Month	Formula (Predicted Units)	
9	17	320,196.72	
10	18	468,536.05	

5

6 When GROWTH(A2:B4, A6:B8) is array-entered into cells C2:C7, those cells take on the results shown.

When GROWTH(A2:B4,A6:B8,A9:A10) is array-entered into cells B9:B10, those cells take on the results shown.

*end example]*

### 3.17.7.138 HARMEAN

#### Syntax:

HARMEAN ( *argument-list* )

**Description:** Computes the harmonic mean of a data set.

#### Mathematical Formula:

$$\frac{1}{H_y} = \frac{1}{n} \sum \frac{1}{Y_j}$$

#### Arguments:

Name	Type	Description
<i>argument-list</i>	logical, text, number, name, array, or reference to number.	The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. Argument values can be numbers, or names, arrays, or references that contain numbers. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The harmonic mean of a data set.

However, if the value of any data point  $\leq 0$ , #NUM! is returned.

[*Example:*

HARMEAN(4.6,5.8,8.3,7) results in 6.124222

HARMMEAN(10.5,{5.3,2.9},"12") results in 5.617360

*end example]*

### 3.17.7.139 HEX2BIN

#### Syntax:

HEX2BIN ( *number* [ , *num-bin-digits* ] )

**Description:** Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	text	A 10-digit hexadecimal number in a string that is to be converted to a binary string. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
<i>num-bin-digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If <i>num-bin-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer.

**Return Type and Value:** text – The binary equivalent of *number*.

However, if

- *number* is outside the range "FFFFFFE00" (11111111111111111111111111111000000000 binary, - 512 decimal) to "1FF" (0000000000000000000000000000000011111111 binary, 511 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* is negative or > 10, #NUM! is returned.

[Example:

HEX2BIN("fE") results in 11111110

HEX2BIN("FFFFFFFFFE") results in 1111111110

HEX2BIN("2") results in 10

HEX2BIN("F",6) results in 001111

end example]

### 3.17.7.140    **HEX2DEC**

**Syntax:**

HEX2DEC ( *number* )

**Description:** Makes the decimal equivalent of *number*.

**Arguments:**

Name	Type	Description
<i>number</i>	string	A 10-digit hexadecimal number in a string that is to be converted to a decimal number. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

**Return Type and Value:** number – The decimal equivalent of *number*.

However, if

- number* contains one or more non-hexadecimal digits, #NUM! is returned.
- number* contains more than 10 hexadecimal digits; that is, *number* is outside the range "8000000000" (-548,755,813,888 decimal) to "7FFFFFFFFF" (548,755,813,887 decimal), inclusive, #NUM! is returned.

[Example:

HEX2DEC("fE") results in 254

HEX2DEC("FFFFFFFFFE") results in -2

HEX2DEC("F000000000") results in -68719476736

end example]

### 3.17.7.141    **HEX2OCT**

**Syntax:**

HEX2OCT ( *number* [ , *num-oct-digits* ] )

**Description:** Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	text	A 10-digit hexadecimal number in a string that is to be converted to an octal string. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
<i>num-oct-</i>	number	The number of digits in the result, with leading zeros

Name	Type	Description
<i>digits</i>		added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer.

**Return Type and Value:** text – The octal equivalent of *number*.

However, if

- number* is outside the range "FFE0000000" (17774000000000 octal, -536,870,912 decimal) to "1FFFFFFF" (00003777777777 octal, 536,870,911 decimal), inclusive, #NUM! is returned.
- number* contains one or more non-hexadecimal digits, #NUM! is returned.
- number* contains more than 10 hexadecimal digits, #NUM! is returned.
- number* needs more digits than *num-oct-digits*, #NUM! is returned.
- num-oct-digits* is negative or > 10, #NUM! is returned.

[Example:

HEX2OCT("fE") results in 376

HEX2OCT("FFFFFFFFFE") results in 7777777776

HEX2OCT("2") results in 2

HEX2OCT("F",6) results in 000017

end example]

### 3.17.7.142 HLOOKUP

**Syntax:**

HLOOKUP ( *lookup-value* , *table-array* , *row-index-num* [ , [ *range-lookup-flag* ] ] )

**Description:** Performs a horizontal search for a value in the top row of a table or an array, noting the column in which the matching value is found. From that column, the value from a given row is returned.

**Arguments:**

Name	Type	Description
<i>lookup-value</i>	value of any type or a reference to a value of any type.	The value to be located in the first row of the table. If <i>range-lookup</i> is FALSE and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or

Name	Type	Description
		asterisk, type a tilde (~) before the character.
<i>table-array</i>	array, reference, name	Designates the table of information to be searched. The values in the first row of <i>table-array</i> can be text, numbers, or logical values. If <i>range-lookup-flag</i> is TRUE, the values in the first row of <i>table-array</i> shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. If <i>range-lookup-flag</i> is FALSE, <i>table-array</i> 's values need not be sorted. Uppercase and lowercase text is treated as equivalent.
<i>row-index-num</i>	number	The row number in <i>table-array</i> from which the matching value is to be returned. (A <i>row-index-num</i> of 1 returns the first row value in <i>table-array</i> , a <i>row-index-num</i> of 2 returns the second row value in <i>table-array</i> , and so on.)
<i>range-lookup-flag</i>	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than <i>lookup-value</i> is returned. If FALSE, an exact match is performed.

**Return Type and Value:** any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *row-index-num* is less than 1, #VALUE! is returned.
- *row-index-num* is greater than the number of rows in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the first row of *table-array*, #N/A is returned.

[Example: Given the following data:

	A	B	C
1	Axles	Bearings	Bolts
2	4	6	9
3	5	7	10
4	6	8	11

HLOOKUP("Axles",A1:C4,2,TRUE) results in 4

HLOOKUP("Bearings",A1:C4,3,FALSE) results in 7

HLOOKUP("B",A1:C4,3,TRUE) results in 5

HLOOKUP("Bolts",A1:C4,4) results in 11

HLOOKUP(3,{1,2,3;"a","b","c";"d","e","f"},2,TRUE) results in c

*end example]*

### 3.17.7.143 HOUR

#### Syntax:

HOUR ( *time-value* )

**Description:** Computes the hour for the date and/or time having the given *time-value*.

#### Arguments:

Name	Type	Description
<i>time-value</i>	number	The date and/or time whose hour is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a <i>string-constant</i> having any valid date and/or time format, in which case, any date information shall be ignored.

**Return Type and Value:** number – The hour for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[*Example:*

HOUR(DATE(2006,2,26)+TIME(2,10,20)) results in 2

HOUR(TIME(22,56,34)) results in 22

HOUR(0) results in 0, since serial value 0 represents 00:00:00

HOUR(10.5) results in 12, since serial value .5 represents 12:00:00

HOUR("22-Oct-2001 10:53:12") results in 10

HOUR("10:53:12 pm") results in 22

HOUR("22:53:12") results in 22

*end example]*

### 3.17.7.144 HYPERLINK

#### Syntax:

HYPERLINK ( *link-location* [ , [ *friendly-name* ] ] )

**Description:** Creates a shortcut that opens a document stored on a network server, an intranet, or the Internet. When the cell that contains the HYPERLINK function call is clicked, the file stored at *link-location* is opened.

**Arguments:**

Name	Type	Description
<i>link-location</i>	text	The path and file name to the document to be opened as text. <i>link-location</i> can refer to a place in a document—such as a specific cell or named range in a SpreadsheetML worksheet or workbook, or to a bookmark in a WordprocessingML document. The path can be to a file stored on a hard disk drive, or the path can be a universal naming convention (UNC) path on a server or a Uniform Resource Locator (URL) path on the Internet or an intranet. If the path specified in <i>link-location</i> does not exist or cannot be navigated, an unspecified error is produced when the cell is clicked. <i>link-location</i> can be a string or a reference to a cell containing a string.
<i>friendly-name</i>	text, number, name	The value that is displayed in the cell. If omitted, the cell displays <i>link-location</i> . <i>friendly-name</i> can be a value, a text string, a name, or a cell that contains the jump text or value. If the evaluation of <i>friendly-name</i> results in an error value, the cell displays that error value rather than the jump text.

**Return Type and Value:** text – The value of *friendly-name*, if it is specified; otherwise, the value of *link-location*.

[Example:

HYPERLINK("http://example.openxmlformats.org/report/budget\_report.xls","Click for report"), which opens a worksheet named "budget report.xls" that is stored on the Internet at the location example.openxmlformats.org/report, and displays the text "Click for report".

HYPERLINK("D:\FINANCE\1stqtr.xls",H10), which opens the file 1stqtr.xls that is stored in a directory named Finance on drive D, and displays the numeric value stored in cell H10.

end example]

### 3.17.7.145 HYPGEOMDIST

**Syntax:**

HYPGEOMDIST ( *sample-successes* , *number-sample* , *population-successes* ,  
*number-population* )

**Description:** Computes the hypergeometric distribution; that is, the probability of a given number of sample successes, given the sample size, population successes, and population size.

**Mathematical Formula:**

$$P(X = x) = h(x; n, M, N) = \frac{\binom{M}{x} \binom{N-M}{n-x}}{\binom{N}{n}}$$

where:

$x$  = *sample-successes*

$n$  = *number-sample*

$M$  = *population-successes*

$N$  = *number-population*

#### Arguments:

Name	Type	Description
<i>sample-successes</i>	number	The number of successes in the sample, truncated to integer.
<i>number-sample</i>	number	The size of the sample, truncated to integer.
<i>population-successes</i>	number	The number of successes in the population, truncated to integer.
<i>number-population</i>	number	The population size, truncated to integer.

**Return Type and Value:** number – The hypergeometric distribution.

However, if

- *sample-successes* < 0 or *sample-successes* is greater than the lesser of *number-sample* and *population-successes*, #NUM! is returned.
- *sample-successes* is less than the larger of 0 or (*number-sample* - *number-population* + *population-successes*), #NUM! is returned.
- *number-sample* ≤ 0 or *number-sample* > *number-population*, #NUM! is returned.
- *population-successes* ≤ 0 or *population-successes* > *number-population*, #NUM! is returned.
- *number-population* ≤ 0, #NUM! is returned.

[Example:

HYPGEOMDIST(1,4,8,20) results in 0.363261

end example]

## 3.17.7.146 IF

**Syntax:**

IF ( *logical-value* , [ *value-if-true* ] [ , [ *value-if-false* ] ] )

**Description:** Tests *logical-value*, and if it is TRUE, *value-if-true* is evaluated and returned; otherwise, *value-if-false* is evaluated and returned.

**Arguments:**

Name	Type	Description
<i>logical-value</i>	logical	The value to be tested.
<i>value-if-true</i>	any	The value returned if <i>logical-value</i> is TRUE. If <i>logical-value</i> is TRUE and <i>value-if-true</i> is omitted, this argument evaluates to 0. <i>value-if-true</i> can contain up to seven levels of nested IF function calls. <i>value-if-true</i> and <i>value-if-false</i> need not evaluate to results of the same type.
<i>value-if-false</i>	any	The value returned if <i>logical-value</i> is FALSE. If <i>logical-value</i> is FALSE and <i>value-if-false</i> and its preceding comma is omitted, this argument evaluates to FALSE. If <i>logical-value</i> is FALSE and <i>value-if-false</i> is omitted, but its preceding comma is present, this argument evaluates to 0. <i>value-if-false</i> can contain at least seven levels of nested IF function calls. <i>value-if-true</i> and <i>value-if-false</i> need not evaluate to results of the same type.

If any argument is an array, every element of that array shall be evaluated when that argument is evaluated.

**Return Type and Value:** any – *value-if-true*, if *logical-value* is TRUE; otherwise, *value-if-false*.

[Example:

IF(10>5, "Yes", "No") results in Yes

IF(10>5, "Yes") results in Yes

IF(10>5, "Yes", ) results in Yes

IF(10<5, "Yes") results in FALSE

IF(10<5, "Yes", ) results in 0

IF(10>5, , "No") results in 0

IF(10>5, , ) results in 0

IF(10>5, "Yes", 20) results in Yes

IF(10<5, "Yes", 20) results in 20

end example]

## 3.17.7.147 IFERROR

**Syntax:**

IFERROR ( *value* , *value-if-error* )

**Description:** Provides a simpler and more efficient way of trapping and handling errors. It allows the generation of user-defined error text for a function call that can result in an error.

**Arguments:**

Name	Type	Description
<i>value</i>	any	The value that is checked for an error (i.e., any of the following: #N/A, #VALUE!, #REF!, #DIV/0!, #NUM!, #NAME?, or #NULL!). If <i>value</i> is an empty cell, it is treated as an empty string.
<i>value-if-error</i>	any	The value to return if <i>value</i> evaluates to an error. If <i>value-if-error</i> is an empty cell, it is treated as an empty string.

**Return Type and Value:** any – *value*, if *value* is not an error; otherwise, *value-if-error*. If *value* is an array formula, an array of results for each cell in the range specified in *value*, is returned.

[*Example:* Consider the case in which A3 contains 55, and B3 contains 0:

A3/B3 results in #DIV/0

IFERROR(A3/B3,"Error in calculation") results in Error in calculation

*end example]*

## 3.17.7.148 IMABS

**Syntax:**

IMABS ( *complex-number* )

**Description:** Computes the absolute value of *complex-number*.

**Mathematical Formula:**

$$\text{IMABS}(z) = |z| = \sqrt{x^2 + y^2}$$

where  $z = x + yi$

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the absolute value is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** number – The absolute value of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMABS("3+4i") results in 5

IMABS("-2.5-34.6j") results in 34.69020035

end example]

### 3.17.7.149 IMAGINARY

**Syntax:**

IMAGINARY ( *complex-number* )

**Description:** Computes the imaginary coefficient of *complex-number*.

**Arguments:**

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the imaginary coefficient is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** number – The imaginary coefficient of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMAGINARY("3+4i") results in 4

IMAGINARY("-2.5-34.6j") results in 34.6

end example]

### 3.17.7.150 IMARGUMENT

**Syntax:**

IMARGUMENT ( *complex-number* )

**Description:** Computes the argument  $\theta$ , an angle expressed in radians, such that for a complex number *complex-number* having the form  $x+yi$ :

$$x + yi = |x + yi| \times e^{i\theta} = |x + yi| (\cos \theta + i \sin \theta)$$

**Mathematical Formula:**

$$\text{IMARGUMENT}(z) = \tan^{-1} \left( \frac{y}{x} \right) = \theta$$

where:

$$\theta \in (-\pi; \pi]$$

and  $z = x + yi$

**Arguments:**

Name	Type	Description
<i>complex-number</i>	text	The complex number in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** number – The angle  $\theta$ , expressed in radians.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMARGUMENT("13+4i") results in 0.298498932

IMARGUMENT("-2.5-5j") results in -2.034443936

end example]

### 3.17.7.151 IMCONJUGATE

**Syntax:**

IMCONJUGATE ( *complex-number* )

**Description:** Computes the complex conjugate of the complex number *complex-number*.

**Mathematical Formula:**

$$\text{IMCONJUGATE}(x + yi) = \bar{z} = (x - yi)$$

**Arguments:**

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the complex conjugate is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – A string containing the complex conjugate of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMCONJUGATE("2.3+4.5i") results in 2.3-4.5i

IMCONJUGATE("-1-4j") results in -1+4j

end example]

### 3.17.7.152 IMCOS

**Syntax:**

IMCOS ( *complex-number* )

**Description:** Computes the cosine of the complex number *complex-number*.

**Mathematical Formula:**

$$\cos(x + yi) = \cos(x) \cosh(y) - \sin(x) \sinh(y)i$$

**Arguments:**

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the cosine is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – A string containing the cosine of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMCOS("2.3+4.5i") results in -29.9918288739746-33.5589799796873i

IMCOS("-1-4j") results in 14.7547011704838-22.963673499193j

*end example]*

### 3.17.7.153 IMDIV

#### Syntax:

IMDIV ( *complex-number-1* , *complex-number-2* )

**Description:** Computes the quotient from dividing two complex numbers.

#### Mathematical Formula:

$$\text{IMDIV}(z_1, z_2) = \frac{(a + bi)}{(c + di)} = \frac{(ac + bd) + (bc - ad)i}{c^2 + d^2}$$

#### Arguments:

Name	Type	Description
<i>complex-number-1</i>	text	Complex numbers in $x + yi$ or $x + yj$ text format; they designate the dividend and divisor, respectively.
<i>complex-number-2</i>	text	

**Return Type and Value:** text – A string containing the quotient from *number-1* / *number-2*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, #NUM! is returned.

[Example:

IMDIV("13+4i", "5+3i") results in 2.26470588235294-0.558823529411765i

IMDIV("-3-3.5i", "5+3i") results in -0.75-0.25i

*end example]*

### 3.17.7.154 IMEXP

#### Syntax:

IMEXP ( *complex-number* )

**Description:** Computes the exponential of the complex number *complex-number*.

#### Mathematical Formula:

$$\text{IMEXP}(z) = e^{(x+yi)} = e^x e^{yi} = e^x (\cos y + i \sin y)$$

#### Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the exponential is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – A string containing the exponential of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMEXP("2.3+4.5i") results in -2.10251576423113-9.75006374866818i

IMEXP("-1-4j") results in -0.240462049968584+0.278412079051034j

end example]

### 3.17.7.155 IMLN

**Syntax:**

IMLN ( *complex-number* )

**Description:** Computes the natural logarithm of *complex-number*.

**Mathematical Formula:**

$$\ln(x + yi) = \ln\sqrt{x^2 + y^2} + i \tan^{-1}\left(\frac{y}{x}\right)$$

**Arguments:**

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the natural logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – The natural logarithm of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLN("3+4i") results in 1.6094379124341+0.927295218001612i

IMLN("-2.5-34.6j") results in 3.54645723627033-1.64292531532225j

*end example]*

### 3.17.7.156 IMLOG10

#### Syntax:

IMLOG10 ( *complex-number* )

**Description:** Computes the base-10 logarithm of *complex-number*.

#### Mathematical Formula:

The common logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_{10}(x + yi) = (\log_{10} e) \ln(x + yi)$$

#### Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the base-10 logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – The base-10 logarithm of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[*Example:*

IMLOG10("3+4i") results in 10.698970004336019+0.402719196273373i

IMLOG10("-2.5-34.6j") results in 11.54020680801806-0.713513398623614j

*end example]*

### 3.17.7.157 IMLOG2

#### Syntax:

IMLOG2 ( *complex-number* )

**Description:** Computes the base-2 logarithm of *complex-number*.

#### Mathematical Formula:

The base-2 logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_2(x + yi) = (\log_2 e) \ln(x + yi)$$

# Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the base-2 logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – The base-2 logarithm of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLOG2("3+4i") results in 2.32192809506607+1.33780421255394i

IMLOG2("-2.5-34.6j") results in 5.11645626788577-2.37024020514877j

end example]

## 3.17.7.158 IMPOWER

### Syntax:

IMPOWER ( *complex-number* ,  $y$  )

**Description:** Computes the complex number *complex-number* raised to the power  $y$ .

### Mathematical Formula:

$$(x + yi)^n = r^n e^{in\theta} = r^n \cos n\theta + ir^n \sin n\theta$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi; \pi]$$

### Arguments:

Name	Type	Description
<i>complex-</i>	text	The complex number in $x + yi$ or $x + yj$ text format.

Name	Type	Description
<i>number</i>		
<i>y</i>	number	The exponent to which <i>complex-number</i> is to be raised.

1

2 **Return Type and Value:** text – A string containing *complex-number*<sup>y</sup>, in *x+yi* or *x+yj* text format.

3 However, if *complex-number* is ill-formed, #NUM! is returned.

4 [Example:

5

6 IMPOWER("2.3+4.5i",2.5) results in -52.9752689709953+22.138528463954i

7 IMPOWER("-1-4j",-3.56) results in 6.34818926783845E-003+1.16156377299512E-003j

8

9 end example]

### 10 3.17.7.159 IMPRODUCT

11 **Syntax:**

12 IMPRODUCT ( *argument-list* )

13 **Description:** Multiplies the values of its complex number arguments.

14 **Mathematical Formula:**

15  $(a + bi)(c + di) = (ac - bd) + (ad + bc)i$

16 **Arguments:**

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> is a complex number string in <i>x + yi</i> or <i>x + yj</i> text format.

17

18 **Return Type and Value:** text – A string containing the product of the values of its arguments, in *x+yi* or *x+yj* text  
19 format.

20 However, if any *argument* in *argument-list* is ill-formed, #NUM! is returned.

21 [Example:

22

23 IMPRODUCT("13+4i") results in 13+4i

24 IMPRODUCT("-3-3.5i","5+3i") results in -4.5-26.5i

25 IMPRODUCT("1.3-2j","-3.4+3j","2.3-6j") results in 67.834+15.13j

26

27 end example]

### 3.17.7.160 IMREAL

#### Syntax:

IMREAL ( *complex-number* )

**Description:** Computes the real coefficient of *complex-number*.

#### Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the real coefficient is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** number – The real coefficient of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMREAL ("3+4i") results in 3

IMREAL ("-2.5-34.6j") results in -2.5

end example]

### 3.17.7.161 IMSIN

#### Syntax:

IMSIN ( *complex-number* )

**Description:** Computes the sine of the complex number *complex-number*.

#### Mathematical Formula:

$$\sin (x + yi) = \sin (x) \cosh (y) - \cos (x) \sinh (y)i$$

#### Arguments:

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the sine is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – A string containing the sine of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMSIN("2.3+4.5i") results in 33.567264016308-29.9844272159606i

IMSIN("-1-4j") results in -22.9790855778861-14.7448051885587j

end example]

### 3.17.7.162 IMSQRT

**Syntax:**

IMSQRT ( *complex-number* )

**Description:** Computes the square root of the complex number *complex-number*.

**Mathematical Formula:**

$$\sqrt{x + yi} = \sqrt{r} \cos\left(\frac{\theta}{2}\right) + i\sqrt{r} \sin\left(\frac{\theta}{2}\right)$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi; \pi]$$

**Arguments:**

Name	Type	Description
<i>complex-number</i>	text	The complex number for which the square root is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – A string containing the square root of *complex-number*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMSQRT("2.3+4.5i") results in 1.91751290835255+1.17339496918073i

IMSQRT("-1-4j") results in 1.24962106768765-1.60048518044024j

end example]

### 3.17.7.163 IMSUB

**Syntax:**

IMSUB ( *complex-number-1* , *complex-number-2* )

**Description:** Computes the difference of two complex numbers.

**Mathematical Formula:**

$$(a + bi) - (c + di) = (a - c) + (b - d)i$$

**Arguments:**

Name	Type	Description
<i>complex-number-1</i>	text	Complex numbers in $x + yi$ or $x + yj$ text format; they designate the minuend and subtrahend, respectively.
<i>complex-number-2</i>	text	

**Return Type and Value:** text – A string containing *number-1* - *number-2*, in  $x+yi$  or  $x+yj$  text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, #NUM! is returned.

[Example:

IMSUB("13+4i","5+3i") results in 8+i

IMSUB("-3-3.5i","5+3i") results in -8-6.5i

end example]

### 3.17.7.164 IMSUM

**Syntax:**

IMSUM ( *argument-list* )

**Description:** Adds the values of its arguments.

**Mathematical Formula:**

$$(a + bi) + (c + di) = (a + c) + (b + d)i$$

## Arguments:

Name	Type	Description
<i>argument-list</i>	text	Each <i>argument</i> in <i>argument-list</i> is a complex number string in $x + yi$ or $x + yj$ text format.

**Return Type and Value:** text – The sum of the values of its arguments, in  $x+yi$  or  $x+yj$  text format.

However, if any *argument* in *argument-list* is ill-formed, #NUM! is returned.

[Example:

IMSUM("3+4i") results in 3+4i

IMSUM("3+4i", "5-3i") results in 8+i

end example]

## 3.17.7.165 INDEX

### Syntax:

array form: INDEX ( *array* , [ *row-number* ] [ , [ *column-number* ] ] )

reference form: INDEX ( *reference* [ , [ *row-number* ] [ , [ *column-number* ] [ , [ *area-number* ] ] ] ] )

**Description:** Locates a value or the reference to a value from within a table or range. There are two forms of the INDEX function: the array form and the reference form.

### Arguments:

Name	Type	Description
<i>array</i>	array, reference	Table or range to be searched. If <i>array</i> contains only one row, the corresponding <i>row-number</i> argument is optional. If <i>array</i> contains only one column, the corresponding <i>column-number</i> argument is optional.
<i>reference</i>	reference	A reference to one or more cell ranges. If each area (§3.17.2.3) in <i>reference</i> contains only one row, <i>row-number</i> is optional. If each area contains only one column, <i>column-number</i> is optional.
<i>row-number</i>	number	<i>row-number</i> indicates the row in <i>array</i> (or <i>reference</i> ) from which to return a value (or reference). If <i>row-number</i> is omitted, <i>column-number</i> shall be present. <i>column-number</i> indicates the column in <i>array</i> (or
<i>column-number</i>	number	

Name	Type	Description
		<i>reference</i> ) from which to return a value (or <i>reference</i> ). If <i>column-number</i> is omitted, <i>row-number</i> shall be present. If both the <i>row-number</i> and <i>column-number</i> arguments are used, INDEX returns the value (or <i>reference</i> ) in the cell at the intersection of <i>row-number</i> and <i>column-number</i> . If <i>array</i> has more than one row and more than one column, and only <i>row-number</i> or <i>column-number</i> is used, INDEX returns an array of the entire row or column in array. If <i>row-number</i> or <i>column-number</i> , but not both, is 0, INDEX returns the array of values for the entire column or row, respectively. In the reference form, if <i>row-number</i> and <i>column-number</i> are both omitted, INDEX returns the area in reference specified by <i>area-number</i> .
<i>area-number</i>	number	Indicates a range in <i>reference</i> from which to return the intersection of <i>row-number</i> and <i>column-number</i> . The first area selected or entered is numbered 1, the second 2, and so on. If <i>area-number</i> is omitted, 1 is assumed. [Example: If <i>reference</i> describes the cells (A1:B4, D1:E4, G1:H4), then area-number 1 is the range A1:B4, area-number 2 is the range D1:E4, and area-number 3 is the range G1:H4. end example]

1

2 **Return Type and Value:** various – For the array form, returns a single value, a whole row, or a whole column  
3 from a table or an array, depending on the presence and values of the row and column number indexes.

4 For the reference form, returns a single reference, a whole row, or a whole column from a reference, depending  
5 on the presence and values of the row and column number indexes, and the area number.

6 However, for the array form

- 7 • *row-number* is outside the bounds of *array*, #REF! is returned.
- 8 • *column-number* is outside the bounds of *array*, #REF! is returned.

9 For the reference form

- 10 • *row-number* is outside the bounds of *reference*, #REF! is returned.
- 11 • *column-number* is outside the bounds of *reference*, #REF! is returned.
- 12 • *area-number* is outside the bounds of *reference*, #REF! is returned.

13 [Example:

14

15 INDEX({"Apples", "Lemons"; "Bananas", "Pears"}, 2, 2) results in Pears

16 INDEX({"Apples", "Lemons"; "Bananas", "Pears"}, 2, 1) results in Bananas

- 1 INDEX({"Apples", "Lemons"}, , 2) results in Lemons
- 2 INDEX({"Apples"; "Bananas"}, 1) results in Apples
- 3 Given the following data:

	A	B	C
1	Fruit	Price	Count
2	Apples	0.69	40
3	Bananas	0.34	38
4	Lemons	0.55	15
5	Oranges	0.25	25
6	Pears	0.59	40
7	Almonds	2.8	10

- 4
- 5 INDEX(A2:C7, 2, 3) results in 38
- 6 INDEX((A2:C4, A6:C7), 2, 2, 2) results in 2.8
- 7 INDEX((A2:C4, A6:C7), 2, 2, 1) results in 0.34
- 8
- 9 *end example]*

### 3.17.7.166 INDIRECT

#### Syntax:

INDIRECT ( *ref-text* [ , [ *A1-ref-style-flag* ] ] )

- 13 **Description:** Locates the reference specified by *ref-text* and evaluates that reference to get to its underlying
- 14 value. [*Note:* This function should be used when the reference to a cell within a formula is to be changed
- 15 without changing the formula itself. *end note]*

#### Arguments:

Name	Type	Description
<i>ref-text</i>	An A1-style reference, an R1C1-style reference, a name defined as a reference, or a reference to a cell as a string.	If <i>ref-text</i> refers to another workbook (i.e., it's an external reference), that other workbook shall be open.
<i>A1-ref-style-flag</i>	logical	Specifies the kind of reference that is contained in the cell <i>ref-text</i> . If TRUE or omitted, <i>ref-text</i> is interpreted as an A1-style reference (§3.17.2.3.1); otherwise, <i>ref-text</i> is

Name	Type	Description
		interpreted as an R1C1-style reference (§3.17.2.3.2).

**Return Type and Value:** any – The underlying value of the location referred to by *ref-text*.

However, if

- *ref-text* is not a valid cell reference, #REF! is returned.
- *ref-text* refers to another workbook yet that other workbook is not currently open, the return value is unspecified.

[Example:

Given the following data:

	A	B
1	Data	Data
2	B2	1.333
3	B3	45
4	George	10
5	5	62

where A2 contains a reference to B2, A3 contains a reference to B3, A4 contains the defined name George that refers to B4, and A5 contains the row number of B5:

INDIRECT(\$A\$2) results in 1.333

INDIRECT(\$A\$3) results in 45

INDIRECT(\$A\$4) results in 10

INDIRECT("B"&\$A\$5) results in 62

INDIRECT("R[-1]C", FALSE) uses the cell in the previous row and current column.

end example]

### 3.17.7.167 INFO

**Syntax:**

INFO ( *category* )

**Description:** Retrieves the operating environment value that corresponds to *category*.

**Arguments:**

Name	Type	Description
<i>category</i>	text	The string designated by <i>category</i> is not case-sensitive. The valid strings are shown in the table below.

1

<i>category</i>	Meaning	Result Type
"directory"	Path of the current directory or folder.	text
"memavail"	Amount of memory available, in bytes.	number
"memused"	Amount of memory being used for data.	number
"numfile"	Number of active worksheets in the open workbooks.	number
"origin"	The absolute cell reference of the top and leftmost cell visible in the window, based on the current scrolling position, prefixed with "\$A:". [Example: Using cell D9 as an example, the return value would be \$A:\$D\$9. end example]	text
"osversion"	Current operating system version.	text
"recalc"	Current recalculation mode: "Automatic" or "Manual"	text
"release"	Version of the implementation.	text
"system"	Name of the operating environment.	text
"totmem"	Total memory available, including memory already in use, in bytes.	number

2

3 **Return Type and Value:** text – The operating environment value that corresponds to *category*.

4 However, if *category* is not one of the values defined above, #VALUE! is returned.

5 [Example:

6

7 INFO("directory") might result in e:\My Documents\

8 INFO(A10) might result in e:\My Documents\, where A10 contains directory

9 INFO("memavail") might result in 1048576

10 INFO("memused") might result in 1474464

11 INFO("numfile") might result in 5

12 INFO("origin") might result in \$A:\$C\$536

13 INFO("osversion") might result in Windows (32-bit) NT 5.01

14 INFO("recalc") might result in Automatic

15 INFO("release") might result in 11.0

16 INFO("system") might result in pcdos

17 INFO("totmem") might result in 2523040

*end example]*

### 3.17.7.168 INT

#### Syntax:

INT ( *x* )

**Description:** Computes *x* rounded down to an integer.

#### Arguments:

Name	Type	Description
<i>x</i>	number	The value to be rounded down.

**Return Type and Value:** number – The rounded-down value of *x*.

[*Example:*

INT(8.9) results in 8

INT(-8.9) results in -9

*end example]*

### 3.17.7.169 INTERCEPT

#### Syntax:

INTERCEPT ( *known-ys* , *known-xs* )

**Description:** Computes the point at which a line will intersect the y-axis by using existing x-values and y-values. The intercept point is based on a best-fit regression line plotted through the known x-values and known y-values.

#### Mathematical Formula:

The equation for the intercept of the regression line, *a*, is:

$$a = \bar{y} - b\bar{x}$$

where the slope, *b*, is calculated as:

$$b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

and where *x* and *y* are the sample means AVERAGE(*known-xs*) and AVERAGE(*known-ys*).

# Arguments:

Name	Type	Description
<i>known-ys</i>	number, name, array, reference to number	The dependent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-xs</i>	number, name, array, reference to number	The independent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The point at which a line will intersect the y-axis by using existing x-values and y-values.

However, if

- *known-ys* and *known-xs* contain a different number of data points, the return value is unspecified.
- *known-ys* or *known-xs* contain no data points, the return value is unspecified.

[Example:

INTERCEPT({2,3,9,1,8},{6,5,11,7,5}) results in 0.048387097

end example]

## 3.17.7.170 INTRATE

### Syntax:

INTRATE ( *settlement* , *maturity* , *investment* , *redemption* [ , [ *basis* ] ] )

**Description:** Computes the interest rate for a fully invested security.

### Mathematical Formula:

$$INTRATE = \frac{redemption - investment}{investment} \times \frac{B}{DIM}$$

where:

B = number of days in a year, depending on the year basis.

DIM = number of days from settlement to maturity.

### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>investment</i>	number	The amount invested in the security.												
<i>redemption</i>	number	The amount to be received at maturity.he security's annual yield.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

1

2 Time information in the date arguments is ignored.

3 **Return Type and Value:** number – The interest rate for a fully invested security.

4 However, if

- 5 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 6 • *settlement*  $\geq$  *maturity*, #NUM! is returned.
- 7 • *investment* or *redemption*  $\leq$  0, #NUM! is returned.
- 8 • *basis*  $<$  0 or *basis*  $>$  4, #NUM! is returned.

9 [Example:

10

11 INTRATE (DATE (2008, 2, 15), DATE (2008, 5, 15), 1000000, 1014420, 2) results in 5.7680%

12

13 end example]

### 14 3.17.7.171 IPMT

15 **Syntax:**

16 IPMT ( *rate* , *per* , *nper* , *pv* , [ *fv* ] [ , [ *type* ] ] )

17 **Description:** Computes the interest payment for a given period for an investment based on periodic, constant  
18 payments and a constant interest rate.

19 **Arguments:**

Name	Type	Description						
<i>rate</i>	number	The interest rate.						
<i>per</i>	number	The period for which the interest is to be found, and shall be in the range 1– <i>nper</i> .						
<i>nper</i>	number	The total number of payment periods in an annuity.						
<i>pv</i>	number	The present value, or the lump-sum amount that a series of future payments is worth right now.						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

1

2 Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing  
3 cash received by the investor shall be expressed as positive numbers.

4 **Return Type and Value:** number – The interest payment for a given period for an investment based on periodic,  
5 constant payments and a constant interest rate.

6 However, if *type* is any number other than 0 or 1, #NUM! is returned.

7 [Example:

8

9 IPMT(0.1/12,1\*3,3,8000) results in -22.41

10 IPMT(0.1,3,3,8000) results in -292.45

11

12 end example]

### 13 3.17.7.172 IRR

14 IRR ( values [ , [ guess ] ] )

15 Description: Computes the internal rate of return for a series of cash flows represented by the numbers in  
16 *values*. (These cash flows do not have to be even, as they would be for an annuity. However, the cash flows shall  
17 occur at regular intervals, such as monthly or annually. The internal rate of return is the interest rate received  
18 for an investment consisting of payments (negative values) and income (positive values) that occur at regular  
19 periods.) IRR uses an iterative calculation technique.

1 Arguments:

Name	Type	Description
<i>values</i>	array, reference, text, logical	The set of numbers for which the internal rate of return is to be calculated. <i>values</i> shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in <i>values</i> is significant, so be sure payment and income numbers are in the desired sequence. If <i>values</i> contains elements that are text, logical values, or empty cells, those elements are ignored.
<i>guess</i>	number	An estimate of the result of IRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

2

3 Return Type and Value: number – The internal rate of return for a series of cash flows.

4 However, if the calculation has not converged after an implementation-defined number of iterations, #NUM! is  
5 returned.

6 [Example:

7

8 IRR({-70000,12000,15000,18000,21000}) results in -2.1245%

9 IRR({-70000,12000,15000,18000,21000,26000}) results in 8.6631%

10 IRR({-70000,12000,15000},-0.1) results in -44.3507%

11

12 end example]

### 13 3.17.7.173 ISBLANK

14 Syntax:

15 ISBLANK ( *value* )

16 **Description:** Determines if *value* refers to an empty cell.

17 Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

18

19 **Return Type and Value:** logical – TRUE if *value* refers to an empty cell; otherwise, FALSE.

20 [Example:

21

ISBLANK(A10) results in TRUE, when A10 is empty  
 ISBLANK(A10) results in FALSE, when A10 contains 123  
 end example]

### 3.17.7.174 ISERR

**Syntax:**

ISERR ( *value* )

**Description:** Determines if *value* is any of the error values other than #N/A.

**Arguments:**

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* is one of the error values, excluding #N/A; otherwise, FALSE.

[Example:

ISERR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example  
 ISERR(B1) results in FALSE if B1 evaluates to #N/A

end example]

### 3.17.7.175 ISERROR

**Syntax:**

ISERROR ( *value* )

**Description:** Determines if *value* is any of the error values.

**Arguments:**

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* is one of the error values; otherwise, FALSE.

[Example:

ISERROR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example

*end example]*

### 3.17.7.176 ISEVEN

#### Syntax:

ISEVEN ( *value* )

**Description:** Determines if *value* is an even number or refers to a cell containing an even number.

#### Arguments:

Name	Type	Description
<i>value</i>	number	The value to be tested. It is truncated to an integer.

**Return Type and Value:** logical – TRUE if *value* is an even number or refers to a cell containing an even number; otherwise, FALSE.

[Example:

ISEVEN(12.456) results in TRUE

ISEVEN(A10) results in FALSE, when A10 contains -15

*end example]*

### 3.17.7.177 ISLOGICAL

#### Syntax:

ISLOGICAL ( *value* )

**Description:** Determines if *value* contains a logical value or refers to a cell containing a logical value.

#### Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* contains a logical value or refers to a cell containing a logical value; otherwise, FALSE.

[Example:

ISLOGICAL(TRUE) results in TRUE  
 ISLOGICAL(A10) results in FALSE, when A10 contains 123  
 ISLOGICAL({TRUE,2}) results in TRUE  
 ISLOGICAL({2,TRUE}) results in FALSE

*end example]*

### 3.17.7.178 ISNA

#### Syntax:

ISNA ( *value* )

**Description:** Determines if *value* is the error value #N/A.

#### Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* is #N/A; otherwise, FALSE.

[*Example:*

ISERR(A1) results in TRUE if A1 evaluates to #N/A  
 ISERR(B1) results in TRUE if B1 evaluates to #DIV/0!, for example

*end example]*

### 3.17.7.179 ISNONTEXT

#### Syntax:

ISNONTEXT ( *value* )

**Description:** Determines if *value* does not contain text or does not refer to a cell containing text. An empty cell is not text.

#### Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* does not contain text or does not refer to a cell containing text; otherwise, FALSE.

[Example:

ISNONTEXT("ABC") results in FALSE

ISNONTEXT(A10) results in TRUE, when A10 contains 123

ISNONTEXT({1,"ABC"}) results in TRUE

ISNONTEXT({"ABC",1}) results in FALSE

end example]

### 3.17.7.180 ISNUMBER

**Syntax:**

ISNUMBER ( *value* )

**Description:** Determines if *value* contains a number or refers to a cell that contains a number.

**Arguments:**

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* contains a number or refers to a cell that contains a number; otherwise, FALSE.

[Example:

ISNUMBER(10.56) results in TRUE

ISNUMBER(A10) results in FALSE, when A10 contains ABC

ISNUMBER({1,"ABC"}) results in TRUE

ISNUMBER({"ABC",1}) results in FALSE

end example]

### 3.17.7.181 ISODD

**Syntax:**

ISODD ( *value* )

**Description:** Determines if *value* is an odd number or refers to a cell containing an odd number.

**Arguments:**

Name	Type	Description
<i>value</i>	number	The value to be tested. It is truncated to an integer.

**Return Type and Value:** logical – TRUE if *value* is an odd number or refers to a cell containing an odd number; otherwise, FALSE.

[Example:

ISODD(12.456) results in FALSE

ISODD(A10) results in TRUE, when A10 contains -15

end example]

### 3.17.7.182 ISPMT

**Syntax:**

ISPMT ( *rate* , *per* , *nper* , *pv* )

**Description:** Computes the interest paid during a specific period of an investment.

**Arguments:**

Name	Type	Description
<i>rate</i>	number	The interest rate for the investment.
<i>per</i>	number	The period for which the interest is to be found, and shall be in the range 1– <i>nper</i> .
<i>nper</i>	number	The total number of payment periods for the investment.
<i>pv</i>	number	The present value the investment.

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

**Return Type and Value:** number – The interest paid during a specific period of an investment.

[Example:

ISPMT(0.1/12,1,3\*12,8000000) results in -64814.81

ISPMT(0.1,1,3,8000000) results in -533333.33

end example]

### 3.17.7.183 ISREF

#### Syntax:

ISREF ( *value* )

**Description:** Determines if *value* is a cell reference.

#### Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* is a cell reference; otherwise, FALSE.

[Example:

ISREF ("ABC") results in FALSE

ISREF (A10) results in TRUE

end example]

### 3.17.7.184 ISTEEXT

#### Syntax:

ISTEXT ( *value* )

**Description:** Determines if *value* contains text or refers to a cell containing text.

#### Arguments:

Name	Type	Description
<i>value</i>	any	The value to be tested. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** logical – TRUE if *value* contains text or refers to a cell containing text; otherwise, FALSE.

[Example:

ISTEXT ("ABC") results in TRUE

ISTEXT (A10) results in FALSE, when A10 contains 123

ISTEXT ({1, "ABC"}) results in FALSE

ISTEXT ({ "ABC", 1 }) results in TRUE

*end example]*

### 3.17.7.185 JIS

#### Syntax:

JIS ( *string* )

**Description:** Creates a string that is the conversion of half-width (single-byte) letters within *string* to full-width (double-byte) characters.

#### Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string to be converted. If <i>string</i> does not contain any half-width English letters or katakana, nothing in <i>string</i> is converted.

**Return Type and Value:** text – The string resulting from the conversion.

[*Example:*

JIS("ABC") results in ABC

JIS("エクセル") results in エクセル

*end example]*

### 3.17.7.186 KURT

#### Syntax:

KURT ( *argument-list* )

**Description:** Computes the kurtosis of a data set. Kurtosis characterizes the relative peakedness or flatness of a distribution compared with the normal distribution. Positive kurtosis indicates a relatively peaked distribution. Negative kurtosis indicates a relatively flat distribution.

#### Mathematical Formula:

Kurtosis is defined as:

$$\left\{ \frac{n(n+1)}{(n-1)(n-2)(n-3)} \sum \left( \frac{x_j - \bar{x}}{s} \right)^4 \right\} - \frac{3(n-1)^2}{(n-2)(n-3)}$$

where  $s$  is the sample standard deviation.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	array reference to an array, number, name, or reference to number.	The <i>arguments</i> in <i>argument-list</i> are the values for which kurtosis is to be calculated. Any <i>argument</i> in <i>argument-list</i> can be an array or a reference to an array. Logical values and text representations of numbers that are directly entered into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The kurtosis of a data set.

However, if

- There are fewer than four data points, the return value is unspecified.
- The standard deviation of the sample equals zero, the return value is unspecified.

[Example:

KURT(10.5,12.4,19.4,23.2) results in -3.644621343

KURT(10.5,{12.4,19.4},23.2) results in -3.644621343

end example]

### 3.17.7.187 LARGE

**Syntax:**

LARGE ( *array* , *k* )

**Description:** Computes the  $k^{\text{th}}$  largest value in a data set.

**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	The set of numbers from which the $k^{\text{th}}$ -largest value is to be determined.
<i>k</i>	number	The position (from the largest) in the array or cell range of data to return.

**Return Type and Value:** number – The  $k^{\text{th}}$  largest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$ , #NUM! is returned.
- $k$  is greater than the number of data points, #NUM! is returned.

[Example:

LARGE({3,5,3,5,4;4,2,4,6,7},3) results in 5

LARGE({3,5,3,5,4;4,2,4,6,7},7) results in 4

end example]

### 3.17.7.188 LCM

**Syntax:**

LCM ( *argument-list* )

**Description:** Computes the least common multiple of the one or more *arguments* in *argument-list*.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	number	<i>argument-list</i> specifies the <i>arguments</i> . Each argument is truncated to an integer.

**Return Type and Value:** number – The least common multiple of one or more numbers.

However, if any *argument* is negative, #NUM! is returned.

[Example:

LCM(5) results in 5

LCM(5,2) results in 10

LCM(24.99,36.45) results in 72

LCM(24,36,15) results in 360

end example]

### 3.17.7.189 LEFT

**Syntax:**

LEFT ( *string* [ , *number-chars* ] )

**Description:** Extracts the left-most *number-chars* characters from *string*. (LEFT is intended for use with languages that use the single-byte character set (SBCS), whereas LEFTB (§3.17.7.190) is intended for use with languages that use the double-byte character set (DBCS).)

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-chars</i>	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. <i>number-chars</i> shall be at least 0. If <i>number-chars</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

**Return Type and Value:** text – A string containing the left-most *number-chars* characters from *string*.

However, if *number-chars* is negative, #VALUE! is returned.

[Example:

LEFT("abcdef",2) results in ab

LEFT(A10,4) results in xyz1, when A10 contains xyz123

end example]

### 3.17.7.190 LEFTB

**Syntax:**

LEFTB ( *string* [ , *number-bytes* ] )

**Description:** Extracts the left-most *number-bytes*-worth of characters from *string*. (LEFTB is intended for use with languages that use the double-byte character set (DBCS), whereas LEFT (§3.17.7.190) is intended for use with languages that use the single-byte character set (SBCS).)

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-bytes</i>	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. <i>number-bytes</i> shall be at least 0. If <i>number-bytes</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

**Return Type and Value:** text – A string containing the left-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* is negative, #VALUE! is returned.

[*Example:* Assuming 1-byte characters:

LEFTB("abcdef",2) results in ab

LEFTB(A10,4) results in xyz1, when A10 contains xyz123

*end example]*

### 3.17.7.191 LEN

#### Syntax:

LEN ( *string* )

**Description:** Determines the number of characters in *string*. (LEN is intended for use with languages that use the single-byte character set (SBCS), whereas LENB (§3.17.7.192) is intended for use with languages that use the double-byte character set (DBCS).)

#### Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string whose length is to be found.

**Return Type and Value:** number – The number of characters in *string*.

[*Example:*

LEN("abc") results in 3

LEN(A10) results in 3, when A1 contains abc

*end example]*

### 3.17.7.192 LENB

#### Syntax:

LENB ( *string* )

**Description:** Determines the number of bytes in *string*. (LENB is intended for use with languages that use the double-byte character set (DBCS), whereas LEN (§3.17.7.191) is intended for use with languages that use the single-byte character set (SBCS).)

#### Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string whose length is to be found.

**Return Type and Value:** number – The number of bytes in *string*.

[*Example:* Assuming 1-byte characters:

LENB("abc") results in 3

LENB(A10) results in 3, when A1 contains abc

*end example]*

### 3.17.7.193 LINEST

**Syntax:**

LINEST ( *known-ys* [ , [ *known-xs* ] [ , [ *const-flag* ] [ , *stats-flag* ] ] )

**Description:** Calculates the statistics for a line by using the "least squares" method to calculate a straight line that best fits the data, and returns an array that describes the line.

**Mathematical Formula:**

The equation for the line is:

$$y = mx + b$$

or

$$y = m_1x_1 + m_2x_2 + \dots + b \text{ (if there are multiple ranges of x-values)}$$

where the dependent y-value is a function of the independent x-values. The m-values are coefficients corresponding to each x-value, and b is a constant value. y, x, and m can be vectors.

When there is only one independent x-variable, the slope and y-intercept values can be obtained directly by using the following formulas:

Slope: INDEX(LINEST(*known-ys*,*known-xs*),1)

Y-intercept: INDEX(LINEST(*known-ys*,*known-xs*),2)

The accuracy of the line calculated by LINEST depends on the degree of scatter in the data. The more linear the data, the more accurate the LINEST model. LINEST uses the method of least squares for determining the best fit for the data. When there is only one independent x-variable, the calculations for m and b are based on the following formulas:

$$m = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

$$b = \bar{y} - m\bar{x}$$

where  $\bar{x}$  and  $\bar{y}$  are sample means, i.e.,  $\bar{x} = \text{AVERAGE}(\text{known-xs})$  and  $\bar{y} = \text{AVERAGE}(\text{known-ys})$ .

#### Arguments:

Name	Type	Description
<i>known-ys</i>	array	The set of y-values already known in the relationship $y=mx+b$ . If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	An optional set of x-values that might already be known in the relationship $y=mx+b$ . The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a range with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant $b$ to be zero. If TRUE or omitted, $b$ is calculated normally. If FALSE, $b$ is set to zero, and the m-values are adjusted to fit $y=mx$ .
<i>stats-flag</i>	logical	Specifies whether to return additional regression statistics. If TRUE, LINEST returns the additional regression statistics (see table below), so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LINEST returns only the m-coefficients and the constant b.

The additional regression statistics are as follows:

Statistic	Description
se1, se2, ..., sen	The standard error values for the coefficients m1, m2, ..., mn.
seb	The standard error value for the constant b.
r2	The coefficient of determination.
sey	The standard error for the y estimate.
F	The F statistic, or the F-observed value.

Statistic	Description
df	The degrees of freedom.
ssreg	The regression sum of squares.
ssresid	The residual sum of squares.

**Return Type and Value:** array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The following illustration shows the order in which the additional regression statistics are returned.

[Example:

LINEST({1,9,5,7},{0,4,2,3},,FALSE) results in a slope of 2 and a y-intercept of 1

end example]

### 3.17.7.194 LN

**Syntax:**

LN ( x )

**Description:** Computes the natural logarithm of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The positive real number for which the natural logarithm is being computed.

**Return Type and Value:** number – The natural logarithm of  $x$ .

However, if  $x$  is zero or negative, #NUM! is returned.

[Example:

LN(86) results in 4.454347296

LN(2.7182818) results in 0.99999999

LN(EXP(3)) results in 3

end example]

### 3.17.7.195 LOG

**Syntax:**

LOG ( x [ , base ] )

**Description:** Computes the logarithm of  $x$  to the base  $base$ .

**Arguments:**

Name	Type	Description
$x$	number	The positive real number for which the logarithm is being computed.
$base$	number	The base of the logarithm. If omitted, base 10 is assumed.

**Return Type and Value:** number – The logarithm of  $x$ .

However, if

- $x$  is zero or negative, #NUM! is returned.
- $base$  is zero or negative, #NUM! is returned.

[Example:

LOG(10) results in 1

LOG(8,2) results in 3

LOG(86,2.7182818) results in 4.454347343

end example]

[3.17.7.196](#) LOG10

**Syntax:**

LOG10 (  $x$  )

**Description:** Computes the base-10 logarithm of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The positive real number for which the logarithm is being computed.

**Return Type and Value:** number – The base-10 logarithm of  $x$ .

However, if  $x$  is zero or negative, #NUM! is returned.

[Example:

LOG10(86) results in 1.934498451

1 LOG10(10) results in 1  
 2 LOG10(1E5) results in 5  
 3 LOG10(10^5) results in 5  
 4  
 5 *end example]*

### 6 3.17.7.197 LOGEST

#### 7 Syntax:

8 LOGEST ( *known-ys* [ , [ *known-xs* ] [ , [ *const-flag* ] [ , *stats-flag* ] ] )

9 **Description:** Calculates an exponential curve that fits the data, and returns an array of values that describes the  
 10 curve.

#### 11 Mathematical Formula:

12 The equation for the curve is:

13  $y = b * m^x$

14 or

15  $y = (b * (m_1^{x_1}) * (m_2^{x_2}) * \dots)$  (if there are multiple x-values)

16 where the dependent y-value is a function of the independent x-values. The m-values are bases corresponding  
 17 to each exponent x-value, and b is a constant value. Note that y, x, and m can be vectors.

18 When there is only one independent x-variable, the y-intercept (b) values can be obtained directly by using the  
 19 following formula:

20 Y-intercept (b): INDEX( LOGEST( *known-ys*, *known-xs* ), 2 )

#### 21 Arguments:

Name	Type	Description
<i>known-ys</i>	array	The set of y-values already known in the relationship $y=b*m^x$ . If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	An optional set of x-values that might already be known in the relationship $y=b*m^x$ . The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that

Name	Type	Description
		is, a range with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant <i>b</i> to be 1. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set to 1, and the m-values are adjusted to fit $y=m^x$ .
<i>stats-flag</i>	logical	Specifies whether to return additional regression statistics. If TRUE, LOGEST returns the additional regression statistics, so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LOGEST returns only the m-coefficients and the constant b.

1

2 The additional regression statistics are described in §3.17.7.193.

3 **Return Type and Value:** array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The order in  
 4 which the additional regression statistics are returned is described in §3.17.7.193.

5 [Example: Given the following data:

	A	B
1	Month	Units
2	11	33,100
3	12	47,300
4	13	69,000
5	14	102,000
6	15	150,000
7	16	220,000
8	Formula	
9	1.463275628	495.3047702

6

7 When LOGEST(B2:B7,A2:A7,TRUE,FALSE) is array-entered into cells A9:B9, those cells take on the results  
 8 shown.

9

10 end example]

11 **3.17.7.198 LOGINV**12 **Syntax:**13 LOGINV ( *probability* , *mean* , *standard-dev* )

**Description:** Calculates the inverse of the lognormal cumulative distribution function of  $x$ , where  $\ln(x)$  is normally distributed with parameters *mean* and *standard-dev*.

**Mathematical Formula:**

$$\text{LOGINV}(p, \mu, \sigma) = e^{[\mu + \sigma \times \text{NORMSINV}(p)]}$$

**Arguments:**

Name	Type	Description
<i>probability</i>	number	A probability associated with the lognormal distribution.
<i>mean</i>	number	The mean of $\ln(x)$ .
<i>standard-dev</i>	number	The standard deviation of $\ln(x)$ .

**Return Type and Value:** number – The inverse of the lognormal cumulative distribution function of  $x$ .

However, if

- probability* < 0 or *probability* > 1, #NUM! is returned.
- standard-dev* ≤ 0, #NUM! is returned.

[Example:

LOGINV(0.039084, 3.5, 1.2) results in 4.000025219

end example]

### 3.17.7.199 LOGNORMDIST

**Syntax:**

LOGNORMDIST (  $x$  , *mean* , *standard-dev* )

**Description:** Calculates the cumulative lognormal distribution of  $x$ , where  $\ln(x)$  is normally distributed with parameters *mean* and *standard-dev*.

**Mathematical Formula:**

$$\text{LOGNORMDIST}(x, \mu, \sigma) = \text{NORMSDIST}\left(\frac{\ln(x) - \mu}{\sigma}\right)$$

**Arguments:**

Name	Type	Description
$x$	number	The value at which to evaluate the function.

Name	Type	Description
<i>mean</i>	number	The mean of $\ln(x)$ .
<i>standard-dev</i>	number	The standard deviation of $\ln(x)$ .

1

2 **Return Type and Value:** number – The inverse of the lognormal cumulative distribution function of  $x$ .

3 However, if

- 4 •  $x \leq 0$ , #NUM! is returned.
- 5 •  $standard-dev \leq 0$ , #NUM! is returned.

6 [Example:

7

8 LOGNORMDIST(4, 3.5, 1.2) results in 0.039083556

9

10 end example]

11 

### 3.17.7.200 LOOKUP

12 **Syntax:**13 vector form: LOOKUP ( *lookup-value* , *lookup-vector* , *result-vector* )14 array form: LOOKUP ( *lookup-value* , *array* )

15 **Description:** The vector form looks in a vector for a value, and returns a value from the same position in a  
 16 second vector. The array form looks in the first row or column of an array for the specified value and returns a  
 17 value from the same position in the last row or column of that array.

18 **Arguments:**

Name	Type	Description
<i>lookup-value</i>	number, string, logical, name, reference	The value to search for in <i>lookup-vector</i> (or <i>array</i> ).
<i>lookup-vector</i>	reference	A range that contains only one row or one column. The values in <i>lookup-vector</i> can be strings, numbers, or logical values. These values shall be placed in "ascending" order, as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If LOOKUP can't find the <i>lookup-value</i> , it matches the largest value in <i>lookup-vector</i> (or <i>array</i> ) that is less than or equal to <i>lookup-value</i> .
<i>result-vector</i>	reference	A range that contains only one row or column. It shall be the same size as <i>lookup-vector</i> .

Name	Type	Description
<i>array</i>	text, number, logical	A range of cells whose values are to be compared with <i>lookup-value</i> . These values shall be placed in "ascending" order, as follows: ..., -2, -1, 0, 1, 2, ..., A-Z, FALSE, TRUE . Upper- and lowercase strings are equivalent. If <i>array</i> covers an area that has more columns than rows, <i>lookup-value</i> is searched for in the first row. If <i>array</i> is square or has more rows than columns, <i>lookup-value</i> is searched for in the first column.

**Return Type and Value:** any – The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

However, if

- *lookup-value* is smaller than the smallest value in *lookup-vector* (or the first row or column of *array*), the return value is unspecified.
- The size of the range specified by *result-vector* is not the same as that specified by *lookup-vector*, the return value is unspecified.
- The values in *lookup-vector* (or *array*) are not in "ascending" order, the return value is unspecified.

[Example: Given the following data:

	A	B
1	Frequency	Color
2	4.14	red
3	4.19	orange
4	5.17	yellow
5	5.77	green
6	6.39	blue

LOOKUP(4.19,A2:A6,B2:B6) results in orange

LOOKUP(5,A2:A6,B2:B6) results in orange

LOOKUP(7.66,A2:A6,B2:B6) results in blue

LOOKUP("C",{ "a", "b", "c", "d";1,2,3,4}) results in 3

LOOKUP("bump",{ "a",1; "b",2; "c",3}) results in 2

end example]

## 3.17.7.201 LOWER

**Syntax:**

LOWER ( *string* )

**Description:** Makes a lowercase version of *string*.

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designates the string to be converted.

**Return Type and Value:** text – The lowercase version of *string*.

[Example:

LOWER("AbCd123#\$\$%^") results in abcd123#\$\$%^

LOWER(A10) results in 234frtqwc\$##, when A10 contains 234FRTqwc\$##

end example]

## 3.17.7.202 MATCH

**Syntax:**

MATCH ( *lookup-value* , *lookup-array* [ , [ *match-type* ] ] )

**Description:** Locates the relative position of an array item that matches a specified value in a specified order.

MATCH shall not distinguish between uppercase and lowercase letters when matching strings.

**Arguments:**

Name	Type	Description
<i>lookup-value</i>	number, string, logical, name, reference	The value to search for in <i>lookup-array</i> . If <i>match-type</i> is 0 and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be used in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To locate a question mark or asterisk, precede that character with a tilde (~).
<i>lookup-array</i>	array, reference	A contiguous range of cells containing possible lookup values.
<i>match-type</i>	number	Specifies how <i>lookup-value</i> is matched with values in <i>lookup-array</i> , as follows:

Name	Type	Description	
		Value	Meaning
		-1	Finds the smallest value that is greater than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ...
		0	Finds the first value that is exactly equal to <i>lookup-value</i> . The values in <i>lookup-array</i> can be in any order.
		1 or omitted	Finds the largest value that is less than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE.

**Return Type and Value:** number – The relative position of an array item that matches a specified value in a specified order.

However, if

- No match is found, #NUM! is returned.
- *match-type*'s value is out-of-bounds, #NUM! is returned.

[Example:

MATCH(39,{25,38,40,41},1) results in 2

MATCH(41,{25,38,40,41},0) results in 4

end example]

### 3.17.7.203 MAX

**Syntax:**

MAX ( *argument-list* )

**Description:** Computes the largest of a set of numbers.

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [Note: To include these, use MAXA (§3.17.7.204). <i>end note</i> ] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

1

2 **Return Type and Value:** number – The largest of a set of numbers; however, if the arguments contain no  
3 numbers, zero is returned.

4 [Example:

5

6 MAX(10.4, -3.5, 12.6) results in 12.6

7 MAX(10.4, {-3.5, 12.6}) results in 12.6

8 MAX({"ABC", TRUE}) results in 0

9 Consider the case in which cell B3 contains 0:

10 MAX(-10, -12, -15, B3) results in -10

11 MAXA(-10, -12, -15, B3) results in 0

12

13 *end example*]

14 3.17.7.204 MAXA

15 **Syntax:**

16 MAXA ( *argument-list* )

17 **Description:** Computes the largest of a set of numbers.

18 **Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [Note: To ignore these, use MAX (§3.17.7.203). <i>end note</i> ] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however,

Name	Type	Description
		cells with the value 0 are included.

**Return Type and Value:** number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[*Example:*

MAXA(10.4, -3.5, 12.6) results in 12.6

MAXA(10.4, {-3.5, 12.6}) results in 12.6

MAXA({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MAX(-10, -12, -15, B3) results in -10

MAXA(-10, -12, -15, B3) results in 0

*end example]*

### 3.17.7.205 MDETERM

**Syntax:**

MDETERM ( *array* )

**Description:** Computes the determinant of the square matrix of numbers designated by *array*. The determinant is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the calculation is not complete. [*Example:* The determinant of a singular matrix can differ from zero by 1E-16. *end example]*

**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	Designate a square matrix of numbers.

**Return Type and Value:** number – The determinant of *array*. Some square matrices cannot be inverted. The determinant of a non-invertible matrix is 0.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.

[*Example:*

MDETERM(A2:D5) results in the determinant of the 4x4 array designated by the cell range

MDTERM({3,6,1;1,1,0;3,10,2}) results in 1

MDTERM({3,6;1,1}) results in -3

end example]

### 3.17.7.206 MDURATION

#### Syntax:

MDURATION ( *settlement* , *maturity* , *coupon* , *yld* , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the modified Macauley duration for a security with an assumed par value of \$100.

#### Mathematical Formula:

$$\text{MDURATION} = \frac{\text{DURATION}}{1 + \left( \frac{\text{Market yield}}{\text{Coupon payments per year}} \right)}$$

#### Arguments:

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>coupon</i>	number	The security's annual coupon rate.												
<i>yld</i>	number	The security's annual yield.												
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The modified Macauley duration for a security with an assumed par value of \$100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *coupon* or *yld*  $< 0$ , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

[Example:

MDURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1) results in 5.7357

end example]

### 3.17.7.207 MEDIAN

**Syntax:**

MEDIAN ( *argument-list* )

**Description:** Computes the median of the numeric values of its arguments.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number.	The <i>arguments</i> in <i>argument-list</i> designate the values whose median is to be computed. If there is an even number of numbers in the set, MEDIAN calculates the average of the two numbers in the middle. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The median of the values of its arguments.

[Example:

MEDIAN(10,20) results in 15

MEDIAN(-3.5,1.4,6.9,-4.5) results in -1.05

MEDIAN({-3.5,1.4,6.9},-4.5) results in -1.05

end example]

### 3.17.7.208 MID

#### Syntax:

MID ( *string* , *start-pos* , *number-chars* )

**Description:** Extracts *number-chars* characters from *string*, starting at character position *start-pos*. (MID is intended for use with languages that use the single-byte character set (SBCS), whereas MIDB (§3.17.7.209) is intended for use with languages that use the double-byte character set (DBCS).)

#### Arguments:

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-chars</i>	number	The number of characters to be extracted. <i>number-chars</i> shall be at least 0.
<i>start-pos</i>	number	The starting position within <i>string</i> , where the first character is position 1. If <i>start-pos</i> is greater than the length of <i>string</i> , or if <i>start-pos</i> and <i>number-chars</i> combined exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

**Return Type and Value:** text – A string containing *number-chars* characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[Example:

MID("abcdef",3,2) results in cd

MID(A10,4,1) results in 1, when A10 contains xyz123

MID("abcdef",4,5) results in def

end example]

### 3.17.7.209 MIDB

#### Syntax:

MIDB ( *string* , *start-pos* , *number-bytes* )

**Description:** Extracts *number-bytes*-worth of characters from *string*, starting at character position *start-pos*. (MIDB is intended for use with languages that use the double-byte character set (DBCS), whereas MID (§3.17.7.208) is intended for use with languages that use the single-byte character set (SBCS).)

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-bytes</i>	number	The number of characters to be extracted. <i>number-bytes</i> shall be at least 0.
<i>start-pos</i>	number	The starting position within <i>string</i> , where the first byte is position 1. If <i>start-pos</i> is greater than the length of <i>string</i> , or if <i>start-pos</i> and <i>number-bytes</i> combined exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

**Return Type and Value:** text – A string containing *number-bytes*-worth of characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

MIDB("abcdef", 3, 2) results in cd

MIDB(A10, 4, 1) results in 1, when A10 contains xyz123

MIDB("abcdef", 4, 5) results in def

end example]

### 3.17.7.210 MIN

**Syntax:**

MIN ( *argument-list* )

**Description:** Computes the smallest of a set of numbers.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number,	The <i>arguments</i> in <i>argument-list</i> designate the values for

Name	Type	Description
	name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [Note: To include these, use MINA (§3.17.7.211). <i>end note</i> ] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

1

2 **Return Type and Value:** number – The smallest of a set of numbers; however, if the *arguments* contain no  
3 numbers, zero is returned.

4 [Example:

5

6 MIN(10.4, -3.5, 12.6) results in -3.5

7 MIN(10.4, {-3.5, 12.6}) results in -3.5

8 MIN({"ABC", TRUE}) results in 0

9 Consider the case in which cell B3 contains 0:

10 MIN(10, 12, 15, B3) results in 10

11 MINA(10, 12, 15, B3) results in 0

12

13 *end example*]

14 [3.17.7.211](#) [MINA](#)

15 **Syntax:**

16 MINA ( *argument-list* )

17 **Description:** Computes the smallest of a set of numbers.

18 **Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [Note: To ignore these, use MIN (§3.17.7.210). <i>end note</i> ] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included.

Any *argument* in *argument-list* can be an array or a reference to an array.

**Return Type and Value:** number – The smallest of a set of numbers; however, if the *arguments* contain no numbers, zero is returned.

[Example:

MINA(10.4, -3.5, 12.6) results in -3.5

MINA(10.4, {-3.5, 12.6}) results in -3.5

MINA({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MIN(10, 12, 15, B3) results in 10

MINA(10, 12, 15, B3) results in 0

end example]

### 3.17.7.212 MINUTE

**Syntax:**

MINUTE ( *time-value* )

**Description:** Computes the minute for the date and/or time having the given *time-value*.

**Arguments:**

Name	Type	Description
<i>time-value</i>	number	The date and/or time whose minute is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a <i>string-constant</i> having any valid date and/or time format, in which case, any date information shall be ignored.

**Return Type and Value:** number – The minute for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[Example:

MINUTE(DATE(2006, 2, 26)+TIME(2, 10, 20)) results in 10

MINUTE(TIME(22, 56, 34)) results in 56

MINUTE(0) results in 0, since serial value 0 represents 00:00:00  
 MINUTE(10.5) results in 0, since serial value .5 represents 12:00:00  
 MINUTE("22-Oct-2001 10:53:12") results in 53  
 MINUTE("10:53:12 pm") results in 53  
 MINUTE("22:53:12") results in 53

*end example]*

### 3.17.7.213 MINVERSE

#### Syntax:

MINVERSE ( *array* )

**Description:** Computes the inverse of the square matrix of numbers designated by *array*. The inverse matrix is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the cancellation is not complete.

#### Arguments:

Name	Type	Description
<i>array</i>	array, reference	Designate a square matrix of numbers.

**Return Type and Value:** number – The inverse of the square matrix designated by *array*.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.
- The matrix cannot be inverted, the return value is unspecified.

[Example:

MINVERSE({3,6,1;1,1,0;3,10,2}) results in 2

MINVERSE({3,6;1,1}) results in -0.333333333

*end example]*

### 3.17.7.214 MIRR

MIRR ( *values* , *finance-rate* , *reinvest-rate* )

**Description:** Computes the modified internal rate of return for a series of periodic cash flows. (Both the cost of the investment and the interest received on reinvestment of cash are considered.)

#### Mathematical Formula:

If  $n$  is the number of cash flows in *values*, *frate* is the *finance-rate*, and *rrate* is the *reinvest-rate*, then the formula for MIRR is:

$$\left( \frac{-\text{NPV}(\text{rrate}, \text{values}[\text{positive}]) * (1 + \text{rrate})^n}{\text{NPV}(\text{frate}, \text{values}[\text{negative}]) * (1 + \text{frate})} \right)^{\frac{1}{n-1}} - 1$$

Arguments:

Name	Type	Description
<i>values</i>	array, reference	Designates a set of numbers for which the rate of return is to be calculated. <i>values</i> shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in <i>values</i> is significant, so be sure payment and income numbers are in the desired sequence. If <i>values</i> contains elements that are text, logical values, or empty cells, those elements are ignored.
<i>finance-rate</i>	number	The interest rate paid pay on the money used in the cash flows.
<i>reinvest-rate</i>	number	The interest rate received on the cash flows as they are reinvested.

Return Type and Value: number – The modified internal rate of return for a series of periodic cash flows.

However, if *values* does not contain at least one positive value and one negative value, #DIV/0! is returned.

[Example:

MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.12) results in 12.6094%

MIRR({-120000,39000,30000,21000},0.1,0.12) results in -4.8045%

MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.14) results in 13.4759%

end example]

### 3.17.7.215 MMULT

**Syntax:**

MMULT ( *array-1* , *array-2* )

**Description:** Computes the product of the matrices of numbers designated by *array-1* and *array-2*.

**Mathematical Formula:**

The matrix product array *a* of two arrays *b* and *c* is:

$$a_{ij} = \sum_{k=1}^n b_{ik} c_{kj}$$

where  $i$  is the row number, and  $j$  is the column number.

#### Arguments:

Name	Type	Description
<i>array-1</i>	array, reference, name	Designate the matrices of numbers to be multiplied.
<i>array-2</i>		

**Return Type and Value:** number – The product of the matrices of numbers designated by *array-1* and *array-2*.

However, if

- Any cells in *array-1* or *array-2* are empty or contain text, the return value is unspecified.
- The number of columns in *array-1* is different from the number of rows in *array-2*, #VALUE! is returned.

[Example:

MMULT({3,6,1;1,1,0},{5,7;4,6;2,5}) results in 41

end example]

#### 3.17.7.216 MOD

##### Syntax:

MOD (  $x$  ,  $y$  )

**Description:** Computes the remainder when  $x$  is divided by  $y$ . The result has the same sign as  $y$ .

#### Arguments:

Name	Type	Description
$x$	number	The number for which the remainder is being sought.
$y$	number	The number by which $x$ is to be divided.

**Return Type and Value:** number – The remainder when  $x$  is divided by  $y$ . The result has the same sign as  $y$ . If  $y$  is 0, the return value is unspecified.

[Example:

MOD(3,2) results in 1

MOD(-3,2) results in 1  
 MOD(3,-2) results in -1  
 MOD(-3,-2) results in -1  
 end example]

### 3.17.7.217 MODE

#### Syntax:

MODE ( *argument-list* )

**Description:** Computes the most frequently occurring of the numeric values of its arguments. If the set of values contains more than one most-frequent value, the first occurrence of any most-frequent value in the list is used as the result.

#### Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array.	The <i>arguments</i> in <i>argument-list</i> designate the values whose mode is to be computed. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The most frequently occurring of the values of its arguments.  
 However, if the data set contains no duplicate data points, #N/A is returned.

[Example:

MODE(9,1,5,1,9,5,6,6) results in 9  
 MODE(1,9,5,1,9,5,6,6) results in 1  
 MODE(5,1,9,5,1,9,6,6) results in 5

end example]

### 3.17.7.218 MONTH

#### Syntax:

MONTH ( *date-value* )

**Description:** Computes the numeric Gregorian month for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

**Arguments:**

Name	Type	Description
<i>date-value</i>	number, text	The date and/or time whose month is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any valid date and/or time format, in which case, any time information shall be ignored.

**Return Type and Value:** number – The Gregorian month for the date and/or time having the given *date-value*, in the range 1900–9999.

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[Example:

MONTH(DATE(2006,1,2)) results in 1

MONTH(DATE(2006,0,2)) results in 12

MONTH("2006/1/2 10:45 AM") results in 1

MONTH(30000) results in 2 for both the 1900 and 1904 date base systems

end example]

### 3.17.7.219 MROUND

**Syntax:**

MROUND ( *x* , *multiple* )

**Description:** Computes *x* rounded to *multiple*, away from zero. It rounds up if the remainder of dividing *x* by *multiple* is greater than or equal to half the value of *multiple*; otherwise, it rounds down.

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value to round.
<i>multiple</i>	number	The multiple to which <i>x</i> is to be rounded.

**Return Type and Value:** number –  $x$  rounded to *multiple*.

However, if  $x$  and *multiple* have different signs, #NUM! is returned.

[Example:

MROUND(10,3) rounds 10 to a nearest multiple of 3; that is, to 9

MROUND(-10,-3) rounds -10 to a nearest multiple of -3; that is, to -9

MROUND(1.3,0.2) rounds 1.3 to a nearest multiple of 0.2; that is, to 1.4

end example]

### 3.17.7.220 MULTINOMIAL

**Syntax:**

MULTINOMIAL ( *argument-list* )

**Description:** Computes the ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

**Mathematical Formula:**

The multinomial is:

$$\text{MULTINOMIAL}(a,b,c) = \frac{(a+b+c)!}{a!b!c!}$$

**Arguments:**

Name	Type	Description
<i>argument-list</i>	number	The <i>arguments</i> in <i>argument-list</i> designate the numerical values for which the multinomial is desired.

**Return Type and Value:** number – The ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

However, if any *argument* is less than zero, #NUM! is returned.

[Example:

MULTINOMIAL(2) results in 1

MULTINOMIAL(2,3) results in 10

MULTINOMIAL(2,3,4) results in 1260

end example]

## 3.17.7.221 N

**Syntax:**N ( *value* )

**Description:** Converts *value* to a number or, if *value* is a reference to a single cell, converts the value of that cell to a number.

**Arguments:**

Name	Type	Description
<i>value</i>	any	Value to be converted.

**Return Type and Value:** number or error – An integer that is the converted value of *value*, or, if *value* is a reference to a single cell, the converted value of that cell, as follows:

<i>value</i>	Value Returned
number	That number
TRUE	1
FALSE	0
error value	That error value
Anything else (including array and text)	0

[Example:

N(10.5) results in 10.5

N(A10) results in -1234, when A10 contains the number -1234

N("ABC") results in 0

N(A10) results in 0, when A10 contains the string ABC

N(TRUE) results in 1

N(A10) results in 0, when A10 contains FALSE

N(A10) results in #N/A, when A10 contains #N/A

N({12.5, 13.6, 56.9}) results in 12.50

N(A10:A11) results in 0, when A10 contains FALSE, and A11 contains 321

end example]

## 3.17.7.222 NA

**Syntax:**

NA ( )

**Description:** Gets the error value #N/A. (The error value #N/A can be used instead of a call to this function; the result is the same.)

**Arguments:** None.

**Return Type and Value:** error – The error value #N/A.

[Example:

NA() results in #N/A

IF(ISNA(NA()), "T", "F") results in T

end example]

### 3.17.7.223 NEGBINOMDIST

**Syntax:**

NEGBINOMDIST ( *number-failures* , *number-successes* , *success-probability* )

**Description:** Computes the negative binomial distribution. NEGBINOMDIST returns the probability that there will be *number-failures* failures before the *number-successes*th success, when the constant probability of a success is *success-probability*.

**Mathematical Formula:**

$$nb(x, r, p) = \binom{x+r-1}{r-1} p^r (1-p)^x$$

where:

x is *number-failures*, r is *number-successes*, and p is *success-probability*.

**Arguments:**

Name	Type	Description
<i>number-failures</i>	number	The number of failures, truncated to integer.
<i>number-successes</i>	number	The threshold number of successes, truncated to integer.
<i>success-probability</i>	number	The probability of a success.

**Return Type and Value:** number – The negative binomial distribution.

However, if

- *number-failures* < 0 or *number-successes* < 1, #NUM! is returned.
- *success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[Example:

NEGBINOMDIST(6,10,0.5) results in 0.076370239

end example]

### 3.17.7.224 NETWORKDAYS

**Syntax:**

NETWORKDAYS ( *start-date* , *end-date* [ , *holidays* ] )

**Description:** Computes the number of whole working days between *start-date* and *end-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

**Arguments:**

Name	Type	Description
<i>start-date</i>	number	The dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .
<i>end-date</i>	number	
<i>holidays</i>	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in <i>holidays</i> can be arbitrary.

**Return Type and Value:** number – The number of whole working days between *start-date* and *end-date*, excluding the specified holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- *end-date* is out of range for the current date base value, #NUM! is returned.

[Example:

NETWORKDAYS (DATE(2006,1,1),DATE(2006,1,31)) results in 23

NETWORKDAYS (DATE(2006,1,31),DATE(2006,1,1)) results in -23

NETWORKDAYS (DATE (2006,1,1),DATE (2006,2,1),{"2006/1/2","2006/1/16"}) results in 21

end example]

### 3.17.7.225 NOMINAL

NOMINAL ( *effect-rate* , *npery* )

Description: Computes the nominal annual interest rate, given the effective rate and the number of compounding periods per year.

#### Mathematical Formula:

NOMINAL is related to EFFECT:

$$EFFECT = \left( 1 + \frac{Nominal\_rate}{Npery} \right)^{Npery} - 1$$

Arguments:

Name	Type	Description
<i>effect-rate</i>	number	The effective interest rate.
<i>npery</i>	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: number – The nominal annual interest rate.

However, if

- *effect-rate* ≤ 0, #NUM! is returned.
- *npery* < 1, #NUM! is returned.

[Example:

NOMINAL (0.053543,4) results in 5.2500%

end example]

### 3.17.7.226 NORMDIST

#### Syntax:

NORMDIST ( *x* , *mean* , *standard-deviation* , *cumulative-flag* )

**Description:** Computes the normal distribution for the specified mean and standard deviation.

#### Mathematical Formula:

The equation for the normal density function (*cumulative-flag* = FALSE) is:

$$f(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\left(\frac{(x-\mu)^2}{2\sigma^2}\right)}$$

When *cumulative-flag* = TRUE, the formula is the integral from negative infinity to x of the given formula.

#### Arguments:

Name	Type	Description
<i>x</i>	number	The value for which the distribution is to be computed.
<i>mean</i>	number	The arithmetic mean of the distribution.
<i>standard-deviation</i>	number	The standard deviation of the distribution.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned; if FALSE, the probability mass function is returned.

**Return Type and Value:** number – The normal distribution for the specified mean and standard deviation.

However, if *standard-deviation* ≤ 0, #NUM! is returned.

[Example:

NORMDIST(42,40,1.5,TRUE) results in 0.90878878

NORMDIST(42,40,1.5,FALSE) results in 0.10934005

end example]

#### 3.17.7.227 NORMINV

##### Syntax:

NORMINV ( *probability* , *mean* , *standard-deviation* )

**Description:** Computes the inverse of the normal distribution for the specified mean and standard deviation.

NORMINV uses an iterative search technique.

#### Arguments:

Name	Type	Description
<i>probability</i>	number	The probability corresponding to the normal distribution.
<i>mean</i>	number	The arithmetic mean of the distribution.
<i>standard-</i>	number	The standard deviation of the distribution.

Name	Type	Description
<i>deviation</i>		

**Return Type and Value:** number – The inverse of the normal distribution for the specified mean and standard deviation.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- *standard-deviation* ≤ 0, #NUM! is returned.
- The search has not converged after an implementation-defined number of iterations, #N/A is returned.

[Example:

NORMINV(0.908789,40,1.5) results in 42.00000201

end example]

### 3.17.7.228 NORMSDIST

**Syntax:**

NORMSDIST ( z )

**Description:** Computes the standard normal distribution for the specified mean and standard deviation.

**Mathematical Formula:**

$$f(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}$$

**Arguments:**

Name	Type	Description
<i>z</i>	number	The value for which the distribution is to be computed.

**Return Type and Value:** number – The standard normal distribution for the specified mean and standard deviation.

[Example:

NORMSDIST(1.333333) results in 0.90878873

NORMSDIST(-1.5) results in 0.06680720

*end example]*

### 3.17.7.229 NORMSINV

#### Syntax:

NORMSINV ( *probability* )

**Description:** Computes the inverse of the standard normal distribution. The distribution has a mean of zero and a standard deviation of 1. NORMSINV uses an iterative search technique.

#### Arguments:

Name	Type	Description
<i>probability</i>	number	The probability corresponding to the normal distribution.

**Return Type and Value:** number – The inverse of the standard normal distribution.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- The search has not converged after an implementation-defined number of iterations, #N/A is returned.

[Example:

NORMSINV(0.945) results in 1.59819314

NORMSINV(0.13) results in -1.12639113

*end example]*

### 3.17.7.230 NOT

#### Syntax:

NOT ( *logical-value* )

**Description:** Computes the logical negation of *logical-value*.

#### Arguments:

Name	Type	Description
<i>logical-value</i>	logical	The value to be negated.

**Return Type and Value:** logical – The logical negation of *logical-value*; that is, it returns TRUE if *logical-value* is FALSE, and FALSE if *logical-value* is TRUE.

[Example:

NOT(TRUE) results in FALSE

NOT(FALSE) results in TRUE

NOT(10>5) results in FALSE

NOT(16.567) results in FALSE

end example]

### 3.17.7.231 NOW

**Syntax:**

NOW ( )

**Description:** Computes the serial value of the current date and time, taking into account the current date base value.

**Arguments:** None.

**Return Type and Value:** number – The serial value of the current date and time.

[Example: On February 26, 2006, between 23:01 and 23:02, NOW( ) resulted in 38774.95958611110 for the 1900 date base system. On February 26, 2006, between 23:02 and 23:03, NOW( ) resulted in 37312.95982569440 for the 1904 date base system. end example]

### 3.17.7.232 NPER

**Syntax:**

NPER ( rate , pmt , pv [ , [ fv ] [ , [ type ] ] ] )

**Description:** Computes the number of periods for an investment based on periodic, constant payments and a constant interest rate.

**Arguments:**

Name	Type	Description
<i>rate</i>	number	The interest rate per period.
<i>pmt</i>	number	The payment made each period; it cannot change over the life of the annuity. Typically, <i>pmt</i> contains principal and interest but no other fees or taxes.
<i>pv</i>	number	The present value, or the lump-sum amount that a series of future payments is worth right now.
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If <i>fv</i> is omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).

Name	Type	Description						
<i>type</i>	number	<div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

1

2 **Return Type and Value:** number – The number of periods for an investment based on periodic, constant  
3 payments and a constant interest rate.

4 However, if *type* is any number other than 0 or 1, #NUM! is returned.

5 [Example:

6

7 NPER(0.12/12, -100, -1000, 10000, 1) results in 59.67

8 NPER(0.12/12, -100, -1000) results in -9.58

9

10 end example]

### 11 3.17.7.233 NPV

12 **Syntax:**

13 NPV ( *rate* , *argument-list* )

14 **Description:** Calculates the net present value of an investment by using a discount rate and a series of future  
15 payments and income.

16 The NPV investment begins one period before the date of the first *argument* cash flow and ends with the last  
17 cash flow in the list. The calculation is based on future cash flows. If the first cash flow occurs at the beginning of  
18 the first period, the first value shall be added to the NPV result, not included in *argument-list*.

19 **Mathematical Formula:**

20 If n is the number of cash flows in the list of values:

21 
$$NPV = \sum_{j=1}^n \frac{values_j}{(1+rate)^j}$$

22 **Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>rate</i>	number	The rate of discount over the length of one period.
<i>argument-list</i>	number	The <i>arguments</i> in <i>argument-list</i> designate the series of future payments (negative values) and income (positive values). <i>arguments</i> shall be equally spaced in time and occur at the end of each period. The order of <i>arguments</i> is significant. <i>arguments</i> that are numbers, empty cells, logical values, or text representations of numbers are included; <i>arguments</i> that are error values or text that cannot be translated into numbers are ignored. If an <i>argument</i> is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

**Return Type and Value:** number – Net present value of an investment by using a discount rate and a series of future payments and income.

[Example:

NPV(0.1, -10000, 3000, 4200, 6800) results in 1188.44

end example]

### 3.17.7.234 OCT2BIN

**Syntax:**

OCT2BIN ( *number* [ , *num-bin-digits* ] )

**Description:** Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	text	A 10-digit octal number in a string that is to be converted to a binary string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
<i>num-bin - digits</i>	number	The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If <i>num-bin-digits</i> is omitted, the minimum number of digits is

Name	Type	Description
		used in the result. <i>num-bin-digits</i> is truncated to an integer.

**Return Type and Value:** text – The binary equivalent of *number*.

However, if

- number* is outside the range "7777777000" (11111111111111111000000000 binary, -512 decimal) to "777" (0000000000000000000011111111 binary, 511 decimal), inclusive, #NUM! is returned.
- number* contains one or more non-octal digits, #NUM! is returned.
- number* contains more than 10 octal digits, #NUM! is returned.
- number* needs more digits than *num-bin-digits*, #NUM! is returned.
- num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

OCT2BIN("67") results in 110111

OCT2BIN("777777776") results in 1111111110

OCT2BIN("7",5) results in 00111

end example]

### 3.17.7.235 OCT2DEC

**Syntax:**

OCT2DEC ( *number* )

**Description:** Makes the decimal equivalent of *number*.

**Arguments:**

Name	Type	Description
<i>number</i>	number	A 10-digit octal number in a string that is to be converted to a decimal number. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

**Return Type and Value:** number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (-536,870,912 decimal) to "3777777777" (536,870,911 decimal), inclusive, #NUM! is returned.

[Example:

OCT2DEC("67") results in 55

OCT2DEC("7777777776") results in -2

OCT2DEC("7000000000") results in -134217728

end example]

### 3.17.7.236 OCT2HEX

**Syntax:**

OCT2HEX ( *number* [ , *num-hex-digits* ] )

**Description:** Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

**Arguments:**

Name	Type	Description
<i>number</i>	text	A 10-digit octal number in a string that is to be converted to a hexadecimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
<i>num-hex-digits</i>	number	<i>num-hex-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer.

