By [Dan Montesanto](#), HP Networking Strategy and Business Planning

Before he jumped on a plane for this week's Interop show in Las Vegas, I had a chance to sit down with Kai Chang, HP Networking switch software product manager, to talk about OpenFlow – an interesting up-and-coming networking technology that's gotten a lot of buzz recently. I wanted Kai to help explain what OpenFlow is about and how it might change the way customers and vendors build and deploy networks.

DM: Hi Kai. Can you describe OpenFlow – what it is, how it works?

Prehistory (2002-2003)

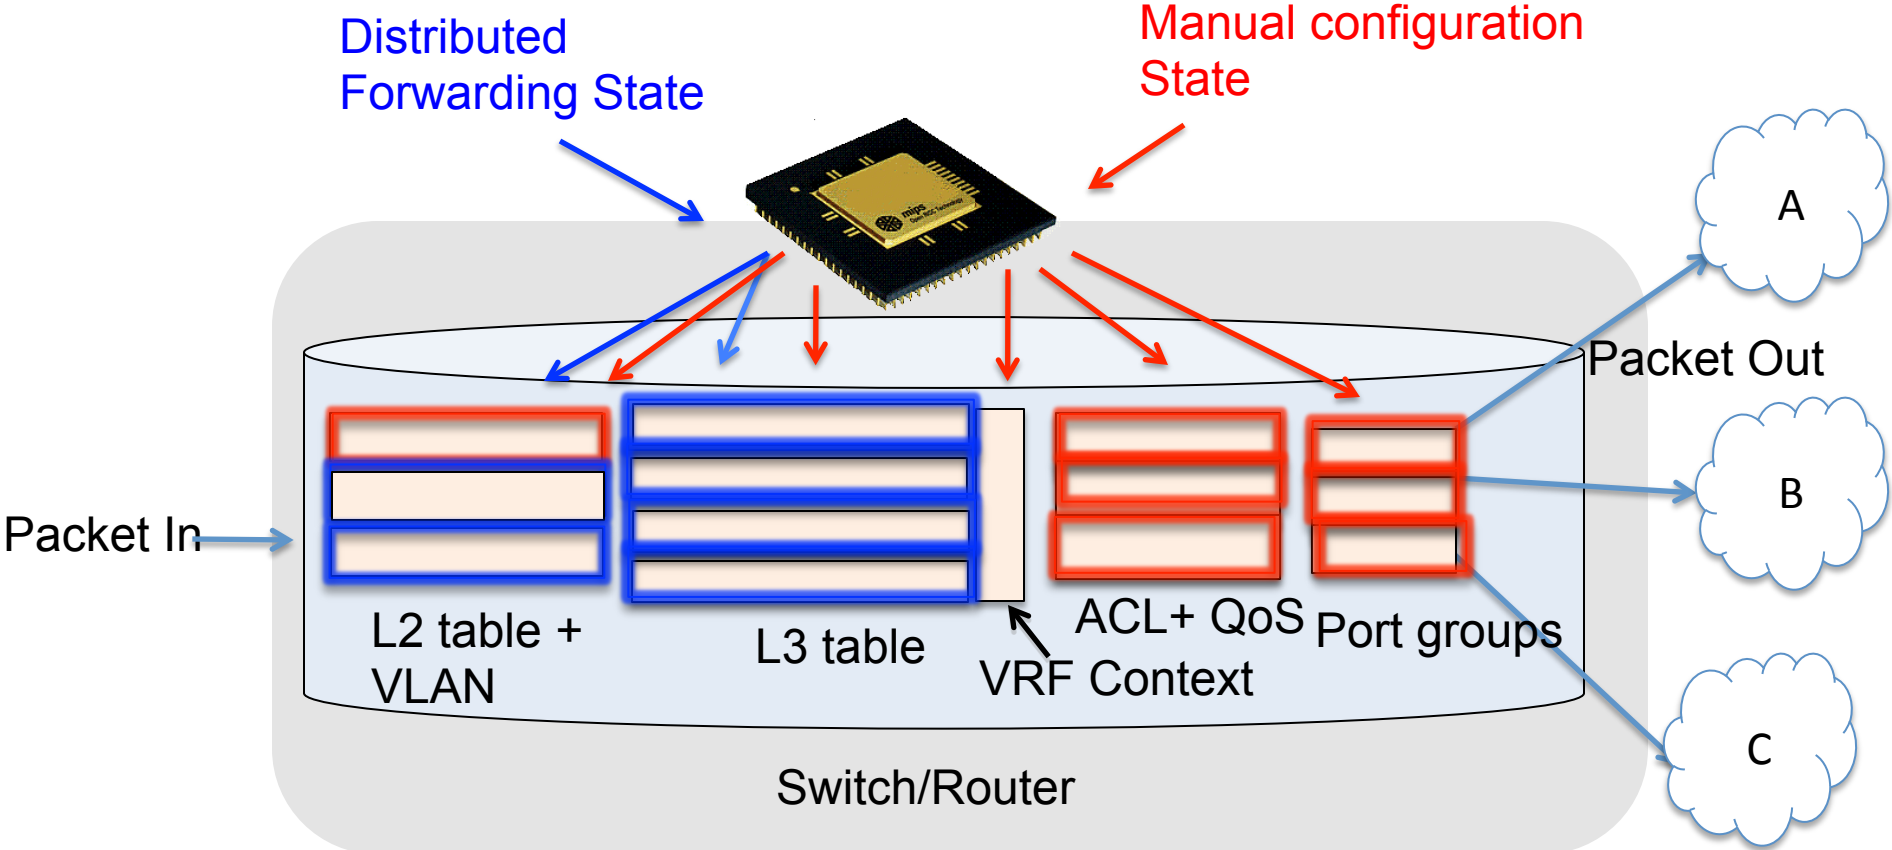

Paradise Lost?

- Limited redundancy
- Constrained topology
- Poor response to dynamic events
- Scaling limited by operational complexity

Networking in Practice

The Problems ...

- Humans suck at state management
 - No well defined APIs for datapath state
 - No general distributed algorithms for all datapath state
-

Developing OpenFlow (2004-Now)

"How to program a network"