**Return Type and Value:** text – The hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (20000000 hex, -536,870,912 decimal) to "3777777777" (1FFFFFFF hex, 536,870,911 decimal), inclusive, #NUM! is returned.

- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

OCT2HEX("777") results in 1FF

OCT2HEX("7777777776") results in FFFFFFFFEE

OCT2HEX("7",5) results in 00007

end example]

### 3.17.7.237 ODD

**Syntax:**

ODD ( *x* )

**Description:** Computes *x* rounded to the nearest odd integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value to be rounded.

**Return Type and Value:** number – The rounded value of *x*.

[Example:

ODD(1.5) rounds 1.5 up to the nearest odd integer; that is, to 3

ODD(3) rounds 3 up to the nearest odd integer; that is, to 3

ODD(2) rounds 2 up to the nearest odd integer; that is, to 3

ODD(-1) rounds -1 up to the nearest odd integer; that is, to -1

ODD(-2) rounds -2 up to the nearest odd integer; that is, to -3

end example]

### 3.17.7.238 ODDFPRICE

**Syntax:**

ODDFPRICE ( *settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *yld* , *redemption* , *frequency* [ , [ *basis* ] ] )

**Description:** Computes the price per \$100 face value of a security having an odd (short or long) first period.

**Mathematical Formula:**

1 Odd short first coupon:

$$\begin{aligned}
 ODDFPRICE = & \left[ \frac{\text{redemption}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(N + \frac{\text{DSC}}{E}\right)}} \right] + \left[ \frac{100 \times \frac{\text{rate}}{\text{frequency}} \times \frac{\text{DFC}}{E}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\frac{\text{DSC}}{E}}} \right] \\
 & + \left[ \sum_{k=2}^N \frac{100 \times \frac{\text{rate}}{\text{frequency}}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(k + \frac{\text{DSC}}{E}\right)}} \right] \\
 & - \left[ 100 \times \frac{\text{rate}}{\text{frequency}} \times \frac{A}{E} \right]
 \end{aligned}$$

3 where:

4 A = number of days from the beginning of the coupon period to the settlement date (accrued days).

5 DSC = number of days from the settlement to the next coupon date.

6 DFC = number of days from the beginning of the odd first coupon to the first coupon date.

7 E = number of days in the coupon period.

8 N = number of coupons payable between the settlement date and the redemption date. (If this number contains  
9 a fraction, it is raised to the next whole number.)

10 Odd long first coupon:

$$\begin{aligned}
 \text{ODDFPRICE} = & \left[ \frac{\text{redemption}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(N + N_q + \frac{\text{DSC}}{E}\right)}} \right] \\
 & + \left[ \frac{100 \times \frac{\text{rate}}{\text{frequency}} \times \left[ \sum_{j=1}^{NC} \frac{DC_j}{NL_j} \right]}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(N_q + \frac{\text{DSC}}{E}\right)}} \right] \\
 & + \left[ \sum_{k=1}^N \frac{100 \times \frac{\text{rate}}{\text{frequency}}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(k + N_q + \frac{\text{DSC}}{E}\right)}} \right] \\
 & - \left[ 100 \times \frac{\text{rate}}{\text{frequency}} \times \sum_{j=1}^{NC} \frac{A_j}{NL_j} \right]
 \end{aligned}$$

where:

Ai = number of days from the beginning of the ith, or last, quasi-coupon period within odd period.

DCi = number of days from dated date (or issue date) to first quasi-coupon (i = 1) or number of days in quasi-coupon (i = 2,..., i = NC).

DSC = number of days from settlement to next coupon date.

E = number of days in coupon period.

N = number of coupons payable between the first real coupon date and redemption date. (If this number contains a fraction, it is raised to the next whole number.)

NC = number of quasi-coupon periods that fit in odd period. (If this number contains a fraction, it is raised to the next whole number.)

NLi = normal length in days of the full ith, or last, quasi-coupon period within odd period.

Nq = number of whole quasi-coupon periods between settlement date and first coupon.

#### Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>issue</i>	number	The security's issue date.
<i>first-coupon</i>	number	The security's first coupon date.
<i>rate</i>	number	The security's interest rate.

Name	Type	Description												
<i>yld</i>	number	The security's annual yield.												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The price per \$100 face value of a security having an odd (short or long) first period.

However, if

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, #NUM! is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so #NUM! is returned.
- *rate* or *yld* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDFPRICE (DATE (2008,11,11),DATE (2021,3,1),DATE (2008,10,15),DATE (2009,3,1),  
0.0785,0.0625,100,2,1) results in 113.5977

end example]

### 3.17.7.239 ODDFYIELD

**Syntax:**

1 ODDFYIELD ( *settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *pr* , *redemption* ,  
 2 *frequency* [ , [ *basis* ] ] )

3 **Description:** Computes the yield of a security that has an odd (short or long) first period.

4 **Arguments:**

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>issue</i>	number	The security's issue date.												
<i>first-coupon</i>	number	The security's first coupon date.												
<i>rate</i>	number	The security's interest rate.												
<i>pr</i>	number	The security's price.												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)												
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

6 Time information in the date arguments is ignored.

7 **Return Type and Value:** number – The yield of a security that has an odd (short or long) first period.

8 However, if

- 9 • *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, #NUM! is returned.
- 10
- 11 • The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so #NUM! is returned.
- 12
- 13 • *rate* or *pr* < 0, #NUM! is returned.
- 14 • *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- 15 • *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDFYIELD(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),DATE(2009,3,1),  
0.0575,84.5,100,2,0) results in 7.7246%

end example]

### 3.17.7.240 ODDLPRICE

#### Syntax:

ODDLPRICE ( *settlement* , *maturity* , *last-interest* , *rate* , *yld* , *redemption* ,  
*frequency* [ , [ *basis* ] ] )

**Description:** Computes the price per \$100 face value of a security having an odd (short or long) last coupon period.

#### Arguments:

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>last-interest</i>	number	The security's last coupon date.												
<i>rate</i>	number	The security's interest rate.												
<i>yld</i>	number	The security's annual yield.												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The price per \$100 face value of a security having an odd (short or long) last coupon period.

However, if

- *settlement*, *maturity*, or *last-interest* is out of range for the current date base value, #NUM! is returned.
- The following is not true: *maturity* is later than *settlement*, which is later than *last-interest*, so #NUM! is returned.
- *rate* or *yld* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDLPRICE (DATE (2008, 11, 11), DATE (2021, 3, 1), DATE (2008, 10, 15),  
0.0785, 0.0625, 100, 2, 1) results in 99.8783

end example]

### 3.17.7.241 ODDLYIELD

**Syntax:**

ODDLYIELD ( *settlement* , *maturity* , *last-interest* , *rate* , *pr* , *redemption* ,  
*frequency* [ , [ *basis* ] ] )

**Description:** Computes the yield of a security that has an odd (short or long) last period.

**Mathematical Formula:**

$$ODDLYIELD = \left[ \frac{\left( redemption + \left( \left( \sum_{j=1}^{MC} \frac{DC_j}{NL_j} \right) \times \frac{100 \times rate}{frequency} \right) \right) - \left( par + \left( \left( \sum_{j=1}^{MC} \frac{A_j}{NL_j} \right) \times \frac{100 \times rate}{frequency} \right) \right)}{par + \left( \left( \sum_{j=1}^{MC} \frac{A_j}{NL_j} \right) \times \frac{100 \times rate}{frequency} \right)} \right] \times \frac{frequency}{\left( \sum_{j=1}^{MC} \frac{DSC_j}{NL_j} \right)}$$

where:

A<sub>i</sub> = number of accrued days for the i<sup>th</sup>, or last, quasi-coupon period within odd period counting forward from last interest date before redemption.

DC<sub>i</sub> = number of days counted in the i<sup>th</sup>, or last, quasi-coupon period as delimited by the length of the actual

- 1 coupon period.  
 2 NC = number of quasi-coupon periods that fit in odd period; if this number contains a fraction it will be raised to  
 3 the next whole number.  
 4 NLi = normal length in days of the  $i^{\text{th}}$ , or last, quasi-coupon period within odd coupon period.

5 **Arguments:**

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>last-interest</i>	number	The security's last coupon date.												
<i>rate</i>	number	The security's interest rate.												
<i>pr</i>	number	The security's price.												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.)												
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows: <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

6

7 Time information in the date arguments is ignored.

8 **Return Type and Value:** number – The yield of a security that has an odd (short or long) last period.

9 However, if

- 10 • *settlement*, *maturity*, or *last-interest* is out of range for the current date base value, #NUM! is returned.  
 11 • The following is not true: *maturity* is later than *settlement*, which is later than *last-interest*, so #NUM! is  
 12 returned.  
 13 • *rate* or *pr* < 0, #NUM! is returned.  
 14 • *frequency* is any number other than 1, 2, or 4, #NUM! is returned.  
 15 • *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDLYIELD(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),  
0.0575,84.5,100,2,0) results in 4.5192%

end example]

### 3.17.7.242 OFFSET

#### Syntax:

OFFSET ( *reference* , *rows* , *cols* [ , [ *height* ] [ , [ *width* ] ] ] )

**Description:** Gets a reference to a range that is a specified number of rows and columns from a cell or range of cells. The reference that is returned can be a single cell or a range of cells. You can specify the number of rows and the number of columns to be returned.

#### Arguments:

Name	Type	Description
<i>reference</i>	reference	Designates the base. <i>reference</i> shall refer to a cell or range of adjacent cells.
<i>rows</i>	number	The number of rows, up or down, that indicates the upper-left cell of the result to refer to. A positive value means below the starting reference; a negative value means above the starting reference.
<i>cols</i>	number	The number of columns, to the left or right, that the upper-left cell of the result to refer to. A positive value means to the right of the starting reference; a negative value means to the left of the starting reference.
<i>height</i>	number	The height, in rows, of the set of cells referred to by the resulting reference. This height shall be positive. If omitted, it is the same as the height of <i>reference</i> .
<i>width</i>	number	The width, in columns, of the set of cells referred to by the resulting reference. The width shall be positive. If omitted, it is the same as the width of <i>reference</i> .

**Return Type and Value:** reference – A reference to a range that is a specified size and number of rows and columns from a cell or range of cells.

However, if

- reference* does not refer to a cell or range of adjacent cells, #VALUE! is returned.
- The combination of *rows* and *cols* results outside the worksheet, #REF! is returned.

[Example:

OFFSET(C3,2,3,1,1) results in the value in cell F5

SUM(OFFSET(C3:E5, -1,0,3,3)) results in the sum of the range C2:E4

end example]

### 3.17.7.243 OR

#### Syntax:

OR ( *argument-list* )

**Description:** Tests if any one or more *arguments* in *argument-list* are TRUE.

#### Arguments:

Name	Type	Description
<i>argument-list</i>	logical, array, reference.	The <i>arguments</i> in <i>argument-list</i> designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

**Return Type and Value:** logical – TRUE if any one or more *arguments* in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, the return value is unspecified.

[Example:

OR(TRUE) results in TRUE

OR(FALSE, FALSE) results in FALSE

OR(10=5, 3=1+2, 0) results in TRUE

OR({10,5,6,7}, TRUE, E6:F6) results in TRUE, when E6 contains FALSE and F6 contains 0

end example]

### 3.17.7.244 PEARSON

#### Syntax:

PEARSON ( *array-1* , *array-2* )

**Description:** Computes the Pearson product moment correlation coefficient, a dimensionless index that ranges from -1.0 to 1.0, inclusive, and reflects the extent of a linear relationship between two data sets.

#### Mathematical Formula:

The formula for the Pearson product moment correlation coefficient,  $r$ , is:

$$r = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where  $x$  and  $y$  are the sample means  $\text{AVERAGE}(\text{array-1})$  and  $\text{AVERAGE}(\text{array-2})$ .

**Arguments:**

Name	Type	Description
<i>array-1</i>	number, name, array, reference to number	The set of independent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>array-2</i>	number, name, array, reference to number	The set of dependent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The Pearson product moment correlation coefficient.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[Example:

PEARSON({9,7,5,3,1},{10,6,1,5,3}) results in 0.699378606

end example]

### 3.17.7.245 PERCENTILE

**Syntax:**

PERCENTILE ( array , k )

**Description:** Computes the  $k^{\text{th}}$  percentile of a set of values in a range.

**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	The set of numerical data that defines relative standing.

Name	Type	Description
$k$	number	The percentile value in the range 0–1, inclusive. If $k$ is not a multiple of $1/(n - 1)$ , PERCENTILE interpolates to determine the value at the $k^{\text{th}}$ percentile.

**Return Type and Value:** number – The  $k^{\text{th}}$  percentile of a set of values in a range.

However, if

- *array* is empty, the return value is unspecified.
- $k$  is  $< 0$  or  $k > 1$ , #NUM! is returned.

[Example:

PERCENTILE({1,3,2,4},0.3) results in 1.9

PERCENTILE({1,3,2,4},0.75) results in 3.25

end example]

### 3.17.7.246 PERCENTRANK

**Syntax:**

PERCENTRANK ( *array* ,  $x$  [ , *significance* ] )

**Description:** Computes the rank of a value in a data set as a percentage of the data set.

**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	<i>array</i> is the set of numerical data that defines relative standing.
$x$	number	The value for which the rank is to be computed. If $x$ does not match one of the values in <i>array</i> , PERCENTRANK interpolates to return the correct percentage rank.
<i>significance</i>	number	The number of significant digits for the returned percentage value. If omitted, a value of 3 is used.

**Return Type and Value:** number – The rank of a value in a data set as a percentage of the data set.

However, if

- *array* is empty, the return value is unspecified.
- *significance*  $< 1$ , #NUM! is returned.

[Example:

PERCENTRANK({12,6,7,9,3,8},4) results in 0.066

PERCENTRANK({12,6,7,9,3,8},5) results in 0.133

end example]

### 3.17.7.247 PERMUT

#### Syntax:

PERMUT ( *number* , *number-chosen* )

**Description:** Computes the number of permutations for *number-chosen* objects that can be selected from *number* objects. [Note: A permutation is any set or subset of objects or events where internal order is significant. Permutations are different from combinations, for which the internal order is not significant. Use this function for lottery-style probability calculations. end note]

#### Mathematical Formula:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

#### Arguments:

Name	Type	Description
<i>number</i>	number	The total number of items available, truncated to integer.
<i>number-chosen</i>	number	The number of items in each permutation, truncated to integer.

**Return Type and Value:** number – The number of different permutations of *number-chosen* in *number*.

However, if

- *number* < 0, #NUM! is returned.
- *number-chosen* < 0, #NUM! is returned.
- *number* < *number-chosen*, #NUM! is returned.

[Example:

PERMUT(8,2) results in 56

PERMUT(10,4) results in 5040

PERMUT(6,5) results in 720

end example]

### 3.17.7.248 PHONETIC

#### Syntax:

PHONETIC ( *string* )

**Description:** Extracts the phonetic (furigana) characters from *string*. [Note: Furigana are aids used to indicate correct pronunciation of Japanese text. *end note*]

#### Arguments:

Name	Type	Description
<i>string</i>	text, reference	Designates a furigana string. If <i>string</i> is a cell range, the furigana string in the upper-left corner cell of that range is returned.

**Return Type and Value:** text – The phonetic (furigana) characters from *string*.

However, if *string* is a range of non-contiguous cells, #N/A is returned.

### 3.17.7.249 PI

#### Syntax:

PI ( )

**Description:** Computes the value  $\pi$  to at least 15 significant figures.

**Arguments:** None.

**Return Type and Value:** number – The value  $\pi$  accurate to at least 15 significant digits.

[Example:

PI() results in 3.141592654

PI()/2 results in 1.570796327

PI()\*(2.5^2) results in 19.63495408

*end example*]

### 3.17.7.250 PMT

#### Syntax:

PMT ( *rate* , *nper* , *pv* [ , [ *fv* ] [ , [ *type* ] ] ] )

**Description:** Computes the payment for a loan based on constant payments and a constant interest rate.

#### Arguments:

Name	Type	Description						
<i>rate</i>	number	The interest rate for the loan.						
<i>nper</i>	number	The total number of payment for the loan.						
<i>pv</i>	number	The present value, or the total amount that a series of future payments is worth now; also known as the principal.						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

1

2 **Return Type and Value:** number – The payment for a loan based on constant payments and a constant interest  
3 rate. (The payment returned by PMT includes principal and interest but no taxes, reserve payments, or fees  
4 sometimes associated with loans.)

5 However, if *type* is any number other than 0 or 1, #NUM! is returned.

6 [Example:

7

8 PMT(0.08/12,10,10000) results in -1,037.03

9 PMT(0.08/12,10,10000,0,1) results in -1,030.16

10

11 end example]

### 12 3.17.7.251 POISSON

13 **Syntax:**

14 POISSON ( *x* , *mean* , *cumulative-flag* )

15 **Description:** Computes the Poisson distribution.

16 **Mathematical Formula:**

17 For *cumulative-flag* = FALSE:

$$POISSON = \frac{e^{-\lambda} \lambda^x}{x!}$$

For *cumulative-flag* = TRUE:

$$CUMPOISSON = \sum_{k=0}^x \frac{e^{-\lambda} \lambda^k}{k!}$$

**Arguments:**

Name	Type	Description
<i>x</i>	number	The number of events, truncated to an integer.
<i>mean</i>	number	The expected numeric value.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, POISSON returns the cumulative Poisson probability that the number of random events occurring will be between zero and <i>x</i> , inclusive; if FALSE, it returns the Poisson probability mass function that the number of events occurring will be exactly <i>x</i> .

**Return Type and Value:** number – The Poisson distribution.

However, if

- $x < 0$ , #NUM! is returned.
- $mean \leq 0$ , #NUM! is returned.

[Example:

POISSON(2,5,TRUE) results in 0.124652019

POISSON(2,5,FALSE) results in 0.084224337

end example]

### 3.17.7.252 POWER

**Syntax:**

POWER ( *x* , *y* )

**Description:** Computes *x* raised to the power *y*.

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
$x$	number	The base and the number $y$ is the exponent to which that base is raised.
$y$	number	The exponent to which the base is raised.

**Return Type and Value:** number –  $x^y$ .

However, if

- The value of  $x$  is negative and  $y$  is not a whole number, #NUM! is returned.
- $x$  is zero and  $y$  is less than or equal to zero, #DIV/0! is returned.
- The result cannot be represented as a number, #NUM! is returned.

[Example:

POWER(2,3) results in 8

POWER(2,0.5) results in 1.414213562

POWER(-1.234,5.0) results in -2.861381721

POWER(1.234,5.1) results in 2.922182358

end example]

### 3.17.7.253 PPMT

**Syntax:**

PPMT ( *rate* , *per* , *nper* , *pv* [ , [ *fv* ] [ , [ *type* ] ] ] )

**Description:** Computes the payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

**Arguments:**

Name	Type	Description
<i>rate</i>	number	The interest rate per period.
<i>per</i>	number	The the period and shall be in the range 1– <i>nper</i> .
<i>nper</i>	number	The total number of payment in an annuity.
<i>pv</i>	number	The present value, or the total amount that a series of future payments is worth now.
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
<i>type</i>	number	The timing of the payment, truncated to integer, as

Name	Type	Description						
		<div>follows:</div> <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

1

2 **Return Type and Value:** number – The payment on the principal for a given period for an investment based on  
3 periodic, constant payments and a constant interest rate.

4 However, if *type* is any number other than 0 or 1, #NUM! is returned.

5 [Example:

6

7 PPMT(0.1/12,1,2\*12,2000) results in -75.62

8 PPMT(0.08,10,10,200000) results in -27,598.05

9

10 end example]

### 11 3.17.7.254 PRICE

12 **Syntax:**

13 PRICE ( *settlement* , *maturity* , *rate* , *yld* , *redemption* , *frequency* [ , [ *basis* ] ] )

14 **Description:** Computes the price per \$100 face value of a security that pays periodic interest.

15 **Mathematical Formula:**

$$PRICE = \left[ \frac{redemption}{\left(1 + \frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}} \right] + \left[ \sum_{k=1}^N \frac{100 \times \frac{rate}{frequency}}{\left(1 + \frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}} \right] - \left( 100 \times \frac{rate}{frequency} \times \frac{A}{E} \right)$$

16

17 where:

18 DSC = number of days from settlement to next coupon date.

19 E = number of days in coupon period in which the settlement date falls.

1 N = number of coupons payable between settlement date and redemption date.

2 A = number of days from beginning of coupon period to settlement date.

3 **Arguments:**

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>rate</i>	number	The security's interest rate.												
<i>yield</i>	number	The security's annual yield.												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

4

5 Time information in the date arguments is ignored.

6 **Return Type and Value:** number – The price per \$100 face value of a security that pays periodic interest.

7 However, if

- 8 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 9 • *settlement*  $\geq$  *maturity*, #NUM! is returned.
- 10 • *rate* or *yld*  $< 0$ , #NUM! is returned.
- 11 • *redemption*  $\leq 0$ , #NUM! is returned.
- 12 • *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- 13 • *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

14 [Example:

15

16 PRICE (DATE (2008, 2, 15), DATE (2017, 11, 15), 0.0575, 0.065, 100, 2, 0) results in 94.6344

end example]

### 3.17.7.255 PRICEDISC

#### Syntax:

PRICEDISC ( *settlement* , *maturity* , *discount* , *redemption* [ , [ *basis* ] ] )

**Description:** Computes the price per \$100 face value of a discounted security.

#### Mathematical Formula:

$$PRICEDISC = redemption - discount \times redemption \times \frac{DSM}{B}$$

where:

B = number of days in year, depending on year basis.

DSM = number of days from settlement to maturity.

#### Arguments:

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>discount</i>	number	The security's discount rate.												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The price per \$100 face value of a discounted security.

However, if

- settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.

- *settlement* ≥ *maturity*, #NUM! is returned.
- *discount* or *redemption* ≤ 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

PRICEDISC (DATE (2008, 2, 16), DATE (2008, 3, 1), 0.0525, 100, 2) results in 99.7958

end example]

### 3.17.7.256 PRICEMAT

**Syntax:**

PRICEMAT ( *settlement* , *maturity* , *issue* , *rate* , *yld* [ , [ *basis* ] ] )

**Description:** Computes the price per \$100 face value of a security that pays interest at maturity.

**Mathematical Formula:**

$$PRICEMAT = \frac{100 + \left( \frac{DIM}{B} \times rate \times 100 \right)}{1 + \left( \frac{DSM}{B} \times yld \right)} - \left( \frac{A}{B} \times rate \times 100 \right)$$

where:

B = number of days in year, depending on year basis.

DSM = number of days from settlement to maturity.

DIM = number of days from issue to maturity.

A = number of days from issue to settlement.

**Arguments:**

Name	Type	Description				
<i>settlement</i>	number	The security's settlement date.				
<i>maturity</i>	number	The security's maturity date.				
<i>issue</i>	number	The security's issue date.				
<i>rate</i>	number	The security's interest rate.				
<i>yld</i>	number	The security's annual yield.				
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360
Value	Day Count Basis					
0 or omitted	US (NASD) 30/360					

Name	Type	Description	
		1	Actual/actual
		2	Actual/360
		3	Actual/365
		4	European 30/360

Time information in the date arguments is ignored.

**Return Type and Value:** number – The price per \$100 face value of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *rate* or *yld*  $< 0$ , #NUM! is returned.
- *basis*  $< 0$  or *basis*  $> 4$ , #NUM! is returned.

[Example:

PRICEMAT (DATE (2008, 2, 15), DATE (2008, 4, 13), DATE (2007, 11, 11), 0.061, 0.061, 0)  
results in 99.9845

end example]

### 3.17.7.257 PROB

**Syntax:**

PROB ( *x-range* , *probability-range* , *lower-limit* [ , *upper-limit* ] )

**Description:** Computes the probability that values in a range are between two limits.

**Arguments:**

Name	Type	Description
<i>x-range</i>	array, reference	The set of numeric values of <i>x</i> with which there are associated probabilities.
<i>probability-range</i>	array, reference	A set of numeric probabilities associated with the values in <i>x-range</i> .
<i>lower-limit</i>	number	The lower bound on the value for which the probability is to be computed.
<i>upper-limit</i>	number	The upper bound on the value for which the probability is to be computed. If omitted, the probability that values in

Name	Type	Description
		<i>x-range</i> are equal to <i>lower-limit</i> is returned.

**Return Type and Value:** number – The probability that values in a range are between two limits.

However, if

- Any value in *probability-range*  $\leq 0$  or any value in *probability-range*  $> 1$ , #NUM! is returned.
- The sum of the values in *probability-range*  $< 1$ , #NUM! is returned.
- x-range* and *probability-range* contain a different number of data points, the return value is unspecified.

[Example:

PROB({0,1,2,3},{0.2,0.3,0.1,0.4},2) results in 0.1

PROB({0,1,2,3},{0.2,0.3,0.1,0.4},1,4) results in 0.8

end example]

### 3.17.7.258 PRODUCT

**Syntax:**

PRODUCT ( *argument-list* )

**Description:** Multiplies the numeric values of *arguments* in *argument-list*.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers to be multiplied. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

**Return Type and Value:** number – The product of the values of its arguments.

[Example:

PRODUCT(1) results in 1

PRODUCT(1,2,3,4,5) results in 120

PRODUCT({1,2;3,4}) results in 24

PRODUCT({2,3},4,"5") results in 120

end example]

### 3.17.7.259 PROPER

#### Syntax:

PROPER ( *string* )

**Description:** Makes a lowercase version of *string* except that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase.

#### Arguments:

Name	Type	Description
<i>string</i>	text, reference	Designates the string to be converted.

**Return Type and Value:** text – A version of *string* such that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase. All other letters are converted to lowercase, and all other non-letters are unchanged.

[Example:

PROPER("12aBC d123aD#\$\$sd^") results in 12Abc D123Ad#\$\$Sd^

PROPER(A10) results in 12Abc D123Ad#\$\$Sd^, when A10 contains 12aBC d123aD#\$\$sd^

end example]

### 3.17.7.260 PV

#### Syntax:

PV ( *rate* , *nper* , *pmt* [ , [ *fv* ] [ , [ *type* ] ] ] )

**Description:** Computes the present value of an investment. (The present value is the total amount that a series of future payments is worth now.)

#### Mathematical Formula:

If *rate* is not 0, then:

$$pv * (1 + rate)^{nper} + pmt(1 + rate * type)^* \left( \frac{(1 + rate)^{nper} - 1}{rate} \right) + fv = 0$$

If *rate* is 0, then:

1  $(pmt * nper) + pv + fv = 0$

2 **Arguments:**

Name	Type	Description						
<i>rate</i>	number	The interest rate per period.						
<i>nper</i>	number	The total number of payment in an annuity.						
<i>pmt</i>	number	The payment made each period and cannot change over the life of the annuity. If is omitted, <i>fv</i> shall be provided. [Note: Typically, <i>pmt</i> includes principal and interest but no other fees or taxes. <i>end note</i> ]						
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, <i>pmt</i> shall be provided.						
<i>type</i>	number	The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing							
0	Payment at the end of the period							
1	Payment at the beginning of the period							

3

4 **Return Type and Value:** number – The present value of an investment.

5 However, if *type* is any number other than 0 or 1, #NUM! is returned.

6 [Example:

7

8  $PV(0.08/12, 12*20, 500, , 0)$  results in -59,777.15

9

10 *end example*]

### 11 3.17.7.261 QUARTILE

12 **Syntax:**

13  $QUARTILE ( array , result-category )$

14 **Description:** Computes the quartile of a data set.

15 **Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description												
<i>array</i>	array, reference	The set of numeric values for which the quartile value is to be computed.												
<i>result-category</i>	number	When truncated to an integer, specifies which value is to be returned, as follows: <table><tr><th>Value</th><th>Value Returned</th></tr><tr><td>0</td><td>Minimum value</td></tr><tr><td>1</td><td>First quartile (25th percentile)</td></tr><tr><td>2</td><td>Median value (50th percentile)</td></tr><tr><td>3</td><td>Third quartile (75th percentile)</td></tr><tr><td>4</td><td>Maximum value</td></tr></table>	Value	Value Returned	0	Minimum value	1	First quartile (25th percentile)	2	Median value (50th percentile)	3	Third quartile (75th percentile)	4	Maximum value
Value	Value Returned													
0	Minimum value													
1	First quartile (25th percentile)													
2	Median value (50th percentile)													
3	Third quartile (75th percentile)													
4	Maximum value													

**Return Type and Value:** number – The quartile of a data set.

However, if

- *array* is empty, the return value is unspecified.
- *result-category* < 0 or *result-category* > 4, #NUM! is returned.

[Example:

QUARTILE({1,2,4,7,8,9,10,12},1) results in 3.5

end example]

### 3.17.7.262 QUOTIENT

**Syntax:**

QUOTIENT ( *dividend* , *divisor* )

**Description:** Computes the integer portion of the division of *dividend* by *divisor*.

**Arguments:**

Name	Type	Description
<i>dividend</i>	number	The dividend
<i>divisor</i>	number	The divisor.

**Return Type and Value:** number – The integer portion of the division of *dividend* by *divisor*.

[Example:

QUOTIENT(5,2) results in 2

QUOTIENT(4.5,3.1) results in 1

QUOTIENT(-10,3) results in -3

end example]

### 3.17.7.263 RADIANS

**Syntax:**

RADIANS ( *angle* )

**Description:** Converts *angle* in degrees into radians.

**Arguments:**

Name	Type	Description
<i>angle</i>	number	The angle expressed in degrees that is to be converted into radians.

**Return Type and Value:** number – *angle* in radians.

[Example:

RADIANS(360) results in 6.283185307

RADIANS(270) results in 4.71238898

RADIANS(45) results in 0.785398163

RADIANS(8.5) results in 0.148352986

end example]

### 3.17.7.264 RAND

**Syntax:**

RAND ( )

**Description:** Computes an evenly distributed random real number greater than or equal to 0 and less than 1. A new random real number is returned every time the cell's value is calculated.

**Arguments:** None.

**Return Type and Value:** number – An evenly distributed random real number greater than or equal to 0 and less than 1.

[Example:

RAND() results in 0.437337454

INT(RAND()\*(6-1)+1) might result in 3

end example]

### 3.17.7.265 RANDBETWEEN

#### Syntax:

RANDBETWEEN ( *lower-bound* , *upper-bound* )

**Description:** Computes a random integer number in the range *lower-bound*–*upper-bound*. A new random integer number is returned every time the cell's value is calculated.

#### Arguments:

Name	Type	Description
<i>lower-bound</i>	number	The smallest integer that will be returned.
<i>upper-bound</i>	number	The largest integer that will be returned.

**Return Type and Value:** number – A random integer number in the range specified.

However, if *lower-bound* is greater than *upper-bound*, #NUM! is returned.

[Example:

RANDBETWEEN(1,6) results in an integer between 1 and 6, inclusive

RANDBETWEEN(-10,10) results in an integer between -10 and 10, inclusive

end example]

### 3.17.7.266 RANK

#### Syntax:

RANK ( *number* , *number-list* [ , *order* ] )

**Description:** Computes the rank of a number in a list of numbers. RANK gives duplicate numbers the same rank. However, the presence of duplicate numbers affects the ranks of subsequent numbers.

#### Arguments:

Name	Type	Description
<i>number</i>	number	The number whose rank is to be found.

Name	Type	Description
<i>number-list</i>	reference	Designates the list of numbers. Non-numeric values in this list are ignored.
<i>order</i>	number	Specifies how <i>number</i> is to be ranked. If zero or omitted, <i>number</i> is ranked as if the list were sorted in descending order. If <i>order</i> is any non-zero value, <i>number</i> is ranked as if the list were sorted in ascending order.

**Return Type and Value:** number – The rank of a number in a list of numbers.

[Example:

When the cells E1:I1 contain 7, 3.5, 3.5, 1, and 2

RANK(E2,E1:I1,1) results in 3

RANK(E2,E1:I1,1,0) results in 2

RANK(E2,E1:I1,1) results in 2

RANK(E1,E1:I1,1) results in 5, as the two 3.5 values both have a rank of 3; no value has rank 4.

end example]

### 3.17.7.267 RATE

Syntax:

RATE ( *nper* , *pmt* , *pv* [ , [ *fv* ] [ , [ *type* ] [ , [ *guess* ] ] ] ] )

Description: Computes the interest rate per period of an annuity, using iteration, which can result in zero or more solutions.

Arguments:

Name	Type	Description
<i>nper</i>	number	The total number of payment periods.
<i>pmt</i>	number	The payment made each period and cannot change over the life of the annuity. (Typically, <i>pmt</i> includes principal and interest but no other fees or taxes.) If omitted, <i>fv</i> shall be present.
<i>pv</i>	number	The present value.
<i>fv</i>	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
<i>type</i>	number	The timing of the payment, truncated to integer, as follows:

Name	Type	Description							
			<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>	Value	Timing	0	Payment at the end of the period	1	Payment at the beginning of the period
Value	Timing								
0	Payment at the end of the period								
1	Payment at the beginning of the period								
<i>guess</i>	number	A guess for what the rate will be. If omitted, it is assumed to be 10 percent.							

**Return Type and Value:** number – The interest rate per period of an annuity.

However, if

- *type* is any number other than 0 or 1, #NUM! is returned.
- The result has not converged after an implementation-defined number of iterations, #NUM! is returned.

[Example:

RATE(4\*12, -200, 8000) results in 0.7701%

RATE(4\*12, -200, 8000)\*12 results in 9.2418%

*end example]*

3.17.7.268 RECEIVED

**Syntax:**

RECEIVED ( *settlement* , *maturity* , *investment* , *discount* [ , [ *basis* ] ] )

**Description:** Computes the amount received at maturity for a fully invested security.

### Mathematical Formula:

$$RECEIVED = \frac{\text{investment}}{1 - (\text{discount} \times \frac{DIM}{R})}$$

where:

B = number of days in a year, depending on the year basis.

DIM = number of days from issue to maturity.

### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description												
<i>settlement</i>	number	The security's settlement date.												
<i>maturity</i>	number	The security's maturity date.												
<i>investment</i>	number	The amount invested in the security.												
<i>discount</i>	number	The security's discount rate.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The amount received at maturity for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *investment* or *discount*  $\leq$  0, #NUM! is returned.
- *basis*  $<$  0 or *basis*  $>$  4, #NUM! is returned.

[Example:

RECEIVED(DATE(2008,2,15),DATE(2008,5,15),1000000,0.0575,2) results in 1014584.65

end example]

### 3.17.7.269 REPLACE

**Syntax:**

REPLACE ( *string-1* , *start-pos* , *number-chars* , *string-2* )

**Description:** Produces a new string that is *string-1* with *number-chars* characters starting at position *start-pos*, replaced by *string-2*. (REPLACE is intended for use with languages that use the single-byte character set (SBCS), whereas REPLACEB (§3.17.7.270) is intended for use with languages that use the double-byte character set (DBCS).)

**Arguments:**

Name	Type	Description
<i>string-1</i>	text	Designates a string.
<i>start-pos</i>	number	The number of the start position within <i>string-1</i> from which characters in <i>string-1</i> are to be replaced. The start position of the first character is 1. <i>start-pos</i> shall be at least 0. If <i>start-pos</i> is beyond the end of <i>string-1</i> , the result is a new string that is <i>string-2</i> appended to <i>string-1</i> . If <i>start-pos</i> is within the bounds of <i>string-1</i> , but <i>number-chars</i> goes beyond the end of <i>string-1</i> , the characters starting at position <i>start-pos</i> through to the end of <i>string-1</i> shall be replaced by <i>string-2</i> .
<i>number-chars</i>	number	The number of characters within <i>string-1</i> that are to be replaced by the string designated by <i>string-2</i> .
<i>string-2</i>	text	Designates a string.

**Return Type and Value:** text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[Example:

REPLACE("abcdefghijk",3,4,"XY") results in abXYghijk

REPLACE("abcdefghijk",3,1,"12345") results in ab12345defghijk

REPLACE("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

### 3.17.7.270 REPLACEB

**Syntax:**

REPLACEB ( *string-1* , *start-pos* , *number-bytes* , *string-2* )

**Description:** Produces a new string that is *string-1* with *number-bytes* bytes starting at position *start-pos*, replaced by *string-2*. (REPLACEB is intended for use with languages that use the double-byte character set (DBCS), whereas REPLACE (§3.17.7.269) is intended for use with languages that use the single-byte character set (SBCS).)

**Arguments:**

Name	Type	Description
<i>string-1</i>	text	Designates a string.
<i>start-pos</i>	number	The number of the start position within <i>string-1</i> from which characters in <i>string-1</i> are to be replaced. The start position of the first character is 1. <i>start-pos</i> shall be at least 0. If <i>start-pos</i> is beyond the end of <i>string-1</i> , the result is a new string that is <i>string-2</i> appended to <i>string-1</i> . If <i>start-pos</i> is within the bounds of <i>string-1</i> , but <i>number-bytes</i> goes beyond the end of <i>string-1</i> , the characters starting at position <i>start-pos</i> through to the end of <i>string-1</i> shall be replaced by <i>string-2</i> .
<i>number-bytes</i>	number	The number of characters within <i>string-1</i> that are to be replaced by the string designated by <i>string-2</i> .
<i>string-2</i>	text	Designates a string.

**Return Type and Value:** text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

REPLACEB("abcdefghijk",3,4,"XY") results in abXYghijk

REPLACEB("abcdefghijk",3,1,"12345") results in ab12345defghijk

REPLACEB("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

### 3.17.7.271 REPT

**Syntax:**

REPT ( *string* , *replication-count* )

**Description:** Creates a string that is *replication-count* number of occurrences of *string* concatenated together.

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the string to be replicated.
<i>replication-count</i>	number	The number of times <i>string</i> is to be replicated, truncated to integer. If <i>replication-count</i> is 0, the resulting string is empty.

**Return Type and Value:** text – The final replicated string.

However, if *replication-count* < 0, #VALUE! is returned.

[Example:

REPT("ABC", 3) results in ABCABCABC

LEN(REPT("ABC", 0)) results in 0

end example]

### 3.17.7.272 RIGHT

**Syntax:**

RIGHT ( *string* [ , *number-chars* ] )

**Description:** Extracts the right-most *number-chars* characters from *string*. (RIGHT is intended for use with languages that use the single-byte character set (SBCS), whereas RIGHTB (§3.17.7.273) is intended for use with languages that use the double-byte character set (DBCS).)

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-chars</i>	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. <i>number-chars</i> shall be at least 0. If <i>number-chars</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

**Return Type and Value:** text – A string containing the right-most *number-chars* characters from *string*.

However, if *number-chars* < 0, #VALUE! is returned.

[Example:

RIGHT("abcdef", 2) results in ef

RIGHT(A10, 4) results in z123, when A10 contains xyz123

end example]

### 3.17.7.273 RIGHTB

**Syntax:**

RIGHTB ( *string* , [ *number-bytes* ] )

**Description:** Extracts the right-most *number-bytes*-worth of characters from *string*. (RIGHTB is intended for use with languages that use the double-byte character set (DBCS), whereas RIGHT (§3.17.7.272) is intended for use with languages that use the single-byte character set (SBCS).)

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designate the string from which a substring is to be extracted.
<i>number-bytes</i>	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. <i>number-bytes</i> shall be at least 0. If <i>number-bytes</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted.

**Return Type and Value:** text – A string containing the right-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

RIGHTB("abcdef",2) results in ef

RIGHTB(A10,4) results in z123, when A10 contains xyz123

end example]

### 3.17.7.274 ROMAN

**Syntax:**

ROMAN ( *number* , *form* )

**Description:** Converts the Arabic number, *number*, to a Roman number according to *form*.

**Arguments:**

Name	Type	Description		
<i>number</i>	number	The Arabic number to be converted.		
<i>form</i>	number	Specifies the type of Roman numeral to be produced. The Roman numeral style ranges from Classic to Simplified, becoming more concise as the value of <i>form</i> increases, as follows: <table><tr><th>Value</th><th>Type</th></tr></table>	Value	Type
Value	Type			

Name	Type	Description	
		0, omitted, or TRUE	Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one.
		1	Concise. Allow subtraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one.
		2	More concise. Allow subtraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one.
		3	Most concise. Allow subtraction of L and V as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one.
		4 or FALSE	Simplified. Produce the fewest Roman digits.

1

2 **Return Type and Value:** text – The corresponding Roman number.

3 However, if

- 4 • *number* < 0 or > 3999, #VALUE! is returned.
- 5 • *form* is not one of the values listed above, #VALUE! is returned.

6 [Example:

7

8 ROMAN(499,0) results in CDXCIX, which is 100 less than 500, plus 10 less than 100, plus one less than 10.

9 ROMAN(499,1) results in LDVLIV, which is 50 less than 500, plus 5 less than 50, plus one less than 5.

10 ROMAN(499,2) results in XDIX, which is 10 less than 500, plus one less than 10.

11 ROMAN(499,3) results in VDIV, which is 5 less than 500, plus one less than 5.

ROMAN(499,4) results in ID, which is 1 less than 500.  
 ROMAN(2013,0) results in MMXIII, which is 2,000, plus 10, plus 3.  
*end example]*

### 3.17.7.275 ROUND

#### Syntax:

ROUND (  $x$  , *number-digits* )

**Description:** Rounds  $x$  to the number of digits specified by *number-digits*.

#### Arguments:

Name	Type	Description
$x$	number	The value to be rounded.
<i>number-digits</i>	number	The number of digits to which $x$ is to be rounded. If <i>number-digits</i> is greater than 0, $x$ is rounded to the specified number of decimal places. If <i>number-digits</i> is 0, $x$ is rounded to the nearest integer. If <i>number-digits</i> is less than 0, $x$ is rounded to the left of the decimal point.

**Return Type and Value:** number – The rounded-down value of  $x$ .

[Example:

ROUND(2.15,1) results in 2.2  
 ROUND(2.149,1) results in 2.1  
 ROUND(-1.475,2) results in -1.48  
 ROUND(21.5,-1) results in 20

*end example]*

### 3.17.7.276 ROUNDDOWN

#### Syntax:

ROUNDDOWN (  $x$  , *number-digits* )

**Description:** Computes  $x$  rounded down, toward zero, to the number of digits specified by *number-digits*. [Note: ROUNDDOWN behaves like ROUND (§3.17.7.275), except that ROUNDDOWN always rounds a number down. *end note]*

#### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description
$x$	number	The value to be rounded down.
<i>number-digits</i>	number	The number of digits to which $x$ is to be rounded. If <i>number-digits</i> is greater than 0, $x$ is rounded to the specified number of decimal places. If <i>number-digits</i> is 0, $x$ is rounded to the nearest integer. If <i>number-digits</i> is less than 0, $x$ is rounded to the left of the decimal point.

**Return Type and Value:** number – The rounded-down value of  $x$ .

[Example:

ROUNDDOWN(3.2,0) rounds 3.2 down to zero decimal places; that is, to 3

ROUNDDOWN(76.9,0) rounds 76.9 down to zero decimal places; that is, to 76

ROUNDDOWN(3.14159,3) rounds 3.14159 down to three decimal places; that is, to 3.141

ROUNDDOWN(-3.14159,1) rounds -3.14159 down to one decimal place; that is, to -3.1

ROUNDDOWN(31415.92654,-2) rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to 31400

end example]

### 3.17.7.277 ROUNDUP

**Syntax:**

ROUNDUP (  $x$  , *number-digits* )

**Description:** Computes  $x$  rounded up, away from zero, to the number of digits specified by *number-digits*. [Note: ROUNDUP behaves like ROUND (§3.17.7.275), except that ROUNDUP always rounds a number up. end note]

**Arguments:**

Name	Type	Description
$x$	number	The value to be rounded up.
<i>number-digits</i>	number	The number of digits to which $x$ is to be rounded. If <i>number-digits</i> is greater than 0, $x$ is rounded up to the specified number of decimal places. If <i>number-digits</i> is 0, $x$ is rounded up to the nearest integer. If <i>number-digits</i> is less than 0, $x$ is rounded up to the left of the decimal point.

**Return Type and Value:** number – The rounded-up value of  $x$ .

[Example:

ROUND(3.2,0) rounds 3.2 down to zero decimal places; that is, to 3

ROUND(76.9,0) rounds 76.9 down to zero decimal places; that is, to 77

ROUND(3.14159,3) rounds 3.14159 down to three decimal places; that is, to 3.142

ROUND(-3.14159,1) rounds -3.14159 down to one decimal place; that is, to -3.2

ROUND(31415.92654,-2) rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to 31500

end example]

### 3.17.7.278 ROW

**Syntax:**

ROW ( [ *reference* ] )

**Description:** Finds the number of the row(s) corresponding to *reference*.

**Arguments:**

Name	Type	Description
<i>reference</i>	reference to a single cell or to a range of contiguous cells	If omitted, the behavior is as if <i>reference</i> referred to the cell containing the formula.

**Return Type and Value:** number – If *reference* refers to a single cell or to a single row of cells, the corresponding row is returned. If *reference* refers to a range of cells involving multiple rows, a vertical array of the corresponding rows as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[Example:

ROW() results in 16, when the cell containing the formula is in row 16

ROW(E17:G17) results in 17

ROW(E16:G17) results in a vertical array containing 16 and 17, respectively

end example]

### 3.17.7.279 ROWS

**Syntax:**

ROWS ( *array* )

**Description:** Finds the number of rows corresponding to *array*.

**Arguments:**

Name	Type	Description
<i>array</i>	array, reference to a single cell, or a reference to a range of contiguous cells	A set of rows.

**Return Type and Value:** number – The number of rows corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, #NULL! is returned.

[Example:

ROWS(E16:H16) results in 1

ROWS(E16:G18) results in 3

ROWS({1,2;3,4}) results in 2

end example]

### 3.17.7.280 RSQ

**Syntax:**

RSQ ( *known-ys* , *known-xs* )

**Description:** Computes the square of the Pearson product moment correlation coefficient through data points in known ys and known xs.

**Mathematical Formula:**

The equation for the Pearson product moment correlation coefficient, *r*, is:

$$r = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where *x* and *y* are the sample means AVERAGE(*known-xs*) and AVERAGE(*known-ys*).

**Arguments:**

Name	Type	Description
<i>known-xs</i>	number, name,	Designate a set of numeric data points. Logical values and

Name	Type	Description
	array, or reference to number, text, logical	text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-ys</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The square of the Pearson product moment correlation coefficient.

However, if

- *known-ys* and *known-xs* are empty or have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* contain only one data point, the return value is unspecified.

[Example:

RSQ({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 0.057950192

end example]

### 3.17.7.281 RTD

**Syntax:**

RTD ( *progID* , [ *rtd-server* ] , *argument-list* )

**Description:** Retrieves data from a program in real-time. Periodically, this function returns new values and causes recalculation of the expression containing the call to it.

**Arguments:**

Name	Type	Description
<i>progID</i>	text	The name of the program from which the data is to be retrieved.
<i>rtd-server</i>	text	An optional string that is specific to the program with which RTD is communicating.
<i>argument list</i>	any	The presence and meaning of each <i>argument</i> in <i>argument-list</i> is specific to the program with which RTD is

Name	Type	Description
		communicating.

**Return Type and Value:** array – The set of values returned by the program with which RTD is communicating.

[*Example:* Consider a stockprice program that is called as follows:

```
RTD("stockprice.rtd", "NASDAQ", "MSFT")
```

The result it returns—the price of the stock MSFT according to NASD—changes over time, often every few seconds.

The *rtd-server* program could also be written to accept multiple arguments, allowing calls like the following::

```
RTD("stockprice.rtd", "NASDAQ", "MSFT", "GOOG", "AMZN")
```

where three stock values are requested.

*end example]*

### 3.17.7.282 SEARCH

#### Syntax:

```
SEARCH (string-1 , string-2 [, start-pos])
```

**Description:** Performs a case-insensitive search for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (SEARCH is intended for use with languages that use the single-byte character set (SBCS), whereas SEARCHB (§3.17.7.283) is intended for use with languages that use the double-byte character set (DBCS).)

#### Arguments:

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> . <i>string-1</i> can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

**Return Type and Value:** number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example:

SEARCH("de", "abcdef") results in 4

SEARCH("?c\*e", "abcdef") results in 2

end example]

### 3.17.7.283 SEARCHB

**Syntax:**

SEARCHB ( *string-1* , *string-2* [ , *start-pos* ] )

**Description:** Performs a case-insensitive search for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (SEARCHB is intended for use with languages that use the double-byte character set (DBCS), whereas SEARCH (§3.17.7.282) is intended for use with languages that use the single-byte character set (SBCS).)

**Arguments:**

Name	Type	Description
<i>string-1</i>	text	Designate the string to be searched for within the string designated by <i>string-2</i> . <i>string-1</i> can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
<i>string-2</i>	text	
<i>start-pos</i>	number	The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0.

**Return Type and Value:** number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example: Assuming 1-byte characters

SEARCHB("de", "abcdef") results in 4

SEARCHB("?c\*e", "abcdef") results in 2

end example]

### 3.17.7.284 SECOND

#### Syntax:

SECOND ( *time-value* )

**Description:** Computes the second for the date and/or time having the given *time-value*.

#### Arguments:

Name	Type	Description
<i>time-value</i>	number	The date and/or time whose second is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a <i>string-constant</i> having any valid date and/or time format, in which case, any date information shall be ignored.

**Return Type and Value:** number – The second for the date and/or time having the given *time-value*.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[Example:

SECOND(DATE(2006,2,26)+TIME(2,10,20)) results in 20

SECOND(TIME(22,56,34)) results in 34

SECOND(0) results in 0, since serial value 0 represents 00:00:00

SECOND(10.5) results in 0, since serial value .5 represents 12:00:00

SECOND("22-Oct-2001 10:53:12") results in 12

SECOND("10:53:12 pm") results in 12

SECOND("22:53:12") results in 12

end example]

### 3.17.7.285 SERIESSUM

#### Syntax:

SERIESSUM ( *input-value* , *initial-power* , *step* , *coefficients* )

**Description:** Computes the sum of a power series.

#### Mathematical Formula:

The sum of a power series is based on the formula:

$$\text{SERIES}(x, n, m, a) = a_1 x^n + a_2 x^{n+m} + a_3 x^{n+2m} + \dots + a_j x^{n+(j-1)m}$$

where *input-value* = *x*, *initial-power* = *n*, *step* = *m*, and *coefficients* is the set of *a* values.

#### Arguments:

Name	Type	Description
<i>input-value</i>	number	The input value to the power series;
<i>initial-power</i>	number	The initial power to which <i>input-value</i> is to be raised.
<i>step</i>	number	The step by which to increase <i>initial-power</i> for each term in the series;
<i>coefficients</i>	reference	A set of coefficients by which each successive power of <i>input-value</i> is multiplied. The number of values in <i>coefficients</i> determines the number of terms in the power series.

**Return Type and Value:** number – The sum of a power series.

[*Example:* Given the following data:

	A
1	1
2	=-1/FACT(2)
3	=1/FACT(4)
4	=-1/FACT(6)

SERIESSUM(PI()/4,0,2,A1:A4) results in 0.707103, an approximation to the cosine of  $\pi/4$  radians

*end example]*

### 3.17.7.286 SIGN

#### Syntax:

SIGN (  $x$  )

**Description:** Determines the sign of  $x$ .

#### Arguments:

Name	Type	Description
$x$	number	The number whose sign is to be determined.

**Return Type and Value:** number – 1 if  $x$  is positive, 0 if  $x$  is 0, and -1 if  $x$  is negative.

[Example:

SIGN(10.5) results in 1

SIGN(0) results in 0

SIGN(-5.4) results in -1

end example]

### 3.17.7.287 SIN

#### Syntax:

SIN (  $x$  )

**Description:** Computes the sine of  $x$ .

#### Arguments:

Name	Type	Description
$x$	number	The number whose sine is to be computed.

**Return Type and Value:** number – The sine of  $x$ .

[Example:

SIN(-1) results in -0.841470985

SIN(0) results in 0

SIN(1) results in 0.841470985

end example]

### 3.17.7.288 SINH

#### Syntax:

SINH ( *x* )

**Description:** Computes the hyperbolic sine of *x*.

#### Arguments:

Name	Type	Description
<i>x</i>	number	The number whose hyperbolic sine is to be computed.

**Return Type and Value:** number – The hyperbolic sine of *x*.

However, if the magnitude of *x* is too large for the result to be represented, #NUM! is returned.

[*Example:*

SINH(1) results in 1.175201194

SINH(10) results in 11013.23287

SINH(100) results in 1.34406E+43

*end example*]

### 3.17.7.289 SKEW

#### Syntax:

SKEW ( *argument-list* )

**Description:** Computes the skewness of a distribution. [*Note:* Skewness characterizes the degree of asymmetry of a distribution around its mean. Positive skewness indicates a distribution with an asymmetric tail extending toward more positive values. Negative skewness indicates a distribution with an asymmetric tail extending toward more negative values. *end note*]

#### Mathematical Formula:

$$\frac{n}{(n-1)(n-2)} \sum \left( \frac{x_j - \bar{x}}{s} \right)^3$$

#### Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers for which the skewness is to be computed. Logical values and text representations of numbers that are entered

Name	Type	Description
		directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The skewness of a distribution.

However, if

- There are fewer than three data points, the return value is unspecified.
- The sample standard deviation is zero, the return value is unspecified.

[Example:

SKEW(3,4,5,2,3,4,5,6,4,7) results in 0.359543071

end example]

### 3.17.7.290 SLN

SLN ( *cost* , *salvage* , *life* )

Description: Computes the straight-line depreciation of an asset for one period.

Arguments:

Name	Type	Description
<i>cost</i>	number	The number <i>cost</i> is the initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)

**Return Type and Value:** number – The straight-line depreciation of an asset for one period.

[Example:

SLN(30000,7500,10) results in 2,250.00

end example]

## 3.17.7.291 SLOPE

**Syntax:**SLOPE ( *known-ys* , *known-xs* )

**Description:** Computes the slope of the linear regression line through data points in known ys and known xs. The slope is the vertical distance divided by the horizontal distance between any two points on the line, which is the rate of change along the regression line.

**Mathematical Formula:**

$$b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

where x and y are the sample means AVERAGE(*known-xs*) and AVERAGE(*known-ys*).

**Arguments:**

Name	Type	Description
<i>known-xs</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-ys</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The slope of the linear regression line through data points in known ys and known xs.

However, if

- *known-ys* and *known-xs* are empty, the return value is unspecified.
- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.

[Example:

SLOPE({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 0.305555556

end example]

## 3.17.7.292 SMALL

**Syntax:**SMALL ( *array* , *k* )**Description:** Computes the  $k^{\text{th}}$  smallest value in a data set.**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	The set of numbers from which the $k^{\text{th}}$ -smallest value is to be determined.
<i>k</i>	number	The position (from the smallest) in the array or cell range of data to return.

**Return Type and Value:** number – The  $k^{\text{th}}$  smallest value in a data set.

However, if

- array* is empty, the return value is unspecified.
- $k \leq 0$  or  $k$  is greater than the number of data points, #NUM! is returned.

[Example:

SMALL ({3,5,3,5,4;4,2,4,6,7},3) results in 3

SMALL ({3,5,3,5,4;4,2,4,6,7},7) results in 5

end example]

## 3.17.7.293 SQRT

**Syntax:**SQRT ( *x* )**Description:** Computes the positive square root of *x*.**Arguments:**

Name	Type	Description
<i>x</i>	number	The number whose positive root is to be found.

**Return Type and Value:** number – The positive square root of *x*.However, if *x* is negative, #NUM! is returned.

[Example:

SQRT(2) results in 1.414213562

SQRT(5) results in 2.236067977

end example]

### 3.17.7.294 SQRTPI

**Syntax:**

SQRTPI ( *x* )

**Description:** Computes the positive square root of  $x \times \pi$ .

**Arguments:**

Name	Type	Description
<i>x</i>	number	The number, which when multiplied by $\pi$ , whose positive root is to be found.

**Return Type and Value:** number – The positive square root of  $x \times \pi$ .

However, if *x* is negative, #NUM! is returned.

[Example:

SQRTPI(1) results in 1.772453851

SQRTPI(2) results in 2.506628275

end example]

### 3.17.7.295 STANDARDIZE

**Syntax:**

STANDARDIZE ( *x* , *mean* , *standard-dev* )

**Description:** Computes a normalized value from a distribution characterized by *mean* and *standard-dev*.

**Mathematical Formula:**

$$Z = \frac{X - \mu}{\sigma}$$

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
$x$	number	The number whose value is to be normalized.
<i>mean</i>	number	The the arithmetic mean of the distribution.
<i>standard-dev</i>	number	The standard deviation of the distribution.

**Return Type and Value:** number – A normalized value from a distribution.

However, if *standard-dev* ≤ 0, #NUM! is returned.

[Example:

STANDARDIZE(42,40,1.5) results in 1.333333333

end example]

### 3.17.7.296 STDEV

**Syntax:**

STDEV ( *argument-list* )

**Description:** Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [Note: STDEV assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVA instead. end note]

**Mathematical Formula:**

$$\sqrt{\frac{\sum (x - \bar{x})^2}{(n-1)}}$$

where  $\bar{x}$  is the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*) and n is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. <i>argument-list</i> can also be an array of numbers. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

**Return Type and Value:** number – An estimate of the standard deviation based on a sample.

[Example:

STDEV(123,134,143,173,112,109) results in 23.72902583

end example]

### 3.17.7.297 STDEVA

**Syntax:**

STDEVA ( *argument-list* )

**Description:** Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [Note: STDEVA assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEV instead. end note]

**Mathematical Formula:**

$$\sqrt{\frac{\sum (x - \bar{x})^2}{(n-1)}}$$

where  $\bar{x}$  is the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*) and n is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference. The argument list can also be an array of numbers.	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

**Return Type and Value:** number – An estimate of the standard deviation based on a sample.

[Example:

STDEVA(123,134,143,173,112,109) results in 23.72902583

end example]

## 3.17.7.298 STDEVP

**Syntax:**STDEVP ( *argument-list* )

**Description:** Computes the standard deviation of an entire population, using the "biased" or "n" method. [Note: STDEVP assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVPA instead. *end note*]

**Mathematical Formula:**

$$\sqrt{\frac{\sum (x - \bar{x})^2}{n}}$$

where  $\bar{x}$  is the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*) and  $n$  is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference. The argument list can also be an array of numbers.	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

**Return Type and Value:** number – The standard deviation of an entire population.

[Example:

STDEVP(123,134,143,173,112,109) results in 21.66153785

*end example*]

## 3.17.7.299 STDEVPA

**Syntax:**STDEVPA ( *argument-list* )

**Description:** Computes the standard deviation of an entire population, using the "biased" or "n" method. [Note: STDEVPA assumes that its arguments are the total population. If the data represents a population sample only,

STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEVP instead. *end note]*

**Mathematical Formula:**

$$\sqrt{\frac{\sum (x - \bar{x})^2}{n}}$$

where  $\bar{x}$  is the sample mean  $AVERAGE(argument-1, argument-2, ..., argument-n)$  and  $n$  is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference. The argument list can also be an array of numbers.	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population.

**Return Type and Value:** number – The standard deviation of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Example:

STDEVPA(123,134,143,173,112,109) results in 21.66153785

*end example]*

### 3.17.7.300 STEYX

**Syntax:**

STEYX ( *known-ys* , *known-xs* )

**Description:** Computes the standard error of the predicted  $y$ -value for each  $x$  in the regression. The standard error is a measure of the amount of error in the prediction of  $y$  for an individual  $x$ .

**Mathematical Formula:**

$$\sqrt{\frac{1}{(n-2)} \left[ \sum (y - \bar{y})^2 - \frac{\left[ \sum (x - \bar{x})(y - \bar{y}) \right]^2}{\sum (x - \bar{x})^2} \right]}$$

where  $\bar{x}$  and  $\bar{y}$  are the sample means  $AVERAGE(known-xs)$  and  $AVERAGE(known-ys)$ , and  $n$  is the sample size.

#### Arguments:

Name	Type	Description
<i>known-xs</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
<i>known-ys</i>	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

**Return Type and Value:** number – The standard error of the predicted  $y$ -value for each  $x$  in the regression.

However, if

- known-ys* and *known-xs* have a different number of data points, the return value is unspecified.
- known-ys* and *known-xs* are empty or have less than three data points, the return value is unspecified.

[Example:

STEYX({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 3.30571895

end example]

#### 3.17.7.301 SUBSTITUTE

##### Syntax:

SUBSTITUTE ( *string* , *old-string* , *new-string* [ , *occurrence* ] )

**Description:** Produces a new string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

##### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>string</i>	text	Designates a string.
<i>old-string</i>	text	Designates a string.
<i>new string</i>	text	Designates a string.
<i>occurrence</i>	number	The occurrence number of the <i>old-string</i> characters within <i>string-1</i> that is to be replaced by the string designated by <i>new-string</i> . If omitted, all occurrences of <i>old-string</i> characters shall be replaced.

**Return Type and Value:** text – A string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

However, if *occurrence* < 0, #VALUE! is returned.

[Example:

SUBSTITUTE("abcaaabca", "a", "xx") results in xxbcxxxxxxbcxx

SUBSTITUTE("abcaaabca", "a", "", 10) results in bcbc

SUBSTITUTE("abcaaabca", "a", "xx", 3) results in abcaxxabca

end example]

### 3.17.7.302 SUBTOTAL

**Syntax:**

SUBTOTAL ( *function-number* , *argument-list* )

**Description:** Computes a value using the function designated by *function-number*, using the *arguments* in *argument-list*.

**Arguments:**

Name	Type	Description
<i>function-number</i>	number	Indicates the function to be called, as shown in the table below.
<i>argument-list</i>	number	Each <i>argument</i> in <i>argument-list</i> is passed to the called function, in the order specified. That shall be no more than 254 <i>arguments</i> .

<i>function-number</i> (includes hidden values)	<i>function-number</i> (excludes hidden values)	Function
1	101	AVERAGE

<i>function-number</i> (includes hidden values)	<i>function-number</i> (excludes hidden values)	Function
2	102	COUNT
3	103	COUNTA
4	104	MAX
5	105	MIN
6	106	PRODUCT
7	107	STDEV
8	108	STDEVP
9	109	SUM
10	110	VAR
11	111	VARP

If any argument contains a SUBTOTAL function call, that call shall be ignored to avoid double counting.

For the *function-number* values 1–11, the values of hidden rows are included. For the *function-number* values 101–111, the values of hidden rows are excluded.

The SUBTOTAL function shall ignore any rows that are not included in the result of a filter, regardless of which *function-number* value is used.

The SUBTOTAL function is designed for columns of data, or vertical ranges. It is not designed for rows of data, or horizontal ranges. [Example: When a horizontal range is subtotaled using a *function-number* of 101 or greater, hiding a column does not affect the subtotal. However, hiding a row in a subtotal of a vertical range does affect the subtotal. end example]

**Return Type and Value:** number – The result from calling the function designated by *function-number*, using the *arguments* in *argument-list*.

However, if *function-number* does not have one of the values specified above, #NUM! is returned.

[Example:

SUBTOTAL (2, E5:E15) counts the number of values in the cell range E5:E15, including hidden values

SUBTOTAL (4, E5:E15) finds the maximum value of the values in the cell range E5: E15, including hidden values

SUBTOTAL (106, E5:E15) finds the product of the values in the cell range E5: E15, excluding hidden values

end example]

### 3.17.7.303 SUM

**Syntax:**

SUM ( *argument-list* )

**Description:** Adds the numeric values of *arguments* in *argument-list*.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference.	The <i>arguments</i> in <i>argument-list</i> designate the numeric values to be added. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

**Return Type and Value:** number – The sum of the values of its arguments.

[Example:

SUM(1,2,3,4,5) results in 15

SUM({1,2;3,4}) results in 10

SUM({1,2,3,4,5},6,"7") results in 28

SUM({1,"2",TRUE,4}) results in 5, as the logical value and numeric text are ignored

end example]

### 3.17.7.304 SUMIF

**Syntax:**

SUMIF ( *cell-range* , *selection-criteria* [ , *sum-range* ] )

**Description:** Applies selection criteria on the values in one range of cells and sums the values of the cells in a corresponding range.

**Arguments:**

Name	Type	Description
<i>cell-range</i>	reference	Designates the range of cells to be inspected.
<i>selection-criteria</i>	number, expression, reference, text	Defines which cells will be counted. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of

Name	Type	Description
		characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>sum-range</i>	reference	If present, <i>sum-range</i> designates the cells whose values are summed. In this case, <i>sum-range</i> does not have to have the same size and shape as <i>cell-range</i> . The actual cells that are added are determined by using the top, left cell in <i>sum-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range</i> . If omitted, <i>cell-range</i> also designates the cells whose values are summed.

**Return Type and Value:** number – The sum of the cells corresponding to those selected.

[Example: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

SUMIF(A1:D1, "=10") results in 20

SUMIF(A1:D1, ">5") results in 27

SUMIF(A1:D1, "<>10") results in 10

Given that A2, B2, C2, and D2, respectively, contain the values apples, melons, 10, and 15

SUMIF(A2:B2, "\*es", C2:D2) results in 10

end example]

### 3.17.7.305 SUMIFS

**Syntax:**

SUMIFS ( *sum-range* , *cell-range-1* , *selection-criteria-1*  
[ , *cell-range-2* , *selection-criteria-2* [ , ... ] ] )

**Description:** Adds the cells in a range that meet multiple criteria.

**Arguments:**

Name	Type	Description
<i>sum-range</i>	reference	Designates the cells whose values are summed. In this case, <i>sum-range</i> does not have to have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>sum-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . Each cell in <i>sum-range</i> is summed only if all of the corresponding criteria specified are true for that cell. Cells in <i>sum-range</i> that contain TRUE

Name	Type	Description
		evaluate to 1; cells in sum-range that contain FALSE evaluate to 0.
<i>cell-range-1</i>	reference	Designates the first range of cells to be inspected.
<i>selection-criteria-1</i>	number, expression, reference, text	Specifies the criteria for the first range of cells that will be counted. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria-1</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
<i>cell-range-n</i>	reference	The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively.
<i>selection-criteria-n</i>	number, expression, reference, text	

**Return Type and Value:** number – The sum of the cells corresponding to those selected.

[Example: Given the following data:

	A	B	C	D
1	Sales Person	Tables	Chairs	Desks
2	Emilio	34	85	97
3	Julie	353	23	18
4	Hans	13	67	14
5	Frederique	0	98	0

SUMIFS(B2:C5,A2:A5,"=Julie") results in 353 (the sum of the number of tables and chairs sold by Julie)

SUMIFS(B2:B5,A2:A5,"=Julie",A2:A5,"=Hans") results in 0 (the sum of the number of tables sold by Julie and Hans)

SUMIFS(B2:B5,A3,"=Julie",A4,"=Hans") results in 34 (the sum of the the number of tables sold by Julie and Hans)

SUMIFS(B2:D5,A2:A5,"<>Emilio") results in 768 (the sum of the number of tables, chairs, and desks sold by all sales persons except Emilio)

end example]

### 3.17.7.306 SUMPRODUCT

#### Syntax:

SUMPRODUCT ( *argument-list* )

**Description:** Multiplies the corresponding elements in the array *arguments* in *argument-list*, and returns the sum of those products. An array element that is not numeric is treated as if it contained 0.

#### Arguments:

Name	Type	Description
<i>argument-list</i>	array of numbers	The <i>arguments</i> in <i>argument-list</i> designate the numeric values to be multiplied.

**Return Type and Value:** number – The sum of the products of the corresponding elements in the *arguments* in *argument-list*.

However, if the array arguments do not have the same dimensions, #NUM! is returned.

[Example:

SUMPRODUCT({2,3}) results in 5

SUMPRODUCT({2,3},{4,5}) results in 23

SUMPRODUCT({2,3},{4,5},{2,2}) results in 46

SUMPRODUCT({2,3;4,5},{2,2;3,4}) results in 42

end example]

### 3.17.7.307 SUMSQ

#### Syntax:

SUMSQ ( *argument-list* )

**Description:** Adds the squares of *arguments* in *argument-list*.

#### Arguments:

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the values whose squares are to be summed. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or

Name	Type	Description
		reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

**Return Type and Value:** number – The sum of the squares of its arguments.

[Example:

SUMSQ(2) results in 4

SUMSQ(2.5, -3.6)) results in 19.21

SUMSQ({2.5, -3.6}), 2.4) results in 24.97

end example]

### 3.17.7.308 SUMX2MY2

**Syntax:**

SUMX2MY2 ( array-1 , array-2 )

**Description:** Computes the sum of the difference of squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

**Mathematical Formula:**

$$\text{SUMX2MY2} = \sum (x^2 - y^2)$$

where *array-1* contains the *x* values, and *array-2* contains the *y* values.

**Arguments:**

Name	Type	Description
<i>array-1</i>	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
<i>array-2</i>		

**Return Type and Value:** number – The sum of the difference of squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMX2MY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 55

SUMX2MY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in -64

end example]

### 3.17.7.309 SUMX2PY2

**Syntax:**

SUMX2PY2 ( array-1 , array-2 )

**Description:** Computes the sum of the sum of the squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

**Mathematical Formula:**

$$\text{SUMX2PY2} = \sum (x^2 + y^2)$$

where *array-1* contains the *x* values, and *array-2* contains the *y* values.

**Arguments:**

Name	Type	Description
<i>array-1</i>	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
<i>array-2</i>		

**Return Type and Value:** number – The sum of the sum of the squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMX2PY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 521

SUMX2PY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 480

end example]

### 3.17.7.310 SUMXMY2

**Syntax:**

SUMXMY2 ( array-1 , array-2 )

**Description:** Computes the sum of the squares of the difference between corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

**Mathematical Formula:**

$$\text{SUMXMY2} = \sum (x - y)^2$$

where *array-1* contains the *x* values, and *array-2* contains the *y* values.

**Arguments:**

Name	Type	Description
<i>array-1</i>	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
<i>array-2</i>		

**Return Type and Value:** number – The sum of the squares of the difference between the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMXMY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 79

SUMXMY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 78

end example]

### 3.17.7.311 SYD

SYD ( *cost* , *salvage* , *life* , *per* )

Description: Computes the sum-of-years' digits depreciation of an asset for a specified period.

**Mathematical Formula:**

$$\text{SYD} = \frac{(\text{cost} - \text{salvage}) * (\text{life} - \text{per} + 1) * 2}{(\text{life})(\text{life} + 1)}$$

Arguments:

Name	Type	Description
<i>cost</i>	number	The initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)

Name	Type	Description
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>per</i>	number	The period and shall have the same units as <i>life</i> .

Return Type and Value: number – The sum-of-years' digits depreciation of an asset for a specified period.

[Example:

SYD(30000,7500,10,1) results in 4,090.91

SYD(30000,7500,10,10) results in 409.09

end example]

3.17.7.312 T

**Syntax:**

T ( *value* )

**Description:** Retrieves the text represented by *value*.

**Arguments:**

Name	Type	Description
<i>value</i>	any	The value to be encoded in text. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** text – *value* if *value* designates text; otherwise, "". [Note: T cannot differentiate between text that is an empty string, and any *value* of non-text type. end note]

[Example:

T("Hello") results in Hello

LEN(T(123)) results in 0

LEN(T(TRUE)) results in 0

end example]

3.17.7.313 TAN

**Syntax:**

TAN ( *x* )

**Description:** Computes the tangent of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The number whose tangent is to be computed.

**Return Type and Value:** number – The tangent of  $x$ .

[Example:

TAN(-1) results in -1.557407725

TAN(0) results in 0

TAN(1) results in 1.557407725

end example]

### 3.17.7.314   TANH

**Syntax:**

TANH (  $x$  )

**Description:** Computes the hyperbolic tangent of  $x$ .

**Arguments:**

Name	Type	Description
$x$	number	The number whose hyperbolic tangent is to be computed.

**Return Type and Value:** number – The hyperbolic tangent of  $x$

[Example:

TANH(-1) results in -0.761594156

TANH(0) results in 0

TANH(1) results in 0.761594156

end example]

### 3.17.7.315   TBILLEQ

TBILLEQ ( *settlement* , *maturity* , *discount* )

**Description:** Computes the bond-equivalent yield for a U.S. Treasury bill.

1 Arguments:

Name	Type	Description
<i>settlement</i>	number	The Treasury bill's settlement date. Any time information in the date is ignored.
<i>maturity</i>	number	The Treasury bill's maturity date. Any time information in the date is ignored.
<i>discount</i>	number	The Treasury bill's discount rate.

2

3 Return Type and Value: number – The bond-equivalent yield for a U.S. Treasury bill.

4 However, if

- 5 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 6 • *settlement* > *maturity*, #NUM! is returned.
- 7 • *maturity* is more than one year after *settlement*, #NUM! is returned.
- 8 • *discount* ≤ 0, #NUM! is returned.

9 [Example:

10

11 TBILLEQ(DATE(2008,3,31),DATE(2008,6,1),0.0914) results in 9.4151%

12

13 end example]

### 14 3.17.7.316 TBILLPRICE

15 TBILLPRICE ( *settlement* , *maturity* , *discount* )

16 Description: Computes the price per \$100 face value for a U.S. Treasury bill.

17 Mathematical Formula:

$$18 \text{ TBILLPRICE} = 100 \times \left(1 - \frac{\text{discount} \times \text{DSM}}{360}\right)$$

19 where:

20 DSM = number of days from settlement to maturity, excluding any maturity date that is more than one calendar  
21 year after the settlement date.

22 Arguments:

Name	Type	Description
<i>settlement</i>	number	The Treasury bill's settlement date. Any time information in the date is ignored.

Name	Type	Description
<i>maturity</i>	number	The Treasury bill's maturity date. Any time information in the date is ignored.
<i>discount</i>	number	The Treasury bill's discount rate.

1

2 Return Type and Value: number – The price per \$100 face value for a U.S. Treasury bill.

3 However, if

- 4 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 5 • *settlement* > *maturity*, #NUM! is returned.
- 6 • *maturity* is more than one year after *settlement*, #NUM! is returned.
- 7 • *discount* ≤ 0, #NUM! is returned.

8 [Example:

9

10 TBILLPRICE (DATE (2008, 3, 31), DATE (2008, 6, 1), 0.09) results in 98.4500

11

12 end example]

## 13 3.17.7.317 TBILLYIELD

14 TBILLYIELD ( *settlement* , *maturity* , *pr* )

15 Description: Computes the yield for a U.S. Treasury bill.

16 **Mathematical Formula:**

$$17 \quad TBILLYIELD = \frac{100 - pr.}{pr.} \times \frac{360}{DSM}$$

18 where:

19 DSM = number of days from settlement to maturity, excluding any maturity date that is more than one calendar  
20 year after the settlement date.

21 Arguments:

Name	Type	Description
<i>settlement</i>	number	The Treasury bill's settlement date. Any time information in the date is ignored.
<i>maturity</i>	number	The Treasury bill's maturity date. Any time information in the date is ignored.
<i>pr</i>	number	The Treasury bill's price per \$100 face value.

22

Return Type and Value: number – The yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- $pr \leq 0$ , #NUM! is returned.

[Example:

TBILLYIELD(DATE(2008,3,31),DATE(2008,6,1),98.45) results in 9.1417%

end example]

### 3.17.7.318 TDIST

**Syntax:**

TDIST ( *x* , *degrees-freedom* , *distribution-tails* )

**Description:** Computes the Percentage Points (probability) for the Student t-distribution where a numeric value, *x*, is a calculated value of *t* for which the Percentage Points are to be computed.

**Mathematical Formula:**

If *distribution-tails* = 1, TDIST =  $P(X > x)$ , where *X* is a random variable that follows the t-distribution.

If *distribution-tails* = 2, TDIST =  $P(|X| > x) = P(X > x \text{ or } X < -x)$

**Arguments:**

Name	Type	Description
<i>x</i>	number	The value at which to evaluate the distribution.
<i>degrees-freedom</i>	number	The number of degrees of freedom, truncated to an integer.
<i>distribution-tails</i>	number	The number of distribution tails to return, truncated to an integer. If 1, TDIST returns the one-tailed distribution. If 2, TDIST returns the two-tailed distribution.

**Return Type and Value:** number – The Percentage Points (probability) for the Student t-distribution.

However, if

- *degrees-freedom* < 1, #NUM! is returned.
- *tails* has any value other than 1 or 2, #NUM! is returned.

- $x < 0$ , #NUM! is returned.

[Example:

TDIST(1.959999998,60,1) results in 0.027322464

TDIST(1.959999998,60,2) results in 0.054644927

end example]

### 3.17.7.319 TEXT

**Syntax:**

TEXT ( *value* , *format* )

**Description:** Produces a string containing *value* formatted according to *format*.

**Arguments:**

Name	Type	Description
<i>value</i>	number	The number that is to be formatted.
<i>format</i>	text	Designates the number, currency, date, or time format to be used. (See §3.8.31 for the set of formats.)

**Return Type and Value:** text – The string containing *number* formatted according to *format*.

[Example:

TEXT(1234.567,"\$0.00") results in \$1234.57

TEXT(.125,"\$0.0%") results in 12.5%

TEXT(1234.567,"YYYY-MM-DD HH:MM:SS") results in 1903-05-18 13:36:29 in the 1900 date-base system.

end example]

### 3.17.7.320 TIME

**Syntax:**

TIME ( *hour* , *minute* , *second* )

**Description:** Computes the serial value for the given time.

**Arguments:**

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>hour</i>	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the hour. Any value greater than 23 shall be divided by 24 and the remainder shall be treated as the hour value.
<i>minute</i>	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the minute. Any value greater than 59 shall be converted to the corresponding number of hours and minutes.
<i>second</i>	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the second. Any value greater than 59 shall be converted to the corresponding number of hours, minutes, and seconds.

**Return Type and Value:** number – The serial value for the given time, as a value greater than or equal to 0 and less than or equal to 1.

However, if *hour*, *minute*, or *second* are out of range, #NUM! is returned.

[Example: The following serial values are displayed with 16 decimal places.

TIME(0,0,0) results in a serial value of 0.0000000000000000

TIME(0,0,1) results in a serial value of 0.0000115740740741

TIME(0,0,2) results in a serial value of 0.0000231481481481

TIME(0,0,20) results in a serial value of 0.0002314814814815

TIME(2,3,20) results in a serial value of 0.0856481481481481

TIME(12,0,0) results in a serial value of 0.5000000000000000

TIME(23,59,59) results in a serial value of 0.9999884259259260

TIME(26,120,240) results in a serial value of 0.16944444444444450

end example]

### 3.17.7.321 TIMEVALUE

**Syntax:**

TIMEVALUE ( *date-time-string* )

**Description:** Computes the serial value of the date and/or time represented by the string *date-time-string*.

**Arguments:**

Name	Type	Description
<i>date-time-string</i>	text	The date and/or time whose serial value is to be computed. <i>date-time-string</i> can have any valid date

Name	Type	Description
		and/or time format. Any date information in <i>date-time-string</i> shall be ignored.

**Return Type and Value:** number – The serial value of the date and/or time represented by the string *date-time-string*.

However, if *date-time-string* is ill-formed, #VALUE! is returned.

[Example: The following serial values are displayed with 16 decimal places.

TIMEVALUE("10:02:34 ") results in 0.4184490740740740

TIMEVALUE("01-Feb-2006 10:15:29 AM") results in 0.4274189814823330

TIMEVALUE("22:02") results in 0.9180555555555560

end example]

### 3.17.7.322 TINV

**Syntax:**

TINV ( *probability* , *degrees-freedom* )

**Description:** Computes the t-value of the Student's t-distribution as a function of the probability and the degrees of freedom.

**Arguments:**

Name	Type	Description
<i>probability</i>	number	A probability associated with the two-tailed Student's t-distribution.
<i>degrees-freedom</i>	number	The number of degrees of freedom with which to characterize the distribution, truncated to an integer.

**Return Type and Value:** number – The t-value of the Student's t-distribution.

However, if

- probability* < 0 or *probability* > 1, #NUM! is returned.
- degrees-freedom* < 1, #NUM! is returned.

[Example:

TINV(0.054644927,60) results in 1.95999999

*end example]*

### 3.17.7.323 TODAY

#### Syntax:

TODAY ( )

**Description:** Computes the serial value of the current date, taking into account the current date base value.

**Arguments:** None.

**Return Type and Value:** number – The serial value of the current date.

[Example:

On February 25, 2006, TODAY( ) results in 38773 for the 1900 date base system, or 37311 for the 1904 date base system

*end example]*

### 3.17.7.324 TRANSPOSE

#### Syntax:

TRANSPOSE ( *array* )

**Description:** Creates a new array that is the transpose of an existing array, by copying the first row of the existing array to the first column of the new array, the second row of the existing array as the second column of the new array, and so on. The formula containing the call to TRANSPOSE shall be an array formula in a range that has the same number of rows and columns, respectively, as *array* has columns and rows.

#### Arguments:

Name	Type	Description
<i>array</i>	array, reference	The set of values to be transposed.

**Return Type and Value:** array – The new array.

[Example:

TRANSPOSE( {10, 20, 30} ) results in the array {10; 20; 30}

*end example]*

## 3.17.7.325 TREND

**Syntax:**

TREND ( *known-ys* [ , [ *known-xs* ] [ , [ *new-xs* ] [ , *const-flag* ] ] )

**Description:** Computes values along a linear trend. Fits a straight line (using the method of least squares) to the arrays *known-ys* and *known-xs*. The y-values along that line for the array of *new-xs* specified.

**Arguments:**

Name	Type	Description
<i>known-ys</i>	array	The set of y-values already known in the relationship $y=mx+b$ . If that array is in a single column, each column of <i>known-xs</i> is interpreted as a separate variable. If that array is in a single row, each row of <i>known-xs</i> is interpreted as a separate variable.
<i>known-xs</i>	array	An optional set of x-values that might already be known in the relationship $y=mx+b$ . The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector. If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>new-xs</i>	array	New x-values for which TREND is to return corresponding y-values. <i>new-xs</i> shall include a column (or row) for each independent variable, just as <i>known-xs</i> does. So, if <i>known-ys</i> is in a single column, <i>known-xs</i> and <i>new-xs</i> shall have the same number of columns. If <i>known-ys</i> is in a single row, <i>known-xs</i> and <i>new-xs</i> shall have the same number of rows. If <i>new-xs</i> is omitted, it is assumed to be the same as <i>known-xs</i> . If both <i>known-xs</i> and <i>new-xs</i> are omitted, they are assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> .
<i>const-flag</i>	logical	Specifies whether to force the constant b to equal 0. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set equal to 0 and the m-values are adjusted so that $y=mx$ .

**Return Type and Value:** array – The values along a linear trend, as an array of numbers.

## 3.17.7.326 TRIM

**Syntax:**

TRIM ( *string* )

**Description:** Makes a string that is a copy of *string* with the leading and trailing space characters removed, and each sequence of embedded spaces reduced to a single space. The space character referred to here is character U+0020.

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designates the string to be trimmed.

**Return Type and Value:** text – The trimmed copy of *string*.

[Example:

TRIM("    abc    def   ") results in abc def

end example]

### 3.17.7.327 TRIMMEAN

**Syntax:**

TRIMMEAN ( *array* , *percent* )

**Description:** Computes the mean of the interior of a data set by excluding a percentage of data points from the top and bottom tails of a data set. TRIMMEAN rounds the number of excluded data points down to the nearest multiple of 2. For symmetry, TRIMMEAN excludes a single value from the top and bottom of the data set.

**Arguments:**

Name	Type	Description
<i>array</i>	array, reference	The numeric values to trim and average.
<i>percent</i>	number	The fractional number of data points to exclude from the calculation. [Example: If <i>percent</i> = 0.2, 4 points are trimmed from a data set of 20 points (20x0.2): 2 from the top and 2 from the bottom of the set. end example]

**Return Type and Value:** number – The mean of the interior of a data set.

However, if *percent* < 0 or *percent* > 1, #NUM! is returned.

[Example:

TRIMMEAN({4,6,2,5,7,8,9},0.2) results in 5.857142857

*end example]*

### 3.17.7.328 TRUE

#### Syntax:

TRUE ( )

**Description:** Computes the value TRUE. (A call to function TRUE is equivalent to using the *logical-constant* TRUE.)

**Arguments:** None.

**Return Type and Value:** logical – The value TRUE.

[Example:

TRUE ( ) results in TRUE

*end example]*

### 3.17.7.329 TRUNC

#### Syntax:

TRUNC (  $x$  [ , *number-digits* ] )

**Description:** Truncates  $x$  to the number of fractional digits by *number-digits*.

#### Arguments:

Name	Type	Description
$x$	array, reference	The value to be rounded down.
<i>number-digits</i>	number	The number of fractional digits to which $x$ is to be truncated. The default value for <i>number-digits</i> is 0.

**Return Type and Value:** number – The truncated value of  $x$ .

[Example:

TRUNC(PI()) results in 3

TRUNC(PI(),1) results in 3.1

TRUNC(PI(),3) results in 3.141

TRUNC(PI(),5) results in 3.14159

*end example]*

### 3.17.7.330 TTEST

#### Syntax:

TTEST ( *array-1* , *array-2* , *distribution-tails* , *test-type* )

**Description:** Computes the probability associated with a Student's t-Test.

#### Arguments:

Name	Type	Description								
<i>array-1</i>	array, reference	The first numerical data set.								
<i>array-1</i>	array, reference	The first numerical data set.								
<i>distribution-tails</i>	number	Specifies the number of distribution tails, truncated to an integer. If 1, TTEST uses the one-tailed distribution. If 2, TTEST uses the two-tailed distribution.								
<i>test-type</i>	number	<div>The truncated-to-integer kind of t-Test to perform, as follows:<table><tr><th>Value</th><th>Test Performed</th></tr><tr><td>1</td><td>Paired</td></tr><tr><td>2</td><td>Two-sample equal variance (homoscedastic)</td></tr><tr><td>3</td><td>Two-sample unequal variance (heteroscedastic)</td></tr></table></div>	Value	Test Performed	1	Paired	2	Two-sample equal variance (homoscedastic)	3	Two-sample unequal variance (heteroscedastic)
Value	Test Performed									
1	Paired									
2	Two-sample equal variance (homoscedastic)									
3	Two-sample unequal variance (heteroscedastic)									

**Return Type and Value:** number – The probability associated with a Student's t-Test.

However, if

- array-1* and *array-2* have a different number of data points, and *test-type* is 1, the return value is unspecified.
- distribution-tails* is any value other than 1 or 2, #NUM! is returned.

[Example: Given the following data:

	A	B
1	Data 1	Data 2
2	3	6
3	4	19
4	5	3
5	8	2
6	9	14

	A	B
7	1	4
8	2	5
9	4	17
10	5	1

TTEST(A2:A10,B2:B10,2,1) results in 0.196016

*end example]*

### 3.17.7.331 TYPE

#### Syntax:

TYPE ( *value* )

**Description:** Computes the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell.

#### Arguments:

Name	Type	Description
<i>value</i>	any	The value whose type is to be determined. No conversion shall take place on an argument passed to this function.

**Return Type and Value:** number – An integer that indicates the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell, as follows:

Type of <i>value</i>	Value Returned
number	1
text	2
logical	4
error value	16
array of any kind	64

[Example:

TYPE(10.5) results in 1

TYPE(A10) results in 1, when A10 contains a number

TYPE("ABC") results in 2

TYPE(A10) results in 2, when A10 contains a string

1 TYPE(TRUE) results in 4  
 2 TYPE(A10) results in 4, when A10 contains a logical value  
 3 TYPE(5/0) results in 16  
 4 TYPE(A10) results in 16, when A10 contains any error value  
 5 TYPE({1, 2, 3}) results in 64  
 6 TYPE({TRUE, 2.5, #N/A}) results in 64  
 7 TYPE(IF(10>5, "Yes", 20)) results in 2  
 8 TYPE(IF(10<5, "Yes", 20)) results in 1  
 9  
 10 *end example]*

### 3.17.7.332 UPPER

#### Syntax:

13 UPPER ( *string* )

14 **Description:** Makes an uppercase version of *string*.

#### Arguments:

Name	Type	Description
<i>string</i>	text	Designates the string to be converted.

16  
 17 **Return Type and Value:** text – The uppercase version of *string*.

18 *[Example:*

19  
 20 UPPER("AbCd123#\$\$%^") results in ABCD123#\$\$%^  
 21 UPPER(A10) results in 234FRTQWC\$##, when A10 contains 234FRTqwc\$##  
 22  
 23 *end example]*

### 3.17.7.333 USDOLLAR

#### Syntax:

26 USDOLLAR ( *number* [ , *num-decimal* ] )

27 **Description:** Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands  
 28 separator is the comma, the radix point is the period, and the currency symbol is "\$". The format used is  
 29 \$#,##0.00;(\$#,##0.00).

#### Arguments:

Name	Type	Description
------	------	-------------

Name	Type	Description
<i>number</i>	number	The number that is to be formatted.
<i>num-decimal</i>	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If <i>num-decimal</i> is negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

**Return Type and Value:** text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[Example:

USDOLLAR(1234.567) results in \$1,234.57

USDOLLAR(1234.567, -2) results in \$1,200

USDOLLAR(-1234.567, 4) results in (\$1,234.5670)

end example]

### 3.17.7.334 VALUE

**Syntax:**

VALUE ( *string* )

**Description:** Converts *string* to a number.

**Arguments:**

Name	Type	Description
<i>string</i>	text	Designates a string that contains a number formatted using any number, currency, date, or time format. (See §3.8.31 for the set of formats.) Date and time strings are converted to their equivalent serial value.

**Return Type and Value:** number – The number represented by *string*.

[Example:

VALUE("123.456") results in 123.456

VALUE("\$1,000") results in 1000

VALUE("23-Mar-2002") results in the corresponding serial value

VALUE("16:48:00") - VALUE("12:17:12") results in 0.188056

end example]

## 3.17.7.335 VAR

**Syntax:**VAR ( *argument-list* )

**Description:** Makes an estimate of the variance based on a sample. [Note: VAR assumes that its arguments are a sample of the population. If the data represents the entire population, VARP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARA instead. *end note*]

**Mathematical Formula:**

$$\frac{\sum (x - \bar{x})^2}{(n-1)}$$

where  $\bar{x}$  is the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*) and n is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

**Return Type and Value:** number – An estimate of the variance based on a sample.

[Example:

VAR(1202, 1220, 1323, 1254, 1302) results in 2683.2

*end example*]

## 3.17.7.336 VARA

**Syntax:**VARA ( *argument-list* )

**Description:** Makes an estimate of the variance based on a sample. [Note: VARA assumes that its arguments are a sample of the population. If the data represents the entire population, VARPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VAR instead. *end note*]

**Mathematical Formula:**

$$\frac{\sum (x - \bar{x})^2}{(n-1)}$$

where  $\bar{x}$  is the sample mean `AVERAGE(argument-1, argument-1,..., argument-n)` and  $n$  is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Logical values and text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

**Return Type and Value:** number – An estimate of the variance based on a sample.

[Example:

`VARA(1202,1220,1323,1254,1302)` results in 2683.2

end example]

### 3.17.7.337 `VARP`

**Syntax:**

`VARP ( argument-list )`

**Description:** Computes the variance of an entire population. [Note: `VARP` assumes that its arguments are the total population. If the data represents a population sample only, `VAR` should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use `VARPA` instead. end note]

**Mathematical Formula:**

$$\frac{\sum (x - \bar{x})^2}{n}$$

where  $\bar{x}$  is the sample mean `AVERAGE(argument-1, argument-1,..., argument-n)` and  $n$  is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

**Return Type and Value:** number – The variance of an entire population.

[Example:

VARP(1202,1220,1323,1254,1302) results in 2146.56

end example]

### 3.17.7.338 VARPA

**Syntax:**

VARPA ( *argument-list* )

**Description:** Makes the variance of an entire population. [Note: VARPA assumes that its arguments are the total population. If the data represents a population sample only, VARA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VARP instead.  
end note]

**Mathematical Formula:**

$$\frac{\sum (x - \bar{x})^2}{n}$$

where  $\bar{x}$  is the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*) and  $n$  is the sample size.

**Arguments:**

Name	Type	Description
<i>argument-list</i>	logical, number, name, text, array, reference	The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population.

**Return Type and Value:** number – The variance of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Example:

VARPA(1202,1220,1323,1254,1302) results in 2146.56

end example]

### 3.17.7.339 VDB

VDB ( *cost* , *salvage* , *life* , *start-period* , *end-period* [ , [[ *factor* ]  
[ , [ *no-switch-flag* ]]] ] )

Description: Computes the depreciation of an asset for the period specified, including partial periods, using the double-declining balance or some other specified method.

Arguments:

Name	Type	Description
<i>cost</i>	number	The number <i>cost</i> is the initial cost of the asset.
<i>salvage</i>	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) This value can be 0.
<i>life</i>	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
<i>start-period</i>	number	The starting period for which the depreciation is to be calculated. ( <i>start-period</i> shall use the same units as <i>life</i> .)
<i>end-period</i>	number	The ending period for which the depreciation is to be calculated. ( <i>end-period</i> shall use the same units as <i>life</i> .)
<i>factor</i>	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).
<i>no-switch-flag</i>	logical	Specifies whether to switch to straight-line depreciation when depreciation is greater than the declining balance calculation. If TRUE, straight-line depreciation is not used even when the depreciation is greater than the declining balance calculation. If FALSE or omitted, the straight-line depreciation is used when depreciation is greater than the declining balance calculation.

Return Type and Value: number – The depreciation of an asset for the period specified.

However, if any numerical argument value is non-positive, #NUM! is returned.

[Example:

VDB(2400,300,10\*365,0,1) results in 1.32

VDB(2400,300,10\*12,0,1) results in 40.00

VDB(2400,300,10\*12,6,18) results in 396.31

end example]

### 3.17.7.340 VLOOKUP

**Syntax:**

VLOOKUP ( *lookup-value* , *table-array* , *col-index-num* [ , [ *range-lookup-flag* ] ] )

**Description:** Performs a vertical search for a value in the left-most column of a table or an array, noting the row in which the matching value is found. From that row, the value from a given column is returned.

**Arguments:**

Name	Type	Description
<i>lookup-value</i>	value of any type or a reference to a value of any type.	The value to be located in the left-most column of the table. If <i>range-lookup</i> is FALSE and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, type a tilde (~) before the character.
<i>table-array</i>	array, reference, name	Designates the table of information to be searched. The values in the left-most column of <i>table-array</i> can be text, numbers, or logical values. The values in the left-most column of <i>table-array</i> shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. Uppercase and lowercase text is treated as equivalent.
<i>col-index-num</i>	number	The column number in <i>table-array</i> from which the matching value is to be returned. (A <i>col-index-num</i> of 1 returns the left-most column value in <i>table-array</i> , a <i>col-index-num</i> of 2 returns the next column in <i>table-array</i> , and so on.)
<i>range-lookup-flag</i>	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found,

Name	Type	Description
		the next largest value that is less than <i>lookup-value</i> is returned. If FALSE, an exact match is performed, in which case, the values in the left-most column of <i>table-array</i> need not be sorted. If there are two or more values in the left-most column of <i>table-array</i> that match <i>lookup-value</i> , the top-most value found is used.

1

2 **Return Type and Value:** any – The value from a given row number, where the column is determined by a search  
3 of the top row looking for a match with a given value.

4 However, if

- 5 • An exact match is performed, but no match is found, #N/A is returned.
- 6 • *col-index-num* is less than 1, #VALUE! is returned.
- 7 • *col-index-num* is greater than the number of columns in *table-array*, #REF! is returned.
- 8 • *lookup-value* is smaller than the smallest value in the left-most column of *table-array*, #N/A is returned.

9 [Example: Given the following data:

	A	B	C
1	Density	Bearings	Bolts
2	0.457	3.55	500
3	0.525	3.25	400
4	0.616	2.93	300
5	0.675	2.75	250
6	0.746	2.57	200
7	0.835	2.38	150
8	0.946	2.17	100
9	1.09	1.95	50
10	1.29	1.71	0

10

11 VLOOKUP(1,A2:C10,2) results in 2.17

12 VLOOKUP(1,A2:C10,3,TRUE) results in 100.00

13 VLOOKUP(2,A2:C10,2,TRUE) results in 1.71

14

15 end example]

16 3.17.7.341 WEEKDAY

17 Syntax:

WEEKDAY ( *serial-value* [ , *weekday-start-flag* ] )

**Description:** Computes the weekday number for the date having the given *serial-value*, taking into account the current date base value and *weekday-start-flag*, if present. See §3.17.4.1 for special handling of certain days in 1900.

**Arguments:**

Name	Type	Description								
<i>serial-value</i>	number	The date whose weekday number is to be computed. The value of <i>serial-value</i> is truncated to an integer.								
<i>weekday-start-flag</i>	number	When truncated to integer, indicates the weekday numbering convention to be used, as follows: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>1 or omitted</td><td>1 (Sunday) through 7 (Saturday)</td></tr><tr><td>2</td><td>1 (Monday) through 7 (Sunday)</td></tr><tr><td>3</td><td>0 (Monday) through 6 (Sunday)</td></tr></table>	Value	Meaning	1 or omitted	1 (Sunday) through 7 (Saturday)	2	1 (Monday) through 7 (Sunday)	3	0 (Monday) through 6 (Sunday)
Value	Meaning									
1 or omitted	1 (Sunday) through 7 (Saturday)									
2	1 (Monday) through 7 (Sunday)									
3	0 (Monday) through 6 (Sunday)									

**Return Type and Value:** number – The weekday number for the date having the given serial value.

However, if

- *serial-value* is out of range for the current date base value, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[Example:

WEEKDAY(DATE(2006,2,1)) results in 4 (Wednesday)

WEEKDAY(DATE(2006,2,1),1) results in 4 (Wednesday)

WEEKDAY(DATE(2006,2,1),2) results in 3 (Wednesday)

WEEKDAY(DATE(2006,2,1),3) results in 2 (Wednesday)

end example]

### 3.17.7.342 WEEKNUM

**Syntax:**

WEEKNUM ( *serial-value* [ , *weekday-start-flag* ] )

**Description:** Computes the week number of the date corresponding to *serial-value*. The week containing January 1 is the first week of the year, and is numbered week 1.

# Arguments:

Name	Type	Description						
<i>serial-value</i>	number	The date whose week number is to be computed. The value of <i>serial-value</i> is truncated to an integer.						
<i>weekday-start-flag</i>	number	When truncated to integer, indicates the weekday on which the week begins, as follows: <table><tr><th><i>weekday-start-flag</i></th><th>Meaning</th></tr><tr><td>1 or omitted</td><td>Week begins on Sunday.</td></tr><tr><td>2</td><td>Week begins on Monday.</td></tr></table>	<i>weekday-start-flag</i>	Meaning	1 or omitted	Week begins on Sunday.	2	Week begins on Monday.
<i>weekday-start-flag</i>	Meaning							
1 or omitted	Week begins on Sunday.							
2	Week begins on Monday.							

**Return Type and Value:** number – The week number of the date corresponding to *serial-value*.

However, if

- *serial-value* is out of range for the current date base value, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[Example:

WEEKNUM(DATE(2006,1,1)) results in 1

WEEKNUM(DATE(2006,1,1),1) results in 1

WEEKNUM(DATE(2006,2,1),1) results in 5

WEEKNUM(DATE(2006,2,1),2) results in 6

end example]

## 3.17.7.343 WEIBULL

### Syntax:

WEIBULL ( *x* , *alpha* , *beta* , *cumulative-flag* )

**Description:** Computes the Weibull distribution.

### Mathematical Formula:

The equation for the Weibull cumulative distribution function is:

$$F(x; \alpha, \beta) = 1 - e^{-(x/\beta)^\alpha}$$

The equation for the Weibull probability density function is:

$$f(x; \alpha, \beta) = \frac{\alpha}{\beta^\alpha} x^{\alpha-1} e^{-(x/\beta)^\alpha}$$

When  $\alpha = 1$ , WEIBULL returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

#### Arguments:

Name	Type	Description
$x$	number	The value at which the distribution is to be evaluated.
$\alpha$	number	A parameter of the distribution.
$\beta$	number	A parameter of the distribution.
<i>cumulative-flag</i>	logical	Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function.

**Return Type and Value:** number – The Weibull distribution.

However, if

- $x < 0$ , #NUM! is returned.
- $\alpha \leq 0$ , #NUM! is returned.
- $\beta \leq 0$ , #NUM! is returned.

[Example:

WEIBULL(105,20,100,TRUE) results in 0.92958139

WEIBULL(105,20,100,FALSE) results in 0.035588864

end example]

### 3.17.7.344 WORKDAY

#### Syntax:

WORKDAY ( *start-date* , *day-offset* [ , *holidays* ] )

**Description:** Computes the serial value of the date that is *day-offset* working days offset from *start-date*.

Weekend days and any holidays specified by *holidays* are not considered as working days.

#### Arguments:

Name	Type	Description
<i>start-date</i>	number	The start date, truncated to integer.

Name	Type	Description
<i>day-offset</i>	number	The number of working days before or after <i>start-date</i> . A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . <i>day-offset</i> is truncated to an integer.
<i>holidays</i>	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in <i>holidays</i> can be arbitrary.

**Return Type and Value:** number – The serial value of the date that is *day-offset* working days offset from *start-date*, excluding the specified holidays.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- Any date in *holidays* is out of range for the current date base value, #NUM! is returned.
- *start-date* plus *day-offset* yields an invalid date, #NUM! is returned.

[Example:

WORKDAY(DATE(2006,1,1),0) results in a serial value corresponding to 1-Jan-2006

WORKDAY(DATE(2006,1,1),10) results in a serial value corresponding to 13-Jan-2006

WORKDAY(DATE(2006,1,1),-10) results in a serial value corresponding to 19-Dec-2005

WORKDAY(DATE(2006,1,1),20,{"2006/1/2","2006/1/16"}) results in a serial value corresponding to 31-Jan-2006

end example]

### 3.17.7.345 XIRR

XIRR ( values , dates [ , [ guess ] ] )

Description: Computes the internal rate of return for a schedule of cash flows that is not necessarily periodic.

XIRR uses an iterative calculation technique that cycles through the calculation until the result is accurate within 0.000001 percent.

#### Mathematical Formula:

Using a changing rate (starting with *guess*), XIRR cycles through the calculation until the result is accurate within 0.000001 percent. The rate is changed until:

$$0 = \sum_{i=1}^N \frac{P_i}{(1 + \text{rate})^{\frac{d_i - d_1}{365}}}$$

where:

$d_i$  = the  $i^{\text{th}}$ , or last, payment date.

$d_1$  = the 0<sup>th</sup> payment date.

$P_i$  = the  $i^{\text{th}}$ , or last, payment.

Arguments:

Name	Type	Description
<i>values</i>	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in <i>dates</i> . The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.
<i>dates</i>	reference	A schedule of payment dates that corresponds to the cash flow payments in <i>values</i> . The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.
<i>guess</i>	number	An estimate of the result of XIRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

Return Type and Value: number – The internal rate of return for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.
- values* and *dates* contain different numbers of values, #NUM! is returned.
- The calculation has not converged after an implementation-defined number of tries, #NUM! is returned.

[Example: When the cells F2397:J2397 contain the dates January 1, 2008; March 1, 2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XIRR({-10000, 2750, 4250, 3250, 2750}, F2397:J2397, 0.1) results in 37.34%

end example]

### 3.17.7.346 XNPV

XNPV ( *rate* , *values* , *dates* )

Description: Computes the net present value for a schedule of cash flows that is not necessarily periodic.

#### Mathematical Formula:

$$XNPV = \sum_{i=1}^N \frac{P_i}{(1 + rate)^{\frac{(d_i - d_1)}{365}}}$$

where:

$d_i$  = the  $i^{th}$ , or last, payment date.

$d_1$  = the 0<sup>th</sup> payment date.

$P_i$  = the  $i^{th}$ , or last, payment.

Arguments:

Name	Type	Description
<i>rate</i>	number	The discount rate to apply to the cash flows.
<i>values</i>	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in <i>dates</i> . The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.
<i>dates</i>	reference	A schedule of payment dates that corresponds to the cash flow payments in <i>values</i> . The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.

Return Type and Value: number – The net present value for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.

- *values* and *dates* contain different numbers of values, #NUM! is returned.

[Example: When the cells F2397:J2397 contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XNPV(0.09,{ -10000,2750,4250,3250,2750},F2397:J2397) results in 2086.65

end example]

### 3.17.7.347 YEAR

#### Syntax:

YEAR ( *date-value* )

**Description:** Computes the numeric Gregorian year for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

#### Arguments:

Name	Type	Description
<i>date-value</i>	number, text	The date and/or time whose year is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any valid date and/or time format, in which case, any time information shall be ignored.

**Return Type and Value:** number – The Gregorian year for the date and/or time having the given *date-value*. For the 1900 date base system, the returned value shall be in the range 1900–9999. For the 1904 date base system, the returned value shall be in the range 1904–9999.

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[Example:

YEAR(DATE(2006,1,2)) results in 2006

YEAR(DATE(2006,0,2)) results in 2005

YEAR("2006/1/2 10:45 AM") results in 2006

YEAR(30000) results in 1982 for the 1900 date base system, or 1986 for the 1904 date base system

end example]

## 3.17.7.348 YEARFRAC

**Syntax:**

YEARFRAC ( *start-date* , *end-date* [ , *basis* ] )

**Description:** Computes the fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date.*, according to *basis*.

**Arguments:**

Name	Type	Description												
<i>start-date</i>	number	The period's starting date. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> .												
<i>end-date</i>	number	The period's ending date.												
<i>day-count-basis</i>	number	The security's issue date.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

All arguments are truncated to integers.

**Return Type and Value:** number – The fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date.*, according to *basis*.

However, if the value of *basis* is out of range, #NUM! is returned.

[Example:

YEARFRAC (DATE (2006,1,1),DATE (2006,3,26)) results in 0.236111111

YEARFRAC (DATE (2006,3,26),DATE (2006,1,1)) results in 0.236111111

YEARFRAC (DATE (2006,1,1),DATE (2006,7,1)) results in 0.5

YEARFRAC (DATE (2006,1,1),DATE (2007,9,1)) results in 1.666666667

YEARFRAC (DATE (2006,1,1),DATE (2006,7,1),0) results in 0.5

YEARFRAC (DATE (2006,1,1),DATE (2006,7,1),1) results in 0.495890411

YEARFRAC (DATE (2006,1,1),DATE (2006,7,1),2) results in 0.502777778

1 YEARFRAC (DATE (2006,1,1),DATE (2006,7,1),3) results in 0.495890411

2 YEARFRAC (DATE (2006,1,1),DATE (2006,7,1),4) results in 0.5

3

4 end example]

### 5 3.17.7.349 YIELD

#### 6 Syntax:

7 YIELD ( *settlement* , *maturity* , *rate* , *pr* , *redemption* , *frequency* [ , [ *basis* ] ] )

8 **Description:** Computes the yield on a security that pays periodic interest.

#### 9 Mathematical Formula:

10 If there is one coupon period or less until redemption, YIELD is calculated as follows:

$$11 \text{ YIELD} = \frac{\left( \frac{\text{redemption}}{100} + \frac{\text{rate}}{\text{frequency}} \right) - \left( \frac{\text{par}}{100} + \left( \frac{A}{E} \times \frac{\text{rate}}{\text{frequency}} \right) \right)}{\frac{\text{par}}{100} + \left( \frac{A}{E} \times \frac{\text{rate}}{\text{frequency}} \right)} \times \frac{\text{frequency} \times E}{\text{DSR}}$$

12 where:

13 A = number of days from the beginning of the coupon period to the settlement date (accrued days).

14 DSR = number of days from the settlement date to the redemption date.

15 E = number of days in the coupon period.

16 If there is more than one coupon period until redemption, YIELD is calculated through some number of  
17 iterations. The resolution uses the Newton method, based on the formula used for the function PRICE. The  
18 yield is changed until the estimated price given the yield is close to price.

#### 19 Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>rate</i>	number	The security's interest rate.
<i>pr</i>	number	The security's price.
<i>redemption</i>	number	The security's redemption value per \$100 face value.
<i>frequency</i>	number	the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer.
<i>basis</i>	number	The truncated integer type of day count basis to use, as follows:

Name	Type	Description												
		<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td></td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360		Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The yield on a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- $\text{settlement} \geq \text{maturity}$ , #NUM! is returned.
- $\text{rate} < 0$ , #NUM! is returned.
- $\text{pr}$  or  $\text{redemption} \leq 0$ , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- $\text{basis} < 0$  or  $\text{basis} > 4$ , #NUM! is returned.

[Example:

`YIELD(DATE(2008,2,15),DATE(2016,11,15),0.0575,95.04287,100,2,0)` results in 6.5000%

*end example]*

## 3.17.7.350 YELDDISC

### Syntax:

YIELDDISC ( *settlement* , *maturity* , *pr* , *redemption* [ , [ *basis* ] ] )

**Description:** Computes the annual yield for a discounted security.

### Arguments:

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>pr</i>	number	The security's price.

Name	Type	Description												
<i>redemption</i>	number	The security's redemption value per \$100 face value.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

1

2 Time information in the date arguments is ignored.

3 **Return Type and Value:** number – The annual yield for a discounted security.

4 However, if

- 5 • *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- 6 • *settlement*  $\geq$  *maturity*, #NUM! is returned.
- 7 • *pr* or *redemption*  $\leq$  0, #NUM! is returned.
- 8 • *basis*  $<$  0 or *basis*  $>$  4, #NUM! is returned.

9 [Example:

10

11 YIELDDISC (DATE (2008,2,16),DATE (2008,3,1),99.795,100,2) results in 5.2823%

12

13 end example]

### 14 3.17.7.351 YIELDMAT

15 **Syntax:**

16 YIELDMAT ( *settlement* , *maturity* , *issue* , *rate* , *pr* [ , [ *basis* ] ] )

17 **Description:** Computes the annual yield of a security that pays interest at maturity.

18 **Arguments:**

Name	Type	Description
<i>settlement</i>	number	The security's settlement date.
<i>maturity</i>	number	The security's maturity date.
<i>issue</i>	number	The security's issue date.

Name	Type	Description												
<i>rate</i>	number	The security's interest rate.												
<i>pr</i>	number	The security's price.												
<i>basis</i>	number	<div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td>3</td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table></div>	Value	Day Count Basis	0 or omitted	US (NASD) 30/360	1	Actual/actual	2	Actual/360	3	Actual/365	4	European 30/360
Value	Day Count Basis													
0 or omitted	US (NASD) 30/360													
1	Actual/actual													
2	Actual/360													
3	Actual/365													
4	European 30/360													

Time information in the date arguments is ignored.

**Return Type and Value:** number – The annual yield of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, #NUM! is returned.
- *settlement*  $\geq$  *maturity*, #NUM! is returned.
- *rate* or *pr*  $\leq$  0, #NUM! is returned.
- *basis*  $<$  0 or *basis*  $>$  4, #NUM! is returned.

[Example:

YIELDMAT (DATE (2008, 3, 15), DATE (2008, 11, 3), DATE (2007, 11, 8), 0.0625, 100.0123, 0) results in 6.0954%

end example]

### 3.17.7.352 ZTEST

**Syntax:**

ZTEST ( *array* , *test-value* [ , *sigma* ] )

**Description:** Computes the one-tailed probability-value of a z-test. For a given hypothesized population mean, *test-value*, ZTEST returns the probability that the sample mean would be greater than the average of observations in the data set *array*; that is, the observed sample mean.

**Mathematical Formula:**

When *sigma* is present:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST((\bar{x} - \mu_0) / (\sigma / \sqrt{n}))$$

When *sigma* is omitted:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST((\bar{x} - \mu_0) / (s / \sqrt{n}))$$

where  $\bar{x}$  is the sample mean `AVERAGE(array)`;  $s$  is the sample standard deviation `STDEV(array)`; and  $n$  is the number of observations in the sample `COUNT(array)`.

#### Arguments:

Name	Type	Description
<i>array</i>	array	The set of numerical data against which to test <i>test-value</i> .
<i>test-value</i>	number	The number to test.
<i>sigma</i>	number	The number is the population (known) standard deviation. If omitted, the sample standard deviation is used.

**Return Type and Value:** number – The one-tailed probability-value of a z-test.

However, if *array* is empty, the return value is unspecified.

[Example:

`ZTEST({3,6,7,8,6,5,4,2,1,9},4)` results in 0.090574197

`ZTEST({3,6,7,8,6,5,4,2,1,9},6)` results in 0.863043389

end example]

## 3.18 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/spreadsheetml/2006/main namespace>.

### 3.18.1 ST\_Axis (PivotTable Axis)

This simple type defines the axes for a PivotTable selection.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
axisCol (Column Axis)	Column axis
axisPage (Include Count Filter)	Page axis
axisRow (Row Axis)	Row axis
axisValues (Values Axis)	Values axis

1

Referenced By
pivotArea@axis (§3.3.1.66); pivotField@axis (§3.10.1.69); pivotSelection@axis (§3.3.1.67)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Axis">
4 <restriction base="xsd:string">
5 <enumeration value="axisRow"/>
6 <enumeration value="axisCol"/>
7 <enumeration value="axisPage"/>
8 <enumeration value="axisValues"/>
9 </restriction>
10 </simpleType>
```

### 11 3.18.2 ST\_BorderId (Border Id)

12 Zero-based index of the border record used by this cell format.

13 This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
xf@borderId (§3.8.45)

14 The following XML Schema fragment defines the contents of this simple type:

```

15 <simpleType name="ST_BorderId">
16 <restriction base="xsd:unsignedInt"/>
17 </simpleType>
```

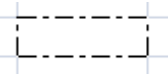

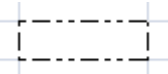

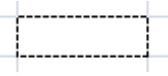

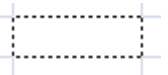

### 18 3.18.3 ST\_BorderStyle (Border Line Styles)

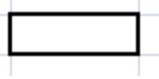

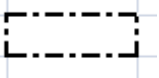

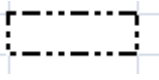

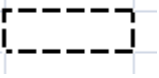

19 The line style of a border in a cell.

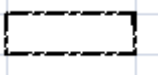

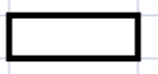

20 This simple type's contents are a restriction of the XML Schema string datatype.

21 The following are possible enumeration values for this type:

Enumeration Value	Description
dashDot (Dash Dot)	The line style of a border is dash-dot. <i>[Example:</i>

Enumeration Value	Description
	 <p><i>end example]</i></p>
dashDotDot (Dash Dot Dot)	<p>The line style of a border is dash-dot-dot.</p> <p>[Example:</p>  <p><i>end example]</i></p>
dashed (Dashed)	<p>The line style of a border is dashed.</p> <p>[Example:</p>  <p><i>end example]</i></p>
dotted (Dotted)	<p>The line style of a border is dotted.</p> <p>[Example:</p>  <p><i>end example]</i></p>
double (Double Line)	<p>The line style of a border is double line.</p> <p>[Example:</p>  <p><i>end example]</i></p>
hair (Hairline Border)	<p>The line style of a border is hairline.</p> <p>[Example:</p> 

Enumeration Value	Description
	<i>end example]</i>
medium (Medium Border)	<p>The line style of a border is medium.</p> <p>[Example:</p>  <p><i>end example]</i></p>
mediumDashDot (Medium Dash Dot)	<p>The line style of a border is medium dash-dot.</p> <p>[Example:</p>  <p><i>end example]</i></p>
mediumDashDotDot (Medium Dash Dot Dot)	<p>The line style of a border is medium dash-dot-dot.</p> <p>[Example:</p>  <p><i>end example]</i></p>
mediumDashed (Medium Dashed)	<p>The line style of a border is medium dashed.</p> <p>[Example:</p>  <p><i>end example]</i></p>
none (None)	<p>The line style of a border is none (no border visible).</p> <p>[Example:</p>  <p><i>end example]</i></p>
slantDashDot (Slant Dash Dot)	<p>The line style of a border is slant-dash-dot.</p>

Enumeration Value	Description
	<p>[Example:</p>  <p>end example]</p>
thick (Thick Line Border)	<p>The line style of a border is 'thick'.</p> <p>[Example:</p>  <p>end example]</p>
thin (Thin Border)	<p>The line style of a border is thin.</p> <p>[Example:</p>  <p>end example]</p>

1

Referenced By
bottom@style (§3.8.6); diagonal@style (§3.8.13); horizontal@style (§3.8.24); left@style (§3.8.27); right@style (§3.8.35); top@style (§3.8.43); vertical@style (§3.8.44)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderStyle">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="thin"/>
 <enumeration value="medium"/>
 <enumeration value="dashed"/>
 <enumeration value="dotted"/>
 <enumeration value="thick"/>
 <enumeration value="double"/>
 <enumeration value="hair"/>
 <enumeration value="mediumDashed"/>
 <enumeration value="dashDot"/>
 <enumeration value="mediumDashDot"/>
 <enumeration value="dashDotDot"/>
 <enumeration value="mediumDashDotDot"/>
 <enumeration value="slantDashDot"/>
 </restriction>
</simpleType>
```

### 3.18.4 ST\_CalcMode (Calculation Mode)

This simple type defines the supported modes for performing calculations on workbook data.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic)	Indicates that calculations in the workbook will be performed automatically when cell values change. The application recalculates those cells that are dependent on other cells that contain changed values. This type of calculation helps to avoid unnecessary calculations.
autoNoTable (Automatic Calculation (No Tables))	Indicates tables be excluded during automatic calculation.
manual (Manual Calculation Mode)	Indicates that calculations in the workbook be triggered manually by the user. For example, the application might expose a command in the user interface.

#### Referenced By

calcPr@calcMode (§3.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalcMode">
 <restriction base="xsd:string">
 <enumeration value="manual"/>
 <enumeration value="auto"/>
 <enumeration value="autoNoTable"/>
 </restriction>
</simpleType>
```

### 3.18.5 ST\_CalendarType (Calendar Type)

Calendar type enumeration for date grouped items of a filter.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
gregorian (Gregorian)	Gregorian (localized) calendar
gregorianArabic (Gregorian Arabic Calendar)	Gregorian Arabic calendar
gregorianMeFrench (Gregorian Middle East French Calendar)	Gregorian Middle East French calendar
gregorianUs (Gregorian (U.S.) Calendar)	Gregorian (U.S.) calendar
gregorianXlitEnglish (Gregorian Transliterated English Calendar)	Gregorian Transliterated English calendar
gregorianXlitFrench (Gregorian Transliterated French Calendar)	Gregorian Transliterated French calendar
hebrew (Hebrew (Lunar) Calendar)	Hebrew (Lunar) calendar
hijri (Hijri (Arabic Lunar) Calendar)	Hijri (Arabic Lunar) calendar
japan (Japanese Emperor Era Calendar)	Japanese Emperor Era calendar
korea (Korean Tangun Era Calendar)	Korean Tangun Era calendar
none (No Calendar Type)	No calendar type specified
taiwan (Taiwan Era Calendar)	Taiwan Era calendar
thai (Thai Calendar)	Thai calendar

#### Referenced By

filters@calendarType (§3.3.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalendarType">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="gregorian"/>
 <enumeration value="gregorianUs"/>
 <enumeration value="japan"/>
 <enumeration value="taiwan"/>
 <enumeration value="korea"/>
 <enumeration value="hijri"/>
 <enumeration value="thai"/>
 <enumeration value="hebrew"/>
 <enumeration value="gregorianMeFrench"/>
 <enumeration value="gregorianArabic"/>
 <enumeration value="gregorianXlitEnglish"/>
 <enumeration value="gregorianXlitFrench"/>
 </restriction>
</simpleType>
```

### 3.18.6 ST\_CellComments (Cell Comments)

These enumerations specify how cell comments shall be displayed for paper printing purposes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
asDisplayed (Print Comments As Displayed)	Print cell comments as displayed.
atEnd (Print At End)	Print cell comments at end of document.
none (None)	Do not print cell comments.

#### Referenced By

pageSetup@cellComments (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellComments">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="asDisplayed"/>
 <enumeration value="atEnd"/>
 </restriction>
</simpleType>
```

### 3.18.7 ST\_CellFormulaType (Formula Type)

Indicates the type of formula in the cell.

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
array (Array Entered)	Formula is an array entered formula.
dataTable (Table Formula)	Formula is a data table formula.
normal (Normal)	Formula is a regular cell formula.
shared (Shared Formula)	Formula is part of a shared formula.

3  
4 The following XML Schema fragment defines the contents of this simple type:

```
5 <simpleType name="ST_CellFormulaType">
6 <restriction base="xsd:string">
7 <enumeration value="normal"/>
8 <enumeration value="array"/>
9 <enumeration value="dataTable"/>
10 <enumeration value="shared"/>
11 </restriction>
12 </simpleType>
```

### 13 3.18.8 ST\_CellRef (Cell Reference)

14 Represents a single cell reference in a SpreadsheetML document.

15 This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
c@r (§3.6.1); c@r (§3.3.1.3); cell@r (§3.14.1); cellSmartTags@r (§3.3.1.6); cellWatch@r (§3.3.1.7); customSheetView@topLeftCell (§3.3.1.23); inputCells@r (§3.3.1.49); nc@r (§3.11.1.3); oc@r (§3.11.1.5); pane@topLeftCell (§3.3.1.64); rcmt@cell (§3.11.1.11); selection@activeCell (§3.3.1.75); sheetView@topLeftCell (§3.3.1.83); singleXmlCell@r (§3.5.2.1); tr@r (§3.15.4); undo@r (§3.11.1.25)

16 The following XML Schema fragment defines the contents of this simple type:

```
17 <simpleType name="ST_CellRef">
18 <restriction base="xsd:string"/>
19 </simpleType>
```

### 20 3.18.9 ST\_CellSpan (Cell Span Type)

21 A single cell span item.

22 This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
ST_CellSpan (§3.18.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellSpan">
 <restriction base="xsd:string"/>
</simpleType>
```

### 3.18.10 ST\_CellSpans (Cell Spans)

List of the cell spans of the item.

This simple type allows a list of items of the ST\_CellSpan simple type (§3.18.9).

Referenced By
row@spans (§3.3.1.71)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellSpans">
 <list itemType="ST_CellSpan"/>
</simpleType>
```

### 3.18.11 ST\_CellStyleXfId (Cell Style Format Id)

Used by xf records and cellStyle records to reference xf records defined in the cellStyleXfs collection.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
cellStyle@xfId (§3.8.7); xf@xfId (§3.8.45)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellStyleXfId">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

### 3.18.12 ST\_CellType (Cell Type)

Indicates the cell's data type.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Boolean)	Cell containing a boolean.
e (Error)	Cell containing an error.
inlineStr (Inline String)	Cell containing an (inline) rich string, i.e., one not in the shared string table. If this cell type is used, then the cell value is in the <code>is</code> element rather than the <code>v</code>

Enumeration Value	Description
	element in the cell (c element).
n (Number)	Cell containing a number.
s (Shared String)	Cell containing a shared string.
str (String)	Cell containing a formula string.

1

Referenced By
c@t (§3.3.1.3); cell@t (§3.14.1); nc@t (§3.11.1.3); oc@t (§3.11.1.5)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_CellType">
4 <restriction base="xsd:string">
5 <enumeration value="b"/>
6 <enumeration value="n"/>
7 <enumeration value="e"/>
8 <enumeration value="s"/>
9 <enumeration value="str"/>
10 <enumeration value="inlineStr"/>
11 </restriction>
12 </simpleType>

```

### 13 3.18.13 ST\_CfType (Conditional Format Type)

14 Conditional format rule type.

15 This simple type's contents are a restriction of the XML Schema string datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
aboveAverage (Above or Below Average)	This conditional formatting rule highlights cells that are above or below the average for all values in the range.
beginsWith (Begins With)	This conditional formatting rule highlights cells in the range that begin with the given text. Equivalent to using the LEFT() sheet function and comparing values.
cellIs (Cell Is)	This conditional formatting rule compares a cell value to a formula calculated result, using an operator.
colorScale (Color Scale)	This conditional formatting rule creates a graduated color scale on the cells.
containsBlanks (Contains Blanks)	This conditional formatting rule highlights cells that are completely blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank.

Enumeration Value	Description
	An empty cell is also considered blank.
containsErrors (Contains Errors)	This conditional formatting rule highlights cells with formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
containsText (Contains Text)	This conditional formatting rule highlights cells containing given text. Equivalent to using the SEARCH() sheet function to determine whether the cell contains the text.
dataBar (Data Bar)	This conditional formatting rule displays a graduated data bar in the range of cells.
duplicateValues (Duplicate Values)	This conditional formatting rule highlights duplicated values.
endsWith (Ends With)	This conditional formatting rule highlights cells ending with given text. Equivalent to using the RIGHT() sheet function and comparing values.
expression (Expression)	This conditional formatting rule contains a formula to evaluate. When the formula result is true, the cell is highlighted.
iconSet (Icon Set)	This conditional formatting rule applies icons to cells according to their values.
notContainsBlanks (Contains No Blanks)	This conditional formatting rule highlights cells that are not blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank.
notContainsErrors (Contains No Errors)	This conditional formatting rule highlights cells without formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
notContainsText (Does Not Contain Text)	This conditional formatting rule highlights cells that do not contain given text. Equivalent to using the SEARCH() sheet function.
timePeriod (Time Period)	This conditional formatting rule highlights cells containing dates in the specified time period. The underlying value of the cell is evaluated, therefore the cell does not need to be formatted as a date to be evaluated. For example, with a cell containing the value 38913 the conditional format shall be applied if the rule requires a value of 7/14/2006.
top10 (Top 10)	This conditional formatting rule highlights cells whose values fall in the top N or bottom N bracket, as specified.

Enumeration Value	Description
uniqueValues (Unique Values)	This conditional formatting rule highlights unique values in the range.

cfRule@type (§3.3.1.9)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_CfType">
4 <restriction base="xsd:string">
5 <enumeration value="expression"/>
6 <enumeration value="cellIs"/>
7 <enumeration value="colorScale"/>
8 <enumeration value="dataBar"/>
9 <enumeration value="iconSet"/>
10 <enumeration value="top10"/>
11 <enumeration value="uniqueValues"/>
12 <enumeration value="duplicateValues"/>
13 <enumeration value="containsText"/>
14 <enumeration value="notContainsText"/>
15 <enumeration value="beginsWith"/>
16 <enumeration value="endsWith"/>
17 <enumeration value="containsBlanks"/>
18 <enumeration value="notContainsBlanks"/>
19 <enumeration value="containsErrors"/>
20 <enumeration value="notContainsErrors"/>
21 <enumeration value="timePeriod"/>
22 <enumeration value="aboveAverage"/>
23 </restriction>
24 </simpleType>

```

### 25 3.18.14 ST\_CfvoType (Conditional Format Value Object Type)

26 This simple type expresses the type of the conditional formatting value object (cfvo). In general the cfvo  
 27 specifies one value used in the graduated scale (max, min, midpoint, etc).

28 This simple type's contents are a restriction of the XML Schema string datatype.

29 The following are possible enumeration values for this type:

Enumeration Value	Description
formula (Formula)	The minimum/ midpoint / maximum value for the gradient is determined by a formula.
max (Maximum)	Indicates that the maximum value in the range shall be used as the maximum value for the gradient.
min (Minimum)	Indicates that the minimum value in the range shall be used as the minimum value for the gradient.

Enumeration Value	Description
num (Number)	Indicates that the minimum / midpoint / maximum value for the gradient is specified by a constant numeric value.
percent (Percent)	Value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum / midpoint / maximum value for the gradient.
percentile (Percentile)	Value indicates a percentile ranking in the range shall be used as the minimum / midpoint / maximum value for the gradient.

1

cfvo@type (§3.3.1.10)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_CfvoType">
4 <restriction base="xsd:string">
5 <enumeration value="num"/>
6 <enumeration value="percent"/>
7 <enumeration value="max"/>
8 <enumeration value="min"/>
9 <enumeration value="formula"/>
10 <enumeration value="percentile"/>
11 </restriction>
12 </simpleType>

```

### 13 3.18.15 ST\_Comments (Comment Display Types)

14 This simple type defines options for displaying comments in the user interface.

15 This simple type's contents are a restriction of the XML Schema string datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
commIndAndComment (Show Comment & Indicator)	Indicates that both the comment indicator and comment text be show in the user interface.
commIndicator (Show Comment Indicator)	Indicates that only the comment indicator be shown in the user interface.
commNone (No Comments)	Indicates that comments not be shown in the user interface.

17

```
<simpleType name="ST_Comments">
 <restriction base="xsd:string">
 <enumeration value="commNone"/>
 <enumeration value="commIndicator"/>
 <enumeration value="commIndAndComment"/>
 </restriction>
</simpleType>
```

### 3.18.16 ST\_ConditionalFormattingOperator (Conditional Format Operators)

These conditional format operators are used for "Highlight Cells That Contain..." rules. For example, "highlight cells that begin with "M2" and contain "Mountain Gear"".

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
beginsWith (Begins With)	'Begins with' operator
between (Between)	'Between' operator
containsText (Contains)	'Contains' operator
endsWith (Ends With)	'Ends with' operator
equal (Equal)	'Equal to' operator
greaterThan (Greater Than)	'Greater than' operator
greaterThanOrEqual (Greater Than Or Equal)	'Greater than or equal to' operator
lessThan (Less Than)	'Less than' operator
lessThanOrEqual (Less Than Or Equal)	'Less than or equal to' operator
notBetween (Not Between)	'Not between' operator
notContains (Does Not Contain)	'Does not contain' operator
notEqual (Not Equal)	'Not equal to' operator

Referenced By
cfRule@operator (§3.3.1.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConditionalFormattingOperator">
 <restriction base="xsd:string">
 <enumeration value="lessThan"/>
 <enumeration value="lessThanOrEqual"/>
 <enumeration value="equal"/>
 <enumeration value="notEqual"/>
 <enumeration value="greaterThanOrEqual"/>
 <enumeration value="greaterThan"/>
 <enumeration value="between"/>
 <enumeration value="notBetween"/>
 <enumeration value="containsText"/>
 <enumeration value="notContains"/>
 <enumeration value="beginsWith"/>
 <enumeration value="endsWith"/>
 </restriction>
</simpleType>
```

### 3.18.17 ST\_CredMethod (Credentials Method)

Credentials method used for server access.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
integrated (Integrated Authentication)	Integrated authentication.
none (No Credentials)	Use no credentials at all.
prompt (Prompt Credentials)	Prompt for credentials.
stored (Stored Credentials)	Use stored credentials.

#### Referenced By

connection@credentials (§3.13.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CredMethod">
 <restriction base="xsd:string">
 <enumeration value="integrated"/>
 <enumeration value="none"/>
 <enumeration value="stored"/>
 <enumeration value="prompt"/>
 </restriction>
</simpleType>
```

### 3.18.18 ST\_DataConsolidateFunction (Data Consolidation Functions)

Data consolidation functions specified by the user and used to consolidate ranges of data.

- 1 This simple type's contents are a restriction of the XML Schema string datatype.
- 2 The following are possible enumeration values for this type:

Enumeration Value	Description
average (Average)	The average of the values.
count (Count)	The number of data values. The Count consolidation function works the same as the COUNTA worksheet function.
countNums (CountNums)	The number of data values that are numbers. The Count Nums consolidation function works the same as the COUNT worksheet function.
max (Maximum)	The largest value.
min (Minimum)	The smallest value.
product (Product)	The product of the values.
stdDev (StdDev)	An estimate of the standard deviation of a population, where the sample is a subset of the entire population.
stdDevp (StdDevP)	The standard deviation of a population, where the population is all of the data to be summarized.
sum (Sum)	The sum of the values.
var (Variance)	An estimate of the variance of a population, where the sample is a subset of the entire population.
varp (VarP)	The variance of a population, where the population is all of the data to be summarized.

3

Referenced By

 <enumeration value="stdDevp"/>
 <enumeration value="sum"/>
 <enumeration value="var"/>
 <enumeration value="varp"/>
 </restriction>
</simpleType>
```

**3.18.19 ST\_DataValidationErrorStyle (Data Validation Error Styles)**

The style of data validation error alert.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
information (Information Icon)	This data validation error style uses an information icon in the error alert. 
stop (Stop Icon)	This data validation error style uses a stop icon in the error alert. 
warning (Warning Icon)	This data validation error style uses a warning icon in the error alert. 

**Referenced By**

dataValidation@errorStyle (§3.3.1.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DataValidationErrorStyle">
 <restriction base="xsd:string">
 <enumeration value="stop"/>
 <enumeration value="warning"/>
 <enumeration value="information"/>
 </restriction>
</simpleType>
```

### 3.18.20 ST\_DataValidationImeMode (Data Validation IME Mode)

These values specify that the IME (input method editor) mode is controlled by data validation.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
disabled (Disabled IME Mode)	IME mode is disabled. Forces the IME control to be disabled when this cell is selected.
fullAlpha (Full-Width Alpha-Numeric IME Mode)	Forces the IME control to be on and in full-width alphanumeric input mode when the cell is first selected.
fullHangul (Full Width Hangul)	Forces the IME control to be on and in full-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.
fullKatakana (Full Katakana IME Mode)	Forces the IME control to be on and in full-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
halfAlpha (Half Alpha IME)	Forces the IME control to be on and in half-width alphanumeric input mode when the cell is first selected.
halfHangul (Half-Width Hangul IME Mode)	Forces the IME control to be on and in half-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.
halfKatakana (Half-Width Katakana)	Forces the IME control to be on and in half-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
hiragana (Hiragana IME Mode)	Forces the IME control to be on and in Hiragana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
noControl (IME Mode Not Controlled)	Data validation does not control the IME control's

Enumeration Value	Description
	mode.
off (IME Off)	Forces the IME control to be off when first selecting the cell (goes to direct cell input mode).
on (IME On)	Forces the IME control to be on when first selecting the cell.

#### Referenced By

dataValidation@imeMode (§3.3.1.30)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_DataValidationImeMode">
 <restriction base="xsd:string">
 <enumeration value="noControl"/>
 <enumeration value="off"/>
 <enumeration value="on"/>
 <enumeration value="disabled"/>
 <enumeration value="hiragana"/>
 <enumeration value="fullKatakana"/>
 <enumeration value="halfKatakana"/>
 <enumeration value="fullAlpha"/>
 <enumeration value="halfAlpha"/>
 <enumeration value="fullHangul"/>
 <enumeration value="halfHangul"/>
 </restriction>
</simpleType>

```

### 3.18.21 ST\_DataValidationOperator (Data Validation Operator)

The relational operator used in data validation.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
between (Between)	Data validation which checks if a value is between two other values.
equal (Equal)	Data validation which checks if a value is equal to a specified value.
greaterThan (Greater Than)	Data validation which checks if a value is greater than a specified value.
greaterThanOrEqual (Greater Than Or Equal)	Data validation which checks if a value is greater than or equal to a specified value.
lessThan (Less Than)	Data validation which checks if a value is less than a

Enumeration Value	Description
	specified value.
lessThanOrEqualTo (Less Than Or Equal)	Data validation which checks if a value is less than or equal to a specified value.
notBetween (Not Between)	Data validation which checks if a value is not between two other values.
notEqual (Not Equal)	Data validation which checks if a value is not equal to a specified value.

```

3 <simpleType name="ST_DataValidationOperator">
4 <restriction base="xsd:string">
5 <enumeration value="between"/>
6 <enumeration value="notBetween"/>
7 <enumeration value="equal"/>
8 <enumeration value="notEqual"/>
9 <enumeration value="lessThan"/>
10 <enumeration value="lessThanOrEqualTo"/>
11 <enumeration value="greaterThan"/>
12 <enumeration value="greaterThanOrEqualTo"/>
13 </restriction>
14 </simpleType>

```

### 15 3.18.22 ST\_DataValidationType (Data Validation Type)

16 Specifies the type of data validation used to validate user input.

17 This simple type's contents are a restriction of the XML Schema string datatype.

18 The following are possible enumeration values for this type:

Enumeration Value	Description
custom (Custom)	Data validation which uses a custom formula to check the cell value.
date (Date)	Data validation which checks for date values satisfying the given condition.
decimal (Decimal)	Data validation which checks for decimal values satisfying the given condition.
list (List)	Data validation which checks for a value matching one of list of values.
none (None)	No data validation.

Enumeration Value	Description
textLength (Text Length)	Data validation which checks for text values, whose length satisfies the given condition.
time (Time)	Data validation which checks for time values satisfying the given condition.
whole (Whole Number)	Data validation which checks for whole number values satisfying the given condition.

1

Referenced By
dataValidation@type (§3.3.1.30)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_DataValidationType">
4 <restriction base="xsd:string">
5 <enumeration value="none"/>
6 <enumeration value="whole"/>
7 <enumeration value="decimal"/>
8 <enumeration value="list"/>
9 <enumeration value="date"/>
10 <enumeration value="time"/>
11 <enumeration value="textLength"/>
12 <enumeration value="custom"/>
13 </restriction>
14 </simpleType>
```

### 15 3.18.23 ST\_DateTimeGrouping (Date Time Grouping)

16 Specifies how to group dateTime values.

17 This simple type's contents are a restriction of the XML Schema string datatype.

18 The following are possible enumeration values for this type:

Enumeration Value	Description
day (Day)	Group by day
hour (Group by Hour)	Group by hour
minute (Group by Minute)	Group by minute
month (Month)	Group by month
second (Second)	Group by second
year (Group by Year)	Group by year

 <enumeration value="month"/>
 <enumeration value="day"/>
 <enumeration value="hour"/>
 <enumeration value="minute"/>
 <enumeration value="second"/>
 </restriction>
</simpleType>
```

### 3.18.24 ST\_DdeValueType (DDE Value Types)

This simple type indicates the type of the DDE value.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Boolean)	Indicates that the value is a boolean.
e (Error)	Indicates that the value is an error.
n (Real Number)	Indicates that the value is a real number.
nil (Nil)	Indicates that the value is nil.
str (String)	Indicates that the value is a string.

**Referenced By**

value@t (§3.14.18)

 <enumeration value="b"/>
 <enumeration value="n"/>
 <enumeration value="e"/>
 <enumeration value="str"/>
 </restriction>
</simpleType>
```

### 3.18.25 ST\_DvAspect (Data View Aspect Type)

Specifies the desired data or view aspect of the object when drawing or getting data.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
DVASPECT_CONTENT (Object Display Content)	Provides a representation of an object so it can be displayed as an embedded object inside of a container.
DVASPECT_ICON (Object Display Icon)	Provides an iconic representation of an object.

#### Referenced By

oleObject@dvAspect (§3.3.1.57)

```
<simpleType name="ST_DvAspect">
 <restriction base="xsd:string">
 <enumeration value="DVASPECT_CONTENT"/>
 <enumeration value="DVASPECT_ICON"/>
 </restriction>
</simpleType>
```

### 3.18.26 ST\_DxfId (Format Id)

This simple type defines the identifier to CT\_Dxfs in the styles part. This a zero-based index. See §3.8.30 in Style for more information on formats.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

#### Referenced By

cfRule@dxfId (§3.3.1.9); colorFilter@dxfId (§3.3.2.1); format@dxfId (§3.10.1.35); sortCondition@dxfId (§3.3.1.88); table@dataDxfId (§3.5.1.2); table@headerRowBorderDxfId (§3.5.1.2); table@headerRowDxfId (§3.5.1.2); table@tableBorderDxfId (§3.5.1.2); table@totalsRowBorderDxfId (§3.5.1.2); table@totalsRowDxfId (§3.5.1.2); tableColumn@dataDxfId (§3.5.1.3); tableColumn@headerRowDxfId (§3.5.1.3); tableColumn@totalsRowDxfId (§3.5.1.3); tableStyleElement@dxfId (§3.8.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DxfId">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

### 3.18.27 ST\_DynamicFilterType (Dynamic Filter)

These are the dynamic filter types. A dynamic filter returns a result set which may vary due to a change in the data itself or a change in the date on which the filter is being applied. For example, for a set of data {1,1,2,3}, the

1 aboveAverage filter would return or highlight the last two values in the set. If the data is refreshed or changed to  
 2 {1,1,1,2}, then only the last value would be highlighted. Similarly, the meaning of "lastQuarter" shall be the same  
 3 for the dates in January, February, and March, but shall change meaning once the date advances from March to  
 4 April.

5 This simple type's contents are a restriction of the XML Schema string datatype.

6 The following are possible enumeration values for this type:

Enumeration Value	Description
aboveAverage (Above Average)	Shows values that are above average.
belowAverage (Below Average)	Shows values that are below average.
lastMonth (Last Month)	Shows last month's dates.
lastQuarter (Last Quarter)	Shows last quarter's dates.
lastWeek (Last Week)	Shows last week's dates.
lastYear (Last Year)	Shows last year's dates.
M1 (1st Month)	Shows the dates that are in January, regardless of year.
M10 (10th Month)	Shows the dates that are in October, regardless of year.
M11 (11th Month)	Shows the dates that are in November, regardless of year.
M12 (12th Month)	Shows the dates that are in December, regardless of year.
M2 (2nd Month)	Shows the dates that are in February, regardless of year.
M3 (3rd Month)	Shows the dates that are in March, regardless of year.
M4 (4th Month)	Shows the dates that are in April, regardless of year.
M5 (5th Month)	Shows the dates that are in May, regardless of year.
M6 (6th Month)	Shows the dates that are in June, regardless of year.
M7 (7th Month)	Shows the dates that are in July, regardless of year.
M8 (8th Month)	Shows the dates that are in August, regardless of year.
M9 (9th Month)	Shows the dates that are in September, regardless of year.
nextMonth (Next Month)	Shows next month's dates.
nextQuarter (Next Quarter)	Shows next quarter's dates.
nextWeek (Next Week)	Shows next week's dates.
nextYear (Next Year)	Shows next year's dates.
null (Null)	Common filter type not available.

Enumeration Value	Description
Q1 (1st Quarter)	Shows the dates that are in the 1st quarter, regardless of year.
Q2 (2nd Quarter)	Shows the dates that are in the 2nd quarter, regardless of year.
Q3 (3rd Quarter)	Shows the dates that are in the 3rd quarter, regardless of year.
Q4 (4th Quarter)	Shows the dates that are in the 4th quarter, regardless of year.
thisMonth (This Month)	Shows this month's dates.
thisQuarter (This Quarter)	Shows this quarter's dates.
thisWeek (This Week)	Shows this week's dates.
thisYear (This Year)	Shows this year's dates.
today (Today)	Shows today's dates.
tomorrow (Tomorrow)	Shows tomorrow's dates.
yearToDate (Year To Date)	Shows the dates between the beginning of the year and today, inclusive.
yesterday (Yesterday)	Shows yesterday's dates.

1

Referenced By
dynamicFilter@type (§3.3.2.5)

 </restriction>
</simpleType>
```

### 3.18.28 ST\_ExternalConnectionType (Text Field Datatype)

These are the possible data types to use when importing text into the SpreadsheetML document. Strings are converted to these data types in the worksheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
DMY (Day Month Year)	Field contains a date in the order: day, month, year.
DYM (Day Year Month)	Field contains a date in the order: day, year, month.
EMD (East Asian Year Month Day)	Field contains an East Asian date in the order: EA era year, month, day.
general (General)	The SpreadsheetML application decides the best fit data type based on the content.
MDY (Month Day Year)	Field contains a date in the order: month, day, year.
MYD (Month Day Year)	Field contains a date in the order: month, year, day.
skip (Skip Field)	Don't import this field at all.
text (Text)	Field contains text.
YDM (Year Day Month)	Field contains a date in the order: year, day, month.
YMD (Year Month Day)	Field contains a date in the order: year, month, day.

1

textField@type (§3.13.10)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_ExternalConnectionType">
4 <restriction base="xsd:string">
5 <enumeration value="general"/>
6 <enumeration value="text"/>
7 <enumeration value="MDY"/>
8 <enumeration value="DMY"/>
9 <enumeration value="YMD"/>
10 <enumeration value="MYD"/>
11 <enumeration value="DYM"/>
12 <enumeration value="YDM"/>
13 <enumeration value="skip"/>
14 <enumeration value="EMD"/>
15 </restriction>
16 </simpleType>

```

### 17 3.18.29 ST\_FieldSortType (Field Sort Type)

18 This simple type defines the sort orders that can be applied to fields in a PivotTable.

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
ascending (Ascending)	Indicates the field is sorted in ascending order.

Enumeration Value	Description
descending (Descending)	Indicates the field is sorted in descending order.
manual (Manual Sort)	Indicates the field is sorted manually.

1

Referenced By
pivotField@sortType (§3.10.1.69)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_FieldSortType">
4 <restriction base="xsd:string">
5 <enumeration value="manual"/>
6 <enumeration value="ascending"/>
7 <enumeration value="descending"/>
8 </restriction>
9 </simpleType>
```

### 10 3.18.30 ST\_FileType (File Type)

11 The file type being used for text import.

12 This simple type's contents are a restriction of the XML Schema string datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
dos (DOS)	DOS (PC-8).
mac (Macintosh)	Macintosh.
win (Windows (ANSI))	Windows (ANSI).

14

Referenced By
textPr@fileType (§3.13.12)

19 <enumeration value="win"/>
20 <enumeration value="dos"/>
21 </restriction>
22 </simpleType>
```

### 23 3.18.31 ST\_FillId (Fill Id)

24 Zero-based index used to reference a fill record.

- 1 This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
xf@fillId (§3.8.45)

- 2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_FillId">
4 <restriction base="xsd:unsignedInt"/>
5 </simpleType>

```

### 6 3.18.32 ST\_FilterOperator (Filter Operator)

- 7 Operator enumerations for filtering.

- 8 This simple type's contents are a restriction of the XML Schema string datatype.

- 9 The following are possible enumeration values for this type:

Enumeration Value	Description
equal (Equal)	Show results which are equal to criteria.
greaterThan (Greater Than)	Show results which are greater than criteria.
greaterThanOrEqual (Greater Than Or Equal)	Show results which are greater than or equal to criteria.
lessThan (Less Than)	Show results which are less than criteria.
lessThanOrEqual (Less Than Or Equal)	Show results which are less than or equal to criteria.
notEqual (Not Equal)	Show results which are not equal to criteria.

10

Referenced By
customFilter@operator (§3.3.2.2)

```

12 <simpleType name="ST_FilterOperator">
13 <restriction base="xsd:string">
14 <enumeration value="equal"/>
15 <enumeration value="lessThan"/>
16 <enumeration value="lessThanOrEqual"/>
17 <enumeration value="notEqual"/>
18 <enumeration value="greaterThanOrEqual"/>
19 <enumeration value="greaterThan"/>
20 </restriction>
21 </simpleType>

```

### 22 3.18.33 ST\_FontId (Font Id)

- 23 An integer that represents a zero based index into the <fonts> collection in the style sheet.

- 1 This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
phoneticPr@fontId (§3.4.3); xf@fontId (§3.8.45)

- 2 The following XML Schema fragment defines the contents of this simple type:

```
3 <simpleType name="ST_FontId">
4 <restriction base="xsd:unsignedInt"/>
5 </simpleType>
```

### 6 3.18.34 ST\_FontScheme (Font scheme Styles)

- 7 Defines the font scheme, if any, to which this font belongs.

- 8 This simple type's contents are a restriction of the XML Schema string datatype.

- 9 The following are possible enumeration values for this type:

Enumeration Value	Description
major (Major Font)	This font is the major font for this theme.
minor (Minor Font)	This font is the minor font for this theme.
none (None)	This font is not a theme font.

10

Referenced By
scheme@val (§3.8.36)

- 11 The following XML Schema fragment defines the contents of this simple type:

```
12 <simpleType name="ST_FontScheme">
13 <restriction base="xsd:string">
14 <enumeration value="none"/>
15 <enumeration value="major"/>
16 <enumeration value="minor"/>
17 </restriction>
18 </simpleType>
```

### 19 3.18.35 ST\_FormatAction (PivotTable Format Types)

- 20 This simple type defines the type of formats that can be applied to PivotTables.

- 21 This simple type's contents are a restriction of the XML Schema string datatype.

- 22 The following are possible enumeration values for this type:

Enumeration Value	Description
blank (Blank)	Indicates no format is applied to the PivotTable. This value is used when formatting is cleared from already

Enumeration Value	Description
	formatted cells in the PivotTable.
drill (Drill Type)	Indicates the PivotTable has drill-through format.
formatting (Formatting)	Indicates the PivotTable has formatting.
formula (Formula Type)	Indicates the PivotTable has formulas.

1

Referenced By
format@action (§3.10.1.35)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_FormatAction">
4 <restriction base="xsd:string">
5 <enumeration value="blank"/>
6 <enumeration value="formatting"/>
7 <enumeration value="drill"/>
8 <enumeration value="formula"/>
9 </restriction>
10 </simpleType>
```

### 11 3.18.36 ST\_Formula (Formula)

12 A formula

13 This simple type's contents are a restriction of the ST\_Xstring simple type (§3.18.96).

Referenced By
formula (§3.3.1.40); formula1 (§3.3.1.41); formula2 (§3.3.1.42); oldFormula (§3.11.1.7)

### 14 3.18.37 ST\_FormulaExpression (Formula Expression Type)

15 This simple type specifies an expression type that can comprise a formula.

16 This simple type's contents are a restriction of the XML Schema string datatype.

17 The following are possible enumeration values for this type:

Enumeration Value	Description
area (Area)	Reference to a range of cells.
areaError (Area Error)	Reference to a range of cells that now evaluates to an error.
computedArea (Computed Area)	Computed area reference.
ref (Reference)	Single cell reference.
refError (Reference Is Error)	Single cell reference that now evaluates to an error.

18

Referenced By
undo@exp (§3.11.1.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FormulaExpression">
 <restriction base="xsd:string">
 <enumeration value="ref"/>
 <enumeration value="refError"/>
 <enumeration value="area"/>
 <enumeration value="areaError"/>
 <enumeration value="computedArea"/>
 </restriction>
</simpleType>
```

### 3.18.38 ST\_GradientType (Gradient Type)

Type of gradient fill being used, either linear or path.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
linear (Linear Gradient)	This gradient fill is of linear gradient type. Linear gradient type means that the transition from one color to the next is along a line (e.g., horizontal, vertical, diagonal, etc.).
path (Path)	This gradient fill is of path gradient type. Path gradient type means the that the boundary of transition from one color to the next is a rectangle, defined by top, bottom, left, and right attributes on the gradientFill element.

Referenced By
gradientFill@type (§3.8.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_GradientType">
 <restriction base="xsd:string">
 <enumeration value="linear"/>
 <enumeration value="path"/>
 </restriction>
</simpleType>
```

### 3.18.39 ST\_GroupBy (Values Group By)

This simple type defines types of data grouping that can be performed on a PivotTable.

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
days (Days)	Indicates a grouping on "days" for date values.
hours (Hours)	Indicates a grouping on "hours" for date values.
minutes (Minutes)	Indicates a grouping on "minutes" for date values.
months (Months)	Indicates a grouping on "months" for date values.
quarters (Quarters)	Indicates a grouping on "quarters" for date values.
range (Group By Numeric Ranges)	Indicates a grouping by numeric ranges for numeric values.
seconds (Seconds)	Indicates a grouping on "seconds" for date values.
years (Years)	Indicates a grouping on "years" for date values.

3

Referenced By
rangePr@groupBy (§3.10.1.78)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_GroupBy">
6 <restriction base="xsd:string">
7 <enumeration value="range"/>
8 <enumeration value="seconds"/>
9 <enumeration value="minutes"/>
10 <enumeration value="hours"/>
11 <enumeration value="days"/>
12 <enumeration value="months"/>
13 <enumeration value="quarters"/>
14 <enumeration value="years"/>
15 </restriction>
16 </simpleType>

```

### 17 3.18.40 ST\_GrowShrinkType (Grow Shrink Type)

18 This type enumerates behavior patterns for refreshing external data in a query table.

19 This simple type's contents are a restriction of the XML Schema string datatype.

20 The following are possible enumeration values for this type:

Enumeration Value	Description
insertClear (Insert & Clear On Refresh)	Insert entire rows for new data, clear unused cells.
insertDelete (Insert & Delete On Refresh)	Insert cells for new data, delete unused cells.

Enumeration Value	Description
overwriteClear (Overwrite & Clear On Refresh)	Overwrite existing cells with new data, clear unused cells.

1

Referenced By
queryTable@growShrinkType (§3.12.2)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_GrowShrinkType">
4 <restriction base="xsd:string">
5 <enumeration value="insertDelete"/>
6 <enumeration value="insertClear"/>
7 <enumeration value="overwriteClear"/>
8 </restriction>
9 </simpleType>
```

### 10 3.18.41 ST\_Guid (Globally Unique Identifier)

11 This simple type defines a 128 bit Globally Unique Identifier (GUID).

12 This simple type's contents are a restriction of the XML Schema token datatype.

13 This simple type also specifies the following restrictions:

- 14 • This simple type's contents must match the following regular expression pattern: `\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}`.

15

Referenced By
comment@guid (§3.7.3); customSheetView@guid (§3.3.1.22); customSheetView@guid (§3.3.1.23); customWorkbookView@guid (§3.2.3); fileVersion@codeName (§3.2.13); header@guid (§3.11.1.1); headers@guid (§3.11.1.2); headers@lastGuid (§3.11.1.2); rcmt@guid (§3.11.1.11); rcv@guid (§3.11.1.12); userInfo@guid (§3.11.2.1)

16 The following XML Schema fragment defines the contents of this simple type:

```

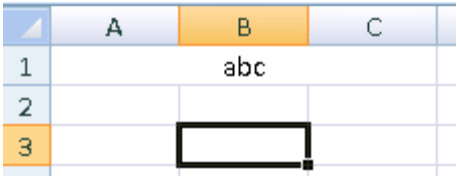

17 <simpleType name="ST_Guid">
18 <restriction base="xsd:token">
19 <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}" />
20 </restriction>
21 </simpleType>
```

### 22 3.18.42 ST\_HorizontalAlignment (Horizontal Alignment Type)

23 The enumeration value indicating the portion of Cell Alignment in a cell format (XF) that is horizontal alignment, i.e., whether it is aligned general, left, right, horizontally centered, filled (replicated), justified, centered across multiple cells, or distributed.

26 This simple type's contents are a restriction of the XML Schema string datatype.

1 The following are possible enumeration values for this type:

Enumeration Value	Description
center (Centered Horizontal Alignment)	The horizontal alignment is centered, meaning the text is centered across the cell.
centerContinuous (Center Continuous Horizontal Alignment)	<p>The horizontal alignment is centered across multiple cells. The information about how many cells to span is expressed in the Sheet Part, in the row of the cell in question. For each cell that is spanned in the alignment, a cell element needs to be written out, with the same style Id which references the centerContinuous alignment.</p> <p>[Example: This shows the value of A1 centered across A1:C1:</p>  <p>The XML from the Sheet Part:</p> <pre>&lt;row r="1" spans="1:3"&gt;   &lt;c r="A1" s="1" t="s"&gt;     &lt;v&gt;0&lt;/v&gt;   &lt;/c&gt;   &lt;c r="B1" s="1"/&gt;   &lt;c r="C1" s="1"/&gt; &lt;/row&gt;</pre> <p>The XML from the Styles Part:</p> <pre>&lt;cellXfs count="2"&gt;   &lt;xf numFmtId="0" fontId="0"     fillId="0" borderId="0" xfId="0"/&gt;   &lt;xf numFmtId="0" fontId="0"     fillId="0" borderId="0" xfId="0"     applyAlignment="1"&gt;     &lt;alignment       horizontal="centerContinuous"/&gt;   &lt;/xf&gt; &lt;/cellXfs&gt;</pre> <p>end example]</p>
distributed (Distributed Horizontal Alignment)	l/ndicates that each 'word' in each line of text inside

Enumeration Value	Description																		
	<p>the cell is evenly distributed across the width of the cell, with flush right and left margins.</p> <p>When there is also an indent value to apply, both the left and right side of the cell are padded by the indent value.</p> <p>A 'word' is a set of characters with no space character in them.</p> <p>Two lines inside a cell are separated by a carriage return.</p> <p>[<i>Example:</i> This shows three lines of text evenly distributed horizontally across the cell. The first line is "abc def ghi", the second line is blank, and the third line is "jkl mno".</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td>abc def ghi</td></tr><tr><td>2</td><td></td><td>jkl mno</td></tr></table> <p>This shows the same example, with an indent value of 2:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td>abc def ghi</td></tr><tr><td>2</td><td></td><td>jkl mno</td></tr></table> <p>Note: there is no vertical component to the alignment being shown here. The row has been manually adjusted to display the text. <i>end example]</i></p>		A	B	1		abc def ghi	2		jkl mno		A	B	1		abc def ghi	2		jkl mno
	A	B																	
1		abc def ghi																	
2		jkl mno																	
	A	B																	
1		abc def ghi																	
2		jkl mno																	
fill (Fill)	<p>Indicates that the value of the cell should be filled across the entire width of the cell. If blank cells to the right also have the fill alignment, they are also filled with the value, using a convention similar to centerContinuous.</p>																		

Enumeration Value	Description																		
	<p>Additional rules:</p> <ul style="list-style-type: none"><li>• Only whole values can be appended, not partial values.</li><li>• The column will not be widened to 'best fit' the filled value</li><li>• If appending an additional occurrence of the value exceeds the boundary of the cell left/right edge, don't append the additional occurrence of the value.</li><li>• The display value of the cell is filled, not the underlying raw number.</li></ul> <p>[Example: This cell is filled with the value 1.2345 and has a width of 15 characters:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td>2</td><td></td><td>1.23451.2345</td></tr></table> <p>This cell is filled with the value abc and has width of 15 characters:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td>2</td><td></td><td>abcbabcbabcbabc</td></tr></table> <p>end example]</p>		A	B	1			2		1.23451.2345		A	B	1			2		abcbabcbabcbabc
	A	B																	
1																			
2		1.23451.2345																	
	A	B																	
1																			
2		abcbabcbabcbabc																	
general (General Horizontal Alignment)	<p>The horizontal alignment is general-aligned. Text data is left-aligned. Numbers, dates, and times are right-aligned. Boolean types are centered. Changing the alignment does not change the type of data.</p> <p>[Example: These cells are general aligned:</p> <table><tr><td></td><td>1-Jan</td></tr><tr><td></td><td>45</td></tr><tr><td></td><td>abc</td></tr><tr><td></td><td>TRUE</td></tr></table> <p>end example]</p>		1-Jan		45		abc		TRUE										
	1-Jan																		
	45																		
	abc																		
	TRUE																		

Enumeration Value	Description
justify (Justify)	<p>The horizontal alignment is justified (flush left and right). For each line of text, aligns each line of the wrapped text in a cell to the right and left (except the last line). If no single line of text wraps in the cell, then the text is not justified.</p> <p>[<i>Example:</i> There are two lines of text in this cell, and the cell's horizontal alignment is justify:</p> <div><div>one two three four five six seven eight nine ten eleven twelve thirteen fourteen fifteen sixteen seventeen eighteen nineteen  six seven eight nine ten eleven twelve</div></div> <p><i>end example]</i></p>
left (Left Horizontal Alignment)	<p>The horizontal alignment is left-aligned, even in Right-to-Left mode. Aligns contents at the left edge of the cell. If an indent amount is specified, the contents of the cell is indented from the left by the specified number of character spaces. The character spaces are based on the default font and font size for the workbook.</p>
right (Right Horizontal Alignment)	<p>The horizontal alignment is right-aligned, meaning that cell contents are aligned at the right edge of the cell, even in Right-to-Left mode.</p>

1

Referenced By
alignment@horizontal (§3.8.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HorizontalAlignment">
 <restriction base="xsd:string">
 <enumeration value="general"/>
 <enumeration value="left"/>
 <enumeration value="center"/>
 <enumeration value="right"/>
 <enumeration value="fill"/>
 <enumeration value="justify"/>
 <enumeration value="centerContinuous"/>
 <enumeration value="distributed"/>
 </restriction>
</simpleType>
```

### 3.18.43 ST\_HtmlFmt (HTML Formatting Handling)

How to handle formatting from the HTML source.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Transfer all HTML formatting into the worksheet along with data.
none (No Formatting)	Bring data in as unformatted text (setting data types still occurs).
rtf (Honor Rich Text)	Translate HTML formatting to rich text formatting on the data brought into the worksheet.

#### Referenced By

webPr@htmlFormat (§3.13.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HtmlFmt">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="rtf"/>
 <enumeration value="all"/>
 </restriction>
</simpleType>
```

### 3.18.44 ST\_IconSetType (Icon Set Type)

Icon set type for conditional formatting. The threshold values for triggering the different icons within a set are configurable, and the icon order is reversible. See element iconSet for more information.

- 1 This simple type's contents are a restriction of the XML Schema string datatype.
- 2 The following are possible enumeration values for this type:

Enumeration Value	Description
3Arrows (3 Arrows)	3 arrows icon set. 
3ArrowsGray (3 Arrows (Gray))	3 gray arrows icon set. 
3Flags (3 Flags)	3 flags icon set. 
3Signs (3 Signs)	3 signs icon set. 
3Symbols (3 Symbols Circled)	3 symbols icon set. 
3Symbols2 (3 Symbols)	3 Symbols icon set. 
3TrafficLights1 (3 Traffic Lights)	3 traffic lights icon set (#1). 
3TrafficLights2 (3 Traffic Lights Black)	3 traffic lights icon set with thick black border. 

Enumeration Value	Description
4Arrows (4 Arrows)	4 arrows icon set. 
4ArrowsGray (4 Arrows (Gray))	4 gray arrows icon set. 
4Rating (4 Ratings)	4 ratings icon set. 
4RedToBlack (4 Red To Black)	4 'red to black' icon set. 
4TrafficLights (4 Traffic Lights)	4 traffic lights icon set. 
5Arrows (5 Arrows)	5 arrows icon set. 
5ArrowsGray (5 Arrows (Gray))	5 gray arrows icon set. 
5Quarters (5 Quarters)	5 quarters icon set. 
5Rating (5 Ratings Icon Set)	5 rating icon set.

Enumeration Value	Description
	

Referenced By

iconFilter@iconSet (§3.3.2.9); iconSet@iconSet (§3.3.1.46); sortCondition@iconSet (§3.3.1.88)

The following XML Schema fragment defines the contents of this simple type:

 <enumeration value="5Rating"/>
 <enumeration value="5Quarters"/>
 </restriction>
</simpleType>
```

3.18.45 ST\_ItemType (PivotItem Type)

This simple type defines the type for a pivotItem.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
avg (Average)	Indicates the pivot item represents an "average" aggregate function.
blank (Blank Pivot Item)	Indicates the pivot item represents a blank line.
count (Count)	Indicates the pivot item represents custom the "count" aggregate."
countA (CountA)	Indicates the pivot item represents the "count

Enumeration Value	Description
	numbers" aggregate function.
data (Data)	Indicate the pivot item represents data.
default (Default)	Indicates the pivot item represents the default type for this PivotTable. The default pivot item type is the "total" aggregate function.
grand (Grand Total Item)	Indicates the pivot items represents the grand total line.
max (Max)	Indicates the pivot item represents the "maximum" aggregate function.
min (Min)	Indicates the pivot item represents the "minimum" aggregate function.
product (Product)	Indicates the pivot item represents the "product" function.
stdDev (stdDev)	Indicates the pivot item represents the "standard deviation" aggregate function.
stdDevP (StdDevP)	Indicates the pivot item represents the "standard deviation population" aggregate function.
sum (Sum)	Indicates the pivot item represents the "sum" aggregate value.
var (Var)	Indicates the pivot item represents the "variance" aggregate value.
varP (VarP)	Indicates the pivot item represents the "variance population" aggregate value.

 <enumeration value="varP"/>
 <enumeration value="grand"/>
 <enumeration value="blank"/>
 </restriction>
</simpleType>
```

### 3.18.46 ST\_MdxFunctionType (MDX Function Type)

This simple type is an enumeration representing different MDX function types.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
c (Cube Set Count)	CUBESETCOUNT
k (Cube KPI Member)	CUBEKPIMEMBER
m (Cube Member)	CUBEMEMBER
p (Cube Member Property)	CUBEMEMBERPROPERTY
r (Cube Ranked Member)	CUBERANKEDMEMBER
s (Cube Set)	CUBESET
v (Cube Value)	CUBEVALUE

#### Referenced By

mdx@f (§3.9.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MdxFunctionType">
 <restriction base="xsd:string">
 <enumeration value="m"/>
 <enumeration value="v"/>
 <enumeration value="s"/>
 <enumeration value="c"/>
 <enumeration value="r"/>
 <enumeration value="p"/>
 <enumeration value="k"/>
 </restriction>
</simpleType>
```

### 3.18.47 ST\_MdxKPIProperty (MDX KPI Property)

An enumeration representing the different types of KPI properties.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
g (Goal)	Goal.
m (Current Time Member)	Current time member.
s (Status)	Status.
t (Trend)	Trend.
v (Value)	Value.
w (Weight)	Weight.

#### Referenced By

k@p (§3.9.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MdxKPIProperty">
 <restriction base="xsd:string">

 <enumeration value="g"/>
 <enumeration value="s"/>
 <enumeration value="t"/>
 <enumeration value="w"/>
 <enumeration value="m"/>
 </restriction>
</simpleType>
```

### 3.18.48 ST\_MdxSetOrder (MDX Set Order)

This type represents an enumeration specifying an MDX set order.

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
a (Ascending)	Sort ascending.
aa (Alpha Ascending Sort Order)	Sorted alphabetically in ascending order by the caption.
ad (Alpha Descending Sort Order)	Sort in descending order alphabetically by the caption.
d (Descending)	Sort descending.
na (Natural Ascending)	Sorted in ascending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this may be in order of account number.
nd (Natural Descending)	Sorted in descending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this may be in order of account number.
u (Unsorted)	Unsorted.

8 <enumeration value="a"/>
9 <enumeration value="d"/>
10 <enumeration value="aa"/>
11 <enumeration value="ad"/>
12 <enumeration value="na"/>
13 <enumeration value="nd"/>
14 </restriction>
15 </simpleType>
```

### 16 3.18.49 ST\_NumFmtId (Number Format Id)

17 This simple type defines the identifier to a style sheet number format entry in CT\_NumFmts. Number formats  
18 are written to the styles part. See §1.1.31 in Style for more information on number formats.

19 This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By

```
<simpleType name="ST_NumFmtId">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

**3.18.50 ST\_Objects (Object Display Types)**

This simple type defines how the application displays objects in this workbook. Objects might include charts, images, and other object data that the application supports.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Indicates that all objects be shown in the workbook.
none (None)	Indicates that all objects be hidden in the workbook.
placeholders (Show Placeholders)	Indicates that the application show placeholders for objects in the workbook.

**Referenced By**

customWorkbookView@showObjects (§3.2.3); workbookPr@showObjects (§3.2.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Objects">

 <enumeration value="all"/>
 <enumeration value="placeholders"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

**3.18.51 ST\_OleUpdate (OLE Update Types)**

Indicates whether the linked object updates the cached data for the linked object automatically or only when the container calls IOleObject::Update or IOleLink::Update methods.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
OLEUPDATE_ALWAYS (Always Update OLE)	Update the link object whenever possible, this option corresponds to the 'automatic update' option in the Links dialog box.
OLEUPDATE_ONCALL (Update OLE On Call)	Update the link object only when IOleObject::Update or IOleLink::Update is called, this option corresponds to the Manual update option in the Links dialog box.