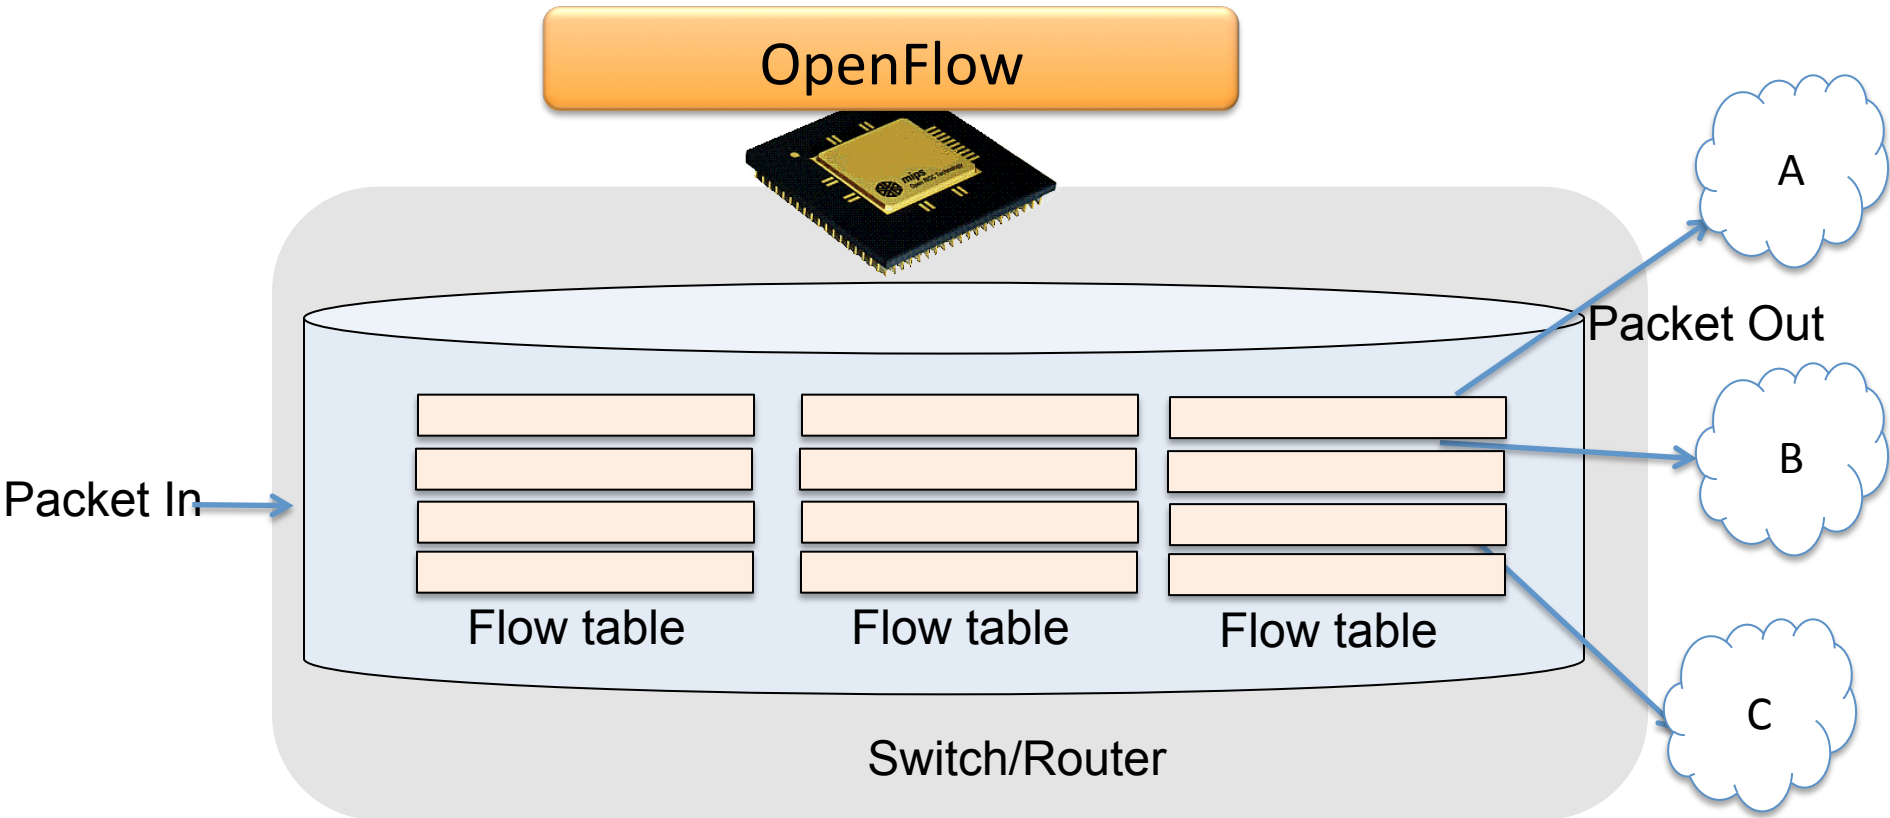

"How to programmatically manage all of
the datapath state in the network"