#### Referenced By

 <restriction base="xsd:string">
 <enumeration value="OLEUPDATE_ALWAYS"/>
 <enumeration value="OLEUPDATE_ONCALL"/>
 </restriction>
</simpleType>
```

### 3.18.52 ST\_Orientation (Orientation)

Print orientation for this sheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default)	Orientation not specified, use the default.
landscape (Landscape)	Landscape orientation.
portrait (Portrait)	Portrait orientation.

#### Referenced By

pageSetup@orientation (§3.3.1.62); pageSetup@orientation (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Orientation">
 <restriction base="xsd:string">
 <enumeration value="default"/>
 <enumeration value="portrait"/>
 <enumeration value="landscape"/>
 </restriction>
</simpleType>
```

### 3.18.53 ST\_PageOrder (Page Order)

Specifies printed page order.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
downThenOver (Down Then Over)	Order pages vertically first, then move horizontally.
overThenDown (Over Then Down)	Order pages horizontally first, then move vertically

#### Referenced By

pageSetup@pageOrder (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageOrder">
 <restriction base="xsd:string">
 <enumeration value="downThenOver"/>
 <enumeration value="overThenDown"/>
 </restriction>
</simpleType>
```

### 3.18.54 ST\_Pane (Pane Types)

Defines the names of the four possible panes into which the view of a workbook in the application can be split.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottomLeft (Bottom Left Pane)	Bottom left pane, when both vertical and horizontal splits are applied.  This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the bottom pane.
bottomRight (Bottom Right Pane)	Bottom right pane, when both vertical and horizontal splits are applied.
topLeft (Top Left Pane)	Top left pane, when both vertical and horizontal splits are applied.  This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower

Enumeration Value	Description
	regions. In that case, this value specifies the top pane.  This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the left pane
topRight (Top Right Pane)	Top right pane, when both vertical and horizontal splits are applied.  This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the right pane.

pane@activePane (§3.3.1.64); pivotSelection@pane (§3.3.1.67); selection@pane (§3.3.1.75)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_Pane">
4 <restriction base="xsd:string">
5 <enumeration value="bottomRight"/>
6 <enumeration value="topRight"/>
7 <enumeration value="bottomLeft"/>
8 <enumeration value="topLeft"/>
9 </restriction>
10 </simpleType>

```

### 11 3.18.55 ST\_PaneState (Pane State)

12 State of the sheet's pane.

13 This simple type's contents are a restriction of the XML Schema string datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
frozen (Frozen)	Panes are frozen, but were not split being frozen. In this state, when the panes are unfrozen again, a single pane results, with no split.  In this state, the split bars are not adjustable.
frozenSplit (Frozen Split)	Panes are frozen and were split before being frozen. In this state, when the panes are unfrozen again, the split remains, but is adjustable.
split (Split)	Panes are split, but not frozen. In this state, the split

Enumeration Value	Description
	bars are adjustable by the user.

pane@state (§3.3.1.64)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_PaneState">
4 <restriction base="xsd:string">
5 <enumeration value="split"/>
6 <enumeration value="frozen"/>
7 <enumeration value="frozenSplit"/>
8 </restriction>
9 </simpleType>

```

### 10 3.18.56 ST\_ParameterType (Parameter Type)

11 Parameter Type.

12 This simple type's contents are a restriction of the XML Schema string datatype.

13 The following are possible enumeration values for this type:

Enumeration Value	Description
cell (Parameter From Cell)	Get the parameter value from a cell on each refresh.
prompt (Prompt on Refresh)	Prompt the user on each refresh for a parameter value.
value (Value)	Use a constant value on each refresh for the parameter value.

14

Referenced By
parameter@parameterType (§3.13.6)

15 The following XML Schema fragment defines the contents of this simple type:

```

16 <simpleType name="ST_ParameterType">
17 <restriction base="xsd:string">
18 <enumeration value="prompt"/>
19 <enumeration value="value"/>
20 <enumeration value="cell"/>
21 </restriction>
22 </simpleType>

```

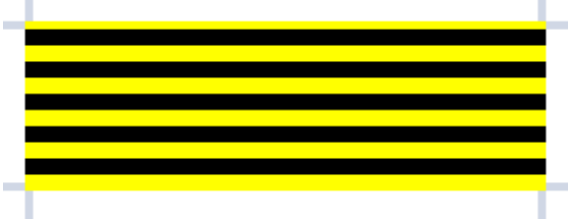

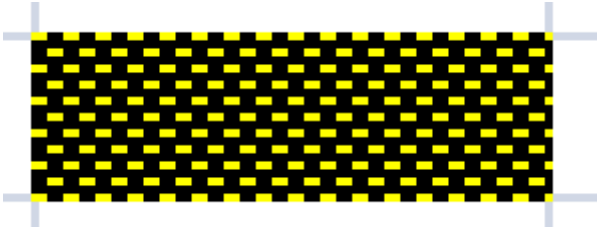

### 23 3.18.57 ST\_PatternType (Pattern Type)

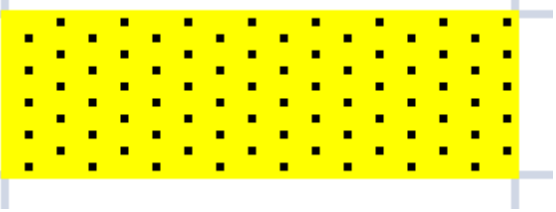

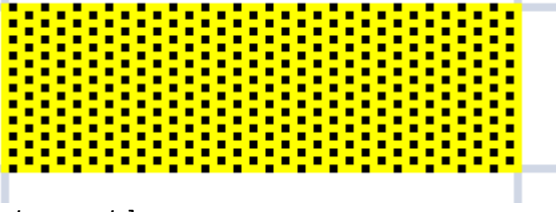

24 Indicates the style of fill pattern being used for a cell format.

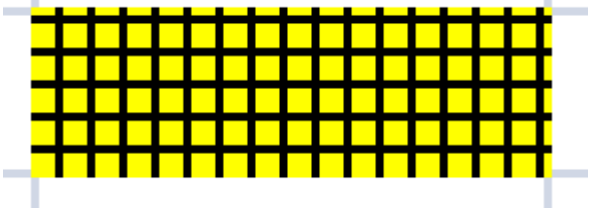

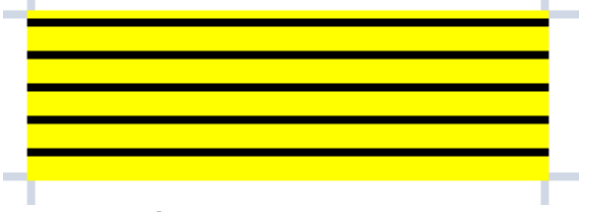

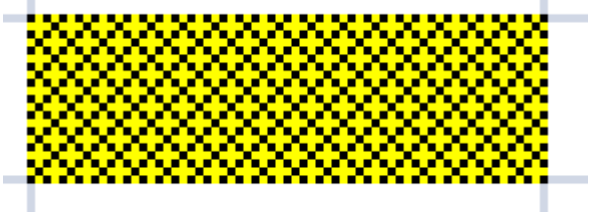

- 1 The examples below use yellow background and black foreground colors.
- 2 This simple type's contents are a restriction of the XML Schema string datatype.
- 3 The following are possible enumeration values for this type:

Enumeration Value	Description
darkDown (Dark Down)	<div>The fill style is 'dark down'. [Example:  end example]</div>
darkGray (Dary Gray)	<div>The fill style is 'dark gray'. [Example:  end example]</div>
darkGrid (Dark Grid)	<div>The fill style is 'dark grid'. [Example:  end example]</div>
darkHorizontal (Dark Horizontal)	<div>The fill style is dark horizontal. [Example:</div>

Enumeration Value	Description
	 <i>end example]</i>
darkTrellis (Dark Trellis)	The fill style is 'dark trellis'. [Example:  <i>end example]</i>
darkUp (Dark Up)	The fill style is 'dark up'. [Example:  <i>end example]</i>
darkVertical (Dark Vertical)	The fill style is 'dark vertical'. [Example:  <i>end example]</i>
gray0625 (Gray 0.0625)	The fill style is grayscale of 0.0625 (1/16) value. [Example:

Enumeration Value	Description
	 <i>end example]</i>
gray125 (Gray 0.125)	The fill style is grayscale of 0.125 (1/8) value. [Example:  <i>end example]</i>
lightDown (Light Down)	The fill style is 'light down'. [Example:  <i>end example]</i>
lightGray (Light Gray)	The fill style is light gray. [Example:  <i>end example]</i>
lightGrid (Light Grid)	The fill style is 'light grid'. [Example:

Enumeration Value	Description
	 <p><i>end example]</i></p>
lightHorizontal (Light Horizontal)	<p>The fill style is light horizontal. [Example:</p>  <p><i>end example]</i></p>
lightTrellis (Light Trellis)	<p>The fill style is 'light trellis'. [Example:</p>  <p><i>end example]</i></p>
lightUp (Light Up)	<p>The fill style is light up. [Example:</p>  <p><i>end example]</i></p>
lightVertical (Light Vertical)	<p>The fill style is light vertical.</p>
mediumGray (Medium Gray)	<p>The fill style is medium gray. [Example:</p>

Enumeration Value	Description
	 <i>end example]</i>
none (None)	<p>The fill style is none (no fill). When foreground and/or background colors are specified, a pattern of 'none' overrides and means the cell has no fill.</p> <p>[Example:</p>  <i>end example]</i>
solid (Solid)	<p>The fill style is solid. When solid is specified, the foreground color (fgColor) is the only color rendered, even when a background color (bgColor) is also specified.</p> <p>[Example:</p>  <i>end example]</i>

 <enumeration value="darkVertical"/>
 <enumeration value="darkDown"/>
 <enumeration value="darkUp"/>
 <enumeration value="darkGrid"/>
 <enumeration value="darkTrellis"/>
 <enumeration value="lightHorizontal"/>
 <enumeration value="lightVertical"/>
 <enumeration value="lightDown"/>
 <enumeration value="lightUp"/>
 <enumeration value="lightGrid"/>
 <enumeration value="lightTrellis"/>
 <enumeration value="gray125"/>
 <enumeration value="gray0625"/>
 </restriction>
</simpleType>
```

**3.18.58 ST\_PhoneticAlignment (Phonetic Alignment Types)**

Phonetic alignment settings. These specify how to align the phonetic text, which represent the sounds, above the base text or base word.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center Alignment)	Center the phonetic characters over the base word, per word.
distributed (Distributed)	Each phonetic character is distributed above each base word character, per word.
left (Left Alignment)	Each phonetic character is left justified with respect to the base text., per word.
noControl (No Control)	Each phonetic character is left justified without respect to the base text (so it is not per word).

Referenced By
phoneticPr@alignment (§3.4.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhonicAlignment">
 <restriction base="xsd:string">
 <enumeration value="noControl"/>
 <enumeration value="left"/>
 <enumeration value="center"/>
 <enumeration value="distributed"/>
 </restriction>
</simpleType>
```

### 3.18.59 ST\_PhonicType (Phonic Type)

Represents the different type of East Asian character sets that shall be used for displaying phonic hints.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fullwidthKatakana (Full-Width Katakana)	Full-width Katakana is used
halfwidthKatakana (Half-Width Katakana)	Half-width Katakana is used, this is the same Katakana character set, just half as wide so it takes up less space.
Hiragana (Hiragana)	Hiragana is used
noConversion (No Conversion)	Any type of characters are allowed. In this case the spreadsheet application shall leave the text as entered.

#### Referenced By

phonicPr@type (§3.4.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhonicType">
 <restriction base="xsd:string">
 <enumeration value="halfwidthKatakana"/>
 <enumeration value="fullwidthKatakana"/>
 <enumeration value="Hiragana"/>
 <enumeration value="noConversion"/>
 </restriction>
</simpleType>
```

### 3.18.60 ST\_PivotAreaType (Rule Type)

Indicates the type of rule being used to describe an area or aspect of the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Refers to the whole PivotTable.
button (Field Button)	Refers to a field button.
data (Data)	Refers to something in the data area.
none (None)	Refers to no Pivot area.
normal (Normal)	Refers to a header or item.
origin (Origin)	Refers to the blank cells at the top-left of the PivotTable (top-right for RTL sheets).
topRight (Top Right)	Refers to the blank cells at the top-right of the PivotTable (top-left for RTL sheets).

2

Referenced By
pivotArea@type (§3.3.1.66)

- 3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_PivotAreaType">
5 <restriction base="xsd:string">
6 <enumeration value="none"/>
7 <enumeration value="normal"/>
8 <enumeration value="data"/>
9 <enumeration value="all"/>
10 <enumeration value="origin"/>
11 <enumeration value="button"/>
12 <enumeration value="topRight"/>
13 </restriction>
14 </simpleType>

```

### 15 3.18.61 ST\_PivotFilterType (Pivot Filter Types)

- 16 This simple type defines filters that can be applied to PivotTables.

- 17 This simple type's contents are a restriction of the XML Schema string datatype.

- 18 The following are possible enumeration values for this type:

Enumeration Value	Description
captionBeginsWith (Caption Begins With)	Indicates the "begins with" filter for field captions.
captionBetween (Caption Is Between)	Indicates the "is between" filter for field captions.
captionContains (Caption Contains)	Indicates the "contains" filter for field captions.
captionEndsWith (Caption Ends With)	Indicates the "ends with" filter for field captions.
captionEqual (Caption Equals)	Indicates the "equal" filter for field captions.

Enumeration Value	Description
captionGreaterThan (Caption Is Greater Than)	Indicates the "is greater than" filter for field captions.
captionGreaterThanOrEqual (Caption Is Greater Than Or Equal To)	Indicates the "is greater than or equal to" filter for field captions.
captionLessThan (Caption Is Less Than)	Indicates the "is less than" filter for field captions.
captionLessThanOrEqual (Caption Is Less Than Or Equal To)	Indicates the "is less than or equal to" filter for field captions.
captionNotBeginsWith (Caption Does Not Begin With)	Indicates the "does not begin with" filter for field captions.
captionNotBetween (Caption Is Not Between)	Indicates the "is not between" filter for field captions.
captionNotContains (Caption Does Not Contain)	Indicates the "does not contain" filter for field captions.
captionNotEndsWith (Caption Does Not End With)	Indicates the "does not end with" filter for field captions.
captionNotEqual (Caption Not Equal)	Indicates the "not equal" filter for field captions.
count (Count)	Indicates the "count" filter.
dateBetween (Date Between)	Indicates the "between" filter for date values.
dateEqual (Date Equals)	Indicates the "equals" filter for date values.
dateNewerThan (Date Newer Than)	Indicates the "newer than" filter for date values.
dateNewerThanOrEqual (Date Newer Than or Equal To)	Indicates the "newer than or equal to" filter for date values.
dateNotBetween (Date Not Between)	Indicates the "not between" filter for date values.
dateNotEqual (Date Does Not Equal)	Indicates the "does not equal" filter for date values.
dateOlderThan (Date Older Than)	Indicates the "older than" filter for date values.
dateOlderThanOrEqual (Date Older Than Or Equal)	Indicates the "older than or equal to" filter for date values.
lastMonth (Last Month)	Indicates the "last month" filter for date values.
lastQuarter (Last Quarter)	Indicates the "last quarter" filter for date values.
lastWeek (Last Week)	Indicates the "last week" filter for date values.
lastYear (Last Year)	Indicates the "last year" filter for date values.
M1 (January)	Indicates the "January" filter for date values.
M10 (Dates in October)	Indicates the "October" filter for date values.
M11 (Dates in November)	Indicates the "November" filter for date values.
M12 (Dates in December)	Indicates the "December" filter for date values.
M2 (Dates in February)	Indicates the "February" filter for date values.
M3 (Dates in March)	Indicates the "March" filter for date values.
M4 (Dates in April)	Indicates the "April" filter for date values.

Enumeration Value	Description
M5 (Dates in May)	Indicates the "May" filter for date values.
M6 (Dates in June)	Indicates the "June" filter for date values.
M7 (Dates in July)	Indicates the "July" filter for date values.
M8 (Dates in August)	Indicates the "August" filter for date values.
M9 (Dates in September)	Indicates the "September" filter for date values.
nextMonth (Next Month)	Indicates the "next month" filter for date values.
nextQuarter (Next Quarter)	Indicates the "next quarter" for date values.
nextWeek (Next Week)	Indicates the "next week" for date values.
nextYear (Next Year)	Indicates the "next year" filter for date values.
percent (Percent)	Indicates the "percent" filter for numeric values.
Q1 (First Quarter)	Indicates the "first quarter" filter for date values.
Q2 (Second Quarter)	Indicates the "second quarter" filter for date values.
Q3 (Third Quarter)	Indicates the "third quarter" filter for date values.
Q4 (Fourth Quarter)	Indicates the "fourth quarter" filter for date values.
sum (Sum)	Indicates the "sum" filter for numeric values.
thisMonth (This Month)	Indicates the "this month" filter for date values.
thisQuarter (This Quarter)	Indicates the "this quarter" filter for date values.
thisWeek (This Week)	Indicates the "this week" filter for date values.
thisYear (This Year)	Indicate the "this year" filter for date values.
today (Today)	Indicates the "today" filter for date values.
tomorrow (Tomorrow)	Indicates the "tomorrow" filter for date values.
unknown (Unknown)	Indicates the PivotTable filter is unknown to the application.
valueBetween (Value Between)	Indicates the "Value between" filter for text and numeric values.
valueEqual (Value Equal)	Indicates the "value equal" filter for text and numeric values.
valueGreaterThan (Value Greater Than)	Indicates the "value greater than" filter for text and numeric values.
valueGreaterThanOrEqual (Value Greater Than Or Equal To)	Indicates the "value greater than or equal to" filter for text and numeric values.
valueLessThan (Value Less Than)	Indicates the "value less than" filter for text and numeric values.
valueLessThanOrEqual (Value Less Than Or Equal To)	Indicates the "value less than or equal to" filter for text and numeric values
valueNotBetween (Value Not Between)	Indicates the "value not between" filter for text and

Enumeration Value	Description
	numeric values.
valueNotEqual (Value Not Equal)	Indicates the "value not equal" filter for text and numeric values.
yearToDate (Year-To-Date)	Indicates the "year-to-date" filter for date values.
yesterday (Yesterday)	Indicates the "yesterday" filter for date values.

18 </simpleType>
```

### 3.18.62 ST\_PrintError (Print Errors)

This enumeration specifies how to display cells with errors when printing the worksheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blank (Show Cell Errors As Blank)	Display cell errors as blank.
dash (Dash Cell Errors)	Display cell errors as dashes.
displayed (Display Cell Errors)	Display cell errors as displayed on screen.
NA (NA)	Display cell errors as #N/A.

23

Referenced By
pageSetup@errors (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
25 <simpleType name="ST_PrintError">
26 <restriction base="xsd:string">
27 <enumeration value="displayed"/>
28 <enumeration value="blank"/>
29 <enumeration value="dash"/>
30 <enumeration value="NA"/>
31 </restriction>
32 </simpleType>
```

### 3.18.63 ST\_Qualifier (Qualifier)

Qualifier to use to denote string data types in when text is imported from an external file.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
doubleQuote (Double Quote)	Quotation mark -- double quote (").
none (No Text Qualifier)	No text string qualifier used.
singleQuote (Single Quote)	Apostrophe mark -- single quote (').

#### Referenced By

textPr@qualifier (§3.13.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Qualifier">
 <restriction base="xsd:string">
 <enumeration value="doubleQuote"/>
 <enumeration value="singleQuote"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

### 3.18.64 ST\_Ref (Cell References)

This simple type defines a reference to a range of cells within a sheet in the workbook. A reference identifies a cell or a range of cells on a worksheet and tells the application where to look for the values or data you want to use in a formula. With references, you can use data contained in different parts of a worksheet in one formula or use the value from one cell in several formulas. You can also refer to cells on other sheets in the same workbook, and to other workbooks. References to cells in other workbooks are called links.

SpreadsheetML defines two reference styles defined in the ST\_RefMode simple type.

This simple type's contents are a restriction of the XML Schema string datatype.

#### Referenced By

autoFilter@ref (§3.3.1.1); comment@ref (§3.7.3); dataRef@ref (§3.3.1.28); dimension@ref (§3.3.1.33); hyperlink@ref (§3.3.1.44); location@ref (§3.10.1.49); mergeCell@ref (§3.3.1.53); oleSize@ref (§3.2.16); pivotArea@offset (§3.3.1.66); raf@ref (§3.11.1.8); rangeSet@ref (§3.10.1.79); rm@destination (§3.11.1.19); rm@source (§3.11.1.19); rqt@ref (§3.11.1.20); rrc@ref (§3.11.1.21); sheetPr@syncRef (§3.3.1.79); sortCondition@ref (§3.3.1.88); sortState@ref (§3.3.1.89); ST\_Ref (§3.18.64); table@ref (§3.5.1.2); webPublishItem@sourceRef (§3.3.1.94); worksheetSource@ref (§3.10.1.95)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Ref">
 <restriction base="xsd:string"/>
</simpleType>
```

### 3.18.65 ST\_RefA (Single Cell Reference)

This simple type specifies a single cell reference that may be absolute.

This simple type's contents are a restriction of the XML Schema string datatype.

#### Referenced By

undo@dr (§3.11.1.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RefA">
 <restriction base="xsd:string"/>
</simpleType>
```

### 3.18.66 ST\_RefMode (Reference Mode)

This simple type defines the supported reference styles or modes for a workbook in SpreadsheetML.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
A1 (A1 Mode)	Indicates that the workbook uses A1 reference style. This is the default for SpreadsheetML. A1 reference style refers to columns with letters and refers to rows with numbers. For example, A1 refers to the cell at the intersection of column A and row 1.
R1C1 (R1C1 Reference Mode)	Indicates that the workbook uses the R1C1 reference style. R1C1 reference style refers to both the rows and the columns on the worksheet with numbers. The location of a cell is indicated with an "R" followed by a row number and a "C" followed by a column number. For example, R1C1 refers to the cell at the intersection of row R1 and column C1.

```
<simpleType name="ST_RefMode">
 <restriction base="xsd:string">
 <enumeration value="A1"/>
 <enumeration value="R1C1"/>
 </restriction>
</simpleType>
```

### 3.18.67 ST\_RevisionAction (Revision Action Types)

Identifies what kind of action the user performed. Applies to Comment and Custom View revision record.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
add (Add)	Add action.
delete (Delete)	Delete action.

#### Referenced By

rcmt@action (§3.11.1.11); rcv@action (§3.11.1.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RevisionAction">
 <restriction base="xsd:string">
 <enumeration value="add"/>
 <enumeration value="delete"/>
 </restriction>
</simpleType>
```

### 3.18.68 ST\_rwColActionType (Row Column Action Type)

Identifies what kind of an action was applied to a row or column.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
deleteCol (Delete Column)	Column delete revision.
deleteRow (Delete Row)	Row delete revision.
insertCol (Column Insert)	Column insert revision.
insertRow (Insert Row)	Row insert revision.

Referenced By
rrc@action (§3.11.1.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_rwColActionType">
 <restriction base="xsd:string">
 <enumeration value="insertRow"/>
 <enumeration value="deleteRow"/>
 <enumeration value="insertCol"/>
 <enumeration value="deleteCol"/>
 </restriction>
</simpleType>
```

### 3.18.69 ST\_Scope (Conditional Formatting Scope)

This simple type defines the scope of conditional formatting applied in the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
data (Data Fields)	Indicates that conditional formatting is applied to the selected data fields.
field (Field Intersections)	Indicates that conditional formatting is applied to the selected PivotTable field intersections.
selection (Selection)	Indicates that conditional formatting is applied to the selected cells.

Referenced By
conditionalFormat@scope (§3.10.1.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Scope">
 <restriction base="xsd:string">
 <enumeration value="selection"/>
 <enumeration value="data"/>
 <enumeration value="field"/>
 </restriction>
</simpleType>
```

### 3.18.70 ST\_SheetState (Sheet Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the XML Schema string datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
hidden (Hidden)	Indicates the book window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the sheet is visible.

2

Referenced By
customSheetView@state (§3.3.1.22); customSheetView@state (§3.3.1.23); sheet@state (§3.2.19)

- 3 The following XML Schema fragment defines the contents of this simple type:

4 <simpleType name="ST_SheetState">
5 <restriction base="xsd:string">
6 <enumeration value="visible"/>
7 <enumeration value="hidden"/>
8 <enumeration value="veryHidden"/>
9 </restriction>
10 </simpleType>

```

### 11 3.18.71 ST\_SheetViewType (Sheet View Type)

- 12 Defines the view setting of the sheet.

- 13 This simple type's contents are a restriction of the XML Schema string datatype.

- 14 The following are possible enumeration values for this type:

Enumeration Value	Description
normal (Normal View)	Normal view
pageBreakPreview (Page Break Preview)	Page break preview
pageLayout (Page Layout View)	Page Layout View

15

Referenced By
customSheetView@view (§3.3.1.23); sheetView@view (§3.3.1.83)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SheetViewType">

 <enumeration value="normal"/>
 <enumeration value="pageBreakPreview"/>
 <enumeration value="pageLayout"/>
 </restriction>
</simpleType>
```

### 3.18.72 ST\_ShowDataAs (Show Data As)

This simple type defines the data formats for a field in the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
difference (Difference)	Indicates the field is shown as the "difference from" a value.
index (Index)	Indicates the field is shown as the "index."
normal (Normal Data Type)	Indicates that the field is shown as its normal data type.
percent (Percentage Of)	Indicates the field is show as the "percentage of
percentDiff (Percentage Difference)	Indicates the field is shown as the "percentage difference from" a value.
percentOfCol (Percent of Column)	Indicates the field is shown as the percentage of column.
percentOfRow (Percentage of Row)	Indicates the field is shown as the percentage of row
percentOfTotal (Percentage of Total)	Indicates the field is shown as percentage of total.
runTotal (Running Total)	Indicates the field is shown as running total in the table.

#### Referenced By

dataField@showDataAs (§3.10.1.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ShowDataAs">
 <restriction base="xsd:string">
 <enumeration value="normal"/>
 <enumeration value="difference"/>
 <enumeration value="percent"/>
 <enumeration value="percentDiff"/>
 <enumeration value="runTotal"/>
 <enumeration value="percentOfRow"/>
 <enumeration value="percentOfCol"/>
 <enumeration value="percentOfTotal"/>
 <enumeration value="index"/>
 </restriction>
</simpleType>
```

### 3.18.73 ST\_SmartTagShow (Smart Tag Display Types)

This simple type defines options for displaying smart tags in the user interface.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Indicates that smart tags are enabled and shown in the user interface.
noIndicator (No Smart Tag Indicator)	Indicates that the smart tags are enabled but the indicator not be shown in the user interface.
none (None)	Indicates that smart tags are disabled and not displayed in the user interface.

#### Referenced By

smartTagPr@show (§3.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SmartTagShow">
 <restriction base="xsd:string">
 <enumeration value="all"/>
 <enumeration value="none"/>
 <enumeration value="noIndicator"/>
 </restriction>
</simpleType>
```

### 3.18.74 ST\_SortBy (Sort By)

Specifies what to sort by. In many cases a range of cells are sorted by their values. However, cells can also be sorted by their background color, font color, and type of icon in the cell.

1 This simple type's contents are a restriction of the XML Schema string datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
cellColor (Sort by Cell Color)	Sort by cell color
fontColor (Sort by Font Color)	Sort by font color
icon (Sort by Icon)	Sort by icon
value (Value)	Sort by value

3

Referenced By
sortCondition@sortBy (§3.3.1.88)

4 The following XML Schema fragment defines the contents of this simple type:

```
5 <simpleType name="ST_SortBy">
6 <restriction base="xsd:string">
7 <enumeration value="value"/>
8 <enumeration value="cellColor"/>
9 <enumeration value="fontColor"/>
10 <enumeration value="icon"/>
11 </restriction>
12 </simpleType>
```

13 **3.18.75 ST\_SortMethod (Sort Method)**

14 Sort method. Chinese Simplified, Chinese Traditional, and Japanese support alternate sort methods (multiple  
15 sort options are available). All other languages support only 1 sort option. In that case, the value pinYin is used.

16 This simple type's contents are a restriction of the XML Schema string datatype.

17 The following are possible enumeration values for this type:

Enumeration Value	Description
none (None)	Not specified, use default sort method.
pinYin (PinYin Sort)	Default sort method. This is the only sort option for most languages.  For Chinese Simplified, Chinese Traditional, and Japanese, pinYin means sort by phonetic value.
stroke (Sort by Stroke)	Sort by stroke count of the characters. Only applies to Chinese Simplified, Chinese Traditional, and Japanese.

18

Referenced By
sortState@sortMethod (§3.3.1.89)

1 The following XML Schema fragment defines the contents of this simple type:

```

2 <simpleType name="ST_SortMethod">
3 <restriction base="xsd:string">
4 <enumeration value="stroke"/>
5 <enumeration value="pinYin"/>
6 <enumeration value="none"/>
7 </restriction>
8 </simpleType>

```

### 9 3.18.76 ST\_SortType (Set Sort Order)

10 This simple type defines the possible sort order for the PivotTable.

11 This simple type's contents are a restriction of the XML Schema string datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
ascending (Ascending)	Indicates that the PivotTable data is sorted in ascending order.
ascendingAlpha (Ascending Alpha)	Indicates that the PivotTable data is sorted in alphabetic order with ascending values.
ascendingNatural (Ascending Natural)	Indicates that the PivotTable data is sorted in natural order with ascending.
descending (Descending)	Indicates that the PivotTable data is sorted in descending.
descendingAlpha (Alphabetic Order Descending)	Indicates that the PivotTable data is sorted in alphabetic order with descending values.
descendingNatural (Natural Order Descending)	Indicates that the PivotTable data is sorted in natural order with descending values.
none (None)	Indicates that the PivotTable data is not sorted.

13

Referenced By
set@sortType (§3.10.1.88)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SortType">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="ascending"/>
 <enumeration value="descending"/>
 <enumeration value="ascendingAlpha"/>
 <enumeration value="descendingAlpha"/>
 <enumeration value="ascendingNatural"/>
 <enumeration value="descendingNatural"/>
 </restriction>
</simpleType>
```

### 3.18.77 ST\_SourceType (PivotCache Type)

This simple type defines the cache types for PivotTables.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
consolidation (Consolidation Ranges)	Indicates that the cache contains data that consolidates ranges.
external (External)	Indicates that the cache contains data from an external data source.
scenario (Scenario Summary Report)	Indicates that the cache contains a scenario summary report
worksheet (Worksheet)	Indicates that the cache contains worksheet data.

#### Referenced By

cacheSource@type (§3.10.1.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Sqref">
 <restriction base="xsd:string">
 <enumeration value="worksheet"/>
 <enumeration value="external"/>
 <enumeration value="consolidation"/>
 <enumeration value="scenario"/>
 </restriction>
</simpleType>
```

### 3.18.78 ST\_Sqref (Reference Sequence)

A sequence of cell references, space delimited.

1 This simple type allows a list of items of the ST\_Ref simple type (§3.18.64).

Referenced By
conditionalFormatting@sqref (§3.3.1.17); dataValidation@sqref (§3.3.1.30); ignoredError@sqref (§3.3.1.47); protectedRange@sqref (§3.3.1.69); rfmt@sqref (§3.11.1.17); scenarios@sqref (§3.3.1.74); selection@sqref (§3.3.1.75)

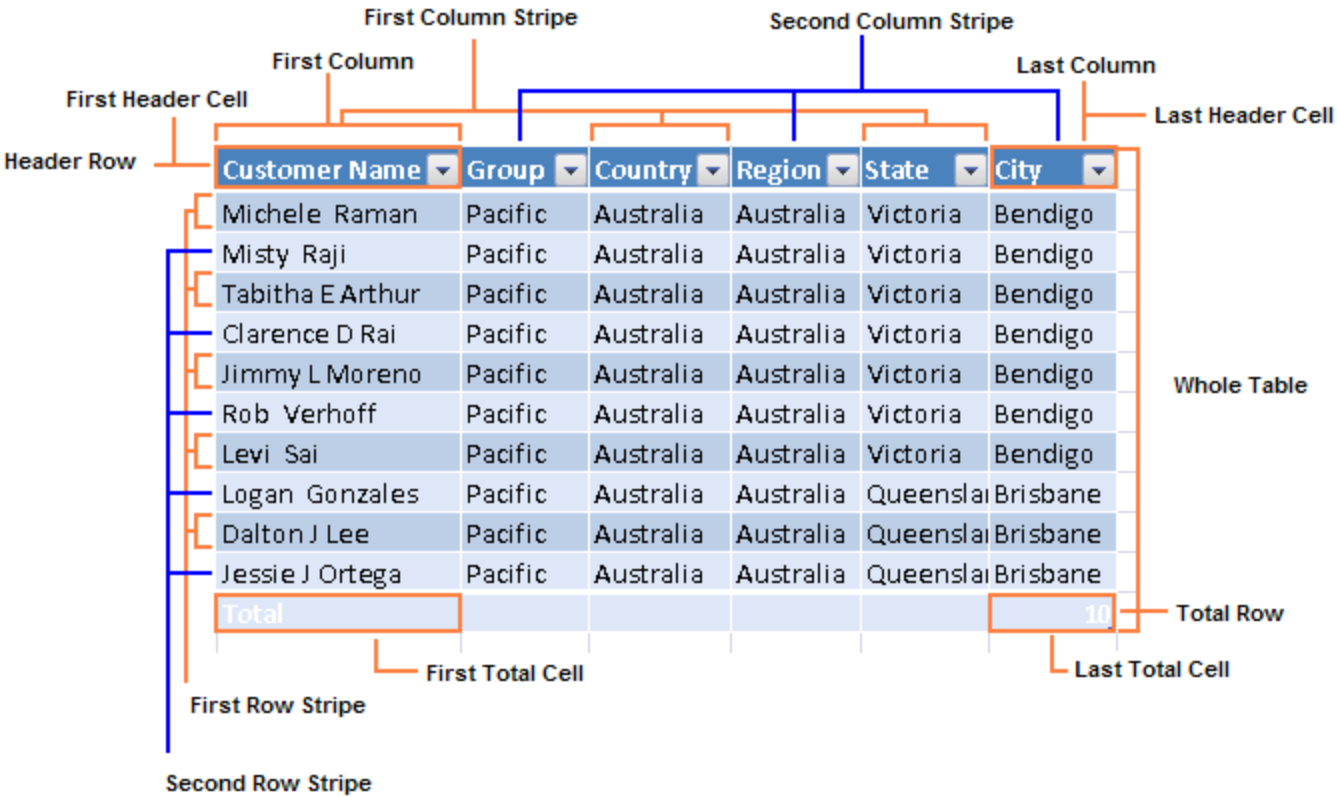

2 The following XML Schema fragment defines the contents of this simple type:

```
3 <simpleType name="ST_Sqref">
4 <list itemType="ST_Ref"/>
5 </simpleType>
```

6 **3.18.79 ST\_TableStyleType (Table Style Type)**

7 Enumeration of the different structured regions of a Table or PivotTable which can be formatted. Specifies  
8 which region is being formatted by this table style element.

9 **Table Regions**

10 **PivotTable Regions**

11 *Blank Row*

12 Only applies when "Insert blank row after each item" is ON.

- 2
- 3
- 4
- 5 This simple type's contents are a restriction of the XML Schema string datatype.
- 6 The following are possible enumeration values for this type:

Enumeration Value	Description
blankRow (Blank Row Style)	Table style element that applies to PivotTable's blank rows.
firstColumn (First Column Style)	Table style element that applies to table's first column.
firstColumnStripe (First Column Stripe Style)	Table style element that applies to table's first column stripes.
firstColumnSubheading (First Column Subheading Style)	Table style element that applies to PivotTable's first column subheading.
firstHeaderCell (First Header Row Style)	Table style element that applies to table's first header row cell.
firstRowStripe (First Row Stripe Style)	Table style element that applies to table's first row stripes.
firstRowSubheading (First Row Subheading Style)	Table style element that applies to PivotTable's first row subheading.
firstSubtotalColumn (First Subtotal Column Style)	Table style element that applies to PivotTable's first subtotal column.
firstSubtotalRow (First Subtotal Row Style)	Table style element that applies to pivot table's first subtotal row.
firstTotalCell (First Total Row Style)	Table style element that applies to table's first total

Enumeration Value	Description
	row cell.
headerRow (Header Row Style)	Table style element that applies to table's header row.
lastColumn (Last Column Style)	Table style element that applies to table's last column.
lastHeaderCell (Last Header Style)	Table style element that applies to table's last header row cell.
lastTotalCell (Last Total Row Style)	Table style element that applies to table's last total row cell.
pageFieldLabels (Page Field Labels Style)	Table style element that applies to pivot table's page field labels.
pageFieldValues (Page Field Values Style)	Table style element that applies to pivot table's page field values.
secondColumnStripe (Second Column Stipe Style)	Table style element that applies to table's second column stripes.
secondColumnSubheading (Second Column Subheading Style)	Table style element that applies to pivot table's second column subheading.
secondRowStripe (Second Row Stripe Style)	Table style element that applies to table's second row stripes.
secondRowSubheading (Second Row Subheading Style)	Table style element that applies to pivot table's second row subheading.
secondSubtotalColumn (Second Subtotal Column Style)	Table style element that applies to PivotTable's second subtotal column.
secondSubtotalRow (Second Subtotal Row Style)	Table style element that applies to PivotTable's second subtotal row.
thirdColumnSubheading (Third Column Subheading Style)	Table style element that applies to PivotTable's third column subheading.
thirdRowSubheading (Third Row Subheading Style)	Table style element that applies to PivotTable's third row subheading.
thirdSubtotalColumn (Third Subtotal Column Style)	Table style element that applies to pivot table's third subtotal column.
thirdSubtotalRow (Third Subtotal Row Style)	Table style element that applies to PivotTable's third subtotal row.
totalRow (Total Row Style)	Table style element that applies to table's total row.
wholeTable (Whole Table Style)	Table style element that applies to table's entire content.

</simpleType>
```

3.18.80 ST\_TableType (Table Type)

An enumeration that specifies what the table data is based on.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
queryTable (Query Table)	A table based on an external data query.
worksheet (Worksheet)	A table based on a worksheet data range.
xml (XML)	A table based on an XML mapping.

Referenced By

Referenced By
table@tableType (§3.5.1.2)

```
<simpleType name="ST_TableType">
 <restriction base="xsd:string">
 <enumeration value="worksheet"/>
 <enumeration value="xml"/>
 <enumeration value="queryTable"/>
 </restriction>
</simpleType>
```

### 3.18.81 ST\_TargetScreenSize (Target Screen Size Types)

This simple type defines the collection of screen resolutions that are supported for this workbook.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024x768 (1024 x 768 Resolution)	Sets the target screen resolution to 1024x768 pixels.
1152x882 (1152 x 882 Resolution)	Sets the target screen resolution to 1152x882 pixels.
1152x900 (1152 x 900 Resolution)	Sets the target screen resolution to 1152x900 pixels
1280x1024 (1280 x 1024 Resolution)	Sets the target screen resolution to 1280x1024 pixels.
1600x1200 (1600 x 1200 Resolution)	Sets the target screen resolution to 1600x1200 pixels.
1800x1440 (1800 x 1440 Resolution)	Sets the target screen resolution to 1800x1440 pixels.
1920x1200 (1920 x 1200 Resolution)	Sets the target screen resolution to 1920x1200 pixels.
544x376 (544 x 376 Resolution)	Sets the target screen resolution to 544x376 pixels.
640x480 (640 x 480 Resolution)	Sets the target screen resolution to 640x480 pixels.
720x512 (720 x 512 Resolution)	Sets the target screen resolution to 720x512 pixels.
800x600 (800 x 600 Resolution)	Sets the target screen resolution to 800x600 pixels.

Referenced By
webPublishing@targetScreenSize (§3.2.24)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TargetScreenSize">
 <restriction base="xsd:string">
 <enumeration value="544x376"/>
 <enumeration value="640x480"/>
 <enumeration value="720x512"/>
 <enumeration value="800x600"/>
 <enumeration value="1024x768"/>

 <enumeration value="1800x1440"/>
 <enumeration value="1920x1200"/>
 </restriction>
</simpleType>
```

### 3.18.82 ST\_TimePeriod (Time Period Types)

Used in a "contains dates" conditional formatting rule. These are dynamic time periods, which change based on the date the conditional formatting is refreshed / applied.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
last7Days (Last 7 Days)	A date in the last seven days.
lastMonth (Last Month)	A date occurring in the last calendar month.
lastWeek (Last Week)	A date occurring last week.
nextMonth (Next Month)	A date occurring in the next calendar month.
nextWeek (Next Week)	A date occurring next week.
thisMonth (This Month)	A date occurring in this calendar month.
thisWeek (This Week)	A date occurring this week.
today (Today)	Today's date.
tomorrow (Tomorrow)	Tomorrow's date.
yesterday (Yesterday)	Yesterday's date.

Referenced By
cfRule@timePeriod (§3.3.1.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TimePeriod">
 <restriction base="xsd:string">
 <enumeration value="today"/>
 <enumeration value="yesterday"/>
 <enumeration value="tomorrow"/>
 <enumeration value="last7Days"/>
 <enumeration value="thisMonth"/>
 <enumeration value="lastMonth"/>
 <enumeration value="nextMonth"/>
 <enumeration value="thisWeek"/>
 <enumeration value="lastWeek"/>
 <enumeration value="nextWeek"/>
 </restriction>
</simpleType>
```

### 3.18.83 ST\_TotalsRowFunction (Totals Row Function Types)

An enumeration that specifies what function is used to aggregate the data in a column before it is displayed in the totals row.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
average (Average)	Represents the arithmetic mean.
count (Non Empty Cell Count)	Represents a count of the number of non-empty cells.
countNums (Count Numbers)	Represents the number of cells that contain numbers.
custom (Custom Formula)	Represents the formula provided in totalsRowFormula.
max (Maximum)	Represents the largest value.
min (Minimum)	Represents the smallest value.
none (None)	No total row.
stdDev (StdDev)	Represents the estimated standard deviation.
sum (Sum)	Represents the arithmetic sum.
var (Var)	Represents the estimated variance.

#### Referenced By

tableColumn@totalsRowFunction (§3.5.1.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TotalsRowFunction">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="sum"/>
 <enumeration value="min"/>
 <enumeration value="max"/>

 <enumeration value="stdDev"/>
 <enumeration value="var"/>
 <enumeration value="custom"/>
 </restriction>
</simpleType>
```

### 3.18.84 ST\_Type (Top N Evaluation Type)

This simple type defines the values for the Top N conditional formatting evaluation for the PivotTable. For more information on Top N conditional formatting, see the Sheet (§3.3.1) reference material.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Indicates that Top N conditional formatting is evaluated across the entire scope range.
column (Column Top N)	Indicates that Top N conditional formatting is evaluated for each column.
none (Top N None)	Indicates that Top N conditional formatting is not evaluated
row (Row Top N)	Indicates that Top N conditional formatting is evaluated for each row.

#### Referenced By

conditionalFormat@type (§3.10.1.18)

```
<simpleType name="ST_Type">
 <restriction base="xsd:string">
 <enumeration value="none"/>
 <enumeration value="all"/>
 <enumeration value="row"/>
 <enumeration value="column"/>
 </restriction>
</simpleType>
```

**3.18.85 ST\_UnderlineValues (Underline Types)**

Represents the different types of possible underline formatting.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
double (Double Underline)	Double-line underlining under each character in the cell. underlines are drawn through the descenders of characters such as g and p. 
doubleAccounting (Accounting Double Underline)	Double-line accounting underlining under each character in the cell. The underlines are drawn under the descenders of characters such as g and p. 
none (None)	No underline.
single (Single Underline)	Single-line underlining under each character in the cell. The underline is drawn through the descenders of characters such as g and p. 
singleAccounting (Accounting Single Underline)	Single-line accounting underlining under each character in the cell. The underline is drawn under the descenders of characters such as g and p.

 <enumeration value="singleAccounting"/>
 <enumeration value="doubleAccounting"/>
 <enumeration value="none"/>
 </restriction>
</simpleType>
```

**3.18.86 ST\_UnsignedIntHex (Hex Unsigned Integer)**

This simple type represents the Hex representation of an unsigned integer.

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 4 characters.

### 3.18.88 ST\_UpdateLinks (Update Links Behavior Types)

This simple type defines when the application updates links to other workbooks when the workbook is opened.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-------------------	-------------

Enumeration Value	Description
always (Always Update Links)	Indicates that links to other workbooks are always updated when the workbook is opened. The application will not display an alert in the user interface (UI).
never (Never Update Links)	Indicates that links to other workbooks are never updated when the workbook is opened. The application will not display an alert in the user interface.
userSet (User Set)	Indicates that the end-user specified whether they receive an alert to update links to other workbooks when the workbook is opened. For example, the application may expose this option in an application settings dialog.

6 <enumeration value="never"/>
7 <enumeration value="always"/>
8 </restriction>
9 </simpleType>
```

### 10 3.18.89 ST\_VerticalAlignment (Vertical Alignment Types)

11 This enumeration value indicates the type of vertical alignment for a cell, i.e., whether it is aligned top, bottom,  
 12 vertically centered, justified or distributed.

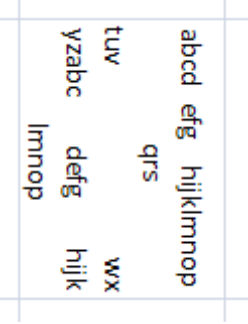

13 This simple type's contents are a restriction of the XML Schema string datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
bottom (Aligned To Bottom)	The vertical alignment is aligned-to-bottom.
center (Centered Vertical Alignment)	The vertical alignment is centered across the height of the cell.
distributed (Distributed Vertical Alignment)	When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top

Enumeration Value	Description																		
	<p>and bottom margins.</p> <p>When text direction is vertical: behaves exactly as distributed horizontal alignment. The first words in a line of text (appearing at the top of the cell) are flush with the top edge of the cell, and the last words of a line of text are flush with the bottom edge of the cell, and the line of text is distributed evenly from top to bottom.</p> <p>[Example: Horizontal text: this first example shows four lines of text (read horizontally from left to right) distributed vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td></td><td></td><td>abc</td></tr><tr><td></td><td></td><td>def</td></tr><tr><td></td><td></td><td>ghi</td></tr><tr><td>2</td><td></td><td>jkl</td></tr></table> <p>Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are:</p> <p>abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop</p> <p>The rendering looks like this:</p>		A	B	1					abc			def			ghi	2		jkl
	A	B																	
1																			
		abc																	
		def																	
		ghi																	
2		jkl																	

Enumeration Value	Description
	<div></div> <p><i>end example]</i></p>
justify (Justified Vertically)	<p>When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top and bottom margins.</p> <p>When text direction is vertical: similar behavior as horizontal justification. The alignment is justified (flush top and bottom in this case). For each line of text, each line of the wrapped text in a cell is aligned to the top and bottom (except the last line). If no single line of text wraps in the cell, then the text is not justified.</p> <p><i>[Example:</i> Horizontal text: this first example shows four lines of text (read horizontally from left to right) justified vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".</p>

Enumeration Value	Description
	<div><div><div><div></div><div>A</div><div>B</div></div><div><div>1</div><div></div><div>abc</div><div></div><div>def</div><div></div><div>ghi</div><div></div><div>2</div><div></div><div>jkl</div></div></div></div> <p>Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are:</p> <p>abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop</p> <p>The rendering looks like this:</p> <div><div><div>abcd efg hijklmnop</div><div>qrs</div><div>tuv wx</div><div>yzabc</div><div>defg</div><div>hijk</div><div>lmnop</div></div></div> <p><i>end example]</i></p>
top (Align Top)	The vertical alignment is aligned-to-top.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAlignment">
 <restriction base="xsd:string">
 <enumeration value="top"/>
 <enumeration value="center"/>
 <enumeration value="bottom"/>
 <enumeration value="justify"/>
 <enumeration value="distributed"/>
 </restriction>
</simpleType>
```

### 3.18.90 ST\_VerticalAlignRun (Vertical Alignment Run Types)

Defines the possible settings for vertical alignment of a run of text. This is used to get superscript or subscript text without altering the font size properties of the rest of the text run.

[Example:

```
<rPr>
 <vertAlign val="subscript"/>
</rPr>
```

end example]

The above example shows a run which shall be positioning as subscript when displaying its contents. The resulting run is positioned as subscript, therefore it is rendered in a smaller size below the default baseline location for the contents of the run.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
baseline (Baseline)	Returns the text in this run to the baseline, default, alignment, and returns it to the original font size.
subscript (Subscript)	Specifies that this text should be subscript.  Lowers the text in this run below the baseline and changes it to a smaller size, if a smaller size is available.
superscript (Superscript)	Specifies that this text should be superscript.  Raises the text in this run above the baseline and changes it to a smaller size, if a smaller size is available.

```
<simpleType name="ST_VerticalAlignRun">
 <restriction base="xsd:string">
 <enumeration value="baseline"/>
 <enumeration value="superscript"/>
 <enumeration value="subscript"/>
 </restriction>
</simpleType>
```

### 3.18.91 ST\_Visibility (Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hidden (Hidden)	Indicates the book window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the workbook window is visible.

```
<simpleType name="ST_Visibility">
 <restriction base="xsd:string">
 <enumeration value="visible"/>
 <enumeration value="hidden"/>
 <enumeration value="veryHidden"/>
 </restriction>
</simpleType>
```

### 3.18.92 ST\_VolDepType (Volatile Dependency Types)

This simple type defines the dependency types available for this workbook.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
olapFunctions (OLAP Formulas)	Indicates that the type is Cube Functions.
realTimeData (Real Time Data)	Indicates that the type is Real Time Data (RTD).

1

Referenced By
volType@type (§3.15.5)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_VolDepType">

6 <enumeration value="olapFunctions"/>
7 </restriction>
8 </simpleType>
```

### 9 3.18.93 ST\_VolValueType (Volatile Dependency Value Types)

10 This simple type defines the data type of the values in the dependency cache.

11 This simple type's contents are a restriction of the XML Schema string datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
b (Boolean)	Indicates topic value is a boolean.
e (Error)	Indicates topic value is an error.
n (Real Number)	Indicates topic value is a real number.
s (String)	Indicates topic value is a string.

13

Referenced By
tp@t (§3.15.3)

18 <enumeration value="n"/>
19 <enumeration value="e"/>
20 <enumeration value="s"/>
21 </restriction>
22 </simpleType>
```

### 3.18.94 ST\_WebSourceType (Web Source Type)

This is an enumeration of types of objects which can be selected from the workbook to be published as HTML. For example, the entire sheet can be published, or a narrower set of objects on the sheet can be published, like a chart or a range.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoFilter (AutoFilter)	Auto filter
chart (Chart)	Chart
label (Label)	Label
pivotTable (PivotTable)	PivotTable
printArea (Print Area)	Print area
query (QueryTable)	Query Table
range (Range)	Range of cells
sheet (All Sheet Content)	All content of a sheet

#### Referenced By

webPublishItem@sourceType (§3.3.1.94)

**3.18.96 ST\_Xstring (Escaped String)**

String of characters with support for escaped invalid-XML characters.

For all characters which cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format `_xHHHH_`, where H represents a hexadecimal character in the character's value. [Example: The Unicode character 8 is invalid in an XML 1.0 document, so it shall be escaped as `_x0008_`. end example]

This simple type's contents are a restriction of the XML Schema string datatype.

# 4. PresentationML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising a PresentationML document, as defined by Part 1 of this Standard.

## 4.1 Table of Contents

This subclause is informative.

<b>4.2 Basics</b>	<b>2951</b>
4.2.1 custData (Customer Data)	2951
4.2.2 custShow (Custom Show)	2952
4.2.3 ext (Extension)	2953
4.2.4 extLst (Extension List with Modification Flag)	2953
4.2.5 extLst (Extension List)	2954
4.2.6 sld (Presentation Slide)	2955
4.2.7 sldAll (All Slides)	2956
4.2.8 sldRg (Slide Range)	2956
4.2.9 tags (Customer Data Tags)	2956
<b>4.3 Presentation</b>	<b>2957</b>
4.3.1 Presentation Properties	2957
4.3.1.1 bold (Bold Embedded Font)	2957
4.3.1.2 boldItalic (Bold Italic Embedded Font)	2958
4.3.1.3 browse (Browse Slide Show Mode)	2959
4.3.1.4 clrMru (Color MRU)	2960
4.3.1.5 custShow (Custom Show)	2960
4.3.1.6 custShowLst (List of Custom Shows)	2961

25	4.8.62	ST_WebScreenSize (HTML/Web Screen Size Target).....	3209

27 **End of informative text.**

## 28 **4.2 Basics**

29 The Basics portion of the PresentationML framework defines all commonly used elements for a PresentationML  
 30 document. That is, those elements that do not fall into one of the following subclauses for PresentationML  
 31 content as defined within this section.

### 32 **4.2.1 custData (Customer Data)**

33 This element specifies customer data which allows for the specifying and persistence of customer specific data  
 34 within the presentation.

Parent Elements
custDataLst (§4.4.1.16)

35

Attributes	Description
id (Relationship ID)	This attribute specifies the relationship id for referencing other resources outside the scope of the current PresentationML file.

Attributes	Description
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_CustomerData">
3 <attribute ref="r:id" use="required"/>
4 </complexType>
```

5 **4.2.2 custShow (Custom Show)**

6 This element specifies a custom show which is an ordered list of a group of slides that are contained within the  
7 presentation. The custom show element allows for the specification of a presentation order that is different  
8 from the order in which the slides themselves are stored.

9 [Example: Consider the following custom show list that outlines a couple custom shows for a given set of slides.

```
10 <p:custShowLst>
11 <p:custShow name="Custom Show 1" id="0">
12 <p:sldLst>
13 <p:sld r:id="rId4"/>
14 <p:sld r:id="rId3"/>
15 <p:sld r:id="rId2"/>
16 <p:sld r:id="rId5"/>
17 </p:sldLst>
18 </p:custShow>
19 <p:custShow name="Custom Show 2" id="1">
20 <p:sldLst>
21 <p:sld r:id="rId4"/>
22 <p:sld r:id="rId5"/>
23 </p:sldLst>
24 </p:custShow>
25 </p:custShowLst>
```

26 In the above example there are two custom shows specified. The first specifies to present the slides in the order  
27 of 4, 3, 2 then 5 while the second specifies to play only slide 4 then 5. End example]

28

Parent Elements
htmlPubPr (§4.3.1.13); showPr (§4.3.1.28)

29

Attributes	Description
id (Custom Show Identifier)	This attribute specifies the custom show identification number. This is a number given that should be unique within the presentation document.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomShowId">
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 4.2.3 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that will be used for later versions of generating applications.

Parent Elements
extLst (§4.2.4); extLst (§4.2.5)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	This attribute specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag.  The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extension">
 <sequence>
 <any processContents="lax"/>
 </sequence>
 <attribute name="uri" type="xsd:token"/>
</complexType>
```

### 4.2.4 extLst (Extension List with Modification Flag)

This element specifies the extension list with modification ability within which all future extensions of type ext will be defined. The extension list along with corresponding future extensions is used to extend the storage

capabilities of the PresentationML framework. This allows for various new types of data to be stored natively within the framework.

[Note: Using this extLst element allows the generating application to store whether this extension property has been modified. *end note*]

Parent Elements
cm (§4.5.1); cxnSp (§4.4.1.17); graphicFrame (§4.4.1.18); grpSp (§4.4.1.19); handoutMaster (§4.4.1.21); hf (§4.4.1.22); notes (§4.4.1.23); notesMaster (§4.4.1.24); ph (§4.4.1.33); pic (§4.4.1.34); sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39); sp (§4.4.1.40); spTree (§4.4.1.42); timing (§4.4.1.44); transition (§4.4.1.46)

Child Elements	Subclause
ext (Extension)	§4.2.3

Attributes	Description
mod (Modify)	This attribute specifies whether the data contained within this element has been modified and should thus be processed again by the generating application.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionListModify">
 <sequence>
 <group ref="EG_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="mod" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

## 4.2.5 extLst (Extension List)

This element specifies the extension list within which all future extensions of type ext will be defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new types of data to be stored natively within the framework.

Parent Elements
bgPr (§4.4.1.2); cmAuthor (§4.5.2); control (§4.4.2.1); cSld (§4.4.1.15); custShow (§4.3.1.5); embed (§4.4.2.2); handoutMasterId (§4.3.1.11); htmlPubPr (§4.3.1.13); link (§4.4.2.3); normalViewPr (§4.3.2.6); notesMasterId (§4.3.1.18); notesTextViewPr (§4.3.2.7); notesViewPr (§4.3.2.8); nvPr (§4.4.1.30); outlineViewPr (§4.3.2.10); photoAlbum (§4.3.1.22); presentation (§4.3.1.24); presentationPr (§4.3.1.25); prnPr (§4.3.1.26); showPr (§4.3.1.28); sldId (§4.3.1.29); sldLayoutId (§4.4.1.37); sldMasterId (§4.3.1.32); sldSyncPr (§4.7.1); slideViewPr (§4.3.2.16); sorterViewPr (§4.3.2.17); txStyles (§4.4.1.48); viewPr (§4.3.2.18); webPr (§4.3.1.36)

Child Elements	Subclause
ext (Extension)	§4.2.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionList">
 <sequence>
 <group ref="EG_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 4.2.6 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[Example: Consider the following custom show with an ordering of slides.

```
<p:custShowLst>
 <p:custShow name="Custom Show 1" id="0">
 <p:sldLst>
 <p:sld r:id="rId4"/>
 <p:sld r:id="rId3"/>
 <p:sld r:id="rId2"/>
 <p:sld r:id="rId5"/>
 </p:sldLst>
 </p:custShow>
</p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. End example]

Parent Elements
sldLst (§4.3.1.31)

Attributes	Description
id (Relationship ID)	This attribute specifies the relationship id that is used to reference to the actual slide XML file that contains all the information to the slide listed within the slide list.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideRelationshipListEntry">
 <attribute ref="r:id" use="required"/>
</complexType>
```

#### 4.2.7 sldAll (All Slides)

This attribute specifies all slides instead of a given range of slides for use within the html publishing properties as well as the show properties.

Parent Elements
htmlPubPr (§4.3.1.13); showPr (§4.3.1.28)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

#### 4.2.8 sldRg (Slide Range)

This element specifies a slide range for use within the html publishing properties as well as the show properties.

[*Note:* The indexes used here correlate directly with the presentation slide numbers which they reference to. That is the slide range must be greater than or equal to 1 and also less than or equal to the number of slides in the presentation document. *end note*]

Parent Elements
htmlPubPr (§4.3.1.13); showPr (§4.3.1.28)

Attributes	Description
end (End)	This attribute defines the end of the index range.  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).
st (Start)	This attribute defines the start of the index range.  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexRange">
 <attribute name="st" type="ST_Index" use="required"/>
 <attribute name="end" type="ST_Index" use="required"/>
</complexType>
```

#### 4.2.9 tags (Customer Data Tags)

This element specifies the existence of customer data in the form of tags. This allows for the storage of customer data within the PresentationML framework. While this is similar to the ext tag in that it can be used store

information, this tag mainly focuses on referencing to other parts of the presentation document. This is accomplished via the relationship identification attribute that is required for all specified tags.

Parent Elements
custDataLst (§4.4.1.16)

Attributes	Description
id (Relationship ID)  Namespace: .../officeDocument /2006/relationships	This attribute specifies the relationship identifier for the customer data tag. This allows for a link to a resource that is external from the current XML document but still contained within the presentation document.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TagsData">
 <attribute ref="r:id" use="required"/>
</complexType>
```

### 4.3 Presentation

The Presentation portion of the PresentationML framework houses a set of elements that describe the storing of presentation-wide and view-specific properties. The presentation-wide properties are those that pertain to the entire presentation. The view-specific properties assist the generating application and viewing application by storing parameters that pertain to the final delivery of the presentation.

#### 4.3.1 Presentation Properties

This section contains all presentation-level properties that pertain to a presentation document:

##### 4.3.1.1 bold (Bold Embedded Font)

This element specifies a bold embedded font that is linked to a parent typeface. Once specified, this bold version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[Example: Consider the following embedded font with a bold version specified.

```
<p:embeddedFont>
 <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
 <p:bold r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
id (Relationship Identifier)  Namespace: .../officeDocument /2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontDataId">
 <attribute ref="r:id" use="required"/>
</complexType>
```

#### 4.3.1.2 boldItalic (Bold Italic Embedded Font)

This element specifies a bold italic embedded font that is linked to a parent typeface. Once specified, this bold italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a bold italic version specified.

```
<p:embeddedFont>
 <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
 <p:boldItalic r:id="rId2"/>
</p:embeddedFont>
```

*end example*]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
------------	-------------

Attributes	Description
id (Relationship Identifier)  Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_EmbeddedFontDataId">
3 <attribute ref="r:id" use="required"/>
4 </complexType>
```

5 4.3.1.3 browse (Browse Slide Show Mode)

6 This element specifies that the presentation slide show should be viewed in a single window or browse mode,  
7 instead of full screen.

8 [Example: Consider the following presentation that is set to be viewed in a browse mode.

```
9 <p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
10 <p:showPr>
11 ..
12 <p:browse showScrollbar="0"/>
13 ..
14 </p:showPr>
15 </p:presentationPr>
```

16 end example]

Parent Elements
showPr (§4.3.1.28)

17

Attributes	Description
showScrollbar (Show Scroll Bar in Window)	Specifies whether to show the scroll bar in the viewing window.  The possible values for this attribute are defined by the XML Schema boolean datatype.

18 The following XML Schema fragment defines the contents of this element:

```
19 <complexType name="CT_ShowInfoBrowse">
20 <attribute name="showScrollbar" type="xsd:boolean" use="optional" default="true"/>
21 </complexType>
```

1    4.3.1.4            clrMru (Color MRU)

2    This specifies the most recently used user-selected colors within the presentation. This list contains custom  
3    user-selected colors outside the presentation's theme colors, enabling the application to expose these  
4    additional color choices for easy reuse. The first item in the list is the most recently used color.

5    [Example: Consider the following presentation with two user-selected colors in the color MRU list.

```
6 <p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
7 ..
8 <p:clrMru>
9 <a:srgbClr val="5361EB"/>
10 <a:srgbClr val="CCECFF"/>
11 </p:clrMru>
12 ..
13 </p:presentationPr>
```

14    end example]

Parent Elements
presentationPr (§4.3.1.25)

15

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

16    The following XML Schema fragment defines the contents of this element:

```
17 <complexType name="CT_ColorMRU">
18 <sequence>
19 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="10"/>
20 </sequence>
21 </complexType>
```

22    4.3.1.5            custShow (Custom Show)

23    This element specifies a custom show that defines a specific slide sequence that the slides will be displayed in.  
24    This allows for many variants of the same set of slides to be presented.

25    [Example: Consider the following custom show using three slides.

```
26 <p:custShow name="Custom Show 1" id="0">
```

```
<p:sldLst>
 <p:sld r:id="rId5"/>
 <p:sld r:id="rId2"/>
 <p:sld r:id="rId4"/>
</p:sldLst>
</p:custShow>
```

Notice here that the custom show specifies a show, or presentation, where slide 5 will be shown first, then slide 2 and finally slide 4. *end example*]

Parent Elements
<a href="#">custShowLst (§4.3.1.6)</a>

Child Elements	Subclause
<a href="#">extLst (Extension List)</a>	<a href="#">§4.2.5</a>
<a href="#">sldLst (List of Presentation Slides)</a>	<a href="#">§4.3.1.31</a>

Attributes	Description
<a href="#">id (Custom Show ID)</a>	Specifies the identification number for this custom show. This should be unique among all the custom shows within the corresponding presentation.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
<a href="#">name (Custom Show Name)</a>	Specifies a name for the custom show.  The possible values for this attribute are defined by the ST_Name simple type (§4.8.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomShow">
 <sequence>
 <element name="sldLst" type="CT_SlideRelationshipList" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="ST_Name" use="required"/>
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
</complexType>
```

#### 4.3.1.6 [custShowLst \(List of Custom Shows\)](#)

This element specifies a list of all custom shows that are available within the corresponding presentation. A custom show is a defined slide sequence that allows for the displaying of the slides with the presentation in any arbitrary order.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
custShow (Custom Show)	§4.3.1.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomShowList">
 <sequence>
 <element name="custShow" type="CT_CustomShow" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 4.3.1.7 defaultTextStyle (Presentation Default Text Style)

This element specifies the default text styles that are to be used within the presentation. The text style defined here can be referenced when inserting a new slide if that slide is not associated with a master slide or if no styling information has been otherwise specified for the text within the presentation slide.

Parent Elements
presentation (§4.3.1.24)

 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

4.3.1.8 embeddedFont (Embedded Font)

This element specifies an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[Example: Consider the following embedded font.

```
<p:embeddedFont>
 <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
 <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

[Note: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. end note]

Parent Elements
embeddedFontLst (§4.3.1.9)

Child Elements	Subclause
bold (Bold Embedded Font)	§4.3.1.1
boldItalic (Bold Italic Embedded Font)	§4.3.1.2
font (Embedded Font Name)	§4.3.1.10
italic (Italic Embedded Font)	§4.3.1.14

Child Elements	Subclause
regular (Regular Embedded Font)	§4.3.1.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontListEntry">
 <sequence>
 <element name="font" type="a:CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="regular" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
 <element name="bold" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
 <element name="italic" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
 <element name="boldItalic" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

4.3.1.9 [embeddedFontLst \(Embedded Font List\)](#)

This element specifies a list of fonts that are embedded within the corresponding presentation. The font data for these fonts is stored alongside the other document parts within the document container. The actual font data is referenced within the embeddedFont element.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
embeddedFont (Embedded Font)	§4.3.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontList">
 <sequence>
 <element name="embeddedFont" type="CT_EmbeddedFontListEntry" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

4.3.1.10 [font \(Embedded Font Name\)](#)

This element specifies specific properties describing an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[Example: Consider the following embedded font.

```
<p:embeddedFont>
 <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
```

1       <p:regular r:id="rId2"/>  
2       </p:embeddedFont>

3   *end example]*

4   [*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which  
5   characters are to be stored in the corresponding font data files. *end note]*

Parent Elements
embeddedFont (§4.3.1.8)

6

Attributes	Description
charset (Similar Character Set)  Namespace: .../drawingml/2006/main	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose Setting)  Namespace: .../drawingml/2006/main	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method.  The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)  Namespace: .../drawingml/2006/main	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one.  The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)  Namespace: .../drawingml/2006/main	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application.  The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

7   The following XML Schema fragment defines the contents of this element:

8   <complexType name="CT_TextFont"> 9    <attribute name="typeface" type="ST_TextTypeface"/> 10   <attribute name="panose" type="ST_Panose" use="optional"/> 11   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/> 12   <attribute name="charset" type="xsd:byte" use="optional" default="1"/> 13 </complexType>
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

4.3.1.11 **handoutMasterId** (Handout Master ID)

This element specifies a handout master that is available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[Example: Consider the following specification of a handout master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
 ..
 <p:handoutMasterIdLst>
 <p:handoutMasterId r:id="rId8"/>
 </p:handoutMasterIdLst>
 ..
</p:presentation>
```

end example]

Parent Elements
handoutMasterIdLst (§4.3.1.12)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the handoutMaster element defining this handout master.
Namespace: .../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HandoutMasterIdListEntry">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.12 **handoutMasterIdLst** (List of Handout Master IDs)

This element specifies a list of identification information for the handout master slides that are available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
handoutMasterId (Handout Master ID)	§4.3.1.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HandoutMasterIdList">
 <sequence>
 <element name="handoutMasterId" type="CT_HandoutMasterIdListEntry" minOccurs="0"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.3.1.13 [htmlPubPr \(HTML Publishing Properties\)](#)

This element specifies the publishing properties to be used when publishing this presentation document to the HTML file format.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
custShow (Custom Show)	§4.2.2
extLst (Extension List)	§4.2.5
sldAll (All Slides)	§4.2.7
sldRg (Slide Range)	§4.2.8

Attributes	Description
id (Publish Path)	Specifies the path that should be used when publishing.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
pubBrowser (Browser Support Target)	Specifies the web browser support that this publishing should be optimized for.  The possible values for this attribute are defined by the ST_HtmlPublishWebBrowserSupport simple type (§4.8.6).
showSpeakerNotes (Show Speaker)	Specifies whether to show speaker notes when publishing.

Attributes	Description
Notes)	The possible values for this attribute are defined by the XML Schema boolean datatype.
title (HTML Output Title)	Specifies a title for the HTML output file. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_HtmlPublishProperties">
 <sequence>
 <group ref="EG_SlideListChoice" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="showSpeakerNotes" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="pubBrowser" type="ST_HtmlPublishWebBrowserSupport" use="optional"
 default="v3v4"/>
 <attribute name="title" type="xsd:string" use="optional" default=""/>
 <attribute ref="r:id" use="required"/>
</complexType>

```

#### 4.3.1.14 *italic* (Italic Embedded Font)

This element specifies an italic embedded font that is linked to a parent typeface. Once specified, this italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example:* Consider the following embedded font with a italic version specified.

```

<p:embeddedFont>
 <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
 <p:italic r:id="rId2"/>
</p:embeddedFont>

```

*end example]*

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note]*

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation.

Attributes	Description
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_EmbeddedFontDataId">
3 <attribute ref="r:id" use="required"/>
4 </complexType>
```

#### 5 4.3.1.15 kinsoku (Kinsoku Settings)

6 This element specifies the presentation-wide kinsoku settings that define the line breaking behaviour of East  
7 Asian text within the corresponding presentation.

Parent Elements
presentation (§4.3.1.24)

8

Attributes	Description
invalEndChars (Invalid Kinsoku End Characters)	Specifies the characters that are not valid for ending a line of text with. The possible values for this attribute are defined by the XML Schema string datatype.
invalStChars (Invalid Kinsoku Start Characters)	Specifies the characters that are not valid for starting a line of text with. The possible values for this attribute are defined by the XML Schema string datatype.
lang (Language)	Specifies the corresponding East Asian language that these settings apply to. The possible values for this attribute are defined by the XML Schema string datatype.

9 The following XML Schema fragment defines the contents of this element:

```
10 <complexType name="CT_Kinsoku">
11 <attribute name="lang" type="xsd:string" use="optional"/>
12 <attribute name="invalStChars" type="xsd:string" use="required"/>
13 <attribute name="invalEndChars" type="xsd:string" use="required"/>
14 </complexType>
```

#### 15 4.3.1.16 kiosk (Kiosk Slide Show Mode)

16 This element specifies that the presentation slide show should be viewed in a full-screen kiosk mode. A  
17 presentation viewed in kiosk mode should have user input disabled and will restart after a specified interval.

18 [Example: Consider the following presentation that is set to be viewed in a looping kiosk mode.

```
19 <p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
20 <p:showPr loop="1" showNarration="1">
```

```
..
<p:kiosk/>
..
</p:showPr>
</p:presentationPr>
```

*end example]*

Parent Elements
showPr (§4.3.1.28)

Attributes	Description
restart (Restart Show)	<p>Specifies the time length that the presentation should run until it is to be restarted. That is, the presentation should loop back to the first slide specified in the presentation or custom show. This value is specified in 1/1000ths of a second and measured from the most recent time the presentation started or restarted.</p> <p>[<i>Note:</i> The counter is reset when a presentation is restarted due to automatic looping at the end of a show, if specified by the loop attribute of showPr. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShowInfoKiosk">
 <attribute name="restart" type="xsd:unsignedInt" use="optional" default="300000"/>
</complexType>
```

4.3.1.17      modifyVerifier (Modification Verifier)

This element specifies the write protection settings which have been applied to a PresentationML document. *Write protection* refers to a mode in which the document's contents cannot be modified, and the document cannot be resaved using the same file name.

When present, the application shall require a password to enable modifications to the document. If the supplied password does not match the hash value in this attribute, then write protection shall be enabled. If this element is omitted, then no write protection shall be applied to the current document. Since this protection does not encrypt the document, malicious applications may circumvent its use.

The password supplied to the algorithm is to be a Unicode string; strings longer than 255 characters are truncated to 255 characters. The attributes of this element specify the algorithm to be used to verify the password provided by the user.

[*Example:* Consider a PresentationML document that can only be opened in a write protected state unless a password is provided, in which case the file would be opened in an editable state. This requirement would be specified using the following PresentationML:

```
<p:documentProtection ...
 p:cryptAlgorithmClass="hash" p:cryptAlgorithmType="typeAny"
 p:cryptAlgorithmSid="1" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" ... />
```

In order for the hosting application to enable edits to the document, the hosting application would have to be provided with a password that the hosting application would then hash using the algorithm specified by the algorithm attributes and compare to the value of the hashData attribute (9oN7nWkCAyEZib1RomSJTjmPpCY=). If the two values matched, the file would be opened in an editable state. *end example]*

Parent Elements
presentation (§4.3.1.24)

11

Attributes	Description
algIdExt (Cryptographic Algorithm Extensibility)	<p>Specifies that a cryptographic algorithm which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined. [<i>Rationale:</i> This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined hashing algorithms in order to remain secure. <i>end rationale]</i></p> <p>If this value is present, the cryptAlgorithmClass, cryptAlgorithmType, and cryptAlgorithmSid attribute values shall be ignored in favor of the algorithm defined by this attribute.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:algIdExt="0000000A"   p:algIdExtSource="futureCryptography"   p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The algIdExt attribute value of 0000000A specifies that the algorithm with hex code A shall be used as defined by the futureCryptography application. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
algIdExtSource (Algorithm Extensibility Source)	Specifies the application which defined the algorithm value specified by the algIdExt attribute.

Attributes	Description																				
	<p>[<i>Example</i>: Consider a PresentationML document with the following information stored in one its protection element:</p> <pre>&lt;p:... p:algIdExt="0000000A"   p:algIdExtSource="futureCryptography"   p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The algIdExtSource attribute value of futureCryptography specifies that the algorithm used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>																				
cryptAlgorithmClass (Cryptographic Algorithm Class)	<p>Specifies the class of cryptographic algorithm used by this protection. [<i>Note</i>: The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:cryptAlgorithmClass="hash"   p:cryptAlgorithmType="typeAny"   p:cryptAlgorithmSid="1"   p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_AlgClass simple type (§4.8.1).</p>																				
cryptAlgorithmSid (Cryptographic Hashing Algorithm)	<p>Specifies the specific cryptographic hashing algorithm which shall be used along with the saltData attribute and user-supplied password in order to compute a hash value for comparison.</p> <p>The possible values for this attribute shall be interpreted as follows:</p> <table border="1" data-bbox="415 1398 1351 1883"> <thead> <tr> <th>Value</th><th>Algorithm</th></tr> </thead> <tbody> <tr> <td>1</td><td>MD2</td></tr> <tr> <td>2</td><td>MD4</td></tr> <tr> <td>3</td><td>MD5</td></tr> <tr> <td>4</td><td>SHA-1</td></tr> <tr> <td>5</td><td>MAC</td></tr> <tr> <td>6</td><td>RIPEMD</td></tr> <tr> <td>7</td><td>RIPEMD-160</td></tr> <tr> <td>8</td><td>Undefined. Shall not be used.</td></tr> <tr> <td>9</td><td>HMAC</td></tr> </tbody> </table>	Value	Algorithm	1	MD2	2	MD4	3	MD5	4	SHA-1	5	MAC	6	RIPEMD	7	RIPEMD-160	8	Undefined. Shall not be used.	9	HMAC
Value	Algorithm																				
1	MD2																				
2	MD4																				
3	MD5																				
4	SHA-1																				
5	MAC																				
6	RIPEMD																				
7	RIPEMD-160																				
8	Undefined. Shall not be used.																				
9	HMAC

11	Undefined. Shall not be used.												
12	SHA-256												
13	SHA-384												
14	SHA-512												
Any other value	Undefined. Shall not be used.												
cryptAlgorithmType (Cryptographic Algorithm Type)	<p data-bbox="418 1083 1446 1188">Specifies the type of cryptographic algorithm used by this protection. [Note: The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. <i>end note</i>]</p> <p data-bbox="418 1230 1479 1293">[Example: Consider a PresentationML document with the following information stored in its protection element:</p> <pre data-bbox="456 1335 1192 1467">&lt;p:... p:cryptAlgorithmClass="hash"   p:cryptAlgorithmType="typeAny"   p:cryptAlgorithmSid="1"   p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p data-bbox="418 1509 1479 1572">The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm may have been used for the password. <i>end example</i>]</p> <p data-bbox="418 1614 1479 1646">The possible values for this attribute are defined by the ST_AlgType simple type (§4.8.2).</p>												
cryptProvider (Cryptographic Provider)	<p data-bbox="418 1661 1479 1797">Specifies the cryptographic provider which was used to generate the hash value stored in this document. If the user provided a cryptographic provider which was not the system's built-in provider, then that provider shall be stored here so it can subsequently be used if available.</p> <p data-bbox="418 1839 1479 1871">If this attribute is omitted, then the built-in cryptographic provider on the system shall be</p>												

Attributes	Description
	<p>used.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:cryptProvider="Krista'sProvider" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProvider attribute value of Krista'sProvider specifies that the cryptographic provider with name "Krista's Provider" shall be used if available. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
cryptProviderType (Cryptographic Provider Type)	<p>Specifies the type of cryptographic provider to be used.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:cryptProviderType="rsaAES" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_CryptProv simple type (§4.8.4).</p>
cryptProviderType Ext (Cryptographic Provider Type Extensibility)	<p>Specifies that a cryptographic provider type which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document.</p> <p>This value, when present, shall be interpreted based on the value of the cryptProviderTypeExtSource attribute in order to determine the provider type used, which shall be application-defined. [<i>Rationale:</i> This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined cryptographic provider types in order to remain secure. <i>end rationale</i>]</p> <p>If this value is present, the cryptProviderType attribute value shall be ignored in favor of the provider type defined by this attribute.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:cryptProviderTypeExt="00A5691D" p:cryptProvideTypeExtSource="futureCryptography" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProviderTypeExt attribute value of 00A5691D specifies that the provider type</p>

Attributes	Description
	<p>associated with hex code A5691D shall be used as defined by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
<p>cryptProviderTypeExtSource (Provider Type Extensibility Source)</p>	<p>Specifies the application which defined the provider type value specified by the cryptProviderTypeExt attribute.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:cryptProviderTypeExt="00A5691D"       p:cryptProvideTypeExtSource="futureCryptography"       p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The cryptProvideTypeExtSource attribute value of futureCryptography specifies that the provider type used here was published by the futureCryptography application. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hashData (Password Hash)</p>	<p>Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p>If this value is omitted, then no password shall be associated with the protection, and it may be turned off without supplying any password.</p> <p>[<i>Example:</i> Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:cryptAlgorithmClass="hash"       p:cryptAlgorithmType="typeAny"       p:cryptAlgorithmSid="1"       p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The hashData attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password shall be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>saltData (Salt for</p>	<p>Specifies the salt which was prepended to the user-supplied password before it was</p>

Attributes	Description
Password Verifier)	<p>hashed using the hashing algorithm defined by the preceding attribute values to generate the hashData attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example</i>: Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:saltData="ZUdHa+D8F/OAKP3I7ssUnQ=="   p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The saltData attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password shall have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
spinCount (Iterations to Run Hashing Algorithm)	<p>Specifies the number of times the hashing function shall be iteratively run (using each iteration's result as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashData attribute. [<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider a PresentationML document with the following information stored in its protection element:</p> <pre>&lt;p:... p:spinCount="100000"   p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /&gt;</pre> <p>The spinCount attribute value of 100000 specifies that the hashing function shall be run one hundred thousand times to generate a hash value for comparison with the hash attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ModifyVerifier">
 <attribute name="cryptProviderType" type="ST_CryptProv" use="required"/>
 <attribute name="cryptAlgorithmClass" type="ST_AlgClass" use="required"/>
 <attribute name="cryptAlgorithmType" type="ST_AlgType" use="required"/>
 <attribute name="cryptAlgorithmSid" type="xsd:unsignedInt" use="required"/>
 <attribute name="spinCount" type="xsd:unsignedInt" use="required"/>
 <attribute name="saltData" type="xsd:string" use="required"/>
 <attribute name="hashData" type="xsd:string" use="required"/>
 <attribute name="cryptProvider" type="xsd:string" use="optional"/>
 <attribute name="algIdExt" type="xsd:unsignedInt" use="optional"/>
 <attribute name="algIdExtSource" type="xsd:string" use="optional"/>
 <attribute name="cryptProviderTypeExt" type="xsd:unsignedInt" use="optional"/>
 <attribute name="cryptProviderTypeExtSource" type="xsd:string" use="optional"/>
</complexType>
```

4.3.1.18 notesMasterId (Notes Master ID)

This element specifies a notes master that is available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

[Example: Consider the following specification of a notes master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
 ..
 <p:notesMasterIdLst>
 <p:notesMasterId r:id="rId8"/>
 </p:notesMasterIdLst>
 ..
</p:presentation>
```

end example]

Parent Elements
notesMasterIdLst (§4.3.1.19)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship Identifier)  Namespace: .../officeDocument	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the notesMaster element defining this notes master.  The possible values for this attribute are defined by the ST_RelationshipId simple type

Attributes	Description
/2006/relationships	(§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesMasterIdListEntry">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.19 notesMasterIdLst (List of Notes Master IDs)

This element specifies a list of identification information for the notes master slides that are available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
notesMasterId (Notes Master ID)	§4.3.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesMasterIdList">
 <sequence>
 <element name="notesMasterId" type="CT_NotesMasterIdListEntry" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

4.3.1.20 notesSz (Notes Slide Size)

This element specifies the size of slide surface used for notes slides and handout slides. Objects within a notes slide can be specified outside these extents, but the notes slide will have a background surface of the specified size when presented or printed. This element is intended to specify the region to which content is fitted in any special type of printout the application may choose to generate, such as an outline handout.

[Example: Consider the following specifying of the size of a notes slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
 ..
 <p:notesSz cx="9144000" cy="6858000"/>
 ..
</p:presentation>
```

1 *end example]*

Parent Elements
<a href="#">presentation (§4.3.1.24)</a>

2

Attributes	Description
<b>cx</b> (Extent Length)  Namespace: .../drawingml/2006/main	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <p style="text-align: center;"><code>&lt;... cx="1828800" cy="200000"/&gt;</code></p> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
<b>cy</b> (Extent Width)  Namespace: .../drawingml/2006/main	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <p style="text-align: center;"><code>&lt; ... cx="1828800" cy="200000"/&gt;</code></p> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

3 The following XML Schema fragment defines the contents of this element:

4 <code>&lt;complexType name="CT_PositiveSize2D"&gt;</code>
5 <code>  &lt;attribute name="cx" type="ST_PositiveCoordinate" use="required"/&gt;</code>
6 <code>  &lt;attribute name="cy" type="ST_PositiveCoordinate" use="required"/&gt;</code>
7 <code>&lt;/complexType&gt;</code>

8 **4.3.1.21**      [penClr \(Pen Color for Slide Show\)](#)

9 This element specifies the pen color that should be used to make markings on the slides while in a presentation.

Parent Elements
<a href="#">showPr (§4.3.1.28)</a>

10

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 4.3.1.22 photoAlbum (Photo Album Information)

This element specifies that the corresponding presentation contains a photo album. A photo album specifies a list of images within the presentation that spread across one or more slides, all of which share a consistent layout. Each image in the album is formatted with a consistent style. This functionality enables the application to manage all of the images together and modify their ordering, layout, and formatting as a set.

This element does not enforce the specified properties on individual photo album images; rather, it specifies common settings that should be applied by default to all photo album images and their containing slides. Images that are part of the photo album are identified by the presence of the isPhoto element in the definition of the picture.

[Example: Consider the following presentation that has been specified as a photo album

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
 ..
 <p:photoAlbum bw="1" layout="2pic"/>
 ..
</p:presentation>
```

end example]

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
bw (Black and White)	Specifies whether all pictures in the photo album are to be displayed as black and white.  The possible values for this attribute are defined by the XML Schema boolean datatype.
frame (Frame Type)	Specifies the frame type that is to be used on all the pictures in the photo album.  The possible values for this attribute are defined by the ST_PhotoAlbumFrameShape simple type (§4.8.11).
layout (Photo Album Layout)	Specifies the layout that is to be used to arrange the pictures in the photo album on individual slides.  The possible values for this attribute are defined by the ST_PhotoAlbumLayout simple type (§4.8.12).
showCaptions (Show/Hide Captions)	Specifies whether to show captions for pictures in the photo album. Captions are text boxes grouped with each image, with the group set to not allow ungrouping.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_PhotoAlbum">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bw" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showCaptions" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="layout" type="ST_PhotoAlbumLayout" use="optional" default="fitToSlide"/>
 <attribute name="frame" type="ST_PhotoAlbumFrameShape" use="optional" default="frameStyle1"/>
</complexType>

```

#### 4.3.1.23 present (Presenter Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen presenter mode. In this mode, the presentation is displayed on one monitor while a different monitor displays notes and provides navigation controls intended to be viewed only by the presenter.

[Example: Consider the following presentation that is set to be viewed in a present mode.]

```

<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
 <p:showPr>
 ..
 <p:present/>
 ..
</p:showPr>
</p:presentationPr>

```

*end example]*

Parent Elements
showPr (§4.3.1.28)

1 The following XML Schema fragment defines the contents of this element:

2 `<complexType name="CT_Empty"/>`

3 **4.3.1.24 presentation (Presentation)**

4 This element specifies within it fundamental presentation-wide properties.

5 [Example: Consider the following presentation with a single slide master and two slides. In addition to these  
6 commonly used elements there can also be the specification of other properties such as slide size, notes size and  
7 default text styles.

8 `<p:presentation xmlns:a="" xmlns:r="" xmlns:p="">`  
9  `<p:sldMasterIdLst>`  
10  `<p:sldMasterId id="2147483648" r:id="rId1"/>`  
11  `</p:sldMasterIdLst>`  
12  `<p:sldIdLst>`  
13  `<p:sldId id="256" r:id="rId3"/>`  
14  `<p:sldId id="257" r:id="rId4"/>`  
15  `</p:sldIdLst>`  
16  `<p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>`  
17  `<p:notesSz cx="6858000" cy="9144000"/>`  
18  `<p:defaultTextStyle>`  
19  `...`  
20  `</p:defaultTextStyle>`  
21 `</p:presentation>`

22 *end example]*

sldSz (Presentation Slide Size)	§4.3.1.34
smartTags (Smart Tags)	§4.3.1.35

1

Attributes	Description
autoCompressPictures (Automatically Compress Pictures)	<p>Specifies whether the generating application should automatically compress all pictures for this presentation.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bookmarkIdSeed (Bookmark ID Seed)	<p>Specifies a seed for generating bookmark IDs to ensure IDs remain unique across the document. This value specifies the number to be used as the ID for the next new bookmark created.</p> <p>The possible values for this attribute are defined by the ST_BookmarkIdSeed simple type (§4.8.3).</p>
compatMode (Compatibility Mode)	<p>Specifies whether the generating application is to be in a compatibility mode which serves to inform the user of any loss of content or functionality when working with older formats.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
embedTrueTypeFonts (Embed True Type Fonts)	<p>Specifies whether the generating application should automatically embed true type fonts or not.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
firstSlideNum (First Slide Number)	<p>Specifies the first slide number in the presentation.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
removePersonalInfoOnSave (Remove Personal Information on Save)	<p>Specifies whether to automatically remove personal information when the presentation document is saved.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rtl (Right-To-Left Views)	<p>Specifies if the current view of the user interface is oriented right-to-left or left-to-right. The view is right-to-left if this value is set to true, and left-to-right otherwise.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
saveSubsetFonts (Save Subset Fonts)	<p>Specifies to save only the subset of characters used in the presentation when a font is embedded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
serverZoom (Server Zoom)	<p>Specifies the scaling to be used when the presentation is embedded in another document. The embedded slides are to be scaled by this percentage.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
showSpecialPlsOn TitleSld (Show Header and Footer Placeholders on Titles)	<p>Specifies whether to show the header and footer placeholders on the title slides.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
strictFirstAndLastC hars (Strict First and Last Characters)	<p>Specifies whether to use strict characters for starting and ending lines of Japanese text.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Presentation">
 <sequence>
 <element name="sldMasterIdLst" type="CT_SlideMasterIdList" minOccurs="0" maxOccurs="1"/>

```

4.3.1.25 presentationPr (Presentation-wide Properties)

This element functions as a parent element within which additional presentation-wide document properties are contained. All properties and their corresponding settings are defined within the child elements.

Parent Elements
Root element of PresentationML Presentation Properties part

Child Elements	Subclause
clrMru (Color MRU)	§4.3.1.4
extLst (Extension List)	§4.2.5
htmlPubPr (HTML Publishing Properties)	§4.3.1.13
prnPr (Printing Properties)	§4.3.1.26
showPr (Presentation-wide Show Properties)	§4.3.1.28
webPr (Web Properties)	§4.3.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresentationProperties">
 <sequence>
 <element name="htmlPubPr" type="CT_HtmlPublishProperties" minOccurs="0" maxOccurs="1"/>
 <element name="webPr" type="CT_WebProperties" minOccurs="0" maxOccurs="1"/>
 <element name="prnPr" type="CT_PrintProperties" minOccurs="0" maxOccurs="1"/>
 <element name="showPr" type="CT_ShowProperties" minOccurs="0" maxOccurs="1"/>
 <element name="clrMrU" type="a:CT_ColorMRU" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

4.3.1.26 prnPr (Printing Properties)

This element specifies the default printing properties associated with this presentation document.

Parent Elements
<a href="#">presentationPr</a> (§4.3.1.25)

Child Elements	Subclause
<a href="#">extLst</a> (Extension List)	§4.2.5

Attributes	Description
<a href="#">clrMode</a> (Print Color Mode)	Specifies the color mode to be used when printing.  The possible values for this attribute are defined by the <a href="#">ST_PrintColorMode</a> simple type (§4.8.15).
<a href="#">frameSlides</a> (Frame slides when printing)	Specifies whether slides should be framed when printing. When framed, an outline border is printed for each slide.  The possible values for this attribute are defined by the XML Schema boolean datatype.
<a href="#">hiddenSlides</a> (Print Hidden Slides)	Specifies whether hidden slides should be printed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
<a href="#">prnWhat</a> (Print Output)	Specifies what the default print output will be in terms of content layout.  The possible values for this attribute are defined by the <a href="#">ST_PrintWhat</a> simple type (§4.8.16).
<a href="#">scaleToFitPaper</a> (Scale to Fit Paper when printing)	Specifies whether the print output should be scaled to fit the paper being used.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PrintProperties">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="prnWhat" type="ST_PrintWhat" use="optional" default="slides"/>
 <attribute name="clrMode" type="ST_PrintColorMode" use="optional" default="clr"/>
 <attribute name="hiddenSlides" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="scaleToFitPaper" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="frameSlides" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.3.1.27 regular (Regular Embedded Font)

This element specifies a regular embedded font that is linked to a parent typeface. Once specified, this regular version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[Example: Consider the following embedded font with a regular version specified.

```
<p:embeddedFont>
 <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
 <p:regular r:id="rId2"/>
</p:embeddedFont>
```

*end example]*

[Note: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note]*

Parent Elements

embeddedFont (§4.3.1.8)

Attributes

Description

id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontDataId">
 <attribute ref="r:id" use="required"/>
</complexType>
```

#### 4.3.1.28 **showPr (Presentation-wide Show Properties)**

- This element functions as a parent element within which all presentation-wide show properties are contained.  
All properties and their corresponding settings are defined within the child elements.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
browse (Browse Slide Show Mode)	§4.3.1.3
custShow (Custom Show)	§4.2.2
extLst (Extension List)	§4.2.5
kiosk (Kiosk Slide Show Mode)	§4.3.1.16
penClr (Pen Color for Slide Show)	§4.3.1.21
present (Presenter Slide Show Mode)	§4.3.1.23
sldAll (All Slides)	§4.2.7
sldRg (Slide Range)	§4.2.8

Attributes	Description
loop (Loop Slide Show)	Specifies whether the slide show should be set to loop at the end.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showAnimation (Show Animation in Slide Show)	Specifies whether slide show animation should be shown when presenting.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showNarration (Show Narration in Slide Show)	Specifies whether slide show narration should be played when presenting.  The possible values for this attribute are defined by the XML Schema boolean datatype.
useTimings (Use Timings in Slide Show)	Specifies whether slide transition timings should be used to advance slides when presenting.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShowProperties">
 <sequence minOccurs="0" maxOccurs="1">
 <group ref="EG_ShowType" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_SlideListChoice" minOccurs="0" maxOccurs="1"/>
 <element name="penClr" type="a:CT_Color" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="loop" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showNarration" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showAnimation" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="useTimings" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.3.1.29 sldId (Slide ID)

This element specifies a presentation slide that is available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[Example: Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
 ..
 <p:sldIdLst>
 <p:sldId id="256" r:id="rId3"/>
 <p:sldId id="257" r:id="rId4"/>
 <p:sldId id="258" r:id="rId5"/>
 <p:sldId id="259" r:id="rId6"/>
 <p:sldId id="260" r:id="rId7"/>
 </p:sldIdLst>
 ..
</p:presentation>
```

end example]

Parent Elements
sldIdLst (§4.3.1.30)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sld element defining this slide.

Attributes	Description
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
id (Slide Identifier)	Specifies the slide identifier that is to contain a value that is unique throughout the presentation.  The possible values for this attribute are defined by the ST_SlideId simple type (§4.8.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideIdListEntry">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="ST_SlideId" use="required"/>
 <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.30 sldIdLst (List of Slide IDs)

This element specifies a list of identification information for the slides that are available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
sldId (Slide ID)	§4.3.1.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideIdList">
 <sequence>
 <element name="sldId" type="CT_SlideIdListEntry" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

4.3.1.31 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
custShow (§4.3.1.5)

Child Elements	Subclause
sld (Presentation Slide)	§4.2.6

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_SlideRelationshipList">
3 <sequence>
4 <element name="sld" type="CT_SlideRelationshipListEntry" minOccurs="0" maxOccurs="unbounded"/>
5 </sequence>
6 </complexType>
```

7 **4.3.1.32 sldMasterId (Slide Master ID)**

8 This element specifies a slide master that is available within the corresponding presentation. A slide master is a  
9 slide that is specifically designed to be a template for all related child layout slides.

10 *[Example: Consider the following specification of a slide master within a presentation*

```
11 <p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
12 ..
13 <p:sldMasterIdLst>
14 <p:sldMasterId id="2147483648" r:id="rId1"/>
15 </p:sldMasterIdLst>
16 ..
17 </p:presentation>
```

18 *end example]*

Parent Elements
sldMasterIdLst (§4.3.1.33)

19

Child Elements	Subclause
extLst (Extension List)	§4.2.5

20

Attributes	Description
id (Slide Master Identifier)	Specifies the slide master identifier that is to contain a value that is unique throughout the presentation.  The possible values for this attribute are defined by the ST_SlideMasterId simple type (§4.8.20).
id (Relationship Identifier)  Namespace:	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sldMaster element defining this slide master.

Attributes	Description
.../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideMasterIdListEntry">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="ST_SlideMasterId" use="optional"/>
 <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.33 sldMasterIdLst (List of Slide Master IDs)

This element specifies a list of identification information for the slide master slides that are available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
sldMasterId (Slide Master ID)	§4.3.1.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideMasterIdList">
 <sequence>
 <element name="sldMasterId" type="CT_SlideMasterIdListEntry" minOccurs="0"
 maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

4.3.1.34 sldSz (Presentation Slide Size)

This element specifies the size of the presentation slide surface. Objects within a presentation slide can be specified outside these extents, but this is the size of background surface that will be shown when the slide is presented or printed..

[Example: Consider the following specifying of the size of a presentation slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
 ..
 <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
 ..
```

1       </p:presentation>

2   *end example]*

3

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
cx (Extent Length)	<p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <p style="text-align: center;">&lt;... cx="1828800" cy="200000"/&gt;</p> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§4.8.21).</p>
cy (Extent Width)	<p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <p style="text-align: center;">&lt; ... cx="1828800" cy="200000"/&gt;</p> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§4.8.21).</p>
type (Type of Size)	<p>Specifies the type of slide size that should be used. This identifies in particular the expected delivery platform for this presentation.</p> <p>The possible values for this attribute are defined by the ST_SlideSizeType simple type (§4.8.22).</p>

4   The following XML Schema fragment defines the contents of this element:

5   <complexType name="CT_SlideSize">
6     <attribute name="cx" type="ST_SlideSizeCoordinate" use="required"/>
7     <attribute name="cy" type="ST_SlideSizeCoordinate" use="required"/>
8     <attribute name="type" type="ST_SlideSizeType" use="optional" default="custom"/>
9   </complexType>

#### 4.3.1.35 smartTags (Smart Tags)

This element specifies the existence of smart tags within the corresponding presentation.

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this smart tag.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTags">
 <attribute ref="r:id" use="required"/>
</complexType>
```

#### 4.3.1.36 webPr (Web Properties)

This element specifies all general output properties that pertain to generating a web format version of the presentation document.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
allowPng (Allow PNG in HTML output)	Specifies whether to allow the output of PNG format pictures in the HTML document.  The possible values for this attribute are defined by the XML Schema boolean datatype.
clr (Slide Navigation Colors for HTML output)	Specifies the color constraints that are to be used when generating HTML output.  The possible values for this attribute are defined by the ST_WebColorType simple type (§4.8.60).
encoding (Encoding for HTML output)	Specifies the particular HTML character set encoding that should be used when generating output.

Attributes	Description
	The possible values for this attribute are defined by the ST_WebEncoding simple type (§4.8.61).
imgSz (Image size for HTML output)	Specifies the screen size for which the images in the HTML output should be optimized.  The possible values for this attribute are defined by the ST_WebScreenSize simple type (§4.8.62).
organizeInFolders (Organize HTML output in folders)	Specifies whether the supporting output files should be automatically organized into a folder.  The possible values for this attribute are defined by the XML Schema boolean datatype.
relyOnVml (Rely on VML for HTML output)	Specifies whether graphics should be output in VML within the HTML.  The possible values for this attribute are defined by the XML Schema boolean datatype.
resizeGraphics (Resize graphics in HTML output)	Specifies whether to resize graphics to fit within the browser window when generating the HTML output.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showAnimation (Show animation in HTML output)	Specifies whether to show presentation animation in the HTML output file.  The possible values for this attribute are defined by the XML Schema boolean datatype.
useLongFileNames (Use long file names in HTML output)	Specifies whether to allow the use of long file names when generating the HTML output.  The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_WebProperties">
3 <sequence>
4 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="showAnimation" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="resizeGraphics" type="xsd:boolean" use="optional" default="true"/>
8 <attribute name="allowPng" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="relyOnVml" type="xsd:boolean" use="optional" default="false"/>
10 <attribute name="organizeInFolders" type="xsd:boolean" use="optional" default="true"/>
11 <attribute name="useLongFileNames" type="xsd:boolean" use="optional" default="true"/>
12 <attribute name="imgSz" type="ST_WebScreenSize" use="optional" default="800x600"/>
13 <attribute name="encoding" type="ST_WebEncoding" use="optional" default=""/>
14 <attribute name="clr" type="ST_WebColorType" use="optional" default="whiteTextOnBlack"/>
15 </complexType>

```

### 16 4.3.2 View Properties

17 This section contains all properties that pertain to the viewing of the presentation.

#### 4.3.2.1 cSldViewPr (Common Slide View Properties)

This element functions as a container for slide view properties that are common across multiple view property elements. The specific properties and associated values for these view properties reside within the child elements and attributes.

Parent Elements
notesViewPr (§4.3.2.8); slideViewPr (§4.3.2.16)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2
guideLst (List of Guides)	§4.3.2.5

Attributes	Description
showGuides (Show Guides in View)	Specifies whether to show guides when editing the presentation. The possible values for this attribute are defined by the XML Schema boolean datatype.
snapToGrid (Snap Objects to Grid)	Specifies whether objects should snap to underlying presentation grid when editing. The possible values for this attribute are defined by the XML Schema boolean datatype.
snapToObjects (Snap Objects to Objects)	Specifies whether objects should snap to other objects when editing the presentation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommonSlideViewProperties">
 <sequence>
 <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
 <element name="guideLst" type="CT_GuideList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="snapToGrid" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="snapToObjects" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="showGuides" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.3.2.2 cViewPr (Common View Properties)

This element specifies the view properties that are common across multiple view property elements.

Parent Elements
cSldViewPr (§4.3.2.1); notesTextViewPr (§4.3.2.7); outlineViewPr (§4.3.2.10); sorterViewPr (§4.3.2.17)

Child Elements	Subclause
origin (View Origin)	§4.3.2.9
scale (View Scale)	§4.3.2.13

1

Attributes	Description
varScale (Variable Scale)	Specifies that the view content should automatically scale to best fit the current window size.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

3 `<complexType name="CT_CommonViewProperties">`  
4  `<sequence>`  
5  `<element name="scale" type="a:CT_Scale2D" minOccurs="1" maxOccurs="1"/>`  
6  `<element name="origin" type="a:CT_Point2D" minOccurs="1" maxOccurs="1"/>`  
7  `</sequence>`  
8  `<attribute name="varScale" type="xsd:boolean" use="optional" default="false"/>`  
9 `</complexType>`

10 **4.3.2.3 gridSpacing (Grid Spacing)**

11 This element specifies the grid spacing that should be used for the grid underlying the presentation document.  
12 The grid may be used to align objects on the slide and to display visual positioning cues.

Parent Elements
viewPr (§4.3.2.18)

13

Attributes	Description
cx (Extent Length)  Namespace: .../drawingml/2006/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).  [Example: Consider a DrawingML object specified as follows:  <... cx="1828800" cy="200000"/>  The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i> ]  The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width)  Namespace:	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).

Attributes	Description
.../drawingml/2006/main	<p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>&lt; ... cx="1828800" cy="200000"/&gt;</pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_PositiveSize2D">
3 <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
4 <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
5 </complexType>
```

#### 6 4.3.2.4 [guide \(A Guide\)](#)

7 This element specifies a guide within the presentation. Guides are lines used for arranging layouts and content  
8 and never appear except as an aid in editing slides.

Parent Elements
guideLst (§4.3.2.5)

9

Attributes	Description
orient (Guide Orientation)	<p>Specifies the orientation for a guide.</p> <p>The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).</p>
pos (Guide Position)	<p>Specifies the position information for a guide.</p> <p>The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).</p>

10 The following XML Schema fragment defines the contents of this element:

```
11 <complexType name="CT_Guide">
12 <attribute name="orient" type="ST_Direction" use="optional" default="vert"/>
13 <attribute name="pos" type="a:ST_Coordinate32" use="optional" default="0"/>
14 </complexType>
```

#### 15 4.3.2.5 [guideLst \(List of Guides\)](#)

16 This element specifies a list of guides for a particular view of the presentation.

Parent Elements
-----------------

Parent Elements
cSldViewPr (§4.3.2.1)

Child Elements	Subclause
guide (A Guide)	§4.3.2.4

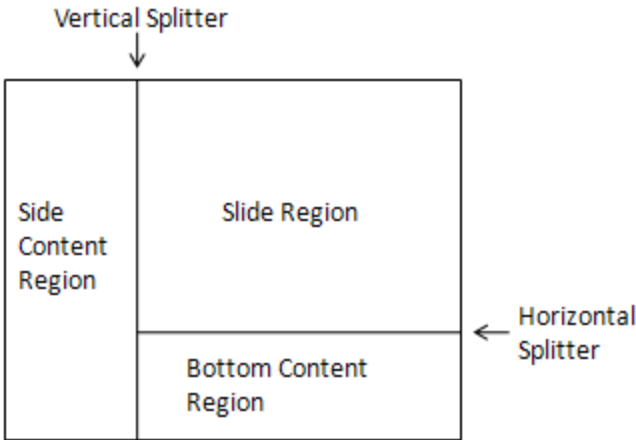

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GuideList">
 <sequence minOccurs="0" maxOccurs="1">
 <element name="guide" type="CT_Guide" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

4.3.2.6 normalViewPr (Normal View Properties)

This element specifies the view properties associated with the normal view mode. The normal view consists of three content regions: the slide itself, a side content region, and a bottom content region. The content of the side content region and bottom content region is determined by the generating application. Properties pertaining to the positioning of the different content regions are stored in this element. This information allows the application to save its view state to the file, so that when reopened the view is in the same state as when the presentation was last saved.

A vertical splitter bar separates the slide from the side content region. A horizontal splitter bar separates the slide from the content region below the slide. If the presentation is set to left-to-right, the side content region is to the left of the slide. If the presentation is set to right-to-left, the side content region is to the right of the slide.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
extLst (Extension List)	§4.2.5
restoredLeft (Normal View Restored Left Properties)	§4.3.2.11
restoredTop (Normal View Restored Top Properties)	§4.3.2.12

1

Attributes	Description
horzBarState (State of the Horizontal Splitter Bar)	<p>Specifies the state that the horizontal splitter bar should be in when in normal view mode. The region to be maximized or minimized is the side content region.</p> <p>The possible values for this attribute are defined by the ST_SplitterBarState simple type (§4.8.23).</p>
preferSingleView (Prefer Single View)	<p>Specifies whether the user prefers to see a full-window single-content region over the standard normal view with three content regions. If enabled, the application may choose to display one of the content regions in the entire window.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
showOutlineIcons (Show Outline Icons in Normal View)	<p>Specifies whether the application should show icons if displaying outline content in any of the content regions of normal view mode.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
snapVertSplitter (Snap Vertical Splitter)	<p>Specifies whether the vertical splitter should snap to a minimized state when the side region is sufficiently small. The specific parameters of this behaviour are left to the generating application.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
vertBarState (State of the Vertical Splitter Bar)	<p>Specifies the state that the vertical splitter bar should be in when in normal view mode. The region to be maximized or minimized is the slide region.</p> <p>The possible values for this attribute are defined by the ST_SplitterBarState simple type (§4.8.23).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_NormalViewProperties">
4 <sequence>
5 <element name="restoredLeft" type="CT_NormalViewPortion" minOccurs="1" maxOccurs="1"/>
6 <element name="restoredTop" type="CT_NormalViewPortion" minOccurs="1" maxOccurs="1"/>
7 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 <attribute name="showOutlineIcons" type="xsd:boolean" use="optional" default="true"/>
10 <attribute name="snapVertSplitter" type="xsd:boolean" use="optional" default="false"/>
11 <attribute name="vertBarState" type="ST_SplitterBarState" use="optional" default="restored"/>
12 <attribute name="horzBarState" type="ST_SplitterBarState" use="optional" default="restored"/>
13 <attribute name="preferSingleView" type="xsd:boolean" use="optional" default="false"/>
14 </complexType>
```

#### 4.3.2.7 [notesTextViewPr \(Notes Text View Properties\)](#)

This element functions as a parent element within which all properties associated with the notes text view are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2
extLst (Extension List)	§4.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesTextViewProperties">
 <sequence minOccurs="1" maxOccurs="1">
 <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.3.2.8 [notesViewPr \(Notes View Properties\)](#)

This element functions as a parent element within which all view properties associated with notes are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cSldViewPr (Common Slide View Properties)	§4.3.2.1
extLst (Extension List)	§4.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesViewProperties">
 <sequence>
 <element name="cSldViewPr" type="CT_CommonSlideViewProperties" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.3.2.9 [origin \(View Origin\)](#)

This element specifies the origin of the slide when it is being viewed with various scaling factors using the scale element.

1

Parent Elements
cViewPr (§4.3.2.2)

Attributes	Description
x (X-Axis Coordinate)  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
y (Y-Axis Coordinate)  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[Example: Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

2 The following XML Schema fragment defines the contents of this element:

3	<complexType name="CT_Point2D">
4	<attribute name="x" type="ST_Coordinate" use="required"/>
5	<attribute name="y" type="ST_Coordinate" use="required"/>
6	</complexType>

7 **4.3.2.10**      **outlineViewPr (Outline View Properties)**

8 This element functions as a parent element within which all view properties associated with the outline view  
9 mode are contained. All properties are defined within the child elements.

10 Outline view displays only the textual content of a presentation. The presentation is formatted as an outline,  
11 with slide titles as the first level of the outline. Body text on slides is indented below the slide title.

Parent Elements
viewPr (§4.3.2.18)

1

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2
extLst (Extension List)	§4.2.5
sldLst (List of Presentation Slides)	§4.3.2.15

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_OutlineViewProperties">
4 <sequence minOccurs="1" maxOccurs="1">
5 <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
6 <element name="sldLst" type="CT_OutlineViewSlideList" minOccurs="0" maxOccurs="1"/>
7 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 </complexType>
```

10 **4.3.2.11 restoredLeft (Normal View Restored Left Properties)**

11 This element specifies the sizing of the side content region of the normal view, when the region is of a variable  
12 restored size (neither minimized nor maximized).

Parent Elements
normalViewPr (§4.3.2.6)

13

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft).  The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_NormalViewPortion">
16 <attribute name="sz" type="a:ST_PositiveFixedPercentage" use="required"/>
17 <attribute name="autoAdjust" type="xsd:boolean" use="optional" default="true"/>
18 </complexType>
```

19 **4.3.2.12 restoredTop (Normal View Restored Top Properties)**

20 This element specifies the sizing of the top slide region of the normal view, when the region is of a variable  
21 restored size (neither minimized nor maximized).

Parent Elements
normalViewPr (§4.3.2.6)

1

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft).  The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_NormalViewPortion">
4 <attribute name="sz" type="a:ST_PositiveFixedPercentage" use="required"/>
5 <attribute name="autoAdjust" type="xsd:boolean" use="optional" default="true"/>
6 </complexType>

```

#### 7 4.3.2.13 scale (View Scale)

8 This element specifies the view scaling factors that the presentation was last viewed with.

Parent Elements
cViewPr (§4.3.2.2)

9

Child Elements	Subclause
sx (Horizontal Ratio)	§5.1.2.1.38
sy (Vertical Ratio)	§5.1.2.1.39

10 The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_Scale2D">
12 <sequence>
13 <element name="sx" type="CT_Ratio" minOccurs="1" maxOccurs="1"/>
14 <element name="sy" type="CT_Ratio" minOccurs="1" maxOccurs="1"/>
15 </sequence>
16 </complexType>

```

#### 17 4.3.2.14 sld (Presentation Slide)

18 This element specifies a presentation slide and properties specific to the slide's appearance in outline view.

19 *[Example: Consider the following presentation slide that has been collapsed in outline view.*

```
1 <p:viewPr xmlns:a="" xmlns:r="" xmlns:p="" lastView="outlineView">
2 ..
3 <p:outlineViewPr>
4 ..
5 <p:sldLst>
6 <p:sld r:id="rId1" collapse="1"/>
7 </p:sldLst>
8 ..
9 </p:outlineViewPr>
10 ..
11 </p:viewPr>
```

12 *end example]*

Parent Elements
sldLst (§4.3.2.15)

13

Attributes	Description
collapse (Collapsed)	Specifies whether this presentation slide is to be shown as collapsed within outline view. That is, all text other than the slide title will not be shown to the user.  The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Relationship Identifier)  Namespace: .../officeDocument /2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this presentation slide within a presentation.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_OutlineViewSlideEntry">
16 <attribute ref="r:id" use="required"/>
17 <attribute name="collapse" type="xsd:boolean" use="optional" default="false"/>
18 </complexType>
```

19 **4.3.2.15 sldLst (List of Presentation Slides)**

20 This element specifies a list of presentation slides. A presentation slide contains the information that is specific  
21 to a single slide such as slide-specific shape and text information.

Parent Elements
outlineViewPr (§4.3.2.10)

22

Child Elements	Subclause
sld (Presentation Slide)	§4.3.2.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OutlineViewSlideList">
 <sequence>
 <element name="sld" type="CT_OutlineViewSlideEntry" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 4.3.2.16 [slideViewPr \(Slide View Properties\)](#)

This element functions as a parent element within which all view properties associated with the slide view mode are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cSldViewPr (Common Slide View Properties)	§4.3.2.1
extLst (Extension List)	§4.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideViewProperties">
 <sequence>
 <element name="cSldViewPr" type="CT_CommonSlideViewProperties" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.3.2.17 [sorterViewPr \(Slide Sorter View Properties\)](#)

This element functions as a parent element within which all view properties associated with the slide sorter view mode are contained. All properties are defined within the child elements.

The slide sorter view displays thumbnails of multiple slides at once; the number of slides and size of thumbnails depends on the scaling factor of the view.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2

Child Elements	Subclause
extLst (Extension List)	§4.2.5

1

Attributes	Description
showFormatting (Show Formatting)	Specifies whether to show associated slide formatting when in slide sorter view mode.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_SlideSorterViewProperties">
4 <sequence minOccurs="1" maxOccurs="1">
5 <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
6 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="showFormatting" type="xsd:boolean" use="optional" default="true"/>
9 </complexType>

```

#### 10 4.3.2.18 viewPr (Presentation-wide View Properties)

11 This element functions as a parent element within which all presentation-wide view properties are contained.

12 All properties and their corresponding settings are defined within the child elements.

Parent Elements
Root element of PresentationML View Properties part

13

Child Elements	Subclause
extLst (Extension List)	§4.2.5
gridSpacing (Grid Spacing)	§4.3.2.3
normalViewPr (Normal View Properties)	§4.3.2.6
notesTextViewPr (Notes Text View Properties)	§4.3.2.7
notesViewPr (Notes View Properties)	§4.3.2.8
outlineViewPr (Outline View Properties)	§4.3.2.10
slideViewPr (Slide View Properties)	§4.3.2.16
sorterViewPr (Slide Sorter View Properties)	§4.3.2.17

14

Attributes	Description
lastView (Last View)	Specifies the view mode that was used when the presentation document was last saved.  The possible values for this attribute are defined by the ST_ViewType simple type (§4.8.59).

Attributes	Description
showComments (Show Comments)	Specifies whether the slide comments should be shown.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ViewProperties">
 <sequence minOccurs="0" maxOccurs="1">
 <element name="normalViewPr" type="CT_NormalViewProperties" minOccurs="0" maxOccurs="1"/>
 <element name="slideViewPr" type="CT_SlideViewProperties" minOccurs="0" maxOccurs="1"/>
 <element name="outlineViewPr" type="CT_OutlineViewProperties" minOccurs="0" maxOccurs="1"/>
 <element name="notesTextViewPr" type="CT_NotesTextViewProperties" minOccurs="0"
 maxOccurs="1"/>
 <element name="sorterViewPr" type="CT_SlideSorterViewProperties" minOccurs="0" maxOccurs="1"/>
 <element name="notesViewPr" type="CT_NotesViewProperties" minOccurs="0" maxOccurs="1"/>
 <element name="gridSpacing" type="a:CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="lastView" type="ST_ViewType" use="optional" default="sldView"/>
 <attribute name="showComments" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

## 4.4 Slides

The Slides portion of the PresentationML framework stores all information pertaining specifically to slides of various types. These slide types and corresponding parts can be broken down into three distinct parts, namely slides, embedded objects, and programmable tags.

### 4.4.1 Slides

Being the main segment of this section of PresentationML, the slides elements encompass all data that is to be contained within a slide. The best way to think of a slide is a container for all data that is to be on that slide. The specific shapes, images and relations within a slide will not come into play here. The elements here pertain to the six different types of slides that can be described within PresentationML, namely slide, slide layout, slide master, handout master, notes master and notes slide.

#### 4.4.1.1 bg (Slide Background)

This element specifies the background appearance information for a slide. The slide background covers the entire slide and is visible where no objects exist and as the background for transparent objects.

Parent Elements
cSld (§4.4.1.15)

Child Elements	Subclause
bgPr (Background Properties)	§4.4.1.2

Child Elements	Subclause
bgRef (Background Style Reference)	§4.4.1.3

1

Attributes	Description
bwMode (Black and White Mode)	<p>Specifies that the background should be rendered using only black and white coloring. That is, the coloring information for the background should be converted to either black or white when rendering the picture.</p> <p>[Note: No gray is to be used in rendering this background, only stark black and stark white. End note]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Background">
4 <sequence>
5 <group ref="EG_Background"/>
6 </sequence>
7 <attribute name="bwMode" type="a:ST_BlackWhiteMode" use="optional" default="white"/>
8 </complexType>

```

#### 9 4.4.1.2 [bgPr \(Background Properties\)](#)

10 This element specifies visual effects used to render the slide background. This includes any fill, image, or effects  
 11 that are to make up the background of the slide.

Parent Elements
bg (§4.4.1.1)

12

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§4.2.5
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

13

Attributes	Description
shadeToTitle (Shade to Title)	<p>Specifies whether the background of the slide is of a shade to title type. This type of gradient fill is on the slide background and changes based on the placement of the slide title placeholder. An example is shown below.</p> <div></div> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_BackgroundProperties">
3 <sequence>
4 <group ref="a:EG_FillProperties" minOccurs="1" maxOccurs="1"/>
5 <group ref="a:EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="shadeToTitle" type="xsd:boolean" use="optional" default="false"/>
9 </complexType>
```

10 4.4.1.3 bgRef (Background Style Reference)

11 This element specifies the slide background is to use a fill style defined in the style matrix. The idx attribute  
12 refers to the index of a background fill style or fill style within the presentation's style matrix, defined by the  
13 fmtScheme element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style  
14 within the fillStyleLst element, and values 1001 and above refer to the index of a background fill style within  
15 the bgFillStyleLst element. The value 1001 corresponds to the first background fill style, 1002 to the second  
16 background fill style, and so on.

17 [Example:

```
18 <p:bgRef idx="2">
19 <a:schemeClr val="bg2"/>
20 </p:bgRef>
```

21 The above code indicates a slide background with the style's second fill style using the second background color  
22 of the color scheme.

1 *end example]*

2 *[Example:*

```
3 <p:bgRef idx="1001">
4 <a:schemeClr val="bg2"/>
5 </p:bgRef>
```

6 The above code indicates a slide background with the style's first background fill style using the second  
7 background color of the color scheme.

8 *end example]*

Parent Elements
bg (§4.4.1.1)

9

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

10

Attributes	Description
idx (Style Matrix Index)  Namespace: .../drawingml/2006/main	Specifies the style matrix index of the style referred to.  The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).

11 The following XML Schema fragment defines the contents of this element:

```
12 <complexType name="CT_StyleMatrixReference">
13 <sequence>
14 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
15 </sequence>
16 <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
17 </complexType>
```

#### 4.4.1.4 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
 ..
 <p:blipFill>
 <a:blip r:embed="rId2"/>
 <a:stretch>
 <a:fillRect/>
 </a:stretch>
 </p:blipFill>
 ..
</p:pic>
```

The above picture object is shown as an example of this fill type. End example]

[Example: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
 ..
 <p:blipFill>
 <a:blip r:embed="rId2"/>
 <a:stretch>
 <a:fillRect/>
 </a:stretch>
 </p:blipFill>
```

```
1 <p:spPr>
2 <a:gradFill>
3 <a:gsLst>
4 <a:gs pos="0">
5 <a:schemeClr val="tx2">
6 <a:shade val="50000"/>
7 </a:schemeClr>
8 </a:gs>
9 <a:gs pos="39999">
10 <a:schemeClr val="tx2">
11 <a:tint val="20000"/>
12 </a:schemeClr>
13 </a:gs>
14 <a:gs pos="70000">
15 <a:srgbClr val="C4D6EB"/>
16 </a:gs>
17 <a:gs pos="100000">
18 <a:schemeClr val="bg1"/>
19 </a:gs>
20 </a:gsLst>
21 </a:gradFill>
22 </p:spPr>
23 ..
24 </p:pic>
```

25

26 The above picture object is shown as an example of this double fill type. End example]

Parent Elements
pic (§4.4.1.34)

27

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

1

Attributes	Description
dpi (DPI Setting)  Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.  [Note: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i> ]  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape)  Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_BlipFillProperties">
4 <sequence>
5 <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
6 <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
10 <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
11 </complexType>

```

#### 12 4.4.1.5 bodyStyle (Slide Master Body Text Style)

13 This element specifies the text formatting style for all body text within a master slide. This formatting will be  
 14 used on all body text within presentation slides related to this master. The text formatting is specified by  
 15 utilizing the DrawingML framework just as within a regular presentation slide. Within the bodyStyle element  
 16 there may be many different types of styles defined as there are different types of text stored within the body of  
 17 a slide.

18

Parent Elements
-----------------

Parent Elements
txStyles (§4.4.1.48)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TextListStyle">
 <sequence>
 <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.6 clrMap (Color Scheme Map)

This element specifies the mapping layer that transforms one color scheme definition to another. Each attribute represents a color name that may be referenced in this master, and the value is the corresponding color in the theme.

[Example: Consider the following mapping of colors that applies to a slide master:

```

1 <p:clrMap bg1="dk1" tx1="lt1" bg2="dk2" tx2="lt2" accent1="accent1"
2 accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
3 accent6="accent6" hlink="hlink" folHlink="folHlink"/>

```

4 *end example]*

Parent Elements
handoutMaster (§4.4.1.21); notesMaster (§4.4.1.24); sldMaster (§4.4.1.39)

5

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

6

Attributes	Description
accent1 (Accent 1)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 1 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 2 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 3 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent4 (Accent 4)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 4 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 5 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 6 color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

Attributes	Description
6/main	
bg1 (Background 1)  Namespace: .../drawingml/2006/main	A color defined which is associated as the first background color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg2 (Background 2)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the second background color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a followed hyperlink.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a hyperlink.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the first text color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2)  Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the second text color.  The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMapping">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
 <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>
```

4.4.1.7 clrMapOvr (Color Scheme Map Override)

This element provides a mechanism with which to override the color schemes listed within the ClrMap element. If the masterClrMapping element is present, the color scheme defined by the master is used. If the overrideClrMapping element is present, it defines a new color scheme specific to the parent notes slide, presentation slide, or slide layout.

Parent Elements
notes (§4.4.1.23); sld (§4.4.1.35); sldLayout (§4.4.1.36)

Child Elements	Subclause
masterClrMapping (Master Color Mapping)	§5.1.8.6
overrideClrMapping (Override Color Mapping)	§5.1.8.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMappingOverride">
 <sequence>
 <choice minOccurs="1" maxOccurs="1">
 <element name="masterClrMapping" type="CT_EmptyElement"/>
 <element name="overrideClrMapping" type="CT_ColorMapping"/>
 </choice>
 </sequence>
</complexType>
```

4.4.1.8 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties specific to a connector shape. This includes information specifying the shapes to which the connector shape is connected.

Parent Elements
nvCxnSpPr (§4.4.1.26)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NonVisualConnectorProperties">
 <sequence>
 <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
 <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.9 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGraphicFramePr (§4.4.1.27)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NonVisualGraphicFrameProperties">
 <sequence>
 <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
 maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.10 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGrpSpPr (§4.4.1.28)

1

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_NonVisualGroupDrawingShapeProps">
4 <sequence>
5 <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 </complexType>

```

#### 9 4.4.1.11 cNvPicPr (Non-Visual Picture Drawing Properties)

10 This element specifies the non-visual properties for the picture canvas. These properties are to be used by the  
 11 generating application to determine how certain properties are to be changed for the picture object in question.

12 [Example: Consider the following DrawingML.

```

13 <p:pic>
14 ..
15 <p:nvPicPr>
16 <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
17 <p:cNvPicPr>
18 <a:picLocks noChangeAspect="1"/>
19 </p:cNvPicPr>
20 <p:nvPr/>
21 </p:nvPicPr>
22 ..
23 </p:pic>

```

24 *end example]*

Parent Elements
nvPicPr (§4.4.1.29)

25

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

26

Attributes	Description
preferRelativeResi ze (Relative Resize Preferred)  Namespace: .../drawingml/200 6/main	<p>Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size.</p> <p>[<i>Example</i>: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
 <sequence>
 <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.4.1.12 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
 ..
 <p:nvPicPr>
 <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
 </p:nvPicPr>
 ..
</p:pic>
```

End example]

hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

1

Attributes	Description
<p>descr (Alternative Text for Object)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>&lt;... descr="A picture of a bowl of fruit"&gt;</pre> <p>The descr attribute contains alternative text which may be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<p>hidden (Hidden)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [<i>Note</i>: An application may have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</p> <pre>&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
<p>id (Unique Identifier)</p> <p>Namespace: .../drawingml/2006/main</p>	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p>

Attributes	Description
	<p data-bbox="456 285 678 315">&lt;... id="10" ... &gt;</p> <p data-bbox="415 354 1403 422">The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p data-bbox="415 462 1445 529">The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).</p>
<p data-bbox="142 548 305 577">name (Name)</p> <p data-bbox="142 617 375 716">Namespace: .../drawingml/2006/main</p>	<p data-bbox="415 548 1442 615">Specifies the name of the object. [<i>Note</i>: Typically, this will be used to store the original file name of a picture object. <i>end note</i>]</p> <p data-bbox="415 655 1117 684">[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <p data-bbox="456 724 773 753">&lt; ... name="foo.jpg" &gt;</p> <p data-bbox="415 793 1468 861">The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p data-bbox="415 900 1430 930">The possible values for this attribute are defined by the XML Schema string datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_NonVisualDrawingProps">
3 <sequence>
4 <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
5 <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="id" type="ST_DrawingElementId" use="required"/>
9 <attribute name="name" type="xsd:string" use="required"/>
10 <attribute name="descr" type="xsd:string" use="optional" default=""/>
11 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
12 </complexType>

```

#### 13 4.4.1.13 cNvSpPr (Non-Visual Drawing Properties for a Shape)

14 This element specifies the non-visual drawing properties for a shape. These properties are to be used by the  
15 generating application to determine how the shape should be dealt with

16 [*Example*: Consider the shape that has a shape lock applied to it.

```

17 <p:sp>
18 <p:nvSpPr>
19 <p:cNvPr id="2" name="Rectangle 1"/>
20 <p:cNvSpPr>
21 <a:spLocks noGrp="1"/>
22 </p:cNvSpPr>
23 </p:nvSpPr>

```

..  
</p:sp>

This shape lock is stored within the non-visual drawing properties for this shape. *End example*]

Parent Elements
nvSpPr (§4.4.1.31)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
spLocks (Shape Locks)	§5.1.2.1.34

Attributes	Description
<b>txBox (Text Box)</b>  Namespace: .../drawingml/2006/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.  <i>[Note: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. end note]</i>  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
 <sequence>
 <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.4.1.14 controls (List of controls)

This element specifies a list of embedded controls for the corresponding slide. Custom embedded controls may be embedded on slides.

Parent Elements
cSld (§4.4.1.15)

Child Elements	Subclause
control (Embedded Control)	§4.4.2.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ControlList">
 <sequence>
 <element name="control" type="CT_Control" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

4.4.1.15 cSld (Common Slide Data)

This element specifies a container for the type of slide information that is relevant to all of the slide types. All slides share a common set of properties that is independent of the slide type; the description of these properties for any particular slide is stored within the slide's cSld container. Slide data specific to the slide type indicated by the parent element is stored elsewhere.

[Note: The actual data in cSld describe only the particular parent slide; it is only the type of information stored that is common across all slides. end note]

[Example: Consider the following PresentationML slide

```
<p:sld>
 <p:cSld>
 <p:spTree>
 ..
 </p:spTree>
 </p:cSld>
 ..
</p:sld>
```

As the above example shows, the shape tree of a slide (spTree) is a child element of cSld because all slide types may contain a shape tree. Other slide properties specific to the type of slide (such as transitions for sld slides) are specified elsewhere. end example]

Parent Elements
handoutMaster (§4.4.1.21); notes (§4.4.1.23); notesMaster (§4.4.1.24); sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
bg (Slide Background)	§4.4.1.1
controls (List of controls)	§4.4.1.14
custDataLst (Customer Data List)	§4.4.1.16
extLst (Extension List)	§4.2.5
spTree (Shape Tree)	§4.4.1.42

Attributes	Description
name (Name)	Specifies the slide name property that is used to further identify this unique configuration of common slide data. This might be used to aid in distinguishing different slide layouts or various other slide types.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CommonSlideData">
 <sequence>
 <element name="bg" type="CT_Background" minOccurs="0" maxOccurs="1"/>
 <element name="spTree" type="CT_GroupShape" minOccurs="1" maxOccurs="1"/>
 <element name="custDataLst" type="CT_CustomerDataList" minOccurs="0" maxOccurs="1"/>
 <element name="controls" type="CT_ControlList" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>

```

#### 4.4.1.16 custDataLst (Customer Data List)

This element allows for the specifying of customer defined data within the PresentationML framework.

References to custom data or tags may be defined within this list.

Parent Elements
cSld (§4.4.1.15); nvPr (§4.4.1.30); presentation (§4.3.1.24)

Child Elements	Subclause
custData (Customer Data)	§4.2.1
tags (Customer Data Tags)	§4.2.9

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_CustomerDataList">
 <sequence minOccurs="0" maxOccurs="1">
 <element name="custData" type="CT_CustomerData" minOccurs="0" maxOccurs="unbounded"/>
 <element name="tags" type="CT_TagsData" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.17 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector will take. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[Example: Consider the following connector shape that connects two regular shapes.

```

<p:spTree>
 ..
 <p:sp>
 <p:nvSpPr>
 <p:cNvPr id="1" name="Rectangle 1"/>
 <p:cNvSpPr/>
 <p:nvPr/>
 </p:nvSpPr>
 ..
 </p:sp>
 <p:sp>
 <p:nvSpPr>
 <p:cNvPr id="2" name="Rectangle 2"/>
 <p:cNvSpPr/>
 <p:nvPr/>
 </p:nvSpPr>
 ..
 </p:sp>
 <p:cxnSp>
 <p:nvCxnSpPr>
 <p:cNvPr id="3" name="Elbow Connector 3"/>
 <p:cNvCxnSpPr>
 <a:stCxn id="1" idx="3"/>
 <a:endCxn id="2" idx="1"/>
 </p:cNvCxnSpPr>
 <p:nvPr/>
 </p:nvCxnSpPr>
 ..
 </p:cxnSp>
</p:spTree>

```

End example]

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
nvCxnSpPr (Non-Visual Properties for a Connection Shape)	§4.4.1.26
spPr (Shape Properties)	§4.4.1.41
style (Shape Style)	§4.4.1.43

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Connector">
 <sequence>
 <element name="nvCxnSpPr" type="CT_ConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.18 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	§4.4.1.27
xfrm (2D Transform for Graphic Frame)	§4.4.1.49

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GraphicalObjectFrame">
 <sequence>
 <element name="nvGraphicFramePr" type="CT_GraphicalObjectFrameNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="xfrm" type="a:CT_Transform2D" minOccurs="1" maxOccurs="1"/>
 <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.19 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the

shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<p:grpSp>
 <p:nvGrpSpPr>
 <p:cNvPr id="10" name="Group 9"/>
 <p:cNvGrpSpPr/>
 <p:nvPr/>
 </p:nvGrpSpPr>
 <p:grpSpPr>
 <a:xfrm>
 <a:off x="838200" y="990600"/>
 <a:ext cx="2426208" cy="978408"/>
 <a:chOff x="838200" y="990600"/>
 <a:chExt cx="2426208" cy="978408"/>
 </a:xfrm>
 </p:grpSpPr>
 <p:sp>
 ..
 </p:sp>
 <p:sp>
 ..
 </p:sp>
 <p:sp>
 ..
 </p:sp>
</p:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. End example]

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
cxnSp (Connection Shape)	§4.4.1.17
extLst (Extension List with Modification Flag)	§4.2.4
graphicFrame (Graphic Frame)	§4.4.1.18

Child Elements	Subclause
grpSp (Group Shape)	§4.4.1.19
grpSpPr (Group Shape Properties)	§4.4.1.20
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§4.4.1.28
pic (Picture)	§4.4.1.34
sp (Shape)	§4.4.1.40

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GroupShape">
 <sequence>
 <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="sp" type="CT_Shape"/>
 <element name="grpSp" type="CT_GroupShape"/>
 <element name="graphicFrame" type="CT_GraphicalObjectFrame"/>
 <element name="cxnSp" type="CT_Connector"/>
 <element name="pic" type="CT_Picture"/>
 </choice>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.20 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44

xfrm (2D Transform for Grouped Objects)	§5.1.9.5

1

Attributes	Description
bwMode (Black and White Mode)  Namespace: .../drawingml/2006/main	<p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note:</i> This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes will use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_GroupShapeProperties">
4 <sequence>
5 <element name="xfrm" type="CT_GroupTransform2D" minOccurs="0" maxOccurs="1"/>
6 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
8 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
9 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
10 </sequence>
11 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
12 </complexType>

```

#### 13 4.4.1.21 handoutMaster (Handout Master)

14 This element specifies an instance of a handout master slide. Within a handout master slide are contained all  
 15 elements that describe the objects and their corresponding formatting for within a handout slide. Within a  
 16 handout master slide the cSld element specifies the common slide elements such as shapes and their attached  
 17 text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the  
 18 intended purpose for a handoutMaster slide.

Parent Elements
Root element of PresentationML Handout Master part

19

Child Elements	Subclause
clrMap (Color Scheme Map)	§4.4.1.6

Child Elements	Subclause
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_HandoutMaster">
 <sequence>
 <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
 <group ref="EG_TopLevelSlide" minOccurs="1" maxOccurs="1"/>
 <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.22 hf (Header/Footer information for a slide master)

This element specifies the header and footer information for a slide. Headers and footers consist of placeholders for text that should be consistent across all slides and slide types, such as a date and time, slide numbering, and custom header and footer text.

Parent Elements
handoutMaster (§4.4.1.21); notesMaster (§4.4.1.24); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4

Attributes	Description
dt (Date/Time Placeholder)	Specifies whether the Date/Time placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
fttr (Footer Placeholder)	Specifies whether the Footer placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
hdr (Header Placeholder)	Specifies whether the Header placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
sldNum (Slide Number)	Specifies whether the slide number placeholder is enabled. If this attribute is not specified, a value of true should be assumed by the generating application.

Attributes	Description
Placeholder)	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_HeaderFooter">
 <sequence>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="sldNum" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="hdr" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="ftr" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="dt" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

#### 4.4.1.23 notes (Notes Slide)

This element specifies the existence of a notes slide along with its corresponding data. Contained within a notes slide are all the common slide elements along with addition properties that are specific to the notes element.

[Example: Consider the following PresentationML notes slide

```

<p:notes>
 <p:cSld>
 ..
 </p:cSld>
 ..
</p:notes>

```

In the above example a notes element specifies the existence of a notes slide with all of its parts. Notice the cSld element, that specifies the common elements that can appear on any slide type and then any elements specify additional non-common properties for this notes slide. *end example]*

Parent Elements
Root element of PresentationML Notes Slide part

Child Elements	Subclause
clrMapOvr (Color Scheme Map Override)	§4.4.1.7
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4

Attributes	Description
------------	-------------

Attributes	Description
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_NotesSlide">
 <sequence minOccurs="1" maxOccurs="1">
 <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
 <group ref="EG_ChildSlide" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_ChildSlide"/>
</complexType>

```

#### 4.4.1.24 notesMaster (Notes Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

Parent Elements
Root element of PresentationML Notes Master part

Child Elements	Subclause
clrMap (Color Scheme Map)	§4.4.1.6
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22
notesStyle (Notes Text Style)	§4.4.1.25

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesMaster">
 <sequence>
 <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
 <group ref="EG_TopLevelSlide" minOccurs="1" maxOccurs="1"/>
 <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 <element name="notesStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.25 notesStyle (Notes Text Style)

This element specifies the text formatting style for the all other text within a notes slide. This formatting will be used on all text within the corresponding notes slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the notesStyle element there may be many different types of styles defined as there are different types of text stored within a notes slide.

Parent Elements
notesMaster (§4.4.1.24)

 <element name="lv17pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv18pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv19pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.26 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§4.4.1.17)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	§4.4.1.8
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvCxnSpPr" type="a:CT_NonVisualConnectorProperties" minOccurs="1"
 maxOccurs="1"/>
 <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.27 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic

frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§4.4.1.18)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§4.4.1.9
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrameNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="1"
 maxOccurs="1"/>
 <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.28 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§4.4.1.10
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGrpSpPr" type="a:CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
 maxOccurs="1"/>
 <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

4.4.1.29 nvPicPr (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following PresentationML.

```
<p:pic>
 ..
 <p:nvPicPr>
 ..
 </p:nvPicPr>
 ..
</p:pic>
```

end example]

Parent Elements
pic (§4.4.1.34)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§4.4.1.11
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
 <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.30 nvPr (Non-Visual Properties)

This element specifies non-visual properties for objects. These properties include multimedia content associated with an object and properties indicating how the object is to be used or displayed in different contexts.

Parent Elements
nvCxnSpPr (§4.4.1.26); nvGraphicFramePr (§4.4.1.27); nvGrpSpPr (§4.4.1.28); nvPicPr (§4.4.1.29); nvSpPr (§4.4.1.31)

Child Elements	Subclause
audioCd (Audio from CD)	§5.1.3.1
audioFile (Audio from File)	§5.1.3.2
custDataLst (Customer Data List)	§4.4.1.16
extLst (Extension List)	§4.2.5
ph (Placeholder Shape)	§4.4.1.33
quickTimeFile (QuickTime from File)	§5.1.3.4
videoFile (Video from File)	§5.1.3.6
wavAudioFile (Audio from WAV File)	§5.1.3.7

Attributes	Description
isPhoto (Is a Photo Album)	Specifies whether the picture belongs to a photo album and should thus be included when editing a photo album within the generating application.  The possible values for this attribute are defined by the XML Schema boolean datatype.
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ApplicationNonVisualDrawingProps">
 <sequence>
 <element name="ph" type="CT_Placeholder" minOccurs="0" maxOccurs="1"/>
 <group ref="a:EG_Media" minOccurs="0" maxOccurs="1"/>
 <element name="custDataLst" type="CT_CustomerDataList" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="isPhoto" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="userDrawn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.4.1.31 **nvSpPr (Non-Visual Properties for a Shape)**

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements	
sp (§4.4.1.40)	

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
cNvSpPr (Non-Visual Drawing Properties for a Shape)	§4.4.1.13
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvSpPr" type="a:CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
 <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.32 **otherStyle (Slide Master Other Text Style)**

This element specifies the text formatting style for the all other text within a master slide. This formatting will be used on all text not covered by the titleStyle or bodyStyle elements within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the otherStyle element there may be many different types of styles defined as there are different types of text stored within a slide.

[Note: The otherStyle element is to be used for specifying the text formatting of text within a slide shape but not within a text box. Text box styling is handled from within the bodyStyle element. *end note*]

Parent Elements	
txStyles (§4.4.1.48)	

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14

Child Elements	Subclause
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TextListStyle">
 <sequence>
 <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.4.1.33 ph (Placeholder Shape)

This element specifies that the corresponding shape should be represented by the generating application as a placeholder. When a shape is considered a placeholder by the generating application it can have special properties to alert the user that they may enter content into the shape. Different types of placeholders are allowed and can be specified by using the placeholder type attribute for this element.

Parent Elements
nvPr (§4.4.1.30)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4

Attributes	Description
hasCustomPrompt (Placeholder has	Specifies whether the corresponding placeholder should have a custom prompt or not.

Attributes	Description
custom prompt)	The possible values for this attribute are defined by the XML Schema boolean datatype.
idx (Placeholder Index)	Specifies the placeholder index. This is used when applying templates or changing layouts to match a placeholder on one template/master to another.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
orient (Placeholder Orientation)	Specifies the orientation of a placeholder.  The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).
sz (Placeholder Size)	Specifies the size of a placeholder.  The possible values for this attribute are defined by the ST_PlaceholderSize simple type (§4.8.13).
type (Placeholder Type)	Specifies what type of content a placeholder is intended to contain.  The possible values for this attribute are defined by the ST_PlaceholderType simple type (§4.8.14).

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Placeholder">
3 <sequence>
4 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="type" type="ST_PlaceholderType" use="optional" default="obj"/>
7 <attribute name="orient" type="ST_Direction" use="optional" default="horz"/>
8 <attribute name="sz" type="ST_PlaceholderSize" use="optional" default="full"/>
9 <attribute name="idx" type="xsd:unsignedInt" use="optional" default="0"/>
10 <attribute name="hasCustomPrompt" type="xsd:boolean" use="optional" default="false"/>
11 </complexType>

```

#### 12 4.4.1.34 pic (Picture)

13 This element specifies the existence of a picture object within the document.

14 [Example: Consider the following PresentationML that specifies the existence of a picture within a document.  
15 This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```

16 <p:pic>
17 <p:nvPicPr>
18 <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
19 <p:cNvPicPr>
20 <a:picLocks noChangeAspect="1"/>
21 </p:cNvPicPr>
22 </p:nvPr>

```

```
1 </p:nvPicPr>
2 <p:blipFill>
3 ...
4 </p:blipFill>
5 <p:spPr>
6 ...
7 </p:spPr>
8 </p:pic>
```

*end example]*

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
blipFill (Picture Fill)	§4.4.1.4
extLst (Extension List with Modification Flag)	§4.2.4
nvPicPr (Non-Visual Properties for a Picture)	§4.4.1.29
spPr (Shape Properties)	§4.4.1.41
style (Shape Style)	§4.4.1.43

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Picture">
 <sequence>
 <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.35 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

*[Example: Consider the following custom show with an ordering of slides.*

```
<p:custShowLst>
 <p:custShow name="Custom Show 1" id="0">
 <p:sldLst>
 <p:sld r:id="rId4"/>
 <p:sld r:id="rId3"/>
 <p:sld r:id="rId2"/>
```

```

1 <p:sld r:id="rId5"/>
2 </p:sldLst>
3 </p:custShow>
4 </p:custShowLst>

```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example*]

Parent Elements
Root element of PresentationML Slide part

Child Elements	Subclause
clrMapOvr (Color Scheme Map Override)	§4.4.1.7
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
timing (Slide Timing Information for a Slide Layout)	§4.4.1.44
transition (Slide Transition for a Slide Layout)	§4.4.1.46

Attributes	Description
show (Show Slide in Slide Show)	Specifies that the current slide should be shown in slide show. If this attribute is omitted then a value of true is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Slide">
 <sequence minOccurs="1" maxOccurs="1">
 <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
 <group ref="EG_ChildSlide" minOccurs="0" maxOccurs="1"/>
 <element name="transition" type="CT_SlideTransition" minOccurs="0" maxOccurs="1"/>
 <element name="timing" type="CT_SlideTiming" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_ChildSlide"/>
 <attribute name="show" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

#### 4.4.1.36 sldLayout (Slide Layout)

This element specifies an instance of a slide layout. The slide layout contains in essence a template slide design that can be applied to any existing slide. When applied to an existing slide all corresponding content should be mapped to the new slide layout.

##### Parent Elements

Root element of PresentationML Slide Layout part

##### Child Elements

##### Subclause

clrMapOvr (Color Scheme Map Override)	§4.4.1.7
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22
timing (Slide Timing Information for a Slide Layout)	§4.4.1.44
transition (Slide Transition for a Slide Layout)	§4.4.1.46

##### Attributes

##### Description

matchingName (Matching Name)	Specifies a name to be used in place of the name attribute within the cSld element. This is used for layout matching in response to layout changes and template applications.  The possible values for this attribute are defined by the XML Schema string datatype.
preserve (Preserve Slide Layout)	Specifies whether the corresponding slide layout will be deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it.  The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterPhAnim (Show Master)	Specifies whether or not to display animations on placeholders from the master slide.

Attributes	Description
Placeholder Animations)	The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not.  The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Slide Layout Type)	Specifies the slide layout type that is used by this slide.  The possible values for this attribute are defined by the ST_SlideLayoutType simple type (§4.8.19).
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_SlideLayout">
 <sequence minOccurs="1" maxOccurs="1">
 <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
 <group ref="EG_ChildSlide" minOccurs="0" maxOccurs="1"/>
 <element name="transition" type="CT_SlideTransition" minOccurs="0" maxOccurs="1"/>
 <element name="timing" type="CT_SlideTiming" minOccurs="0" maxOccurs="1"/>
 <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_ChildSlide"/>
 <attribute name="matchingName" type="xsd:string" use="optional" default=""/>
 <attribute name="type" type="ST_SlideLayoutType" use="optional" default="cust"/>
 <attribute name="preserve" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="userDrawn" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

#### 4.4.1.37 sldLayoutId (Slide Layout Id)

This element specifies the relationship information for each slide layout that is used within the slide master. The slide master has relationship identifiers that it uses internally for determining the slide layouts that should be used. Then, to resolve what these slide layouts should be the sldLayoutId elements in the sldLayoutIdLst are utilized.

Parent Elements
sldLayoutIdLst (§4.4.1.38)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

1

Attributes	Description
id (ID Tag)  Namespace: .../officeDocument /2006/relationships	Specifies the relationship id value that the generating application can use to resolve which slide layout will be used in the creation of the slide. This relationship id is used within the relationship file for the master slide to expose the location of the corresponding layout file within the presentation.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
id (ID Tag)	Specifies the identification number that uniquely identifies this slide layout within the presentation file.  The possible values for this attribute are defined by the ST_SlideLayoutId simple type (§4.8.18).

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_SlideLayoutIdListEntry">
4 <sequence>
5 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 <attribute name="id" type="ST_SlideLayoutId" use="optional"/>
8 <attribute ref="r:id" use="required"/>
9 </complexType>
```

10 4.4.1.38 sldLayoutIdLst (List of Slide Layouts)

11 This element specifies the existence of the slide layout identification list. This list is contained within the slide  
12 master and is used to determine which layouts are being used within the slide master file. Each layout within the  
13 list of slide layouts has its own identification number and relationship identifier that uniquely identifies it within  
14 both the presentation document and the particular master slide within which it is used.

Parent Elements
sldMaster (§4.4.1.39)

15

Child Elements	Subclause
sldLayoutId (Slide Layout Id)	§4.4.1.37

16 The following XML Schema fragment defines the contents of this element:

```
17 <complexType name="CT_SlideLayoutIdList">
18 <sequence>
19 <element name="sldLayoutId" type="CT_SlideLayoutIdListEntry" minOccurs="0"
20 maxOccurs="unbounded"/>
21 </sequence>
22 </complexType>
```

#### 4.4.1.39 sldMaster (Slide Master)

This element specifies an instance of a slide master slide. Within a slide master slide are contained all elements that describe the objects and their corresponding formatting for within a presentation slide. Within a slide master slide are two main elements. The cSld element specifies the common slide elements such as shapes and their attached text bodies. Then the txStyles element specifies the formatting for the text within each of these shapes. The other properties within a slide master slide specify other properties for within a presentation slide such as color information, headers and footers, as well as timing and transition information for all corresponding presentation slides.

##### Parent Elements

 </sequence>
 <attribute name="preserve" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.4.1.40 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[Note: Shapes are the preferred mechanism for specifying text on a slide. End note]

sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

##### Attributes

##### Description

bwMode (Black and White Mode)	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white
-------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Attributes	Description
Namespace: .../drawingml/2006/main	<p>when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ShapeProperties">
 <sequence>
 <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>

```

#### 4.4.1.42 spTree (Shape Tree)

This element specifies all shapes within a slide. Contained within here are all the shapes, either grouped or not, that can be referenced on a given slide. As most objects within a slide are shapes, this represents the majority of content within a slide. Text and effects are attached to shapes that are contained within the spTree element.

[*Example*: Consider the following PresentationML slide

```

<p:sld>
 <p:cSld>
 <p:spTree>
 <p:nvGrpSpPr>
 ..
 </p:nvGrpSpPr>
 <p:grpSpPr>
 ..
 </p:grpSpPr>
 <p:sp>
 ..
 </p:sp>

```

```
</p:spTree>
</p:cSld>
..
</p:sld>
```

In the above example the shape tree specifies all the shape properties for this slide. *end example*]

Parent Elements
cSld (§4.4.1.15)

Child Elements	Subclause
cxnSp (Connection Shape)	§4.4.1.17
extLst (Extension List with Modification Flag)	§4.2.4
graphicFrame (Graphic Frame)	§4.4.1.18
grpSp (Group Shape)	§4.4.1.19
grpSpPr (Group Shape Properties)	§4.4.1.20
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§4.4.1.28
pic (Picture)	§4.4.1.34
sp (Shape)	§4.4.1.40

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShape">
 <sequence>
 <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
 <choice minOccurs="0" maxOccurs="unbounded">
 <element name="sp" type="CT_Shape"/>
 <element name="grpSp" type="CT_GroupShape"/>
 <element name="graphicFrame" type="CT_GraphicalObjectFrame"/>
 <element name="cxnSp" type="CT_Connector"/>
 <element name="pic" type="CT_Picture"/>
 </choice>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.43 style (Shape Style)

This element specifies the style information for a shape. This is used to define a shape's appearance in terms of the preset styles defined by the style matrix for the theme.

[Example:

```
<p:style>
 <a:lnRef idx="3">
```

```
1 <a:schemeClr val="lt1"/>
2 </a:lnRef>
3 <a:fillRef idx="1">
4 <a:schemeClr val="accent3"/>
5 </a:fillRef>
6 <a:effectRef idx="1">
7 <a:schemeClr val="accent3"/>
8 </a:effectRef>
9 <a:fontRef idx="minor">
10 <a:schemeClr val="lt1"/>
11 </a:fontRef>
12 </p:style>
```

13 The parent shape of the above code is to have an outline that uses the third line style defined by the theme, use  
14 the first fill defined by the scheme, and be rendered with the first effect defined by the theme. Text inside the  
15 shape is to use the minor font defined by the theme.

16 *end example]*

Parent Elements
cxnSp (§4.4.1.17); pic (§4.4.1.34); sp (§4.4.1.40)

17

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

18 The following XML Schema fragment defines the contents of this element:

```
19 <complexType name="CT_ShapeStyle">
20 <sequence>
21 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
22 <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
23 <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
24 <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
25 </sequence>
26 </complexType>
```

27 **4.4.1.44 timing (Slide Timing Information for a Slide Layout)**

28 This element specifies the timing information for handling all animations and timed events within the  
29 corresponding slide. This information is tracked via time nodes within the timing element. More information on  
30 the specifics of these time nodes and how they are to be defined can be found within the Animation section of  
31 the PresentationML framework.

Parent Elements
sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
bldLst (Build List)	§4.6.14
extLst (Extension List with Modification Flag)	§4.2.4
tnLst (Time Node List)	§4.6.87

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideTiming">
 <sequence>
 <element name="tnLst" type="CT_TimeNodeList" minOccurs="0" maxOccurs="1"/>
 <element name="bldLst" type="CT_BuildList" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.45 titleStyle (Slide Master Title Text Style)

This element specifies the text formatting style for the title text within a master slide. This formatting will be used on all title text within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within a title style there may be many different types of styles defined as there are different types of text stored within a slide title.

Parent Elements
txStyles (§4.4.1.48)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextListStyle">
 <sequence>
 <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv11pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv12pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv13pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv14pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv15pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv16pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv17pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv18pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="lv19pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.4.1.46 transition (Slide Transition for a Slide Layout)

This element specifies the type of slide transition that should be used to transition to the current slide from the previous slide. That is, the transition information is stored on the slide that will appear after the transition is complete.

##### Parent Elements

sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

##### Child Elements

##### Subclause

blinds (Blinds Slide Transition)	§4.6.18
checker (Checker Slide Transition)	§4.6.24
circle (Circle Slide Transition)	§4.6.26
comb (Comb Slide Transition)	§4.6.30
cover (Cover Slide Transition)	§4.6.32
cut (Cut Slide Transition)	§4.6.34
diamond (Diamond Slide Transition)	§4.6.35
dissolve (Dissolve Slide Transition)	§4.6.36
extLst (Extension List with Modification Flag)	§4.2.4
fade (Fade Slide Transition)	§4.6.41
newsflash (Newsflash Slide Transition)	§4.6.50
plus (Plus Slide Transition)	§4.6.54
pull (Pull Slide Transition)	§4.6.58
push (Push Slide Transition)	§4.6.59
random (Random Slide Transition)	§4.6.60

Child Elements	Subclause
randomBar (Random Bar Slide Transition)	§4.6.61
sndAc (Sound Action)	§4.6.69
split (Split Slide Transition)	§4.6.71
strips (Strips Slide Transition)	§4.6.74
wedge (Wedge Slide Transition)	§4.6.94
wheel (Wheel Slide Transition)	§4.6.95
wipe (Wipe Slide Transition)	§4.6.96
zoom (Zoom Slide Transition)	§4.6.97

1

Attributes	Description
advClick (Advance on Click)	<p>Specifies whether a mouse click will advance the slide or not. If this attribute is not specified then a value of true is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
advTm (Advance after time)	<p>Specifies the time, in milliseconds, after which the transition should start. This setting may be used in conjunction with the advClick attribute. If this attribute is not specified then it is assumed that no auto-advance will occur.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spd (Transition Speed)	<p>Specifies the transition speed that is to be used when transitioning from the current slide to the next.</p> <p>The possible values for this attribute are defined by the ST_TransitionSpeed simple type (§4.8.58).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideTransition">
 <sequence>
 <choice minOccurs="0" maxOccurs="1">
 <element name="blinds" type="CT_OrientationTransition"/>
 <element name="checker" type="CT_OrientationTransition"/>
 <element name="circle" type="CT_Empty"/>
 <element name="dissolve" type="CT_Empty"/>
 <element name="comb" type="CT_OrientationTransition"/>
 <element name="cover" type="CT_EightDirectionTransition"/>
 <element name="cut" type="CT_OptionalBlackTransition"/>
 <element name="diamond" type="CT_Empty"/>
 <element name="fade" type="CT_OptionalBlackTransition"/>
 <element name="newsflash" type="CT_Empty"/>
 <element name="plus" type="CT_Empty"/>
 <element name="pull" type="CT_EightDirectionTransition"/>
 <element name="push" type="CT_SideDirectionTransition"/>
 <element name="random" type="CT_Empty"/>
 <element name="randomBar" type="CT_OrientationTransition"/>
 <element name="split" type="CT_SplitTransition"/>
 <element name="strips" type="CT_CornerDirectionTransition"/>
 <element name="wedge" type="CT_Empty"/>
 <element name="wheel" type="CT_WheelTransition"/>
 <element name="wipe" type="CT_SideDirectionTransition"/>
 <element name="zoom" type="CT_InOutTransition"/>
 </choice>
 <element name="sndAc" minOccurs="0" maxOccurs="1" type="CT_TransitionSoundAction"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="spd" type="ST_TransitionSpeed" use="optional" default="fast"/>
 <attribute name="advClick" type="xsd:boolean" use="optional" default="true"/>
 <attribute name="advTm" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

4.4.1.47 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
sp (§4.4.1.40)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
 <sequence>
 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

4.4.1.48 txStyles (Slide Master Text Styles)

This element specifies the text styles within a slide master. Within this element is the styling information for title text, the body text and other slide text as well. This element is only for use within the Slide Master and thus sets the text styles for the corresponding presentation slides.

[Example: Consider the case where we would like to specify the title text for a master slide.

```
<p:txStyles>
 <p:titleStyle>
 <a:lvl1pPr algn="ctr" rtl="0" latinLnBrk="0">
 <a:spcBef>
 <a:spcPct val="0"/>
 </a:spcBef>
 <a:buNone/>
 <a:defRPr sz="4400" kern="1200">
 <a:solidFill>
 <a:schemeClr val="tx1"/>
 </a:solidFill>
 <a:latin typeface="+mj-lt"/>
 <a:ea typeface="+mj-ea"/>
 <a:cs typeface="+mj-cs"/>
 </a:defRPr>
 </a:lvl1pPr>
 </p:titleStyle>
</p:txStyles>
```

In the above example the title text will be set according to the above formatting for all related slides within the presentation. *end example*

Parent Elements
sldMaster (§4.4.1.39)

Child Elements	Subclause
bodyStyle (Slide Master Body Text Style)	§4.4.1.5

Child Elements	Subclause
extLst (Extension List)	§4.2.5
otherStyle (Slide Master Other Text Style)	§4.4.1.32
titleStyle (Slide Master Title Text Style)	§4.4.1.45

1   The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_SlideMasterTextStyles">
3 <sequence>
4 <element name="titleStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
5 <element name="bodyStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
6 <element name="otherStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
7 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 </complexType>
```

10   4.4.1.49       xfrm (2D Transform for Graphic Frame)

11   This element specifies the transform to be applied to the corresponding graphic frame. This transformation will  
12   be applied to the graphic frame just as it would be for a shape or group shape.

Parent Elements
graphicFrame (§4.4.1.18)

13

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

14

Attributes	Description
flipH (Horizontal Flip)  Namespace: .../drawingml/2006/main	<p>Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p> <div></div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
flipV (Vertical Flip)	<p>Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box.</p>

Attributes	Description
Namespace: .../drawingml/2006/main	<p>[Example: The following illustrates the effect of a vertical flip.</p> <div></div> <p>end example]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
rot (Rotation)  Namespace: .../drawingml/2006/main	<p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Transform2D">
 <sequence>
 <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
 <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
 <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

## 4.4.2 Embedded Objects

Within the slides portion of PresentationML, there are the embedded elements. These are objects that can be embedded within a slide. As we defined a slide to be a container it can be seen that it does not just contain shapes, pictures and text but embedded objects as well that are not necessarily native to the PresentationML platform.

### 4.4.2.1 control (Embedded Control)

This element specifies the existence of an embedded control in the slide.

Parent Elements	
controls (§4.4.1.14)	

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship ID)  Namespace: .../officeDocument /2006/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control.  The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
imgW (Image Width)	Specifies the width of the embedded control.  The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name.  The possible values for this attribute are defined by the XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object will be shows as an icon or using its native representation.  The possible values for this attribute are defined by the XML Schema boolean datatype.
spid (Embedded object Shape ID)	Specifies the identifier of the shape associated with this Embedded object. The shape will contain all coordinate anchoring information.  The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Control">
3 <sequence>
4 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attributeGroup ref="AG_Ole"/>
7 </complexType>
```

#### 8 4.4.2.2 [embed \(Embedded Object or Control\)](#)

9 This element specifies an Embedded object or Control that is embedded within the presentation.

Parent Elements
oleObj (§4.4.2.4)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

1

Attributes	Description
followColorScheme (Color Scheme Properties for Embedded object)	Specifies the Color Scheme Properties for the corresponding Embedded object being specified.  The possible values for this attribute are defined by the ST_OleObjectFollowColorScheme simple type (§4.8.10).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_OleObjectEmbed">
4 <sequence>
5 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 <attribute name="followColorScheme" type="ST_OleObjectFollowColorScheme" use="optional"
8 default="none"/>
9 </complexType>

```

#### 10 4.4.2.3 [link \(Linked Object or Control\)](#)

11 This element specifies a link to an external Embedded object or Control.

Parent Elements
oleObj (§4.4.2.4)

12

Child Elements	Subclause
extLst (Extension List)	§4.2.5

13

Attributes	Description
updateAutomatic (Update Linked Embedded Objects Automatically)	This attribute determines if linked embedded objects will be automatically updated when the presentation is opened or printed.  The possible values for this attribute are defined by the XML Schema boolean datatype.

14 The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_OleObjectLink">
16 <sequence>
17 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
18 </sequence>
19 <attribute name="updateAutomatic" type="xsd:boolean" use="optional" default="false"/>
20 </complexType>

```

- 1 4.4.2.4 **oleObj (Global Element for Embedded objects and Controls)**
- 2 This element specifies a global element to be used for an Embedded object and Control.

Child Elements	Subclause
embed (Embedded Object or Control)	§4.4.2.2
link (Linked Object or Control)	§4.4.2.3

3

Attributes	Description
id (Relationship ID)  Namespace: .../officeDocument /2006/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control.  The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
imgW (Image Width)	Specifies the width of the embedded control.  The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name.  The possible values for this attribute are defined by the XML Schema string datatype.
progId (Embedded Object ProgID)	Specifies the progid for an Embedded object.  The possible values for this attribute are defined by the XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object will be shows as an icon or using its native representation.  The possible values for this attribute are defined by the XML Schema boolean datatype.
spid (Embedded object Shape ID)	Specifies the identifier of the shape associated with this Embedded object. The shape will contain all coordinate anchoring information.  The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObject">
 <choice minOccurs="1" maxOccurs="1">
 <element name="embed" type="CT_OleObjectEmbed"/>
 <element name="link" type="CT_OleObjectLink"/>
 </choice>
 <attributeGroup ref="AG_Ole"/>
 <attribute name="progId" type="xsd:string" use="optional"/>
</complexType>
```

### 4.4.3 Programmable Tags

Within the slides portion of PresentationML there are the tag elements. These are extensibility names and values that assist in the storage of legacy variables from older file formats.

#### 4.4.3.1 tag (Programmable Extensibility Tag)

This element specifies a programmable extensibility tag to be used for storage of legacy variables.

Parent Elements
tagLst (§4.4.3.2)

Attributes	Description
name (Name)	Specifies the name associated with this specific programmable tag.  The possible values for this attribute are defined by the XML Schema string datatype.
val (Value)	Specifies the value associated with this specific programmable tag.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StringTag">
 <attribute name="name" type="xsd:string"/>
 <attribute name="val" type="xsd:string"/>
</complexType>
```

#### 4.4.3.2 tagLst (Programmable Tab List)

This element specifies the list of programmable extensibility tags that will be used to store variables from legacy file formats.

Parent Elements
Root element of PresentationML User-Defined Tags part

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
tag (Programmable Extensibility Tag)	§4.4.3.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TagList">
 <sequence>
 <element name="tag" type="CT_StringTag" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

## 4.5 Comments

A comment is a text note attached to a slide, with the primary purpose of allowing readers of a presentation to provide feedback to the presentation author. Each comment contains an unformatted text string and information about its author, and is attached to a particular location on a slide. Comments may be visible while editing the presentation, but do not appear when a slide show is given. The displaying application decides when to display comments and determines their visual appearance.

### 4.5.1 cm (Comment)

This element specifies a single comment attached to a slide. It contains the text of the comment, its position on the slide, and attributes referring to its author and date.

*[Example:*

```
<p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
 <p:pos x="10" y="10"/>
 <p:text>Add diagram to clarify.</p:text>
</p:cm>
```

*End example]*

Parent Elements
cmLst (§4.5.4)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
pos (Comment Position)	§4.5.5
text (Comment's Text Content)	§4.5.6

Attributes	Description
authorId (Comment Author ID)	This attribute specifies the author of the comment. It refers to the ID of an author in the comment author list for the document.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
dt (Comment Date/Time)	This attribute specifies the date and time this comment was last modified.  The possible values for this attribute are defined by the XML Schema dateTime datatype.
idx (Comment Index)	This attribute specifies an identifier for this comment that is unique within a list of all comments by this author in this document. An author's first comment in a document has index 1.  [Note: Because the index is unique only for the comment author, a document may contain multiple comments with the same index created by different authors. End note]  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Comment">
 <sequence>
 <element name="pos" type="a:CT_Point2D" minOccurs="1" maxOccurs="1"/>
 <element name="text" type="xsd:string" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="authorId" type="xsd:unsignedInt" use="required"/>
 <attribute name="dt" type="xsd:dateTime" use="optional"/>
 <attribute name="idx" type="ST_Index" use="required"/>
</complexType>

```

## 4.5.2 cmAuthor (Comment Author)

This element specifies a single author with comments in the document. It contains a unique author ID, the author's name and initials, the index of the author's last comment, and the index of a color associated with the author.

[Example:

```
<p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

End example]

Parent Elements
cmAuthorLst (§4.5.3)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
clrIdx (Comment Author Color Index)	<p>This attribute specifies an index into the generating application's comments color table to allow for visual (color) differentiation of different author's comments. This color is used for all comments by this author. If more authors exist than there are entries in the color table, the color index wraps around to the beginning of the table.</p> <p>[<i>Note:</i> It is left entirely up to the generating application to determine the amount of colors used in the comments color table and in what order these will be used when rendering comments on a slide surface. <i>End note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
id (Comment Author ID)	<p>This attribute specifies a unique (within the document) zero-based identifier that refers to a single comment author.</p> <p>[<i>Note:</i> The method of generating an author id is determined by the application and need not be sequential, provided each id is unique within the list of comment authors for the document. <i>End note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
initials (Comment Author Initials)	<p>This attribute specifies a string that represents the initials of this particular author. The value is not necessarily unique. It is intended for use by the application as an abbreviated version of the comment author's name.</p> <p>The possible values for this attribute are defined by the ST_Name simple type (§4.8.9).</p>
lastIdx (Index of Comment Author's last comment)	<p>Index of the last comment added to this document by this author. New comments by this author are counted starting with the value one greater than this index.</p> <p>[<i>Note:</i> The index of a deleted comment is not reused; therefore, this value is not an accurate count of the total number of comments by the author. <i>End note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
name (Comment Author Name)	<p>This attribute specifies the full name of this particular author. As a string, it has no security or authentication data. This value is not guaranteed to be unique across all document authors.</p> <p>The possible values for this attribute are defined by the ST_Name simple type (§4.8.9).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommentAuthor">
 <sequence>
 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="xsd:unsignedInt" use="required"/>
 <attribute name="name" type="ST_Name" use="required"/>
 <attribute name="initials" type="ST_Name" use="required"/>
 <attribute name="lastIdx" type="xsd:unsignedInt" use="required"/>
 <attribute name="clrIdx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

### 4.5.3 cmAuthorLst (List of Comment Authors)

This element specifies a list of authors with comments in the current document. Each comment in a document must refer to an author in this list. To determine if a new author is in this list, the author's name and initials must both match; otherwise, the new author is considered unique and a separate cmAuthor element is added.

*[Example: A document contains comments left by two authors.]*

```
<p:cmAuthorLst>
 <p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
 <p:cmAuthor id="1" name="Fred Jones" initials="FJ" lastIdx="2" clrIdx="1"/>
</p:cmAuthorLst>
```

*End example]*

Parent Elements
Root element of PresentationML Comment Authors part

Child Elements	Subclause
cmAuthor (Comment Author)	§4.5.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommentAuthorList">
 <sequence>
 <element name="cmAuthor" type="CT_CommentAuthor" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 4.5.4 cmLst (Comment List)

This element specifies a list of comments for a particular slide.

*[Example: A slide contains two comments, each left by a different author. This example demonstrates that two comments may have the same index if they are created by different authors.]*

```

1 <p:cmLst>
2 <p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
3 <p:pos x="10" y="10"/>
4 <p:text>Add diagram to clarify.</p:text>
5 </p:cm>
6 <p:cm authorId="1" dt="2006-08-28T17:44:19.679" idx="1">
7 <p:pos x="1426" y="660"/>
8 <p:text>Clean up this text.</p:text>
9 </p:cm>
10 </p:cmLst>

```

*End example]*

Parent Elements
Root element of PresentationML Comments part

Child Elements	Subclause
cm (Comment)	§4.5.1

The following XML Schema fragment defines the contents of this element:

```

14 <complexType name="CT_CommentList">
15 <sequence>
16 <element name="cm" type="CT_Comment" minOccurs="0" maxOccurs="unbounded"/>
17 </sequence>
18 </complexType>

```

#### 4.5.5 pos (Comment Position)

This element specifies the positioning information for the placement of a comment on a slide surface. In LTR versions of the generating application, this position information should refer to the upper left point of the comment shape. In RTL versions of the generating application, this position information should refer to the upper right point of the comment shape.

[*Note:* The anchoring point on the slide surface is unaffected by a right-to-left or left-to-right layout change. That is the anchoring point remains the same for all language versions. *End note*]

[*Note:* Because there is no specified size or formatting for comments, this UI widget used to display a comment can be any size and thus the lower right point of the comment shape is determined by how the viewing application chooses to display comments. *End note*]

[*Example:*

```
<p:pos x="1426" y="660"/>
```

*End example]*

Parent Elements

1

Attributes	Description
<b>x (X-Axis Coordinate)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>
<b>y (Y-Axis Coordinate)</b>  Namespace: .../drawingml/2006/main	<p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre>&lt;wp:... x="0" y="100" /&gt;</pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_Point2D">
4 <attribute name="x" type="ST_Coordinate" use="required"/>
5 <attribute name="y" type="ST_Coordinate" use="required"/>
6 </complexType>

```

7 **4.5.6 text (Comment's Text Content)**

8 This element specifies the content of a comment. This is the text with which the author has annotated the slide.

9 [*Example:*10 `<p:text>Add diagram to clarify.</p:text>`11 *End example]*

12 The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
cm (§4.5.1)

## 4.6 Animation

The Animation section of the PresentationML framework stores the movement and related information of objects.

This schema is loosely based on the syntax and concepts from the Synchronized Multimedia Integration Language (SMIL), a W3C Recommendation for describing multimedia presentations using XML.

The schema describes all the animations effects on that reside on a slide and also the animation that occurs when going from slide to slide (slide transition).

Animations on a slide are inherently time-based and consists of an animation effects on an object or text.. Slide transitions however do not follow this concept and always appear before any animation on a slide.

All elements described in this schema are contained within the slide XML file. More superficially they are in the <transition> and the <timing> element as shown below:

```
<p:sld>
 <p:cSld>...
 <p:clrMapOvr>...
 <p:transition>...
 <p:timing>...
</p:sld>
```

### 4.6.1 anim (Animate)

This element is a generic animation element that requires little or no semantic understanding of the attribute being animated. It can animate text within a shape or even the shape itself.

[Example: Consider trying to emphasize text within a shape by changing the size of its font by 150%. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
 <p:cBhvr override="childStyle">
 <p:cTn id="1" dur="2000" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="1">
 <p:txEl>
 <p:charRg st="1" end="4"/>
 </p:txEl>
 </p:spTgt>
 </p:tgtEl>
 <p:attrNameLst>
```

```

1 <p:attrName>style.fontSize</p:attrName>
2 </p:attrNameLst>
3 </p:cBhvr>
4 </p:anim>

```

end example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22
tavLst (Time Animated Value List)	§4.6.80

Attributes	Description
by (By)	<p>This attribute specifies a relative offset value for the animation with respect to its position before the start of the animation.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
calcmode (Calculation Mode)	<p>This attribute specifies the interpolation mode for the animation.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateBehaviorCalcMode simple type (§4.8.24).</p>
from (From)	<p>This attribute specifies the starting value of the animation.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
to (To)	<p>This attribute specifies the ending value for the animation as a percentage.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
valueType (Value Type)	<p>This attribute specifies the type of property value.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateBehaviorValueType simple type (§4.8.25).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateBehavior">
 <sequence>
 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
 <element name="tavLst" type="CT_TLTimeAnimateValueList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="by" type="xsd:string" use="optional"/>
 <attribute name="from" type="xsd:string" use="optional"/>
 <attribute name="to" type="xsd:string" use="optional"/>
 <attribute name="calcMode" type="ST_TLAnimateBehaviorCalcMode" use="optional"/>
 <attribute name="valueType" type="ST_TLAnimateBehaviorValueType" use="optional"/>
</complexType>
```

## 4.6.2 animClr (Animate Color Behavior)

This animation element is responsible for animating the color of an object.

[Example: Consider trying to emphasize a shape by changing its fill color to scheme color accent2. The <animClr> element should be used as follows:

```
<p:animClr clrSpc="rgb">
 <p:cBhvr>
 <p:cTn id="1" dur="2000" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="1"/>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>fillcolor</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
 <p:to>
 <a:schemeClr val="accent2"/>
 </p:to>
</p:animClr>
```

end example]

### Parent Elements

### Child Elements

### Subclause

by (By)

§4.6.21

cBhvr (Common Behavior)

§4.6.22

from (From)

§4.6.44

to (To)

§4.6.90

1

Attributes	Description
clrSpc (Color Space)	<p>This attribute specifies the color space in which to interpolate the animation. Valid values for example can be HSL &amp; RGB.</p> <p>The values for from/to/by/etc. can still be specified in any supported color format without affecting the color space within which the animation happens.</p> <p>The RGB color space is best used for doing animations between two different colors since it doesn't require going through any other hues between the two colors specified. The HSL space is useful for animating through a rainbow of colors or for modifying just the saturation by 30% for example.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateColorSpace simple type (§4.8.27).</p>
dir (Direction)	<p>This attribute specifies which direction to cycle the hue around the color wheel. Valid values are clockwise or counter clockwise. Default is clockwise.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateColorDirection simple type (§4.8.26).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TLAnimateColorBehavior">
4 <sequence>
5 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
6 <element name="by" type="CT_TLByAnimateColorTransform" minOccurs="0" maxOccurs="1"/>
7 <element name="from" type="a:CT_Color" minOccurs="0" maxOccurs="1"/>
8 <element name="to" type="a:CT_Color" minOccurs="0" maxOccurs="1"/>
9 </sequence>
10 <attribute name="clrSpc" type="ST_TLAnimateColorSpace" use="optional"/>
11 <attribute name="dir" type="ST_TLAnimateColorDirection" use="optional"/>
12 </complexType>

```

### 13 4.6.3 animEffect (Animate Effect)

14 This animation behavior provides the ability to do image transform/filter effects on elements. Some visual  
15 effects are dynamic in nature and have a progress that animates from 0 to 1 over a period of time to do visual  
16 transitions between hidden and visible states. Other filters are static and apply a effects like a blur or drop-  
17 shadow which aren't inherently time-based.

18 [Example: Consider trying to emphasize a shape by creating an entrance animation using a "blinds" motion.

```

19 <p:animEffect transition="in" filter="blinds(horizontal)">
20 <p:cBhvr>
21 <p:cTn id="7" dur="500"/>
22 <p:tgtEl>
23 <p:spTgt spid="4"/>

```

```

1 </p:tgtEl>
2 </p:cBhvr>
3 </p:animEffect>

```

4 *end example]*

5

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22
progress (Progress)	§4.6.57

6

Attributes	Description
filter (Filter)	<p>This attribute specifies the named transitions for the effect.</p> <p>It allows specifying multiple down-level transition types to use. The runtime will try to use the first type listed and if that one is not supported, will try the next until it either finds one it supports or there are no more in the list.</p> <p>The syntax used for the filter attribute value is as follows: "type(subtype);type(subtype)". Subtype may be a string value such as "fromLeft" or a numerical value depending on the type specified.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
prLst (Property List)	<p>This attribute describes a list of properties that coincide with the effect specified in the filter attribute. These properties can be set by providing a name:value pairs in a semicolon-separated list. When multiple types are listed in the filter attribute, the runtime will attempt to apply each property value even though some may not apply to it.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
transition (Transition)	<p>This attribute specifies whether to transition the element in or out or treat it as a static filter. The valid values are none, in and out and the default value is in.</p> <p>When a value of "in" is specified, the element will not be visible at the start of the animation and will become completely visible by the end of the duration. When "out" is specified, the element will be visible at the start and not visible at the end of the effect. This visibility is in addition to the effect of setting CSS visibility or display attributes.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateEffectTransition simple type (§4.8.28).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateEffectBehavior">
 <sequence>
 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
 <element name="progress" type="CT_TLAnimVariant" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="transition" type="ST_TLAnimateEffectTransition" use="optional"/>
 <attribute name="filter" type="xsd:string" use="optional"/>
 <attribute name="prLst" type="xsd:string" use="optional"/>
</complexType>
```

#### 4.6.4 animMotion (Animate Motion)

Animate motion provides an abstracted way to move positioned elements. It provides the ability to specify from/to/by type motion as well as to use more detailed path descriptions for motion over polylines or bezier curves.

[Example: Consider animating a shape from its original position to the right.. The <animMotion> element should be used as follows:

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0 E" pathEditMode="relative">
 <p:cBhvr>
 <p:cTn id="1" dur="2000" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="1"/>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>ppt_x</p:attrName>
 <p:attrName>ppt_y</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
</p:animMotion>
```

End example]

#### Parent Elements

#### Child Elements

#### Subclause

by (By)

§4.6.20

cBhvr (Common Behavior)

§4.6.22

from (From)

§4.6.43

rCtr (Rotation Center)

§4.6.62

to (To)

§4.6.88

Attributes	Description
origin (Origin)	<p>Specifies what the origin of the motion path is relative to such as the layout of the slide, or the parent.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateMotionBehaviorOrigin simple type (§4.8.29).</p>
path (Path)	<p>Specifies the path primitive followed by coordinates for the animation motion. The allowed values that are understood within a path are as follows:</p> <p>M = move to, L = line to, C = curve to, Z=close loop, E=end  UPPERCASE = absolute coords, lowercase = relative coords  Thus total allowed set = {M,L,C,Z,E,m,l,c,z,e}</p> <p>[<i>Example:</i> The following string is a sample path.  path: "M 0 0 L 1 1 c 1 2 3 4 4 4 Z"  <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
pathEditMode (Path Edit Mode)	<p>This attribute specifies how the motion path moves when the target element is moved.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateMotionPathEditMode simple type (§4.8.30).</p>
ptsTypes (Points Types)	<p>This attribute describes the type of the points in the path attribute. The allowed values that are understood for the ptsTypes attribute are as follows:</p> <p>A = Auto, F = Corner, T = Straight, S = Smooth  UPPERCASE = Straight Line follows point, lowercase = curve follows point.  Thus, the total allowed set = {A,F,T,S,a,f,t,s}</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
rAng (Relative Angle)	<p>The attribute describes the relative angle of the motion path.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateMotionBehavior">
 <sequence>
 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
 <element name="by" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 <element name="from" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 <element name="to" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 <element name="rCtr" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="origin" type="ST_TLAnimateMotionBehaviorOrigin" use="optional"/>
 <attribute name="path" type="xsd:string" use="optional"/>
 <attribute name="pathEditMode" type="ST_TLAnimateMotionPathEditMode" use="optional"/>
 <attribute name="rAng" type="a:ST_Angle" use="optional"/>
 <attribute name="ptsTypes" type="xsd:string" use="optional"/>
</complexType>
```

4.6.5 animRot (Animate Rotation)

This animation element is responsible for animating the rotation of an object. Rotation values set in the "by" , "to, and "from" attributes are specified in degrees measured to a 60,000th, i.e 1 degree is 60,000. Rotation values can be larger than 360°.