Problem: Poor Forwarding Abstractions

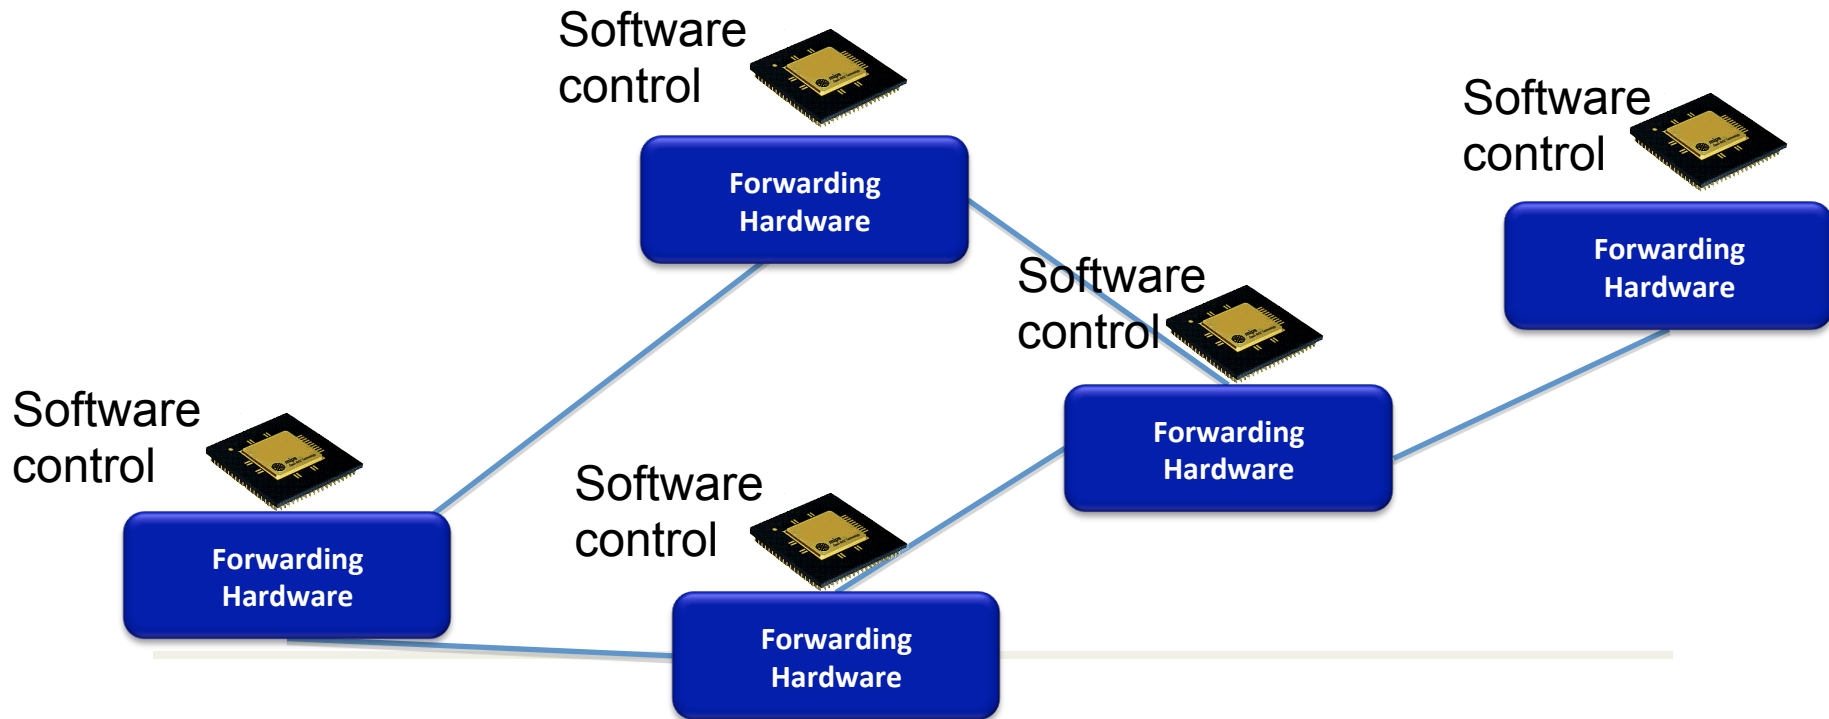

- Fixed function
 - Often expose implementation details
 - Non-standard/non-existent state management APIs
-