The sign of the rotation angle specifies the direction for rotation. A negative rotation specifies that the rotation should appear in the host to go counter-clockwise".

[Example: Consider trying to emphasize a shape by rotating it 360 degrees clockwise. The <animRot> element should be used as follows:

```
<p:animRot by="21600000">
 <p:cBhvr>
 <p:cTn id="6" dur="2000" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="5"/>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>r</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
</p:animRot>
```

End example]

----------------	-----------

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22

1

Attributes	Description
by (By)	This attribute describes the relative offset value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).
from (From)	This attribute describes the starting value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).
to (To)	This attribute describes the ending value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TLAnimateRotationBehavior">
4 <sequence>
5 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
6 </sequence>
7 <attribute name="by" type="a:ST_Angle" use="optional"/>
8 <attribute name="from" type="a:ST_Angle" use="optional"/>
9 <attribute name="to" type="a:ST_Angle" use="optional"/>
10 </complexType>

```

## 11 4.6.6 animScale (Animate Scale)

12 This animation element is responsible for animating the scale of an object. When animating the scale, the  
13 element must scale around the reference point of the element and the positioning system used should be  
14 consistent with the one used for motion paths. When animating the width and height of an element, all of the  
15 width/height animation values are calculated first then the scale animations are applied on top of that. So for  
16 example, an animation from 0 to 100 of the width with a concurrent scale from 100% to 200% would result in  
17 the element appearing to scale from 0 to 200.

18 [Example: Consider trying to emphasize a shape by scaling it larger by 150%. The <animScale> element should  
19 be used as follows:

```

20 <p:childTnLst>
21 <p:animScale>
22 <p:cBhvr>
23 <p:cTn id="6" dur="2000" fill="hold"/>
24 <p:tgtEl>
25 <p:spTgt spid="5"/>
26 </p:tgtEl>
27 </p:cBhvr>

```

```

1 <p:by x="150000" y="150000"/>
2 </p:animScale>
3 </p:childTnLst>

```

End example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
by (By)	§4.6.20
cBhvr (Common Behavior)	§4.6.22
from (From)	§4.6.43
to (To)	§4.6.88

Attributes	Description
zoomContents (Zoom Content)	<p>This attribute specifies whether to zoom the contents of an object when doing a scaling animation.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLAnimateScaleBehavior">
 <sequence>
 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
 <element name="by" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 <element name="from" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 <element name="to" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="zoomContents" type="xsd:boolean" use="optional"/>
</complexType>

```

#### 4.6.7 attrName (Attribute Name)

This element is used to contain an attribute value for an Attribute Name List. This value defines the specific attribute that an animation should be applied to, such as fill, style, and shadow, etc. A specific property is defined by using a "property.sub-property" format which is often extended to multiple sub properties as seen in the allowed values below.

Allowed property values:

```

1 style.opacity, style.rotation, style.visibility, style.color, style.fontSize,
2 style.fontWeight, style.fontStyle, style.fontFamily, style.textEffectEmboss,
3 style.textShadow, style.textTransform, style.textDecorationUnderline,
4 style.textEffectOutline, style.textDecorationLineThrough, style.sRotation,
5 imageData.cropTop, imageData.cropBottom, imageData.cropLeft,
6 imageData.cropRight, imageData.cropRight, imageData.gain, imageData.blacklevel,
7 imageData.gamma, imageData.grayscale, imageData.chromakey, fill.on, fill.type,
8 fill.color, fill.opacity, fill.color2, fill.method, fill.opacity2, fill.angle,
9 fill.focus, fill.focusposition.x, fill.focusposition.y, fill.focussize.x,
10 fill.focussize.y, stroke.on, stroke.color, stroke.weight, stroke.opacity,
11 stroke.linestyle, stroke.dashstyle, stroke.filltype, stroke.src, stroke.color2,
12 stroke.imagesize.x, stroke.imagesize.y, stroke.startArrow, stroke.endArrow,
13 stroke.startArrowWidth, stroke.startArrowLength, stroke.endArrowWidth,
14 stroke.endArrowLength, shadow.on, shadow.type, shadow.color, shadow.color2,
15 shadow.opacity, shadow.offset.x, shadow.offset.y, shadow.offset2.x,
16 shadow.offset2.y, shadow.origin.x, shadow.origin.y, shadow.matrix.xtox,
17 shadow.matrix.ytox, shadow.matrix.xtoy, shadow.matrix.ytoy,
18 shadow.matrix.perspectiveX, shadow.matrix.perspectiveY, skew.on, skew.offset.x,
19 skew.offset.y, skew.origin.x, skew.origin.y, skew.matrix.xtox, skew.matrix.ytox,
20 skew.matrix.xtoy, skew.matrix.ytoy, skew.matrix.perspectiveX,
21 skew.matrix.perspectiveY, extrusion.on, extrusion.type, extrusion.render,
22 extrusion.viewpointorigin.x, extrusion.viewpointorigin.y, extrusion.viewpoint.x,
23 extrusion.viewpoint.y, extrusion.viewpoint.z, extrusion.plane,
24 extrusion.skewangle, extrusion.skewamt, extrusion.backdepth,
25 extrusion.foredepth, extrusion.orientation.x, extrusion.orientation.y,
26 extrusion.orientation.z, extrusion.orientationangle, extrusion.color,
27 extrusion.rotationangle.x, extrusion.rotationangle.y,
28 extrusion.lockrotationcenter, extrusion.autorotationcenter,
29 extrusion.rotationcenter.x, extrusion.rotationcenter.y,
30 extrusion.rotationcenter.z, and extrusion.colormode.

```

[Example: Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```

33 <p:anim to="1.5" calcmode="lin" valueType="num">
34 <p:cBhvr override="childStyle">
35 <p:cTn id="6" dur="2000" fill="hold"/>
36 <p:tgtEl>
37 <p:spTgt spid="3">
38 <p:txEl>
39 <p:charRg st="4294967295" end="4294967295"/>
40 </p:txEl>
41 </p:spTgt>
42 </p:tgtEl>

```

```

1 <p:attrNameLst>
2 <p:attrName>style.fontSize</p:attrName>
3 </p:attrNameLst>
4 </p:cBhvr>
5 </p:anim>

```

*end example]*

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
attrNameLst (§4.6.8)

#### 4.6.8 attrNameLst (Attribute Name List)

This element is used to describe a list of attributes in which to apply an animation to.

[Example: Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```

12 <p:anim to="1.5" calcmode="lin" valueType="num">
13 <p:cBhvr override="childStyle">
14 <p:cTn id="6" dur="2000" fill="hold"/>
15 <p:tgtEl>
16 <p:spTgt spid="3">
17 <p:txEl>
18 <p:charRg st="4294967295" end="4294967295"/>
19 </p:txEl>
20 </p:spTgt>
21 </p:tgtEl>
22 <p:attrNameLst>
23 <p:attrName>style.fontSize</p:attrName>
24 </p:attrNameLst>
25 </p:cBhvr>
26 </p:anim>

```

*End example]*

Parent Elements
cBhvr (§4.6.22)

Child Elements	Subclause
attrName (Attribute Name)	§4.6.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLBehaviorAttributeNameList">
 <sequence>
 <element name="attrName" type="xsd:string" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 4.6.9 audio (Audio)

This element is used to include audio during an animation.

[Example: Consider adding applause sound to an animation sequence. The <audio> element is used as follows:

```
<p:cTn>
 <p:stCondLst>...
 <p:childTnLst>...
 <p:subTnLst>
 <p:audio>
 <p:cMediaNode vol="11000">...
 </p:audio>
 </p:subTnLst>
</p:cTn>
```

End example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cMediaNode (Common Media Node Properties)	§4.6.29

Attributes	Description
isNarration (Is Narration)	This attribute indicates whether the audio is a narration for the slide. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLMediaNodeAudio">
 <sequence>
 <element name="cMediaNode" type="CT_TLCommonMediaNodeData" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="isNarration" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.6.10 **bg (Background)**

This element is used to specify animating the background of an object.

[Example: Consider adding animation to the background of Shape Id 3. The <bg> tag can be used as follows:

```
<p:tgtEl>
 <p:spTgt spid="3">
 <p:bg/>
 </p:spTgt>
</p:tgtEl>
```

End example]

Parent Elements
spTgt (§4.6.72)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

#### 4.6.11 **bldAsOne (Build As One)**

This element specifies in the build list to build the entire graphical object as one entity.

[Example: Consider having a graph appear as on entity as opposed to by category. The <bldAsOne> element should be used as follows:

```
<p:bldLst>
 <p:bldGraphic spid="4" grpId="0">
 <p:bldAsOne/>
 </p:bldGraphic>
</p:bldLst>
```

End example]

Parent Elements
bldGraphic (§4.6.13)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

#### 4.6.12 **bldDgm (Build Diagram)**

This element specifies how to build the animation for a diagram.

[Example: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```

1 <p:bdldLst>
2 <p:bldGraphic spid="4" grpId="0">
3 <p:bldSub>
4 <a:bldChart bld="category"/>
5 </p:bldSub>
6 </p:bldGraphic>
7 </p:bdldLst>

```

8 End example]

#### Parent Elements

bldLst (§4.6.14)

#### Attributes

#### Description

bld (Diagram Build Types)

This attribute describes how the diagram will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute.

The possible values for this attribute are defined by the ST\_TLDiagramBuildType simple type (§4.8.37).

grpId (Group ID)

This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

spid (Shape ID)

This attribute describes the shape to which the build applies.

The possible values for this attribute are defined by the ST\_ShapeID simple type (§5.1.12.55).

uiExpand (Expand UI)

This attribute describes the view option indicating if the build should be displayed expanded.

The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_TLBuildDiagram">
12 <attributeGroup ref="AG_TLBuild"/>
13 <attribute name="bld" type="ST_TLDiagramBuildType" use="optional" default="whole"/>
14 </complexType>

```

### 4.6.13 bldGraphic (Build Graphics)

This element specifies how to build a graphical element.

[Example: Consider having a chart graphical element appear as a whole as opposed to by a category. The <bldGraphic> element should be used as follows:

```
<p:bldLdst>
 <p:bldGraphic spid="3" grpId="0">
 <p:bldSub>
 <a:bldChart bld="category"/>
 </p:bldSub>
 </p:bldGraphic>
</p:bldLdst>
```

End example]

Parent Elements
bldLst (§4.6.14)

Child Elements	Subclause
bldAsOne (Build As One)	§4.6.11
bldSub (Build Sub Elements)	§4.6.17

Attributes	Description
grpId (Group ID)	<p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spid (Shape ID)	<p>This attribute describes the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).</p>
uiExpand (Expand UI)	<p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLGraphicalObjectBuild">
 <choice minOccurs="1" maxOccurs="1">
 <element name="bldAsOne" type="CT_Empty"/>
 <element name="bldSub" type="a:CT_AnimationGraphicalObjectBuildProperties"/>
 </choice>
 <attributeGroup ref="AG_TLBuild"/>
</complexType>
```

#### 4.6.14 bldLst (Build List)

This element specifies the list of graphic elements to build. This refers to how the different sub-shapes or sub-components of a object are displayed. The different objects that can have build properties are text, diagrams, and charts.

[Example: Consider animating a pie chart but based on category as shown below:

The <bldList> element should be used as follows:

```
<p:bldLst>
 <p:bldGraphic spid="1" grpId="0">
 <p:bldSub>
 <a:bldChart bld="category"/>
 </p:bldSub>
```

1       </p:bldGraphic>  
 2       </p:bldLst>

3   End example]

Parent Elements
timing (§4.4.1.44)

4

Child Elements	Subclause
bldDgm (Build Diagram)	§4.6.12
bldGraphic (Build Graphics)	§4.6.13
bldOleChart (Build Embedded Chart)	§4.6.15
bldP (Build Paragraph)	§4.6.16

5   The following XML Schema fragment defines the contents of this element:

```

6 <complexType name="CT_BuildList">
7 <choice minOccurs="1" maxOccurs="unbounded">
8 <element name="bldP" type="CT_TLBuildParagraph"/>
9 <element name="bldDgm" type="CT_TLBuildDiagram"/>
10 <element name="bldOleChart" type="CT_TLOleBuildChart"/>
11 <element name="bldGraphic" type="CT_TLGraphicalObjectBuild"/>
12 </choice>
13 </complexType>

```

#### 14   4.6.15    bldOleChart (Build Embedded Chart)

15   This element describes animation an a embedded Chart.

16   [Example: Consider displaying animation on a embedded graphical chart. The <bldOleChart>element should be  
 17   use as follows:

```

18 <p:bldLst>
19 <p:bldOleChart spid="1025" grpId="0"/>
20 </p:bldLst>

```

21   End example]

Parent Elements
bldLst (§4.6.14)

22

Attributes	Description
animBg (Animate Background)	This attribute describes whether to animate the background of the shape.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
bld (Build)	<p>This attribute describes how the diagram will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute.</p> <p>The possible values for this attribute are defined by the ST_TLOleChartBuildType simple type (§4.8.39).</p>
grpId (Group ID)	<p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
spid (Shape ID)	<p>This attribute describes the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).</p>
uiExpand (Expand UI)	<p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLOleBuildChart">
 <attributeGroup ref="AG_TLBuild"/>
 <attribute name="bld" type="ST_TLOleChartBuildType" use="optional" default="allAtOnce"/>
 <attribute name="animBg" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

#### 4.6.16 bldP (Build Paragraph)

This element specifies how to build paragraph level properties.

[Example: Consider having animation applied only to 1st level paragraphs. The <bldP> element should be used as follows:

```

<p:bldLst>
 <p:bldP spid="3" grpId="0" build="p"/>
</p:bldLst>

```

End example]

Parent Elements
bldLst (§4.6.14)

Child Elements	Subclause
tmplLst (Template effects)	§4.6.85

1

Attributes	Description
advAuto (Auto Advance Time)	<p>This attribute specifies time after which to automatically advance the build to the next step.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).</p>
animBg (Animate Background)	<p>This attribute indicates whether to animate the background of the shape associated with the text.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
autoUpdateAnimBg (Auto Update Animation Background)	<p>This attribute indicates whether to automatically update the "animateBg" setting to true when the shape associated with the text has a fill or line.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
bldLvl (Build Level)	<p>This attribute describes the build level for the paragraph. It is only supported in paragraph type builds i.e the build attribute must also be set to "byParagraph" for this attribute to apply.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
build (Build Types)	<p>This attribute describe the build types.</p> <p>The possible values for this attribute are defined by the ST_TLParaBuildType simple type (§4.8.40).</p>
grpId (Group ID)	<p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
rev (Reverse)	<p>This attribute is only supported in paragraph type builds. This specifies the direction of the build relative to the order of the elements in the container. When this is set to "true", the animations for the paragraphs will be persisted in reverse order to the order of the paragraphs themselves such that the last paragraph animates first. Default value is "false".</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
spid (Shape ID)	This attribute describes the shape to which the build applies.

Attributes	Description
	The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLBuildParagraph">
 <sequence>
 <element name="tplLst" type="CT_TLTemplateList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_TLBuild"/>
 <attribute name="build" type="ST_TLParaBuildType" use="optional" default="whole"/>
 <attribute name="bldLvl" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="animBg" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="autoUpdateAnimBg" type="xsd:boolean" default="true" use="optional"/>
 <attribute name="rev" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="advAuto" type="ST_TLTime" use="optional" default="indefinite"/>
</complexType>

```

#### 4.6.17 bldSub (Build Sub Elements)

This element specifies the animation properties of a graphical object's sub-elements.

[Example: Consider applying animation to a graphical element consisting of a diagram. The <bldSub> element should be used as follows:

```

<p:bldLst>
 <p:bldGraphic spid="5" grpId="0">
 <p:bldSub>
 <a:bldDgm bld="one"/>
 </p:bldSub>
 </p:bldGraphic>
</p:bldLst>

```

End example]

Parent Elements
bldGraphic (§4.6.13)

Child Elements	Subclause
bldChart (Build Chart)	§5.1.2.1.1

Child Elements	Subclause
bldDgm (Build Diagram)	§5.1.2.1.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationGraphicalObjectBuildProperties">
 <choice>
 <element name="bldDgm" type="CT_AnimationDgmBuildProperties"/>
 <element name="bldChart" type="CT_AnimationChartBuildProperties"/>
 </choice>
</complexType>
```

#### 4.6.18 blinds (Blinds Slide Transition)

This element describes the a "Blinds" slide transition effect.

[Example: Consider we have a slide with a "blind" style transition. The <blinds> element should be used as follows:

```
<p:transition>
 <p:blinds/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition.  The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
 <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

#### 4.6.19 boolVal (Boolean Variant)

This element describes a Boolean Variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

1

Attributes	Description
val (Value)	This attribute describes the boolean value for this element.  The possible values for this attribute are defined by the XML Schema boolean datatype.

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TLAnimVariantBooleanVal">
4 <attribute name="val" type="xsd:boolean" use="required"/>
5 </complexType>
```

#### 6 4.6.20 by (By)

7 This element describes the relative offset value for the animation.

8 [Example: Consider a shape with an animation effect that scales the size of an object by 150%. The <by>  
9 element should be used as follows:

```
10 <p:animScale>
11 <p:cBhvr>
12 <p:cTn id="6" dur="2000" fill="hold"/>
13 <p:tgtEl>
14 <p:spTgt spid="4"/>
15 </p:tgtEl>
16 </p:cBhvr>
17 <p:by x="150000" y="150000"/>
18 </p:animScale>
```

19 End Example]

Parent Elements
animMotion (§4.6.4); animScale (§4.6.6)

20

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLPoint">
 <attribute name="x" type="a:ST_Percentage" use="required"/>
 <attribute name="y" type="a:ST_Percentage" use="required"/>
</complexType>
```

4.6.21 by (By)

This element describes the relative offset value for the color animation.

[Example: Consider a shape with a lightening emphasis animation applied to it. The <by> element should be used as follows:

```
<p:animClr clrSpc="hsl">
 <p:cBhvr>
 <p:cTn id="8" dur="500" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="4"/>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>stroke.color</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
 <p:by>
 <p:hsl h="0" s="0" l="0"/>
 </p:by>
</p:animClr>
```

End Example]

Parent Elements
animClr (§4.6.2)

Child Elements	Subclause
hsl (HSL)	§4.6.46
rgb (RGB)	§4.6.63

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLByAnimateColorTransform">
 <choice minOccurs="1" maxOccurs="1">
 <element name="rgb" type="CT_TLByRgbColorTransform"/>
 <element name="hsl" type="CT_TLByHslColorTransform"/>
 </choice>
</complexType>
```

## 4.6.22 cBhvr (Common Behavior)

This element describes the common behaviors of animations.

[Example: Consider trying to emphasize text within a shape by changing the size of its font. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
 <p:cBhvr override="childStyle">
 <p:cTn id="6" dur="2000" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="3">
 <p:txEl>
 <p:charRg st="4294967295" end="4294967295"/>
 </p:txEl>
 </p:spTgt>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>style.fontSize</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
</p:anim>
```

End example]

### Parent Elements

anim (§4.6.1); animClr (§4.6.2); animEffect (§4.6.3); animMotion (§4.6.4); animRot (§4.6.5); animScale (§4.6.6); cmd (§4.6.28); set (§4.6.66)

### Child Elements

### Subclause

attrNameLst (Attribute Name List)

§4.6.8

cTn (Common Time Node Properties)

§4.6.33

tgtEl (Target Element)

§4.6.81

### Attributes

### Description

accumulate  
(Accumulate)

This attribute makes a repeating animation build with each iteration when set to "always."

The possible values for this attribute are defined by the ST\_TLBehaviorAccumulateType simple type (§4.8.31).

additive (Additive)

This attribute specifies how to apply the animation values to the original value for the property.

Attributes	Description
	The possible values for this attribute are defined by the ST_TLBehaviorAdditiveType simple type (§4.8.32).
by (By)	<p>This attribute specifies a relative offset value for the animation..</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
from (From)	<p>This attribute specifies the starting value of the animation.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
override (Override)	<p>This attribute specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" will clear the attributes on the children contained inside the target element.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorOverrideType simple type (§4.8.33).</p>
rctx (Runtime Context)	<p>This attribute describes the runtime context of the animation. The currently-understood values are "PPT" and "IE." This is used to specify the behavior used when animating in the PPT slideshow vs. IE HTML runtime. An example can be seen with the transparency effect. In IE, the transparency is animated as a bitmap, where in PPT, the style.opacity property of a shape is used to animate the transparency.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
to (To)	<p>This attribute specifies the ending value of the animation.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
xfrmType (Transform Type)	<p>This attribute specifies the type of transform to be used.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorTransformType simple type (§4.8.34).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLCommonBehaviorData">
 <sequence>
 <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
 <element name="tgtEl" type="CT_TLTimeTargetElement" minOccurs="1" maxOccurs="1"/>
 <element name="attrNameLst" type="CT_TLBehaviorAttributeNameList" minOccurs="0"
 maxOccurs="1"/>
 </sequence>
 <attribute name="additive" type="ST_TLBehaviorAdditiveType" use="optional"/>
 <attribute name="accumulate" type="ST_TLBehaviorAccumulateType" use="optional"/>
 <attribute name="xfrmType" type="ST_TLBehaviorTransformType" use="optional"/>
 <attribute name="from" type="xsd:string" use="optional"/>
 <attribute name="to" type="xsd:string" use="optional"/>
 <attribute name="by" type="xsd:string" use="optional"/>
 <attribute name="rctx" type="xsd:string" use="optional"/>
 <attribute name="override" type="ST_TLBehaviorOverrideType" use="optional"/>
</complexType>
```

4.6.23 charRg (Character Range)

This element specifies animation on a character range defined by a start and end character position.

[Example: Consider animating the first word (characters 1 through 9) within a sentence. The <charRg> element should be used as follows:

```
<p:animMotion>
 <p:cBhvr>
 <p:cTn id="6" dur="2000" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="3">
 <p:txEl>
 <p:charRg st="0" end="9"/>
 </p:txEl>
 </p:spTgt>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>ppt_x</p:attrName>
 <p:attrName>ppt_y</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
</p:animMotion>
```

End example]

Parent Elements
txEl (§4.6.91)

Attributes	Description
end (End)	This attribute defines the end of the index range.  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).
st (Start)	This attribute defines the start of the index range.  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexRange">
 <attribute name="st" type="ST_Index" use="required"/>
 <attribute name="end" type="ST_Index" use="required"/>
</complexType>
```

#### 4.6.24 checker (Checker Slide Transition)

This element describes the Checker slide transition effect.

[Example: Consider we have a slide with a "checker" slide transition animated vertically. The <checker> element should be used as follows:

```
<p:transition>
 <p:checker dir="vert"/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition.  The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
 <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

#### 4.6.25 childTnLst (Children Time Node List)

This element describes the list of time nodes that have a fixed location in the timing tree based on their parent time node. The children's start time is defined relative to their parent time node's start.

Parent Elements
cTn (§4.6.33)

1

Child Elements	Subclause
anim (Animate)	§4.6.1
animClr (Animate Color Behavior)	§4.6.2
animEffect (Animate Effect)	§4.6.3
animMotion (Animate Motion)	§4.6.4
animRot (Animate Rotation)	§4.6.5
animScale (Animate Scale)	§4.6.6
audio (Audio)	§4.6.9
cmd (Command)	§4.6.28
excl (Exclusive)	§4.6.40
par (Parallel Time Node)	§4.6.53
seq (Sequence Time Node)	§4.6.65
set (Set Time Node Behavior)	§4.6.66
video (Video)	§4.6.93

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TimeNodeList">
4 <choice minOccurs="1" maxOccurs="unbounded">
5 <element name="par" type="CT_TLTimeNodeParallel"/>
6 <element name="seq" type="CT_TLTimeNodeSequence"/>
7 <element name="excl" type="CT_TLTimeNodeExclusive"/>
8 <element name="anim" type="CT_TLAnimateBehavior"/>
9 <element name="animClr" type="CT_TLAnimateColorBehavior"/>
10 <element name="animEffect" type="CT_TLAnimateEffectBehavior"/>
11 <element name="animMotion" type="CT_TLAnimateMotionBehavior"/>
12 <element name="animRot" type="CT_TLAnimateRotationBehavior"/>
13 <element name="animScale" type="CT_TLAnimateScaleBehavior"/>
14 <element name="cmd" type="CT_TLCommandBehavior"/>
15 <element name="set" type="CT_TLSetBehavior"/>
16 <element name="audio" type="CT_TLMediaNodeAudio"/>
17 <element name="video" type="CT_TLMediaNodeVideo"/>
18 </choice>
19 </complexType>

```

## 20 4.6.26 circle (Circle Slide Transition)

21 This element describes the Circle transition effect..

22 [Example: Consider we have a slide with a "circle" style transition. The <circle> element should be used as  
 23 follows:

```

1 <p:transition>
2 <p:circle/>
3 </p:transition>

```

4 End example]

Parent Elements
transition (§4.4.1.46)

5 The following XML Schema fragment defines the contents of this element:

```

6 <complexType name="CT_Empty"/>

```

### 7 4.6.27 clrVal (Color Value)

8 This element describes the color variant. This is used to specify a color that we will use for animating the color  
9 property of an object.

10 [Example: Consider trying to emphasize text within a shape by changing the color its font.

```

11 <p:set>
12 <p:cBhvr override="childStyle">
13 ...
14 </p:cBhvr>
15 <p:to>
16 <p:clrVal>
17 <a:schemeClr val="accent2"/>
18 </p:clrVal>
19 </p:to>
20 </p:set>

```

21 End example]

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

22

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 4.6.28 cmd (Command)

This element describes the several non-durational type of commands that can be executed within a timeline.

This can be used to send events, call functions on elements, and send verbs to embedded objects. For example "Object Action" effects for Embedded objects and Media commands for sounds/movies such as "PlayFrom(0.0)" and "togglePause".

##### Parent Elements

childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

##### Child Elements

cBhvr (Common Behavior)

##### Subclause

§4.6.22

##### Attributes

##### Description

cmd (Command)

This is a string used to define the actual command. When an event is specified, in IE, the runtime will register the specific event and make sure that time conditions (begin/end/etc.) elsewhere on the page which listen for the event get hooked up correctly.

The possible values for this attribute are defined by the XML Schema string datatype.

type (Command Type)

This attribute is required and defines the type of command.

When the value is set to "event", the "cmd" attribute string is used to send out an event to the target element.

When the value is set to "call", the "cmd" string is used to call a method or function on the target element.

When the value is set to "verb", the "cmd" string is treated as an verb on the element.

When the value is set to "script", the cmd will be interpreted in the IE runtime as a string containing javascript statements. Note that this may cause a runtime script error if the script is invalid at the time it's called.

If the targetElement is not found, the command will not execute.

The possible values for this attribute are defined by the ST\_TLCommandType simple

Attributes	Description
	type (§4.8.36).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLCommandBehavior">
 <sequence>
 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute type="ST_TLCommandType" name="type" use="optional"/>
 <attribute name="cmd" type="xsd:string" use="optional"/>
</complexType>

```

#### 4.6.29 cMediaNode (Common Media Node Properties)

This element is used to describe behavior of media elements, such as sound or movies, in an animation.

[Example: Consider a shape with a sound effect attached to its animation. The <cMediaNode> element should be used as follows:

```

<p:audio>
 <p:cMediaNode mute="1">
 <p:cTn display="0" masterRel="sameClick">
 <p:stCondLst>...
 <p:endCondLst>..
 </p:cTn>
 <p:tgtEl>..
 </p:cMediaNode>
</p:audio>

```

End Example]

Parent Elements
audio (§4.6.9); video (§4.6.93)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33
tgtEl (Target Element)	§4.6.81

Attributes	Description
mute (Mute)	This attribute describes whether the media should be mute.  The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
numSld (Number of Slides)	This attribute describes the numbers of slides across which the media should play.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showWhenStopped (Show When Stopped)	This attribute describes whether the media should be displayed when it is stopped.  The possible values for this attribute are defined by the XML Schema boolean datatype.
vol (Volume)	This attribute describes the volume of the media element.  The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLCommonMediaNodeData">
 <sequence>
 <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
 <element name="tgtEl" type="CT_TLTimeTargetElement" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="vol" type="a:ST_PositiveFixedPercentage" default="50000" use="optional"/>
 <attribute name="mute" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="numSld" type="xsd:unsignedInt" use="optional" default="1"/>
 <attribute name="showWhenStopped" type="xsd:boolean" use="optional" default="true"/>
</complexType>

```

#### 4.6.30 comb (Comb Slide Transition)

This element describes a comb slide transition effect.

[Example: Consider we have a slide with a comb slide transition animated vertically. The <comb> element should be used as follows:

```

<p:transition>
 <p:comb/>
</p:transition>

```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition	This attribute specifies a horizontal or vertical transition.

Attributes	Description
Direction)	The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
 <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

#### 4.6.31 cond (Condition)

This element specifies conditions on time nodes in a timeline. It is used within a list of start condition or list of end condition elements.

[Example: For example, suppose we have a shape with a two second delay after the animation is started.

```
<p:cTn>
 <p:stCondLst>
 <p:cond delay="2000"/>
 </p:stCondLst>
 <p:childTnLst>
 <p:set>...
 <p:animEffect transition="in" filter="blinds(horizontal)">
 <p:cBhvr>
 <p:cTn id="7" dur="1000"/>
 <p:tgtEl>
 <p:spTgt spid="4"/>
 </p:tgtEl>
 </p:cBhvr>
 </p:animEffect>
 </p:childTnLst>
</p:cTn>
```

End Example]

Parent Elements
endCondLst (§4.6.37); nextCondLst (§4.6.51); prevCondLst (§4.6.55); stCondLst (§4.6.73)

Child Elements	Subclause
rtn (Runtime Node Trigger Choice)	§4.6.64
tgtEl (Target Element)	§4.6.81
tn (Time Node)	§4.6.86

1

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered.  The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
evt (Trigger Event)	This attribute describes the event that triggers an animation.  The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§4.8.52).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TLTimeCondition">
4 <choice minOccurs="0" maxOccurs="1">
5 <element name="tgtEl" type="CT_TLTimeTargetElement"/>
6 <element name="tn" type="CT_TLTriggerTimeNodeID"/>
7 <element name="rtn" type="CT_TLTriggerRuntimeNode"/>
8 </choice>
9 <attribute name="evt" use="optional" type="ST_TLTriggerEvent"/>
10 <attribute name="delay" type="ST_TLTime" use="optional"/>
11 </complexType>

```

### 12 4.6.32 cover (Cover Slide Transition)

13 This element describes a cover slide transition effect.

14 [Example: Consider we have a slide with a cover slide transition animated vertically. The <cover> element  
15 should be used as follows:

```

16 <p:transition>
17 <p:cover/>
18 </p:transition>

```

19 End example]

Parent Elements
transition (§4.4.1.46)

20

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition.  The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§4.8.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EightDirectionTransition">
 <attribute name="dir" type="ST_TransitionEightDirectionType" use="optional" default="1"/>
</complexType>
```

### 4.6.33 cTn (Common Time Node Properties)

This element describes the properties that are common for time nodes.

#### Parent Elements

cBhvr (§4.6.22); cMediaNode (§4.6.29); excl (§4.6.40); par (§4.6.53); seq (§4.6.65)

#### Child Elements

#### Subclause

childTnLst (Children Time Node List)

§4.6.25

endCondLst (End Conditions List)

§4.6.37

endSync (EndSync)

§4.6.39

iterate (Iterate)

§4.6.49

stCondLst (Start Conditions List)

§4.6.73

subTnLst (Sub-TimeNodes List)

§4.6.78

#### Attributes

#### Description

accel (Acceleration)

This attribute describes the percentage of specified duration over which the element's time will take to accelerate from 0 up to the "run rate."

The possible values for this attribute are defined by the ST\_PositiveFixedPercentage simple type (§5.1.12.45).

afterEffect (After Effect)

This attribute specifies whether there is an after effect applied to the time node.

The possible values for this attribute are defined by the XML Schema boolean datatype.

autoRev (Auto Reverse)

This attribute describes whether to automatically play the animation in reverse after playing it in the forward direction.

The possible values for this attribute are defined by the XML Schema boolean datatype.

bldLvl (Build level)

This attribute describes the build level of the animation.

The possible values for this attribute are defined by the XML Schema int datatype.

decel (Deceleration)

This attribute describes the percentage of specified duration over which the element's time will take to decelerate from the "run rate" down to 0.

The possible values for this attribute are defined by the ST\_PositiveFixedPercentage simple type (§5.1.12.45).

Attributes	Description
display (Display)	<p>This attribute describes whether the state of the time node is visible or hidden.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
dur (Duration)	<p>This attribute describes the duration of the time node, expressed as unit time.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).</p>
evtFilter (Event Filter)	<p>This attribute describes the event filter for this time node.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
fill (Fill)	<p>This attribute describes the fill type for the time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeFillType simple type (§4.8.45).</p>
grpId (Group ID)	<p>This attribute describes the Group ID of the time node.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
id (ID)	<p>This attribute specifies the identifier for the timenode.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§4.8.46).</p>
masterRel (Master Relation)	<p>This attribute specifies how the time node plays back relative to its master time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeMasterRelation simple type (§4.8.47).</p>
nodePh (Node Placeholder)	<p>This attribute describes whether this node is a placeholder.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
nodeType (Node Type)	<p>This attribute specifies the type of time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeType simple type (§4.8.51).</p>
presetClass (Preset Types)	<p>This attribute describes the class of effect in which it belongs.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodePresetClassType simple type (§4.8.48).</p>
presetID (Preset ID)	<p>This attribute describes the preset identifier for the time node.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
presetSubtype	<p>This attribute is a bitflag that specifies a direction or some other attribute of the effect.</p>

Attributes	Description
(Preset SubType)	<p>For example it can be set to specify a “From Bottom” for the Fly In effect, or “Bold” for the Change Font Style effect.</p> <p>The possible values for this attribute are defined by the XML Schema int datatype.</p>
repeatCount (Repeat Count)	<p>This attribute describes the number of times the element should repeat, in units of thousandths.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).</p>
repeatDur (Repeat Duration)	<p>This attribute describes the amount of time over which the element should repeat. If absent, the attribute is taken to be the same as the specified duration.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).</p>
restart (Restart)	<p>This attribute specifies if a node is to restart when it completes its action.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeRestartType simple type (§4.8.49).</p>
spd (Speed)	<p>This attribute specifies the percentage by which to speed up (or slow down) the timing. If negative, the timing will be reversed. Example: if speed is 200% and the specified duration is 10 seconds, the actual duration will be 5 seconds.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
syncBehavior (Synchronization Behavior)	<p>This attribute specifies how the time node synchronizes to its group.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeSyncType simple type (§4.8.50).</p>
tmFilter (Time Filter)	<p>This attribute specifies the time filter for the time node.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLCommonTimeNodeData">
 <sequence>
 <element name="stCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
 <element name="endCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
 <element name="endSync" type="CT_TLTimeCondition" minOccurs="0" maxOccurs="1"/>
 <element name="iterate" type="CT_TLIterateData" minOccurs="0" maxOccurs="1"/>
 <element name="childTnLst" type="CT_TimeNodeList" minOccurs="0" maxOccurs="1"/>
 <element name="subTnLst" type="CT_TimeNodeList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="id" type="ST_TLTimeNodeID" use="optional"/>
 <attribute name="presetID" type="xsd:int" use="optional"/>
 <attribute name="presetClass" type="ST_TLTimeNodePresetClassType" use="optional"/>
 <attribute name="presetSubtype" type="xsd:int" use="optional"/>
 <attribute name="dur" type="ST_TLTime" use="optional"/>
 <attribute name="repeatCount" type="ST_TLTime" use="optional" default="1000"/>
 <attribute name="repeatDur" type="ST_TLTime" use="optional"/>
 <attribute name="spd" type="a:ST_Percentage" use="optional" default="100000"/>
 <attribute name="accel" type="a:ST_PositiveFixedPercentage" use="optional" default="0"/>
 <attribute name="decel" type="a:ST_PositiveFixedPercentage" use="optional" default="0"/>
 <attribute name="autoRev" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="restart" type="ST_TLTimeNodeRestartType" use="optional"/>
 <attribute name="fill" type="ST_TLTimeNodeFillType" use="optional"/>
 <attribute name="syncBehavior" type="ST_TLTimeNodeSyncType" use="optional"/>
 <attribute name="tmFilter" type="xsd:string" use="optional"/>
 <attribute name="evtFilter" type="xsd:string" use="optional"/>
 <attribute name="display" type="xsd:boolean" use="optional"/>
 <attribute name="masterRel" type="ST_TLTimeNodeMasterRelation" use="optional"/>
 <attribute name="bldLvl" type="xsd:int" use="optional"/>
 <attribute name="grpId" type="xsd:unsignedInt" use="optional"/>
 <attribute name="afterEffect" type="xsd:boolean" use="optional"/>
 <attribute name="nodeType" type="ST_TLTimeNodeType" use="optional"/>
 <attribute name="nodePh" type="xsd:boolean" use="optional"/>
</complexType>
```

#### 4.6.34 cut (Cut Slide Transition)

This element describes a cut slide transition effect.

[Example: Consider we have a slide with a cut slide transition animated vertically. The <cut>element should be used as follows:

```
<p:transition>
 <p:cut/>
</p:transition>
```

End example]

#### Parent Elements

transition (§4.4.1.46)

Attributes	Description
thruBlk (Transition Through Black)	This attribute specifies if the transition will start from a black screen (and then transition the new slide over black).  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OptionalBlackTransition">
 <attribute name="thruBlk" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 4.6.35 diamond (Diamond Slide Transition)

This element describes a diamond slide transition effect.

[Example: Consider we have a slide with a diamond slide transition animated vertically. The <diamond> element should be used as follows:

```
<p:transition>
 <p:diamond/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

### 4.6.36 dissolve (Dissolve Slide Transition)

This element describes a dissolve slide transition effect.

[Example: Consider we have a slide with a dissolve slide transition animated vertically. The <dissolve> element should be used as follows:

```
<p:transition>
 <p:dissolve/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

### 4.6.37 endCondLst (End Conditions List)

This element describes a list of the end conditions that must be met in order to stop the time node.

[Example: Consider a shape a shape with an audio attached to the animation. The <endCondList> element should be used as follows to specifies when the sound is done:

```
<p:audio>
 <p:cMediaNode>
 <p:cTn display="0" masterRel="sameClick">
 <p:stCondLst>...
 <p:endCondLst>
 <p:cond evt="onStopAudio" delay="0">
 <p:tgtEl>
 <p:sldTgt/>
 </p:tgtEl>
 </p:cond>
 </p:endCondLst>
 </p:cTn>
 <p:tgtEl>...
 </p:cMediaNode>
</p:audio>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
 <sequence>
 <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

### 4.6.38 endSnd (Stop Sound Action)

This element will stops all previous sounds during a slide transition.

[Example: Consider a slide transition that stops all previous sounds. The <endSnd> element should be used as follows:

```
<p:transition>
 <p:sndAc>
 <p:endSnd/>
 </p:sndAc>
</p:transition>
```

End Example]

Parent Elements
sndAc (§4.6.69)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

### 4.6.39 endSync (EndSync)

This element is used to synchronizes the stopping of parallel elements in the timing tree. It is used on interactive timeline sequences to specify that the interactive sequence's duration ends when all of the child timenodes have ended. It is also used to make interactive sequences restart-able (so that the entire interactive sequence can be repeated if the trigger object is clicked on repeatedly).

[Example: Consider a shape with a fill change animation. The <endSync> element should be used as follows:

```
<p:seq concurrent="1" nextAc="seek">
 <p:cTn>
 <p:stCondLst/>
 <p:endSync evt="end" delay="0">
 <p:rtn val="all"/>
 </p:endSync>
 <p:childTnLst/>
 </p:cTn>
 <p:nextCondLst/>
</p:seq>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
rtn (Runtime Node Trigger Choice)	§4.6.64

Child Elements	Subclause
tgtEl (Target Element)	§4.6.81
tn (Time Node)	§4.6.86

1

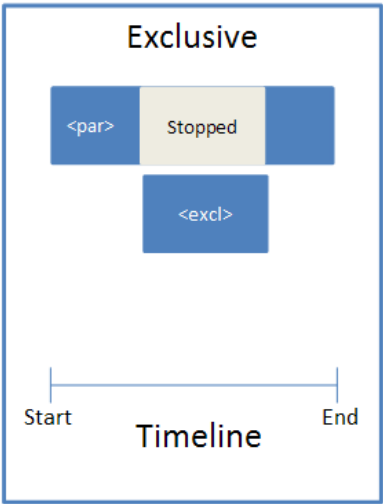

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered.  The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
evt (Trigger Event)	This attribute describes the event that triggers an animation.  The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§4.8.52).

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_TLTimeCondition">
4 <choice minOccurs="0" maxOccurs="1">
5 <element name="tgtEl" type="CT_TLTimeTargetElement"/>
6 <element name="tn" type="CT_TLTriggerTimeNodeID"/>
7 <element name="rtn" type="CT_TLTriggerRuntimeNode"/>
8 </choice>
9 <attribute name="evt" use="optional" type="ST_TLTriggerEvent"/>
10 <attribute name="delay" type="ST_TLTime" use="optional"/>
11 </complexType>
```

12 **4.6.40 excl (Exclusive)**

13 This element describes the Exclusive time node. This time node is used to pause all other timelines when it is  
14 activated. Conceptually it can be though of as follows:

15

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeNodeExclusive">
 <sequence>
 <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 4.6.41 fade (Fade Slide Transition)

This element describes a fade slide transition effect.

[Example: Consider we have a slide with a fade slide transition animated vertically. The <fade> element should be used as follows:

```
<p:transition>
 <p:fade/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
thruBlk (Transition Through Black)	This attribute specifies if the transition will start from a black screen (and then transition the new slide over black).  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OptionalBlackTransition">
 <attribute name="thruBlk" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.6.42 fltVal (Float Value)

This element describes a float variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute specifies the value of this element as a floating point.  The possible values for this attribute are defined by the XML Schema float datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantFloatVal">
 <attribute name="val" type="xsd:float" use="required"/>
</complexType>
```

#### 4.6.43 from (From)

This element specifies an x/y co-ordinate to start the animation from.

[Example: Consider a shape with an animation sequence that needs to start at a certain coordinate. The <from> element should be used as follows:

```
<p:animScale>
 <p:cBhvr>
 <p:cTn>...
 <p:tgtEl>
 <p:spTgt spid="4"/>
 </p:tgtEl>
 </p:cBhvr>
 <p:from x="100000" y="100000"/>
 <p:to x="80000" y="100000"/>
</p:animScale>
```

End Example]

Parent Elements
animMotion (§4.6.4); animScale (§4.6.6)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate.

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TLPoint">
3 <attribute name="x" type="a:ST_Percentage" use="required"/>
4 <attribute name="y" type="a:ST_Percentage" use="required"/>
5 </complexType>
```

#### 6 4.6.44 from (From)

7 This element is used to specify the starting color of the target element.

8 [Example: Consider a shape with an animation fill change from one accent color to another. The <from>  
9 element should be used as follows:

```
10 <p:animClr clrSpc="rgb" dir="cw">
11 <p:cBhvr>
12 <p:cTn id="6" dur="2000" fill="hold"/>
13 <p:tgtEl>...
14 <p:attrNameLst>
15 <p:attrName>fillcolor</p:attrName>
16 </p:attrNameLst>
17 </p:cBhvr>
18 <p:from>
19 <a:schemeClr val="accent3"/>
20 </p:from>
21 <p:to>
22 <a:schemeClr val="accent2"/>
23 </p:to>
24 </p:animClr>
```

25 End Example]

Parent Elements
animClr (§4.6.2)

26

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30

Child Elements	Subclause
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 4.6.45 graphicEl (Graphic Element)

This element specifies a graphical element which to animate.

[Example: Consider a diagram with an animation effect applied to it. The <graphicEl> element should be used as follows:

```
<p:set>
 <p:cBhvr>
 <p:cTn id="6" dur="1" fill="hold">...
 <p:tgtEl>
 <p:spTgt spid="4">
 <p:graphicEl>
 <a:dgm id="{87C2C707-C3F4-4E81-A967-A8B8AE13E575}"/>
 </p:graphicEl>
 </p:spTgt>
 </p:tgtEl>
 <p:attrNameLst>...
 </p:cBhvr>
 <p:to>
</p:set>
```

End Example]

Parent Elements
spTgt (§4.6.72)

Child Elements	Subclause
chart (Chart to Animate)	§5.1.2.1.3
dgm (Diagram to Animate)	§5.1.2.1.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationElementChoice">
 <choice minOccurs="1" maxOccurs="1">
 <element name="dgm" type="CT_AnimationDgmElement"/>
 <element name="chart" type="CT_AnimationChartElement"/>
 </choice>
</complexType>
```

4.6.46 hsl (HSL)

This element specifies an incremental HSL (Hue, Saturation, Lightness) value to add to a color animation.

[Example: Consider a shape with a lightening emphasis animation. The <hsl> element should be used as follows:

```
<p:animClr clrSpc="hsl">
 <p:cBhvr>
 <p:cTn id="8" dur="500" fill="hold"/>
 <p:tgtEl>
 <p:spTgt spid="4"/>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>stroke.color</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
 <p:by>
 <p:hsl h="0" s="0" l="0"/>
 </p:by>
</p:animClr>
```

End Example]

Parent Elements
by (§4.6.21)

Attributes	Description
h (Hue)	Specifies hue as an angle. The valid values range from [0, 360] degrees.  The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).
l (Lightness)	Specifies a lightness as fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%].  The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
s (Saturation)	Specifies a saturation as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%].

Attributes	Description
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLByHslColorTransform">
 <attribute name="h" type="a:ST_Angle" use="required"/>
 <attribute name="s" type="a:ST_FixedPercentage" use="required"/>
 <attribute name="l" type="a:ST_FixedPercentage" use="required"/>
</complexType>
```

#### 4.6.47 inkTgt (Ink Target)

This element specifies an animation target element that is represented by a sub-shape in a legacy graphical object.

[Example: Consider an ink diagram with an animation blinds transition effect applied to it. The <inkTgt> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
 <p:cBhvr>
 <p:cTn id="7" dur="500"/>
 <p:tgtEl>
 <p:inkTgt spid="_x0000_s2057"/>
 </p:tgtEl>
 </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
tgtEl (§4.6.81)

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier.  The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLSubShapeId">
 <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

#### 4.6.48 intVal (Integer)

This element describes an integer variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute specifies the value of this element as a floating point.  The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantIntegerVal">
 <attribute name="val" type="xsd:int" use="required"/>
</complexType>
```

#### 4.6.49 iterate (Iterate)

This element specifies how the animation should be successively applied to sub elements of the target element for a repeated effect. It can be applied to contained timing and animation structures over the letters, words, or shapes within a target element.

[Example: Consider a text animation where the words appear letter by letter. The <iterate> element should be used as follows:

```
<p:par>
 <p:cTn id="1" >
 <p:stCondLst>...
 <p:iterate type="lt">
 <p:tmPct val="10000"/>
 </p:iterate>
 <p:childTnLst>...
 </p:cTn>
</p:par>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
tmAbs (Time Absolute)	§4.6.82

Child Elements	Subclause
tmPct (Time Percentage)	§4.6.83

1

Attributes	Description
backwards (Backwards)	This attribute specifies whether to go backwards in the timeline to the previous node.  The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Iterate Type)	This attribute specifies the iteration behavior and applies it to each letter, word or shape within a container element.  Valid values are by word, by letter, or by element. If there is no text or block elements such as shapes within the container or a single word, letter, or shape (depending on iterate type) then no iteration will happen and the behavior is applied to the element itself instead.  The possible values for this attribute are defined by the ST_IterateType simple type (§4.8.8).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TLIterateData">
4 <choice minOccurs="1" maxOccurs="1">
5 <element name="tmAbs" type="CT_TLIterateIntervalTime"/>
6 <element name="tmPct" type="CT_TLIterateIntervalPercentage"/>
7 </choice>
8 <attribute name="type" type="ST_IterateType" use="optional" default="el"/>
9 <attribute name="backwards" type="xsd:boolean" use="optional" default="false"/>
10 </complexType>

```

11 **4.6.50 newsflash (Newsflash Slide Transition)**

12 This element describes a newsflash slide transition effect.

13 [Example: Consider we have a slide with a newsflash slide transition animated vertically. The <newsflash>  
14 element should be used as follows:

```

15 <p:transition>
16 <p:newsflash/>
17 </p:transition>

```

18 End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

#### 4.6.51 nextCondLst (Next Conditions List)

This element describes a list of conditions that must be met to advance to the next animation sequence.

[Example: Consider a shape with a text emphasis changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
 <p:cTn id="2" dur="indefinite" nodeType="mainSeq">...
 <p:prevCondLst>...
 <p:nextCondLst>
 <p:cond evt="onNext" delay="0">
 <p:tgtEl>
 <p:sldTgt/>
 </p:tgtEl>
 </p:cond>
 </p:nextCondLst>
</p:seq>
```

End example]

Parent Elements
seq (§4.6.65)

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
 <sequence>
 <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 4.6.52 oleChartEl (Embedded Chart Element)

This element specifies the subelement of an embedded chart to animate.

[Example: Consider an embedded Chart with a entrance animation effect applied to each of the graph's categories. The <oleChartEl> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
 <p:cBhvr>
 <p:cTn id="12" dur="500"/>
 </p:cBhvr>
</p:animEffect>
```

```

1 <p:tgtEl>
2 <p:spTgt spid="19460">
3 <p:oleChartEl type="category" lvl="1"/>
4 </p:spTgt>
5 </p:tgtEl>
6 </p:cBhvr>
7 </p:animEffect>

```

8 End Example]

Parent Elements
spTgt (§4.6.72)

Attributes	Description
lvl (Level)	<p>This attribute describes the element levels to animate.</p> <p>The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</p>
type (Type)	<p>This attribute specifies how to chart should be built during its animation.</p> <p>The possible values for this attribute are defined by the ST_TLChartSubelementType simple type (§4.8.35).</p>

10 The following XML Schema fragment defines the contents of this element:

```

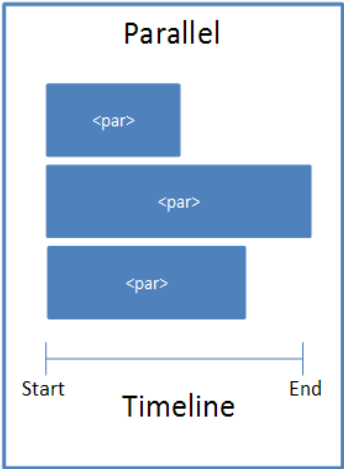

11 <complexType name="CT_TLOleChartTargetElement">
12 <attribute name="type" type="ST_TLChartSubelementType" use="required"/>
13 <attribute name="lvl" type="xsd:unsignedInt" use="optional" default="0"/>
14 </complexType>

```

#### 15 4.6.53 par (Parallel Time Node)

16 This element describes the Parallel time node which can be activated along with other parallel time node  
 17 containers. Conceptually it can be thought of as follows:

1

2 [Example: Consider a simple animation with a blind entrance. The `<par>` element should be used as follows:

```
3 <p:timing>
4 <p:tnLst>
5 <p:par>
6 <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
7 <p:childTnLst>
8 <p:seq concurrent="1" nextAc="seek">
9 ...
10 </p:seq>
11 </p:childTnLst>
12 </p:cTn>
13 </p:par>
14 </p:tnLst>
15 </p:timing>
```

16 End Example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

17

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33

18 The following XML Schema fragment defines the contents of this element:

```
19 <complexType name="CT_TLTimeNodeParallel">
20 <sequence>
21 <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
22 </sequence>
23 </complexType>
```

#### 4.6.54 plus (Plus Slide Transition)

This element describes a plus slide transition effect.

[Example: Consider we have a slide with a plus slide transition animated vertically. The <plus> element should be used as follows:

```
<p:transition>
 <p:plus/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

#### 4.6.55 prevCondLst (Previous Conditions List)

This element describes a list of conditions that must be met in order to go backwards in an animation sequence.

[Example: Consider trying to emphasize text within a shape by changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
 <p:cTn id="2" dur="indefinite" nodeType="mainSeq">
 </p:cTn>
 <p:prevCondLst>
 <p:cond evt="onPrev" delay="0">
 <p:tgtEl>
 <p:sldTgt/>
 </p:tgtEl>
 </p:cond>
 </p:prevCondLst>
 <p:nextCondLst>
 </p:nextCondLst>
 </p:seq>
```

End example]

Parent Elements
seq (§4.6.65)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
 <sequence>
 <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 4.6.56 pRg (Paragraph Text Range)

This element specifies a text range to animate based on starting and ending paragraph number.

[Example: Consider an animation entrance of the first 3 text paragraphs. The <pRg> element should be used as follows:

```
<p:animEffect transition="in" filter="checkerboard(across)">
 <p:cBhvr>
 <p:cTn id="12" dur="500"/>
 <p:tgtEl>
 <p:spTgt spid="3">
 <p:txEl>
 <p:pRg st="0" end="2"/>
 </p:txEl>
 </p:spTgt>
 </p:tgtEl>
 </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
txEl (§4.6.91)

Attributes	Description
end (End)	This attribute defines the end of the index range.  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).
st (Start)	This attribute defines the start of the index range.  The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexRange">
 <attribute name="st" type="ST_Index" use="required"/>
 <attribute name="end" type="ST_Index" use="required"/>
</complexType>
```

#### 4.6.57 progress (Progress)

This element defines the animation's overall progress that remains throughout the entire animation.

Parent Elements
animEffect (§4.6.3)

Child Elements	Subclause
boolVal (Boolean Variant)	§4.6.19
clrVal (Color Value)	§4.6.27
fltVal (Float Value)	§4.6.42
intVal (Integer)	§4.6.48
strVal (String Value)	§4.6.75

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariant">
 <choice minOccurs="1" maxOccurs="1">
 <element name="boolVal" type="CT_TLAnimVariantBooleanVal"/>
 <element name="intVal" type="CT_TLAnimVariantIntegerVal"/>
 <element name="fltVal" type="CT_TLAnimVariantFloatVal"/>
 <element name="strVal" type="CT_TLAnimVariantStringVal"/>
 <element name="clrVal" type="a:CT_Color"/>
 </choice>
</complexType>
```

#### 4.6.58 pull (Pull Slide Transition)

This element describes a pull slide transition effect.

[Example: Consider we have a slide with a pull slide transition. The <pull> element should be used as follows:

```
<p:transition>
 <p:pull/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

1

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition.  The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§4.8.55).

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_EightDirectionTransition">
4 <attribute name="dir" type="ST_TransitionEightDirectionType" use="optional" default="l"/>
5 </complexType>
```

### 6 4.6.59 push (Push Slide Transition)

7 This element describes a push slide transition effect.

8 [Example: Consider we have a slide with a push slide transition. The <push> element should be used as follows:

```
9 <p:transition>
10 <p:push dir="r"/>
11 </p:transition>
```

12 End example]

Parent Elements
transition (§4.4.1.46)

13

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition.  The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§4.8.57).

14 The following XML Schema fragment defines the contents of this element:

```
15 <complexType name="CT_SideDirectionTransition">
16 <attribute name="dir" type="ST_TransitionSideDirectionType" use="optional" default="l"/>
17 </complexType>
```

### 18 4.6.60 random (Random Slide Transition)

19 This element describes a random slide transition effect.

20 [Example: Consider we have a slide with a random slide transition. The <random> element should be used as  
21 follows:

```

1 <p:transition>
2 <p:random/>
3 </p:transition>

```

4 End example]

Parent Elements
transition (§4.4.1.46)

5 The following XML Schema fragment defines the contents of this element:

```

6 <complexType name="CT_Empty"/>

```

#### 7 4.6.61 randomBar (Random Bar Slide Transition)

8 This element describes a random bar slide transition effect.

9 [Example: Consider we have a slide with a random bar slide transition. The <randomBar> element should be  
10 used as follows:

```

11 <p:transition>
12 <p:randomBar/>
13 </p:transition>

```

14 End example]

Parent Elements
transition (§4.4.1.46)

15

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition.  The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

16 The following XML Schema fragment defines the contents of this element:

```

17 <complexType name="CT_OrientationTransition">
18 <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
19 </complexType>

```

#### 20 4.6.62 rCtr (Rotation Center)

21 This element describes the center of the rotation used to rotate a motion path by X angle.

22 [Example: For example, suppose we have a simple animation with a checkbox text entrance.

```

1 <p:animMotion origin="layout" path="M 0 0 L 0.25 0.33333 E"
2 pathEditMode="relative" rAng="0" ptsTypes="">
3 <p:cBhvr>
4 <p:cTn id="6" dur="2000" fill="hold"/>
5 <p:tgtEl>
6 <p:spTgt spid="3"/>
7 </p:tgtEl>
8 <p:attrNameLst>
9 <p:attrName>ppt_x</p:attrName>
10 <p:attrName>ppt_y</p:attrName>
11 </p:attrNameLst>
12 </p:cBhvr>
13 <p:rCtr x="457200" y="274638"/>
14 </p:animMotion>

```

*end example]*

#### Parent Elements

animMotion (§4.6.4)

#### Attributes

#### Description

x (X coordinate)

This attribute describes the X coordinate.

The possible values for this attribute are defined by the ST\_Percentage simple type (§5.1.12.41).

y (Y coordinate)

This attribute describes the Y coordinate.

The possible values for this attribute are defined by the ST\_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```

18 <complexType name="CT_TLPoint">
19 <attribute name="x" type="a:ST_Percentage" use="required"/>
20 <attribute name="y" type="a:ST_Percentage" use="required"/>
21 </complexType>

```

### 4.6.63 rgb (RGB)

The element specifies an incremental RGB value to add to the color property.

[Example: Consider a shape with a color emphasis animation. The <rgb> element should be used as follows:

```

25 <p:animClr clrSpc="rgb">
26 <p:cBhvr>
27 <p:cTn id="8" dur="500" fill="hold"/>

```

```

1 <p:tgtEl>
2 <p:spTgt spid="4"/>
3 </p:tgtEl>
4 <p:attrNameLst>
5 <p:attrName>stroke.color</p:attrName>
6 </p:attrNameLst>
7 </p:cBhvr>
8 <p:by>
9 <p:rgb r="10" g="20" b="30"/>
10 </p:by>
11 </p:animClr>

```

End Example]

#### Parent Elements

by (§4.6.21)

#### Attributes

#### Description

b (Blue)

This attribute specifies a blue as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%].

The possible values for this attribute are defined by the ST\_FixedPercentage simple type (§5.1.12.22).

g (Green)

This attribute specifies a green as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%].

The possible values for this attribute are defined by the ST\_FixedPercentage simple type (§5.1.12.22).

r (Red)

This attribute specifies a red as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%].

The possible values for this attribute are defined by the ST\_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLByRgbColorTransform">
 <attribute name="r" type="a:ST_FixedPercentage" use="required"/>
 <attribute name="g" type="a:ST_FixedPercentage" use="required"/>
 <attribute name="b" type="a:ST_FixedPercentage" use="required"/>
</complexType>

```

#### 4.6.64 rtn (Runtime Node Trigger Choice)

This element specifies the child time node that triggers a time condition. References a child time node or all child nodes. Order is based on the child's end time.

[Example: Consider an animation which will end the synchronization of all parallel time nodes when all the child nodes have ended their animation. The <rtn> element should be used as follows:

```
<p:cTn>
 <p:stCondLst>...
 <p:endSync evt="end" delay="0">
 <p:rtn val="all"/>
 </p:endSync>
 <p:childTnLst>...
</p:cTn>
```

End Example]

Parent Elements
cond (§4.6.31); endSync (§4.6.39)

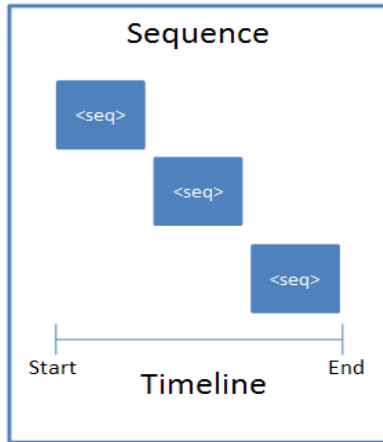

Attributes	Description
val (Value)	<p>This attribute describes the value that will trigger the runtime node.</p> <p>The possible values for this attribute are defined by the ST_TLTriggerRuntimeNode simple type (§4.8.53).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTriggerRuntimeNode">
 <attribute name="val" type="ST_TLTriggerRuntimeNode" use="required"/>
</complexType>
```

#### 4.6.65 seq (Sequence Time Node)

This element describes the Sequence time node and it can only be activated when the one before it finishes. Conceptually it can be thought of as follows:

[Example: For example, suppose we have a simple animation with a blind entrance.

```

<p:timing>
 <p:tnLst>
 <p:par>
 <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
 <p:childTnLst>
 <p:seq concurrent="1" nextAc="seek">
 ...
 </p:seq>
 </p:childTnLst>
 </p:cTn>
 </p:par>
 </p:tnLst>
</p:timing>

```

End Example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33
nextCondLst (Next Conditions List)	§4.6.51
prevCondLst (Previous Conditions List)	§4.6.55

Attributes	Description
concurrent (Concurrent)	This attribute specifies if concurrency is enabled or disabled. By default this attribute has a value of "disabled". When the value is set to "enabled", the previous element is left

Attributes	Description
	<p>enabled when advancing to the next element in a sequence instead of being ended. This is only relevant for advancing via the next condition element being triggered. The only other way to advance to the next element would be to have the current element end, which implies it is no longer concurrent.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
nextAc (Next Action)	<p>This attribute specifies what to do when going forward in sequence. By default this attribute has a value of "none". When this is set to seek it will seek the element to a natural end time (not necessarily the actual end time).</p> <p>The natural end position is defined as the latest non-infinite end time of the children. If a child loops forever, the end of its first loop is used as its "end time" for the purposes of this calculation.</p> <p>Some container elements may have infinite durations due to an infinite-duration child element. The engine needs to recurse down through all infinite duration containers to calculate their natural duration in case a child might have non-infinite duration within it that needs to be taken into account.</p> <p>The possible values for this attribute are defined by the ST_TLNextActionType simple type (§4.8.38).</p>
prevAc (Previous Action)	<p>This attribute specifies what to do when going backwards in a sequence. By default it is set to "none" and nothing special is done. When the value is "skipTimed", the sequence will continue to go backwards until it reaches a sequence element that was defined to begin only on the next condition element.</p> <p>The possible values for this attribute are defined by the ST_TLPreviousActionType simple type (§4.8.41).</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLTimeNodeSequence">
 <sequence>
 <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
 <element name="prevCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
 <element name="nextCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="concurrent" type="xsd:boolean" use="optional"/>
 <attribute name="prevAc" type="ST_TLPreviousActionType" use="optional"/>
 <attribute name="nextAc" type="ST_TLNextActionType" use="optional"/>
</complexType>

```

#### 4.6.66 set (Set Time Node Behavior)

This element allows the setting of a particular property value to a fixed value while the behavior is active and restores the value when the behavior is reset or turned off.

[Example: For example, suppose we want to set certain properties during an animation effect. The <set> element should be used as follows:

```

<p:childTnLst>
 <p:set>
 <p:cBhvr>
 <p:cTn id="6" dur="1" fill="hold">...
 <p:tgtEl>
 <p:spTgt spid="4"/>
 </p:tgtEl>
 <p:attrNameLst>
 <p:attrName>style.visibility</p:attrName>
 </p:attrNameLst>
 </p:cBhvr>
 <p:to>
 <p:strVal val="visible"/>
 </p:to>
 </p:set>
 <p:animEffect transition="in" filter="blinds(horizontal)">...
</p:childTnLst>

```

End Example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22
to (To)	§4.6.89

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLSetBehavior">
 <sequence>
 <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
 <element name="to" type="CT_TLAnimVariant" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 4.6.67 sldTgt (Slide Target)

This element specifies the slide as the target element.

[Example: For example, suppose we have a simple animation with a blind entrance.

```

<p:seq concurrent="1" nextAc="seek">

```

```

1 <p:cTn id="2" dur="indefinite" nodeType="mainSeq">...
2 <p:prevCondLst>...
3 <p:nextCondLst>
4 <p:cond evt="onNext" delay="0">
5 <p:tgtEl>
6 <p:sldTgt/>
7 </p:tgtEl>
8 </p:cond>
9 </p:nextCondLst>
10 </p:seq>

```

End Example]

Parent Elements
tgtEl (§4.6.81)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

#### 4.6.68 snd (Sound)

This element specifies the audio information to play during a slide transition.

[Example: Consider a slide transition with an audio effect. The <snd> element should be used as follows:

```

17 <p:transition>
18 <p:sndAc>
19 <p:stSnd>
20 <p:snd r:embed="rId2" r:link="rId3"/>
21 </p:stSnd>
22 </p:sndAc>
23 </p:transition>

```

End Example]

Parent Elements
stSnd (§4.6.76)

Attributes	Description
builtIn (Recognized Built-In Sound)	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed.
Namespace: .../drawingml/200	The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
6/main	
embed (Embedded Audio File Relationship ID)  Namespace: .../officeDocument/2006/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sound Name)  Namespace: .../drawingml/2006/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.  The possible values for this attribute are defined by the XML Schema string datatype.

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_EmbeddedWAVAudioFile">
3 <attribute ref="r:embed" use="required"/>
4 <attribute name="name" type="xsd:string" use="optional" default=""/>
5 <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
6 </complexType>

```

#### 7 4.6.69 sndAc (Sound Action)

8 This element describes the Sound Action for slide transition.

9 [Example: Consider a slide transition with a sound effect. The <sndAc> element should be used as follows:

```

10 <p:transition>
11 <p:sndAc>
12 <p:stSnd>
13 <p:snd r:embed="rId2" r:link="rId3"/>
14 </p:stSnd>
15 </p:sndAc>
16 </p:transition>

```

17 End Example]

Parent Elements
transition (§4.4.1.46)

18

Child Elements	Subclause
endSnd (Stop Sound Action)	§4.6.38

Child Elements	Subclause
stSnd (Start Sound Action)	§4.6.76

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TransitionSoundAction">
 <choice minOccurs="1" maxOccurs="1">
 <element name="stSnd" type="CT_TransitionStartSoundAction"/>
 <element name="endSnd" type="CT_Empty"/>
 </choice>
</complexType>

```

#### 4.6.70 sndTgt (Sound Target)

This element describes the sound information for a target object.

[Example: Consider a shape with a sound effect animation. The <sndTgt> element should be used as follows:

```

<p:subTnLst>
 <p:audio>
 <p:cMediaNode>
 <p:cTn display="0" masterRel="sameClick">...
 <p:tgtEl>
 <p:sndTgt r:embed="rId2" r:link="rId3"/>
 </p:tgtEl>
 </p:cMediaNode>
 </p:audio>
</p:subTnLst>

```

End Example]

Parent Elements
tgtEl (§4.6.81)

Attributes	Description
builtIn (Recognized Built-In Sound)  Namespace: .../drawingml/2006/main	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
embed (Embedded Audio File Relationship ID)  Namespace:	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

Attributes	Description
.../officeDocument/2006/relationships	
name (Sound Name)  Namespace: .../drawingml/2006/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedWAVAudioFile">
 <attribute ref="r:embed" use="required"/>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
 <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.6.71 split (Split Slide Transition)

This element describes a split slide transition effect.

[Example: Consider we have a slide with a split slide transition. The <split> element should be used as follows:

```
<p:transition>
 <p:split dir="in"/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies the direction of a "split" slide transition.  The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§4.8.56).
orient (Orientation)	This attribute specifies the orientation of a "split" slide transition.  The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SplitTransition">
 <attribute name="orient" type="ST_Direction" use="optional" default="horz"/>
 <attribute name="dir" type="ST_TransitionInOutDirectionType" use="optional" default="out"/>
</complexType>
```

#### 4.6.72 spTgt (Shape Target)

The element specifies the shape in which to apply a certain animation to.

[Example: Consider a shape whose id is 3 in which we want to apply a fade animation effect. The <spTgt> should be used as follows:

```
<p:animEffect transition="in" filter="fade">
 <p:cBhvr>
 <p:cTn id="7" dur="2000"/>
 <p:tgtEl>
 <p:spTgt spid="3"/>
 </p:tgtEl>
 </p:cBhvr>
</p:animEffect>
```

End Example]

##### Parent Elements

tgtEl (§4.6.81)
-----------------

##### Child Elements

##### Subclause

bg (Background)	§4.6.10
graphicEl (Graphic Element)	§4.6.45
oleChartEl (Embedded Chart Element)	§4.6.52
subSp (Subshape)	§4.6.77
txEl (Text Element)	§4.6.91

##### Attributes

##### Description

spid (Shape ID)	<p>This attribute specifies the shape identifier.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).</p>
-----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLShapeTargetElement">
 <choice minOccurs="0" maxOccurs="1">
 <element name="bg" type="CT_Empty"/>
 <element name="subSp" type="CT_TLSubShapeId"/>
 <element name="oleChartEl" type="CT_TLOleChartTargetElement"/>
 <element name="txEl" type="CT_TLTextTargetElement"/>
 <element name="graphicEl" type="a:CT_AnimationElementChoice"/>
 </choice>
 <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

#### 4.6.73 stCondLst (Start Conditions List)

This element contains a list conditions that must be met for a time node to be activated.

[Example: For example, suppose we have a shape with an entrance appearance after 5 seconds. The <stCondLst>element should be used as follows:

```
<p:par>
 <p:cTn id="5" nodeType="clickEffect">
 <p:stCondLst>
 <p:cond delay="5000"/>
 </p:stCondLst>
 <p:childTnLst>...
 </p:cTn>
</p:par>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
 <sequence>
 <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

#### 4.6.74 strips (Strips Slide Transition)

This element describes a strips slide transition effect.

[Example: Consider we have a slide with a strips slide transition. The <strips> element should be used as follows:

```
<p:transition>
 <p:strips/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition.  The possible values for this attribute are defined by the ST_TransitionCornerDirectionType simple type (§4.8.54).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CornerDirectionTransition">
 <attribute name="dir" type="ST_TransitionCornerDirectionType" use="optional" default="lu"/>
</complexType>
```

#### 4.6.75 strVal (String Value)

This element describes a string variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute specifies the value of this element as a string  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantStringVal">
 <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

#### 4.6.76 stSnd (Start Sound Action)

This element describes the sound that will start playing during a slide transition.

[Example: Consider a slide transition that starts with a sound effect. The <stSnd> element should be used as follows:

```
<p:transition>
 <p:sndAc>
 <p:stSnd>
 <p:snd r:embed="rId2" r:link="rId3"/>
 </p:stSnd>
 </p:sndAc>
</p:transition>
```

End Example]

Parent Elements
sndAc (§4.6.69)

Child Elements	Subclause
snd (Sound)	§4.6.68

Attributes	Description
loop (Loop Sound)	This attribute specifies if the sound will loop until the next sound event occurs in slideshow.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TransitionStartSoundAction">
 <sequence>
 <element minOccurs="1" maxOccurs="1" name="snd" type="a:CT_EmbeddedWAVAudioFile"/>
 </sequence>
 <attribute name="loop" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

#### 4.6.77 subSp (Subshape)

This element specifies the subshape of a legacy graphical object to animate.

[Example: Consider adding animation to a legacy diagram. The <subSp> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
 <p:cBhvr>
 <p:cTn id="7" dur="500"/>
 <p:tgtEl>
 <p:spTgt spid="2053">
```

```

1 <p:subSp spid="_x0000_s70664"/>
2 </p:spTgt>
3 </p:tgtEl>
4 </p:cBhvr>
5 </p:animEffect>

```

End Example]

Parent Elements
spTgt (§4.6.72)

Attributes	Description
spid (Shape ID)	<p>This attribute specifies the shape identifier.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).</p>

The following XML Schema fragment defines the contents of this element:

```

8 <complexType name="CT_TLSubShapeId">
9 <attribute name="spid" type="a:ST_ShapeID" use="required"/>
10 </complexType>

```

#### 4.6.78 subTnLst (Sub-TimeNodes List)

This element describes time nodes that have a start time which is not based on the containing timenode. It is instead based on their master relationship (masterRel). At runtime, they are inserted dynamically into the timing tree as child timenodes for playback, based on the logic defined by the master relationship. These elements are used for animations such as "dim after" and "play sound effects"

[Example: Consider an animation with a "Fly In" effect on paragraphs so that each paragraph flies in on a separate click. Then the "Dim After" effect for paragraph 1 does not happen until paragraph 2 flies in. The <subTnLst> element should be used as follows:

```

20 <p:par>
21 <p:cTn id="5" grpId="0" nodeType="clickEffect">
22 <p:stCondLst>...
23 <p:childTnLst>...
24 <p:subTnLst>
25 <p:set>
26 <p:cBhvr override="childStyle">
27 <p:cTn fill="hold" masterRel="nextClick" afterEffect="1"/>
28 <p:tgtEl>...
29 <p:attrNameLst>...
30 </p:cBhvr>

```

```

1 <p:to>...
2 </p:set>
3 </p:subTnLst>
4 </p:cTn>
5 </p:par>

```

6 End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
anim (Animate)	§4.6.1
animClr (Animate Color Behavior)	§4.6.2
animEffect (Animate Effect)	§4.6.3
animMotion (Animate Motion)	§4.6.4
animRot (Animate Rotation)	§4.6.5
animScale (Animate Scale)	§4.6.6
audio (Audio)	§4.6.9
cmd (Command)	§4.6.28
excl (Exclusive)	§4.6.40
par (Parallel Time Node)	§4.6.53
seq (Sequence Time Node)	§4.6.65
set (Set Time Node Behavior)	§4.6.66
video (Video)	§4.6.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeNodeList">
 <choice minOccurs="1" maxOccurs="unbounded">
 <element name="par" type="CT_TLTimeNodeParallel"/>
 <element name="seq" type="CT_TLTimeNodeSequence"/>
 <element name="excl" type="CT_TLTimeNodeExclusive"/>
 <element name="anim" type="CT_TLAnimateBehavior"/>
 <element name="animClr" type="CT_TLAnimateColorBehavior"/>
 <element name="animEffect" type="CT_TLAnimateEffectBehavior"/>
 <element name="animMotion" type="CT_TLAnimateMotionBehavior"/>
 <element name="animRot" type="CT_TLAnimateRotationBehavior"/>
 <element name="animScale" type="CT_TLAnimateScaleBehavior"/>
 <element name="cmd" type="CT_TLCommandBehavior"/>
 <element name="set" type="CT_TLSetBehavior"/>
 <element name="audio" type="CT_TLMediaNodeAudio"/>
 <element name="video" type="CT_TLMediaNodeVideo"/>
 </choice>
</complexType>
```

**4.6.79      tav (Time Animate Value)**

This element defines a "keypoint" in animation interpolation.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
 <p:cBhvr additive="base">...
 <p:tavLst>
 <p:tav tm="0">
 <p:val>
 <p:strVal val="1+#ppt_h/2"/>
 </p:val>
 </p:tav>
 <p:tav tm="100000">
 <p:val>
 <p:strVal val="#ppt_y"/>
 </p:val>
 </p:tav>
 </p:tavLst>
</p:anim>
```

End Example]

Parent Elements
tavLst (§4.6.80)

Child Elements	Subclause
val (Value)	§4.6.92

1

Attributes	Description
fmla (Formula)	<p>This attribute allows for a specific formula to be used during the animation. This is specified in a semicolon-separated list of formulas. The value generated by interpolating the values list will be fed into the formula as an input. The resulting value is used to set the property being animated. There should be n-1 number of formulas for n values in the values list. The formula is applied starting at the corresponding time in the keyTimes list and up to the next time in the list.</p> <p>Formulas can only support a calcMode (Calculation Mode) of linear or discrete. If another calcMode is specified or no calcMode is specified then a calcMode of linear will be assumed.</p> <p>Formulas must be written using the elements defined below. When a formula is used in an attribute that takes more than one parameter (such as for animateScale or animateMotion), a space will be taken as a delimiter between parameter values. To work around this, either don't put spaces in the formula or include parentheses around the formula.</p> <p>Formulas within values, from, to, by attributes can be made up of these:</p> <ul style="list-style-type: none"> <li>• Standard arithmetic operators: '+', '-', '*', '/', '^', '%' (mod)</li> <li>• Constants: 'pi' 'e'</li> <li>• Conditional operators: 'abs', 'min', 'max', '?' (if)</li> <li>• Comparison operators: '==', '&gt;=', '&lt;=', '!=', '!'</li> <li>• Trigonometric operators: 'sin()', 'cos()', 'tan()', 'asin()', 'acos()', 'atan()'</li> <li>• Natural logarithm 'ln()'</li> <li>• Property references (host supported properties)</li> </ul> <p>[Note: The above formula elements are different than those used in javascript expressions. For example "cos()" used in formulas would be "Math.cos()" in javascript. end note]</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
tm (Time)	<p>This attribute specifies the time at which the attribute being animated will take on the value.</p> <p>The possible values for this attribute are defined by the ST_TLTimeAnimateValueTime simple type (§4.8.43).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeAnimateValue">
 <sequence>
 <element name="val" type="CT_TLAnimVariant" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="tm" type="ST_TLTimeAnimateValueTime" use="optional" default="indefinite"/>
 <attribute name="fm1a" type="xsd:string" use="optional" default=""/>
</complexType>
```

#### 4.6.80 **tavLst (Time Animated Value List)**

This element specifies a list of time animated value elements.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
 <p:cBhvr additive="base">...
 <p:tavLst>
 <p:tav tm="0">
 <p:val>
 <p:strVal val="1+#ppt_h/2"/>
 </p:val>
 </p:tav>
 <p:tav tm="100000">
 <p:val>
 <p:strVal val="#ppt_y"/>
 </p:val>
 </p:tav>
 </p:tavLst>
</p:anim>
```

End Example]

Parent Elements
anim (§4.6.1)

Child Elements	Subclause
tav (Time Animate Value)	§4.6.79

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeAnimateValueList">
 <sequence>
 <element name="tav" type="CT_TLTimeAnimateValue" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

## 4.6.81 tgtEl (Target Element)

This element specifies the target children elements which will have the animation effects applied to.

[Example: Consider a shape with ID 3 with a fade effect animation applied to it. The <tgtEl> element should be used as follows:

```
<p:animEffect transition="in" filter="fade">
 <p:cBhvr>
 <p:cTn id="7" dur="2000"/>
 <p:tgtEl>
 <p:spTgt spid="3"/>
 </p:tgtEl>
 </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
cBhvr (§4.6.22); cMediaNode (§4.6.29); cond (§4.6.31); endSync (§4.6.39)

Child Elements	Subclause
inkTgt (Ink Target)	§4.6.47
sldTgt (Slide Target)	§4.6.67
sndTgt (Sound Target)	§4.6.70
spTgt (Shape Target)	§4.6.72

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeTargetElement">
 <choice minOccurs="1" maxOccurs="1">
 <element name="sldTgt" type="CT_Empty"/>
 <element name="sndTgt" type="a:CT_EmbeddedWAVAudioFile"/>
 <element name="spTgt" type="CT_TLShapeTargetElement"/>
 <element name="inkTgt" type="CT_TLSubShapeId"/>
 </choice>
</complexType>
```

## 4.6.82 tmAbs (Time Absolute)

This element describes the duration of the iteration interval in absolute time.

[Example: Consider a text animation where the words appear letter by letter every 10 seconds. The <tmAbs> element should be used as follows:

```
<p:par>
```

```

1 <p:cTn id="5" >
2 <p:stCondLst>...
3 <p:iterate type="lt">
4 <p:tmAbs val="10000"/>
5 </p:iterate>
6 <p:childTnLst>...
7 </p:cTn>
8 </p:par>

```

9 End Example]

Parent Elements
iterate (§4.6.49)

Attributes	Description
val (Time)	This attribute describes an amount of time, in milliseconds.  The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).

11 The following XML Schema fragment defines the contents of this element:

```

12 <complexType name="CT_TLIterateIntervalTime">
13 <attribute name="val" type="ST_TLTime" use="required"/>
14 </complexType>

```

### 15 4.6.83 tmPct (Time Percentage)

16 This element describes the duration of the iteration interval in a percentage of time.

17 [Example: Consider a text animation where the words appear letter by letter every 10th of the animation  
18 duration. The <tmPct> element should be used as follows:

```

19 <p:par>
20 <p:cTn id="5" >
21 <p:stCondLst>...
22 <p:iterate type="lt">
23 <p:tmPct val="10000"/>
24 </p:iterate>
25 <p:childTnLst>...
26 </p:cTn>
27 </p:par>

```

28 End Example]

Parent Elements
iterate (§4.6.49)

Attributes	Description
val (Value)	This attribute specifies the time expressed as a percentage.  The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLIterateIntervalPercentage">
 <attribute name="val" type="a:ST_PositivePercentage" use="required"/>
</complexType>
```

#### 4.6.84 **tmpl (Template Effects)**

This element specifies the "template" effects that are used by the build element. Template effects are used in text builds on the master slide. They define the rules of what effect should be applied to the 1st level paragraph, 2nd level paragraph, etc.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
 <p:tnLst>...
 <p:bldLst>
 <p:bldP spid="3" grpId="0" build="p">
 <p:tmplLst>
 <p:tmpl lvl="1">
 </p:tmpl>
 </p:tmplLst>
 </p:bldP>
 </p:bldLst>
 </p:timing>
```

End Example]

Parent Elements
tmplLst (§4.6.85)

Child Elements	Subclause
tnLst (Time Node List)	§4.6.87

Attributes	Description
lvl (Level)	This attribute describes the paragraph indent level to which this template effect applies.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTemplate">
 <sequence>
 <element name="tnLst" type="CT_TimeNodeList" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="lvl" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

#### 4.6.85 **tmplLst (Template effects)**

This element describes a list of template effects that describe what kind of effects should be applied to a paragraph level properties.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
 <p:tnLst>...
 <p:bldLst>
 <p:bldP spid="3" grpId="0" build="p">
 <p:tmplLst>
 <p:tmpl lvl="1">
 </p:tmpl>
 </p:tmplLst>
 </p:bldP>
 </p:bldLst>
 </p:timing>
```

End Example]

Parent Elements
bldP (§4.6.16)

Child Elements	Subclause
tmpl (Template Effects)	§4.6.84

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTemplateList">
 <sequence>
 <element name="tmpl" type="CT_TLTemplate" minOccurs="0" maxOccurs="9"/>
 </sequence>
</complexType>
```

#### 4.6.86 tn (Time Node)

This element describes the time node trigger choice.

[Example: Consider a time node with an event condition. The <tn> element should be used as follows:

```
<p:par>
 <p:cTn id="5">
 <p:stCondLst>
 <p:cond delay="0"/>
 </p:stCondLst>
 <p:endCondLst>
 <p:cond evt="begin" delay="0">
 <p:tn val="5"/>
 </p:cond>
 </p:endCondLst>
 <p:childTnLst>...
 </p:cTn>
</p:par>
```

End Example]

#### Parent Elements

cond (§4.6.31); endSync (§4.6.39)

#### Attributes

val (Value)

#### Description

This attribute specifies a time node identifier.

The possible values for this attribute are defined by the ST\_TLTimeNodeID simple type (§4.8.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTriggerTimeNodeID">
 <attribute name="val" type="ST_TLTimeNodeID" use="required"/>
</complexType>
```

#### 4.6.87 tnLst (Time Node List)

This element specifies a list of time node elements used in an animation sequence.

1 [Example: Consider a simple animation sequence. The <tnLst> element should be used as follows:

```
2 <p:timing>
3 <p:tnLst>
4 <p:par>...
5 </p:tnLst>
6 </p:timing>
```

7 End Example]

Parent Elements
timing (§4.4.1.44); tmpl (§4.6.84)

8

Child Elements	Subclause
anim (Animate)	§4.6.1
animClr (Animate Color Behavior)	§4.6.2
animEffect (Animate Effect)	§4.6.3
animMotion (Animate Motion)	§4.6.4
animRot (Animate Rotation)	§4.6.5
animScale (Animate Scale)	§4.6.6
audio (Audio)	§4.6.9
cmd (Command)	§4.6.28
excl (Exclusive)	§4.6.40
par (Parallel Time Node)	§4.6.53
seq (Sequence Time Node)	§4.6.65
set (Set Time Node Behavior)	§4.6.66
video (Video)	§4.6.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeNodeList">
 <choice minOccurs="1" maxOccurs="unbounded">
 <element name="par" type="CT_TLTimeNodeParallel"/>
 <element name="seq" type="CT_TLTimeNodeSequence"/>
 <element name="excl" type="CT_TLTimeNodeExclusive"/>
 <element name="anim" type="CT_TLAnimateBehavior"/>
 <element name="animClr" type="CT_TLAnimateColorBehavior"/>
 <element name="animEffect" type="CT_TLAnimateEffectBehavior"/>
 <element name="animMotion" type="CT_TLAnimateMotionBehavior"/>
 <element name="animRot" type="CT_TLAnimateRotationBehavior"/>
 <element name="animScale" type="CT_TLAnimateScaleBehavior"/>
 <element name="cmd" type="CT_TLCommandBehavior"/>
 <element name="set" type="CT_TLSetBehavior"/>
 <element name="audio" type="CT_TLMediaNodeAudio"/>
 <element name="video" type="CT_TLMediaNodeVideo"/>
 </choice>
</complexType>
```

4.6.88 to (To)

This element specifies the target location for an animation motion or animation scale effect

[Example: Consider an animation with a "light speed" entrance effect.

```
<p:animScale>
 <p:cBhvr>
 <p:cTn id="9" dur="200" decel="100000" autoRev="1" fill="hold">
 <p:stCondLst>
 <p:cond delay="600"/>
 </p:stCondLst>
 </p:cTn>
 <p:tgtEl>
 <p:spTgt spid="4"/>
 </p:tgtEl>
 </p:cBhvr>
 <p:from x="100000" y="100000"/>
 <p:to x="80000" y="100000"/>
</p:animScale>
```

End Example]

Parent Elements
animMotion (§4.6.4); animScale (§4.6.6)

Attributes	Description
------------	-------------

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLPoint">
 <attribute name="x" type="a:ST_Percentage" use="required"/>
 <attribute name="y" type="a:ST_Percentage" use="required"/>
</complexType>
```

#### 4.6.89 to (To)

The element specifies the certain attribute of a time node after an animation effect.

[Example: Consider an animation effect that leaves a string value visible afterwards. The <to> element should be used as follows:

```
<p:childTnLst>
 <p:set>
 <p:cBhvr>...
 <p:to>
 <p:strVal val="visible"/>
 </p:to>
 </p:set>
 <p:anim calcmode="lin" valueType="num">...
 <p:anim calcmode="lin" valueType="num">...
</p:childTnLst>
```

End Example]

#### Parent Elements

set (§4.6.66)

#### Child Elements

#### Subclause

boolVal (Boolean Variant)

§4.6.19

clrVal (Color Value)

§4.6.27

Child Elements	Subclause
fltVal (Float Value)	§4.6.42
intVal (Integer)	§4.6.48
strVal (String Value)	§4.6.75

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_TLAnimVariant">
 <choice minOccurs="1" maxOccurs="1">
 <element name="boolVal" type="CT_TLAnimVariantBooleanVal"/>
 <element name="intVal" type="CT_TLAnimVariantIntegerVal"/>
 <element name="fltVal" type="CT_TLAnimVariantFloatVal"/>
 <element name="strVal" type="CT_TLAnimVariantStringVal"/>
 <element name="clrVal" type="a:CT_Color"/>
 </choice>
</complexType>

```

#### 4.6.90 to (To)

This element specifies the resulting color for the animation color change.

[Example: Consider emphasize a shape by changing its fill color from blue to red. The <to> element should be used as follows:

```

<p:childTnLst>
 <p:animClr clrSpc="rgsb">
 <p:cBhvr>...
 <p:to>
 <a:schemeClr val="accent2"/>
 </p:to>
 </p:animClr>
</p:childTnLst>

```

End example]

Parent Elements
animClr (§4.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32

Child Elements	Subclause
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 4.6.91 txEl (Text Element)

This element specifies a text element to animate.

[Example: Consider a shape containing text to be animated. The <txEl> should be used as follows:

```
<p:tgtEl>
 <p:spTgt spid="5">
 <p:txEl>
 <p:pRg st="1" end="1"/>
 </p:txEl>
 </p:spTgt>
</p:tgtEl>
```

End Example]

Parent Elements
spTgt (§4.6.72)

Child Elements	Subclause
charRg (Character Range)	§4.6.23
pRg (Paragraph Text Range)	§4.6.56

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTextTargetElement">
 <choice minOccurs="0" maxOccurs="1">
 <element name="charRg" type="CT_IndexRange"/>
 <element name="pRg" type="CT_IndexRange"/>
 </choice>
</complexType>
```

#### 4.6.92 val (Value)

The element specifies a value for a time animate.

[Example: Consider a shape with a fade in animation effect. The <val> element should be used as follows:

```

1 <p:anim calcmode="lin" valueType="num">
2 <p:cBhvr additive="base">...
3 <p:tavLst>
4 <p:tav tm="0">
5 <p:val>
6 <p:strVal val="0-#ppt_w/2"/>
7 </p:val>
8 </p:tav>
9 <p:tav tm="100000">
10 <p:val>
11 <p:strVal val="#ppt_x"/>
12 </p:val>
13 </p:tav>
14 </p:tavLst>
15 </p:anim>

```

End Example]

Parent Elements
tav (§4.6.79)

tav (§4.6.79)

Child Elements	Subclause
boolVal (Boolean Variant)	§4.6.19
clrVal (Color Value)	§4.6.27
fltVal (Float Value)	§4.6.42
intVal (Integer)	§4.6.48
strVal (String Value)	§4.6.75

The following XML Schema fragment defines the contents of this element:

```

19 <complexType name="CT_TLAnimVariant">
20 <choice minOccurs="1" maxOccurs="1">
21 <element name="boolVal" type="CT_TLAnimVariantBooleanVal"/>
22 <element name="intVal" type="CT_TLAnimVariantIntegerVal"/>
23 <element name="fltVal" type="CT_TLAnimVariantFloatVal"/>
24 <element name="strVal" type="CT_TLAnimVariantStringVal"/>
25 <element name="clrVal" type="a:CT_Color"/>
26 </choice>
27 </complexType>

```

### 4.6.93 video (Video)

This element specifies video information in an animation sequence.

[Example: Consider a slide with an animated video content. The <video> element should be used as follows:

```

1 <p:childTnLst>
2 <p:seq concurrent="1" nextAc="seek">...
3 <p:video>
4 <p:cMediaNode>...
5 </p:video>
6 </p:childTnLst>
7 End Example]
8

```

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cMediaNode (Common Media Node Properties)	§4.6.29

Attributes	Description
fullScrn (Full Screen)	This attribute specifies if the video will be displayed in full-screen. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

12 <complexType name="CT_TLMediaNodeVideo">
13 <sequence>
14 <element name="cMediaNode" type="CT_TLCommonMediaNodeData" minOccurs="1" maxOccurs="1"/>
15 </sequence>
16 <attribute name="fullScrn" type="xsd:boolean" use="optional" default="false"/>
17 </complexType>

```

#### 4.6.94 wedge (Wedge Slide Transition)

This element describes a wedge slide transition effect.

[Example: Consider we have a slide with a wedge slide transition. The <wedge> element should be used as follows:

```

22 <p:transition>
23 <p:wedge/>
24 </p:transition>

```

End example]

Parent Elements
-----------------

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

### 4.6.95 wheel (Wheel Slide Transition)

This element describes a wheel slide transition effect.

[Example: Consider we have a slide with a wheel slide transition. The <wheel> element should be used as follows:

```
<p:transition>
 <p:wheel/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
spokes (Spokes)	This attributes specifies the number of spokes ("pie pieces") in the wheel  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WheelTransition">
 <attribute name="spokes" type="xsd:unsignedInt" use="optional" default="4"/>
</complexType>
```

### 4.6.96 wipe (Wipe Slide Transition)

This element describes a wipe slide transition effect.

[Example: Consider we have a slide with a wipe slide transition. The <wipe> element should be used as follows:

```
<p:transition>
 <p:wipe/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	<p>This attribute specifies the direction of the slide transition.</p> <p>The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§4.8.57).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SideDirectionTransition">
 <attribute name="dir" type="ST_TransitionSideDirectionType" use="optional" default="l"/>
</complexType>
```

#### 4.6.97 zoom (Zoom Slide Transition)

This element describes a zoom slide transition effect.

[Example: Consider we have a slide with a zoom slide transition. The <zoom> element should be used as follows:

```
<p:transition>
 <p:zoom/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	<p>This attribute specifies the direction of an "in/out" slide transition.</p> <p>The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§4.8.56).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InOutTransition">
 <attribute name="dir" type="ST_TransitionInOutDirectionType" use="optional" default="out"/>
</complexType>
```

1    **4.7      Slide Synchronization Data**

2    It is often desired to allow a user to pull slides from a library of pre-existing content. In order to facilitate  
3    synchronization of this content with a server, the sldSyncPr element exists to store modification/insertion time  
4    properties to enable this synchronization. The sldSyncPr element lives in the slideUpdateInfo directory of the  
5    PowerPoint file container.

6    **4.7.1      sldSyncPr (Slide Synchronization Properties)**

7    This element specifies the properties associated with the slide synchronization specified for the current slide.

8

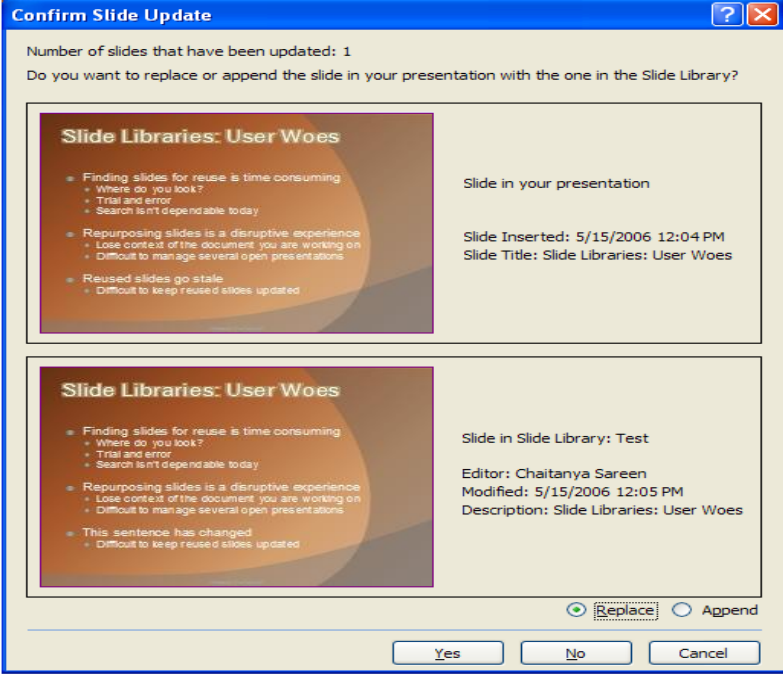

Parent Elements
Root element of PresentationML Slide Synchronization Data part

9

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
clientInsertedTime (Client Slide Insertion date/time)	<p>The date and time that the server-based slide was inserted into the client presentation. This field is used purely for informative purposes so that the user may know when the slide was inserted.</p> <p>The date/time is stored in ISO 8061 format.</p> <p>[Example: Notice the use of clientInsertedTime in this UI to provide users information on when the slide was inserted from the slide library.</p>

Attributes	Description
	 <p>End Example]</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>
<b>serverSldId</b> (Server's Slide File ID)	<p>Identifier of the slide file on the server. This ID is unrelated to the Slide's ID, and is a unique identifier for the slide in the slide library.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
<b>serverSldModified Time</b> (Server's Slide File's modification date/time)	<p>The last modification date and time for the slide file that is located on the server. This date, when compared with the last modification date and time on the server, determines whether an update of this slide is necessary.</p> <p>The date and time are stored in ISO 8061 format.</p> <p>The possible values for this attribute are defined by the XML Schema dateTime datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_SlideSyncProperties">
3 <sequence>
4 <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="serverSldId" type="xsd:string" use="required"/>
7 <attribute name="serverSldModifiedTime" type="xsd:dateTime" use="required"/>
8 <attribute name="clientInsertedTime" type="xsd:dateTime" use="required"/>
9 </complexType>

```

## 4.8 Simple Types

This is the complete list of simple types in the <http://schemas.openxmlformats.org/presentationml/2006/main> namespace.

### 4.8.1 ST\_AlgorithmClass (Cryptographic Algorithm Classes)

This simple type specifies the possible classes of cryptographic algorithm used by protection. [*Note: The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. end note*]

[*Example: Consider a PresentationML document with the following information stored in its protection element:*

```
<p:... p:cryptAlgorithmClass="hash"
 p:cryptAlgorithmType="typeAny"
 p:cryptAlgorithmSid="1"
 p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hash (Hash Algorithm Class)	A hash class algorithm is used.
invalid (Invalid Algorithm Class)	An algorithm with an invalid class is used.

#### Referenced By

modifyVerifier@cryptAlgorithmClass (§4.3.1.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgorithmClass">
 <restriction base="xsd:string">
 <enumeration value="hash"/>
 <enumeration value="invalid"/>
 </restriction>
</simpleType>
```

### 4.8.2 ST\_AlgorithmType (Cryptographic Algorithm Type)

This simple type specifies the possible values for the type of cryptographic algorithm used by protection. [*Note: The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. end note*]

[*Example:* Consider a PresentationML document with the following information stored in its protection element:

```
<p:... p:cryptAlgorithmClass="hash"
 p:cryptAlgorithmType="typeAny"
 p:cryptAlgorithmSid="1"
 p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm may have been used for the password. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
invalid (Invalid Algorithm Type)	An invalid algorithm type is used.
typeAny (Any Algorithm Type)	Any algorithm type is used.

#### Referenced By

modifyVerifier@cryptAlgorithmType (§4.3.1.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgType">
 <restriction base="xsd:string">
 <enumeration value="typeAny"/>
 <enumeration value="invalid"/>
 </restriction>
</simpleType>
```

### 4.8.3 ST\_BookmarkIdSeed (Bookmark ID Seed)

This type specifies constraints for value of the Bookmark ID seed.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than 2147483648.

#### Referenced By

presentation@bookmarkIdSeed (§4.3.1.24)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BookmarkIdSeed">
 <restriction base="xsd:unsignedInt">
 <minInclusive value="1"/>
 <maxExclusive value="2147483648"/>
 </restriction>
</simpleType>
```

#### 4.8.4 ST\_CryptProv (Cryptographic Provider Type)

This simple type specifies the possible types of cryptographic providers which may be used.

[*Example:* Consider a PresentationML document with the following information stored in one of its protection elements:

```
<p:modifyVerifier p:cryptProviderType="rsaAES" ... />
```

The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
invalid (Invalid Encryption Scheme)	Invalid Encryption scheme provided.
rsaAES (RSA AES Encryption Scheme)	Specifies that the provider shall support the Advanced Encryption Algorithm standard.
rsaFull (RSA Full Encryption Scheme)	Specifies that any suitable provider shall be used.

#### Referenced By

modifyVerifier@cryptProviderType (§4.3.1.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CryptProv">
 <restriction base="xsd:string">
 <enumeration value="rsaAES"/>
 <enumeration value="rsaFull"/>
 <enumeration value="invalid"/>
 </restriction>
</simpleType>
```

#### 4.8.5 ST\_Direction (Direction)

This simple type defines a direction of either horizontal or vertical.

This simple type's contents are a restriction of the XML Schema token datatype.

- 1 The following are possible enumeration values for this type:

Enumeration Value	Description
horz (Horizontal)	Defines a horizontal direction.
vert (Vertical)	Defines a vertical direction.

2

Referenced By
blinds@dir (§4.6.18); checker@dir (§4.6.24); comb@dir (§4.6.30); guide@orient (§4.3.2.4); ph@orient (§4.4.1.33); randomBar@dir (§4.6.61); split@orient (§4.6.71)

- 3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_Direction">
5 <restriction base="xsd:token">
6 <enumeration value="horz"/>
7 <enumeration value="vert"/>
8 </restriction>
9 </simpleType>

```

#### 10 4.8.6 ST\_HtmlPublishWebBrowserSupport (Web browsers supported for HTML 11 output)

- 12 This type specifies the Web Browsers supported for output to HTML.

- 13 This simple type's contents are a restriction of the XML Schema token datatype.

- 14 The following are possible enumeration values for this type:

Enumeration Value	Description
v3 (Browser v3)	Generate HTML optimized for Netscape Navigator 3.0, Microsoft Internet Explorer 3, and equivalent browsers.
v3v4 (Browser v3v4)	Generate HTML optimized for Netscape Navigator 3.0 and 4.0, Microsoft Internet Explorer 3 and 4, and equivalent browsers.
v4 (Browser v4)	Generate HTML optimized for Netscape Navigator 4.0, Microsoft Internet Explorer 4, and equivalent browsers.

15

Referenced By
htmlPubPr@pubBrowser (§4.3.1.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HtmlPublishWebBrowserSupport">
 <restriction base="xsd:token">
 <enumeration value="v4"/>
 <enumeration value="v3"/>
 <enumeration value="v3v4"/>
 </restriction>
</simpleType>
```

#### 4.8.7 ST\_Index (Index)

This type defines the position of an object in an ordered list.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

##### Referenced By

charRg@end (§4.6.23); charRg@st (§4.6.23); cm@idx (§4.5.1); pRg@end (§4.6.56); pRg@st (§4.6.56); sldRg@end (§4.2.8); sldRg@st (§4.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Index">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

#### 4.8.8 ST\_IterateType (Iterate Type)

This type specifies how the animation will be applied over subelements of the target element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
el (Element)	Iterate by element.
lt (Letter)	Iterate by Letter.
wd (Word)	Iterate by Word.

##### Referenced By

iterate@type (§4.6.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_IterateType">
 <restriction base="xsd:token">
 <enumeration value="el"/>
 <enumeration value="wd"/>
 <enumeration value="lt"/>
 </restriction>
</simpleType>
```

#### 4.8.9 ST\_Name (Name string)

This type specifies a name, such as for a comment author or custom show.

This simple type's contents are a restriction of the XML Schema string datatype.

##### Referenced By

cmAuthor@initials (§4.5.2); cmAuthor@name (§4.5.2); custShow@name (§4.3.1.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Name">
 <restriction base="xsd:string"/>
</simpleType>
```

#### 4.8.10 ST\_OleObjectFollowColorScheme (Embedded object to Follow Color Scheme)

This simple type determines if the Embedded object will be re-colored to reflect changes to the color schemes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
full (Full)	Setting this enumeration causes the Embedded object to respond to all changes in the color scheme in the presentation.
none (None)	Setting this enumeration causes the Embedded object to not respond to changes in the color scheme in the presentation.
textAndBackground (Text and Background)	Setting this enumeration causes the Embedded object to respond only to changes in the text and background colors of the color scheme in the presentation.

##### Referenced By

embed@followColorScheme (§4.4.2.2)

The following XML Schema fragment defines the contents of this simple type:

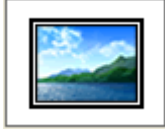

```
<simpleType name="ST_OleObjectFollowColorScheme">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="full"/>
 <enumeration value="textAndBackground"/>
 </restriction>
</simpleType>
```

**4.8.11 ST\_PhotoAlbumFrameShape (Photo Album Shape for Photo Mask)**

This type specifies the values for photo frame types within a photo album presentation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
frameStyle1 (Rectangle Photo Frame)	
frameStyle2 (Rounded Rectangle Photo Frame)	
frameStyle3 (Simple White Photo Frame)	
frameStyle4 (Simple Black Photo Frame)	
frameStyle5 (Compound Black Photo Frame)	
frameStyle6 (Center Shadow Photo Frame)	
frameStyle7 (Soft Edge Photo Frame)	

Referenced By
photoAlbum@frame (§4.3.1.22)

1 The following XML Schema fragment defines the contents of this simple type:

```
2 <simpleType name="ST_PhotoAlbumFrameShape">
3 <restriction base="xsd:token">
4 <enumeration value="frameStyle1"/>
5 <enumeration value="frameStyle2"/>
6 <enumeration value="frameStyle3"/>
7 <enumeration value="frameStyle4"/>
8 <enumeration value="frameStyle5"/>
9 <enumeration value="frameStyle6"/>
10 <enumeration value="frameStyle7"/>
11 </restriction>
12 </simpleType>
```

13 **4.8.12 ST\_PhotoAlbumLayout (Photo Album Layout Definition)**

14 This type specifies the values for photo layouts within a photo album presentation.

15 This simple type's contents are a restriction of the XML Schema token datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
1pic (1 Photo per Slide)	 Specifies that photo album slides should have a single picture, centered horizontally and vertically, on the slide with no title.
1picTitle (1 Photo per Slide with Titles)	 Specifies that photo album slides should have a single picture and a single title text box, centered horizontally and vertically, on the slide.
2pic (2 Photos per Slide)	 Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, centered horizontally and vertically, on the slide with no title.

Enumeration Value	Description
2picTitle (2 Photos per Slide with Titles)	 <p>Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, with a single title text box centered over them, collectively centered horizontally and vertically, on the slide.</p>
4pic (4 Photos per Slide)	 <p>Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, centered horizontally and vertically, on the slide with no title.</p>
4picTitle (4 Photos per Slide with Titles)	 <p>Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, with a single title text box centered over the matrix, centered horizontally and vertically, on the slide.</p>
fitToSlide (Fit Photos to Slide)	 <p>Specifies that photo album slides should have a single picture, stretched to fit the entire slide size, with no title.</p>

1

Referenced By
photoAlbum@layout (§4.3.1.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhotoAlbumLayout">
 <restriction base="xsd:token">
 <enumeration value="fitToSlide"/>
 <enumeration value="1pic"/>
 <enumeration value="2pic"/>
 <enumeration value="4pic"/>
 <enumeration value="1picTitle"/>
 <enumeration value="2picTitle"/>
 <enumeration value="4picTitle"/>
 </restriction>
</simpleType>
```

#### 4.8.13 ST\_PlaceholderSize (Placeholder Size)

This simple type facilitates the storing of the size of the placeholder. This size is described relative to the body placeholder on the master.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
full (Full)	Specifies that the placeholder should take the full size of the body placeholder on the master.
half (Half)	Specifies that the placeholder should take the half size of the body placeholder on the master. Half size vertically or horizontally? Needs a picture.
quarter (Quarter)	Specifies that the placeholder should take a quarter of the size of the body placeholder on the master. Picture would be helpful

#### Referenced By

ph@sz (§4.4.1.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PlaceholderSize">
 <restriction base="xsd:token">
 <enumeration value="full"/>
 <enumeration value="half"/>
 <enumeration value="quarter"/>
 </restriction>
</simpleType>
```

#### 4.8.14 ST\_PlaceholderType (Placeholder IDs)

This simple type facilitates the storing of the type of content a placeholder should contain.

- 1 [Note: Some types are not valid for all types of SlideBase. End note]
- 2 This simple type's contents are a restriction of the XML Schema token datatype.
- 3 The following are possible enumeration values for this type:

Enumeration Value	Description
body (Body)	Contains body text. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master. Can be horizontal or vertical on Slide and Slide Layout.
chart (Chart)	Contains a chart or graph. Special type. Valid for Slide and Slide Layout.
clipArt (Clip Art)	Contains a single clip art image. Special type. Valid for Slide and Slide Layout.
ctrTitle (Centered Title)	Contains a title intended to be centered on the slide. Valid for Slide and Slide Layout.
dgm (Diagram)	Contains a diagram. Special type. Valid for Slide and Slide Layout.
dt (Date and Time)	Contains the date and time. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
fttr (Footer)	Contains text to be used as a footer in the document. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
hdr (Header)	Contains text to be used as a header for the document. Valid for Notes, Notes Master, Handout Master .
media (Media)	Contains multimedia content such as audio or a movie clip. Special type. Valid for Slide and Slide Layout.
obj (Object)	Contains any type of content. Special type. Valid for Slide and Slide Layout.
pic (Picture)	Contains a picture. Special type. Valid for Slide and Slide Layout.
sldImg (Slide Image)	Contains an image of the slide. Valid for Notes and Notes Master.
sldNum (Slide Number)	Contains the number of a slide. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
subTitle (Subtitle)	Contains a subtitle. Valid for Slide and Slide Layout.
tbl (Table)	Contains a table. Special type. Valid for Slide and Slide Layout.
title (Title)	Contains a slide title. Valid for Slide, Slide Layout and

Enumeration Value	Description
	Slide Master. Can be horizontal or vertical on Slide and Slide Layout.

17 <enumeration value="dgm"/>
18 <enumeration value="media"/>
19 <enumeration value="sldImg"/>
20 <enumeration value="pic"/>
21 </restriction>
22 </simpleType>

```

### 23 4.8.15 ST\_PrintColorMode (Print Color Mode)

24 This type specifies the color mode that should be used when printing a presentation document.

25 This simple type's contents are a restriction of the XML Schema token datatype.

26 The following are possible enumeration values for this type:

Enumeration Value	Description
bw (Black and White Mode)	Print should be in Black and White only
clr (Color Mode)	Print should be in Full Color
gray (Grayscale Mode)	Print should be in Grayscale only

27

Referenced By
prnPr@clrMode (§4.3.1.26)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PrintColorMode">
 <restriction base="xsd:token">
 <enumeration value="bw"/>
 <enumeration value="gray"/>
 <enumeration value="clr"/>
 </restriction>
</simpleType>
```

#### 4.8.16 ST\_PrintWhat (Default print output)

This type specifies the default print layout that should be used when printing

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
handouts1 (1 Slide / Handout Page)	1 Slide and Handout Page layout should be used.
handouts2 (2 Slides / Handout Page)	2 Slides and Handout Page layout should be used.
handouts3 (3 Slides / Handout Page)	3 Slides and Handout Page layout should be used.
handouts4 (4 Slides / Handout Page)	4 Slides and Handout Page layout should be used.
handouts6 (6 Slides / Handout Page)	6 Slides and Handout Page layout should be used.
handouts9 (9 Slides / Handout Page)	9 Slides and Handout Page layout should be used.
notes (Notes)	Notes layout should be used.
outline (Outline)	Outline layout should be used.
slides (Slides)	Slides layout should be used.

#### Referenced By

prnPr@prnWhat (§4.3.1.26)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PrintWhat">
 <restriction base="xsd:token">
 <enumeration value="slides"/>
 <enumeration value="handouts1"/>
 <enumeration value="handouts2"/>
 <enumeration value="handouts3"/>
 <enumeration value="handouts4"/>
 <enumeration value="handouts6"/>
 <enumeration value="handouts9"/>
 <enumeration value="notes"/>
 <enumeration value="outline"/>
 </restriction>
</simpleType>
```

#### 4.8.17 ST\_SlideId (Slide Identifier)

This type specifies the allowed numbering for the slide identifier.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 256.
- This simple type has a maximum value of less than 2147483648.

Referenced By
sldId@id (§4.3.1.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideId">
 <restriction base="xsd:unsignedInt">
 <minInclusive value="256"/>
 <maxExclusive value="2147483648"/>
 </restriction>
</simpleType>
```

#### 4.8.18 ST\_SlideLayoutId (Slide Layout ID)

This simple type sets the bounds for the slide layout id value. This layout id is used to identify the different slide layout designs.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

Referenced By
sldLayoutId@id (§4.4.1.37)

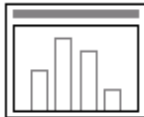

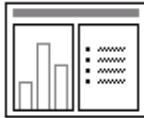

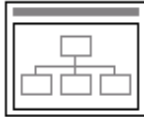

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideLayoutId">
 <restriction base="xsd:unsignedInt">
 <minInclusive value="2147483648"/>
 </restriction>
</simpleType>
```

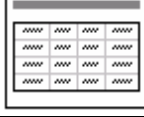

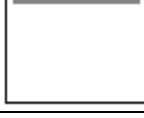

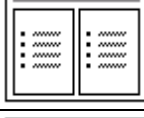

#### 4.8.19 ST\_SlideLayoutType (Slide Layout Type)

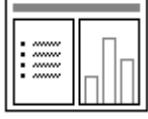

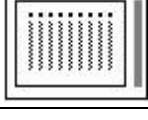

This simple type defines an arrangement of content on a slide. Each layout type is not tied to an exact positioning of placeholders, but rather provides a higher-level description of the type of content and positioning

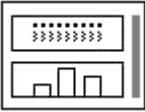

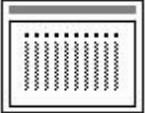

- 1 of placeholders. This information may be used by the application to aid in mapping between different layouts.
- 2 The application may choose which, if any, of these layouts to make available through its user interface.
- 3 Each layout contains zero or more placeholders, each with a specific content type. An "object" placeholder may
- 4 contain any type of data. Media placeholders are intended to hold video or audio clips. The enumeration value
- 5 descriptions include illustrations of sample layouts for each value of the simple type.
- 6 This simple type's contents are a restriction of the XML Schema token datatype.
- 7 The following are possible enumeration values for this type:

Enumeration Value	Description
blank (Slide Layout Type Enumeration ( Blank ))	 Blank
chart (Chart)	 Title and chart
chartAndTx (Slide Layout Type Enumeration ( Chart and Text ))	 Title, chart on left and text on right
clipArtAndTx (Clip Art and Text)	 Title, clipart on left, text on right
clipArtAndVertTx (Clip Art and Vertical Text)	 Title, clip art on left, vertical text on right
cust (Slide Layout Type Enumeration ( Custom ))	Custom layout defined by user
dgm (Slide Layout Type Enumeration ( Diagram ))	 Title and diagram
fourObj (Four Objects)	 Title and four objects
mediaAndTx (Slide Layout Type Enumeration ( Media and Text ))	 Title, media on left, text on right
obj (Title and Object)	 Title and object
objAndTwoObj (Object and Two Object)	Title, one object on left, two objects on right

Enumeration Value	Description	
		
objAndTx (Slide Layout Type Enumeration ( Object and Text ))		Title, object on left, text on right
objOnly (Object)		Object only
objOverTx (Slide Layout Type Enumeration ( Object over Text))		Title, object on top, text on bottom
objTx (Title, Object, and Caption)		Title, object and caption text
picTx (Picture and Caption)		Title, picture, and caption text
secHead (Section Header)		Section header title and subtitle text
tbl (Slide Layout Type Enumeration ( Table ))		Title and table
title (Slide Layout Type Enumeration ( Title ))		Title layout with centered title and subtitle placeholders
titleOnly (Slide Layout Type Enumeration ( Title Only ))		Title only
twoColTx (Slide Layout Type Enumeration ( Two Column Text ))		Title, text on left, text on right
twoObj (Two Objects)		Title, object on left, object on right
twoObjAndObj (Two Objects and Object)		Title, two objects on left, one object on right

Enumeration Value	Description	
		
twoObjAndTx (Two Objects and Text)		Title, two objects on left, text on right
twoObjOverTx (Two Objects over Text)		Title, two objects on top, text on bottom
twoTxTwoObj (Two Text and Two Objects)		Title, two objects each with text
tx (Slide Layout Type Enumeration ( Text ))		Title and text
txAndChart (Slide Layout Type Enumeration ( Text and Chart ))		Title, text on left and chart on right
txAndClipArt (Text and Clip Art)		Title, text on left, clip art on right
txAndMedia (Slide Layout Type Enumeration ( Text and Media ))		Title, text on left, media on right
txAndObj (Slide Layout Type Enumeration ( Text and Object ))		Title, text on left, object on right
txAndTwoObj (Text and Two Objects)		Title, text on left, two objects on right
txOverObj (Slide Layout Type Enumeration ( Text over Object))		Title, text on top, object on bottom
vertTitleAndTx (Vertical Title and Text)		Vertical title on right, vertical text on left
vertTitleAndTxOverChart (Vertical Title and Text Over Chart)		Vertical title on right, vertical text on top, chart on bottom

Enumeration Value	Description	
		
vertTx (Vertical Text)		Title and vertical text body

1

Referenced By
sldLayout@type (§4.4.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideLayoutType">
 <restriction base="xsd:token">
 <enumeration value="title"/>
 <enumeration value="tx"/>
 <enumeration value="twoColTx"/>
 <enumeration value="tbl"/>
 <enumeration value="txAndChart"/>
 <enumeration value="chartAndTx"/>

 <enumeration value="twoTxTwoObj"/>
 <enumeration value="objTx"/>
 <enumeration value="picTx"/>
 </restriction>
</simpleType>
```

#### 4.8.20 ST\_SlideMasterId (Slide Master ID)

This type specifies the allowed numbering for the slide master identifier.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

Referenced By
sldMasterId@id (§4.3.1.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideMasterId">
 <restriction base="xsd:unsignedInt">
 <minInclusive value="2147483648"/>
 </restriction>
</simpleType>
```

#### 4.8.21 ST\_SlideSizeCoordinate (Slide Size Coordinate)

This type specifies the slide size coordinate in EMUs (English Metric Units).

This simple type's contents are a restriction of the ST\_PositiveCoordinate32 simple type (§5.1.12.43).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 914400.
- This simple type has a maximum value of less than or equal to 51206400.

Referenced By
sldSz@cx (§4.3.1.34); sldSz@cy (§4.3.1.34)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideSizeCoordinate">
 <restriction base="a:ST_PositiveCoordinate32">
 <minInclusive value="914400"/>
 <maxInclusive value="51206400"/>
 </restriction>
</simpleType>
```

#### 4.8.22 ST\_SlideSizeType (Slide Size Type)

This type specifies the type of slide size that the slide should be optimized for.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
35mm (35mm Film)	Slide size should be optimized for 35mm film output
A3 (A3)	Slide size should be optimized for A3 output
A4 (A4)	Slide size should be optimized for A4 output
B4ISO (B4ISO)	Slide size should be optimized for B4ISO output
B4JIS (B4JIS)	Slide size should be optimized for B4JIS output

Enumeration Value	Description
B5ISO (B5ISO)	Slide size should be optimized for B5ISO output
B5JIS (B5JIS)	Slide size should be optimized for B5JIS output
banner (Banner)	Slide size should be optimized for banner output
custom (Custom)	Slide size should be optimized for custom output
hagakiCard (Hagaki Card)	Slide size should be optimized for hagaki card output
ledger (Ledger)	Slide size should be optimized for ledger output
letter (Letter)	Slide size should be optimized for letter output
overhead (Overhead)	Slide size should be optimized for overhead output
screen16x10 (Screen 16x10)	Slide size should be optimized for 16x10 screen output
screen16x9 (Screen 16x9)	Slide size should be optimized for 16x9 screen output
screen4x3 (Screen 4x3)	Slide size should be optimized for 4x3 screen output

1

Referenced By
sldSz@type (§4.3.1.34)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_SlideSizeType">
4 <restriction base="xsd:token">
5 <enumeration value="screen4x3"/>
6 <enumeration value="letter"/>
7 <enumeration value="A4"/>
8 <enumeration value="35mm"/>
9 <enumeration value="overhead"/>
10 <enumeration value="banner"/>
11 <enumeration value="custom"/>
12 <enumeration value="ledger"/>
13 <enumeration value="A3"/>
14 <enumeration value="B4ISO"/>
15 <enumeration value="B5ISO"/>
16 <enumeration value="B4JIS"/>
17 <enumeration value="B5JIS"/>
18 <enumeration value="hagakiCard"/>
19 <enumeration value="screen16x9"/>
20 <enumeration value="screen16x10"/>
21 </restriction>
22 </simpleType>

```

### 23 4.8.23 ST\_SplitterBarState (Splitter Bar State)

24 This type specifies the state that the splitter bar should be shown in. The splitter bar separates a primary and  
 25 secondary region within a viewing area.

26 This simple type's contents are a restriction of the XML Schema token datatype.

1 The following are possible enumeration values for this type:

Enumeration Value	Description
maximized (Max)	The primary region occupies the greatest amount of the viewing area allowed by the application.
minimized (Min)	The primary region occupies the least amount of the viewing area allowed by the application.
restored (Restored)	The primary region has a specific intermediate size.

2

Referenced By
normalViewPr@horzBarState (§4.3.2.6); normalViewPr@vertBarState (§4.3.2.6)

3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_SplitterBarState">
5 <restriction base="xsd:token">
6 <enumeration value="minimized"/>
7 <enumeration value="restored"/>
8 <enumeration value="maximized"/>
9 </restriction>
10 </simpleType>
```

#### 11 4.8.24 ST\_TLAnimateBehaviorCalcMode (Time List Animate Behavior Calculate 12 Mode)

13 This type specifies how the animation flows from point to point.

14 This simple type's contents are a restriction of the XML Schema token datatype.

15 The following are possible enumeration values for this type:

Enumeration Value	Description
discrete (Calc Mode Enum ( Discrete ))	Discrete
fm1a (Calc Mode Enum ( Formula ))	Formula
lin (Calc Mode Enum ( Linear ))	Linear

16

Referenced By
anim@calcmode (§4.6.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateBehaviorCalcMode">
 <restriction base="xsd:token">
 <enumeration value="discrete"/>
 <enumeration value="lin"/>
 <enumeration value="fmla"/>
 </restriction>
</simpleType>
```

#### 4.8.25 ST\_TLAnimateBehaviorValueType (Time List Animate Behavior Value Types)

This type specifies the type of property value.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clr (Value Type Enum ( Color ))	Color
num (Value Type Enum ( Number ))	Number
str (Value Type Enum ( String ))	String

#### Referenced By

anim@valueType (§4.6.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateBehaviorValueType">
 <restriction base="xsd:token">
 <enumeration value="str"/>
 <enumeration value="num"/>
 <enumeration value="clr"/>
 </restriction>
</simpleType>
```

#### 4.8.26 ST\_TLAnimateColorDirection (Time List Animate Color Direction)

This type specifies the direction in which to interpolate the animation (clockwise or counterclockwise).

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ccw (Counter-Clockwise)	Counter-Clockwise
cw (Direction Enum ( Clockwise ))	Clockwise

1

Referenced By
animClr@dir (§4.6.2)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TLAnimateColorDirection">
4 <restriction base="xsd:token">
5 <enumeration value="cw"/>
6 <enumeration value="ccw"/>
7 </restriction>
8 </simpleType>
```

#### 9 4.8.27 ST\_TLAnimateColorSpace (Time List Animate Color Space)

10 This type specifies the color space of the animation.

11 This simple type's contents are a restriction of the XML Schema token datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
hsl (Color Space Enum ( HSL ))	Hue, Saturation, Luminance
rgb (Color Space Enum ( RGB ))	Red, Green, Blue

13

Referenced By
animClr@clrSpc (§4.6.2)

14 The following XML Schema fragment defines the contents of this simple type:

```

15 <simpleType name="ST_TLAnimateColorSpace">
16 <restriction base="xsd:token">
17 <enumeration value="rgb"/>
18 <enumeration value="hsl"/>
19 </restriction>
20 </simpleType>
```

#### 21 4.8.28 ST\_TLAnimateEffectTransition (Time List Animate Effect Transition)

22 This type specifies whether the effect is a transition in, transition out, or neither.

23 This simple type's contents are a restriction of the XML Schema token datatype.

24 The following are possible enumeration values for this type:

Enumeration Value	Description
in (Transition Enum ( In ))	In

Enumeration Value	Description
none (Transition Enum ( None ))	None
out (Transition Enum ( Out ))	Out

1

Referenced By
animEffect@transition (§4.6.3)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TLAnimateEffectTransition">
4 <restriction base="xsd:token">
5 <enumeration value="in"/>
6 <enumeration value="out"/>
7 <enumeration value="none"/>
8 </restriction>
9 </simpleType>
```

#### 10 4.8.29 ST\_TLAnimateMotionBehaviorOrigin (Time List Animate Motion Behavior 11 Origin)

12 This type specifies what the origin of the motion path is relative to.

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
layout (Origin Enum ( Layout ))	Layout
parent (Origin Enum ( Parent ))	Parent

15

Referenced By
animMotion@origin (§4.6.4)

16 The following XML Schema fragment defines the contents of this simple type:

```

17 <simpleType name="ST_TLAnimateMotionBehaviorOrigin">
18 <restriction base="xsd:token">
19 <enumeration value="parent"/>
20 <enumeration value="layout"/>
21 </restriction>
22 </simpleType>
```

#### 23 4.8.30 ST\_TLAnimateMotionPathEditMode (Time List Animate Motion Path Edit 24 Mode)

25 This type specifies how the motion path moves when the target element is moved.

1 This simple type's contents are a restriction of the XML Schema token datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
fixed (Path Edit Mode Enum ( Fixed ))	Fixed
relative (Path Edit Mode Enum ( Relative ))	Relative

3

Referenced By
animMotion@pathEditMode (§4.6.4)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_TLAnimateMotionPathEditMode">
6 <restriction base="xsd:token">
7 <enumeration value="relative"/>
8 <enumeration value="fixed"/>
9 </restriction>
10 </simpleType>
```

### 11 4.8.31 ST\_TLBehaviorAccumulateType (Behavior Accumulate Type)

12 This type makes a repeating animation build with each iteration when set to "always."

13 This simple type's contents are a restriction of the XML Schema token datatype.

14 The following are possible enumeration values for this type:

Enumeration Value	Description
always (Accumulate Enum ( Always ))	Always
none (Accumulate Enum ( None ))	None

15

Referenced By
cBhvr@accumulate (§4.6.22)

16 The following XML Schema fragment defines the contents of this simple type:

```

17 <simpleType name="ST_TLBehaviorAccumulateType">
18 <restriction base="xsd:token">
19 <enumeration value="none"/>
20 <enumeration value="always"/>
21 </restriction>
22 </simpleType>
```

### 23 4.8.32 ST\_TLBehaviorAdditiveType (Behavior Additive Type)

24 This type specifies how to apply the animation values to the original value for the property.

1 This simple type's contents are a restriction of the XML Schema token datatype.

2 The following are possible enumeration values for this type:

Enumeration Value	Description
base (Additive Enum ( Base ))	Base
mult (Additive Enum ( Multiply ))	Multiply
none (None)	None
repl (Additive Enum ( Replace ))	Replace
sum (Additive Enum ( Sum ))	Sum

3

Referenced By
cBhvr@additive (§4.6.22)

4 The following XML Schema fragment defines the contents of this simple type:

```

5 <simpleType name="ST_TLBehaviorAdditiveType">
6 <restriction base="xsd:token">
7 <enumeration value="base"/>
8 <enumeration value="sum"/>
9 <enumeration value="repl"/>
10 <enumeration value="mult"/>
11 <enumeration value="none"/>
12 </restriction>
13 </simpleType>
```

### 14 4.8.33 ST\_TLBehaviorOverrideType (Behavior Override Type)

15 This type specifies how a behavior should override values of the attribute being animated on the target element.

16 The "childStyle" will clear the attributes on the children contained inside the target element.

17 This simple type's contents are a restriction of the XML Schema token datatype.

18 The following are possible enumeration values for this type:

Enumeration Value	Description
childStyle (Override Enum ( Child Style ))	Child Style
normal (Override Enum ( Normal ))	Normal

19

Referenced By
cBhvr@override (§4.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLBehaviorOverrideType">
 <restriction base="xsd:token">
 <enumeration value="normal"/>
 <enumeration value="childStyle"/>
 </restriction>
</simpleType>
```

#### 4.8.34 ST\_TLBehaviorTransformType (Behavior Transform Type)

This type specifies how the behavior animates the target element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
img (Image)	Image transform
pt (Point)	Point transform

#### Referenced By

cBhvr@xfrmType (§4.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLBehaviorTransformType">
 <restriction base="xsd:token">
 <enumeration value="pt"/>
 <enumeration value="img"/>
 </restriction>
</simpleType>
```

#### 4.8.35 ST\_TLChartSubelementType (Chart Subelement Type)

This type defines an animation target element that is represented by a subelement of a chart.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
category (Chart Build Element Type Enum ( Category ))	Category
gridLegend (Chart Build Element Type Enum ( Grid Legend ))	Background Element (Grid and Legend)
ptInCategory (Chart Build Element Type Enum ( Point in Cat ))	Category Element
ptInSeries (Chart Build Element Type Enum ( Point in Series ))	Series Element

Enumeration Value	Description
Series ))	
series (Chart Build Element Type Enum ( Series ))	Series

#### Referenced By

oleChartEl@type (§4.6.52)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_TLChartSubelementType">
 <restriction base="xsd:token">
 <enumeration value="gridLegend"/>
 <enumeration value="series"/>
 <enumeration value="category"/>
 <enumeration value="ptInSeries"/>
 <enumeration value="ptInCategory"/>
 </restriction>
</simpleType>

```

### 4.8.36 ST\_TLCommandType (Command Type)

This type specifies a command type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
call (Command Type Enum ( Call ))	Call
evt (Command Type Enum ( Event ))	Event
verb (Command Type Enum ( Verb ))	Verb

#### Referenced By

cmd@type (§4.6.28)

The following XML Schema fragment defines the contents of this simple type:

```

<simpleType name="ST_TLCommandType">
 <restriction base="xsd:token">
 <enumeration value="evt"/>
 <enumeration value="call"/>
 <enumeration value="verb"/>
 </restriction>
</simpleType>

```

#### 4.8.37 ST\_TLDiagramBuildType (Diagram Build Types)

This type specifies the different diagram build types.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (Diagram Build Type Enum ( All At Once ))	All At Once
breadthByLvl (Diagram Build Type Enum ( Breadth By Level ))	Breadth By Level
breadthByNode (Diagram Build Type Enum ( Breadth By Node ))	Breadth By Node
ccw (Diagram Build Type Enum ( Counter-Clockwise ))	Counter-Clockwise
ccwIn (Diagram Build Type Enum ( Counter-Clockwise-In ))	Counter-Clockwise-In
ccwOut (Diagram Build Type Enum ( Counter-Clockwise-Out ))	Counter-Clockwise-Out
cust (Diagram Build Type Enum ( Custom ))	Custom
cw (Diagram Build Type Enum ( Clockwise ))	Clockwise
cwIn (Diagram Build Type Enum ( Clockwise-In ))	Clockwise-In
cwOut (Diagram Build Type Enum ( Clockwise-Out ))	Clockwise-Out
depthByBranch (Diagram Build Type Enum ( Depth By Branch ))	Depth By Branch
depthByNode (Diagram Build Type Enum ( Depth By Node ))	Depth By Node
down (Diagram Build Type Enum ( Down ))	Down
inByRing (Diagram Build Type Enum ( In-By-Ring ))	In-By-Ring
outByRing (Diagram Build Type Enum ( Out-By-Ring ))	Out-By-Ring
up (Diagram Build Type Enum ( Up ))	Up
whole (Diagram Build Type Enum ( Whole ))	Whole

#### Referenced By

bldDgm@bld (§4.6.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLDiagramBuildType">
 <restriction base="xsd:token">
 <enumeration value="whole"/>
 <enumeration value="depthByNode"/>
 <enumeration value="depthByBranch"/>
 <enumeration value="breadthByNode"/>
 <enumeration value="breadthByLv1"/>
 <enumeration value="cw"/>
 <enumeration value="cwIn"/>
 <enumeration value="cwOut"/>
 <enumeration value="ccw"/>
 <enumeration value="ccwIn"/>
 <enumeration value="ccwOut"/>
 <enumeration value="inByRing"/>
 <enumeration value="outByRing"/>
 <enumeration value="up"/>
 <enumeration value="down"/>
 <enumeration value="allAtOnce"/>
 <enumeration value="cust"/>
 </restriction>
</simpleType>
```

**4.8.38 ST\_TLNextActionType (Next Action Type)**

This type specifies what to do when going forward in a sequence. When the value is "seek," it will seek the current child element to its natural end time before advancing to the next element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (Next Action Type Enum ( None ))	None
seek (Next Action Type Enum ( Seek ))	Seek

Referenced By
seq@nextAc (§4.6.65)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLNextActionType">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="seek"/>
 </restriction>
</simpleType>
```

### 4.8.39 ST\_TLOleChartBuildType (Embedded Chart Build Type)

This type describes how to build an embedded Chart.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (Chart Build Type Enum ( All At Once ))	All At Once
category (Chart Build Type Enum ( Category ))	By Category
categoryEl (Chart Build Type Enum ( Category Element ))	By Category Element
series (Chart Build Type Enum ( Series ))	By Series
seriesEl (Chart Build Type Enum ( Series Element ))	By Series Element

#### Referenced By

bldOleChart@bld (§4.6.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLOleChartBuildType">
 <restriction base="xsd:token">
 <enumeration value="allAtOnce"/>
 <enumeration value="series"/>
 <enumeration value="category"/>
 <enumeration value="seriesEl"/>
 <enumeration value="categoryEl"/>
 </restriction>
</simpleType>
```

### 4.8.40 ST\_TLParaBuildType (Paragraph Build Type)

This type describes how to build a paragraph.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (All At Once)	Specifies to animate all paragraphs at once.
cust (Custom)	Specifies the build has custom user settings.
p (Paragraph)	Specifies to animate paragraphs grouped by bullet level.
whole (Whole)	Specifies to animate the entire body of text as one

Enumeration Value	Description
	block.

1

Referenced By
bldP@build (§4.6.16)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TLParaBuildType">
4 <restriction base="xsd:token">
5 <enumeration value="allAtOnce"/>
6 <enumeration value="p"/>
7 <enumeration value="cust"/>
8 <enumeration value="whole"/>
9 </restriction>
10 </simpleType>
```

#### 11 4.8.41 ST\_TLPreviousActionType (Previous Action Type)

12 This type specifies what to do when going backwards in a sequence. When the value is "skipTimed," the  
 13 sequence will continue to go backwards until it reaches a sequence element that was defined to being only on a  
 14 "next" event.

15 This simple type's contents are a restriction of the XML Schema token datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
none (Previous Action Type Enum ( None ))	None
skipTimed (Previous Action Type Enum ( Skip Timed ))	Skip Timed

17

Referenced By
seq@prevAc (§4.6.65)

18 The following XML Schema fragment defines the contents of this simple type:

```

19 <simpleType name="ST_TLPreviousActionType">
20 <restriction base="xsd:token">
21 <enumeration value="none"/>
22 <enumeration value="skipTimed"/>
23 </restriction>
24 </simpleType>
```

#### 25 4.8.42 ST\_TLTime (Time)

26 This type specifies time after which to automatically advance the build to the next step. An amount of time, in  
 27 milliseconds.

This simple type is defined as a union of the following types:

- TheXML Schema unsignedInt datatype.
- TheST\_TLTimeIndefinite simple type (§4.8.44).

Referenced By
bldP@advAuto (§4.6.16); cond@delay (§4.6.31); cTn@dur (§4.6.33); cTn@repeatCount (§4.6.33); cTn@repeatDur (§4.6.33); endSync@delay (§4.6.39); tmAbs@val (§4.6.82)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTime">
 <union memberTypes="xsd:unsignedInt ST_TLTimeIndefinite"/>
</simpleType>
```

#### 4.8.43 ST\_TLTimeAnimateValueTime (Animation Time)

This type specifies a percentage within the time span of the element. A value of indefinite means the attribute should be ignored.

This simple type is defined as a union of the following types:

- TheST\_PositiveFixedPercentage simple type (§5.1.12.45).
- TheST\_TLTimeIndefinite simple type (§4.8.44).

Referenced By
tav@tm (§4.6.79)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeAnimateValueTime">
 <union memberTypes="a:ST_PositiveFixedPercentage ST_TLTimeIndefinite"/>
</simpleType>
```

#### 4.8.44 ST\_TLTimeIndefinite (Indefinite Time Declaration)

This type specifies a value that designates an "indefinite" amount time -- typically means this property is subordinate to other, defined properties.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
indefinite (Indefinite Type Enum)	Specifies Indefinite Time

Referenced By
---------------

Referenced By
ST_TLTime (§4.8.42); ST_TLTimeAnimateValueTime (§4.8.43)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeIndefinite">
 <restriction base="xsd:token">
 <enumeration value="indefinite"/>
 </restriction>
</simpleType>
```

#### 4.8.45 ST\_TLTimeNodeFillType (Time Node Fill Type)

This type specifies what modifications the effect leaves on the target element's properties when the effect ends.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
freeze (Freeze)	Freeze
hold (TimeNode Fill Type Enum ( Hold ))	Hold
remove (Remove)	Remove
transition (Transition)	Transition

Referenced By
cTn@fill (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeFillType">
 <restriction base="xsd:token">
 <enumeration value="remove"/>
 <enumeration value="freeze"/>
 <enumeration value="hold"/>
 <enumeration value="transition"/>
 </restriction>
</simpleType>
```

#### 4.8.46 ST\_TLTimeNodeID (Time Node ID)

This type represents a node or event on the timeline by its identifier.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
cTn@id (§4.6.33); tn@val (§4.6.86)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeID">
 <restriction base="xsd:unsignedInt"/>
</simpleType>
```

#### 4.8.47 ST\_TLTimeNodeMasterRelation (Time Node Master Relation)

This type specifies how the time node plays back relative to its master time node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
lastClick (TimeNode Master Relation Enum ( Last Click ))	Last Click
nextClick (TimeNode Master Relation Enum ( Next Click ))	Next Click
sameClick (TimeNode Master Relation Enum ( Same Click ))	Same Click

#### Referenced By

cTn@masterRel (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeMasterRelation">
 <restriction base="xsd:token">
 <enumeration value="sameClick"/>
 <enumeration value="lastClick"/>
 <enumeration value="nextClick"/>
 </restriction>
</simpleType>
```

#### 4.8.48 ST\_TLTimeNodePresetClassType (Time Node Preset Class Type)

This type specifies the class of effect in which this effect belongs.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
emph (Preset Type Enum ( Emphasis ))	Emphasis Preset
entr (Preset Type Enum ( Entrance ))	Entrance Preset
exit (Exit)	Exit Preset

Enumeration Value	Description
mediacall (Preset Type Enum ( Media Call ))	Media Call Preset
path (Preset Type Enum ( Path ))	Path Preset
verb (Preset Type Enum ( Verb ))	Verb Preset

1

Referenced By
cTn@presetClass (§4.6.33)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TLTimeNodePresetClassType">
4 <restriction base="xsd:token">
5 <enumeration value="entr"/>
6 <enumeration value="exit"/>
7 <enumeration value="emph"/>
8 <enumeration value="path"/>
9 <enumeration value="verb"/>
10 <enumeration value="mediacall"/>
11 </restriction>
12 </simpleType>

```

#### 13 4.8.49 ST\_TLTimeNodeRestartType (Time Node Restart Type)

14 This type determines whether an effect can play more than once.

15 This simple type's contents are a restriction of the XML Schema token datatype.

16 The following are possible enumeration values for this type:

Enumeration Value	Description
always (Restart Enum ( Always ))	Always restart node
never (Restart Enum ( Never ))	Never restart node
whenNotActive (Restart Enum ( When Not Active ))	Restart when node is not active

17

Referenced By
cTn@restart (§4.6.33)

18 The following XML Schema fragment defines the contents of this simple type:

```

19 <simpleType name="ST_TLTimeNodeRestartType">
20 <restriction base="xsd:token">
21 <enumeration value="always"/>
22 <enumeration value="whenNotActive"/>
23 <enumeration value="never"/>
24 </restriction>
25 </simpleType>

```

#### 4.8.50 ST\_TLTimeNodeSyncType (Time Node Sync Type)

This type specifies how the time node synchronizes to its group.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
canSlip (TimeNode Sync Enum ( Can Slip ))	Can Slip
locked (TimeNode Sync Enum ( Locked ))	Locked

#### Referenced By

cTn@syncBehavior (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeSyncType">
 <restriction base="xsd:token">
 <enumeration value="canSlip"/>
 <enumeration value="locked"/>
 </restriction>
</simpleType>
```

#### 4.8.51 ST\_TLTimeNodeType (Time Node Type)

This type specifies time node types.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
afterEffect (Node Type Enum ( After Effect ))	After Effect
afterGroup (Node Type Enum ( After Group ))	After Group
clickEffect (Node Type Enum ( Click Effect ))	Click Effect
clickPar (Node Type Enum ( Click Paragraph ))	Click Paragraph
interactiveSeq (Node Type Enum ( Interactive Sequence ))	Interactive Sequence
mainSeq (Node Type Enum ( Main Sequence ))	Main Sequence
tmRoot (Node Type Enum ( Timing Root ))	Timing Root
withEffect (Node Type Enum ( With Effect ))	With Effect
withGroup (Node Type Enum ( With Group ))	With Group

Referenced By
cTn@nodeType (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeType">
 <restriction base="xsd:token">
 <enumeration value="clickEffect"/>
 <enumeration value="withEffect"/>
 <enumeration value="afterEffect"/>
 <enumeration value="mainSeq"/>
 <enumeration value="interactiveSeq"/>
 <enumeration value="clickPar"/>
 <enumeration value="withGroup"/>
 <enumeration value="afterGroup"/>
 <enumeration value="tmRoot"/>
 </restriction>
</simpleType>
```

#### 4.8.52 ST\_TLTriggerEvent (Trigger Event)

This type specifies a particular event that causes the time condition to be true.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
begin (Trigger Event Enum ( Begin ))	Fire trigger at the beginning
end (Trigger Event Enum ( End ))	Fire trigger at the end
onBegin (Trigger Event Enum ( On Begin ))	Fire trigger at the beginning
onClick (Trigger Event Enum ( On Click ))	Fire trigger on a mouse click
onDbClick (Trigger Event Enum ( On Double Click ))	Fire trigger on double-mouse click
onEnd (Trigger Event Enum ( On End ))	Fire trigger at the end
onMouseOut (Trigger Event Enum ( On Mouse Out ))	Fire trigger on mouse out
onMouseOver (Trigger Event Enum ( On Mouse Over ))	Fire trigger on mouse over
onNext (Trigger Event Enum ( On Next ))	Fire trigger on next node
onPrev (Trigger Event Enum ( On Previous ))	Fire trigger on previous node
onStopAudio (Trigger Event Enum ( On Stop Audio ))	Fire trigger on stop audio

Referenced By
cond@evt (§4.6.31); endSync@evt (§4.6.39)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTriggerEvent">
 <restriction base="xsd:token">
 <enumeration value="onBegin"/>
 <enumeration value="onEnd"/>
 <enumeration value="begin"/>
 <enumeration value="end"/>
 <enumeration value="onClick"/>
 <enumeration value="onDbClick"/>
 <enumeration value="onMouseOver"/>
 <enumeration value="onMouseOut"/>
 <enumeration value="onNext"/>
 <enumeration value="onPrev"/>
 <enumeration value="onStopAudio"/>
 </restriction>
</simpleType>
```

#### 4.8.53 ST\_TLTriggerRuntimeNode (Trigger RunTime Node)

This type specifies the child time node that triggers a time condition. References a child TimeNode or all child nodes. Order is based on the child's end time.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (Trigger RunTime Node Enum ( All ))	All
first (Trigger RunTime Node ( First ))	First
last (Trigger RunTime Node ( Last ))	Last

#### Referenced By

rtn@val (§4.6.64)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTriggerRuntimeNode">
 <restriction base="xsd:token">
 <enumeration value="first"/>
 <enumeration value="last"/>
 <enumeration value="all"/>
 </restriction>
</simpleType>
```

#### 4.8.54 ST\_TransitionCornerDirectionType (Transition Corner Direction Type)

This type specifies diagonal directions for slide transitions.

This simple type's contents are a restriction of the XML Schema token datatype.

1 The following are possible enumeration values for this type:

Enumeration Value	Description
ld (Transition Corner Direction Enum ( Left-Down ))	Specifies the slide transition direction of left-down
lu (Transition Corner Direction Enum ( Left-Up ))	Specifies the slide transition direction of left-up
rd (Transition Corner Direction Enum ( Right-Down ))	Specifies the slide transition direction of right-down
ru (Transition Corner Direction Enum ( Right-Up ))	Specifies the slide transition direction of right-up

2

Referenced By
ST_TransitionEightDirectionType (§4.8.55); strips@dir (§4.6.74)

3 The following XML Schema fragment defines the contents of this simple type:

```

4 <simpleType name="ST_TransitionCornerDirectionType">
5 <restriction base="xsd:token">
6 <enumeration value="lu"/>
7 <enumeration value="ru"/>
8 <enumeration value="ld"/>
9 <enumeration value="rd"/>
10 </restriction>
11 </simpleType>

```

## 12 4.8.55 ST\_TransitionEightDirectionType (Transition Eight Direction)

13 This type specifies the direction of an animation.

14 This simple type is defined as a union of the following types:

- 15 • TheST\_TransitionSideDirectionType simple type (§4.8.57).
- 16 • TheST\_TransitionCornerDirectionType simple type (§4.8.54).

Referenced By
cover@dir (§4.6.32); pull@dir (§4.6.58)

17 The following XML Schema fragment defines the contents of this simple type:

```

18 <simpleType name="ST_TransitionEightDirectionType">
19 <union memberTypes="ST_TransitionSideDirectionType ST_TransitionCornerDirectionType"/>
20 </simpleType>

```

## 21 4.8.56 ST\_TransitionInOutDirectionType (Transition In/Out Direction Type)

22 This type specifies if a slide transition should go in or out.

23 This simple type's contents are a restriction of the XML Schema token datatype.

24 The following are possible enumeration values for this type:

Enumeration Value	Description
in (Transition In/Out Direction Enum ( In ))	Specifies the slide transition should go in
out (Transition In/Out Direction Enum ( Out ))	Specifies the slide transition should go out

1

Referenced By
split@dir (§4.6.71); zoom@dir (§4.6.97)

2 The following XML Schema fragment defines the contents of this simple type:

```

3 <simpleType name="ST_TransitionInOutDirectionType">
4 <restriction base="xsd:token">
5 <enumeration value="out"/>
6 <enumeration value="in"/>
7 </restriction>
8 </simpleType>
```

### 9 4.8.57 ST\_TransitionSideDirectionType (Transition Slide Direction Type)

10 This type defines a set of slide transition directions.

11 This simple type's contents are a restriction of the XML Schema token datatype.

12 The following are possible enumeration values for this type:

Enumeration Value	Description
d (Transition Slide Direction Enum ( Down ))	Specifies that the transition direction is down
l (Transition Slide Direction Enum ( Left ))	Specifies that the transition direction is left
r (Transition Slide Direction ( Right ))	Specifies that the transition direction is right
u (Transition Slide Direction Enum ( Up ))	Specifies that the transition direction is up

13

Referenced By
push@dir (§4.6.59); ST_TransitionEightDirectionType (§4.8.55); wipe@dir (§4.6.96)

14 The following XML Schema fragment defines the contents of this simple type:

```

15 <simpleType name="ST_TransitionSideDirectionType">
16 <restriction base="xsd:token">
17 <enumeration value="l"/>
18 <enumeration value="u"/>
19 <enumeration value="r"/>
20 <enumeration value="d"/>
21 </restriction>
22 </simpleType>
```

#### 4.8.58 ST\_TransitionSpeed (Transition Speed)

This simple type defines the allowed transition speeds for transitioning from the current slide to the next.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fast (Fast)	Fast slide transition.
med (Medium)	Medium slide transition.
slow (low)	Slow slide transition.

#### Referenced By

transition@spd (§4.4.1.46)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TransitionSpeed">
 <restriction base="xsd:token">
 <enumeration value="slow"/>
 <enumeration value="med"/>
 <enumeration value="fast"/>
 </restriction>
</simpleType>
```

#### 4.8.59 ST\_ViewType (List of View Types)

This type specifies the type of view that should be used when displaying the presentation document to the user.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
handoutView (Handout View)	Handout View mode should be used.
notesMasterView (Notes Master View)	Notes Master View mode should be used.
notesView (Notes View)	Notes View mode should be used.
outlineView (Outline View)	Outline View mode should be used.
sldMasterView (Slide Master View)	Slide Master View mode should be used.
sldSorterView (Slide Sorter View)	Slide Sorter View mode should be used.
sldThumbnailView (Slide Thumbnail View)	Slide Thumbnail View mode should be used.
sldView (Normal Slide View)	Normal Slide View mode should be used.

Referenced By
viewPr@lastView (§4.3.2.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ViewType">
 <restriction base="xsd:token">
 <enumeration value="sldView"/>
 <enumeration value="sldMasterView"/>
 <enumeration value="notesView"/>
 <enumeration value="handoutView"/>
 <enumeration value="notesMasterView"/>
 <enumeration value="outlineView"/>
 <enumeration value="sldSorterView"/>
 <enumeration value="sldThumbnailView"/>
 </restriction>
</simpleType>
```

#### 4.8.60 ST\_WebColorType (HTML Slide Navigation Control Colors)

This type specifies the coloring that should be used when outputting to web formats.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blackTextOnWhite (Black Text on White Colors)	Black Text on White coloring should be used.
browser (Browser Colors)	Browser coloring should be used.
none (Non-specific Colors)	No specific coloring has been specified.
presentationAccent (Presentation Accent Colors)	Presentation accent coloring should be used.
presentationText (Presentation Text Colors)	Presentation text coloring should be used.
whiteTextOnBlack (White Text on Black Colors)	White text on black coloring should be used.

Referenced By
webPr@clr (§4.3.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WebColorType">
 <restriction base="xsd:token">
 <enumeration value="none"/>
 <enumeration value="browser"/>
 <enumeration value="presentationText"/>
 <enumeration value="presentationAccent"/>
 <enumeration value="whiteTextOnBlack"/>
 <enumeration value="blackTextOnWhite"/>
 </restriction>
</simpleType>
```

#### 4.8.61 ST\_WebEncoding (Web Encoding)

This type specifies a string representing the HTML character set used when outputting to web formats.

This simple type's contents are a restriction of the XML Schema string datatype.

##### Referenced By

webPr@encoding (§4.3.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WebEncoding">
 <restriction base="xsd:string"/>
</simpleType>
```

#### 4.8.62 ST\_WebScreenSize (HTML/Web Screen Size Target)

This type specifies the intended screen resolution for output to web formats.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024x768 (HTML/Web Size Enumeration 1024x768)	Screen size is 1024x768 pixels
1152x882 (HTML/Web Size Enumeration 1152x882)	Screen size is 1152x882 pixels
1152x900 (HTML/Web Size Enumeration 1152x900)	Screen size is 1152x900 pixels
1280x1024 (HTML/Web Size Enumeration 1280x1024)	Screen size is 1280x1024 pixels
1600x1200 (HTML/Web Size Enumeration 1600x1200)	Screen size is 1600x1200 pixels
1800x1400 (HTML/Web Size Enumeration 1800x1400)	Screen size is 1800x1400 pixels
1920x1200 (HTML/Web Size Enumeration 1920x1200)	Screen size is 1920x1200 pixels

Enumeration Value	Description
544x376 (HTML/Web Size Enumeration 544x376)	Screen size is 544x376 pixels
640x480 (HTML/Web Size Enumeration 640x480)	Screen size is 640x480 pixels
720x512 (HTML/Web Size Enumeration 720x515)	Screen size is 720x512 pixels
800x600 (HTML/Web Size Enumeration 800x600)	Screen size is 800x600 pixels

1

Referenced By
webPr@imgSz (§4.3.1.36)

2 The following XML Schema fragment defines the contents of this simple type:

# 5. DrawingML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising DrawingML content, which may be used within the contents of WordprocessingML, SpreadsheetML, or PresentationML documents.

## 5.1 DrawingML - Main

The DrawingML Main namespace defines all of the base constructs for all types of DrawingML objects (charts, diagrams, shapes, pictures, and so on). These constructs and primitives are defined below.

### 5.1.1 Table of Contents

This subclause is informative.

<b>5.1.2 Basics</b>	<b>3220</b>
5.1.2.1 Core Drawing Object Information	3220
5.1.2.1.1 bldChart (Build Chart)	3220
5.1.2.1.2 bldDgm (Build Diagram)	3221
5.1.2.1.3 chart (Chart to Animate)	3222
5.1.2.1.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	3223
5.1.2.1.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	3223
5.1.2.1.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	3224
5.1.2.1.7 cNvPicPr (Non-Visual Picture Drawing Properties)	3224
5.1.2.1.8 cNvPr (Non-Visual Drawing Properties)	3226
5.1.2.1.9 cNvSpPr (Non-Visual Shape Drawing Properties)	3228
5.1.2.1.10 cxnSp (Connection Shape)	3229
5.1.2.1.11 cxnSpLocks (Connection Shape Locks)	3231
5.1.2.1.12 dgm (Diagram to Animate)	3232
5.1.2.1.13 endCxn (Connection End)	3233
5.1.2.1.14 ext (Extension)	3234
5.1.2.1.15 extLst (Extension List)	3234
5.1.2.1.16 graphic (Graphic Object)	3235
5.1.2.1.17 graphicData (Graphic Object Data)	3236
5.1.2.1.18 graphicFrame (Graphic Frame)	3236
5.1.2.1.19 graphicFrameLocks (Graphic Frame Locks)	3237
5.1.2.1.20 grpSp (Group shape)	3238
5.1.2.1.21 grpSpLocks (Group Shape Locks)	3240
5.1.2.1.22 grpSpPr (Visual Group Shape Properties)	3242
5.1.2.1.23 hlinkHover (Hyperlink for Hover)	3243
5.1.2.1.24 ln (Outline)	3244
5.1.2.1.25 nvCxnSpPr (Non-Visual Properties for a Connection Shape)	3246
5.1.2.1.26 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	3246
5.1.2.1.27 nvGrpSpPr (Non-Visual Properties for a Group Shape)	3247
5.1.2.1.28 nvPicPr (Non-Visual Properties for a Picture)	3248
5.1.2.1.29 nvSpPr (Non-Visual Properties for a Shape)	3248

1	5.1.2.1.30 pic (Picture) .....	3249
2	5.1.2.1.31 picLocks (Picture Locks) .....	3250

25	5.1.12.86	ST_TileFlipMode (Tile Flip Mode).....	3883

26

27 **End of informative text.**

28 **5.1.2 Basics**

29 This section describes all the basic common elements associated with the DrawingML framework.

30 **5.1.2.1 Core Drawing Object Information**

31 Within DrawingML, there is the notion of core drawing elements. These are elements that both are vital to and  
32 common across the DrawingML framework. These elements denote the most integral pieces of the DrawingML  
33 document structure and thus are among the most widely used.

34 [Note: Measurement Units - Length units shall be expressed in device-independent physical units: English Metric  
35 units (EMUs), points, picas, and inches. Device-dependent units such as pixels shall not be used. *end note*]

36 **5.1.2.1.1 bldChart (Build Chart)**

37 This element specifies how to build the animation for a diagram.

38 [Example: Consider the following example where a chart is specified to be animated by category rather than as  
39 one entity. Thus, the bldChart element should be used as follows:

```

1 <p:bdldLst>
2 <p:bldGraphic spid="4" grpId="0">
3 <p:bldSub>
4 <a:bldChart bld="category"/>
5 </p:bldSub>
6 </p:bldGraphic>
7 </p:bdldLst>
8 end example]

```

Parent Elements
bldSub (§4.6.17)

Attributes	Description
animBg (Animate Background)	Specifies whether or not the chart background elements should be animated as well. An example of background elements are grid lines and the chart legend.  The possible values for this attribute are defined by the XML Schema boolean datatype.
bld (Build)	Specifies how the chart will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute.  The possible values for this attribute are defined by the ST_AnimationChartBuildType simple type (§5.1.12.5).

The following XML Schema fragment defines the contents of this element:

```

11 <complexType name="CT_AnimationChartBuildProperties">
12 <attribute name="bld" type="ST_AnimationChartBuildType" use="optional" default="allAtOnce"/>
13 <attribute name="animBg" type="xsd:boolean" use="optional" default="true"/>
14 </complexType>

```

#### 5.1.2.1.2 bldDgm (Build Diagram)

This element specifies how to build the animation for a diagram.

[Example: Consider having a diagram appear as on entity as opposed to by section. The bldDgm element should be used as follows:

```

19 <p:bdldLst>
20 <p:bldGraphic spid="4" grpId="0">
21 <p:bldSub>
22 <a:bldDgm bld="one"/>
23 </p:bldSub>
24 </p:bldGraphic>
25 </p:bdldLst>

```

1 *end example]*

Parent Elements
bldSub (§4.6.17)

2

Attributes	Description
bld (Build)	Specifies how the chart will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute.  The possible values for this attribute are defined by the ST_AnimationDgmBuildType simple type (§5.1.12.7).
rev (Reverse Animation)	Specifies whether the animation of the objects in this diagram should be reversed or not. If this attribute is not specified, a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.

3 The following XML Schema fragment defines the contents of this element:

```

4 <complexType name="CT_AnimationDgmBuildProperties">
5 <attribute name="bld" type="ST_AnimationDgmBuildType" use="optional" default="allAtOnce"/>
6 <attribute name="rev" type="xsd:boolean" use="optional" default="false"/>
7 </complexType>

```

### 8 5.1.2.1.3 chart (Chart to Animate)

9 This element specifies a reference to a chart that should be animated within a sequence of slide animations. In  
10 addition to simply acting as a reference to a chart there is also animation build steps defined.

Parent Elements
graphicEl (§4.6.45)

11

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the chart should be built using. For instance the chart can be built as one object meaning it will be animated as a single graphic. Alternatively the chart can be animated, or built as separate pieces.  The possible values for this attribute are defined by the ST_ChartBuildStep simple type (§5.1.12.13).
categoryIdx (Category Index)	Specifies the index of the category within the corresponding chart that should be animated.  The possible values for this attribute are defined by the XML Schema int datatype.
seriesIdx (Series Index)	Specifies the index of the series within the corresponding chart that should be animated.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationChartElement">
 <attribute name="seriesIdx" type="xsd:int" use="optional" default="-1"/>
 <attribute name="categoryIdx" type="xsd:int" use="optional" default="-1"/>
 <attribute name="bldStep" type="ST_ChartBuildStep" use="required"/>
</complexType>
```

#### 5.1.2.1.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvCxnSpPr (§5.1.2.1.25)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualConnectorProperties">
 <sequence>
 <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
 <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGraphicFramePr (§5.1.2.1.26)

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
 <sequence>
 <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
 maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGrpSpPr (§5.1.2.1.27)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
 <sequence>
 <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

*[Example: Consider the following DrawingML.*

```
1 <p:pic>
2 ...
3 <p:nvPicPr>
4 <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
5 <p:cNvPicPr>
6 <a:picLocks noChangeAspect="1"/>
7 </p:cNvPicPr>
8 <p:nvPr/>
9 </p:nvPicPr>
10 ...
11 </p:pic>
12 end example]
```

13

Parent Elements
<a href="#">nvPicPr (§5.1.2.1.28)</a>

14

Child Elements	Subclause
<a href="#">extLst (Extension List)</a>	<a href="#">§5.1.2.1.15</a>
<a href="#">picLocks (Picture Locks)</a>	<a href="#">§5.1.2.1.31</a>

Attributes	Description
<a href="#">preferRelativeResize (Relative Resize Preferred)</a>	<p>Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size.</p> <p>[<i>Example:</i> Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
 <sequence>
 <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.2.1.8 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following DrawingML.

```
<p:pic>
 ...
 <p:nvPicPr>
 <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
 </p:nvPicPr>
 ...
</p:pic>
```

end example]

Parent Elements
nvCxnSpPr (§5.1.2.1.25); nvGraphicFramePr (§5.1.2.1.26); nvGrpSpPr (§5.1.2.1.27); nvPicPr (§5.1.2.1.28); nvSpPr (§5.1.2.1.29)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object)	<p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[Example: Consider a DrawingML object defined as follows:</p> <p>&lt;... descr="A picture of a bowl of fruit"&gt;</p>

Attributes	Description
	<p>The descr attribute contains alternative text which may be used in place of the actual DrawingML object. <i>end example</i></p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>
hidden (Hidden)	<p>Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. <i>[Note: An application may have settings which allow this object to be viewed. end note]</i></p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p><i>[Example: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:</i></p> <pre data-bbox="451 829 760 861">&lt;... hidden="true" /&gt;</pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example]</i></p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
id (Unique Identifier)	<p>Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p><i>[Example: Consider a DrawingML object defined as follows:</i></p> <pre data-bbox="451 1375 678 1407">&lt;... id="10" ... &gt;</pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).</p>
name (Name)	<p>Specifies the name of the object. <i>[Note: Typically, this will be used to store the original file name of a picture object. end note]</i></p> <p><i>[Example: Consider a DrawingML object defined as follows:</i></p> <pre data-bbox="451 1816 776 1848">&lt; ... name="foo.jpg" &gt;</pre>

Attributes	Description
	The name attribute has a value of <code>foo.jpg</code> , which is the name of this DrawingML object. <i>end example]</i>
	The possible values for this attribute are defined by the XML Schema string datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_NonVisualDrawingProps">
3 <sequence>
4 <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
5 <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="id" type="ST_DrawingElementId" use="required"/>
9 <attribute name="name" type="xsd:string" use="required"/>
10 <attribute name="descr" type="xsd:string" use="optional" default=""/>
11 <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
12 </complexType>
```

13 5.1.2.1.9 cNvSpPr (Non-Visual Shape Drawing Properties)

14 This element specifies the non-visual drawing properties for a shape. These properties are to be used by the  
15 generating application to determine how the shape should be dealt with

16 [Example: Consider the shape that has a shape lock applied to it.

```
17 <p:sp>
18 <p:nvSpPr>
19 <p:cNvPr id="2" name="Rectangle 1"/>
20 <p:cNvSpPr>
21 <a:spLocks noGrp="1"/>
22 </p:cNvSpPr>
23 </p:nvSpPr>
24 ...
25 </p:sp>
```

26 This shape lock is stored within the non-visual drawing properties for this shape. *end example]*

27

Parent Elements
nvSpPr (§5.1.2.1.29)

28

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Child Elements	Subclause
spLocks (Shape Locks)	§5.1.2.1.34

1

Attributes	Description
txBox (Text Box)	<p>Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.</p> <p>[<i>Note</i>: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_NonVisualDrawingShapeProps">
4 <sequence>
5 <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
6 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
9 </complexType>
```

10 5.1.2.1.10 cxnSp (Connection Shape)

11 This element specifies a connection shape that is used to connect two sp elements. Once a connection is  
12 specified using a cxnSp, it is left to the generating application to determine the exact path the connector will  
13 take. That is the connector routing algorithm is left up to the generating application as the desired path might be  
14 different depending on the specific needs of the application.

15

16 [Example: Consider the following connector shape that connects two regular shapes.

17 <p:spTree>

1       ...

2       <p:sp>

3        <p:nvSpPr>

4         <p:cNvPr id="1" name="Rectangle 1"/>

5         <p:cNvSpPr/>

6         <p:nvPr/>

7       </p:nvSpPr>

8       ...

9       </p:sp>

10      <p:sp>

11        <p:nvSpPr>

12         <p:cNvPr id="2" name="Rectangle 2"/>

13         <p:cNvSpPr/>

14         <p:nvPr/>

15       </p:nvSpPr>

16       ...

17      </p:sp>

18      <p:cxnSp>

19        <p:nvCxnSpPr>

20         <p:cNvPr id="3" name="Elbow Connector 3"/>

21         <p:cNvCxnSpPr>

22           <a:stCxn id="1" idx="3"/>

23           <a:endCxn id="2" idx="1"/>

24         </p:cNvCxnSpPr>

25         <p:nvPr/>

26       </p:nvCxnSpPr>

27       ...

28      </p:cxnSp>

29    </p:spTree>

30    *end example]*

```

#### 5.1.2.1.11 cxnSpLocks (Connection Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

##### Parent Elements

cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4)

##### Child Elements

extLst (Extension List)

##### Subclause

§5.1.2.1.15

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeShapeType (Disallow Shape Type Change)	Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noEditPoints	Specifies that the generating application should not allow shape point changes for the

Attributes	Description
(Disallow Shape Point Editing)	<p>corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ConnectorLocking">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_Locking"/>
</complexType>

```

#### 5.1.2.1.12 dgm (Diagram to Animate)

This element specifies a reference to a diagram that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a diagram there is also animation build steps defined.

#### Parent Elements

Parent Elements
graphicEl (§4.6.45)

1

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the diagram should be built using. For instance the diagram can be built as one object meaning it will be animated as a single graphic. Alternatively the diagram can be animated, or built as separate pieces.  The possible values for this attribute are defined by the ST_DgmBuildStep simple type (§5.1.12.18).
id (Identifier)	Specifies the GUID of the shape for this build step in the animation.  The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_AnimationDgmElement">
4 <attribute name="id" type="ST_Guid" use="optional" default="{00000000-0000-0000-0000-
5 000000000000}"/>
6 <attribute name="bldStep" type="ST_DgmBuildStep" use="optional" default="sp"/>
7 </complexType>

```

### 8 5.1.2.1.13 endCxn (Connection End)

9 This element specifies the ending connection that should be made by the corresponding connector shape. This  
10 connects the end tail of the connector to the final destination shape.

Parent Elements
cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4)

11

Attributes	Description
id (Identifier)	Specifies the id of the shape to make the final connection to.  The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
idx (Index)	Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it must be specified which connection site the corresponding connector shape should connect to.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connection">
 <attribute name="id" type="ST_DrawingElementId" use="required"/>
 <attribute name="idx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

#### 5.1.2.1.14 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that will be used for later versions of generating applications.

Parent Elements
extLst (§5.1.2.1.15); extLst (§5.9.2.13)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag.  The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfficeArtExtension">
 <sequence>
 <any processContents="lax"/>
 </sequence>
 <attribute name="uri" type="xsd:token"/>
</complexType>
```

#### 5.1.2.1.15 extLst (Extension List)

This element specifies the extension list within which all future extensions of type ext will be defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the framework.