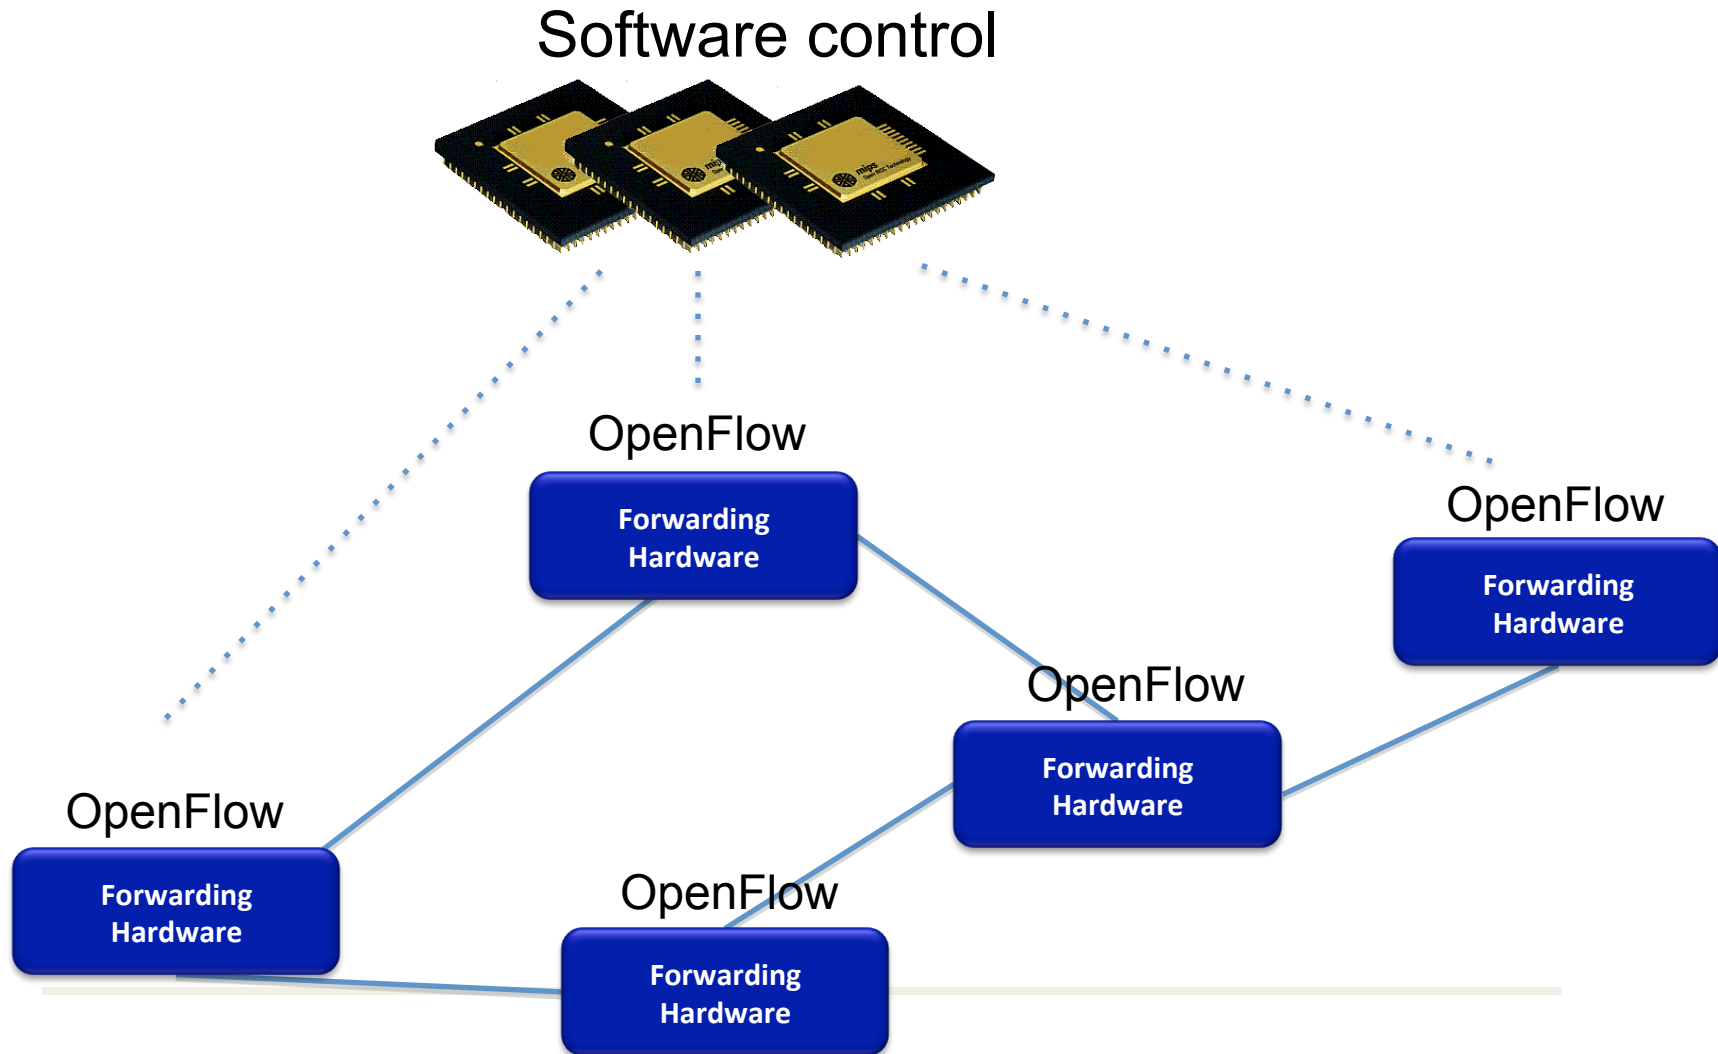

Solution: Generalize Dataplane

Problem: Distributed Computing is Hard

Solution: Decouple Distribution Model from Topology

OpenFlow/SDN FAQ

What is the Primary Value Proposition?

- Ability to innovate within the network
 - Horizontal integration
 - Market efficiency
 - Rapid innovation at each layer
-

Does OpenFlow Offer New Functionality?

- Not really ...

Does SDN Scale?

- Yes

A Restrospective on the Future of OpenFlow (Now-??)

Is OpenFlow ...

- ... a new idea?
 - ... well designed?
 - ... a path to new functionality?
-

So What is the Cause of its Success?

You