Parent Elements
audioCd (§5.1.3.1); audioFile (§5.1.3.2); backdrop (§5.1.7.2); blip (§5.1.10.13); bodyPr (§5.1.5.1.1); bodyStyle (§4.4.1.5); cell3D (§5.1.6.1); clrMap (§4.4.1.6); clrMap (§5.1.8.1); clrMapOvr (§5.7.2.30); clrScheme (§5.1.8.2); cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4); cNvGraphicFramePr (§4.4.1.9); cNvGraphicFramePr (§5.5.2.4); cNvGraphicFramePr (§5.8.2.4);

Parent Elements
cNvGraphicFramePr (§5.6.2.5); cNvGraphicFramePr (§5.1.2.1.5); cNvGrpSpPr (§5.1.2.1.6); cNvGrpSpPr (§5.8.2.5); cNvGrpSpPr (§5.6.2.6); cNvGrpSpPr (§4.4.1.10); cNvPicPr (§5.6.2.7); cNvPicPr (§4.4.1.11); cNvPicPr (§5.2.2.2); cNvPicPr (§5.1.2.1.7); cNvPicPr (§5.8.2.6); cNvPr (§5.2.2.3); cNvPr (§5.8.2.7); cNvPr (§4.4.1.12); cNvPr (§5.6.2.8); cNvPr (§5.1.2.1.8); cNvSpPr (§5.1.2.1.9); cNvSpPr (§5.8.2.8); cNvSpPr (§5.6.2.9); cNvSpPr (§4.4.1.13); cxnSp (§5.1.2.1.10); cxnSpLocks (§5.1.2.1.11); defaultTextStyle (§4.3.1.7); defPPr (§5.1.5.2.2); defRPr (§5.1.5.3.2); docPr (§5.5.2.5); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); fontScheme (§5.1.4.1.18); graphicFrame (§5.1.2.1.18); graphicFrameLocks (§5.1.2.1.19); gridCol (§5.1.6.2); grpSp (§5.1.2.1.20); grpSpLocks (§5.1.2.1.21); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); hlinkClick (§5.1.5.3.5); hlinkHover (§5.1.2.1.23); hlinkMouseOver (§5.1.5.3.6); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnDef (§5.1.4.1.20); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); lockedCanvas (§5.4.2.1); lstStyle (§5.1.5.4.12); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); notesStyle (§4.4.1.25); objectDefaults (§5.1.8.7); otherStyle (§4.4.1.32); overrideClrMapping (§5.1.8.8); pic (§5.1.2.1.30); picLocks (§5.1.2.1.31); pPr (§5.1.5.2.7); quickTimeFile (§5.1.3.4); rPr (§5.1.5.3.9); scene3d (§5.1.4.1.26); scene3d (§5.9.5.5); sp (§5.1.2.1.33); sp3d (§5.1.7.12); sp3d (§5.9.5.6); spDef (§5.1.4.1.27); spLocks (§5.1.2.1.34); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tableStyle (§5.1.6.9); tblPr (§5.1.6.13); tblStyle (§5.1.4.2.26); tc (§5.1.6.14); tcBdr (§5.1.4.2.28); tcPr (§5.1.6.15); tcTxStyle (§5.1.4.2.30); theme (§5.1.8.9); themeElements (§5.1.8.10); titleStyle (§4.4.1.45); tr (§5.1.6.16); txDef (§5.1.4.1.28); txSp (§5.1.2.1.41); uLn (§5.1.5.3.14); videoFile (§5.1.3.6)

1

Child Elements	Subclause
ext (Extension)	§5.1.2.1.14

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_OfficeArtExtensionList">
4 <sequence>
5 <group ref="EG_OfficeArtExtensionList" minOccurs="1" maxOccurs="1"/>
6 </sequence>
7 </complexType>

```

### 8 5.1.2.1.16 graphic (Graphic Object)

9 This element specifies the existence of a single graphic object. Document authors should refer to this element  
10 when they wish to persist a graphical object of some kind. The specification for this graphical object will be  
11 provided entirely by the document author and referenced within the graphicData child element.

Parent Elements
anchor (§5.5.2.3); graphicFrame (§5.1.2.1.18); graphicFrame (§5.8.2.12); graphicFrame (§5.6.2.15); graphicFrame (§4.4.1.18); inline (§5.5.2.8)

12

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
graphicData (Graphic Object Data)	§5.1.2.1.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObject">
 <sequence>
 <element name="graphicData" type="CT_GraphicalObjectData"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.17 graphicData (Graphic Object Data)

This element specifies the reference to a graphic object within the document. This graphic object is provided entirely by the document authors who choose to persist this data within the document.

[Note: Depending on the type of graphical object used not every generating application that supports the OOXML framework will have the ability to render the graphical object. *end note*]

Parent Elements
graphic (§5.1.2.1.16)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag.  The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectData">
 <sequence>
 <any minOccurs="0" maxOccurs="unbounded" processContents="strict"/>
 </sequence>
 <attribute name="uri" type="xsd:token"/>
</complexType>
```

#### 5.1.2.1.18 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	§5.1.2.1.26
xfrm (2D Transform for Individual Objects)	§5.1.9.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGraphicalObjectFrame">
 <sequence>
 <element name="nvGraphicFramePr" type="CT_GvmlGraphicFrameNonVisual" minOccurs="1"
 maxOccurs="1"/>
 <element ref="graphic" minOccurs="1" maxOccurs="1"/>
 <element name="xfrm" type="CT_Transform2D" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.19 graphicFrameLocks (Graphic Frame Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvGraphicFramePr (§4.4.1.9); cNvGraphicFramePr (§5.5.2.4); cNvGraphicFramePr (§5.8.2.4); cNvGraphicFramePr (§5.6.2.5); cNvGraphicFramePr (§5.1.2.1.5)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noDrilldown (Disallow Selection of Child Shapes)	Specifies that the generating application should not allow selecting of objects within the corresponding graphic frame but allow selecting of the graphic frame itself. If this attribute is not specified, then a value of false is assumed.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding graphic frame. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding picture. That means also that no picture, shapes or text attached to this picture can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.  [Note: If this attribute is specified to be true then the graphic frame cannot be selected and the objects within the graphic frame cannot be selected as well. That is the entire graphic frame including all sub-parts are considered un-selectable. end note]  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GraphicalObjectFrameLocking">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="noGrp" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="noDrilldown" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="noSelect" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="noChangeAspect" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="noMove" type="xsd:boolean" use="optional" default="false"/>
 <attribute name="noResize" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

#### 5.1.2.1.20 grpSp (Group shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are

specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<p:grpSp>
 <p:nvGrpSpPr>
 <p:cNvPr id="10" name="Group 9"/>
 <p:cNvGrpSpPr/>
 <p:nvPr/>
 </p:nvGrpSpPr>
 <p:grpSpPr>
 <a:xfrm>
 <a:off x="838200" y="990600"/>
 <a:ext cx="2426208" cy="978408"/>
 <a:chOff x="838200" y="990600"/>
 <a:chExt cx="2426208" cy="978408"/>
 </a:xfrm>
 </p:grpSpPr>
 <p:sp>
 ...
 </p:sp>
 <p:sp>
 ...
 </p:sp>
 <p:sp>
 ...
 </p:sp>
</p:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.1.2.1.10
extLst (Extension List)	§5.1.2.1.15
graphicFrame (Graphic Frame)	§5.1.2.1.18
grpSp (Group shape)	§5.1.2.1.20

Child Elements	Subclause
grpSpPr (Visual Group Shape Properties)	§5.1.2.1.22
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§5.1.2.1.27

 <element name="cxnSp" type="CT_GvmlConnector"/>
 <element name="pic" type="CT_GvmlPicture"/>
 <element name="graphicFrame" type="CT_GvmlGraphicalObjectFrame"/>
 <element name="grpSp" type="CT_GvmlGroupShape"/>
 </choice>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.2.1.21 grpSpLocks (Group Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvGrpSpPr (§5.1.2.1.6); cNvGrpSpPr (§5.8.2.5); cNvGrpSpPr (§5.6.2.6); cNvGrpSpPr (§4.4.1.10)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the corresponding group shape cannot be grouped. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified,

Attributes	Description
	<p>then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noMove (Disallow Moving Shape)	<p>Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noResize (Disallow Shape Resizing)	<p>Specifies that the corresponding group shape cannot be resized. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the corresponding group shape cannot be rotated. Objects that reside within the group can still be rotated unless they also have been locked. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the corresponding group shape cannot have any part of it be selected. That means that no picture, shapes or attached text can be selected either if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>[Note: This property is inherited by sub-elements and thus all shapes within the group shape cannot be selected when this attribute is set to a value of true. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noUngrp (Disallow Shape Ungrouping)	<p>Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_GroupLocking">
3 <sequence>
4 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="noGrp" type="xsd:boolean" use="optional" default="false"/>
7 <attribute name="noUngrp" type="xsd:boolean" use="optional" default="false"/>
8 <attribute name="noSelect" type="xsd:boolean" use="optional" default="false"/>
9 <attribute name="noRot" type="xsd:boolean" use="optional" default="false"/>
10 <attribute name="noChangeAspect" type="xsd:boolean" use="optional" default="false"/>
11 <attribute name="noMove" type="xsd:boolean" use="optional" default="false"/>
12 <attribute name="noResize" type="xsd:boolean" use="optional" default="false"/>
13 </complexType>

```

### 5.1.2.1.22 grpSpPr (Visual Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

#### Parent Elements

grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

#### Child Elements

#### Subclause

blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15

 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

#### 5.1.2.1.23 hlinkHover (Hyperlink for Hover)

This element specifies the hyperlink information to be activated when the user's mouse is hovered over the corresponding object. The operation of the hyperlink is to have the specified action be activated when the mouse of the user hovers over the object. When this action is activated then additional attributes can be used to specify other tasks that should be performed along with the action.

##### Parent Elements

cNvPr (§5.2.2.3); cNvPr (§5.8.2.7); cNvPr (§4.4.1.12); cNvPr (§5.6.2.8); cNvPr (§5.1.2.1.8); docPr (§5.5.2.5)

##### Child Elements

extLst (Extension List)

§5.1.2.1.15

snd (Hyperlink Sound)

§5.1.2.1.32

##### Attributes

##### Description

action (Action Setting)

Specifies an action that is to be taken when this hyperlink is activated. This may be used to specify a slide to be navigated to or a script of code to be run.

The possible values for this attribute are defined by the XML Schema string datatype.

endSnd (End Sounds)

Specifies if the URL in question should stop all sounds that are playing when it is clicked.

The possible values for this attribute are defined by the XML Schema boolean datatype.

highlightClick (Highlight Click)

Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application may determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied.

The possible values for this attribute are defined by the XML Schema boolean datatype.

history (Add Hyperlink to Page History)

Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1, or true is assumed.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Drawing Object Hyperlink Target)  Namespace: .../officeDocument /2006/relationships	Specifies the relationship id that when looked up in this slides relationship file will contain the target of this hyperlink. This attribute cannot be omitted.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
invalidUrl (Invalid URL)	Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application may still store the URL but it is known that this URL is not correct.  The possible values for this attribute are defined by the XML Schema string datatype.
tgtFrame (Target Frame)	Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute will be used to determine if a new window must be launched for viewing or if an existing one may be used. If this attribute is omitted, than a new window will be opened.  The possible values for this attribute are defined by the XML Schema string datatype.
tooltip (Hyperlink Tooltip)	Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, than the hyperlink text itself may be displayed.  The possible values for this attribute are defined by the XML Schema string datatype.

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Hyperlink">
3 <sequence>
4 <element name="snd" type="CT_EmbeddedWAVAudioFile" minOccurs="0" maxOccurs="1"/>
5 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 <attribute ref="r:id" use="optional"/>
8 <attribute name="invalidUrl" type="xsd:string" use="optional" default=""/>
9 <attribute name="action" type="xsd:string" use="optional" default=""/>
10 <attribute name="tgtFrame" type="xsd:string" use="optional" default=""/>
11 <attribute name="tooltip" type="xsd:string" use="optional" default=""/>
12 <attribute name="history" type="xsd:boolean" use="optional" default="true"/>
13 <attribute name="highlightClick" type="xsd:boolean" use="optional" default="false"/>
14 <attribute name="endSnd" type="xsd:boolean" use="optional" default="false"/>
15 </complexType>

```

#### 16 5.1.2.1.24 ln (Outline)

17 This element specifies an outline style that can be applied to a number of different objects such as shapes and  
18 text. The line allows for the specifying of many different types of outlines including even line dashes and bevels.

**Parent Elements**

bottom (§5.1.4.2.6); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); insideH (§5.1.4.2.14); insideV (§5.1.4.2.15); left (§5.1.4.2.18); lnStyleLst (§5.1.4.1.21); right (§5.1.4.2.22); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tl2br (§5.1.4.2.31); top (§5.1.4.2.32); tr2bl (§5.1.4.2.33); whole (§5.9.3.9)

solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

2

**Attributes****Description**

algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke.  The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, then a value of square is assumed.  The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed.  The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed.  The possible values for this attribute are defined by the ST_LineWidth simple type

Attributes	Description
	(§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_LineProperties">
 <sequence>
 <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
 <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>

 <attribute name="w" type="ST_LineWidth" use="optional"/>
 <attribute name="cap" type="ST_LineCap" use="optional"/>
 <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
 <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>

```

#### 5.1.2.1.25 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§5.1.2.1.10)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	§5.1.2.1.4
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GvmlConnectorNonVisual">
 <sequence>
 <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvCxnSpPr" type="CT_NonVisualConnectorProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.2.1.26 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic

frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§5.1.2.1.18)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§5.1.2.1.5
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGraphicFrameNonVisual">
 <sequence>
 <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGraphicFramePr" type="CT_NonVisualGraphicFrameProperties" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.27 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§5.1.2.1.6
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGroupShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvGrpSpPr" type="CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
 maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.2.1.28 **nvPicPr (Non-Visual Properties for a Picture)**

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following PresentationML.

```
<p:pic>
...
<p:nvPicPr>
...
</p:nvPicPr>
...
</p:pic>
```

*end example]*

Parent Elements
pic (§5.1.2.1.30)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.1.2.1.7
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Gvm1PictureNonVisual">
 <sequence>
 <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvPicPr" type="CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.2.1.29 **nvSpPr (Non-Visual Properties for a Shape)**

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements
sp (§5.1.2.1.33)

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

Child Elements	Subclause
cNvSpPr (Non-Visual Shape Drawing Properties)	§5.1.2.1.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Gvm1ShapeNonVisual">
 <sequence>
 <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
 <element name="cNvSpPr" type="CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.2.1.30 pic (Picture)

This element specifies the existence of a picture object within the document.

[Example: Consider the following PresentationML that specifies the existence of a picture within a document.

This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
 <p:nvPicPr>
 <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
 <p:cNvPicPr>
 <a:picLocks noChangeAspect="1"/>
 </p:cNvPicPr>
 <p:nvPr/>
 </p:nvPicPr>
 <p:blipFill>
 ...
 </p:blipFill>
 <p:spPr>
 ...
 </p:spPr>
</p:pic>
```

*end example]*

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
extLst (Extension List)	§5.1.2.1.15
nvPicPr (Non-Visual Properties for a Picture)	§5.1.2.1.28

Child Elements	Subclause
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_GvmlPicture">
 <sequence>
 <element name="nvPicPr" type="CT_GvmlPictureNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="blipFill" type="CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.2.1.31 picLocks (Picture Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvPicPr (§5.6.2.7); cNvPicPr (§4.4.1.11); cNvPicPr (§5.2.2.2); cNvPicPr (§5.1.2.1.7); cNvPicPr (§5.8.2.6)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeShapeTy	Specifies that the generating application should not allow shape type changes for the

Attributes	Description
pe (Disallow Shape Type Change)	<p>corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noCrop (Disallow Crop Changes)	<p>Specifies that the generating application should not allow cropping for the corresponding picture. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noEditPoints (Disallow Shape Point Editing)	<p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noSelect (Disallow Shape Selection)	<p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureLocking">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attributeGroup ref="AG_Locking"/>
 <attribute name="noCrop" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.32 snd (Hyperlink Sound)

This element specifies a sound to be played when a hyperlink within the document is activated. This sound is specified from within the parent hyperlink element.

Parent Elements
hlinkClick (§5.1.5.3.5); hlinkHover (§5.1.2.1.23); hlinkMouseOver (§5.1.5.3.6)

Attributes	Description
builtIn (Recognized Built-In Sound)	<p>Specifies whether or not this sound is a built-in sound. If this attribute is set to true then the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
embed (Embedded Audio File Relationship ID)  Namespace: .../officeDocument /2006/relationships	<p>Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).</p>
name (Sound Name)	<p>Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.</p> <p>The possible values for this attribute are defined by the XML Schema string datatype.</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedWAVAudioFile">
 <attribute ref="r:embed" use="required"/>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
 <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

### 5.1.2.1.33 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[Note: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
nvSpPr (Non-Visual Properties for a Shape)	§5.1.2.1.29
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37
txSp (Text Shape)	§5.1.2.1.41

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlShape">
 <sequence>
 <element name="nvSpPr" type="CT_GvmlShapeNonVisual" minOccurs="1" maxOccurs="1"/>
 <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="txSp" type="CT_GvmlTextShape" minOccurs="0" maxOccurs="1"/>
 <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

### 5.1.2.1.34 spLocks (Shape Locks)

This element specifies all locking properties for a shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvSpPr (§5.1.2.1.9); cNvSpPr (§5.8.2.8); cNvSpPr (§5.6.2.9); cNvSpPr (§4.4.1.13)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
------------	-------------

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	<p>Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noChangeArrowheads (Disallow Arrowhead Changes)	<p>Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noChangeAspect (Disallow Aspect Ratio Change)	<p>Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noChangeShapeType (Disallow Shape Type Change)	<p>Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noEditPoints (Disallow Shape Point Editing)	<p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noGrp (Disallow Shape Grouping)	<p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noMove (Disallow Shape Movement)	<p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noResize (Disallow Shape Resize)	<p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the XML Schema boolean datatype.</p>
noRot (Disallow Shape Rotation)	<p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
noTextEdit (Disallow Shape Text Editing)	Specifies that the generating application should not allow editing of the shape text for the corresponding shape. If this attribute is not specified, then a value of false is assumed.  The possible values for this attribute are defined by the XML Schema boolean datatype.

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_ShapeLocking">
3 <sequence>
4 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attributeGroup ref="AG_Locking"/>
7 <attribute name="noTextEdit" type="xsd:boolean" use="optional" default="false"/>
8 </complexType>

```

#### 9 5.1.2.1.35 spPr (Shape Properties)

10 This element specifies the visual shape properties that can be applied to a shape.

Parent Elements
cxnSp (§5.1.2.1.10); lnDef (§5.1.4.1.20); pic (§5.1.2.1.30); sp (§5.1.2.1.33); spDef (§5.1.4.1.27); txDef (§5.1.4.1.28)

11

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44

Child Elements	Subclause
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

1

Attributes	Description
bwMode (Black and White Mode)	<p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note:</i> This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).</p>

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ShapeProperties">
4 <sequence>
5 <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
6 <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
7 <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
8 <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
9 <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
10 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
11 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
12 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
13 </sequence>
14 <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
15 </complexType>

```

### 16 5.1.2.1.36 stCxn (Connection Start)

17 This element specifies the starting connection that should be made by the corresponding connector shape. This  
18 connects the head of the connector to the first shape.

Parent Elements
cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4)

19

Attributes	Description
id (Identifier)	Specifies the id of the shape to make the final connection to.  The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
idx (Index)	Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it must be specified which connection site the corresponding connector shape should connect to.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Connection">
3 <attribute name="id" type="ST_DrawingElementId" use="required"/>
4 <attribute name="idx" type="xsd:unsignedInt" use="required"/>
5 </complexType>
```

#### 6 5.1.2.1.37 style (Shape Style)

7 This element specifies the style information for a shape.

Parent Elements
cxnSp (§5.1.2.1.10); lnDef (§5.1.4.1.20); pic (§5.1.2.1.30); sp (§5.1.2.1.33); spDef (§5.1.4.1.27); txDef (§5.1.4.1.28)

8

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

9 The following XML Schema fragment defines the contents of this element:

```
10 <complexType name="CT_ShapeStyle">
11 <sequence>
12 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
13 <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
14 <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
15 <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
16 </sequence>
17 </complexType>
```

#### 18 5.1.2.1.38 sx (Horizontal Ratio)

19 This element specifies the horizontal ratio for use within a scaling calculation.

Parent Elements
scale (§4.3.2.13)

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation.  The possible values for this attribute are defined by the XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation.  The possible values for this attribute are defined by the XML Schema long datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Ratio">
 <attribute name="n" type="xsd:long" use="required"/>
 <attribute name="d" type="xsd:long" use="required"/>
</complexType>
```

### 5.1.2.1.39 sy (Vertical Ratio)

This element specifies the vertical ratio for use within a scaling calculation.

Parent Elements
scale (§4.3.2.13)

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation.  The possible values for this attribute are defined by the XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation.  The possible values for this attribute are defined by the XML Schema long datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Ratio">
 <attribute name="n" type="xsd:long" use="required"/>
 <attribute name="d" type="xsd:long" use="required"/>
</complexType>
```

### 5.1.2.1.40 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
tc (§5.1.6.14); txSp (§5.1.2.1.41)

1

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_TextBody">
4 <sequence>
5 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
6 <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
7 <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
8 </sequence>
9 </complexType>

```

#### 10 5.1.2.1.41 txSp (Text Shape)

11 This element specifies the existence of a text shape within a parent shape. This text shape is specifically used for  
 12 displaying text as it has only text related child elements.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1); sp (§5.1.2.1.33)

13

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
txBody (Shape Text Body)	§5.1.2.1.40
useSpRect (Use Shape Text Rectangle)	§5.1.2.1.42
xfrm (2D Transform for Individual Objects)	§5.1.9.6

14 The following XML Schema fragment defines the contents of this element:

```

15 <complexType name="CT_GvmlTextShape">
16 <sequence>
17 <element name="txBody" type="CT_TextBody" minOccurs="1" maxOccurs="1"/>
18 <choice>
19 <element name="useSpRect" type="CT_GvmlUseShapeRectangle" minOccurs="1" maxOccurs="1"/>
20 <element name="xfrm" type="CT_Transform2D" minOccurs="1" maxOccurs="1"/>
21 </choice>
22 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
23 </sequence>
24 </complexType>

```

5.1.2.1.42 useSpRect (Use Shape Text Rectangle)

This element specifies that the text rectangle from the parent shape should be used for this text shape. If this attribute is specified then the text rectangle, or text bounding box as it is also called should have the same dimensions as the text bounding box of the parent shape within which this text shape resides.

Parent Elements
txSp (§5.1.2.1.41)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Gvm1UseShapeRectangle"/>
```

5.1.2.2 Colors

Given its own section within DrawingML Basics, colors are an integral part of the DrawingML framework. Colors are used in virtually every object to help describe it's appearance when it is rendered on the screen. Since not every generating application wishes to represent color in the same manner, it is possible to specify color in a number of different ways.

5.1.2.2.1 alpha (Alpha)

This element specifies its input color with the specific opacity, but with its color unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); srgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	<p>Specifies the opacity as expressed by a percentage value.</p> <p><i>[Example: The following represents a green solid fill which is 50% opaque</i></p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:alpha val="50000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedPercentage">
 <attribute name="val" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

#### 5.1.2.2.2 alphaMod (Alpha Modulation)

This element specifies a more or less opaque version of its input color. An alpha modulate never increases the alpha beyond 100%. A 200% alpha modulate makes a input color twice as opaque as before. A 50% alpha modulate makes a input color half as opaque as before.

##### Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

##### Attributes

##### Description

val (Value)

Specifies the opacity as expressed by a percentage relative to the input color.

[Example: The following represents a green solid fill which is 50% opaque

```
<a:solidFill>
 <a:srgbClr val="00FF00">
 <a:alphaMod val="50000"/>
 </a:srgbClr>
</a:solidFill>
```

end example]

The possible values for this attribute are defined by the ST\_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositivePercentage">
 <attribute name="val" type="ST_PositivePercentage" use="required"/>
</complexType>
```

#### 5.1.2.2.3 alphaOff (Alpha Offset)

This element specifies a more or less opaque version of its input color. Increases or decreases the input alpha percentage by the specified percentage offset. A 10% alpha offset increases a 50% opacity to 60%. A -10% alpha offset decreases a 50% opacity to 40%. The transformed alpha values are limited to a range of 0 to 100%. A 10% alpha offset increase to a 100% opaque object still results in 100% opacity.

##### Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

1

Attributes	Description
val (Value)	<p>Specifies the opacity as expressed by a percentage offset increase or decrease relative to the input color. Increases will never increase the opacity beyond 100%, decreases will never decrease the opacity below 0%.</p> <p>[Example: The following represents a green solid fill which is 90% opaque]</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:alphaOff val="-10000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_FixedPercentage">
4 <attribute name="val" type="ST_FixedPercentage" use="required"/>
5 </complexType>
```

#### 6 5.1.2.2.4 blue (Blue)

7 This element specifies the input color with the specific blue component, but with the red and green color  
8 components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

9

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)]</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre>

Attributes	Description
	<p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Percentage">
3 <attribute name="val" type="ST_Percentage" use="required"/>
4 </complexType>
```

#### 5 5.1.2.2.5 blueMod (Blue Modification)

6 This element specifies the input color with its blue component modulated by the given percentage. A 50% blue  
7 modulate will reduce the blue component by half. A 200% blue modulate will double the blue component.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

8

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p><i>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</i></p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

9 The following XML Schema fragment defines the contents of this element:

```
10 <complexType name="CT_Percentage">
11 <attribute name="val" type="ST_Percentage" use="required"/>
12 </complexType>
```

5.1.2.2.6 blueOff (Blue Offset)

This element specifies the input color with its blue component shifted, but with its red and green color components unchanged.

Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes

Description

val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
-------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.7 comp (Complement)

This element specifies that the color rendered should be the complement of its input color with the complement being defined as such. Two colors are called complementary if, when mixed they produce a shade of grey. For instance, the complement of red which is RGB (255, 0, 0) is cyan which is RGB (0, 255, 255).

Primary colors and secondary colors are typically paired in this way:

- red and cyan (where cyan is the mixture of green and blue)
- green and magenta (where magenta is the mixture of red and blue)
- blue and yellow (where yellow is the mixture of red and green)

[Example:

The following represents the complement of red:

```
<a:solidFill>
 <a:srgbClr val="FF0000">
 <a:comp/>
 </a:srgbClr>
</a:solidFill>
```

*end example]*

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ComplementTransform"/>
```

5.1.2.2.8 **gamma (Gamma)**

This element specifies that the output color rendered by the generating application should be the sRGB gamma shift of the input color.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GammaTransform"/>
```

5.1.2.2.9 **gray (Gray)**

This element specifies a grayscale of its input color, taking into relative intensities of the red, green, and blue primaries.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GrayscaleTransform"/>
```

5.1.2.2.10 **green (Green)**

This elements specifies the input color with the specified green component, but with its red and blue color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Parent Elements
sysClr (§5.1.2.2.33)

1

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Percentage">
4 <attribute name="val" type="ST_Percentage" use="required"/>
5 </complexType>
```

6 

### 5.1.2.2.11 greenMod (Green Modification)

7 This element specifies the input color with its green component modulated by the given percentage. A 50%  
8 green modulate will reduce the green component by half. A 200% green modulate will double the green  
9 component.

Parent Elements

10

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;</pre>

Attributes	Description
	<pre>&lt;a:srgbClr val="00FF00"&gt;   &lt;a:blue val="100000"/&gt; &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Percentage">
3 <attribute name="val" type="ST_Percentage" use="required"/>
4 </complexType>
```

#### 5 5.1.2.2.12 greenOff (Green Offset)

6 This element specifies the input color with its green component shifted, but with its red and blue color  
7 components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

8

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p><i>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</i></p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

#### 5.1.2.2.13 hslClr (Hue, Saturation, Luminance Color Model)

This element specifies a color using the HSL color model. A perceptual gamma of 2.2 is assumed.

Hue refers to the dominant wavelength of color, saturation refers to the purity of its hue, and luminance refers to its lightness or darkness.

As with all colors, colors defined with the HSL color model may have color transforms applied to it.

*[Example:*

The color blue having RGB value RRGGBB = (00, 00, 80) is equivalent to

```
<a:solidFill>
 <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
```

*end example]*

1

Attributes	Description
hue (Hue)	<p>Specifies the angular value describing the wavelength. Expressed in 1/6000ths of a degree.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).</p>
lum (Luminance)	<p>Specifies the luminance referring to the lightness or darkness of the color. Expressed as a percentage with 0% referring to maximal dark (black) and 100% referring to maximal white.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>
sat (Saturation)	<p>Specifies the saturation referring to the purity of the hue. Expressed as a percentage with 0% referring to grey, 100% referring to the purest form of the hue.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type</p>

Attributes	Description
	(§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HslColor">
 <sequence>
 <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="hue" type="ST_PositiveFixedAngle" use="required"/>
 <attribute name="sat" type="ST_Percentage" use="required"/>
 <attribute name="lum" type="ST_Percentage" use="required"/>
</complexType>
```

#### 5.1.2.2.14 hue (Hue)

This element specifies the input color with the specified hue, but with its saturation and luminance unchanged.

[Example: The following two solid fills are equivalent.

```
<a:solidFill>
 <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
<a:solidFill>
 <a:hslClr hue="0" sat="100000" lum="50000">
 <a:hue val="14400000"/>
 <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the actual angle value to be used with the input color's hue component.  The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedAngle">
 <attribute name="val" type="ST_PositiveFixedAngle" use="required"/>
</complexType>
```

### 5.1.2.2.15 hueMod (Hue Modulate)

This element specifies the input color with its hue modulated by the given percentage. A 50% hue modulate decreases the angular hue value by half. A 200% hue modulate doubles the angular hue value.

#### Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

#### Attributes

val (Value)

#### Description

Specifies the opacity as expressed by a percentage relative to the input color.

[Example: The following represents a green solid fill which is 50% opaque

```
<a:solidFill>
 <a:srgbClr val="00FF00">
 <a:alphaMod val="50000"/>
 </a:srgbClr>
</a:solidFill>
```

*end example]*

The possible values for this attribute are defined by the ST\_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositivePercentage">
 <attribute name="val" type="ST_PositivePercentage" use="required"/>
</complexType>
```

### 5.1.2.2.16 hueOff (Hue Offset)

This element specifies the input color with its hue shifted, but with its saturation and luminance unchanged.

#### Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

#### Attributes

val (Value)

#### Description

Specifies the actual angular value of the shift. The result of the shift must be between 0 and 360 degrees. Shifts resulting in angular values less than 0 will be treated as 0. Shifts resulting in angular values greater than 360 will be treated as 360.

[Example:

The following increases the hue angular value by 10 degrees.

Attributes	Description
	<pre> &lt;a:solidFill&gt;   &lt;a:hslClr hue="0" sat="100000" lum="50000"/&gt;   &lt;a:hueOff val="600000"/&gt; &lt;/a:solidFill&gt; end example] </pre> <p>The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Angle">
3 <attribute name="val" type="ST_Angle" use="required"/>
4 </complexType>

```

#### 5 5.1.2.2.17 inv (Inverse)

6 This element specifies the inverse of its input color. For example, the inverse of red (1, 0, 0) is cyan (0, 1, 1 ).

7 *[Example:*

8 The following represents cyan, the inverse of red:

```

9 <a:solidFill>
10 <a:srgbClr val="FF0000">
11 <a:inv/>
12 </a:srgbClr>
13 </a:solidFill>

```

14 *end example]*

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

15 The following XML Schema fragment defines the contents of this element:

```

16 <complexType name="CT_InverseTransform"/>

```

#### 17 5.1.2.2.18 invGamma (Inverse Gamma)

18 This element specifies that the output color rendered by the generating application should be the inverse sRGB  
19 gamma shift of the input color.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InverseGammaTransform"/>
```

5.1.2.2.19 lum (Luminance)

This element specifies the input color with the specified luminance, but with its hue and saturation unchanged. Typically luminance values fall in the range [0%, 100%].

[Example:

The following two solid fills are equivalent:

```
<a:solidFill>
 <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
<a:solidFill>
 <a:hslClr hue="14400000" sat="100000" lum="0">
 <a:lum val="50000"/>
 <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes

Description

val (Value)

Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.

[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)

```
<a:solidFill>
 <a:srgbClr val="00FF00">
 <a:blue val="100000"/>
 </a:srgbClr>
</a:solidFill>
```

end example]

The possible values for this attribute are defined by the ST\_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.20 lumMod (Luminance Modulation)

This element specifies the input color with its luminance modulated by the given percentage. A 50% luminance modulate will reduce the luminance by half. A 200% luminance modulate will double the luminance.

Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes

Description

val (Value)

Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.

[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)

```
<a:solidFill>
 <a:srgbClr val="00FF00">
 <a:blue val="100000"/>
 </a:srgbClr>
</a:solidFill>
```

end example]

The possible values for this attribute are defined by the ST\_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.21 lumOff (Luminance Offset)

This element specifies the input color with its luminance shifted, but with its hue and saturation unchanged.

Parent Elements

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Percentage">
3 <attribute name="val" type="ST_Percentage" use="required"/>
4 </complexType>
```

#### 5 5.1.2.2.22 prstClr (Preset Color)

6 This element specifies a color which is bound to one of a predefined collection of colors.

7 [Example:

8 The following defines a solid fill bound to the "black" preset color.

```
9 <a:solidFill>
10 <a:prstClr val="black">
11 </a:solidFill>
```

12 *end example]*

 <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
 </sequence>
 <attribute name="val" type="ST_PresetColorVal"/>
</complexType>
```

#### 5.1.2.2.23 red (Red)

This element specifies the input color with the specified red component, but with its green and blue color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

#### 5.1.2.2.24 redMod (Red Modulation)

This element specifies the input color with its red component modulated by the given percentage. A 50% red modulate will reduce the red component by half. A 200% red modulate will double the red component.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32);

Parent Elements
sysClr (§5.1.2.2.33)

1

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Percentage">
4 <attribute name="val" type="ST_Percentage" use="required"/>
5 </complexType>
```

#### 6 5.1.2.2.25 redOff (Red Offset)

7 This element specifies the input color with its red component shifted, but with its green and blue color  
8 components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

9

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;</pre>

Attributes	Description
	<pre>&lt;a:blue val="100000"/&gt; &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Percentage">
3 <attribute name="val" type="ST_Percentage" use="required"/>
4 </complexType>
```

#### 5 5.1.2.2.26 sat (Saturation)

6 This element specifies the input color with the specified saturation, but with its hue and luminance unchanged.  
7 Typically saturation values fall in the range [0%, 100%].

8  
9 *[Example:*

10 The following two solid fills are equivalent:

```
11 <a:solidFill>
12 <a:hslClr hue="14400000" sat="100000" lum="50000">
13 </a:solidFill>
14 <a:solidFill>
15 <a:hslClr hue="14400000" sat="0" lum="50000">
16 <a:sat val="100000"/>
17 <a:hslClr/>
18 </a:solidFill>
```

19 *end example]*

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

20

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p><i>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</i></p>

Attributes	Description
	<pre> &lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_Percentage">
3 <attribute name="val" type="ST_Percentage" use="required"/>
4 </complexType>

```

#### 5 5.1.2.2.27 satMod (Saturation Modulation)

6 This element specifies the input color with its saturation modulated by the given percentage. A 50% saturation  
7 modulate will reduce the saturation by half. A 200% saturation modulate will double the saturation.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

8

Attributes	Description
val (Value)	<p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre> &lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:blue val="100000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt; </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.28      **satOff (Saturation Offset)**

This element specifies the input color with its saturation shifted, but with its hue and luminance unchanged. A 10% offset to 20% saturation yields 30% saturation.

**Parent Elements**

hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

**Attributes**

**Description**

val (Value)

Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.

[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)

```
<a:solidFill>
 <a:srgbClr val="00FF00">
 <a:blue val="100000"/>
 </a:srgbClr>
</a:solidFill>
```

*end example]*

The possible values for this attribute are defined by the ST\_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
 <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.29      **schemeClr (Scheme Color)**

This element specifies a color bound to a user's theme. As with all elements which define a color, it is possible to apply a list of color transforms to the base color defined.

**Parent Elements**

accent1 (§5.1.4.1.1); accent2 (§5.1.4.1.2); accent3 (§5.1.4.1.3); accent4 (§5.1.4.1.4); accent5 (§5.1.4.1.5); accent6 (§5.1.4.1.6); alphaInv (§5.1.10.4); bgClr (§5.1.10.10); bgRef (§4.4.1.3); buClr (§5.1.5.4.4); clrFrom (§5.1.10.17); clrMru (§4.3.1.4); clrRepl (§5.1.10.18); clrTo (§5.1.10.19); clrVal (§4.6.27); contourClr (§5.1.7.6);

Attributes	Description
val (Value)	<p>Specifies the desired scheme.</p> <p><i>[Example: The following represents a color bound to the "lt1" theme color</i></p> <pre>&lt;a:solidFill&gt;   &lt;a:schemeClr val="lt1"/&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_SchemeColorVal simple type (§5.1.12.54).</p>

2 The following XML Schema fragment defines the contents of this element:

3	<complexType name="CT_SchemeColor">
4	<sequence>
5	<group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
6	</sequence>
7	<attribute name="val" type="ST_SchemeColorVal" use="required"/>
8	</complexType>

9 **5.1.2.2.30      scrgbClr (RGB Color Model - Percentage Variant)**

10 This element specifies a color using the red, green, blue RGB color model. Each component, red, green, and blue  
 11 is expressed as a percentage from 0% to 100%. A linear gamma of 1.0 is assumed.

12 Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

13 *[Example: The following represent the same color*

```
14 <a:solidFill>
15 <a:scrgbClr r="50000" g="50000" b="50000"/>
16 </a:solidFill>
17 <a:solidFill>
18 <a:srgbClr val="BCBCBC"/>
19 </a:solidFill>
```

1

Attributes	Description
b (Blue)	Specifies the percentage of blue.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
g (Green)	Specifies the percentage of green.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Red)	Specifies the percentage of red.  The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_ScRgbColor">
4 <sequence>
5 <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="r" type="ST_Percentage" use="required"/>
8 <attribute name="g" type="ST_Percentage" use="required"/>
9 <attribute name="b" type="ST_Percentage" use="required"/>
10 </complexType>

```

11 **5.1.2.2.31 shade (Shade)**

12 This element specifies a darker version of its input color. A 10% shade is 10% of the input color combined with  
13 90% black.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

14

Attributes	Description
val (Value)	Specifies the opacity as expressed by a percentage value.  [Example: The following represents a green solid fill which is 50% opaque

Attributes	Description
	<pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:alpha val="50000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_PositiveFixedPercentage">
3 <attribute name="val" type="ST_PositiveFixedPercentage" use="required"/>
4 </complexType>
```

5 **5.1.2.2.32 srgbClr (RGB Color Model - Hex Variant)**

6 This element specifies a color using the red, green, blue RGB color model. Red, green, and blue is expressed as  
7 sequence of hex digits, RRGGBB. A perceptual gamma of 2.2 is used.

8 Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

9 *[Example: The following represent the same color*

```
10 <a:solidFill>
11 <a:scrgbClr r="50000" g="50000" b="50000"/>
12 </a:solidFill>
13 <a:solidFill>
14 <a:srgbClr val="BCBCBC"/>
15 </a:solidFill>
```

16 *end example]*

Attributes	Description
lastClr (Last Color)	Specifies the color value that was last computed by the generating application.  The possible values for this attribute are defined by the ST_HexBinary3 simple type (§5.1.12.28).
val (Value)	Specifies the system color value.  The possible values for this attribute are defined by the ST_SystemColorVal simple type (§5.1.12.58).

2 The following XML Schema fragment defines the contents of this element:

```

3 <complexType name="CT_SystemColor">
4 <sequence>
5 <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
6 </sequence>
7 <attribute name="val" type="ST_SystemColorVal" use="required"/>
8 <attribute name="lastClr" type="ST_HexBinary3" use="optional"/>
9 </complexType>

```

#### 5.1.2.2.34 tint (Tint)

This element specifies a lighter version of its input color. A 10% tint is 10% of the input color combined with 90% white.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	<p>Specifies the opacity as expressed by a percentage value.</p> <p>[Example: The following represents a green solid fill which is 50% opaque</p> <pre>&lt;a:solidFill&gt;   &lt;a:srgbClr val="00FF00"&gt;     &lt;a:alpha val="50000"/&gt;   &lt;/a:srgbClr&gt; &lt;/a:solidFill&gt;</pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).</p>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedPercentage">
 <attribute name="val" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

### 5.1.3 Audio and Video

The Audio and Video portion of the DrawingML framework deals with all media of these two types that can be attached to objects within a document. Types of audio that can be represented within a file are CD audio, QuickTime audio, and any other generic audio. When dealing with generic audio there is the option for embedding it within the file and also linking it. The linking option is preferable if the size of the audio file is too large and will thus increase the size of the document by an undesirable amount. For video there are two types that can be represented and that is either a QuickTime movie or any other generic movie. When dealing with generic video there is only the option of linking to the media as video is too large to embed within a document.

#### 5.1.3.1 audioCd (Audio from CD)

This element specifies the existence of Audio from a CD. This element is specified within the non-visual properties of an object. The audio must be attached to an object as this is how it is represented within the document. The actual playing of the sound however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has an audio from a CD attached to it.

```
<p:pic>
 <p:nvPicPr>
 <p:cNvPr id="7" name="Rectangle 6">
 <a:hlinkClick r:id="" action="ppaction://media"/>
 </p:cNvPr>
 <p:cNvPicPr>
 <a:picLocks noRot="1"/>
 </p:cNvPicPr>
 <p:nvPr>
 <a:audioCd>
 <a:st track="1"/>
 <a:end track="3" time="65"/>
 </a:audioCd>
 </p:nvPr>
 </p:nvPicPr>
 ...
</p:pic>
```

In the above example, we see that there is a single audioCD element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this audioCD element from within the timing node list. For this example we see that the audio for this CD will start playing at the 0 second mark on the first track and will end on the 1 minute 5 second mark of the third track. *end example*]

Parent Elements
<code>nvPr</code> (§4.4.1.30)

Child Elements	Subclause
<code>end</code> (Audio End Time)	§5.1.3.3
<code>extLst</code> (Extension List)	§5.1.2.1.15
<code>st</code> (Audio Start Time)	§5.1.3.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioCD">
 <sequence>
 <element name="st" type="CT_AudioCDTime" minOccurs="1" maxOccurs="1"/>
 <element name="end" type="CT_AudioCDTime" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.3.2 audioFile (Audio from File)

This element specifies the existence of an audio file. This element is specified within the non-visual properties of an object. The audio must be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has an audio file attached to it.

```
<p:pic>
 <p:nvPicPr>
 <p:cNvPr id="7" name="Rectangle 6">
 <a:hlinkClick r:id="" action="ppaction://media"/>
 </p:cNvPr>
 <p:cNvPicPr>
 <a:picLocks noRot="1"/>
 </p:cNvPicPr>
 <p:nvPr>
 <a:audioFile r:link="rId1"/>
 </p:nvPr>
 </p:nvPicPr>
 ...
</p:pic>
```

In the above example, we see that there is a single audioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this audioFile element from within the timing node list. The Linked relationship id will be used to retrieve the actual audio file for playback purposes. end example]

Parent Elements
<a href="#">nvPr (§4.4.1.30)</a>

Child Elements	Subclause
<a href="#">extLst (Extension List)</a>	<a href="#">§5.1.2.1.15</a>

Attributes	Description
<a href="#">link (Linked Relationship ID)</a>	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioFile">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:link" use="required"/>
</complexType>
```

### 5.1.3.3 end (Audio End Time)

This element specifies the end point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should halt its playback. This element will be used in conjunction with an Audio Start Time element to specify the time span for an entire audioCD sound element.

[Example: Consider the following DrawingML.

```
<a:audioCd>
 <a:st track="1" time="2"/>
 <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown will specify for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Parent Elements
audioCd (§5.1.3.1)

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio will begin playing on. This attribute is required and cannot be omitted.  The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioCDTime">
 <attribute name="track" type="xsd:unsignedByte" use="required"/>
 <attribute name="time" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

5.1.3.4 quickTimeFile (QuickTime from File)

This element specifies the existence of a QuickTime file. This element is specified within the non-visual properties of an object. The QuickTime file must be attached to an object as this is how it is represented within the document. The actual playing of the QuickTime however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has a QuickTime file attached to it.

```
<p:pic>
 <p:nvPicPr>
 <p:cNvPr id="7" name="Rectangle 6">
 <a:hlinkClick r:id="" action="ppaction://media"/>
 </p:cNvPr>
 <p:cNvPicPr>
 <a:picLocks noRot="1"/>
 </p:cNvPicPr>
 <p:nvPr>
 <a:quickTimeFile r:link="rId1"/>
 </p:nvPr>
 </p:nvPicPr>
 ...
</p:pic>
```

In the above example, we see that there is a single quickTimeFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this quickTimeFile element from within the timing node list. The Linked relationship id will be used to retrieve the actual video file for playback purposes. end example]

Parent Elements
<a href="#">nvPr (§4.4.1.30)</a>

Child Elements	Subclause
<a href="#">extLst (Extension List)</a>	<a href="#">§5.1.2.1.15</a>

Attributes	Description
<a href="#">link (Linked Relationship ID)</a>	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file.
Namespace: .../officeDocument /2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QuickTimeFile">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:link" use="required"/>
</complexType>
```

### 5.1.3.5 st (Audio Start Time)

This element specifies the start point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should begin its playback. This element will be used in conjunction with an Audio End Time element to specify the time span for an entire audioCD sound element.

[Example: Consider the following DrawingML.

```
<a:audioCd>
 <a:st track="1" time="2"/>
 <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown will specify for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Parent Elements
audioCd (§5.1.3.1)

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed.  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio will begin playing on. This attribute is required and cannot be omitted.  The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioCDTime">
 <attribute name="track" type="xsd:unsignedByte" use="required"/>
 <attribute name="time" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

5.1.3.6 videoFile (Video from File)

This element specifies the existence of a video file. This element is specified within the non-visual properties of an object. The video must be attached to an object as this is how it is represented within the document. The actual playing of the video however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has a video attached to it.

```
<p:pic>
 <p:nvPicPr>
 <p:cNvPr id="7" name="Rectangle 6">
 <a:hlinkClick r:id="" action="ppaction://media"/>
 </p:cNvPr>
 <p:cNvPicPr>
 <a:picLocks noRot="1"/>
 </p:cNvPicPr>
 <p:nvPr>
 <a:videoFile r:link="rId1"/>
 </p:nvPr>
 </p:nvPicPr>
 ...
</p:pic>
```

In the above example, we see that there is a single videoFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this videoFile element from within the timing node list. The Linked relationship id will be used to retrieve the actual video file for playback purposes. end example]

Parent Elements
<a href="#">nvPr (§4.4.1.30)</a>

Child Elements	Subclause
<a href="#">extLst (Extension List)</a>	<a href="#">§5.1.2.1.15</a>

Attributes	Description
<a href="#">link (Linked Relationship ID)</a>	Specifies the identification information for a linked video file. This attribute is used to specify the location of an object that does not reside within this file.
Namespace: .../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VideoFile">
 <sequence>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute ref="r:link" use="required"/>
</complexType>
```

### 5.1.3.7 wavAudioFile (Audio from WAV File)

This element specifies the existence of an audio WAV file. This element is specified within the non-visual properties of an object. The audio must be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has an audio WAV file attached to it.

```
<p:pic>
 <p:nvPicPr>
 <p:cNvPr id="7" name="Rectangle 6">
 <a:hlinkClick r:id="" action="ppaction://media"/>
 </p:cNvPr>
 <p:cNvPicPr>
 <a:picLocks noRot="1"/>
 </p:cNvPicPr>
 <p:nvPr>
 <a:wavAudioFile r:embed="rId2"/>
 </p:nvPr>
 </p:nvPicPr>
 ...
</p:pic>
```

In the above example, we see that there is a single wavAudioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this wavAudioFile element from within the timing node list. The Embedded relationship id will be used to retrieve the actual audio file for playback purposes. *end example]*

[Note: This element is generally used for the purposes of embedding audio files within the document. For linking to generic audio files the audioFile element should be used. *end note]*

Parent Elements
nvPr (§4.4.1.30)

Attributes	Description
builtIn (Recognized)	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then

Attributes	Description
Built-In Sound)	the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed.  The possible values for this attribute are defined by the XML Schema boolean datatype.
embed (Embedded Audio File Relationship ID)  Namespace: .../officeDocument/2006/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file.  The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_EmbeddedWAVAudioFile">
 <attribute ref="r:embed" use="required"/>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
 <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>

```

## 5.1.4 Styles

Styles within DrawingML refer to the way a particular object (be it text or a shape, or anything else) is formatted. Different aspects, ranging from color, line type, fill, and effects applied to the object can be predefined within a theme. The main purpose of a theme is to define a style matrix from which a document can pull style information from in order to format the visual look of objects in a document.

### 5.1.4.1 Styles

The elements in this section compose the basic definition of a style, including its associated colors, effect styles, line styles, fill styles, background styles, and font scheme.

#### 5.1.4.1.1 accent1 (Accent 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

*[Example: Consider the following example of a set of colors that form a color scheme:*

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>

```

#### 5.1.4.1.2 accent2 (Accent 2)

This element defines a color that happens to be the accent 2 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

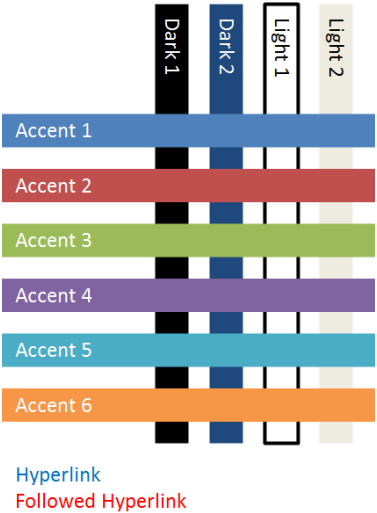

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.3      accent3 (Accent 3)

This element defines a color that happens to be the accent 3 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.4      accent4 (Accent 4)

This element defines a color that happens to be the accent 4 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

#### 5.1.4.1.5 accent5 (Accent 5)

This element defines a color that happens to be the accent 5 color. The set of twelve colors come together to form the color scheme for a theme.

*[Example:* Consider the following example of a set of colors that form a color scheme:

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.6      accent6 (Accent 6)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.7 bgFillStyleLst (Background Fill Style List)

This element defines a list of background fills that are used within a theme. The background fills consist of three fills, arranged in order from subtle to moderate to intense.

[Example: Consider the following example of a background fill style list within DrawingML:

```
1 <bgFillStyleLst>
2 <solidFill>
3 ...
4 </solidFill>
5 <gradFill rotWithShape="1">
6 ...
7 </gradFill>
8 <blipFill>
9 ...
10 </blipFill>
11 </bgFillStyleLst>
```

12 In this example, we see that the list contains a solid fill for the subtle fill, a gradient fill for the moderate fill and  
13 an image fill for the intense background fill. *end example]*

Parent Elements	
fmtScheme (§5.1.4.1.14)	

14

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

15 The following XML Schema fragment defines the contents of this element:

```
16 <complexType name="CT_BackgroundFillStyleList">
17 <sequence>
18 <group ref="EG_FillProperties" minOccurs="3" maxOccurs="unbounded"/>
19 </sequence>
20 </complexType>
```

21 **5.1.4.1.8**      **custClr (Custom color)**

22 This element defines a custom color. The custom colors are used within a custom color list to define custom  
23 colors that are extra colors that can be appended to a theme. This is useful within corporate scenarios where  
24 there is a set corporate color palette from which to work.

Parent Elements	
custClrLst (§5.1.8.3)	

25

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

1

Attributes	Description
name (Name)	The name of the color shown in the color picker.  The possible values for this attribute are defined by the XML Schema string datatype.

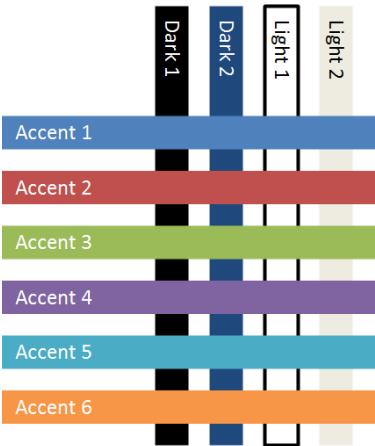

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_CustomColor">
4 <sequence>
5 <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
6 </sequence>
7 <attribute name="name" type="xsd:string" use="optional" default=""/>
8 </complexType>
```

9 5.1.4.1.9 dk1 (Dark 1)

10 This element defines a color that happens to be the dark 1 color. The set of twelve colors come together to  
11 form the color scheme for a theme.

12 [Example: Consider the following example of a set of colors that form a color scheme:

Hyperlink  
Followed Hyperlink

13

14 end example]

Parent Elements
clrScheme (§5.1.8.2)

1

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Color">
4 <sequence>
5 <group ref="EG_ColorChoice"/>
6 </sequence>
7 </complexType>
```

8 5.1.4.1.10 dk2 (Dark 2)

9 This element defines a color that happens to be the dark 2 color. The set of twelve colors come together to  
10 form the color scheme for a theme.

11 [Example: Consider the following example of a set of colors that form a color scheme:

12

13 end example]

Parent Elements
clrScheme (§5.1.8.2)

1

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

2 The following XML Schema fragment defines the contents of this element:

```
3 <complexType name="CT_Color">
4 <sequence>
5 <group ref="EG_ColorChoice"/>
6 </sequence>
7 </complexType>
```

8 5.1.4.1.11 effectStyle (Effect Style)

9 This element defines a set of effects and 3D properties that can be applied to an object.

10 [Example: Consider the following example of an effect style within DrawingML:

```
11 <effectStyle>
12 <effectLst>
13 <outerShdw blurRad="57150" dist="38100" dir="5400000" align="ctr"
14 rotWithShape="0">
15 <schemeClr val="phClr">
16 <shade val="9000"/>
17 <satMod val="105000"/>
18 <alpha val="48000"/>
19 </schemeClr>
20 </outerShdw>
21 </effectLst>
22 </effectStyle>
```

23

24 In this example, an outer shadow is being applied to a shape as the moderate effect. *end example*]

Parent Elements
-----------------

Parent Elements
effectStyleLst (§5.1.4.1.12)

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
scene3d (3D Scene Properties)	§5.1.4.1.26
sp3d (Apply 3D shape properties)	§5.1.7.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectStyleItem">
 <sequence>
 <group ref="EG_EffectProperties" minOccurs="1" maxOccurs="1"/>
 <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
 <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.4.1.12 effectStyleLst (Effect Style List)

This element defines a set of three effect styles that create the effect style list for a theme. The effect styles are arranged in order of subtle to moderate to intense.

[Example: Consider the following example of an effect style list within DrawingML:

```
<effectStyleLst>
 <effectStyle>
 <effectLst>
 <outerShdw blurRad="57150" dist="38100" dir="5400000"
 align="ctr" rotWithShape="0">
 ...
 </outerShdw>
 </effectLst>
 </effectStyle>
 <effectStyle>
 <effectLst>
 <outerShdw blurRad="57150" dist="38100" dir="5400000"
 align="ctr" rotWithShape="0">
 ...
 </outerShdw>
 </effectLst>
 </effectStyle>
```

```
1 <effectStyle>
2 <effectLst>
3 <outerShdw blurRad="57150" dist="38100" dir="5400000"
4 align="ctr" rotWithShape="0">
5 ...
6 </outerShdw>
7 </effectLst>
8 <scene3d>
9 ...
10 </scene3d>
11 <sp3d prstMaterial="powder">
12 ...
13 </sp3d>
14 </effectStyle>
15 </effectStyleLst>
```

16 In this example, we see three effect styles defined. The first two (subtle and moderate) define an outer shadow  
17 as the effect, while the third effect style (intense) defines an outer shadow along with 3D properties which are  
18 to be applied to the object as well. *end example*]

Parent Elements
fmtScheme (§5.1.4.1.14)

19

Child Elements	Subclause
effectStyle (Effect Style)	§5.1.4.1.11

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_EffectStyleList">
22 <sequence>
23 <element name="effectStyle" type="CT_EffectStyleItem" minOccurs="3" maxOccurs="unbounded"/>
24 </sequence>
25 </complexType>
```

26 **5.1.4.1.13 fillStyleLst (Fill Style List)**

27 This element defines a set of three fill styles that are used within a theme. The three fill styles are arranged in  
28 order from subtle to moderate to intense.

29 [Example: Consider the following example of a fill style list within DrawingML:

```
30 <fillStyleLst>
31 <solidFill>
32 ...
33 </solidFill>
```

```
1 <gradFill rotWithShape="1">
2 ...
3 </gradFill>
4 <gradFill rotWithShape="1">
5 ...
6 </gradFill>
7 </fillStyleLst>
```

In this example, we see three fill styles being defined within the fill style list. The first style is the subtle style and defines simply a solid fill. The second and third styles (moderate and intense fills respectively) define gradient fills. *end example*

Parent Elements
fmtScheme (§5.1.4.1.14)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

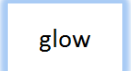

The following XML Schema fragment defines the contents of this element:

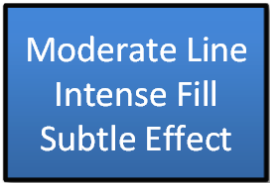

```
<complexType name="CT_FillStyleList">
 <sequence>
 <group ref="EG_FillProperties" minOccurs="3" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

5.1.4.1.14      **fmtScheme (Format Scheme)**

This element contains the background fill styles, effect styles, fill styles, and line styles which define the style matrix for a theme. The style matrix consists of subtle, moderate, and intense fills, lines, and effects. The background fills are not generally thought of to directly be associated with the matrix, but do play a role in the style of the overall document. Usually, a given object will choose a single line style, a single fill style, and a single effect style in order to define the overall final look of the object.

[*Example:* Consider the following example of the style matrix in use within DrawingML:

	Line	Fill	Effect
Subtle			
Moderate			
Intense			

In this example, we see a shape styled which utilizes different aspects from the above defined style matrix. *end example]*

Parent Elements
themeElements (§5.1.8.10); themeOverride (§5.1.8.12)

Child Elements	Subclause
bgFillStyleLst (Background Fill Style List)	§5.1.4.1.7
effectStyleLst (Effect Style List)	§5.1.4.1.12
fillStyleLst (Fill Style List)	§5.1.4.1.13
lnStyleLst (Line Style List)	§5.1.4.1.21

Attributes	Description
name (Name)	Defines the name for the format scheme. The name is simply a human readable string which identifies the format scheme in the user interface.  The possible values for this attribute are defined by the XML Schema string datatype.

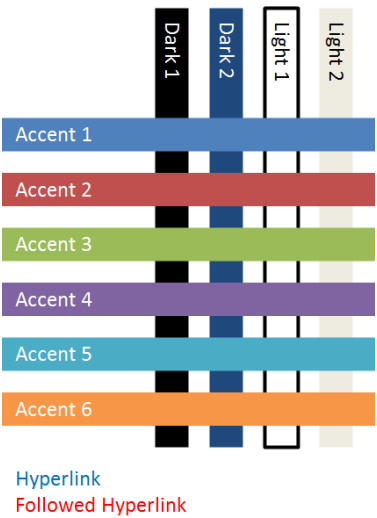

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrix">
 <sequence>
 <element name="fillStyleLst" type="CT_FillStyleList" minOccurs="1" maxOccurs="1"/>
 <element name="lnStyleLst" type="CT_LineStyleList" minOccurs="1" maxOccurs="1"/>
 <element name="effectStyleLst" type="CT_EffectStyleList" minOccurs="1" maxOccurs="1"/>
 <element name="bgFillStyleLst" type="CT_BackgroundFillStyleList" minOccurs="1" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.1.4.1.15 folHlink (Followed Hyperlink)

This element defines a color that happens to be the followed hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.16 font (Font)

This element defines a font within the styles area of DrawingML. A font is defined by a script along with a typeface.

[Example: Consider the following example of a font in DrawingML:

```

```

In this example, we see that the script 'Thai' is supposed to use the font face 'Cordia New'. *end example]*

Parent Elements

font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25)

Attributes

Description

script (Script)	Specifies the script, or language, in which the typeface is supposed to be used.  The possible values for this attribute are defined by the XML Schema string datatype.
typeface (Typeface)	Specifies the font face to use.  The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SupplementalFont">
 <attribute name="script" type="xsd:string" use="required"/>
 <attribute name="typeface" type="ST_TextTypeface" use="required"/>
</complexType>
```

5.1.4.1.17 fontRef (Font Reference)

This element represents a reference to a themed font. When used it specifies which themed font to use along with a choice of color.

[Example: Consider the following example of a font reference within DrawingML:

```
<fontRef idx="minor">
 <schemeClr val="tx1"/>
</fontRef>
```

1 In this example, we see a font referencing the minor font defined within the theme. *end example]*

Parent Elements
style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tcTxStyle (§5.1.4.2.30)

2

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

3

Attributes	Description
idx (Identifier)	Specifies the identifier of the font to reference.  The possible values for this attribute are defined by the ST_FontCollectionIndex simple type (§5.1.12.23).

4 The following XML Schema fragment defines the contents of this element:

```

5 <complexType name="CT_FontReference">
6 <sequence>
7 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
8 </sequence>
9 <attribute name="idx" type="ST_FontCollectionIndex" use="required"/>
10 </complexType>
```

#### 11 5.1.4.1.18 fontScheme (Font Scheme)

12 This element defines the font scheme within the theme. The font scheme consists of a pair of major and minor  
 13 fonts for which to use in a document. The major font corresponds well with the heading areas of a document,  
 14 and the minor font corresponds well with the normal text or paragraph areas.

15 [Example: Consider the following example of a font scheme within DrawingML:

```

16 <fontScheme name="sample">
17 <majorFont>
18 ...
19 </majorFont>
```

```
<minorFont>
...
</minorFont>
</fontScheme>
```

In this example, we see the major and minor font lists within the font scheme that is named 'sample'. *end example]*

Parent Elements
themeElements (§5.1.8.10); themeOverride (§5.1.8.12)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
majorFont (Major Font)	§5.1.4.1.24
minorFont (Minor fonts)	§5.1.4.1.25

Attributes	Description
name (Name)	The name of the font scheme shown in the user interface.  The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontScheme">
 <sequence>
 <element name="majorFont" type="CT_FontCollection" minOccurs="1" maxOccurs="1"/>
 <element name="minorFont" type="CT_FontCollection" minOccurs="1" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="name" type="xsd:string" use="required"/>
</complexType>
```

5.1.4.1.19 **hlink (Hyperlink)**

This element defines a color that happens to be the hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

*end example]*

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.20 InDef (Line Default)

This element defines a default line that is used within a document.

[Example: Consider the following example of a default line defined in DrawingML:

```
1 <lnDef>
2 <spPr/>
3 <bodyPr/>
4 <lstStyle/>
5 <style>
6 <lnRef idx="1">
7 <schemeClr val="accent2"/>
8 </lnRef>
9 <fillRef idx="0">
10 <schemeClr val="accent2"/>
11 </fillRef>
12 <effectRef idx="0">
13 <schemeClr val="accent2"/>
14 </effectRef>
15 <fontRef idx="minor">
16 <schemeClr val="tx1"/>
17 </fontRef>
18 </style>
19 </lnDef>
```

20 In this example, we see that the default line for the document is being defined as a themed line which  
21 references the subtle line style with idx equal to 1. *end example*]

22

Parent Elements
objectDefaults (§5.1.8.7)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
extLst (Extension List)	§5.1.2.1.15
lstStyle (Text List Styles)	§5.1.5.4.12
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

23 The following XML Schema fragment defines the contents of this element:

```
24 <complexType name="CT_DefaultShapeDefinition">
25 <sequence>
26 <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
27 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
28 <element name="lstStyle" type="CT_TextListStyle" minOccurs="1" maxOccurs="1"/>
29 <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
30 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
31 </sequence>
32 </complexType>
```

5.1.4.1.21 **lnStyleLst (Line Style List)**

This element defines a list of three line styles for use within a theme. The three line styles are arranged in order from subtle to moderate to intense versions of lines. This list makes up part of the style matrix.

[Example: Consider the following example of a line style list within DrawingML:

```
<lnStyleLst>
 <ln w="9525" cap="flat" cmpd="sng" algn="ctr">
 <solidFill>
 <schemeClr val="phClr">
 <shade val="50000"/>
 <satMod val="103000"/>
 </schemeClr>
 </solidFill>
 <prstDash val="solid"/>
 </ln>
 <ln w="25400" cap="flat" cmpd="sng" algn="ctr">
 <solidFill>
 <schemeClr val="phClr"/>
 </solidFill>
 <prstDash val="solid"/>
 </ln>
 <ln w="38100" cap="flat" cmpd="sng" algn="ctr">
 <solidFill>
 <schemeClr val="phClr"/>
 </solidFill>
 <prstDash val="solid"/>
 </ln>
</lnStyleLst>
```

In this example, we see three lines defined within a line style list. The first line corresponds to the subtle line, the second to the moderate, and the third corresponds to the intense line defined in the theme. *end example*]

Parent Elements
fmtScheme (§5.1.4.1.14)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24

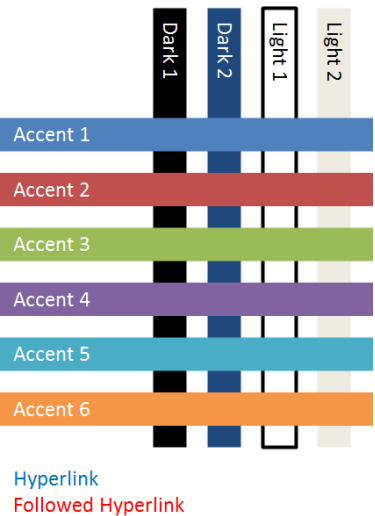

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineStyleList">
 <sequence>
 <element name="ln" type="CT_LineProperties" minOccurs="3" maxOccurs="unbounded"/>
 </sequence>
</complexType>
```

5.1.4.1.22 lt1 (Light 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

Parent Elements

clrScheme (§5.1.8.2)

Child Elements

Subclause

hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.23 lt2 (Light 2)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

Parent Elements

clrScheme (§5.1.8.2)

Child Elements

Subclause

hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
 <sequence>
 <group ref="EG_ColorChoice"/>
 </sequence>
</complexType>
```

5.1.4.1.24 majorFont (Major Font)

This element defines the set of major fonts which are to be used under different languages or locals.

[Example: Consider the following example of the major fonts being defined within DrawingML:

```
<majorFont>
 <latin typeface="Calibri"/>
 <ea typeface="Arial"/>
 <cs typeface="Arial"/>

</majorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*

Parent Elements

fontScheme (§5.1.4.1.18)

Child Elements

Subclause

cs (Complex Script Font)

§5.1.5.3.1

ea (East Asian Font)

§5.1.5.3.3

extLst (Extension List)

§5.1.2.1.15

font (Font)

§5.1.4.1.16

Child Elements	Subclause
latin (Latin Font)	§5.1.5.3.7

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_FontCollection">
 <sequence>
 <element name="latin" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="ea" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="cs" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="font" type="CT_SupplementalFont" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.4.1.25 minorFont (Minor fonts)

This element defines the set of minor fonts that are to be used under different languages or locals.

[Example: Consider the following example of the minor fonts being defined within DrawingML:

```

<minorFont>
 <latin typeface="Calibri"/>
 <ea typeface="Arial"/>
 <cs typeface="Arial"/>

</minorFont>

```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*

Parent Elements
fontScheme (§5.1.4.1.18)

Child Elements	Subclause
cs (Complex Script Font)	§5.1.5.3.1
ea (East Asian Font)	§5.1.5.3.3
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.1.16
latin (Latin Font)	§5.1.5.3.7

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_FontCollection">
 <sequence>
 <element name="latin" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="ea" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="cs" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="font" type="CT_SupplementalFont" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.4.1.26 scene3d (3D Scene Properties)

This element defines optional scene-level 3D properties to apply to an object.

Parent Elements
bodyPr (§5.1.5.1.1); effectStyle (§5.1.4.1.11); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6)

Child Elements	Subclause
backdrop (Backdrop Plane)	§5.1.7.2
camera (Camera)	§5.1.7.5
extLst (Extension List)	§5.1.2.1.15
lightRig (Light Rig)	§5.1.7.9

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_Scene3D">
 <sequence>
 <element name="camera" type="CT_Camera" minOccurs="1" maxOccurs="1"/>
 <element name="lightRig" type="CT_LightRig" minOccurs="1" maxOccurs="1"/>
 <element name="backdrop" type="CT_Backdrop" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

5.1.4.1.27 spDef (Shape Default)

This element defines the formatting that is associated with the default shape. The default formatting can be applied to a shape when it is initially inserted into a document.

[Example: Consider the following example of a shape default being used within DrawingML:

```
<spDef>
 <spPr>
 <solidFill>
 <schemeClr val="accent2">
 <shade val="75000"/>
 </schemeClr>
 </solidFill>
 </spPr>
 <bodyPr rtlCol="0" anchor="ctr"/>
 <lstStyle>
 <defPPr algn="ctr">
 <defRPr/>
 </defPPr>
 </lstStyle>
 <style>
 <lnRef idx="1">
 <schemeClr val="accent1"/>
 </lnRef>
 <fillRef idx="2">
 <schemeClr val="accent1"/>
 </fillRef>
 <effectRef idx="1">
 <schemeClr val="accent1"/>
 </effectRef>
 <fontRef idx="minor">
 <schemeClr val="dk1"/>
 </fontRef>
 </style>
</spDef>
```

In this example, we see a default shape which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

Parent Elements
objectDefaults (§5.1.8.7)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
extLst (Extension List)	§5.1.2.1.15
lstStyle (Text List Styles)	§5.1.5.4.12
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_DefaultShapeDefinition">
 <sequence>
 <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lstStyle" type="CT_TextListStyle" minOccurs="1" maxOccurs="1"/>
 <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.4.1.28 txDef (Text Default)

This element defines the default formatting which is applied to text in a document by default. The default formatting can and should be applied to the shape when it is initially inserted into a document.

[Example: Consider the following example of a text default being used within DrawingML:

```

<txDef>
 <spPr>
 <solidFill>
 <schemeClr val="accent2">
 <shade val="75000"/>
 </schemeClr>
 </solidFill>
 </spPr>
 <bodyPr rtlCol="0" anchor="ctr"/>
 <lstStyle>
 <defPPr algn="ctr">
 <defRPr/>
 </defPPr>
 </lstStyle>
 <style>
 <lnRef idx="1">
 <schemeClr val="accent1"/>
 </lnRef>
 </style>

```

```
1 <fillRef idx="2">
2 <schemeClr val="accent1"/>
3 </fillRef>
4 <effectRef idx="1">
5 <schemeClr val="accent1"/>
6 </effectRef>
7 <fontRef idx="minor">
8 <schemeClr val="dk1"/>
9 </fontRef>
10 </style>
11 </txDef>
```

12 In this example, we see a default text which references a certain themed fill, line, effect, and font along with an  
13 override fill to these. *end example*]

14

Parent Elements
objectDefaults (§5.1.8.7)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
extLst (Extension List)	§5.1.2.1.15
lstStyle (Text List Styles)	§5.1.5.4.12
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

15 The following XML Schema fragment defines the contents of this element:

```
16 <complexType name="CT_DefaultShapeDefinition">
17 <sequence>
18 <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
19 <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
20 <element name="lstStyle" type="CT_TextListStyle" minOccurs="1" maxOccurs="1"/>
21 <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
22 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
23 </sequence>
24 </complexType>
```

25 **5.1.4.2 Table Styles**

26 Table styles are responsible for the rapid formatting that can be applied to a table. This rapid formatting takes  
27 different parts of a table into account, such as if the first row or last row should be emphasized, or if there is  
28 some type of banding (row for example) present on the table. All of these different types of formatting can be  
29 defined within a table style

5.1.4.2.1 band1H (Band 1 Horizontal)

This element describes the formatting for the first row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 1 horizontal being used within DrawingML:

```
<band1H>
 <tcStyle>
 <tcBdr/>
 <fill>
 <solidFill>
 <schemeClr val="accent1">
 <tint val="40000"/>
 </schemeClr>
 </solidFill>
 </fill>
 </tcStyle>
</band1H>
```

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example]*

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.4.2.2 band1V (Band 1 Vertical)

This element describes the formatting for the first row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 1 vertical being used within DrawingML:

```
<band1V>
 <tcStyle>
 <tcBdr/>
 <fill>
 <solidFill>
 <schemeClr val="accent1">
 <tint val="40000"/>
 </schemeClr>
 </solidFill>
 </fill>
 </tcStyle>
</band1V>
```

Band 1 Vertical

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. end example]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.4.2.3 band2H (Band 2 Horizontal)

This element describes the formatting for the second row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 2 horizontal being used within DrawingML:

```
<band2H>
 <tcStyle>
 <tcBdr/>
 <fill>
 <solidFill>
 <schemeClr val="accent2">
 <tint val="40000"/>
 </schemeClr>
 </solidFill>
 </fill>
 </tcStyle>
</band2H>
```

Band 2  
Horizontal

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. end example]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.4.2.4 band2V (Band 2 Vertical)

This element describes the formatting for the second row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 2 vertical being used within DrawingML:

```
<band2V>
 <tcStyle>
 <tcBdr/>
 <fill>
 <solidFill>
 <schemeClr val="accent2">
 <tint val="40000"/>
 </schemeClr>
 </solidFill>
 </fill>
 </tcStyle>
</band2V>
```

Band 2 Vertical

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example]*

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

1

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

2 The following XML Schema fragment defines the contents of this element:

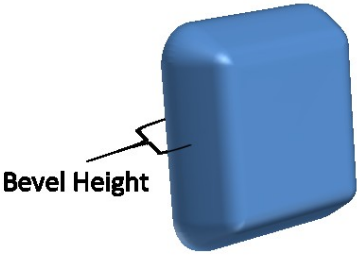

```
3 <complexType name="CT_TablePartStyle">
4 <sequence>
5 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
6 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
7 </sequence>
8 </complexType>
```

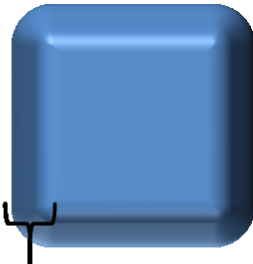

9 5.1.4.2.5 bevel (Bevel)

10 This element defines the properties of the bevel associated with the 3D effect applied to a cell in a table.

Parent Elements
cell3D (§5.1.6.1)

11

Attributes	Description
h (Height)	<p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="430 1192 784 1444" data-label="Image"></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>
prst (Preset Bevel)	<p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§5.1.12.9).</p>
w (Width)	<p>Specifies the width of the bevel, or how far into the shape it is applied.</p>

Attributes	Description
	<p>[Example: Consider the following example bevel</p> <div><p><b>Bevel Width</b></p></div> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).</p>

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_Bevel">
3 <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="76200"/>
4 <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="76200"/>
5 <attribute name="prst" type="ST_BevelPresetType" use="optional" default="circle"/>
6 </complexType>
```

7 **5.1.4.2.6 bottom (Bottom Border)**

8 This element defines the line properties associated with the bottom border in a table cell.

9 [Example: Consider the following example of the bottom border in use within DrawingML:

```
10 <bottom>
11 <ln w="12700" cmpd="sng">
12 <solidFill>
13 <schemeClr val="accent1"/>
14 </solidFill>
15 </ln>
16 </bottom>
```

17 In this example, we see the bottom border on a table cell to be a single 1pt line which is colored accent 1. *end*  
18 *example*]

Parent Elements
tcBdr (§5.1.4.2.28)

19

Child Elements	Subclause
----------------	-----------

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_ThemeableLineStyle">
 <choice>
 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 </choice>
</complexType>

```

#### 5.1.4.2.7 effect (Effect)

This element defines the effect that can be applied to a table as a whole through a table style.

[Example: Consider the following example of an effect in use within DrawingML:

```

<effect>
 <effectLst>
 <glow rad="228600">
 <schemeClr val="accent1">
 <satMod val="175000"/>
 <alpha val="40000"/>
 </schemeClr>
 </glow>
 </effectLst>
</effect>

```

In this example, we see a glow being defined within the table style that will be applied to the table as a whole.  
end example]

Parent Elements
tblBg (§5.1.4.2.25)

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_EffectProperties">
 <sequence>
 <group ref="EG_EffectProperties" minOccurs="1" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.4.2.8 effectRef (Effect Reference)

This element defines a reference to an effect style within the style matrix. The idx attribute refers the index of an effect style within the effectStyleLst element.

Parent Elements
style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tblBg (§5.1.4.2.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to.  The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrixReference">
 <sequence>
 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
 </sequence>
 <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
</complexType>
```

#### 5.1.4.2.9 fill (Fill)

This element defines the fill that is applied to the table as a whole. The background of the table can contain a single fill that is the entire size of the table. This can allow for gradient fills, or image fills, which span the entire size of the table.

[Example: Consider the following example of a fill on a table background in DrawingML:

```
1 <fill>
2 <gradFill flip="none" rotWithShape="1">
3 <gsLst>
4 <gs pos="0">
5 <schemeClr val="accent2">
6 <shade val="75000"/>
7 </schemeClr>
8 </gs>
9 <gs pos="100000">
10 <schemeClr val="accent2">
11 <shade val="75000"/>
12 <tint val="20000"/>
13 </schemeClr>
14 </gs>
15 </gsLst>
16 <lin ang="2700000" scaled="1"/>
17 <tileRect/>
18 </gradFill>
19 </fill>
```

20 In this example, we apply a gradient fill to the entire table on the background shape of the table. *end example]*

21

Parent Elements
tblBg (§5.1.4.2.25); tcStyle (§5.1.4.2.29)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

22 The following XML Schema fragment defines the contents of this element:

```
23 <complexType name="CT_FillProperties">
24 <sequence>
25 <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
26 </sequence>
27 </complexType>
```

5.1.4.2.10 fillRef (Fill Reference)

This element defines a reference to a fill style within the style matrix. The idx attribute refers to the index of a fill style or background fill style within the presentation's style matrix, defined by the fmtScheme element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the fillStyleLst element, and values 1001 and above refer to the index of a background fill style within the bgFillStyleLst element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[Example:

```
<a:fillRef idx="2">
 <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's second fill style using the accent2 color of the color scheme.

end example]

[Example:

```
<a:fillRef idx="1001">
 <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's first background fill style using the accent2 color of the color scheme.

end example]

Parent Elements
style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tblBg (§5.1.4.2.25); tcStyle (§5.1.4.2.29)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index)	<p>Specifies the style matrix index of the style referred to.</p> <p>The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).</p>

1 The following XML Schema fragment defines the contents of this element:

```

2 <complexType name="CT_StyleMatrixReference">
3 <sequence>
4 <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
5 </sequence>
6 <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
7 </complexType>

```

8 5.1.4.2.11 firstCol (First Column)

9 This element defines the cell formatting which can be applied to the first column of the table.

10 [Example: Consider the following example of first column formatting within DrawingML:

```

11 <firstCol>
12 <tcTxStyle b="on">
13 <fontRef idx="minor">
14 <scrgbClr r="0" g="0" b="0"/>
15 </fontRef>
16 <schemeClr val="lt1"/>
17 </tcTxStyle>
18 <tcStyle>
19 <tcBdr/>
20 <fill>
21 <solidFill>
22 <schemeClr val="accent1"/>
23 </solidFill>
24 </fill>
25 </tcStyle>
26 </firstCol>

```

First Column

<b>text</b>	text	text	text	text	text
<b>text</b>	text	text	text	text	text
<b>text</b>	text	text	text	text	text
<b>text</b>	text	text	text	text	text
<b>text</b>	text	text	text	text	text
<b>text</b>	text	text	text	text	text

In this example, we define the first column cell fills to be accent 1 along with the text properties to be bold when first column formatting is enabled through the user interface. *end example*

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.4.2.12 firstRow (First Row)

This element defines the cell formatting which can be applied to the first row of the table.

[Example: Consider the following example of first row formatting within DrawingML:

```
<firstRow>
 <tcTxStyle b="on">
 <fontRef idx="minor">
 <scrgbClr r="0" g="0" b="0"/>
 </fontRef>
 <schemeClr val="lt1"/>
 </tcTxStyle>
```

```
1 <tcStyle>
2 <tcBdr/>
3 <fill>
4 <solidFill>
5 <schemeClr val="accent1"/>
6 </solidFill>
7 </fill>
8 </tcStyle>
9 </firstRow>
```

First Row 

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we define the first row cell fills to be accent 1 along with the text properties to be bold when first row formatting is enabled through the user interface. *end example]*

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.4.2.13 font (Font)

This element defines the font to be used within a given table cell text style. This element allows for exact definition of the font within the table style instead of referencing a themed font.

Parent Elements
tcTxStyle (§5.1.4.2.30)

Child Elements	Subclause
cs (Complex Script Font)	§5.1.5.3.1
ea (East Asian Font)	§5.1.5.3.3
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.1.16
latin (Latin Font)	§5.1.5.3.7

The following XML Schema fragment defines the contents of this element:

```

<complexType name="CT_FontCollection">
 <sequence>
 <element name="latin" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="ea" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="cs" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
 <element name="font" type="CT_SupplementalFont" minOccurs="0" maxOccurs="unbounded"/>
 <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>

```

#### 5.1.4.2.14 insideH (Inside Horizontal Border)

This element defines the line properties associated with the inner horizontal borders in a table.

[*Example:* Consider the following example of the inner horizontal borders in use within DrawingML:

```

<insideH>
 <ln w="12700" cmpd="sng">
 <solidFill>
 <schemeClr val="accent1"/>
 </solidFill>
 </ln>
</insideH>

```

In this example, we see the inner horizontal borders in a table to be a single 1pt line which is colored accent 1.  
*end example]*

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
 <choice>
 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 </choice>
</complexType>
```

5.1.4.2.15      **insideV (Inside Vertical Border)**

This element defines the line properties associated with the inner vertical borders in a table.

[Example: Consider the following example of the inside vertical borders in use within DrawingML:

```
<insideV>
 <ln w="12700" cmpd="sng">
 <solidFill>
 <schemeClr val="accent1"/>
 </solidFill>
 </ln>
</insideV>
```

In this example, we see the inner vertical borders in a table to be a single 1pt line which is colored accent 1. *end example]*

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
 <choice>
 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 </choice>
</complexType>
```

5.1.4.2.16      **lastCol (Last Column)**

This element defines the cell formatting which can be applied to the last column of the table.

[Example: Consider the following example of last column formatting within DrawingML:

```
1 <lastCol>
2 <tcTxStyle b="on">
3 <fontRef idx="minor">
4 <scrgbClr r="0" g="0" b="0"/>
5 </fontRef>
6 <schemeClr val="lt1"/>
7 </tcTxStyle>
8 <tcStyle>
9 <tcBdr/>
10 <fill>
11 <solidFill>
12 <schemeClr val="accent1"/>
13 </solidFill>
14 </fill>
15 </tcStyle>
16 </lastCol>
```

Last Column

text	text	text	text	text	<b>text</b>
text	text	text	text	text	<b>text</b>
text	text	text	text	text	<b>text</b>
text	text	text	text	text	<b>text</b>
text	text	text	text	text	<b>text</b>
text	text	text	text	text	<b>text</b>

17

18 In this example, we define the last column cell fills to be accent 1 along with the text properties to be bold when  
19 last column formatting is enabled through the user interface. *end example*]

20

Parent Elements	
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)	

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

5.1.4.2.17 lastRow (Last Row)

This element defines the cell formatting which can be applied to the last row of the table.

[Example: Consider the following example of last row formatting within DrawingML:

```
<lastRow>
 <tcTxStyle b="on">
 <fontRef idx="minor">
 <scrgbClr r="0" g="0" b="0"/>
 </fontRef>
 <schemeClr val="lt1"/>
 </tcTxStyle>
 <tcStyle>
 <tcBdr/>
 <fill>
 <solidFill>
 <schemeClr val="accent1"/>
 </solidFill>
 </fill>
 </tcStyle>
</lastRow>
```

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

Last Row

In this example, we define the last row cell fills to be accent 1 along with the text properties to be bold when last row formatting is enabled through the user interface. *end example]*

Parent Elements

tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

1 The following XML Schema fragment defines the contents of this element:

```
2 <complexType name="CT_TablePartStyle">
3 <sequence>
4 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
5 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
6 </sequence>
7 </complexType>
```

#### 8 5.1.4.2.18 left (Left Border)

9 This element defines the line properties associated with the left border in a table cell.

10 *[Example: Consider the following example of the left border in use within DrawingML:*

```
11 <left>
12 <ln w="12700" cmpd="sng">
13 <solidFill>
14 <schemeClr val="accent1"/>
15 </solidFill>
16 </ln>
17 </left>
```

18 In this example, we see the left border on a table cell to be a single 1pt line which is colored accent 1. *end*  
19 *example]*

Parent Elements
tcBdr (§5.1.4.2.28)

20

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

21 The following XML Schema fragment defines the contents of this element:

```
22 <complexType name="CT_ThemeableLineStyle">
23 <choice>
24 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
25 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
26 </choice>
27 </complexType>
```

5.1.4.2.19 InRef (Line Reference)

This element defines a reference to a line style within the style matrix. The idx attribute refers the index of a line style within the fillStyleLst element.

Parent Elements
bottom (§5.1.4.2.6); insideH (§5.1.4.2.14); insideV (§5.1.4.2.15); left (§5.1.4.2.18); right (§5.1.4.2.22); style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tl2br (§5.1.4.2.31); top (§5.1.4.2.32); tr2bl (§5.1.4.2.33)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index)	<p>Specifies the style matrix index of the style referred to.</p> <p>The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).</p>

The following XML Schema fragment defines the contents of this element:

<pre>&lt;complexType name="CT_StyleMatrixReference"&gt;   &lt;sequence&gt;     &lt;group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/&gt;   &lt;/sequence&gt;   &lt;attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/&gt; &lt;/complexType&gt;</pre>
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

5.1.4.2.20 neCell (Northeast Cell)

This element defines the formatting for the cell in the northeast corner of a table when both the first row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[Example: Consider the following example of the northeast cell formatting within DrawingML:

```
1 <neCell>
2 <tcTxStyle b="on">
3 <fontRef idx="minor">
4 <scrgbClr r="0" g="0" b="0"/>
5 </fontRef>
6 <schemeClr val="lt1"/>
7 </tcTxStyle>
8 <tcStyle>
9 <tcBdr/>
10 <fill>
11 <solidFill>
12 <schemeClr val="accent1"/>
13 </solidFill>
14 </fill>
15 </tcStyle>
16 </neCell>
```

17 In this example, we specifically set the northeast cell to contain bold text with a solid cell fill in the color of  
18 accent 1. *end example*]

19

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_TablePartStyle">
22 <sequence>
23 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
24 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
25 </sequence>
26 </complexType>
```

27 **5.1.4.2.21 nwCell (Northwest Cell)**

28 This element defines the formatting for the cell in the northwest corner of a table when both the first row  
29 formatting and first column formatting are enabled. This formatting is only applied to the single cell which  
30 overlaps between the two formatting options.

31 [Example: Consider the following example of the northwest cell formatting within DrawingML:

```
1 <nwCell>
2 <tcTxStyle b="on">
3 <fontRef idx="minor">
4 <scrgbClr r="0" g="0" b="0"/>
5 </fontRef>
6 <schemeClr val="lt1"/>
7 </tcTxStyle>
8 <tcStyle>
9 <tcBdr/>
10 <fill>
11 <solidFill>
12 <schemeClr val="accent1"/>
13 </solidFill>
14 </fill>
15 </tcStyle>
16 </nwCell>
```

17 In this example, we specifically set the northwest cell to contain bold text with a solid cell fill in the color of  
18 accent 1. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

19

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

20 The following XML Schema fragment defines the contents of this element:

```
21 <complexType name="CT_TablePartStyle">
22 <sequence>
23 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
24 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
25 </sequence>
26 </complexType>
```

27 5.1.4.2.22 right (Right Border)

28 This element defines the line properties associated with the right border in a table cell.

29 [Example: Consider the following example of the right border in use within DrawingML:

```
<right>
 <ln w="12700" compd="sng">
 <solidFill>
 <schemeClr val="accent1"/>
 </solidFill>
 </ln>
</right>
```

In this example, we see the right border on a table cell to be a single 1pt line which is colored accent 1. *end example]*

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
 <choice>
 <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
 <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
 </choice>
</complexType>
```

#### 5.1.4.2.23 seCell (Southeast Cell)

This element defines the formatting for the cell in the southeast corner of a table when both the last row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[Example: Consider the following example of the southeast cell formatting within DrawingML:

```
<seCell>
 <tcTxStyle b="on">
 <fontRef idx="minor">
 <scrgbClr r="0" g="0" b="0"/>
 </fontRef>
 <schemeClr val="lt1"/>
 </tcTxStyle>
```

```
<tcStyle>
 <tcBdr/>
 <fill>
 <solidFill>
 <schemeClr val="accent1"/>
 </solidFill>
 </fill>
</tcStyle>
</seCell>
```

In this example, we specifically set the southeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example]*

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.4.2.24 swCell (Southwest Cell)

This element defines the formatting for the cell in the southwest corner of a table when both the last row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[Example: Consider the following example of the southwest cell formatting within DrawingML:

```
<swCell>
 <tcTxStyle b="on">
 <fontRef idx="minor">
 <scrgbClr r="0" g="0" b="0"/>
 </fontRef>
 <schemeClr val="lt1"/>
 </tcTxStyle>
```

```
1 <tcStyle>
2 <tcBdr/>
3 <fill>
4 <solidFill>
5 <schemeClr val="accent1"/>
6 </solidFill>
7 </fill>
8 </tcStyle>
9 </swCell>
```

In this example, we specifically set the southwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
 <sequence>
 <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
 <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
 </sequence>
</complexType>
```

#### 5.1.4.2.25 tblBg (Table Background)

This element defines the formatting options which can be applied to the table background shape. The background shape is the same size as the entire table and can hold a fill or an effect which spans the entire table.

[*Example:* Consider the following example of a table background in use within DrawingML:

```
<tblBg>
 <fillRef idx="2">
 <schemeClr val="accent1"/>
 </fillRef>
 <effectRef idx="1">
 <schemeClr val="accent1"/>
 </effectRef>
</tblBg>
```

- 1 In this example, we see that there is a themed fill and themed effect being applied to the table background  
 2 through the table style. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

3

Child Elements	Subclause
effect (Effect)	§5.1.4.2.7
effectRef (Effect Reference)	§5.1.4.2.8
fill (Fill)	§5.1.4.2.9
fillRef (Fill Reference)	§5.1.4.2.10

- 4 The following XML Schema fragment defines the contents of this element:

```

5 <complexType name="CT_TableBackgroundStyle">
6 <sequence>
7 <group ref="EG_ThemeableFillStyle" minOccurs="0" maxOccurs="1"/>
8 <group ref="EG_ThemeableEffectStyle" minOccurs="0" maxOccurs="1"/>
9 </sequence>
10 </complexType>

```

#### 11 5.1.4.2.26 [tblStyle \(Table Style\)](#)

- 12 This is the root element for a table style. Within the table style are different formatting options available in  
 13 order to apply a table.

Parent Elements
tblStyleLst (§5.1.4.2.27)

14

Child Elements	Subclause
band1H (Band 1 Horizontal)	§5.1.4.2.1
band1V (Band 1 Vertical)	§5.1.4.2.2
band2H (Band 2 Horizontal)	§5.1.4.2.3
band2V (Band 2 Vertical)	§5.1.4.2.4
extLst (Extension List)	§5.1.2.1.15
